Using a variable in a filter lets you combine the functionality of filters with the flexibility of variables. For example, you could create a variable that groups records together in time periods, and then create a filter with an expression of `date_format(opportunities.created, $date_group)`, where `$date_group` is the variable to filter on opportunities created during a particular year. To use the filter, you would simply enter the year you want to report on. Without such a filter, the report would need to include a filter using the *between* operator that requires entering both a start time and an end time.

Using a variable in a data exception lets you use a single exception to flag different data. This eliminates the need to create multiple exceptions to flag data in different columns. For example, you could use a variable in an exception to flag incidents that were created more than one day ago or to flag incidents that were updated more than one day ago. The information you want to flag is selected on the Search window when you run the report. Refer to Creating data exceptions.

Using a variable in an image lets you dynamically generate links to web pages and change the displayed image when you select different variable values. Refer to Adding images to reports. Using a variable in a text field lets you display the variable's current value in the text field. Refer to Populating text fields with filter and variable values.

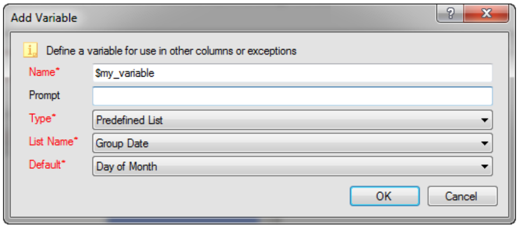
Creating variables

Before you use variables in output columns, filters, or data exceptions, the variables first need to be created. There are several types of variables you can use, including predefined lists, user-defined lists, ad hoc values, and replacement values. Each of these serves a unique function.

To add variables

1 Click the Home tab.

2 Click the Add Variable button to open the Add Variable window.



3 Type a name for the variable in the Name field. Variable names are always preceded by the dollar sign.

Note The options on the Add Variable window change depending on the variable type that is selected.

4 Type an optional prompt in the Prompt field. This text is displayed on the Search window when running the report. If this field is left empty, the variable's name is displayed instead.

Note The Prompt field is not available when using a Replacement Value variable type, as this type is not displayed when running a report.

5 Select the variable type from the Type drop-down menu. The following variable types are available.

Table 242: Variable Types

Field	Description
Predefined List	Select this type to use values from an existing menu or predefined list in the variable. When selecting this option, all menu fields from the tables used in the report are available, along with three predefined lists: • **Group Date**—This list contains date/time formats, such as Month, Week, and Day of Month. • **Yes/No**—This list contains Yes and No options. • **Currency Formats**—This list contains currency formats, such as USD and CAN, that are defined on your site.
User Defined List	Select this type to compile your own list of menu items to use for the variable. For example, if you wanted the variable to return either incidents' statuses or assigned staff accounts, you could create a variable value for *incidents.status* and another for *incidents.assgn_acct_id*. **Note:** When you select this type, you must select a data type for the variable. Click here for a description of the available data types.

Table 242: Variable Types (Continued)

Field	Description
Ad Hoc Value	Select this type to allow staff members to type their own value for the parameter at run-time, without having to select from a list. For example, an individual using the report types the exact expression or string to use as the variable value. **Note:** When you select this type, you must select a data type for the variable. Click here for a description of the available data types.
Replacement Value	Select this type to enter an expression that you want to use in several places in the report. The replacement value variable you create can be added to the report in any place you would otherwise need to type the expression. This lets you use a short variable name rather than a lengthy expression.

6 If using a predefined list variable type, select the list to use from the List Name drop-down menu.

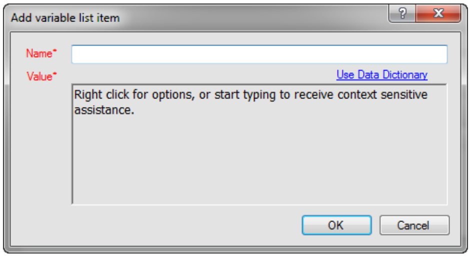
7 If using a user-defined list or ad hoc value variable type, select the data type to use from the Data Type drop-down menu. The following data types are available.

Table 243: Variable Data Types

Data Type	Description
String	Select this option to add a variable that uses a string field.
Integer	Select this option to add a variable that uses an integer field.
Float	Select this option to add a variable that uses a numeric field that can contain decimal points.
Date and Time	Select this option to add a variable that uses a date and time field.
Currency	Select this option to add a variable that uses a currency field.
Expression	Select this option to add a variable that uses a database field (for example, *incidents.status*). **Note:** This data type is not available for Ad Hoc Value.

8 If using a user-defined list variable type, create the list items you want to include.

a Click Add Item to open the Edit Variable List Item window. The following figure shows the window when adding a variable with an Expression data type.



b Type a name for the list item in the Name field.

c Enter a value for the list item in the Value field.

The format of the Value field changes depending on the data type selected for the user-defined list. For example, the Value field for a Date and Time list item displays a calendar, whereas the Value field for an expression list item displays a text box and includes an Advanced option you can click to open the data dictionary to help you build the expression.

d Click the OK button to save the list item.

e Add the other list items you want to be able to select for the variable.

9 If using a predefined list or user-defined list variable type, enter a default value for the variable in the Default field.

10 If using an ad hoc value variable type, type a default value for the variable in the Default field.

11 If using a replacement variable type, type the expression you want the variable to replace.

Or

Click Use Data Dictionary to open the data dictionary to create the expression from database fields and functions.

12 Click the OK button to save the variable.

Adding variables to a column

Once you create a variable in a report, it is added to the variables list in the report design center's data dictionary. You can then create output columns that use the variable in the same manner as you would any other output column, creating the column's expression out of database fields, **functions**, **computed fields**, and **variables** listed in the data dictionary. In some cases, the variable will be the only item in the column's expression. In other cases, the variable will be combined with functions or database fields to form the column's expression. Refer to Adding columns to reports.

When a predefined list, user-defined list, or ad hoc value variable is included in a report's output columns, a menu listing the variable's options displays on the report's Search window. The variable menu can also display at the top of the report in the docked filters section for easy access by individuals using the report. Refer to Docking variables and run-time selectable filters.

Computed fields

Computed fields are not actual fields in the database, but are calculated from the columns in your output level. Before the output level has columns added, computed fields are not available. Once you add columns to the output level, the data dictionary's Computed Fields tree includes the columns you added. If you click a column in the tree, the available computed fields for that column appear in computed fields in the data dictionary. You can then drag the computed field you want to the design surface, just as you would with a standard database field.

Tip You can also add computed fields by clicking a column on the design surface to select it, clicking the Design tab, clicking the arrow on the Insert Column button, and selecting the computed field you want to add.

Most database fields have only a comparison value computed field available. Additional calculations are available for integer fields, which store numbers. The moving average, moving total, percentage of average, percentage of total, running average, and running total columns are all available to use in output levels and in rollups, if rollups exist in the report. When computed fields are added to rollups, the values are reset at the beginning of each rollup section.

The Comparison Value and Comparison Percentage Value computed fields are described in Adding comparison columns to reports. The Trend Value and Trend Percentage Value computed fields are described in Adding trending columns to reports.

Report moving average

This column outputs a centered moving average. Centered averages calculate the average for a value in a column by averaging that value, along with a number of values in the column prior to and preceding that value. For example, if a report outputs the number of incidents per month, a centered average for March that uses three data points would use the number of incidents from February, March, and April to derive the average.

Tip Moving averages work best using odd numbers of data points, but can use an even number, though the internal calculation to derive the value will differ somewhat.

For an odd number of data points, the centered average at *i* for a given data point, *di*, and number of data points, *N*, is:

```
(di-(N-1)/2 + di-(N-1)/2 +1 + ...di + ...di + (N-1)/2 -1 + di + (N-1)/
2)/N.
```

For an even number of data points, the centered average at *i* for a given data point, *di*, and number of data points, *N*, is:

```
(di-N/2 + 2*di-N/2 +1 + ...2*di + ...2*di + N/2 -1 + di + N/2)/2N.
```

When you add a report moving average column to a report, the calculation automatically uses three data points. However, the number of data points can be changed. Refer to Specifying data points for moving calculation columns.

Report moving total

A report moving total column outputs a running total of the values in the specified column. The totals are calculated for the current row, and a number of preceding rows determined by the number of data points you select. By default, the report moving total calculation uses three data points. For example, if you had a column with four rows, with values of 10, 20, 30, and 40, respectively, and used three data points, the corresponding values in the report moving total column would be NULL, NULL, 60, and 90.

Specifying data points for moving calculation columns

The report moving average and report moving total computed fields use data points in their calculations. The method to select the number of data points to use is identical for either computed field.

To change the number of data points

1 Add a report moving average or report moving total column to the output level.

2 Right-click the column on the design surface and select Edit Moving Calculations Options.

3 Type the number of data points you want to use in the calculation.

4 Click the OK button to save the number of data points used for the moving calculation.

Tip You can also change the number of data points by selecting the moving calculations column, clicking the Design tab, and entering the number of data points in the Number of Data Points drop-down menu.

Report percentage of average

A report percentage of average column calculates the average of the values in the specified column, and then returns the percentage of that total of the value in the current row. For example, if you had a column with three rows whose values were 10, 20, and 30, the average of the values in the column would be 20. The values returned in the report percentage of average column would be derived by dividing the value in each row by the average value of the column, and multiplying the result by 100. In this example, the values returned would be 50%, 100%, and 150%, respectively.

Report percentage of total

A report percentage of total column calculates the total of the values in the specified column, and then returns the percentage of that total of the value in the current row. For example, if you had a column with three rows whose values were 10, 20, and 30, the total of the values in the column would be 60. The values returned in the report percentage of total column would be derived by dividing the value in each row by the total value of the column, and multiplying the result by 100. In this example, the values returned would be 16.6%, 33.3%, and 50%, respectively.

Report running average

A report running average column averages the values in a specified column for all the column's rows, up to and including the value in the current row. For example, if you had a column with three rows, with values of 10, 20, and 30, respectively, the corresponding values in the report running average column would be 10, 15, and 20.

Report running total

A report running total column totals the values in a specified column for all the column's rows, up to and including the value in the current row. For example, if you had a column with three rows, with values of 10, 20, and 30, respectively, the corresponding values in the report running total column would be 10, 30, and 60.

Functions

Functions allow you to apply standard mathematical functions to the data from your database, and output the modified data in report columns. For example, using the *count()* function, you can output the number of contacts associated with an organization. The column's expression in this example would be *count(contacts.c_id)*. Expressions that use more complex functions allow more complex modifications to the data that is displayed. You can also combine different functions and database fields in the same column's expression.

When you drag a function from the data dictionary to the design surface, the Column Definition window opens. This lets you enter the variables used in the function's expression. You can either type the variables in the Expression field or, if the variable is an item listed in the Available Columns/Functions field, you can drag the item into the function's expression. Refer to the following table for descriptions of the functions you can use in reports.

Table 244: Functions Description

Function	Description
Aggregate Functions	Select from the following to use an aggregate function in the expression. **Note:** Aggregate functions can be used only when defining output.
avg(expr)	This function computes an average value for the **data set** *expr*.
count(expr)	This function returns the number of rows included in the data set *expr*.
first(expr, sort column1[, sort column2][,...])	This function returns the first value of data set *expr* based on the order of the specified sort columns. For example, the expression `first(threads.note, threads.entered, threads.seq)` returns the first thread note in the data set based on time entered and thread sequence.
group_concat(expr, separator[, sort column 1, ASC|DESC][, sort column 2, ASC|DESC][,...])	This function allows you to combine multiple values from data set *expr* into a delimited list in a single row. The list is delimited by *separator* and ordered by the specified sort columns. For example, the expression `group_concat(threads.note, ',', threads.entered, ASC)` returns a comma-delimited list of thread notes ordered by time entered ascending.

Table 244: Functions Description (Continued)

Function	Description
last(expr, sort column1[, sort column2][,...])	This function returns the last value of data set *expr* based on the order of the specified sort columns. For example, the expression `last(threads.note, threads.entered, threads.seq)` returns the last thread note in the data set based on time entered and thread sequence.
max(expr)	This function returns the largest numerical value, the last string in alphabetical order, or the latest date in the data set *expr*.
min(expr)	This function returns the smallest numerical value, the first string in alphabetical order, or the earliest date in the data set *expr*.
sum(expr)	This function returns the sum of the values in the data set *expr*.
sum_distinct(expr, reference)	This function returns the sum of distinct values in an expression for a particular record (reference) rather than for all records of the same type in a table. For example, if you want to calculate the sum of all quotas for a particular sales person, you could add a function of `sum_distinct(sa_period2accts.quota, sa_period2accts.acct_id)`.
stddev(expr)	This function returns the standard deviation of *expr*. For example, the expression `stddev(answers.solved_count)` returns the standard deviation of all the values in the *solved_count* column of the *answers* table.
String Functions	Select from the following to use a string function in the expression:
concat(str1, str2)	This function combines input character strings from multiple expressions into a single output string. Two or more expressions can be appended with this function. For example, the expression `concat('www.','global','.com')` returns the value `www.global.com`.
instr(str, substr)	This function returns the numeric position (in characters) of the initial occurrence of string *substr* in string *str*. For example, the expression `instr('globalcellphones.com','cell')` returns the value `7`.
length(str)	This function returns the length (in characters) of the string. For example, the expression `length('cell phones')` returns the value `10`.

Table 244: Functions Description (Continued)

Function	Description
lower(str)	This function returns string *str* in all lowercase characters. For example, the expression `lower('Global.COM')` returns the value `global.com.`
ltrim(str)	This function returns the string *str* without leading spaces. For example, the expression `ltrim('     Cell phone')` returns the value `Cell phone.`
lpad(str1, X, str2)	This function returns *str1* padded on the left with *str2* until *str1* is *X* characters long. For example, the expression `lpad('phone', 10, '@')` returns the value `@@@@@phone`.
rpad(str1, X, str2)	This function returns *str1* padded on the right with *str2* until *str1* is *X* characters long. For example, the expression `rpad('phone', 10, '@')` returns the value `phone@@@@@`.
rtrim(str)	This function returns the string *str* without trailing spaces. For example, the expression `rtrim('agarfield@global.com ')` returns the value `agarfield@global.com`.
substr(str, start_pos, [length])	This function returns a portion of the string *str* starting at the character defined by *start_pos* (an integer) and ending at the character defined by *length* (an integer). If *length* is not indicated, it returns the remainder of the string.
to_char(expr)	This function converts the numeric *expr* to a character string.
to_number(str)	This function converts the character string *str* to a numeric. If the *str* is not numeric, this function returns zero. If *str* is a combination of numbers and other characters and begins with a number, this function returns only the initial numeric portion. For example, `to_number('123ABC')` returns 123.
upper(str)	This function returns string *str* in all uppercase characters. For example, the expression `upper('global.COM')`returns the value `GLOBAL.COM.`

Table 244: Functions Description (Continued)

Function	Description
Date Functions	Select from the following to use a date function in the expression. **Note:** Refer to Date and time format tokens for analytics for a list of the date/time format tokens you can use in date functions. Most of the date functions allow you to combine the supported format tokens in any combination you want.
date_add(date, units, interval, round)	This function returns the value of *date* plus a specified amount of time where date is a date/time type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. The amount of time to add is specified by *units* and *interval. Units* is an integer or expression referring to an integer database field specifying the number of intervals to add or subtract. *Interval* can be SECONDS, MINUTES, HOURS, DAYS, WEEKS (Sunday through Saturday), IWEEKS (Monday through Sunday), MONTHS, QUARTERS, or YEARS. To round the result to the beginning of the specified interval, set the *round* argument to 1. If you set *round* to 0, the result will not be rounded. For example, the expression `date_add('2013-11-25 22:35:00', 48, HOURS, 1)` returns the value `2013-11-27 22:00:00`.

Table 244: Functions Description (Continued)

Function	Description
to_date(str, format)	This function converts the value entered in *str* that is in the format specified in *format* to a date or date/time value. For example, the expression `to_date('20140215','YYYYMMDD')` returns a value of `02/15/2014`. **Note:** Unlike other date functions, *to_date* supports only the following date formats. DD MM YYYY HH24:MI:SS DD MM YYYY HH:MI:SS AM DD MON YY DD MON YYYY DD-MM-YY DD-MM-YYYY DD.MM.YY DD.MM.YYYY DD/MM/YY DD/MM/YYYY DD/MM/YYYY HH:MI:SS AM MM-DD-YY MM-DD-YYYY MM/DD/YY MM/DD/YYYY MON DD YY MON DD YYYY MON DD YYYY HH:MI AM MON DD YYYY HH:MI:SS AM YY.MM.DD YY/MM/DD YYMMDD YYYY-MM-DD YYYY-MM-DD HH24:MI:SS YYYY-MM-DDTHHH24:MI:SS YYYY.MM.DD YYYY/MM/DD YYYYMMDD

Table 244: Functions Description (Continued)

Function	Description
date_format(date, format)	This function converts *date* from a date/time data type to a string and reformats it to match the format specified by *format*. *Date* can be a date/time type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. For example, the expression `date_format('2013-11-25 22:25:00', 'DAY, MONTH DD, YYYY, HH12:MI PM')` returns the value `Tuesday, November 25, 2013 10:25 PM.`
date_diff(date, date)	This function returns the number of seconds occurring between two dates. For example, the expression `date_diff('2014-07-26 22:25:00', '2014-07-25 10:30:00')` returns the value `129300`. Another example is `date_diff(sysdate(),incidents.updated)`. This expression returns the number of seconds between the current time and the time that incidents were last updated. **Note:** To change the format of the output, use the time_format function. For example, `time_format(date_diff('2014-07-26 22:25:00', '2014-07-25 10:30:00'), 'HH24h MIm SSs')` returns the value `35h 55m 00s.`
rel_date_diff(date2, date1, rr_id)	This function returns the number of seconds between two dates, taking holidays and the work hours specified in response requirements into account. For example, if a site's response requirements are configured with work hours from 9 A.M. to 5 P.M., the expression `rel_date_diff('2014-07-26 22:25:00', '2014-07-25 10:30:00',1)` returns the value `52200`. Another example is `rel_date_diff(sysdate(),incidents.rel_due,incidents.rr_id)`. This expression returns the number of seconds between the current time and incidents' due dates, excluding holidays and taking the work hours configured in the response requirements associated with the incidents into account. **Note:** This function is not available for use in variables, filters, or exceptions. In addition, it cannot be nested in other expressions.
date_trunc(date, units)	This function truncates *date* to the unit specified by *units*, with *units* being a time interval of SECONDS, MINUTES, HOURS, DAYS, WEEKS (Sunday through Saturday), IWEEKS (Monday through Sunday), MONTHS, QUARTERS, or YEARS. For example, the expression `date_trunc('2013-11-25 22:25:10', HOURS)` returns the value `2013-11-25 22:00:00`.

Table 244: Functions Description (Continued)

Function	Description
sysdate()	This function returns the current system date in the format YYYY-MM-DD HH:MI:SS.
time_format (seconds, format)	This function converts *seconds* to the specified time format. For example, the expression `time_format(86610,'HH24 MI SS')` returns the value `24 03 30.`
date_group(expr, format)	This function lets you group records together according to a date range that you specify, and include rows for date ranges that have no associated records. If you do not want to return rows for date ranges with no records, you could use date_format instead. For example, if you have incidents created in January and March, but none in February, and create a report with the expression for column A set to *date_group(incidents.created, 'YYYY-MM')*, and the expression for Column B set to *count(*)*, the report would output: 2014-01 10 2014-02 0 2014-03 15 If you changed Column A's expression to *date_format(incidents.created, 'YYYY-MM')* to use the date_format function instead of date_group, the output would be similar, but would not include a row for February. **Note:** When this function is used in a column, the report design center automatically groups the data in the output level, and sets the output level's group and sort order options. At least one date filter is required to use this function.
Logical Functions	Select from the following to use a logical function in the expression.
if(expression, then result, else result)	This function returns the then result if the expression is true and returns the else result if the expression is false. For example, the expression `if(incident.c$field=1, 'Yes', 'No')` returns Yes for incidents where the value of `c$field` is 1. If the value is not 1, No is returned. **Note:** You can use IS NULL and IS NOT NULL as part of the expression. For example, you could use the expression `if(incident.c$field IS NOT NULL, 'Yes', 'No')`.

Table 244: Functions Description (Continued)

Function	Description
decode(test expression, test value 1, result 1, [, next test value, next result]* [,default])	This function compares *test expression* to each *test value* in order and returns *result* for the first *test value* that *expression* matches. If *expression* does not match any *test value*, *default* is returned. If *default* is undefined, NULL is returned. The decode function can perform table lookups, allowing you to use text strings as test values rather than requiring coded values (for example, you can use Review as a test value for the expression *faqs.status* even though the table contains code value in the *status* column).
nvl(expr1, expr2)	If the value *expr1* is null, this function returns the value *expr2*. However, if the value *expr1* is not null, then the value *expr1* is returned. The value of *expr2* must match the data type of *expr1*.
Math Functions	Select from the following to use a math function in the expression.
bitand(X, Y)	This function returns the bitwise AND of two integers, *X* and *Y*.
ceiling(X)	This function returns the smallest integer value greater than or equal to *X*.
floor(X)	This function returns the largest integer less than or equal to *X*.
power(X, Y)	This function returns the value of *X* to the power of *Y*. For example, `power(2,3)` would return `8`.
rand()	This function generates a random number between 0 and 1. This output can be used to produce a random sampling of data. For example, to generate a random sample of incidents, add a column with an expression of `rand()` to an incidents report and sort on the column. The report will show information for incidents meeting your search criteria, sorted randomly.
round(X, D)	This function returns the value *X* rounded to the nearest number with *D* decimals. For example, `round(5.55555,2)` returns the value `5.56`.
truncate(X, D)	This function returns the value *X* truncated to the *D* decimal places. For example, the expression truncate`(5.55555, 2)` returns the value `5.55`.

Table 244: Functions Description (Continued)

Function	Description
Currency Functions	Select from the following to use a currency function in the expression.
cvt_currency(expr, str)	This function converts the currency value *expr* to the specified currency *str*. For example, the expression `cvt_currency(opportunities.rep_value, 'USD')` returns the *rep_value* in U.S. dollars when "USD" is stored as the abbreviation for U.S. dollars in the *currencies* table.
make_currency(expr, str)	This function converts an integer or decimal number to the specified currency *str*. For example, the expression `make_currency(100.00, 'USD')` returns the *expr* in U.S. dollars. You can also replace *str* with the value *dflt* to convert the expression to the user's currency.
to_currency(expr, str)	This function converts an integer *expr* to a value in *str* currency. The numeric value is converted to an amount in the user's default currency. The conversion rate used for this function is the exchange rate defined in the exchange_rates table. For example, for a user with a default currency of `USD`, `to_currency(sa_products.c$price, 'EUR')` returns an amount in `USD` that is equal to the number in the `sa_products.c$price` custom field converted to Euros.

Adding columns to reports

The procedures to add report columns are the same whether you are adding standard or custom fields from the database, functions, variables, or computed fields. If your column returns information directly from the database, and does not require a complicated expression, you can add the column using the data dictionary. If your column's expression is complicated, perhaps using several functions, it can be easier to add the column from the Column Definition window.

Tip Each output level can have a maximum of 100 output columns. In addition, the number of tables used in a report is limited to 20.

To add an output column from the data dictionary

1 Select the field, **function**, **variable**, or **computed field** you want from the data dictionary.

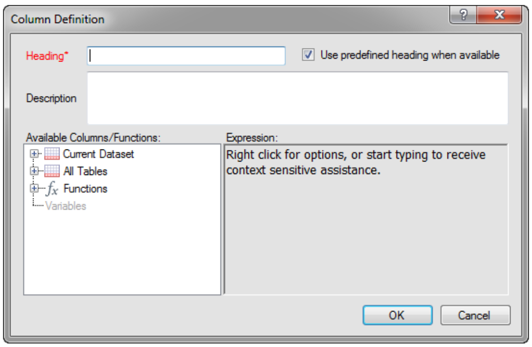
Note If the data dictionary is not shown on the design surface, click the Home tab and click the Data Dictionary button to display it.

2 Drag the field you selected to the data area on the design surface.

When you drag an item from the data dictionary to the data area, you can place it in any position. If other columns are in the data area when you drag a field, arrows appear between column headers indicating where the field will be placed. When the field is in the desired location, drop it onto the data area.

To add a column from the Column Definition window

1 Click the Home tab and click the Add Column button. The Column Definition window opens.



2 Enter the following field information.

Table 245: Column Definition Window Description

Field	Description
Heading*	Type a heading for the column. This heading displays in the report output.
Use predefined heading when available	Select this check box to use the default heading for the column. This is the name of the field as it appears in the data dictionary.

Table 245: Column Definition Window Description (Continued)

Field	Description
Description	Type an optional description for the column. Text that you enter in this field displays in the report when you include the Output Descriptions report section. Refer to Output descriptions.
Available Columns/ Functions	This area displays the data dictionary, which lists the available fields, functions, and parameters you can add as columns to the report. To add an item, expand the tree, select the item, and drag it to the Expression section. **Note:** This option does not display when defining columns for **computed fields**.
Expression	This area displays the field, function, or parameter you have defined as a column. If you know the specific field or function you want to add, you can also type it in this field to add it as an output column without dragging it from the Available Columns/Functions field. You can also manually edit the expression shown in this section. The Expression area does not display when defining columns for computed fields. **Note:** The maximum number of characters allowed in the expression field is 3,500. You can use replacement variables to create expressions that require more characters. Refer to Creating variables.

3 Click the OK button to add the output column.

The column is added as the last column on the report level. Refer to Moving columns for information about how to reposition the column.

Once you add columns to the data area, the report design center displays the columns on the design surface. Four rows of sample text display under each column to give you an idea of what the report output will look like.

Adding comparison columns to reports

Adding a comparison value **computed field** to a report lets you view the same data for two different time periods side-by-side in a report. You can specify the time periods used, and change them while running the report to view the data for different time periods. For example, you could have a report that shows the number of incidents created in the current week and the number of incidents created in the previous week. You could then run the report again to compare numbers of incidents created in the current month and previous month.

Once you add a comparison value column to a report, the Comparison button on the ribbon's Home tab becomes active and you can select the comparison time period. The comparison time period is relative to the time specified in a required date filter you must add to the report.

To add a comparison value column to a report

1. Add an output column that returns values you want to compare. For example, if you want to compare the number of incidents created from one week to the next, you could add a column for *count(incidents.i_id)* to return a count of incidents.
2. Expand the Computed Fields tree in the data dictionary.

Tip You can also add comparison columns by clicking the column you want to compare on the design surface, clicking the Design tab, clicking the arrow on the Insert Column button, and selecting the column you want to add.

3. Click the column you want to compare.
4. From the right side of the data dictionary, drag Comparison Value (*column name*) and drop it on the design surface.
5. Click the Home tab.
6. Click the Comparison button and select Edit Comparison Date Offset.
7. Type the relative value you want to use for the default comparison date offset. For example, entering `-1 Weeks Exactly` returns values in the comparison value column that are derived from data that is exactly one week earlier than the data returned in the column that is being compared.

   Or

   Click the Calendar button to specify relative date and time values. Refer to Selecting date ranges.

   When you run the report, the default comparison date offset can be changed on the Search window. This allows you to run the report several times to compare different time periods.
8. Click the OK button to save the default comparison date offset.

9 Add a **fixed** or **run-time selectable** date filter to the report. This date filter is used to filter the data returned in the column being compared and determines the time period that the comparison column's relative comparison date offset is based on. Refer to Creating report filters.

Changing comparison options

When using comparison values in a report, the comparison and compared values do not necessarily display on the same row as the corresponding values in the other column. This is because a value is not automatically returned in a comparison column if there are no records to return. For example, if a report outputs numbers of incidents assigned to two staff members during the current week and previous week, but the top staff member listed in the report had no incidents assigned in the previous week, there will not be an entry for that staff member in the comparison value column. This results in the comparison value for the second staff member displaying on the first row of the report.

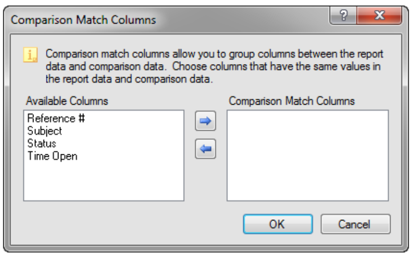
To prevent this, you can set comparison options to have the report output a zero for any rows that lack a value in a column. This results in the corresponding values lining up with one another.

To change comparison options

1 Add a comparison value column to a report.

2 Click the Home tab.

3 Click the Comparison button and select Edit Comparison Match Columns.



4 Select the column(s) that define the corresponding values. For example, to keep the number of incidents assigned to the same staff member on the same row, select the Assigned Account column.

5 Move the selected column to the Comparison Match Columns panel by dragging the field or clicking the right arrow.

6 Click the OK button to save the change to the comparison options.

Adding comparison percentage columns

Once you add a comparison value column to a report for a numeric field, you can then add a Comparison Percentage **computed field** column to the report. This column returns the percentage difference between the comparison value column and the column being compared. For example, if a value in the compared column is 10, and the corresponding comparison value is 15, the percentage difference would be 50%.

To add a comparison percentage column to a report

1 Add a comparison value column to the report, as described in [Adding comparison columns to reports](#).

2 Expand the Computed Fields tree in the data dictionary.

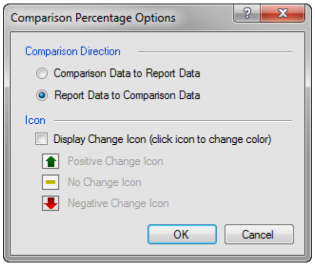
Tip You can also add comparison percentage columns by clicking the comparison column you added on the design surface, clicking the Design tab, clicking the arrow on the Insert Column button, and selecting Comparison % Change.

3 Click the comparison value column you added.

4 From the right side of the data dictionary, drag Comparison Percentage (*column name*) and drop it on the design surface.

5 To set options for the column, right-click the column on the design surface and select Edit Comparison Percentage Options.

Tip You can also adjust options by selecting the column and using the buttons on the Design tab's % Change group.



a Enter the following field information.

Table 246: Comparison Percentage Options Window Description

Field	Description
Comparison Direction	Select whether the comparison column or the compared column is used as the initial column to derive the comparison percentage.
Comparison Data to Report Data	Select this radio button to use the comparison value column as the initial column to derive the comparison percentage. If the value in the comparison value column is greater than the corresponding value in the compared column, a positive percentage is returned.
Report Data to Comparison Data	Select this radio button to use the compared column as the initial column to derive the comparison percentage. If the value in the compared column is greater than the corresponding value in the comparison value column, a positive percentage is returned.
Display Change Icon	Select this check box to display icons next to the percentage values returned in the column. The icons indicate whether there is a positive change, negative change, or no change. To alter the colors used for the icons, click the icon to open the Color window. Refer to Choosing colors.

b Click the OK button to save the comparison percentage options.

Adding trending columns to reports

Trend value **computed fields** are similar to comparison value computed fields. However, where comparison value columns return data from previous time periods, trend value columns return forecasts of data in future time periods, calculated from current data.

Note Trend values are best used when trending a column that groups data together by a time period, such as a column that shows the number of incidents created in the same week.

To add a trend value column to a report

1 Add a numeric output column that returns values you want to trend. For example, if you want to forecast the number of incidents that will be created in future weeks, you could add a column for *count(incidents.i_id)* to return a count of incidents.

2 Expand the Computed Fields tree in the data dictionary.

3 Click the column you want to trend.

4 From the right side of the data dictionary, drag Trend Value (*column name*) and drop it on the design surface.

Tip You can also add trend value columns by clicking the column you want to trend on the design surface, clicking the Design tab, clicking the arrow on the Insert Column button, and selecting Trend Value.

Specifying trend value duration

You can edit trend options to specify the number of time units that are forecast forward. For example, if the trended column groups data by week, trending forward three units shows data trended three weeks in the future.

To change trend options

1 Right-click the trend value column on the design surface and select Edit Trend Options.

2 Select the Perform Forecast check box to enable forecasting.

3 Type the number of units.

4 Click the OK button to save the number of trending units.

Tip You can also edit trend options from the Trend Options group on the Design tab after selecting the column on the design surface.

Adding trend percentage columns

Once you add a trend value column to a report, you can then add a Trend Percentage **computed field** column to the report, either from the data dictionary or the Design tab's Insert Column button. Trend Percentage columns return the percentage difference between the trend value column and the column being trended. For example, if a value in the trended column is 10, and the corresponding trend value is 15, the percentage difference would be 50%.

To add a trend percentage column to a report

1 Add a trend value column to the report, as described in Adding trending columns to reports.

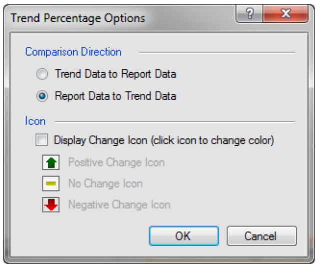
2 Expand the Computed Fields tree in the data dictionary.

3 Click the trend value column you added.

4 From the right side of the data dictionary, drag Trend Percentage (*column name*) and drop it on the design surface.

5 To set options for the column, right-click the column on the design surface and select Edit Trend Percentage Options.

Tip You can also edit trend percentage options from the % Change group on the Design tab.



a Enter the following field information.

Table 247: Trend Percentage Options Window Description

Field	Description
Comparison Direction	Select whether the trend value or the trended column is used as the initial column to derive the trend percentage.
Trend Data to Report Data	Select this radio button to use the trend value column as the initial column to derive the trending percentage. If the value in the trend value column is greater than the corresponding value in the trended column, a positive percentage is returned.
Report Data to Trend Data	Select this radio button to use the trended column as the initial column to derive the trending percentage. If the value in the trended column is greater than the corresponding value in the trend value column, a positive percentage is returned.

Table 247: Trend Percentage Options Window Description (Continued)

Field	Description
Display Change Icon	Select this check box to display icons next to the percentage values returned in the column. The icons indicate whether there is a positive change, negative change, or no change. To alter the colors used for the icons, click the icon to open the Color window. Refer to Choosing colors.

b Click the OK button to save the trend percentage options.

Editing columns

Once you add a column to the data area, you can edit it to change the header, definition, sorting, or position in the report. Depending on the type of information the column returns, you may also have options to add calculations to the column or change how the data is displayed. Other options let you show data in the column as URL links or images. Refer to Adding column calculations and URL Tab Description.

If you decide you no longer need a column in the report, you can also easily remove it. Refer to Removing columns from reports.

Moving columns

You can rearrange the columns displayed on the design surface by clicking anywhere in the column's header and dragging it to the new position in your report. You can also move a column by clicking it on the design surface to select it, clicking the Home tab, and selecting Move Left or Move Right.

Changing column options

To view the available edit options for a column, you can right-click the column on the design surface to display a list of options. You can also click the column on the design surface to select it and then choose from options shown on the ribbon's Design and Format tabs.

The options shown in the list when you right-click a column are described in the following table.

Table 248: Column Options Description

Button	Description
Edit Definitions	Select this option to open the Column Definition window where you can edit the column heading, descriptions, and expression. Refer to To add an output column from the data dictionary.
Edit Format	Select this option to open the Column Format window where you can change the column format, alignment, width, and styles. Refer to Editing column format options.
Edit Calculations	Select this option to open the Calculations window where you can select calculations on the column values to display beneath the column. Refer to Adding column calculations.
Sort Ascending/Sort Descending	Select these options to sort the values in the column in ascending or descending order. Refer to Changing sort options.
Move Column Left	Select one of these options to move the column left or right. You can also move columns by dragging them on the design surface.
Move Column Right	
Insert New Column Before	Select one of these options to add a new column before or after the column you have selected. When you select this option, the Column Definition window opens so you can create the new column.
Insert New Column After	
Delete Column	Select this option to delete the column from the report. You can also delete a column by selecting the column and pressing **Delete**.
Freeze Column	Click this button to fix the selected column in place so it does not move when you horizontally scroll the report. This can be helpful if you want to continue to view the first column in the report while scrolling the report to see the columns on the right of the report. **Note:** When you fix a column, all columns to the left of the column are also fixed. You can still scroll the columns to the right of the fixed column.

Table 248: Column Options Description (Continued)

Button	Description
Hide Column	Select this option to prevent the column from displaying in the report output. The column is only hidden, so you can display the column when running the report if you need to see it. For information about showing and hiding columns, refer to Selecting columns to display.
Insert Hidden Column	Select this option to view a list of any hidden or rolled-up columns in the report. Click the hidden or rolled-up column you want to display.

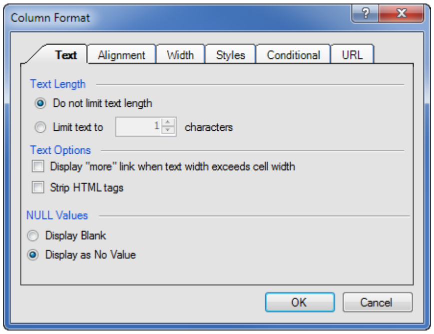
Editing column format options

Format options are available to output a column's data differently and to modify the column's display. You can adjust a column's fonts, colors, width, and alignment settings, and modify other settings that are specific to the column's data type. In addition, conditional formatting can be added to a column to flag data that meets your specified criteria, and numeric values returned in a column can be replaced with gauges to display graphical representations of the data. You can also add a URL link to a column that, when clicked, launches the web page you specify.

Note The following procedure describes editing column format options from a window. However, many of the options available from the window are also available on the ribbon.

To edit column format options

1 Right-click the column and select Edit Format to open the Column Format window. The tab that is initially displayed when you open the window varies depending on whether you are editing a column that contains text, dates, numbers, or currency. The following figure shows the column format options for a text column.



2 To define options for a text column, enter the following field information.

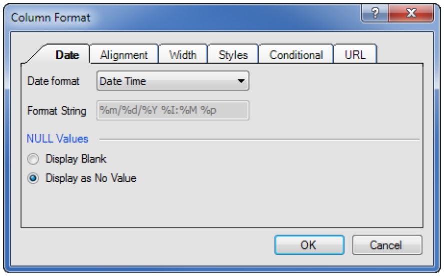
Table 249: Text Tab Description

Field	Description
Text Length	Define limits to the length of text strings appearing in the column.
Do not limit text length	Select this radio button to allow an unlimited length of text strings in the column. The column is automatically resized to fit the length of the output text. **Note:** This option is not available for menu type fields.
Limit text to *x* characters	Select this radio button to limit the text string length to a certain number of characters and then type the number of characters. Text strings that exceed this value are truncated.
Text Options	Define options to determine how column contents are displayed.
Display “more” link when text width exceeds cell width	Select this check box to display a link in a row whose text exceeds the allowed width of the column. When a link is displayed, you can click the link or hover over it to open a window with the full text.
Display tooltip when cell text exceeds cell bounds	Select this option to display a tooltip showing the field’s entire text entry when hovering over a field with a text entry that exceeds the width of the column. **Note:** This option is available only from the Options button on the ribbon’s Format tab.
Strip HTML tags	Select this check box to remove HTML tags from text that is displayed in a column.

Table 249: Text Tab Description (Continued)

Field	Description
NULL Values	Define how NULL values in the database should display.
Display Blank	Select this radio button to display a blank for NULL values.
Display as No Value	Select this radio button to display “No Value” for NULL values.

The following shows the column format options for a date column.



3 To define options for a date column, enter the following field information.

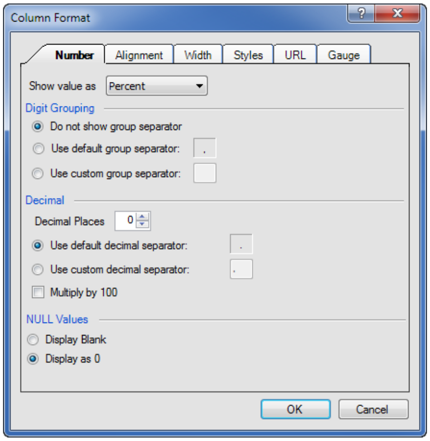
Table 250: Date Tab Description

Field	Description
Date Format	Click this drop-down menu to select the date format you want to use for date fields. The available options are Date Time, Long, Short, Month Year, Clock, Month Day, Year, Date Time (time zone), and Custom. **Note:** When you select any option other than Custom, the selected format displays in the Format String field so you can see the string that is used for the selected format.
Format String	Type the format string for the custom date format in this field when the Custom date format option is selected.
NULL Values	Define how NULL values in the database should display.
Display Blank	Select this radio button to display a blank for NULL values.

Table 250: Date Tab Description (Continued)

Field	Description
Display as No Value	Select this radio button to display “No Value” for NULL values.

The following shows the column format options for a numeric column.



4 To define options for a numeric column, enter the following field information.

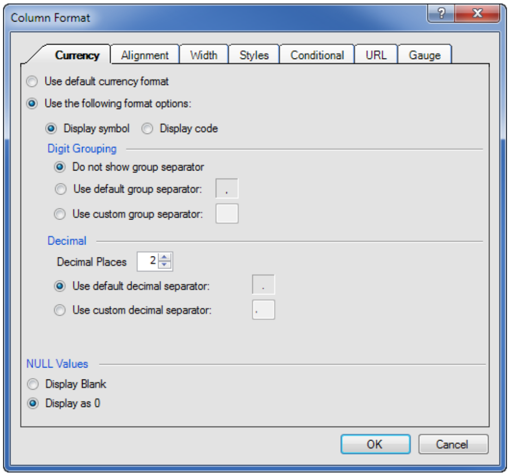
Table 251: Number Tab Description

Field	Description
Show Value As	Click this drop-down menu to select the format to use when displaying content in numeric columns. The available options are Number, Seconds, Minutes, Percent, and File Size. **Note:** The options available on the Number tab vary depending on the selected value format.
Digit Grouping	Define whether digits are grouped in threes. For example, instead of the column returning “123456,” you can group the digits to return “123,456.” **Note:** This option appears only when the selected value format is Number, Decimal, or Percent.
Do not show group separator	Select this radio button to prevent the values in the column from including a separator character.

Table 251: Number Tab Description (Continued)

Field	Description
Use default group separator	Select this radio button to use the default group separator character. The default separator is a comma.
Use custom group separator	Select this radio button to define your own group separator character. Type the character you want to use in the field.
Decimal	Define how decimal and percentage formats should be displayed. **Note:** This option appears only when the selected value format is Percent.
Decimal Places	Enter the number of decimal places to display in the output.
Use default decimal separator	Select this radio button to use the default group separator character. The default separator is a period.
Use custom decimal separator	Select this radio button to define your own decimal separator character. Type the character you want to use in the field.
Multiply by 100	Select this check box to multiply the decimal values by 100. **Note:** This option appears only when the selected value format is Percent.
Seconds	Define how time units should be displayed. **Note:** This option appears only when the selected value format is Seconds or Minutes.
Seconds	When the column outputs a value in seconds, specify the format you want to display the time in. The available options are "Days, Hours, Minutes," and "Hours, Minutes, Seconds."
Minutes	When the column outputs a value in minutes, specify the format you want to display the time in. The available options are "Days, Hours, Minutes," and "Hours, Minutes."
NULL Values	Define how NULL values in the database should display.
Display Blank	Select this radio button to display a blank for NULL values.
Display as 0	Select this radio button to display 0 for NULL values.

The following shows the column format options for a currency column.



5 To define options for a currency column, enter the following field information.

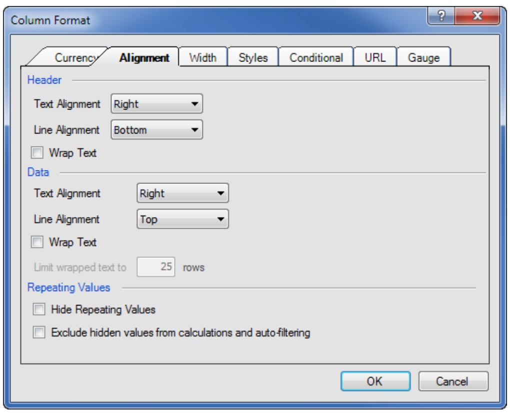
Table 252: Currency Tab Description

Field	Description
Use Default Currency Format	Select this radio button to use default currency settings, as specified by your **administrator**. When this radio button is selected, most of the other fields on the Currency tab are disabled.
Use the Following Format Options	Select this radio button to define your own currency format settings. When you select this option, the fields on the Currency tab are enabled.
Display Symbol	Select this option to display the symbol for the currency. For example, ten U.S. dollars would display as $10.00.
Display Code	Select this option to display the code for the currency. For example, ten U.S. dollars would display as 10.00USD.
Digit Grouping	The radio buttons in this section let you group digits in threes. For example, instead of the column returning “$123456,” you can group the digits to return “$123,456.”
Do Not Show Group Separator	Select this radio button to prevent the values in the column from including a separator character.

Table 252: Currency Tab Description (Continued)

Field	Description
Use Default Group Separator	Select this radio button to use the default group separator character. The default separator is a comma.
Use Custom Group Separator	Select this radio button to define your own group separator character. Type the character you want to use in the field.
Decimal	Define how decimal and percentage formats should be displayed.
Decimal Places	Enter the number of decimal places to display in the output.
Use Default Decimal Separator	Select this radio button to use the default group separator character. The default separator is a period.
Use Custom Decimal Separator	Select this radio button to define your own decimal separator character. Type the character you want to use in the field.
NULL Values	Define how NULL values in the database should display.
Display Blank	Select this radio button to display a blank for NULL values.
Display as 0	Select this radio button to display "No Value" for NULL values.

6 Click the Alignment tab to define the column's alignment.



7 Enter the following field information.

Table 253: Alignment Tab Description

Field	Description
Header	The fields in this section determine the alignment for the column's header.
Text Alignment	Click this drop-down menu to select the column header's horizontal alignment. The available options are Left, Center, and Right.
Line Alignment	Click this drop-down menu to select the column header's vertical alignment. The available options are Bottom, Center, and Top.
Wrap Text	Select this check box to allow the column header's text to wrap to a new line if it exceeds the width of the column.
Data	The fields in this section determine the alignment for the column's data.
Text Alignment	Click this drop-down menu to select the horizontal alignment for the column's data. The available options are Left, Center, and Right.
Line Alignment	Click this drop-down menu to select the vertical alignment for the column's data. The available options are Bottom, Center, and Top.
Wrap Text	Select this check box to allow the column's data to wrap to a new line if it exceeds the width of the column.
Limit Wrapped Text to *x* Rows	If the Wrap Text check box is selected, type the maximum number of wrapped rows that should be shown in the report output. You can type a value between 1 and 100.
Repeating Values	The fields in this section let you hide repeating values in the column.
Hide Repeating Values	Select this check box to hide repeating values in the column. The value will display in the first row with value, but subsequent rows with the same value will be blank. Selecting this option can make a report's output more legible by hiding repetitive text in a column.
Exclude Hidden Values from Calculations and Auto-Filtering	Select this check box to exclude hidden values from consideration in column calculations and column auto-filter options.

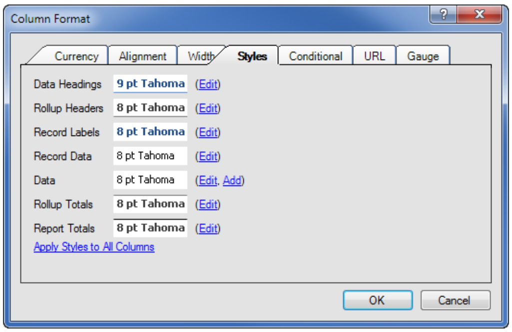
8 Click the Width tab to define the column's width.

9 Enter the following field information.

Table 254: Width Tab Description

Field	Description
Best Fit	Select this radio button to allow the width of the column to be automatically sized to the best fit for the report.
Specific Width	Select this radio button to define a width for the column. Type the width of the column and select the unit to use from the drop-down menu. You can choose Percentage (of the total width of the report), Pixel, Inch, Cm (centimeter), Mm (millimeter), Pica, Point, Em, and Ex.

10 Click the Styles tab to define the column's text styles. Text styles control the font, color, margins, background colors, and borders for text fields. The current setting for each text field's style is shown next to the name of the text field.



11 Enter the following field information.

Table 255: Styles Tab Description

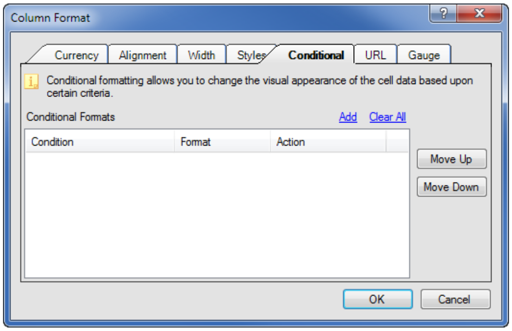
Field	Description
Data Headings	Click Edit to define the style for the column's heading when the report is shown with a tabular layout.

Table 255: Styles Tab Description (Continued)

Field	Description
Rollup Headers	Click Edit to define the style for the rollup headers if shown in the report's output.
Record Labels	Click Edit to define the style for the column's heading when the report is shown with a record layout.
Record Data	Click Edit to define the style for the column's data when the report is shown with a record layout.
Data	Define the style for the data text in the column when the report is shown with a tabular layout.
Edit	Click Edit to edit the style that is currently used for the data text in the column.
Add	Click this text to add other styles for alternating data rows in the column. The new style you create is initially identical to the original data style. Once you add the new style, another data style appears. The data rows in your report then alternate between the two styles you have defined. If you add a third data style, it is used in every third row.
Remove	Click this text to remove the new data style. "Remove" appears next to new data styles you add. You cannot remove the original data style.
Rollup Totals	Click Edit to define the style for the rollup totals if shown in the report's output.
Report Totals	Click Edit to define the style for the report totals headers if shown in the report's output.
Apply Styles to All Columns	Click this text to apply the styles you defined on this tab to all the columns currently in your report.

12 Click the Conditional tab to apply conditional formatting to the column.

Note Conditional formatting is not available for columns that return hierarchical values.



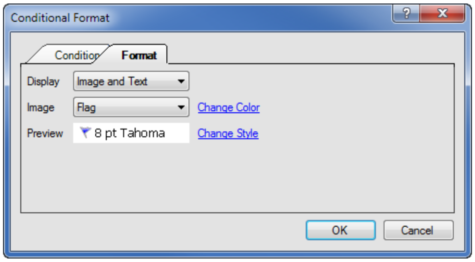
Conditional formatting flags information in output columns without creating a data exception. For example, you could add formatting to a column in an incidents report to display the column's output in red text if an incident's status is Unresolved. Multiple format options can be used to flag output using images, background colors, and fonts.

13 Click Add to open the Conditional Format window.

Note The options shown on the Condition tab depend on the type of data output in the column the condition is added to. For example, a column that outputs dates has operators and values that are unique to date fields.

14 Select the operator and value(s) you want flagged.

15 Click the Format tab to define how the flagged data is displayed.



16 Enter the following field information.

Table 256: Conditional Format Window Description

Field	Description
Display	Click this drop-down menu to select the type of formatting you want to use to indicate column output that meets the selected condition(s).
Image and Text	Select this option to show images next to the column output that meets the selected condition(s) and display the output with different font options.
Image Only	Select this option to show an image next to the column output that meets the selected condition(s).
Text Only	Select this option to use different font options for column output that meets the selected condition(s).
Image	Click this drop-down menu to select the image to display. The options are Circle, Square, Flag, Check, Up Arrow, Down Arrow, and Custom. Select Custom to select the image from the Images explorer. **Note:** This drop-down menu is disabled if Text Only is the selected display option.
Change Color	Click this text to change the color of the selected image. **Note:** The color of custom images cannot be changed.
Preview	This field displays a preview of the selected image, text, or both, depending on the selected display option.
Change Style	Click this text to select font attributes for conditional column text.

17 Click the OK button to save the conditional formatting.

18 If multiple conditional formats are applied to the column, define the order in which the formats should be applied.

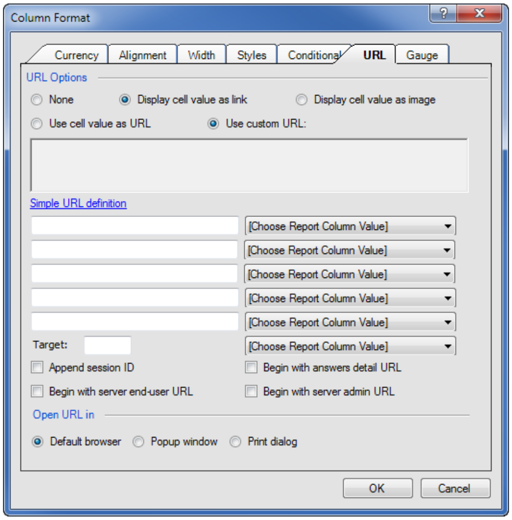
Multiple conditional formats can be applied to the same column to indicate different values. For example, different incident statuses can have different font colors or images. When a column has multiple formats, the order of the conditions is important since this determines which condition is applied first. If a row in a report meets both the first and second conditions in a column, only the first condition is applied to the value.

a Select the conditional format to move from the Conditional Formats list.

b Click the Move Up or Move Down button to move the conditional format up or down in the list.

19 Click the URL tab to add URL links to your column.

Note When you click a URL link in a report, your web browser launches and the website the URL points to opens. You can customize the URL and add variables to the link, using the values in any of the report's columns. For example, you could direct a URL to open an answer on the **customer portal**, or you could direct the URL to a page designed by your organization.



20 Enter the following field information.

Table 257: URL Tab Description

Field	Description
URL Options	Specify how you want to define the URL in this section.
Display Cell Value as Link	Select this radio button to enable URL options for the column. This lets you create a link to a website using either the value displayed in the field or a custom URL.

Table 257: URL Tab Description (Continued)

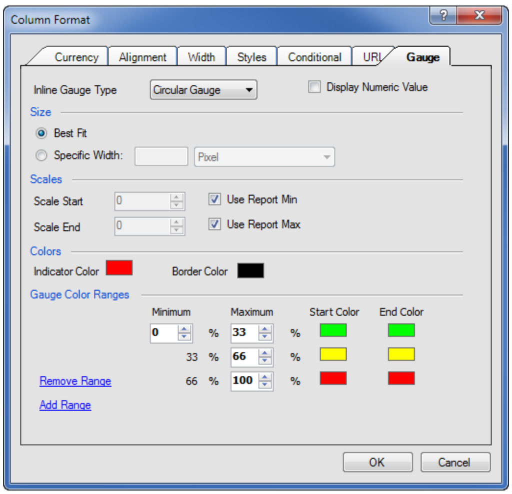
Field	Description
Display Cell Value as Image	Select this radio button to enable image options for the column. This lets you store images on a separate server and display the images in the column. Since you can point to external locations for the image files, you do not need to upload the images to Oracle Service Cloud. Instead, you specify the URL where the image you want to display is stored. Refer to Displaying external images in columns.
Use Cell Value as URL	Select this radio button to use the value in the field as the URL link. Select this option only if the value in the field is a valid URL.
Use Custom URL	Select this radio button to manually specify the URL. You can enter the URL you want in the text box, or click Advanced URL Definition to view options to help you define the URL.
Advanced URL Definition	Click this text to display advanced URL formatting options. **Note:** When you click Advanced URL Definition, the text changes to read Simple URL Definition. Click this text to hide the Advanced URL Definition options.
Report Column Selection	You can add variables and variable values to the custom URL in this section. Type the variable you want to add to the URL in the text field, and then select the column to use to populate the variable's values from the drop-down menu.
Target	Type the value you want for the customer portal URL's *target* attribute in this field. This is optional and is used to specify where the customer portal page that is linked to opens. This can be used to customize the browser window used to display content customers can view, such as answers.
Append Session ID	Select this check box to append the session ID number to the URL. Use this option when the URL links to a customer portal page to ensure the URL for the page is valid.
Begin with Server End-User URL	Select this check box to automatically prepend the path to the Oracle Service Cloud server to the custom URL.
Begin with Answers Detail URL	Select this check box to automatically prepend the path to the customer portal's answers detail page to the URL. This is defined in the CP_ANSWERS_DETAIL_URL configuration setting.

Table 257: URL Tab Description (Continued)

Field	Description
Begin with Server Admin URL	Select this check box to automatically prepend the path to the Oracle Service Cloud server's PHP directory to the custom URL.
Open URL in	You can use the options in this section to specify where you want the web page that is linked to from the column to open.
Default Browser	Select this radio button to open the web page in the computer's default browser. A new browser window opens if one is not already open.
Popup Window	Select this radio button to open the web page in a pop-up window.
Print Dialog	Select this radio button to open the web page in the Print window. You can then print the content displayed in this window.

21 Click the Gauge tab to configure the column to display values using gauges.

Note The Gauge tab is available only for columns that return numeric or currency values.



22 Enter the following field information.

Table 258: Gauge Tab Description

Field	Description
Inline Gauge Type	Click this drop-down menu to select the type of gauge you want to use. The available options are None, Linear Gauge, Circular Gauge, and Progress Bar.
Display Numeric Value	Select this check box to display numeric values on the gauge.
Size	Define the size of the gauge in this section.
Best Fit	Select this radio button to allow the width of the gauge to be automatically sized to the best fit for the report.
Specific Width	Select this radio button to define a width for the gauge. Type the width of the gauge and select the unit to use from the drop-down menu. You can choose Percentage (of the total width of the column), Pixel, Inch, Cm (centimeter), Mm (millimeter), Pica, Point, Em, and Ex.
Scales	Define the scale ranges used for the gauge in this section.
Scale Start/Scale End	Enter the starting value (lowest value) and ending (highest value) for the gauge's scale in these fields. **Note:** These options are enabled only when defining a custom scale.
Use Report Min	Select these check boxes to use the lowest value or highest value returned in the column as the scale start value.
Use Report Max	Select this check box to use the highest value returned in the column as the scale end value.
Colors	Select colors used for the gauge in this section.
Indicator Color	Click this color box to select the color to use as the gauge indicator color.
Border Color	Click this color box to select the color to use as the gauge border color.

Table 258: Gauge Tab Description (Continued)

Field	Description
Gauge Color Ranges	Add color ranges and define range colors in this section. Color ranges can be used to display numeric ranges in different colors. For example, a range of 0-33 could be green, 34-65 could be yellow, and 66-100 could be red. **Note:** Color ranges are not available with Progress Bar gauges.
Add Range	Click this text to add a color range. **Note:** A maximum of five ranges can be shown on the gauge. The range values cannot contain gaps or overlap.
Remove Range	Click this text to remove a range you have added.
Minimum/Maximum	Enter the starting and ending value for the range in these fields.
Start Color/End Color	Click these color boxes to select colors to indicate the start and end points of the range.

23 Click the OK button to save the changes to your column's format.

Displaying external images in columns

If you store images on a separate server, you can display those images in reports by configuring column format options. Since you can point to external locations for the image files, you do not need to upload the images using the Images explorer.

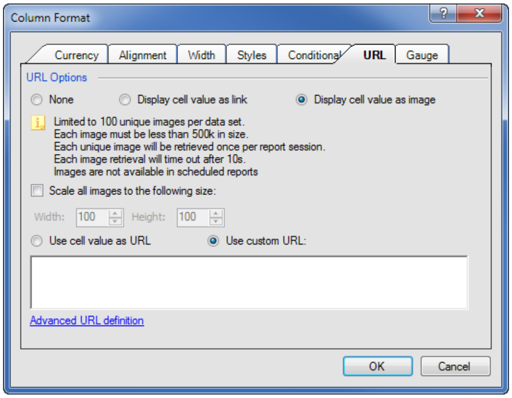
For instance, you can create a text system attribute for the Accounts standard object to store the URLs to photos of your staff members. You can then display the photos in reports that include the system attribute field. Refer to Creating system attributes.

Important There are some considerations when configuring column image options.

- Column format image options can only be configured using the report design center. They cannot be configured when viewing a report.
- Some restrictions exist on the external images you can display in reports. Each image file must be smaller than 500K in size, and a maximum of 100 unique images can be displayed each time the report is generated. (If you generate the same report multiple times using different search criteria, different images can be displayed.) In addition, to ensure reports run successfully, retrieval of the images times out after 10 seconds.
- External images will display in exported, published, and printed reports. However, they do not display in scheduled reports.
- The image file formats you can use in reports are BMP, EXIF, GIF, JPEG, PNG, and TIFF. If an unsupported file type is encountered when the report runs, the column output displays "Invalid Image."

To display external images in a report

1. Click the Analytics button on the navigation pane.
2. Double-click Reports Explorer.
3. Right-click the report you want to add the image to and select Edit.
4. Right-click the column on the report where you want the image displayed and select Edit Format. The Column Format window opens.
5. Click the URL tab and then select the Display Cell Value as Image radio button.



6 To specify a custom size for the images, select the Scale All Images to the Following Size check box and select width and height values between 1 and 500 pixels. By default, images are sized to 100x100 pixels.

7 In the text box, type the URL of the image file.

8 Click the OK button to save the column format options and close the Column Format window.

9 Save the report.

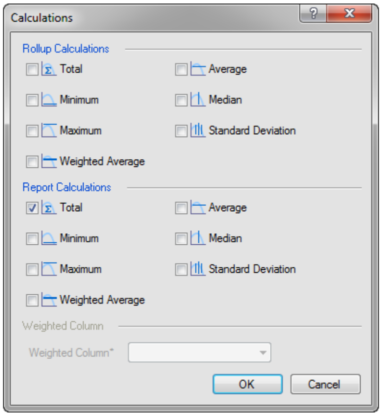
Adding column calculations

You can add rows to the bottom of a column to display calculations performed on the column's data. You can also perform calculations on data rollups. Refer to Displaying rollup levels.

The Calculations window displays all the calculations that can be performed on the data in the column. If the report does not have rollup columns, the Rollup Calculations section does not appear. Also, columns that do not contain numeric values have only the Minimum, Maximum, and Median calculations available.

To add calculations to a column

1 Right-click the column and select Edit Calculations. The Calculations window opens.



2 Enter the following field information.

Table 259: Column Calculations Window Description

Field	Description
Rollup Calculations	The check boxes in this section apply to calculations for data rollups. **Note:** These options display only when a rollup is defined in the report output.
Total	Select this check box to display the total value of the output column for all records.
Minimum/Maximum	Select these check boxes to display the minimum and maximum values of the output column for all records.
Weighted Average	Select this check box to display the weighted average of the column for all records.
Average	Select this check box to display the average value of the output column for all records.
Median	Select this check box to display the median (middle) value of the output column for all records.

Table 259: Column Calculations Window Description (Continued)

Field	Description
Standard Deviation	Select this check box to display the standard deviation of the column for all records. Standard deviation is the square root of the variance. It projects how various values in a set of values deviate from the mean for that set.
Report Calculations	The check boxes in this section apply to calculations for the output columns in the report.
Total	Select this check box to display the total value of the output column for all records.
Minimum/Maximum	Select these check boxes to display the minimum and maximum values of the output column for all records.
Weighted Average	Select this check box to display the weighted average of the column for all records.
Average	Select this check box to display the average value of the output column for all records.
Median	Select this check box to display the median (middle) value of the output column for all records.
Standard Deviation	Select this check box to display the standard deviation of the column for all records. Standard deviation is the square root of the variance. It projects how various values in a set of values deviate from the mean for that set.

Table 259: Column Calculations Window Description (Continued)

Field	Description
Weighted Column	Click the Weighted Column drop-down menu and select the column to use in conjunction with the current column to derive the weighted average. This drop-down menu is activated when the Weighted Average report or rollup calculation is selected, and displays only numeric columns you can use with weighted averages. For example, if you have a report with column X showing the number of incidents solved by a group, and column Y showing the average amount of time spent solving the incidents, a weighted average calculation can determine the average amount of time spent solving each incident regardless of how many incidents each group solved. That is, if group A solves 30 incidents and averages 30 minutes per incident, and group B solves 10 incidents averaging 110 minutes per incident, a normal average would calculate 70 minutes per incident, which would not reflect the different number of incidents for each group. A weighted average would show a more accurate average of 50 minutes per incident, since it takes the number of incidents solved by each group into account. The calculation used to determine weighted averages is `((x1*y1)+(x2*y2)) / (x1+x2)` or, in this example, `((30*30) + (10*110)) / (30 + 10) = 50`.

3 Click the OK button to save the column calculation.

Tip You can also add calculations from a selected column's Design tab.

Removing columns from reports

If you decide you no longer need a column in the report, you can remove it when working on the report design center.

To remove a column

1 Select the column you want to remove from the report.

2 Click the Delete button on the ribbon's Design tab.

Or

Press **Delete**.

Note If the column you delete uses a table that is no longer needed in the report, you should remove the table from the report to help the report run efficiently. Refer to Editing data set properties.

Creating data exceptions

You can create data exceptions to highlight data displayed in columns or charts that meets certain criteria. Exceptions can be created to flag data that matches expressions built from standard and custom database fields, functions, and variables. For example, you could create an exception to flag incidents with a response time greater than twenty-four hours. Incidents that match the exception could be shown on the report with custom colors, fonts, and markers. Information about the percentage of data meeting the exception can also be displayed.

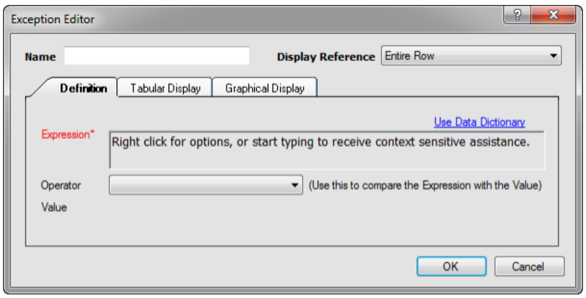
After you define your exceptions, you can **schedule** the report to send alerts whenever the criteria of a data exception is met. Refer to Scheduling reports.

Tip Each report level can have a maximum of thirty-two data exceptions.

To create a data exception

1 Click the Insert tab on the ribbon.

2 Click the Exception button to open the Exception Editor.

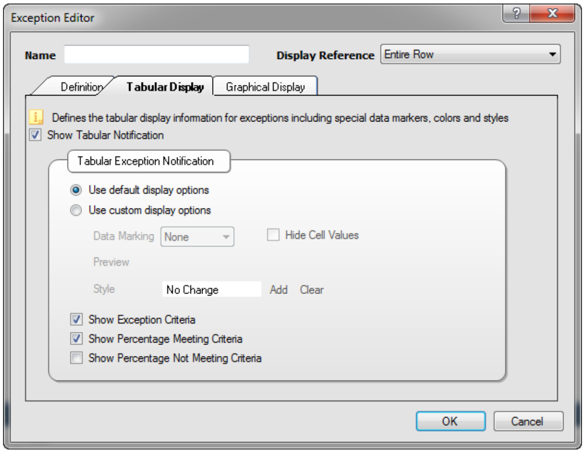


3 Enter the following field information.

Table 260: Definition Tab Description

Field	Description
Name	Type the name of the data exception.
Display Reference	Click this drop-down menu to select how the data is highlighted. Options are Entire Row or specific columns from the report.
Expression*	Right-click in this field to select the database column used to except data in the report.
Use Data Dictionary	Click this text to open the Edit Expression window where you can select **functions**, **variables**, and database fields.
Operator	Click this drop-down menu to select the operator to use in the exception criteria. This drop-down menu is activated once a database column is selected. Click here for a description of operators.
Value	Specify the second part of the expression in this field. The options available depend on the selected value type, the type of database field the exception is based on, and the operator that is used. You can type in a value, select items from a drop-down menu, or select dates from calendars.

4 To define how the data exception displays in the report's tabular output, click the Tabular Display tab.



5 Enter the following field information.

Table 261: Tabular Display Tab Description

Field	Description
Show Tabular Notification	Select this check box to display the data exception in the report's tabular output. If this option is cleared, the other options on the Tabular Display tab are unavailable.
Use Default Display Options	Select this radio button to display the exception using the color, font, and marking method defined in the style that is being used for the report. Refer to Styles explorer for information about creating styles and Changing report displays with styles for information about applying styles to reports.

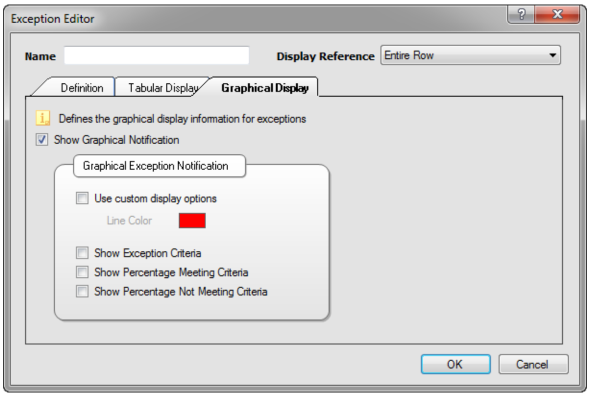
Table 261: Tabular Display Tab Description (Continued)

Field	Description
Use Custom Display Options	Select this radio button to define a custom color, font, and data marking method for the exception.
Data Marking	Click this drop-down menu to select a data marking to mark the data that meets your exception criteria. You can choose None, Circle, Square, Flag, Check, Up Arrow, Down Arrow, or Custom. • Select Custom to open the Select Image window and select images you have added in the Images explorer. Refer to Images explorer. • Select None to prevent a graphic from indicating the data exception. The text style you define for the marker will still be applied to the data exception. This allows you to change the color or font of tabular data that meets the exception without adding a graphic. **Note:** The data marking symbol displays in the window's Preview field so you can view the symbol as you define it.
Hide Cell Values	Select this check box to hide the value in the column that is used as the display reference. **Note:** This check box is available if the exception's display reference is set to a column rather than an entire row.
Change Color	Click this text to open the Color window to change the color of the graphic. Refer to Choosing colors. **Note:** This option appears if Circle, Square, Flag, Check, Up Arrow, or Down Arrow is selected in the Data Marking drop-down menu.
Change Image	Click this text to open the Select Image window to change the image data marking image. **Note:** Change Image appears only if Custom is selected in the Data Marking drop-down menu.
Style	Click Add next to the Style box to open the Edit Style window where you can change the font, colors, margins, and borders for the data in the report that matches your data exception criteria. Refer to Selecting style options. To remove a style that has already been defined, click Clear next to the Style box.

Table 261: Tabular Display Tab Description (Continued)

Field	Description
Show Exception Criteria	Select this check box to display the exception criteria at the bottom of the report in the Data Exceptions report section. For example, if the data exception marks opportunities that are still active, the criteria would display *opportunities.status_id = Active*.
Show Percentage Meeting Criteria	Select this check box to show the percentage of data in the report that meets the specified exception criteria. This displays at the bottom of the report in the Data Exceptions report section.
Show Percentage Not Meeting Criteria	Select this check box to show the percentage of data in the report that does not meet the specified exception criteria. This displays at the bottom of the report in the Data Exceptions report section.

6 To define how the data exception displays in the report's graphical output, click the Graphical Display tab.



7 Enter the following field information.

Table 262: Graphical Display Tab Description

Field	Description
Show Graphical Notification	Select this check box to display the data exception in the report's chart output. If this option is cleared, the other options on the Graphical Display tab are unavailable.

Table 262: Graphical Display Tab Description (Continued)

Field	Description
Use Custom Display Options	Select this radio button to choose your own line color for the data exception. If this box is not selected, the exception uses the line color defined in the chart style that is being used for the report. Refer to Chart Styles explorer for information about creating chart styles and Adding and editing charts for information about applying chart styles to reports.
Line Color	Click the color box to open the Color window and select a line color for the excepted data. Refer to Choosing colors.
Show Exception Criteria	Select this check box to display the exception criteria in an exceptions box in the chart.
Show Percentage Meeting Exception	Select this check box to show the percentage of data in the report that meets the specified exception criteria. This displays in an exceptions box in the chart.
Show Percentage Not Meeting Exception	Select this check box to show the percentage of data in the report that does not meet the specified exception criteria. This displays in an exceptions box in the chart.

Ordering data exceptions

When you add multiple data exceptions that are based on the same database field to the same output level, the ordering of the exceptions can impact which exception the data matches. In such cases, you want the most restrictive exception listed first, since the data is checked against the first exception before other exceptions in the list are matched.

For example, you could create exceptions in a report that show the number of open incidents each of your contacts have. You could create an exception to indicate contacts with five or more incidents and another exception to indicate contacts with ten or more incidents. If the first exception is *count(incidents.i_id) > 5*, and the second is *count(incidents.i_id) > 10*, then your data would match only the first exception even if a row had an incident count greater than ten. This occurs because the first exception has precedence over the second exception. To correct this, you would reorder the data exceptions.

To order data exceptions

1 Select the data exception you want to move on the design surface.

2 Click the Design tab.

3 Click the Move Up or Move Down button to move the exception to the position you want.

Tip You can also reorder exceptions by dragging them in the exceptions report section on the design surface.

Adding row limits and page breaks

Reports can return large amounts of data, especially if they lack fixed filters or required run-time selectable filters. It can be difficult to print or view a report with thousands of rows, and finding specific records in such a report can be challenging. However, you can limit the number of rows returned on each page or on the entire output level. Limits are set for each output level in the report.

To set record limits

1. Select the level you want to add the record limit to from the Level drop-down menu at the top of the design surface.
2. Click the Level tab.
3. Click the Record Limit button.
4. Enter the following field information.

Table 263: Edit Row Limit Window Description

Field	Description
Limit To	Select this check box to limit the records returned on the output level.
Rows	Type the maximum number of rows you want returned. **Note:** The VRL_HARD configuration setting sets a hard limit on the number of rows that can be returned in a report. Values entered in this field that exceed the VRL_HARD limit are ignored. Refer to Analytics Configuration Settings for information about this and other configuration settings that can impact reports.
Per Page	Select this check box to apply the record limit to each page of the report. If this check box is not selected, the row limit you enter restricts the total number of rows returned in the selected output level.

5 Click the OK button to save the change to the record limit.

Managing table relationships

When you use fields from different database tables in a report's columns or filters, the fields' tables are automatically added to the report, and the tables are joined by their fields that are linked together in the database. Tables such as *incidents* and *contacts* are tied together with a single field in each table, specifically the *incidents.c_id* and *contacts.c_id* fields. Since there is only one way to link these tables together, Analytics links them in the report automatically using a table join. By joining the tables, information from both tables can be displayed together.

Note When viewing a report, you can see the report's tables in the report definition. Refer to Viewing and exporting report definitions. When editing a report, you can see and manage the report's tables by clicking the Tables button on the Home tab of the report design center's ribbon. Refer to Editing table relationships.

Some reports you create may need to reference numerous tables with different relationships. For example, you may need to use fields from tables that are not linked together in the database, or you may need to use fields from tables that can be linked together in more than one way. In these instances, you will need to select the fields you want to use to join the tables. Refer to Manually defining table joins.

In addition, if you require a high degree of control over the tables used in a complex report, you can manually add them to the report instead of having the tables added automatically. Refer to Manually adding tables.

Note In general, we recommend using as few tables as possible in a single report to help the report run efficiently. If you need to reference numerous tables in a report to return a wide array of information, you can instead create multiple reports, each with a minimum of tables that are focused on one area of the information you are interested in. You can then link the tables together so they function like a single report. Refer to Linking reports.

Types of table joins

Analytics uses two types of table joins. The join type that is used to link the tables in your report impacts what records the report can return. If the report does not return the information you want to see, you may need to change the join type to allow the report to access the appropriate records in the tables. Refer to Editing table relationships.

Inner joins

When tables are linked with an inner join, only records in the tables that share common data can be returned. For example, when the *contacts* table and the *incidents* table are linked with an inner join, only contacts that have incidents associated with them can be returned by the report. Information about a contact who has never submitted an incident cannot be returned.

Inner joins are used when tables are automatically joined together since they meet the requirements of most reports and are easier to process in database queries than outer joins.

Outer joins

When tables are linked with an outer join, all rows from the first table added to the report (referred to as the primary table) can be returned in the report, regardless of their relationship to rows in the secondary table. Information in the secondary table that is related to information in the primary table can also be returned. For example, if *accounts* is the primary table and *incidents* is the secondary table in a report, it can return information about all staff accounts, whether or not they have incidents assigned to them. The report can also return information about incidents that are assigned to staff members, but cannot return information about incidents that are not assigned.

Since outer joins allow all data from the primary table to be returned, but only some from the secondary table, the ordering of the tables is important when using outer joins. If your report does not return the information you want from two tables that are outer joined, you may need to change which table is the primary and which is the secondary. Refer to Repositioning tables in the data set.

Tip When using outer joins, it can be helpful to add a field from the table you are most interested in first. If your report's purpose is primarily to output information about contacts, a field from the *contacts* table should be added as a column before fields from other tables.

Outer joins are not automatically used in reports since inner joins meet the requirements of most reports and are easier to process in database queries than outer joins. Outer joins are also referred to as left joins by those familiar with database queries.

Manually defining table joins

Generally, you do not need to specify which fields are used to join tables together in reports since the tables that are commonly used in reports are often joined automatically. However, some tables can be joined through more than one field and other tables do not have linked fields in the database and cannot directly join together. If you encounter one of these situations when adding a field to a report, you need to specify how the tables are joined.

Note The relationships between **custom object** tables and other tables are defined when the custom object is created. Refer to Defining relationships.

Specifying joins for tables with multiple relationships

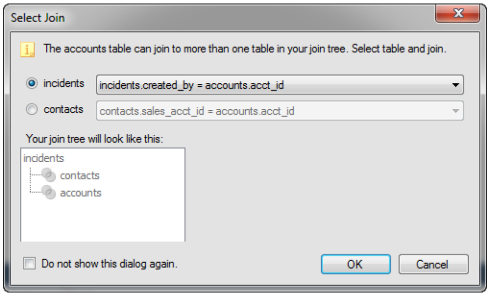
Some tables are linked together in the database using more than one field. For example, *incidents* can link to *accounts* through three fields in the *incidents* table. When joining these tables, the link between the tables is not automatically created, so you must define which field should be used to tie the tables together in the report. You'll do this on the Select Join window, which automatically opens when you add fields from tables such as this to the same report.

The Select Join window also appears if your report already has multiple tables and you add a field from another table that can be related to more than one of the tables already in the report. In this case, you must define which table the new table should be joined to, since different data can be returned by joining different tables. By default, the new table is joined to the primary table in the report using an inner join.

An example that illustrates both cases is if your report includes the *incidents* and *contacts* tables, and you then add a field from the *accounts* table. The *accounts* table can link to the *incidents* table through three *incident* fields and can link to the *contacts* table through one *contact* field. In this instance, you would be asked if the *accounts* table should link to *incidents* or *contacts*, and, if it is the *incidents* table, which field in the *incidents* table should be used as the link.

To select linked fields

1 Add a column or filter to the report from a table that can be linked in more than one way to the other tables in the report. The Select Join window opens.



2 To accept the default table relationship that is displayed, click the OK button.

3 To define which tables should be linked, select the radio button next to the table that the new table should join to.

a If the new table can link to the selected table by more than one field, select the correct field from the drop-down menu that displays next to the table's radio button.

The field you join the new table to should be associated with the information you want to output in the report. For example, if you are joining the *accounts* table to the *incidents* table, select the *incidents.created_by* => *accounts.acct_id* option to output information about the staff member who originally created the incident. If you instead want to output information about the staff member the incident is assigned to, select the *incidents.assgn_acct_id* => *accounts.acct_id* option.

4 To prevent the Select Join window from displaying again when editing the current report, select the Do Not Show This Dialog Again check box. If you then add another field that requires defining a table relationship, you need to define the relationship from the Data Set window. Refer to Editing data set properties.

5 To not define any table relationship, click the Cancel button.

Important If you click the Cancel button, the field you added is still added to the report output, and the new table is added to the report as another primary table. However, there will not be a relationship between this table and the other tables in the report until you manually define the relationship from the Data Set window. You will not be able to save the report until you define this relationship. Refer to Editing table relationships.

6 Click the OK button to save the table relationship.

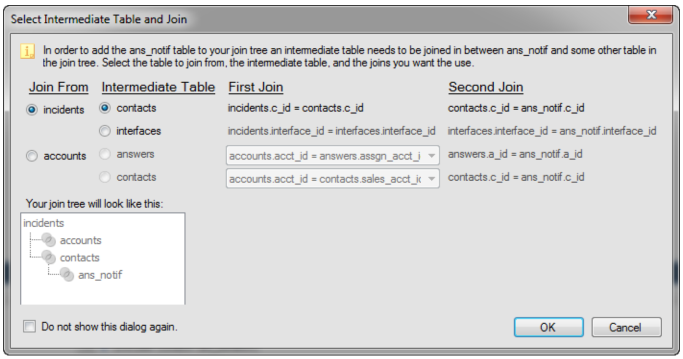
Defining intermediate table joins

If your report uses data from tables that are not directly linked together in the database, you need to choose how you want to link the tables together when you create your report. Tables that are not directly linked together in the database can still be joined by going through intermediate tables that are common to both.

Note If you attempt to use fields from two tables related to different areas of the application, it may not be possible to join them using an intermediate table. In these instances, both tables will be considered primary tables in the report and you will need to manually edit the table relationships before you can save the report. Refer to Editing table relationships. However, if you encounter this scenario, we recommend reconsidering the report's design since a single report is not intended to report on unrelated information.

To define intermediate table joins

1 Add a column or filter to the report that requires an intermediate table join. The Select Intermediate Table and Join window opens.



2 In the Join From column, select the radio button next to the table you want to join the new table to.

3 In the Intermediate Table column, select the radio button next to the table you want to use as the intermediate table to join the new table with the table selected in the Join From column.

4 In the First Join column, click the drop-down menu and select the fields you want to join from the intermediate table and the table selected in the Join From column.

5 In the Second Join column, click the drop-down menu and select the fields you want to join from the intermediate table and the new table you are adding. The join tree you define displays on the window.

6 To prevent the Select Intermediate Table and Join window from displaying again when editing the current report, select the Do Not Show This Dialog Again check box. If you then add another field that requires defining an intermediate table relationship, you need to define the relationship from the Data Set window. Refer to Editing data set properties.

7 Click the OK button to save the intermediate table join.

Editing table relationships

If you create a report that returns data from multiple tables and find that the data you want is not being returned, you may need to change the relationships of the report's tables. You can change the order of the tables, the join types connecting the tables, and the specific fields that are linked together in the tables, as long as the fields are linked in the database. You can also delete tables that are no longer needed in the report.

Editing data set properties

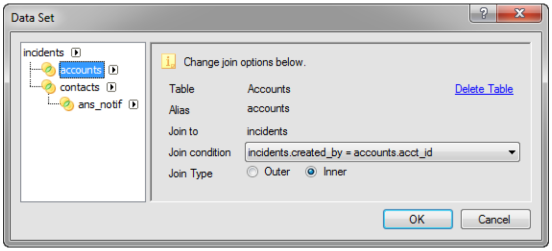
You can edit your report's **data set** to change the tables' join types. In addition, if the tables can be linked by more than one field, you can select a new field to link to.

To change the table join and linked fields

1 Click the Home tab.

2 Click the Tables button to open the Data Set window.

Note When you open the Data Set window, you see the tables in your report and their relationships. When two tables are inner joined, displays next to the secondary table. When two tables are outer joined, displays next to the secondary table.



3 Click the table that is joined to the primary table. In the previous figure, the *contacts* table is joined to the *incidents* table, which is the parent in the table relationship.

4 Enter the following field information.

Table 264: Data Set Window Description

Field	**Description**
Table	This field displays the database name of the table you have selected.
Delete Table	Click this text to remove the table you have selected from the report. If the table acts as a parent to other tables in the report, the child tables are also removed. **Note:** Columns are not automatically removed from the report when their associated tables are deleted. These need to be manually removed before the report can be saved.
Alias	This field displays the alias name of the table you have selected. The alias allows you to add multiple instances of the same database table to the same report. For example, the first instance of the *contacts* table could have an alias of “contacts,” and the second instance could have an alias of “contacts2” to distinguish it from the first instance.
Join To	This field displays the table the selected table is joined to.
Join Condition	If the table join can link to more than one field in the joined tables, click this drop-down menu to select the fields you want to use to join the tables.

Table 264: Data Set Window Description (Continued)

Field	Description
Join Type	Select the Inner radio button to use an **inner join** or the Outer radio button to use an **outer join**. Refer to Types of table joins. **Note:** To change the join type, you can also right-click the joined table in the data set tree and select Toggle Join Type.
Join Filters	You can add, delete, or view join filters in this section. Refer to Creating join filters. **Note:** Join filters apply only to outer joins and are not available if the Inner join type radio button is selected.

Repositioning tables in the data set

When using outer joins to combine tables, the ordering of tables can affect what data the report can return (refer to Outer joins). If multiple tables are used in the report, you may also need to change which secondary tables are directly linked to the primary table or change the relationships between secondary tables in the data set.

To change the ordering of tables

1 Open the Data Set window.

2 To select a different table in the data set as the primary table, right-click the table and select Set as Root.

Note When you set a new table as the root, or primary table, the relationship between the table and the old primary table is broken, resulting in the data set having two primary tables.

3 To move a table beneath another to make it a secondary table, drag the table onto the primary table. The tables are automatically joined and the new table relationship is displayed on the Data Set window.

Manually adding tables

When you add output columns or filters, the appropriate database tables are automatically added to the report. However, if you require a high degree of control over the tables used in a complex report, you can manually add them to the report instead of having the tables added automatically.

Caution To ensure report queries are efficient, manually adding tables to a report should be performed only by individuals with a thorough understanding of SQL queries.

To manually add tables to a report

1 Delete all columns and filters from an existing report, or start with a report with no columns.

2 Click the Home tab.

3 Click the Tables button. The Data Set window opens.

4 Click Select Table. A list of all tables displays.

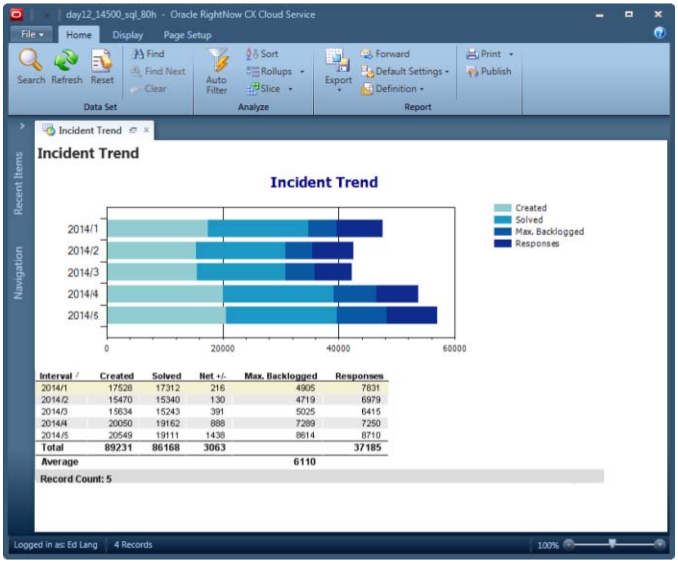
5 Select the table you want from the list.

6 Click the OK button to add the table to the report.

7 To join additional tables to the table you added, right-click the table you added, select Join To, and select the table to join. Repeat this step for each table you want to add.

Adding and editing charts

You can add charts to your reports to provide the audience with graphical representations of the report's data. Using charts, you can clearly compare data or highlight trends or patterns in the data. For example, a pie chart could show comparisons in the number of incidents assigned to staff accounts in the previous week, or you could use a bar chart to view patterns in sales opportunities generated during the previous quarter.



You can manually add charts to reports, or you can use a chart table layout to automatically add generic charts with preconfigured positions. You can edit charts with the Chart Wizard, which lets you select the chart type, the data used in the chart, labels for the chart, and other settings. You can change the appearance of your chart by selecting a chart style created from the Chart Style explorer, or you can define custom style attributes for an individual chart by selecting from style options on the ribbon. You can also edit display attributes for the report's chart section, which contains the charts you add to your report.

Tip Each report level can have a maximum of twenty charts.

Adding charts manually

When you manually add a chart to a report, you can define all the chart elements, determine how the chart should be sized, and where it should be located in the report.

Note This procedure describes adding charts using the buttons on the Insert tab. You can also add charts by selecting the Charts report section, clicking the Options tab, and clicking the Add Chart button to open the Chart Wizard. Refer to Using the Chart Wizard.

To manually add a chart

1 Open the report you want to edit.

2 If your report has multiple output levels, select the level you want to add the chart to from the Level drop-down menu at the top of the design surface.

3 Click the Insert tab. Buttons for the types of charts you can add to the report are displayed on the tab's Chart group.

4 Click the button for the chart type you want to add and select the chart subtype you want to add to your report. Click here for descriptions of the available chart types.

5 Click the Charts report section to add the chart to the report. The Chart Wizard opens.

6 Configure the chart and select a chart style with the Chart Wizard. Refer to Using the Chart Wizard.

Note If you have applied a report style to the report, the chart style that is associated with the report style is used by default You can select a different chart style on the Chart Wizard or by clicking the Chart Style button on the Design tab. Refer to Changing report displays with styles.

7 Apply any custom style attributes you want for the chart from the ribbon's Design, Layout, and Format tabs. For information about the options available on these tabs, refer to Creating and editing chart styles.

8 To enable automatic positioning and sizing for your chart, edit style options for the chart's report section. Refer to Modifying chart placement and sizing.

9 Repeat steps 2 through 7 to add additional charts to your report.

Adding charts with chart table layouts

If you do not want to manually place charts in your report, you can add them using chart table layouts. When you use a layout, charts are automatically added to your report and are given optimal placement. In addition, the charts are automatically sized in your report. For information about changing chart size and placement, refer to Modifying chart placement and sizing.

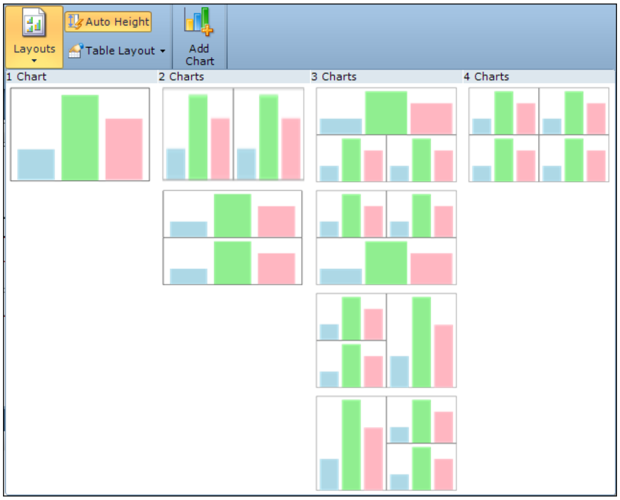
To add charts using chart layouts

1 If the Charts report section is not displayed on the report level, click the Display tab and select the Charts check box.

2 Click the Charts report section on the design surface to select it.

3 Click the Automatic button on the Options tab to apply automatic formatting to the report section. Refer to Editing section layout properties.

4 Click the Layouts button to view chart section layouts.



5 Click one of the table layouts to apply it to the current output level. The table layout you select determines how many blank charts are added to your report and how they are arranged.

6 Right-click a blank chart on the design surface and select Edit Chart to configure the chart with the Chart Wizard. Refer to Using the Chart Wizard.

Or

Select a chart on the design surface.

a Click the Design tab.

b Click the Type button and select the chart type and subtype you want to use. The wizard opens automatically if the new chart type requires different source data than the previous chart type.

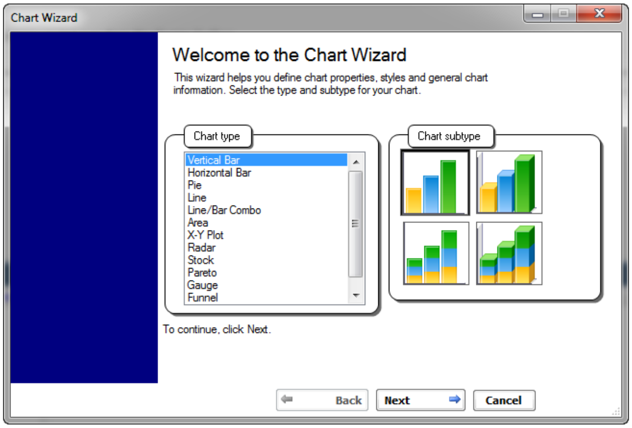
c To change data options for a chart type that does not require different source data, click the Define Data Source button to manually open the Chart Wizard.

Using the Chart Wizard

The Chart Wizard displays a series of windows for customizing charts. The first window displays the list of available chart types and subtypes. Each successive window contains additional options for customizing your chart. The available options on each succeeding window depend on the chart type and subtype selected. The options that differ are noted in the procedure.

To add or edit a chart with the Chart Wizard

1 Add or edit a chart to open the Chart Wizard. Refer to Adding charts manually and Adding charts with chart table layouts.



2 Select the chart type you want from the Chart Type menu. Refer to the following table for descriptions of the available chart types.

Table 265: Chart Types Description

Chart Type	Description
	Vertical bar charts display data as a series of vertical bars. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.

Table 265: Chart Types Description (Continued)

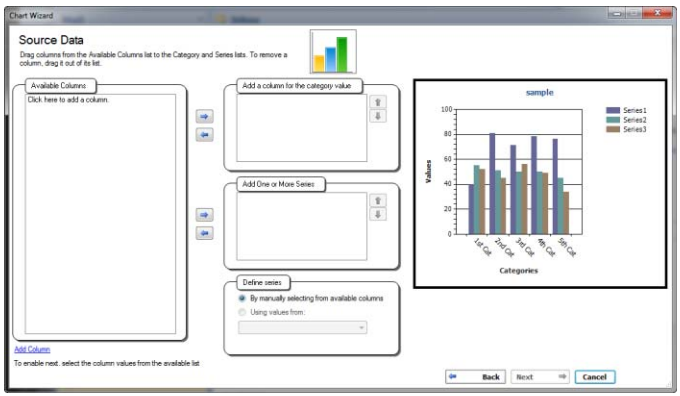
Chart Type	Description
 Horizontal Bar	Horizontal bar charts display data as a series of horizontal bars. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.
 Pie	Pie charts display data as a percentage of a whole. Subtype options can display two- or three-dimensional pie charts or doughnut charts.
 Line	Line charts display data as a series of points connected by a line. Subtype options can display the chart as two- or three-dimensional.
 Line/Bar Combo	Line/bar combo charts display both a line chart and a vertical bar chart. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.
 Area	Area charts display data as areas on an x- and y-axis. Subtype options can display the chart as two- or three-dimensional.
 X-Y	X-Y charts display data as a series of plotted points. Subtype options can display the plotted points as points, lines, or bubbles and as two- or three-dimensional.
 Radar	Radar charts display data in a radar format. Numeric values are plotted at markers on the perimeter.
 Stock	Stock charts display the minimum and maximum values for data. Subtype options can display the chart using squares or lines to represent the high and low points of each plot.
 Pareto	Pareto charts display data in descending order with an ascending plot line for cumulative percentage. Subtype options can display the chart as two- or three-dimensional.

Table 265: Chart Types Description (Continued)

Chart Type	Description
	Gauge charts display a numeric value as a percentage of a whole. Subtype options can display the chart as a gradation bar or a simple color meter. **Note:** Gauge charts cannot be used in reports that contain non-aggregate columns.
	Funnel charts display data as areas shown in ascending or descending order. Subtype options can display two- or three-dimensional funnel or pyramid charts.
	Gantt charts display time lines for completion of scheduled tasks. Subtype options can display the chart as two- or three-dimensional.

3 Select one of the chart subtypes from the Chart Subtype section.

4 Click the Next button to open the Source Data window.



The source data options let you specify the data to display in the chart. For example, if you are creating a vertical bar chart, you can specify a column to use as the chart's category value, displaying on the x-axis, and the column to use as the chart's series value, displaying on the y-axis. The wizard also displays a sample chart to help you identify chart elements.

5 Enter the following field information.

Table 266: Select Source Data Description

Field	Description
Available Columns	This field displays the columns you have added to the report level that can be used in the chart. **Note:** If you have not yet added columns to the report, you can click this area to open the Column Definition window. Refer to To add a column from the Column Definition window.
Add Column	Click this text to open the Column Definition window to add a column to your report level. This option provides a method to add columns if your report level does not have any columns or does not include a column you want to use for your chart. Refer to To add a column from the Column Definition window.
Add a Column for the Category Value	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as categories in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. **Note:** This option is not available for Pie, Gauge, and Funnel charts.
	Select a column and then click these buttons to move the column up or down one position.
Add One or More Series	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as series in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. Only numeric columns can be used as series. **Note:** This option is not available for Gauge and Line/Bar Combo charts. In addition, Pie and Funnel charts accept only one series.
	Select a column and then click these buttons to move the column up or down one position.

Table 266: Select Source Data Description (Continued)

Field	Description
Define Series	This section allows you to manually choose the output columns or column values to use for the series. **Note:** This section is not available for Pie, Line/Bar Combo, X-Y, Stock, Pareto, Gauge, and Funnel chart types.
By Manually Selecting from Available Columns	Select this radio button to manually select the columns used as values in the chart. For example, if you were reporting on incident statistics for different products, you could define the category as “Products” and the series as “Unresolved Incidents” and “Solved Incidents.” The category axis would display each product and the value axis would display a list of values. Each product would have two bars: one for unresolved incidents and one for solved incidents.
Using Values From	Select this radio button to choose the output column that is used to automatically populate values for the series. For example, if you were reporting on incident statistics for different products and assigned to different groups, you could define the category as “Products” and the series as “Unresolved Incidents.” If you selected groups from the drop-down menu associated with this radio button, each group would be used as a bar chart for each product. The category axis would display each product and the value axis would display a list of values (unresolved incidents). Each product would have bars for each group.
Get Labels From	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as labels in your chart. Labels represent each piece of the pie. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. **Note:** This option is available only for Pie and Funnel charts.
Add Line Series	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as the line series in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. Only numeric columns can be used as series. **Note:** This option is available only for Line/Bar Combo charts.

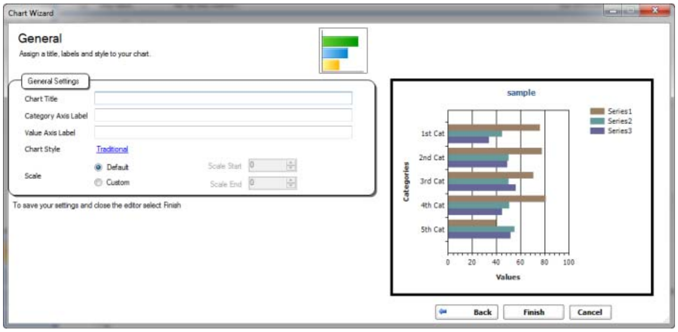
Table 266: Select Source Data Description (Continued)

Field	Description
Add Bar Series	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as the bar series in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. Only numeric columns can be used as series. **Note:** This option is available only for Line/Bar Combo charts.
Select Gauge Series	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as series in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. Only numeric columns can be used as series. **Note:** This option is available only for Gauge charts.
Select Line Series	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as the line series in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. Only numeric columns can be used as series. **Note:** This option is available only for X-Y charts with a combo subtype.
Add Bubble Series	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as the bubble series in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. Only numeric columns can be used as series. **Note:** This option is available only for X-Y charts with bubble or combo subtypes.
Add Bubble Values	Select one or more columns from Available Columns and either drag them or click the arrow to move them to this grid. Columns added to this grid are used as bubble values in your chart. To remove a column, drag it back to the Available Columns section or select the column and press **Delete**. **Note:** This option is available only for X-Y charts with bubble or combo subtypes.
Category Axis Series	Select a column to use as the category for the chart from this drop-down menu. **Note:** This option is available only for Gantt charts.

Table 266: Select Source Data Description (Continued)

Field	Description
Select Progress Series	Select a column to use as the progress series for the chart from this drop-down menu. Only integer columns can be selected for the progress series. **Note:** This option is available only for Gantt charts.
Select Start Date Series	Select a column to define the start date series from this drop-down menu. Only date columns can be selected for the start date series. **Note:** This option is available only for Gantt charts.
Select End Date Series	Select a column to define the end date series from this drop-down menu. Only date columns can be selected for the start date series. **Note:** This option is available only for Gantt charts.

6 Click the Next button to define general chart settings.



7 Enter the following field information.

Table 267: General Chart Settings Description

Field	Description
Chart Title	Type the title of the chart in this text box.
Category Axis Label	Type the label of the category axis in this text box. **Note:** This option is not available for Pie, Radar, Gauge, or Funnel charts.

Table 267: General Chart Settings Description (Continued)

Field	Description
Value Axis Label	Type the label of the value axis in this text box. **Note:** This option is not available for Pie, Line/Bar Combo, Radar, Gauge, or Funnel charts.
Bar Value Axis Label	Type the label for the chart's bar value. **Note:** This option is available only for Line/Bar Combo charts.
Line Value Axis Label	Type the label for the chart's line value. **Note:** This option is available only for Line/Bar Combo charts.
Sync Bar Line Scales	Select this check box to use the same range for the chart's bar and line scales. **Note:** This option is available only for Line/Bar Combo charts.
Chart Style	Click the underlined text to select a chart style for the chart. The chart style you select appears on the sample chart displayed on the Chart Wizard. **Note:** Once you apply a chart style, you can customize the style options for the chart you are editing using options on the ribbon's Design, Layout, and Format tabs. Refer to Chart Styles explorer.
Scale	Specify the scale used by the chart in this section. **Note:** This option is not available for Pie, Radar, or Funnel charts.
Default	Select this radio button to use the scale values specified in the selected chart style.
Custom	Select this radio button to define a custom scale for the chart. For example, if the values listed in a chart range from 10 to 50, you can create a custom scale to use these values as the scale's start and end points to prevent the chart from displaying ranges with no data.
Scale Start/Scale End	Enter the starting value (lowest value) and ending (highest value) for the chart's scale in these fields. **Note:** These options are enabled only when defining a custom scale.
Gauge Color Ranges	Add color ranges and define range colors in this section. Color ranges can be used to display numeric ranges in different colors. For example, a range of 0-33 could be green, 34-65 could be yellow, and 66-100 could be red. **Note:** This option is available only for Gauge charts.

Table 267: General Chart Settings Description (Continued)

Field	Description
Add Range	Click this text to add a color range. **Note:** A maximum of five ranges can be shown on the gauge. The range values cannot contain gaps or overlap.
Remove Range	Click this text to remove a range you have added.
Minimum/Maximum	Enter the starting and ending values for the range in these fields.
Start Color/End Color	Click these color boxes to select colors to indicate the start and end points of the range.

8 Click the Finish button to save your chart.

You can edit or delete any chart you add by right-clicking the chart on the design surface and selecting the appropriate option. You can also click the chart on the design surface and edit the chart with options available on the Design, Layout, and Format tabs. Refer to Creating and editing chart styles for information about the options on these tabs.

Modifying chart placement and sizing

The Charts report section can be configured to use automatic or manual section layouts, described in Editing section layout properties. Each type of layout for the report section affects the display of data in your charts.

When the Charts section has a manual layout, you can select a chart on the report section and drag it to reposition it. You can also select a chart and drag the handles on the chart's outline to resize the chart. When you specify a specific chart size using a manual layout, the data displayed on the chart is adjusted to fit the chart. A large chart displaying a small amount of data may appear too large. Also, a small chart displaying a large amount of data can be difficult to read since the data is compressed to fit the chart.

However, when using an automatic section layout, charts you add are automatically sized to best display the data initially presented in the charts. In addition, when you adjust the report's search parameters, the charts are automatically resized to ensure that all the data is clearly displayed. For example, if your chart shows incidents created over a date interval, and the report's interval is adjusted to a longer period, the chart automatically expands to clearly display all the additional intervals shown in the report.

Specifying filters

Filters are added to a report to limit the data the report returns. If filters were not used, a report that included information from a certain table would always return all the records in that table. Some filters set hard limits as to what the report can return and other filters can be changed when you run the report so you can look at different records. Filters also help improve report performance by preventing the report from examining data you do not want included in the report.

You can restrict the data returned in a report using the following filters.

- **Report fixed filters**—Fixed filters restrict the data the report can access. Fixed filters cannot be changed or edited when the report is run. Refer to Creating report filters.
- **Report run-time selectable filters**—Run-time filter values can be changed from their default values when running a report. This lets you run the report to view data about records that share the values selected in the filter and then immediately run the report again with different values selected in the filter. Refer to Creating report filters.
- **Level filters**—Level filters are fixed or run-time selectable filters that limit data at the individual output levels. Level filters can restrict data from appearing in one level, while allowing it to be returned in other levels in the same report. Refer to Creating level filters.
- **Group filters**—Group filters are applied to an output level's grouped data to filter out certain groups from displaying in the report level's output. Refer to Creating group filters.
- **Join filters**—Join filters restrict data returned in the secondary table of outer table joins. Refer to Creating join filters.

Tip Each report can have up to 100 report filters and each output level in a report can have 100 level filters and one hundred group filters.

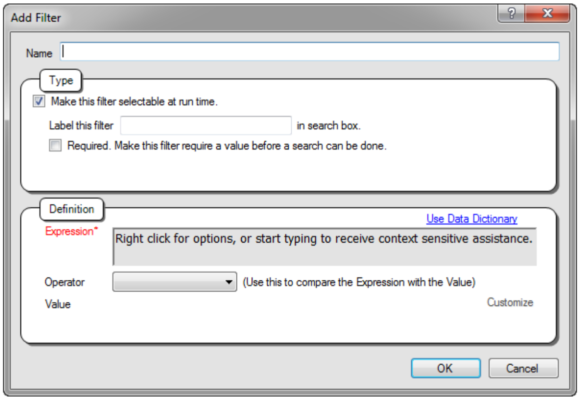
Creating report filters

Report filters limit the data that can be returned in any level of the report. Report filters can be fixed or run-time selectable. These filters are similar in that both restrict the data that is returned in the report according to what the filter allows and are created in the same way. However, run-time filters can be changed when the report is run, whereas fixed filters cannot. Run-time filters values can be changed by anyone viewing the report, either from the Search window or from docked filters, to return different data each time someone runs the report. Fixed filter values cannot be changed when the report is run, which allows you to restrict the data that report users can view.

Tip Most reports used on workspaces automatically attempt to filter on the record shown in the workspace to display only information that is related to the record. For this reason, when creating reports for use on workspaces, we recommend including a filter based on the unique identifier for the primary type of record shown in the workspace. For example, a report used on an incident workspace could filter on the incident ID field (*incidents.i_id*).

To create a fixed or run-time selectable report filter

1. Open the report you want to edit.
2. Click the Home tab.
3. Click the Add Filter button.



4 Enter the following field information.

Table 268: Add Filter Window Description

Field	Description
Name	Type a name for the filter in this field. The name identifies the filter on the report design center but does not display when the report is run. Entering a value for this field is optional. If a name is not entered, the name defaults to the name of the filter's database field.
Make This Filter Selectable at Run-time	Select this check box to make the field a run-time selectable filter. If this check box is cleared, the filter becomes a **fixed filter**.
Label This Filter	Type a label for the filter in this text field. This label displays on the Search window when the report is run.
Required	Select this check box to require the report's user to enter a value for the filter when running the report. If this option is selected, the Search window opens automatically when the report is opened and the filter's value must be specified before results are returned.

Table 268: Add Filter Window Description (Continued)

Field	Description
Expression*	Enter the expression you want to use for the filter in this field. You can right-click to select from a list of database tables, fields, and functions, or you can type the expression. A menu displays when you start typing that lists the database tables that begin with the typed letters. You can either continue typing the expression or select a table and field from the list. For descriptions of the types of columns and functions you can use in the expression, refer to Adding columns to reports. **Note:** The maximum number of characters allowed in the expression field is 3,500. You can use replacement variables to create expressions that require more characters. Refer to Creating variables. **Note:** Only indexed database fields are available for use in filters.
Use Data Dictionary	Click this text to open a window containing the data dictionary tree where you can select fields, functions, and variables for the expression.
Operator	Select the operator to use with the expression. The available operators vary depending on the type of field used in the expression. Click here for descriptions of operators.
Value	Enter the value for the filter. If you are creating a run-time filter, this value is the filter's default value which can be changed when the report is run. If you are creating a fixed filter, this is the filter value the report uses when it is run. **Note:** The available options in the Value field change depending on the type of field and the operator you select. For example, a menu field's values display in a drop-down menu, whereas a date field's values display date and time options. Text area fields are not available for use in report filters.
Customize	Click this text when using In List or Not in List operators with menu fields to select menu options you want displayed to the report's audience. Refer to Hiding menu options.

5 Click the OK button to save the filter.

6 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Hiding menu options

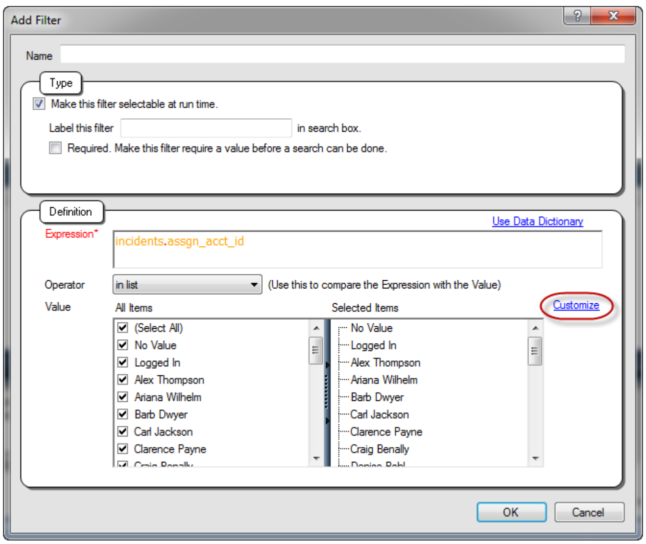
In some instances, you may have run-time filters that display a large number of menu options. If the staff members using the report do not need to see all the menu options, you can hide the ones that are irrelevant to them to make it easier to navigate the menu list. For example, if an incidents report includes a filter on the assigned group, and some staff members don't need to see incidents assigned to particular groups, you can hide those groups in the filter.

Note If you need a report to display different menu options to different audiences, create a copy of the original report for each audience and choose the menu options you want in each of the new reports. You can then specify which profiles have permission to open each report. Refer to Copying items and Specifying permissions.

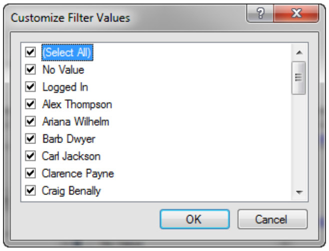
To customize menu filter options

1 Open the report on the report design center.

2 Click the Filters button on the ribbon's Home tab, select the filter you want to customize, and select Edit Filter. The Edit Filter window displays the filter details.



3 Click Customize. The Customize Filter Values window opens.



4 Clear the check boxes next to the menu options you do not want to display.

5 Click the OK button.

6 Click the OK button to close the Edit Filter window.

7 Save the changes to the report.

Creating level filters

Level filters are similar to the filters that are applied to the main report. However, while report filters are applied to the report as a whole, restricting the data that is returned at any level in the report, level filters are applied to individual output levels and only restrict the data returned at the level where they are created. If the report has multiple output levels, the other levels are not subject to the level filters applied to other levels in the report.

To create a level filter

1 Open the report you want to edit.

2 Select the level you want to add the filter to from the Level drop-down menu at the top of the design surface.

3 Click the Level tab.

4 Click the Add Level Filter button. The Add Filter window opens.

5 Enter field information described in Add Filter Window Description.

6 Click the OK button.

7 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Creating group filters

Group filters can be used in output levels with grouped data to prevent rows with a certain number of grouped items from displaying. For example, an output level that returns rows showing the number of unresolved incidents for each staff member could have a group filter to display only rows for staff members with more than ten unresolved incidents. Group filters can be **fixed** or **run-time** selectable.

To create a group filter

1 Open the report you want to edit.

2 Select the level you want to add the filter to from the Level drop-down menu at the top of the design surface.

3 Click the Level tab.

4 Click the Add Group Filter button. The Add Filter window opens.

5 Enter field information described in Add Filter Window Description.

Important The filter options for group filters are identical to those for filters applied to the overall report. However, you generally want group filters to filter on the results in the output level's aggregate column. For example, if the aggregate column in your report counts the number of unresolved incidents a staff member has with *count(incidents.i_id)*, then the group filter's expression could be *count(incidents.i_id)* > 10, to return rows for staff members with more than ten incidents.

6 Click the OK button.

7 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Selecting filter operators

The operator you select when creating filters greatly impacts the data that is returned, so it is important to understand the functionality of each operator. The types of operators available for a filter depend on the data type of the filter's expression. The following table describes all available operators.

Table 269: Filter Operators Description

Operator	Description
equals	The expression matches the value exactly, including case. **Note:** When using this operator with menu fields, you can quickly locate the menu item you want by typing the first few characters of the item's name. Menu items that do not start with the text you type are removed from the list.
not equals (exclude No Value)	The expression does not match the value exactly, including case. This operator excludes any values of No Value (Null). For example, a report with a filter of `field X not equals (exclude No Value) Y` cannot return any records with a value of Y or No Value in field X. **Note:** When using this operator with menu fields, you can quickly locate the menu item you want by typing the first few characters of the item's name. Menu items that do not start with the text you type are removed from the list.
not equals (include No Value)	The expression does not exactly match the value, or is No Value (Null). For example, a report with a filter of `field X not equals (include No Value) Y` cannot return records with a value of Y, but does return records with a value of No Value. **Note:** When using this operator with menu fields, you can quickly locate the menu item you want by typing the first few characters of the item's name. Menu items that do not start with the text you type are removed from the list.
less than	The expression is less than the value.
less than or equals	The expression is less than or equal to the value.
greater than	The expression is greater than the value.
greater than or equals	The expression is greater than or equal to the value.

Table 269: Filter Operators Description (Continued)

Operator	Description
between	The expression is between two specified values. The between operator is available to use with date, currency, and numeric (integer and float) expressions. **Note:** When using this operator with a date expression, records matching the beginning value's date and time are returned, but those matching the ending value's date and time are not. This prevents records from being displayed twice on a report that is run once to view records created between 9:00 AM and 10:00 AM, and run again to view records created between 10:00 AM and 11:00 AM, for example.
like	The expression matches any part of the value. When using the Like operator, you should use the % wildcard symbol to offset your value. For example, if you were looking for all fields that contain "all," you should type %all% in the field.
not like	The expression does not match any part of the value. Wildcard characters are supported.
not like or null	The expression does not match any part of the value, or is a null value. **Note:** This operator is not available in run-time selectable filters.
in list	The expression values you want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. **Note:** When using this operator with menu fields, you can quickly locate the menu item you want by typing the first few letters of the value you want in the filter's Search Text field. To view the menu options you have selected from a long menu list, click the splitter bar to the right of the list. **Note:** When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes (for example, `'red','green','orange'`). Spaces between entries are ignored.

Table 269: Filter Operators Description (Continued)

Operator	Description
not in list	The expression values you do not want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. This operator is available only with menu field expressions. **Note:** When using this operator with menu fields, you can quickly locate the menu item you want by typing the first few letters of the value you want in the filter's Search Text field. To view the menu options you have selected from a long menu list, click the splitter bar to the right of the list. **Note:** When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes (for example, `'red','green','orange')`. Spaces between entries are ignored.
is null	The expression has a null value. **Note:** This operator is not available in run-time selectable filters.
is not null	The expression does not have a null value. **Note:** This operator is not available in run-time selectable filters.
Complex Expression	The expression matches any part of the value. This operator allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only. Refer to Using special characters when searching.
Not Complex Expression	The expression does not match the complex expression in the value. The Not Complex Expression operator is available only with text field expressions.

Defining logical expressions

When you add multiple fixed or **run-time filters** at the same level in a report, the filters are automatically joined together with a logical expression. This defines how the filters should work together to return data. By default, the logical expression uses Boolean AND logic rather than OR logic. If you have a filter of *incidents.status_id = Solved* and a filter of *inci-*

dents.queue_id = *Queue A*, the logical expression is *incidents.status_id* = *Solved* AND *incidents.queue_id* = *Queue A*. This expression would result in the report returning only solved incidents that are in Queue A.

If the default logical expression does not suit your needs, you can modify the expression from the Edit Logical Expression window. You can also delete, edit, and add filters from this window if you decide your existing filters need to be changed while editing the logical expression. Report filters, level filters, and group filters are joined with separate logical expressions, though each expression is edited in the same manner.

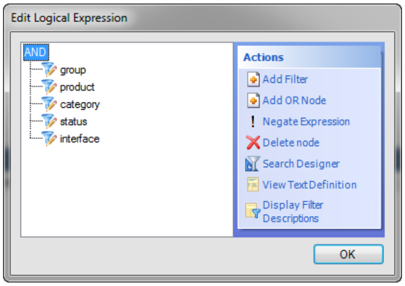
To edit a logical expression

1 Open the report you want to edit.

2 Open the Edit Logical Expression window for the report filters, level filters, or group filters, depending on the type of filters you want to change the expression for.

a To open the Edit Logical Expression window for report filters, click the Home tab and click the Filters button.

b To open the Edit Logical Expression window for level filters or group filters, select the report level you want from the Level drop-down menu at the top of the design surface. Click the Level tab and then click the Level Filters or Group Filters button.



When you add filters, they are automatically joined with AND logic and display in an AND tree. Run-time selectable filters are displayed in the tree along with **fixed filters**, which have an icon displaying a lock.

3 To add a filter joined with OR logic to the logical expression.

a Click Add OR Node. The node is added to the logical expression.

b Click the filter that should be joined with OR logic and drag it to the new OR node.

When you add nodes to the expression, the nodes are displayed in a tree structure, with filters displayed either under an AND node or an OR node. Filters under the same AND node are joined to each other using AND logic. Filters under the same OR node are joined to each other using OR logic.

4 To negate a filter, select the filter and click Negate Filter. To negate a node in the expression, select the node and click Negate Expression.

   A negated filter or node displays on the Edit Logical Expression window with an exclamation mark. Negated filters and nodes add NOT logic to the filter. For example, if your filter is *incidents.status_id=Solved* and you negate the filter, the filter becomes *incidents.status_id NOT= Solved*.

5 To add a new filter, select the node you want to add the filter to and click Add Filter. Refer to Creating report filters.

6 To edit a filter, select the filter you want to edit and click Edit Filter. Refer to Creating report filters for information about editing filters.

7 To delete a filter, select the filter you want to remove and click Delete Filter.

Note If the filter you delete uses a table that is no longer needed in the report, you should remove the table from the report to help the report run efficiently. Refer to Editing data set properties.

8 To display the filters' field definitions rather than their names, click Display Filter Descriptions. The Edit Logical Expression window is updated to display the filters' definitions. To display the filters' names again, click Display Filter Names.

9 To view a text definition of the current filters' logical expression, click View Text Definition.

10 Click the OK button to close the Text Definition window.

11 Click the OK button on the Edit Logical Expression window to save the logical expression.

12 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Combining run-time selectable filters

When your report includes multiple **run-time selectable filters** that expect the same type of search input, you can combine the filters to display a single search field on the report's Search window or **docked filters**. This lets report users enter one search value to search by two or more filters simultaneously. For example, you could have one search field to search by contacts' first names, last names, and organizations' names.

The combined filters can be joined using AND or OR logical expressions. Using AND logic, the search value you enter must match values in all the combined fields to return results. Using OR logic, the search value you enter needs to match a value in only one of the combined fields. By default, filters are joined using AND logic. Refer to Defining logical expressions.

Run-time selectable filters that have the same data type, operator, and search options, such as items in a menu field, can be combined. You can combine multiple report filters and multiple level filters, though you cannot combine report filters with level filters.

To combine run-time selectable filters

1 Create a run-time selectable filter. Refer to Creating report filters.

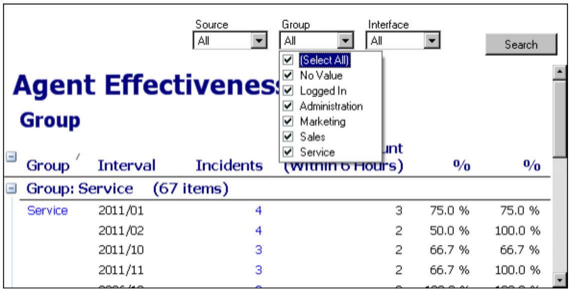
2 Create a second run-time selectable filter.

Important This filter must have the same name as the other filter you are combining. In addition, the two filters must use the same operator and must be of the same data type. For example, you can combine two integer fields, but you cannot combine an integer field with a menu field.

Docking variables and run-time selectable filters

When you open a report or output level with variables or run-time selectable filters, you can select the variables' or filters' values from one of three locations.

- If variables or run-time filters are required, the Search window automatically opens when the report is opened and you must enter values for the variables or filters.
- If run-time filters are present, but not required, you can click the Search button on the report's Home tab to open the Search window. Refer to Opening reports.
- If variables or run-time selectable report or level filters are added to an output level's **docked filters**, you can select variable and filter values at the top of the report. Docked filters in a sample report are shown in the following figure.



To add variables or run-time filters to an output level's docked filters

1. Open the report you want to edit.
2. Click the Home tab.
3. Click the arrow on the Views button and select Data Set View.

Tip Using the data set view, you can see every filter and variable in your report, and you can select them on the design surface for editing.

4. Click a filter or variable on the design surface.
5. Click the Design tab.
6. Select the Display in Docked Filters check box.

Tip You can double-click docked filters and variables shown on the design surface to open them for editing.

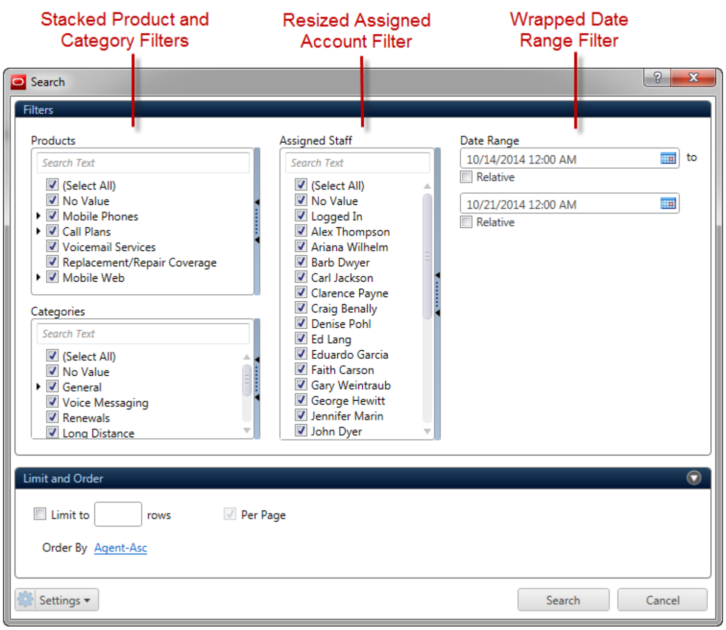
7. Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

When you run your report or view it using a different view, the filters and variables you selected in the Docked Filters report section display at the top of the report.

Customizing the Search window

The Search window you use to search for information in a report or **dashboard** displays the variables and run-time filters configured for it. By default, the controls for the filters and variables have fixed sizes and are grouped by the type of input field they use. For instance, filters for text fields are grouped together as are filters for menu fields. The contents of each group are further arranged according to the operators used by each field in the group. The controls on a dashboard's Search window are also grouped by the items common to all reports on the dashboard and those that are report specific (refer to Searching dashboard reports).

If the default layout of your report's Search window does not meet your needs, you can resize and organize the window's contents to ensure that they display as you want them to. For example, you can place the filters you regularly use before the filters with default values you seldom change. In addition, you can manage whitespace on the window by stacking smaller filters and wrapping date range filters. A customized Search window indicating some of these options is shown here.



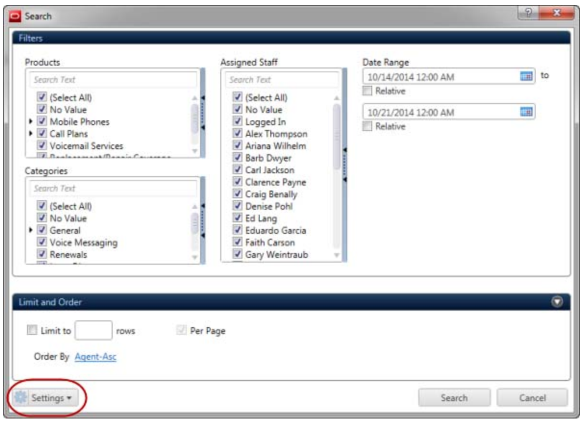
When you customize a Search window layout from the report or dashboard design center, the layout you save is used as the default layout for all users of the report or dashboard. However, they can also customize the layout and then save it to their local workstation so they see the same layout when they next open the report or dashboard.

Note If you define a custom layout for a report that is later modified on the report designer, any changes made to the report will not overwrite the layout you define. If new filters are added to the report, they will display last in the user's customized layout, and any filters deleted from the report will disappear from the layout.

To customize the Search window

1 Open the search designer.

a To open the search designer when viewing a report or dashboard, open the Search window and click the Gear button next to Settings. Refer to Searching in reports and Searching dashboard reports.



Or

Click Settings and select Enter Search Design Mode.

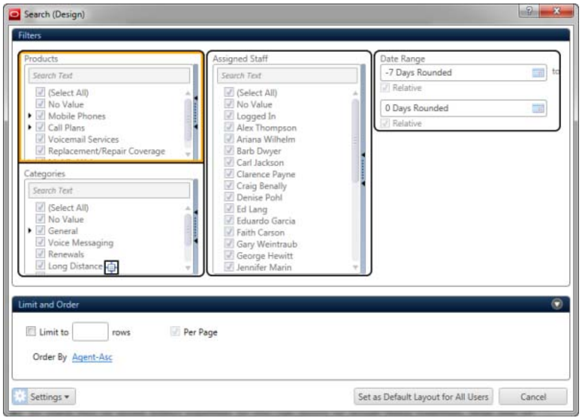
b To open the search designer when editing a report, add the filters you want to the report, click the arrow on the Home tab's Filters button, and select Search Designer.

Or

Click the Filters button on the ribbon's Home tab to open the Edit Logical Expression window and click Search Designer.

c To open the search designer when editing a dashboard, click the Parameters Values button and click the Gear button next to Settings. Dashboard filters are grouped by filters common to multiple reports and filters unique to individual reports. When configuring the search layout for a dashboard, you cannot move filters between the groups.

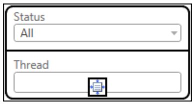
A search designer with several filters is shown here.



2 To move a filter, hover over it. The active filter is outlined and the cursor displays as positioning arrows. Drag the filter to the position you want. Blue indicators display, showing you where the filter will be placed.

3 To resize a filter, hover over a border of the filter and then drag the border until the filter is sized as you want.

4 To stack two or more filters together so you can move or resize them together, drag one of the filters immediately below another. An icon displays at the bottom of the stack, as shown here.



a To move the stacked filters as a group, click the icon and then drag the filters where you want.

5 To save the layout you configured when editing a report or dashboard, click the Set as Default Layout for All Users button. The search designer closes. Once you save the report or dashboard, the layout is saved to the report's or dashboard's definition.

6 To save the layout you configured for a report or dashboard you are viewing, click the Set as Default Layout button. The search designer closes and the layout you configured is saved to your workstation.

Creating join filters

You can create join filters to filter data in tables that are joined to the primary table with an outer join. Join filters are fixed and cannot be changed when the report is run. Join filters are similar to report filters in that they set restrictions on the records that can be returned by the report, but they apply to the table join rather than to the data that is returned by the query on the database. Join filters limit the data contained in the secondary table of the table join. Without join filters, there would be no way to add a report filter to limit returned data from the secondary table, while not preventing data from the primary table from being returned.

Note From an SQL perspective, join filters are a condition of the ON clause, whereas report filters are a condition of the WHERE clause.

For example, suppose you want your report to return a list of organizations and the number of incidents they have opened before January 1st. You also want to return any organizations even if they have not submitted any incidents, so you need to join the *incidents* table to the *organizations* table with an outer join. Using an inner join would prevent organizations that have no associated incidents from being returned in the report. You would then add a join filter of *incidents.created* < *January 1st*. If you also wanted incidents created after March 1st, you would add an OR join filter of *incidents.created* > *March 1st* to the first filter. The resulting join filters definition would be *incidents.created* < *January 1st* OR *incidents.created* > *March 1st*.

The method of adding join filters is similar to that for adding report filters. However, unlike report filters, join filters allow you to use either a constant value, as report filters do, or an expression you create from the database fields and the functions. Click here for function descriptions.

To create join filters

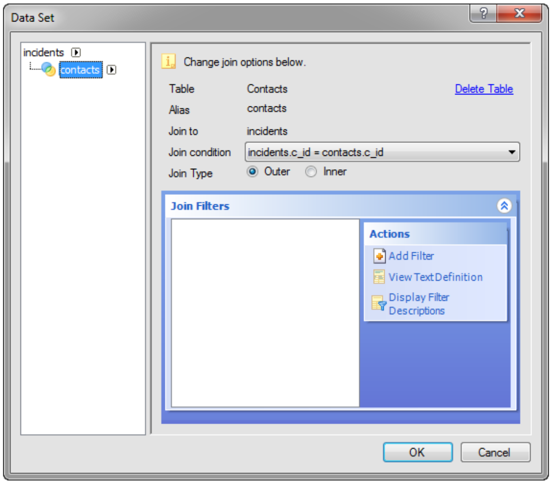
1 Click the Home tab while editing a report that has multiple tables.

2 Click the Tables button.

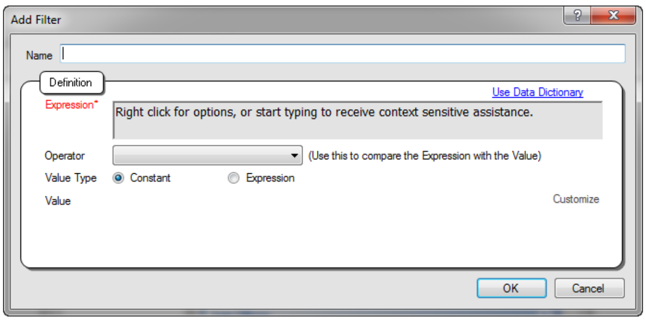
3 Select the table you want to add a join filter to.

4 Click Join Filters. The Data Set window displays the Join Filters section.

Important Join filters are not applicable to tables joined with an **inner join**. Tables joined with an inner join do not have the Join Filters option.



5 Click Add Filter to open the Add Filter window.

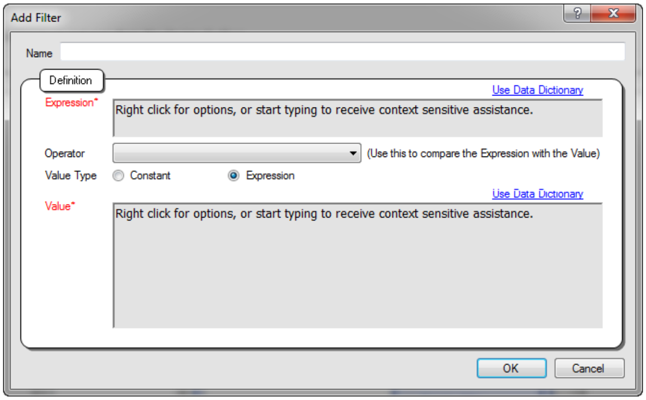


6 Enter the expression for the join filter.

Or

Click Use Data Dictionary to open the data dictionary where you can define the filter’s expression.

7 To use an expression filter value, select the Expression radio button. The Add Filter window then displays a Value field.



8 Enter the expression in the Value field.

Or

Click Use Data Dictionary to open the Edit Expression window, from which you can create the value's expression using database fields, functions, and variables listed in the data dictionary.

Note Currency fields are not available for use in join filters.

9 Click the OK button to save the join filter.

Once you add a join filter, the Data Set window is updated to display the filter, along with additional actions that are identical to those used when creating **logical expressions** for report, group, and level filters. These actions allow you to edit your filter, create additional filters, add OR logic to the join filters, negate filters, view a text definition of the join filters' logical expression, and toggle between the filters' descriptions and names. Refer to Defining logical expressions.

Adding additional output levels

Once you configure the primary output level in your report, you can add additional output levels, also referred to as drill-down levels, that contain details about records in the first level. These secondary levels are configured just like the primary output level and are accessed by clicking on records in the first level that act as links. You can have multiple drill-down levels in your report which can be linked to from the same output level or from sub-levels of the primary output level. Refer to Drilling down in reports.

Tip You can also add drill-down functionality to reports by linking reports together. Refer to Linking reports.

When adding drill-down levels to reports, you can group data in one output level and then create a drill-down level with more information about the group's data. You can also create **comparison periods**, graph data trends, and specify **data exceptions**, and choose to graph your data and specify the type of chart used in the report.

For example, you could create a report listing all unresolved incidents in your knowledge base grouped by the queue they are associated with. The report's first output level could display every queue and the number of unresolved incidents in the queue. You could then create a second output level to display incident details when drilling down on a queue's name, or on the number of unresolved incidents in the queue.

Tip Each report can have up to fifty output levels.

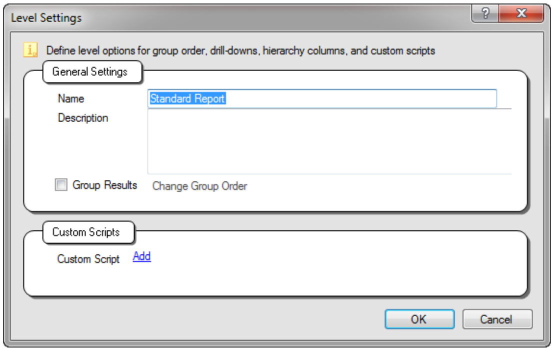
Result grouping

Grouping data in an output level allows you to combine records with similar data into one row. Output levels with grouped data often have additional output levels added to them, so you can drill down into another output level to view details about the grouped records. When you group data, you can order the grouped columns to best suit your needs when you create drill-down output levels.

Important When you add an aggregate column to an output level, grouping is automatically enabled in the output level. For example, if you were to add a column with an expression of *count(incidents.i_id)* to an output level to see how many incidents a contact has, the output level would automatically be grouped since you are using a **function** to group records together in the column.

To enable grouping in an output level

1. Open the report you want to edit.
2. Select the output level you want to edit from the Level drop-down menu at the top of the design surface.
3. Click the Level tab.
4. Click the Edit button to open the Level Settings window.



5. Select the Group Results check box.
6. Click the OK button.

7 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Changing group ordering

When data is grouped in a level, it is automatically grouped in the order in which the columns are listed in the output level. If you add a drill-down level to the output level, the filter options for the drill-down level are also listed in this order.

For example, if an output level has columns for Reference #, Subject, and Status Type in that order, the output level's data are also be grouped in that order. If you then add a drill-down level and configure the level settings, the options in the Filter drop-down menu are listed in the following order.

- incidents.ref_no
- incidents.ref_no, incidents.subject
- incidents.ref_no, incidents.subject, incidents.status_id

Group ordering does not affect the rows displayed in the grouped output level. It instead affects the ordering of the drill-down filters on the output level that you drill down into. The order of the drill-down filters in an output level impacts what records can be viewed when drilling down into the level. For example, a drill-down level with *incidents.ref_no* as the first group item in the drill-down filter would have limited usefulness. This is a unique field, so multiple incidents cannot be grouped together based on this field.

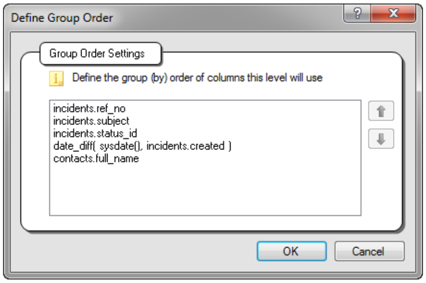
Note Unique fields contain values that only a single record in the database can have. Some examples of unique fields are the Reference #, Contact ID, and Organization ID fields.

If *incidents.ref_no* was the first ordering field for a drill-down level, it would return only information related to the particular incident you drilled down on. If you wanted to drill down on all incidents grouped by a different field, such as the incidents' status, you would need to reorder the grouping so *incidents.status_id* is grouped first.

To change group order

1 Select the Group Results check box on the Level Settings window. Refer to To enable grouping in an output level for information about the window.

2 Click Change Group Order to open the Define Group Order window. The window is populated with the columns included in the output level.



3 Select the field in the list that you want to move.

4 To move the field higher in the list, click the up arrow.

5 To move the field lower in the list, click the down arrow.

6 Click the OK button to save the order.

Adding output levels

Once you configure your primary output level, adding a drill-down output level is simple, requiring only that you identify the column to filter on and the column(s) to link from in the parent output level. By default, the new output level displays the same report sections shown on the parent level, such as the charts and data area sections, though you can select different sections to display on the new level from the ribbon. You can add content such as text fields, charts, and columns to the new output level just as you did in the primary output level.

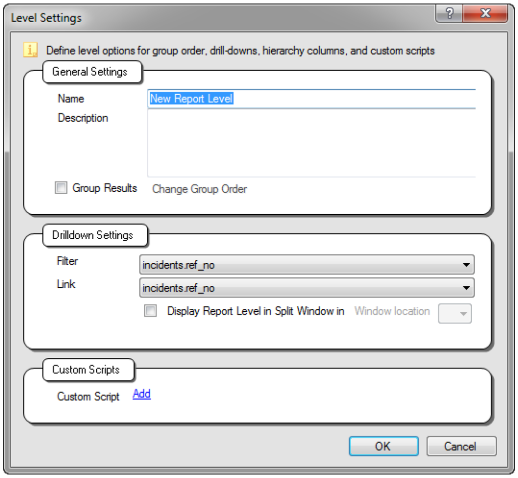
To create an additional output level

1 Open the report you want to edit.

2 Select the parent level you want to add the new output level to from the Level drop-down menu at the top of the design surface.

3 Click the Level tab.

4 Click the Add Drilldown button to open the Level Settings window with drill-down options.



5 Enter the following field information.

Table 270: Level Settings Window Description

Field	Description
Name	Type the name of the new level in this text box.
Description	To add an optional description for the output level, type the description you want in this text box. The description displays in the level's Output Descriptions section. Refer to Adding output and search criteria descriptions.
Group Results	This check box is not used when initially creating new output levels. Refer to Result grouping.
Drill-Down Settings	This section defines the data and the link in the parent output level you use to open the drill-down output level.
Filter	Click this drop-down menu to select the output column or columns to use as the filter for the new level. The drill-down filter determines the data set displayed in the drill-down level.

Table 270: Level Settings Window Description (Continued)

Field	Description
Link	Click this drop-down menu to select the output column that you click to open the drill-down level. You can also select Entire Row to open the drill-down level by clicking anywhere on a row in the parent output level. **Note:** If you want to drill down into another report level instead of opening a specific record when a value from the record is double-clicked on a report, select Entire Row as the drill-down link. When configuring record commands for the report, select None from the Default Record drop-down menu. Refer to Customizing record commands.
Display Report Level in Split Window	Select this check box to open the drill-down output level in a split window on the content pane. This results in the parent output level remaining visible on the other part of the content pane.
Window Location	When you select the Display Report Level in Split Window check box, you can then select the position where the split window should open. Click this drop-down menu to select Top, Bottom, Left, or Right.
Custom Script	This section allows you to create, edit, and remove custom scripts to modify the output level's output. Refer to Adding custom scripts to output levels.
Add	Click this text to add a custom script to the output level.
Edit	Click this text to edit an existing custom script. **Note:** This option is available only when a custom script has been added to the output level.
Remove	Click this text to delete an existing custom script. **Note:** This option is available only when a custom script has been added to the output level.

6 Click the OK button to save the output level.

7 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Configuring recursive drill-down levels

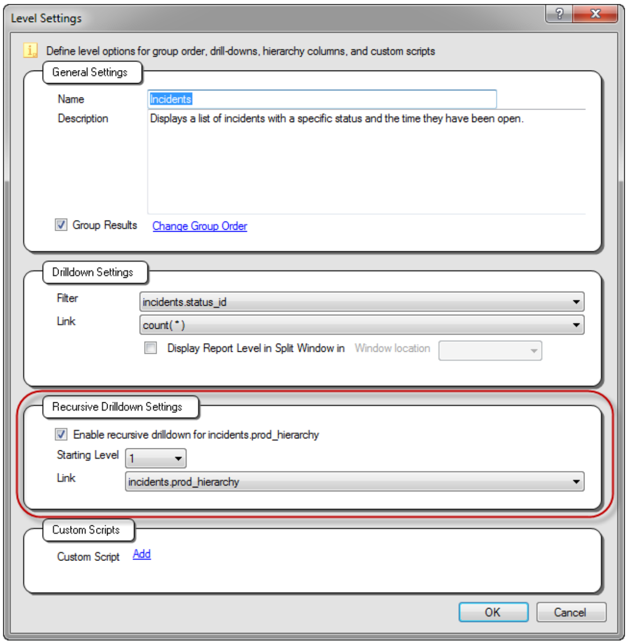
You can **drill down** recursively on hierarchical items (for example, accounts, products, and categories). Recursive drill-down allows you to start at specified levels of a hierarchy and become more specific at each lower level as you drill down into it. This feature enables automatic links for hierarchical items so you can access additional levels of detail when viewing a report.

You can enable recursive drill-down only for a level that has a hierarchical output column. If an output level has a hierarchical output column and you do not enable recursive drill-down for the level, then only data for the output column's first level can be displayed. A level can have both regular and recursive drill-down enabled, but the **drill-down links** cannot be the same.

To configure recursive drill-down levels

1 Create a report output column from a hierarchical item (for example, *accounts.hierarchy* or *incidents.prod_hierarchy*).

2 Click the Level tab and click the Edit button. The Level Settings window opens with recursive drill-down options.



The recursive drill-down feature is automatically enabled. To disable the feature, clear the Enable Recursive Drilldown check box.

3 Click the Starting Level drop-down menu and select the starting point for the drill-down level. For example, starting level 1 would be the top product in your list of products. Starting level 3 would be three sub-products down from the parent product.

4 Click the Link drop-down menu and select the output column you want as the drill-down link in the report. By default, this is the hierarchical item.

5 Click the OK button to save the recursive drill-down settings.

Adding custom scripts to output levels

You can add custom scripts to your output levels to further manipulate the data in your report. For example, a custom script could be used to convert a row of data into a table, remove unwanted data, or create a link to another web page.

Tip When troubleshooting reports, it can be helpful to remove or disable custom scripts since these can modify the reports' appearance and functionality.

PHP scripting language must be used when defining a custom script. PHP is a free, open-source scripting language and interpreter, similar in many ways to JavaScript and Microsoft's VBScript. Like other scripting languages, PHP allows server-side scripting to be embedded inside client scripting. We recommend that you do not attempt to create custom scripts unless you are familiar with the PHP language and programming concepts. For documentation and information, refer to the official PHP site.

Important Custom scripts cannot include direct SQL statements.

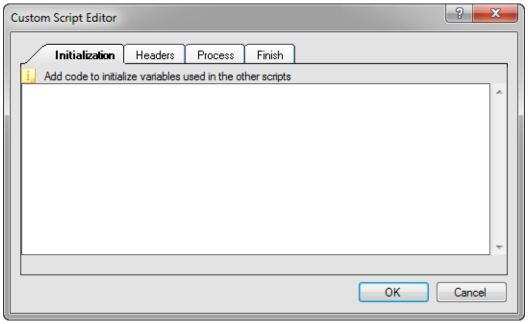
To create a custom script

1 Open the report you want to edit.

2 Select the output level you want to add the custom script to from the Level drop-down menu at the top of the report design center.

3 Click the Level tab.

4 Click the Custom Scripts button to open the Custom Script editor. If the output level already has a custom script, the editor displays the custom script for editing.



5 From the Initialization tab, type the script executed before the report is processed. This script is executed once when the report starts to process.

Important If the report is to be scheduled (refer to Scheduling reports), add the following to the Initialization pane to ensure the custom script runs correctly when recipients open the report.

```
putenv('TEMPORARY_RNW_CONF_DIRECTORY');
```

6 Click the Headers tab.

7 Type the script that runs during the start process. This script is called once while passing the column headings. The $headers parameter is an array that contains the column headers for the report. For example:

```
Array
(
 [0] => Account ID
 [1] => Full Name
)
```

You could manipulate this array by changing, adding, or removing column headers. The resulting array displays as column headers in the report.

8 Click the Process tab.

9 Type the script that runs while the report is generating. This script is called with each row passing the row data. The $rows parameter is a nested array, allowing you to return a “table” of data rather than just a row. Initially, the $rows parameter contains only data in

the first row of the table ($rows[0] [$i]). Each data cell contains a val variable that holds the value of the data cell. It can also contain a URL variable that contains a link for the data cell.

10 Click the Finish tab.

11 Type the script that runs during the exit process. This script is called after the rows have been processed. The Finish script returns data in the $exit_obj variable, which is added to the report after each row of the Process script.

12 Click the OK button to apply your custom script to your output level.

13 To remove a custom script, click the Level tab, click the Edit button, and click Remove. Click Yes at the removal confirmation.

14 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Linking reports

Just as you can drill down into different levels within a report, you can also drill down into another report or dashboard using report linking. You can create links to a report or dashboard from numerous reports, allowing you to use a single report or dashboard as a drill-down for a number of separate reports. Linking reports is particularly beneficial when you need to create multiple reports with identical drill-down levels, since you can create a single report and link to it instead of re-creating identical levels in multiple reports.

Since linked reports do not need to use the same database tables, you can access a large amount of data by linking to a number of reports from a single parent report. Conversely, a single report with multiple output levels must include all the database tables used by any of the report levels, so is more likely to run slowly or encounter limitations in the amount of data that can be queried. By linking reports that each use a smaller data set, you are far less likely to encounter data limits or negatively impact analytics performance.

Using report links

When a report link is created, it is applied to a specific column in the parent report. When you click the link in the column, the linked report opens on a new tab, an existing tab, or on the same tab as the parent report in a split window, depending on how the report link is configured. You close a linked report or dashboard by closing the tab or clicking the Top Level link in the report.

Since report links are specific to columns, you can have several links to reports and dashboards in the same report. Your report can also include drill-down links to other levels in the same report. Report links can be added to any of the output levels in the parent report, allowing you to link to a large number of reports and dashboards from one report.

While report links are easy to use, there are some considerations before adding them to reports.

- Report links function normally when they are added to workspaces, but the links are unavailable if the reports are used in workspace relationship items. Refer to Working with report controls for information about using reports in workspaces.
- Just as with drill-down links to other report levels, report links are unavailable when a report is forwarded, exported, published, or sent as a scheduled report. Refer to Distributing reports and dashboards.
- Report links are unavailable when the columns they are in are rolled up. Refer to Displaying rollup levels.
- While you can create links to dashboards, you cannot link to a dashboard from a report that is being viewed in a dashboard. Links to dashboards are unavailable when the reports they are in are viewed in a dashboard.
- You can create links to public or private reports and dashboards. Staff members with permission to view the parent report can view any reports or dashboards linked to from the parent report, whether they are public or private. Because of this, you should be familiar with the content of the report or dashboard you are linking so staff members are not able to access sensitive information.
- You cannot create report links from columns that display values from hierarchical fields, such as the *incidents product hierarchy* field. In addition, columns can be associated with a report link or with a drill-down level in the report, but not both.
- If a report or dashboard is deleted, any links to that report or dashboard are automatically disabled, but the reports containing the links continue to function normally.

Creating report links

Before you create report links, you should be familiar with the variables and run-time selectable filters in the reports or dashboards you are linking to since you define the values you want to use for these every time you create a report link. In addition, you should know whether you want to use unconditional or conditional links.

- **Unconditional links**—Use an unconditional link to open a specific report or dashboard when you drill down on any value in the parent report's linked column. The content in the linked report or dashboard vary depending on the report's variables and filters and the value you drill down on, but the same report or dashboard is linked to regardless of the value selected in the parent report's column. This functionality is similar to drilling down on a value in a column to open another report level.
- **Conditional links**—Use conditional links to open different reports or dashboards depending on the value you drill down on in the parent report's linked column. For example, if a column in your parent report lists contacts' SLAs (**service level agreements**), you could add a conditional link for each unique SLA listed in the column. When you click one of the SLAs in the column, a report that shows information specific to that SLA would open. Just as with unconditional links, the content in the linked reports or dashboards can vary depending on the values you specify for the linked reports' variables and filters.

You create links using the Report Linking wizard or the Conditional Report Linking wizard. The wizards are similar, though the Conditional Report Linking wizard includes an additional step. In addition, the ordering of conditional links is important.

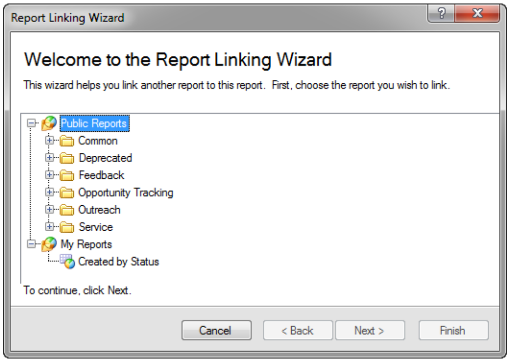
To create an unconditional report link

1 Open the report you want to create the link from on the report design center.

2 If your report has multiple output levels, select the report level where you want to create the link.

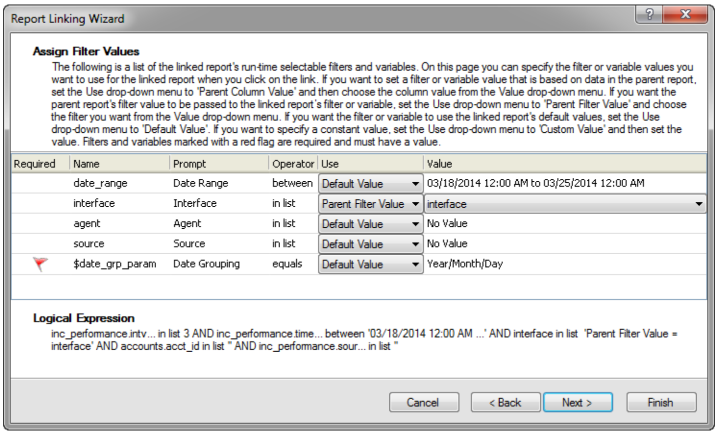
3 Select the column where you want the link to display. It does not need to be the column with the data used to filter shown on the linked report.

4 Click the Report Linking button on the ribbon's Design tab and select Add Report Link. The Report Linking wizard opens.



The first page of the wizard shows you the reports and dashboards you have access to, excluding published reports. You can create links to any of the reports or dashboards shown on the page, including those that are private.

5 Select the report or dashboard you want to link to and click the Next button.



Once you select the report or dashboard you want to link to, you select the values you want to use for the report's or dashboard's variables and run-time selectable filters. The values you specify are applied to the linked report or dashboard when it opens. Required variables and filters are indicated with a red flag and you must set a value for these. You can also choose to define values for items that are not required.

Important The values you specify determine the information shown in the linked report when it opens. You generally want to use a value that corresponds to the value clicked in the parent report to display data related to the value in the parent report.

6 Select the type of value you want to use for the linked report's or dashboard's variables and filters from the Use drop-down menu. The value types you can choose from are described in the following table.

Table 271: Variable and Filter Value Types Description

Type	Description
Parent Column Value	Select this option to use the values in the parent report's selected column to populate the linked report's variable or filter. When you click the link on a row in the parent report, the column's value from the selected row is used as the linked report's variable or filter value. **Note:** This option is available only when the parent report includes a column with the same data type, such as text, integer, or menu, as the linked report's variable or filter.
Parent Filter Value	Select this option to populate the linked report's variable or filter with the current value from one of the parent report's filters. **Note:** This option is available only when the parent report has filters with the same data type and operator as the linked report's variable or filter.
Parent Variable Value	Select this option to populate the linked report's filter with the current value from one of the parent report's variables. **Note:** This option is available only when the parent report has variables with the same data type and operator as the linked report's variable or filter.
Default Value	Select this option to use the default variable or filter value specified in the linked report for the variable or filter value.

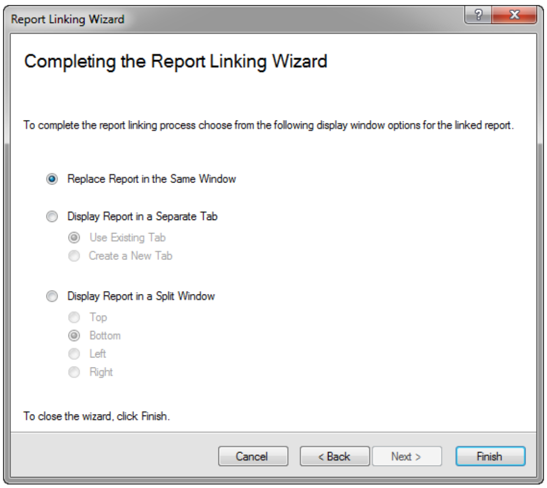
Table 271: Variable and Filter Value Types Description (Continued)

Type	Description
Custom Value	Select this option to specify a custom value for the variable or filter. The values you can enter depend on the data type and available options. For instance, if a filter uses a text field, you can type the text you want to use for the filter's value. If a filter uses a menu field containing staff accounts, you select the staff accounts you want from a menu.

7 From the Value drop-down menu, select the parent report's column, variable, or filter you want to use to populate the variable or filter in the linked report or dashboard. If you choose a custom value, you enter the custom value you want in the Value field.

Note When you select values for the linked report's variables and filters, the logical expression displayed at the bottom of the window is updated to reflect the values you select. This is the expression that is passed to the linked report or dashboard when you click the link. This information is displayed for reference and cannot be edited.

8 Click the Next button. The wizard presents options for specifying where you want the linked report to open.



9 Select the radio button next to the option you want to use to display the linked report or dashboard. The available options are described in the following table.

Table 272: Linked Report Display Options Description

Radio Button	Description
Replace Report in the Same Window	Select this radio button to close the parent report and display the linked report instead.
Display Report in a Separate Tab	Select this radio button to open the linked report on a separate tab on the content pane.
Use Existing Tab	Select this radio button to open the linked report on an existing tab each time you click the link. The tab is created the first time you click the link. When you open the report again from the same link, the report displays on the same tab.
Create a New Tab	Select this radio button to open the linked report on a new tab each time you click the link.
Display Report in a Split Window	Select this radio button to open the linked report in a split window. The parent report remains open on one half of the window, and the linked report displays above or below the parent report, or to the left or right of the parent report.
Top/Bottom	Select these radio buttons to display the linked report above or below the parent report.
Left/Right	Select these radio buttons to display the linked report to the left or right of the parent report.

10 Click the Finish button to save your changes.

11 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

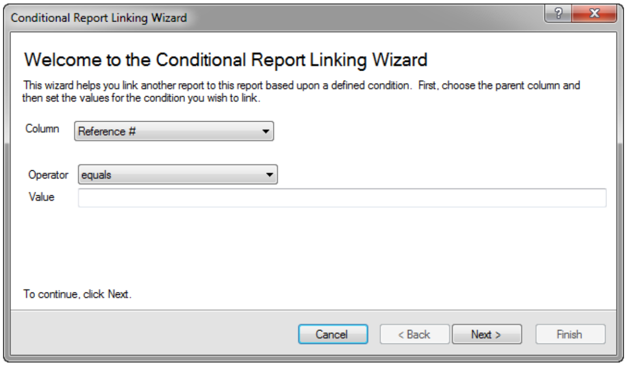
To create a conditional report link

1 Open the report that you want to create the link from on the report design center.

2 If your report has multiple output levels, select the report level where you want to create the link.

3 Select the column in the parent report where you want the link to display. It does not need to be the column with the data used to create the link's condition.

4 Click the Report Linking button on the ribbon's Design tab and select Add Conditional Report Link. The Conditional Report Linking wizard opens.



On this page of the wizard, you specify the condition(s) that must be met for the link to be triggered. The link you create is activated only when a value in the parent report meets the condition(s) you specify. You can add other conditional links to the same column to open different reports or dashboards when selecting other rows in the report.

5 Click the Column drop-down menu and select the column in the parent report that you want to use to create the link's condition. The column you select does not need to be the same column the link is displayed on. For example, you can use the values in a hidden column to create the link's condition, but display the link on another column in the report.

6 Click the Operator drop-down menu and select the operator you want to use for the link. The operators displayed depend on the column's data type.

7 Enter the value you want to use for the conditional link.

8 Click the Next button. The remaining pages of the Conditional Report Linking wizard are identical to those on the Report Linking wizard. Refer to the previous procedure for descriptions of these pages.

9 To add other conditional links, repeat steps 2 through 8.

10 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

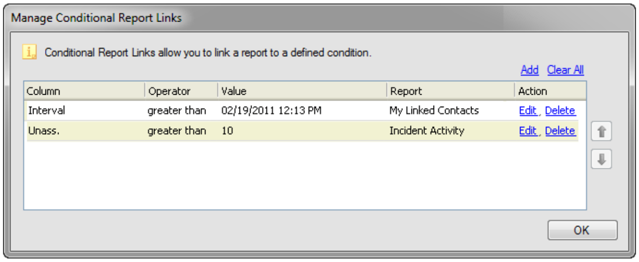
Ordering conditional links

If you create several conditional links on the same column, you may need to reorder them to ensure that links with conditions that might overlap are triggered in the order you want. While ordering is irrelevant for conditional links with exclusive conditions, it can impact which linked report or dashboard opens if you have multiple links that could match a particular column value.

To reorder a conditional link

1 Select the report column that is associated with the link and click the Report Linking button on the ribbon's Design tab.

2 Select Manage Conditional Report Links.



The Manage Conditional Report Links window shows all the conditional links that are associated with the selected column. From this window you can add, remove, edit, and reorder conditional links.

3 Select the link you want to move and click the up or down arrow to move it to the position you want. Conditional links are examined starting with the link at the top of the list. The first link that matches the column value is triggered and any other links that could match the column value are ignored.

4 Click the OK button to close the Manage Conditional Report Links window.

Editing and removing report links

Once you create conditional or unconditional report links, you can edit or remove them.

Tip You can use the standard Linked Reports and Reports with Disabled Links reports to list reports that contain links to reports and dashboards.

To edit a report link

1 Open the report that includes the link on the report design center.

2 Select the report column that is associated with the link and click the Report Linking button on the ribbon's Design tab.

3 To edit an unconditional report link, select Edit Report Link to open the Report Linking wizard. Refer to To create an unconditional report link.

4 To edit a conditional report link, select Manage Conditional Report Links to open the Manage Conditional Report Links window.

   a Click Edit next to the link you want to edit. The Conditional Report Linking wizard opens where you can edit the link. Refer to To create a conditional report link.

   b Click the OK button on the Manage Conditional Report Links window to close it.

5 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

To remove a link

1 Open the report that includes the link on the report design center.

2 Select the report column that is associated with the link and click the Report Linking button on the ribbon's Design tab.

3 To remove an unconditional link from the column, select Remove Report Link. The column's unconditional link is deleted.

4 To remove all conditional links from the column, select Clear All Conditional Report Links. All conditional links on the column are deleted.

5 To remove only some of the conditional links on the column, select Manage Conditional Report Links.

   a Click Delete next to the link you want to remove, and click the Yes button when asked to confirm the deletion.

   b Click the OK button to close the window.

6 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Configuring reports for editing records

When the rows in a report display information from unique records, such as incident reference numbers, contacts' names, or organizations' names, you can perform actions on the records using a variety of methods. You can double-click a row, click a link on the row, right-click the row and select from commands displayed on a menu, or click a button on the ribbon's Home tab to perform an action related to the highlighted record. In addition, you can edit information directly from the report without opening records using **inline editing**.

Note To edit records shown on reports, staff members' profiles must include permissions to modify the appropriate **record types**. Refer to Customizing profiles.

You can customize the actions you can perform on records when using any of these methods. You can choose the action performed when double-clicking a row and the commands available as buttons, links, and right-click menu options. You can also enable inline editing and specify the fields that can be edited directly on the report.

Note Record command options are not applied when viewing reports in workspaces. Refer to Working with report controls.

Customizing record commands

The record commands that are available on your report help your staff members work with records shown on the report. For example, staff members can open, print, and delete records using record commands. Record commands can be displayed as buttons on the report's Home tab, links displayed in a column, and as options displayed when right-clicking a row.

Using record commands, you can perform actions on the record types that are displayed in the report, but you can also perform actions on other **record types** that are related to the information displayed in the report. For example, if the report displays information about incidents, the report's record commands can be configured to perform actions on the contacts that are associated with the incidents.

You can select the record commands and record command links you want on your report and customize the actions performed when using record commands.

Note Add-ins that perform actions on records can also be added as record commands. For information about creating add-ins, refer to the Oracle Service Cloud Desktop Add-Ins Developer Guide. For information about installing add-ins, refer to Add-Ins.

Selecting record commands

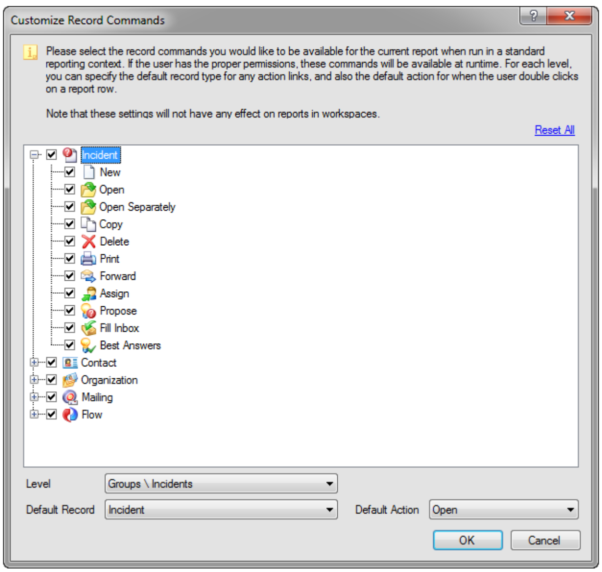
By default, every record command available for your report is enabled, with the exception of the Incident>Fill Inbox command, but you can remove record commands you do not want staff members to access. Record command buttons and right-click menu options are added automatically depending on which record commands are enabled for the report. The enabled record commands also determine which record command links are available, though these need to be added to the report manually. Refer to Adding record command links.

To select record commands

1 Open the report you want to edit.

2 Click the Home tab and click the Records button. The Customize Record Commands window opens.

Note The Records button is disabled on reports that do not have rows that display or are associated with unique records.



3 To remove a record command from the current report level, expand the record commands list to find the command you want to disable and clear the check box next to the command.

4 To restore the default record commands for all levels in the report, click Reset All.

5 Click the OK button to save your changes.

6 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Customizing record command actions

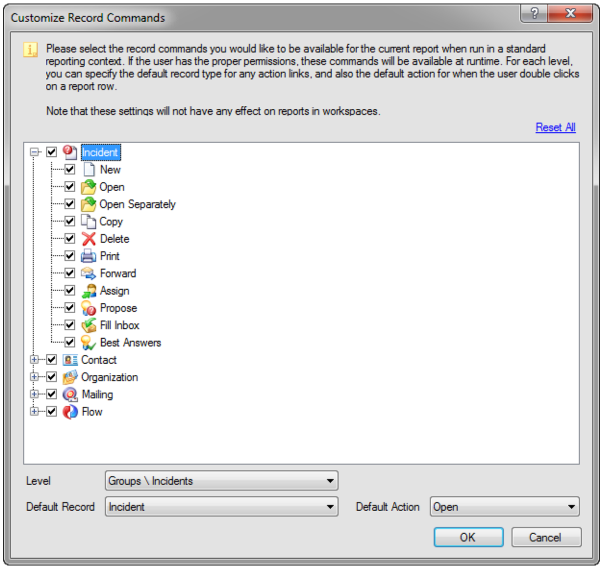
You can further customize the record commands in your report by selecting the **record type** that actions are performed on when you click record command links or double-click the report's rows. The record type you select is also used as the default record type for record command buttons and right-click menu options, though you can select any of the record types when using buttons or the right-click menu.

You can also choose the actions you want to perform when you double-click the report's rows. For example, you can choose to open a record, assign a record, or perform other actions when you double-click the row.

To customize record command actions

1 Open the report you want to edit.

2 Click the Home tab and click the Records button. The Customize Record Commands window opens.



3 To select the report level you want to configure, click the Level drop-down menu and select the report level you want. The options available on the Default Record and Default Action drop-down menus depend on the information displayed in the report level you select.

4 Click the Default Record drop-down menu and select the record type you want the record command actions to apply to.

Note The record type you select determines which links are available on the Links button on the report design center's Display tab, since different actions can be performed on different record types. Refer to Adding record command links.

a To drill down into another report level instead of opening a record when a row in the report is double-clicked, select None from the Default Record drop-down menu. The additional report level must be configured with a drill-down link of Entire Row. Refer to Adding output levels.

5 Click the Default Action drop-down menu and select the action you want performed when you double-click a row in the report.

6 To restore the default record command settings for all the levels in the report, click Reset All near the top of the window.

7 Click the OK button to save your changes.

8 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Adding record command links

When you add record command links, they are displayed in a column that is automatically added to your report. You can select the links you want to display, though the links' record commands must be enabled for the report on the Customize Record Commands window. Not all the record commands you specify for the report are available as links.

Tip When using the report, you can hide or display links that are enabled for the report from the Links button on the report's Display tab.

To add record command links to a report

1 Open the report you want to edit.

2 If your report has more than one output level, click the Level drop-down menu on the design surface and select the level you want to add links to.

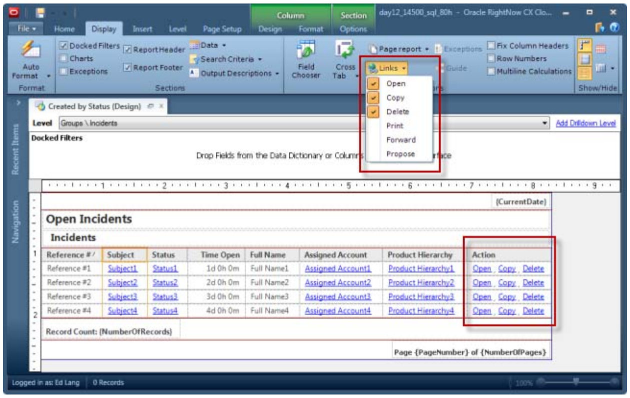
3 Click the Display tab.

4 Click the Links button and select the link you want to add to the report. When you add the first record command link to your report, the Action column is added to the report.

Note If the link you want to add to the report is not displayed on the Links button, verify that the associated record command for the link is enabled and that the **record type** you want the links to apply to is selected as the default record. Refer to Customizing record commands.

5 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

The following figure shows options on the Links button for an incidents report and the Action column where the record command links are displayed.



Enabling inline editing

When a report displays unique records, such as incidents or opportunities, the Inline Editing feature lets you edit the values in columns shown on the report without opening the records. Individual values can be edited directly from the report, or groups of records can be selected to edit values in multiple records. For example, if a report shows the staff member an incident is assigned to, you can change the assigned staff member from the report without opening the record, or you can reassign several incidents shown on the report to a selected staff member. Refer to Editing data inline.

Important You can configure inline editing in reports only if your profile includes the Modify Inline Report Editing permission on the Analytics tab. Refer to Analytics permissions.

To enable inline editing

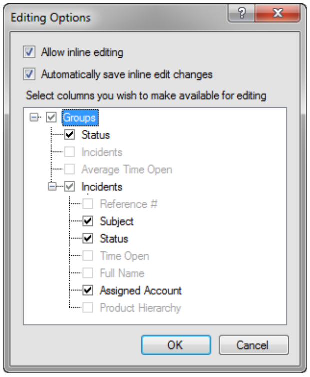
1 Open the report you want to edit.

2 Click the Home tab.

3 Click the Inline Editing button and select Allow Inline Editing. By default, inline editing is enabled for all editable columns in the report. Only certain columns, such as those containing unique values, can be edited inline.

Note **Custom objects**, other than menu-only objects, included in your report can also be edited inline. Refer to Analytics.

4 To specify the columns you want inline editing enabled for, click the Inline Editing button again and select Choose Editable Columns. The Editing Options window opens.



5 Enter the following field information.

Table 273: Editing Options Window Description

Field	Description
Allow Inline Editing	Select this check box to enable editing from the report.
Automatically Save Inline Edit Changes	Select this check box to enable the Auto Save feature by default. Refer to Saving changes to the server.
Select Columns You Wish to Make Available for Editing	Select the check boxes next to the report's columns that you want to make available for editing. **Note:** Reports with multiple output levels show all output levels in an expandable tree. Only columns that return unique, editable values from database fields are available for editing. For example, a column that returns the staff account an incident is assigned to is available for inline editing, whereas a column that returns incident creation dates or a count of incidents is not.

6 Click the OK button to save the editing options.

7 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Selecting report options

Once you create a report, you can choose which staff members can use the report, change the report's owner, set the time zone to use when the report is run, and modify other options that can impact how the report functions.

Viewing the audit log

You can open an audit log for a report to see when the report was created, edited, run, and **published**, and which staff members performed these actions. Since the audit log is a report, you can perform common report actions on the audit log, such as printing, forwarding, or slicing.

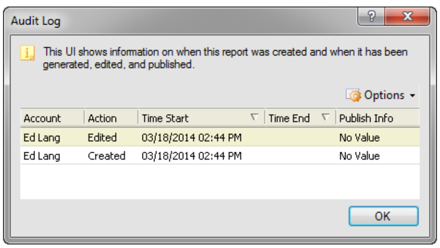
To view the audit log

1 Open the report on the report design center.

2 Click the Home tab.

Note This step is not necessary when viewing a standard report.

3 Click the Audit Log button to open the Audit Log window.



4 To access a list of actions that can be taken on the audit log, click the Options button. Refer to [Ribbon options when viewing reports](#) for descriptions of the actions.

5 Click the OK button to close the audit log.

6 Click X on the top right to close the report.

Specifying permissions

Report permissions allow you to specify which profiles can open or edit a report. You can select Open and Edit permissions for each profile defined in your system.

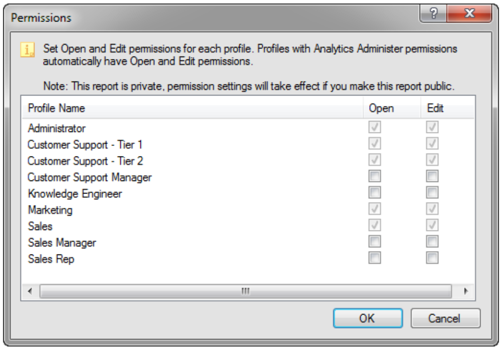
Note Permissions applied to private reports are irrelevant until the report is made public.

To specify report permissions

1 Open the report you want to edit.

2 Click the Home tab.

3 Click the Permissions button to open the Permissions window.



4 Select the check boxes next to the profile names to allow staff members assigned to the profiles to open or edit the report.

5 Click the OK button to save the permissions.

6 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Changing report properties

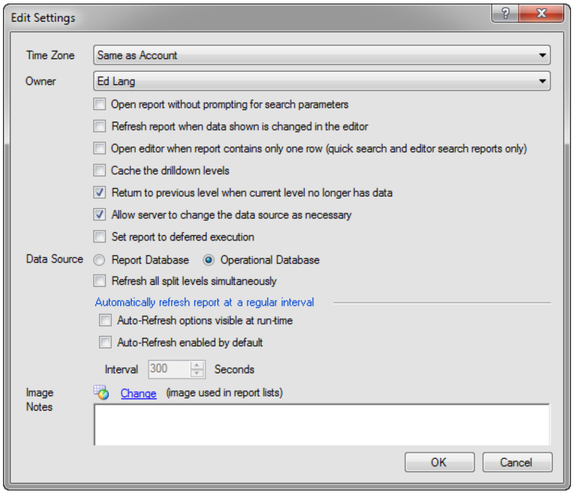
Report options allow you to select the time zone that should be used for the report, change the report's owner, and modify settings that impact how the report functions when it is opened for viewing. You can also configure automatic refresh of the data shown in the report, add notes to the report, and change the image displayed for the report in lists.

To change report properties

1 Open the report you want to edit.

2 Click the Home tab.

3 Click the Options button and select More Options to open the Edit Settings window.



4 Enter the following field information.

Table 274: Edit Settings Window Description

Field	Description
Time Zone	Click this drop-down menu to select the time zone to use with the report. The dates and times shown in the report's filters, variables, and output columns are adjusted to reflect the time zone you select. The available options include the following: • Same as Interface—The report's time zone matches the time zone set for the interface. This is the default setting. • Same as Account—The report's time zone matches that of the staff member who is running the report. Refer to Adding and editing staff accounts. • A specific time zone you can select from a list of standard time zones. **Note:** The database query used to return data in the report always uses the time zone of the interface. For example, if you select the GMT time zone for an incidents report and run it on an interface with an EST time zone, the report could return incidents with a created date of April 1st, 2011, but with reference numbers starting with 110331. This indicates that the incidents were actually created on March 31st, 2011, in the EST time zone, but the displayed date and time are adjusted to reflect when the incidents were created in the GMT time zone. In addition, if the report groups incidents by the day they were created, the same number of incidents will display each day regardless of the time zone that is used since they are grouped according to the interface's time zone.
Owner	Click this drop-down menu to select a report owner. The report owner is the only staff member who can view or edit the report, unless the owner grants permissions to other profiles. Refer to Specifying permissions. **Note:** Changing the owner of a private report makes the report unavailable to the previous owner.
Open report without prompting for search parameters	Select this check box to have the report automatically run and return data when it is selected from a navigation list. The report uses the default values specified in the report's filters. **Note:** This option is referred to as Initial Run on the Reports explorer's Find menu. Refer to Searching in explorers for information about finding reports.

Table 274: Edit Settings Window Description (Continued)

Field	Description
Refresh report when data shown is changed due to an action initiated from this report	Select this check box to have the report's output automatically updated when an edit to a record is initiated from the report. The report refreshes only if a record is modified in such a way that it no longer matches the report's search criteria.
Open editor when report contains only one row (quick search and editor search reports only)	Select this check box to automatically open the record for editing when the report returns only one record. **Note:** This option applies only to Quick Search reports and reports used in workspaces.
Cache the drilldown levels	Select this check box to enable caching of data shown in report output levels. When this option is enabled, the data shown in the initial output level when you view a report is stored on your workstation. When you view a second output level and then return to the top level of the report, it loads quickly since the data you are viewing is cached on your workstation. The cache is cleared when you close the report. **Note:** When this option is not enabled, the database is queried every time you drill down to an output level or return to a previous level even if you have recently viewed the output level.
Return to previous level when current level no longer has data	Select this check box to instruct the report to automatically display the previous output level if the current output level no longer displays any records.
Allow server to change the data source as necessary	Select this check box to allow Analytics to automatically change the data source if necessary to allow the report to run. For example, if a report is configured to run on the operational database but is unable to do so due to data constraints, selecting this check box allows the report to run on the report database (also referred to as the replication database). Clearing this check box forces reports to run on the data source that is selected. Refer to Specifying the preferred database. **Note:** This check box is selected by default when you create a report, and is cleared automatically any time the data source is changed on the Edit Settings window.

Table 274: Edit Settings Window Description (Continued)

Field	Description
Set report to deferred execution	Select this check box to automatically queue the report when it runs. Refer to Preventing automatic queuing. **Note:** If this option is not selected but the report is automatically queued the next time it is run due to meeting queuing criteria, the Set Report to Deferred Execution check box is selected automatically. To prevent the report from being queued when it is next run, edit the report and clear this check box.
Data Source	Select which database you want the report to run on. You can choose the **operational** or the **report database** (also referred to as the replication database). Refer to Report databases for more information about data sources. **Note:** This option is available only if your site has a report database. If your site does not have a report database, contact your Oracle account manager for more information.
Report Database	Select this radio button if you want the report to run on your report database. This option is helpful if your report queries a large amount of data since the query size restrictions on report databases are more relaxed than those on operational databases. **Note:** If you select this option in a report that includes the Fill Inbox record command and a staff member clicks the Fill Inbox button when using the report, the report will be automatically configured to use the operational database. This ensures that current data is used when incidents are assigned. Refer to Filling your inbox and Report databases.
Operational Database	Select this radio button if you want the report to run on your operational database. This option is helpful if you need the report to return the most current data available. **Note:** The operational database is selected by default when you create a new report.
Refresh all split levels simultaneously	Select this check box to automatically refresh all report levels shown in split windows when data in one of the report levels is refreshed. When this option is disabled, only the data shown in the window selected when the refresh occurs is updated.

Table 274: Edit Settings Window Description (Continued)

Field	Description
Automatically refresh report at a regular interval	Options in this section let you configure automatic refresh of the report's data to ensure the most recent data is displayed.
Auto-refresh options visible at run-time	Select this check box to add an arrow on the Home tab's Refresh button. Clicking the arrow displays options to enable or disable automatic refresh and to change the refresh interval time. When this check box is not selected, the report's data is refreshed only when the button is clicked.
Auto-refresh enabled by default	Select this check box to enable automatic refresh of the data shown on the report.
Interval	Enter the number of seconds after which the data shown on the report is automatically refreshed.
Image	Click Change to select a different image to display next to the report in lists such as navigation lists. The image that is displayed by default is determined by the layout selected when creating a new report. When selecting an image, you can choose from a list of standard images or from custom images that have been added in the Images explorer. Refer to Images explorer.
Notes	Type any text you want to add as a note to the report. The note displays on the Edit Settings window, but does not display to anyone viewing the report.

5 Click the OK button to save the report options.

6 Click the arrow on the Save button on the Quick Access toolbar and select a save option. Refer to Saving items in explorers.

Reviewing report performance

Reports that are configured to examine large amounts of data may run slowly or may not run at all. These reports might use too few filters, include a large number of tables, or might be running on an excessively large database. Using certain standard reports and the report analyzer helps you identify such reports and determine why they don't run as efficiently as you want.

Important While you want to avoid running reports that examine large amounts of data, it may occasionally be necessary to do so to meet your business needs. In such cases, you have several options.

- Run the report on the **report database** instead of the **operational database** so the report can query more data. Refer to Report databases.
- Queue the report to run at a later time. Refer to Queuing reports.
- If the report includes multiple output levels, you may be able to use **report linking** to reduce the number of tables and rows queried by the report. Refer to Linking reports.

Identifying report run failures

You can view reports that fail to run and the types of failures they encounter using two standard reports available in the Reports explorer under Public Reports > Common > Site Administration > Reports.

- **Report Failure Details**—This report lists reports that failed to run, and how often they failed, during a specified date range. The reasons the reports failed to run are also listed. Reasons include Too Much Data, Timed Out, and Unexpected Error. You can drill down on the rows in this report to view more specific information about each failure.
- **Summary of Report Failures**—This report lists the types of report failures along with the number of times the failure was encountered during a specified date range. You can drill down on the rows in the report to access information in the Report Failure Details report.

Tip To create custom reports that display or filter on the success of report generation, you can use the Result Code (*result_code*) field in the Analytics Audit Log (*ac_audit_log*) table.

Examining reports with the report analyzer

If you encounter problems running a report, or want to view potential issues after you create a report, you can run the report analyzer to check the report's database queries. This helps you fine-tune custom reports to ensure they run as quickly and efficiently as possible.

The report analyzer examines your report and provides suggestions as to how you can improve the report by removing database tables, adding filters, and making other changes. The analyzer also shows you the estimated number of rows the report's query may need to access so you know if the report can run without encountering row limits.

Note Reports are analyzed using either the **report** or **operational database**, depending on which database they are configured to use. Refer to Report databases.

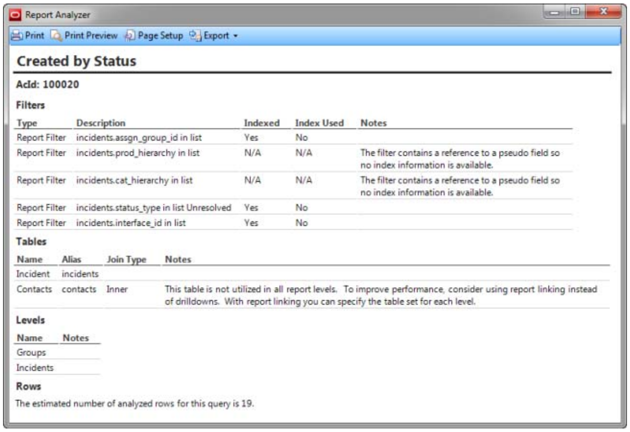
To analyze a report

1 Open the report you want to analyze on the report design center.

2 Click the Analyze button on the ribbon's Home tab. The report's Search window opens where you can enter the filter and variable values you want the report to use when it is analyzed.

Note If your report lacks required run-time selectable filters or the Open Report Without Prompting for Search Parameters check box is selected on the report's Edit Settings window, the Report Analyzer window opens instead of the Search window. Refer to Searching in reports

3 If you are presented with the report's Search window, enter the search criteria you want to use and click the OK button. The search criteria you specify can change the estimated number of database rows the query must examine.



The Report Analyzer window is similar to the Report Definition window and includes the same functions at the top of the window (refer to Viewing and exporting report definitions for information about the Report Definition window). The report analyzer lists the report's filters, tables, output levels, and the estimated number of rows the report's query will examine when it runs. If the analyzer finds potential issues with the report's query, it lists the issues in the Notes column next to the applicable report component.

The following table describes the four report components included on the Report Analyzer window and lists the messages you may see in the Notes column when potential issues are found.

Table 275: Report Analyzer Window Description

Report Component	Potential Issue
Filters	This section lists the expressions used for each report and level filter and identifies whether the filters' fields are indexed in the database and whether the index is used. Custom fields can be indexed for faster queries, though too many indexes can slow down queries. The following messages can be returned in this section. • The filter contains a custom field that does not have an index. To improve the performance of this query, consider adding an index on the custom field. • The filter contains a reference to a pseudo field, so no index information is available.

Table 275: Report Analyzer Window Description (Continued)

Report Component	**Potential Issue**
Tables	This section lists the tables that are used in the report, along with the types of joins used to link the data in the tables. Four messages can be returned in this section. • This table is in an **outer join** but there are one or more filters on fields in this table. Make sure this is by design. If not, consider changing the join type to **inner** or changing these filters to join filters to prevent an implicit inner join. • This table is not used in the report. Consider removing the table from the data set. If you need to filter out rows in the parent table that do not have rows in this table, consider adding a not null filter on the join field in the parent table. • This table is not used in all report levels. To improve performance, consider using report linking instead of drill-downs. With report linking, you can specify the table set for each level. • The data set contains the *inc_performance* and the *transactions* tables, but there are no filters that provide additional joins between the two tables. To increase performance, consider adding a filter that provides an additional join between the two tables.
Levels	This section lists the output levels (also called drill-down levels) that are used in the report. One message can be returned in this section. This level contains one or more columns with a *sum_distinct* expression. *Sum_distinct* expressions have a negative impact on performance. If possible, consider a different approach that does not involve using a *sum_distinct* expression. You may be able to remove the *sum_distinct* expression by converting any drill-down levels to linked reports.

Table 275: Report Analyzer Window Description (Continued)

Report Component	Potential Issue
Rows	This section lists the estimated number of rows that will be examined by the query. Messages display if the number of rows exceeds the threshold values for the operational and report databases (also referred to as replication databases). Three messages can be returned in this section. The messages vary depending on whether your site has a report database in addition to the operational database and the Data Source options specified on the report's Edit Settings window. • The estimated number of analyzed rows for this query is *X*. This value exceeds the threshold of 2,000,000 for the operational database. Consider using the report database for this report. Otherwise, it is likely this will occur automatically. • The estimated number of analyzed rows for this query is *X*. This value exceeds the threshold of 2,000,000 for the operational database. Since you have specified the operational database for this report, it is unlikely the report will execute. Consider using the report database for this report. • The estimated number of analyzed rows for this query is *X*. This value exceeds the threshold of 5,000,000 for the report database. Consider adding or refining filters to reduce the number of analyzed rows to below this threshold. Otherwise, it is unlikely the report will execute. • The report will likely return a large number of rows. Consider using filters instead of paging to navigate the result set. • A row estimate is not available because the report contains `sum_distinct` expressions. • Due to the complex nature of the report, a row estimate is not available. • The estimated number of rows is X. However, the underlying query contains a one-to-many relationship so the estimate may not be accurate.

4 Click X on the top right to close the Report Analyzer window.

5 Click X on the top right to close the report.

35

Report Management

You manage standard and custom reports using the Reports explorer. From the explorer you can organize, locate, and view reports. When viewing a report, you can print, forward, and export the report. If the report allows **inline editing**, you can also edit data shown on the report directly from the report. In addition, you can adjust the report's display options to better suit your needs, and alter data characteristics to sort, filter, and output the data in different formats.

Viewing reports

Oracle Service Cloud includes numerous standard reports you can use to track activity in any application, such as Oracle RightNow Feedback Cloud Service (**Feedback**). You can view a detailed description of any report by viewing the report's definition. If one of the standard reports does not meet your needs, you can create a custom report to return the specific information you want. Custom and standard reports are opened in the same manner.

You can also use the options on the ribbon to search for information, change the report's display, share the report with others, and perform other actions. Some reports also include multiple output levels or link to other reports or dashboards that you open to view additional information.

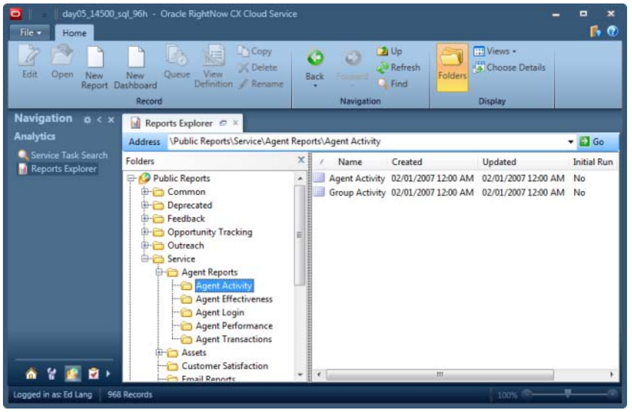
Opening reports

Staff members with the appropriate permissions can open standard and custom reports from the navigation pane or from the Reports explorer. You can double-click a report in a navigation list or double-click the Reports explorer to select a specific report to open.

To open a report from the Reports explorer

1 Click the Analytics button on the navigation pane.

2 Double-click Reports Explorer. The explorer opens on the content pane with the folders tree on the left and a detailed list of the selected folder's contents on the right.

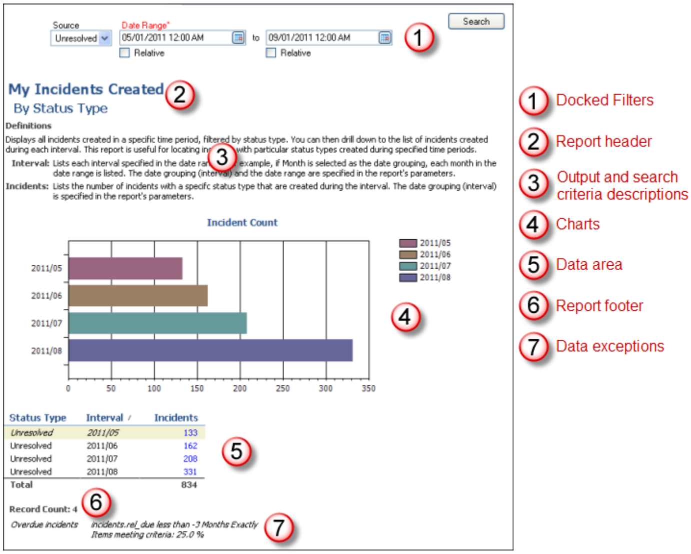


3 In the list on the right, right-click the report you want to open and select Open.

When you open a report, the Search window may be displayed where you can specify the search parameters you want to use for the report. The window displays if the report has required run-time selectable filters or is configured to display the Search window. For information about using the Search window, refer to Searching in reports.

Note When you attempt to open reports that examine a large amount of data or that may take a long time to run, you may be presented with an option to queue the report. Refer to Queuing reports.

An example of a report is shown below. Some of the standard sections you will see in reports are indicated.



The following table describes the standard sections you will see when you view reports, though some reports do not include all sections.

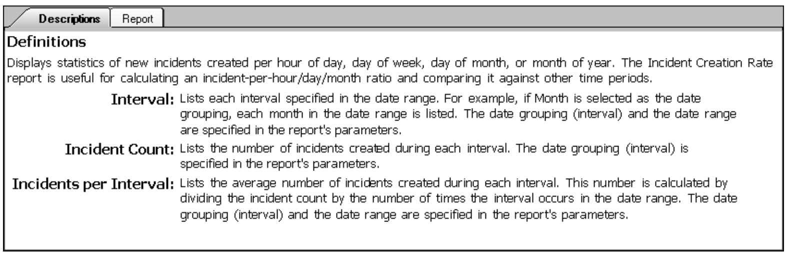
Table 276: Report Sections Description

Field	Description
Docked Filters	Docked run-time filters defined in the report display above the report output, allowing you to quickly select different filter values. For information about adding docked run-time filters, refer to Docking variables and run-time selectable filters. **Note:** You can dock output variables in reports in the same manner as run-time filters.
Report Header	Text added to this area displays near the top of each page in the report. Refer to Adding text fields to reports.
Output Descriptions	Report output descriptions let the report's creator relay information, such as the report's intended purpose, to those who view the report. Output descriptions can be displayed **inline**, on a separate tab, or on column rollover.

Table 276: Report Sections Description (Continued)

Field	Description
Search Criteria Descriptions	Descriptions of the filters in the report can be displayed to describe the report's filters and values. Refer to Search criteria descriptions.
Charts	Any charts defined in the report display above the tabular report output. Refer to Adding and editing charts. **Note:** When viewing a chart in a report, you can right-click the chart to switch to a two- or three-dimensional view. When viewing a three-dimensional chart, you can right-click the chart, select Rotate, and drag the chart to change the viewing angle.
Data Area	This area contains the tabular report output.
Report Footer	Text added to this area displays near the bottom of each page in the report. Refer to Adding text fields to reports.
Data Exceptions	Records matching **data exceptions** defined in the report are flagged, and a summary of the data exception can be displayed in the report output. Refer to Creating data exceptions.

4 If output or search criteria descriptions are displayed as a tab in the report, click the Descriptions tab to view the descriptions. Descriptions can also be displayed as inline text in the report header, or by rolling over the column names in the report. Refer to Adding output and search criteria descriptions.



Selecting report or layout view

When you open a report, you can choose to view it using a layout or report mode. The report view is used by default and lets you look at the report's data, print the report, and work with the report's records if you have permissions to do so. However, you cannot add column calculations or adjust column formatting options using the report view. Most staff members use the report view when they look at a report.

You can also look at the report using the layout view, which lets you apply formatting options and calculations to individual columns in the report. For example, if you wanted to add conditional formatting to a column to highlight data that met certain criteria in the column, you could change to the layout view, select the column, and configure conditional formatting for the column. Or, to display a calculation at the bottom of a particular column, such as the total of the values shown in a currency column, you could select the column and then select the calculation you want from the report's Design tab. When using the layout view, you can also change the width of individual columns, and move columns in a report if you want them displayed in a different order. For information about moving columns, changing column format options, and adding column calculations, refer to Editing columns.

To select the report or layout view

1 Open a report. By default, the report opens in the report view.

2 Click the ribbon's Display tab.

3 Click the arrow on the Views button and select Layout View to change the view.

4 To return to the report view, click the arrow on the Views button and select Report View.

Viewing and exporting report definitions

If you want to see descriptions of a report's output columns, search criteria, and other components, you can view the report definition. This can be helpful if you want to see exactly how the report was created or determine if the report meets your needs. You can print a report's definition, and you can export the output to a file for later viewing.

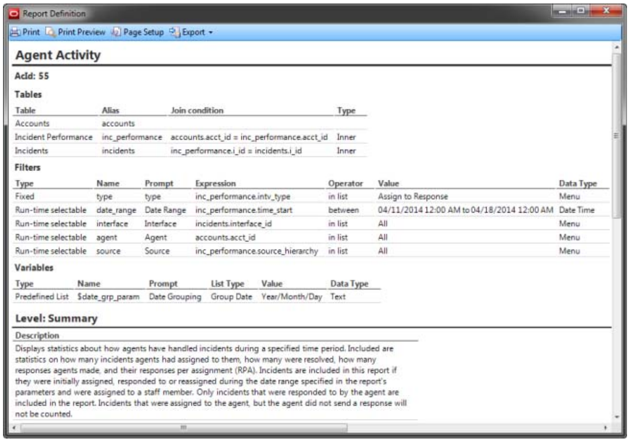
To view report definitions

1 From the Reports explorer, select a report and click the ribbon's View Definition button.

Or

Open a report, click the Home tab, click the Definition button, and select View. The Report Definition window opens.

Tip You can also open the Report Definition window by right-clicking reports in navigation lists or the Reports explorer and selecting View Report Definition.



2 To preview the page layout page before printing it, click the Print Preview button. Refer to Printing reports.

3 To configure the page layout, click the Page Setup button. Refer to Printing reports.

4 To save the output from the report definition to a file for later viewing, click the Export button and select the file type.

You can select HTML, PDF, Excel, Image, and Delimited file types. Refer to Exporting report output for a description of these file types. You can also choose to export the definition to an XML file which you can use to create duplicate reports on other interfaces. Refer to Exporting report definitions.

5 To send the report definitions to the printer, click the Print button.

6 Click X on the top right to close the Report Definition window.

Exporting report definitions

If you have multiple **interfaces**, you can use report definitions saved in XML files to create reports on other interfaces. This allows you to create duplicates of complex custom reports on other interfaces without manually re-creating the reports.

Important Since reports are not shared between interfaces, you must export a report from one interface and import it into another to have the same report available in multiple interfaces.

The following procedure explains how to export report definitions to XML files, which you can later import. Refer to Importing reports.

To export report definitions to XML files

1 Open the Report Definition window, as described in Viewing and exporting report definitions, click the window's Export button, and select Report Definition.

  Or

  When viewing a report, click the Home tab, click the Definition button, and select Export.

  The Save As window opens.

2 Select a location for the file and enter a file name.

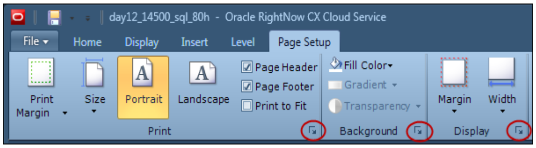
3 Click the Save button to save the report definition to an XML file.

Ribbon options when viewing reports

When viewing a report, you can move between the Home, Display, and Page Setup tabs on the ribbon to access buttons to modify the report's display, search for data, and edit records. When looking at a report using the layout view, you can also access Design and Format tabs to adjust formatting and display options. The buttons you see on some of the tabs vary depending on the report's configuration and on what is selected on the report.

Tip You can minimize the ribbon when viewing a report by double-clicking the active tab. Click the tab to temporarily display the buttons on the tab, or double-click the tab again to maximize the ribbon.

Each tab on the ribbon has one or more groups containing buttons you can use to modify the report or items on the report. Some groups have a button to the right of their name that you can click to open windows. For example, you can click the Background group's button on the Page Setup tab to open the Display Options window.

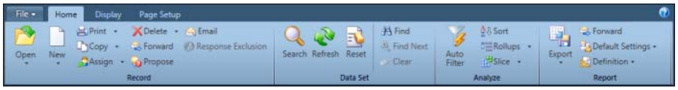


Windows give you access to the same features you can access from the ribbon, though the windows group the options differently, and sometimes contain options not available from the ribbon.

Important When explaining features that can be accessed from a window or the ribbon, we describe the feature using the window. However, the ribbon's buttons provide shortcuts to most of the same features available on windows.

Home tab

The buttons on the Home tab let you search for records in the report, refresh the report, and modify records displayed in the report. Buttons to modify records are shown on the tab only when the current report level displays individual records. These options vary depending on the type of records shown in the report and are disabled if the staff member viewing the report lacks permissions to perform the action. Here is the Home tab of an incidents report.



The groups and buttons on the Home tab are described in the following table.

Table 277: Home Tab Description

Group/Button	Description
Record	The buttons in this group let you work with the specific records returned in the report. The available buttons vary depending on the type of records returned in the report and permissions in your profile. When editing custom reports, you can choose the buttons you want to display on this group. Refer to Customizing record commands. **Note:** The buttons in this group are displayed only if the report level you view returns unique records that can be edited such as incidents, answers, contacts, or organizations.
Open	Click this button to open the selected record. To open a record that is associated with the selected record, click the arrow on the button and select the type of record you want to open. For example, you could open the contact record for the customer who submitted the selected incident.
New	Click this button to create a record of the same type as the record selected on the report. To create a record of a different type, click the arrow on the button and select the type of record you want to create.
Print	Click this button and select the record you want to print. You can print the selected record or another record associated with the selected record. For example, to print the contact record of the customer who submitted the selected record, click the Print button and choose Contact.
Copy	Click this button and select the record you want to copy. You can copy the selected record or another record associated with the selected record.
Assign	Click this button and select the record you want to assign to another staff member. You can assign the selected record or another record associated with the selected record.
Delete	Click this button and select the record you want to delete. You can delete the selected record or another record associated with the selected record.

Table 277: Home Tab Description (Continued)

Group/Button	Description
Preview Answer	Click this button to view the selected answer as it will display on your site's customer portal. This button is displayed only when viewing a report that lists answers.
Forward	Click this button to forward the selected record in an email.
Propose	Click this button to propose the selected incident as an answer. This button is displayed only when viewing a report that lists incidents.
Fill Inbox	Click this button to assign incidents to yourself from incident queues. This button is displayed only when viewing a report that lists incident information and when the permissions in your profile allow you to pull incidents from queues. This button must be manually enabled on custom reports. Refer to Customizing record commands. **Caution!** If the report is configured to use the **report database**, it will automatically be updated to instead use the **operational database** when you click Fill Inbox. This ensures that the report uses current data when assigning incidents. Refer to Filling your inbox and Report databases.
Email	Click this button to open your default email program to send an email to the contact associated with the record.
Monitor	Click this button to open the chat sessions workspace to monitor agents' chat sessions. This button is displayed only when **Chat** is enabled and when the permissions in your profile allow you to monitor chat sessions.
Force Logout	Click this button to log out the selected staff account. This button displays only when the report returns staff account information and can be enabled or disabled on custom reports. Refer to Customizing record commands.
Editing	This group is displayed when inline editing is enabled on the report. The buttons in this group let you save and edit records using inline editing. Refer to Editing data inline.

Table 277: Home Tab Description (Continued)

Group/Button	Description
Data Set	The buttons in this group let you search for data in the report, refresh the display, and reset the search criteria to the report's defaults. Refer to Searching in reports. **Note:** The buttons in this group are not available when viewing a report that was queued. Refer to Queuing reports.
Search	Click this button to open the report's Search window to select criteria for variables and run-time selectable filters.
Refresh	Click this button to reload the data shown using the report's current search criteria. If staff members are permitted to change automatic refresh settings, an arrow is added to the button. You can click the arrow to enable or disable automatic refresh and set the refresh interval. Refer to Changing report properties for information about changing refresh intervals.
Reset	Click this button to reload the data shown using the report's default search criteria.
Find	Click this button to open the Find window to enter text, numeric values, or special characters you want to locate in the report's output. Report cells that contain the search value are highlighted on the report. Refer to Finding content in reports.
Find Next	Click this button to highlight the next instance of the search values entered on the Find window.
Clear	Click this button to clear the search values entered on the Find window.
Analyze	The buttons in this group let you sort the data shown on the report and apply auto filtering, rollups, and slicing to the data.
Auto Filter	Click this button to enable auto-filtering in the report. Auto-filtering provides column filtering after the report has been generated. Refer to Using Auto Filter.
Sort	Click this button to open the Sort window and select which output columns to sort by and the sort method. Refer to Changing sort options.

Table 277: Home Tab Description (Continued)

Group/Button	Description
Rollups	Click this button to select rollup options and open the Rollups window. Refer to Displaying rollup levels.
Slice	Click this button to select slice options and open the Slice window. Slicing groups data so you can view only the subset of records you are interested in. Refer to Slicing report data.
Report	The buttons in this group let you export the report, forward the report in an email, save and restore default settings, and view and export the report definition.
Export	Click this button to export the data from a report to a file for use with third-party applications. You can export report data in the following formats: HTML, PDF, Excel, XML, Image, and Delimited. Refer to Exporting report output. **Note:** Permission to export, print, and forward reports must be enabled in your profile for this button to display. Refer to Analytics permissions.
Forward	Click this button to send the report to individuals or distribution lists in an email. Refer to Forwarding reports. **Note:** Permission to export, print, and forward reports must be enabled in your profile for this button to display. Refer to Analytics permissions.
Default Settings	Click this button and select Save as Default to save your personalized display and data settings for a report for later use. Select Restore to remove personalized display and data settings from a report and restore the settings to those defined in the report. Refer to Resetting display and data settings. **Note:** This button is not available on a report's Home tab when viewing the report in a dashboard.

Table 277: Home Tab Description (Continued)

Group/Button	Description
Definition	Click this button and select View to view the report definition, showing descriptions of the report's tables, columns, filters, and other information describing the report's structure. Click Export to export the definition to a file which you can import into another **interface** to copy the report. Click Edit to open the report for editing on the report design center. Refer to Viewing and exporting report definitions and Exporting report definitions. For information about editing reports, refer to Opening the report design center. **Note:** This button is not available when viewing a report that was queued. Refer to Queuing reports.

Display tab

The display tools let you adjust the fonts, colors, margins, and other display settings in the viewed report.

The groups and buttons on the Display tab are described in the following table.

Table 278: Display Tab Description

Group/Button	Description
Views	Click the arrow on this button to choose whether to view the report using the report view or layout view. Refer to Selecting report or layout view.
Auto Format	Click this button to apply a style to a report. Refer to Changing report displays with styles.
Sections	The check boxes in this section let you show or hide the Docked Filters, Charts, Exceptions, Report Header, and Report Footer report sections. You can also use the buttons in the group to select how you want to display the data, search criteria descriptions, and output descriptions.

Table 278: Display Tab Description (Continued)

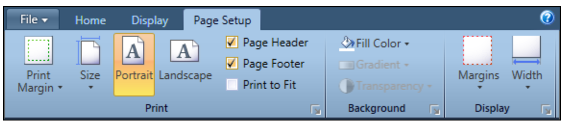
Group/Button	Description
Data	Click this button to select how you want to display the report's data. You can choose to hide the data, display the data in a tabular layout, or display it in a record layout. Refer to Selecting record or tabular layouts.
Search Criteria	Click this button to hide or show the report's search criteria. You can show the criteria inline or on a separate tab. Refer to Opening reports for information about search criteria descriptions.
Output Descriptions	Click this button to hide or show the report's output description. You can show the description on column rollover, inline, or on a separate tab. Refer to Opening reports for information about output descriptions.
Options	The buttons and check boxes in this group let you add page breaks to the report, apply cross tabs, add links and row numbers, fix column headers, show multiline calculations, and select the fields and data exceptions you want to view.
Field Chooser	Click this button to open the Field Chooser window and show or hide output columns in a report. Refer to Selecting columns to display.
Cross Tab	Click this button to select cross tab options and open the Cross Tab window and select the output columns to use as cross tabs. Refer to Displaying data using cross tabs.
Page Report	Click this button to add page breaks to a report and select the number of records to display on each page. Refer to Adding page breaks.
Links	Click this button to select the action links you want displayed on the report or to hide links that you do not want displayed. The available links vary depending on the type of record the report returns and on the links that are enabled when editing the report. **Note:** This button is active only if the current report level displays unique records and the report is configured to display links by default. Refer to Adding record command links.

Table 278: Display Tab Description (Continued)

Group/Button	Description
Exceptions	Click this button to show or hide data exceptions in the report. Refer to Showing and hiding data exceptions. **Note:** This button is active only if the current report level includes data exceptions.
Guide	Click this button to configure the report to display guided assistance response data in a tree format. Refer to Displaying guided assistance data in trees. **Note:** This button is active only if the report includes data from the Guided Assistance Responses (*decision_tree_responses*) table. The button is also disabled if the current report level is configured to display data using cross tabs.
Fix Column Headers	Select this check box to fix the column headers. Fixed column headers do not move when you use the vertical scroll bar.
Row Numbers	Select this check box to display row numbers in the report.
Multiline Calculations	Select this check box to display calculations on separate rows.

Page Setup tab

The options on the Page Setup tab let you configure printing options for the report. You can also change the report's background, margins, and width.



The groups and buttons on the Page Setup tab are described in the following table.

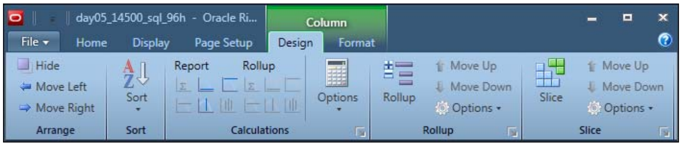
Table 279: Page Setup Tab Description

Group/Button	Description
Print	The buttons in this group let you configure the report for printing and add the Page Header and Page Footer sections. Refer to Printing reports. **Note:** This button group displays only if your profile includes the Print/Export/Forward Reports permission. Refer to Analytics permissions.
Print Margin	Click this button to select the size of the margins used when printing the report. The available options are Normal, Narrow, Medium, and Wide.
Size	Click this button to select the size of the paper used when printing the report. The available options are Letter, Legal, Executive, A3, A4, and A5.
Portrait/Landscape	Click these buttons to print the report in portrait or landscape mode.
Page Header/Page Footer	Select these check boxes to include a page header and page footer when printing the report.
Print to Fit	Select this check box to scale the report to your printer's default page width and send the report to the printer.
Background	The buttons in this group let you add a background color to the report. You can select the background color and add a gradient color to blend into the primary color. You can also choose how intense the colors should be with the Transparency setting.
Display	The buttons in this group let you add margins to the report and set the report's width.
Margin	Click this button to select the width of the margins around the report. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Width	Click this button to select the width of the entire report. The available options are Best Fit and Fit to Window.

Design tab

When viewing a report in the layout view, you can select a column and select options on the Design tab to change how the data in the column is presented. For example, you can add calculations to the column or roll up the column’s data.

Note This tab displays only when editing reports or viewing them using the layout view. Refer to Selecting report or layout view.



The groups and buttons on the Design tab are described in the following table.

Table 280: Design Tab Description

Group/Button	Description
Arrange	The buttons in this group let you move and hide the selected column. **Note:** To show hidden columns, right-click the header of a visible column, select Insert Hidden Column, and select the column you want to show.
Sort	Click this button and select Sort Ascending or Sort Descending to sort the data in the report by the values in the selected column. Refer to Changing sort options.
Calculations	The buttons in this group let you add calculations to the selected column. You can hover over each button to view a description of the calculation. You can also choose to show multiple calculations on a single row or on separate rows. Refer to Adding column calculations.
Rollup	The buttons in this group let you group the information in the report by the selected column. You can also change the ordering if your report has multiple rolled-up columns. Refer to Displaying rollup levels.

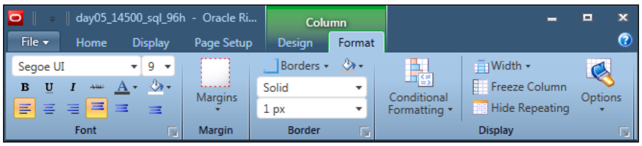
Table 280: Design Tab Description (Continued)

Group/Button	Description
Slice	The buttons in this group let you slice the data in the report by the selected column. You can also change the slice level if your report's data is sliced by more than one column. You can choose to display slice columns as a tree or as links. Refer to Slicing report data.

Format tab

When viewing a report in the layout view, you can select a column and select options on the Format tab to change how the data in the column is displayed. For example, you can change the fonts, hide repeating lines of data, and replace numeric data with gauges.

Note This tab displays only when editing reports or viewing them using the layout view. Refer to Selecting report or layout view.



The groups and buttons on the Format tab are described in the following table.

Table 281: Format Tab Description

Group/Button	Description
Font	The buttons in this group let you change the font style, size, and color. You can also select font attributes, such as bold and italic, and change the text's alignment. In addition, you can add a back-ground color.
Margin	Click this button to select the width of the margins around the selected column. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.

Table 281: Format Tab Description (Continued)

Group/Button	Description
Border	The buttons in this group let you add borders to the column and change the borders' display options. You can identify which borders you want and choose the borders' color, size, and style.
Display	The buttons in this group let you apply conditional formatting to the column, change the column's width, freeze the column, and hide repeating values in the column. You can also select other display options for the column.
Conditional Formatting	Click this button to apply conditional formatting to the column's data. Refer to Editing column format options.
Width	Click this button to select a width for the column. Select Best Fit to automatically set the width based on the amount of space needed to display the column's contents. Best Fit also takes into account the width needed by other columns in the report. Select Percentage to specify a percentage of the total report width for the column.
Freeze Column	Click this button to fix the selected column in place so it does not move when you horizontally scroll the report. This can be helpful if you want to continue to view the first column in the report while scrolling the report to see the columns on the right of the report. **Note:** When you fix a column, all columns to the left of the column are also fixed. You can still scroll the columns to the right of the fixed column.
Hide Repeating	Click this button to hide consecutive repeating values in the column. For example, if the name of a staff member is shown in the column in five consecutive rows, you can hide repeating values to show the name in only the first column. **Note:** If the Exclude Hidden Values from Calculations check box is selected on the Column Format window's Alignment tab, any calculations on a column with the Hide Repeating option enabled do not include values in hidden rows. Refer to Editing column format options.
Options	Click this button to select display options for the column. Refer to Editing column format options.

Table 281: Format Tab Description (Continued)

Group/Button	Description
Number	The options in this group let you display numeric values as a gauge and select numeric formats. Refer to Editing column format options. **Note:** This group displays when selecting a column containing numeric values.
Date	The options in this group let you select a date format for the column and view the format. Refer to Editing column format options. **Note:** This group displays when selecting a column containing date/time data.

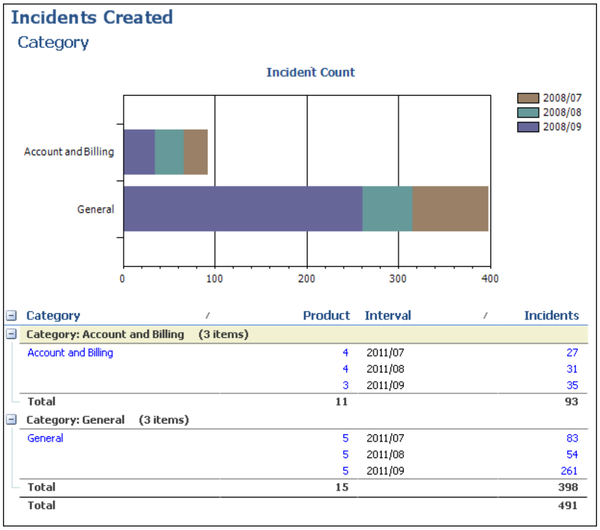
Drilling down in reports

The drill-down feature lets you click data in a report to open another report, dashboard, or output level to view information related to that shown in the first report or output level. For example, if you have a report displaying contacts and the number of incidents they have submitted, you can add a report link to the column showing the number of incidents. When you click the number of incidents on one of the report's rows, another report opens showing details about the contact's incidents.

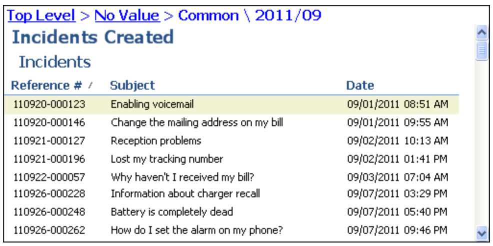
Drilling down to open another output level in the same report is similar to drilling down to open another report. For instance, the first level of the standard Incidents by Category report displays category names and the number of incidents in each category grouped by date range. By clicking a category name in the report's chart or tabular data, you can drill down on the category to open a new level showing the number of incidents in each sub-category. You can then drill down on each sub-category to open an additional level showing details about the incidents in the sub-category.

Tip By default, each time you drill down into another output level in a report, the database is queried to ensure the most current data is displayed even if you have already viewed the output level. However, this can take extra time and may be unnecessary when viewing reports with data that does not change frequently. To more quickly load report output levels you have already viewed, you can cache the data shown in each level. Refer to Changing report properties.

To drill down into a report, click the highlighted link shown on the row you want to drill down into. The Incidents Created by Category report has drill-down links in the Product and Incidents columns.



Clicking a link in the Product column opens another output level that shows the number of incidents submitted by product name. Clicking a link in the Incidents column opens another level showing details about the incidents.



By default, output levels opened from drill-down links replace the parent output level on the content pane. You navigate back to other output levels, including the report's top level, by clicking the level you want at the top of the report. Drill-down levels, reports, and dashboards opened from drill-down links can also be configured to display separately from the parent report.

For information about adding output levels to custom reports, refer to Adding additional output levels. For information about adding links to other reports or dashboards to a report, refer to Linking reports.

Searching in reports

You search for specific records in reports from the Search window. You can open the Search window from the report's Home tab. This window also opens automatically when the report includes required **run-time filters** or when the Open Report Without Prompting for Search Parameters report option is not selected. Refer to Changing report properties.

The options available when searching for information consist of the run-time filters, output **variables**, sorting options, and other search parameters added when the reports are created or edited. You can modify the layout of these options on the window and save the layout for later use (refer to Customizing the Search window). The search parameters are specific to each report, though many reports share similar filters and output variables. While most search parameters need little or no explanation, some are unique and require additional explanation.

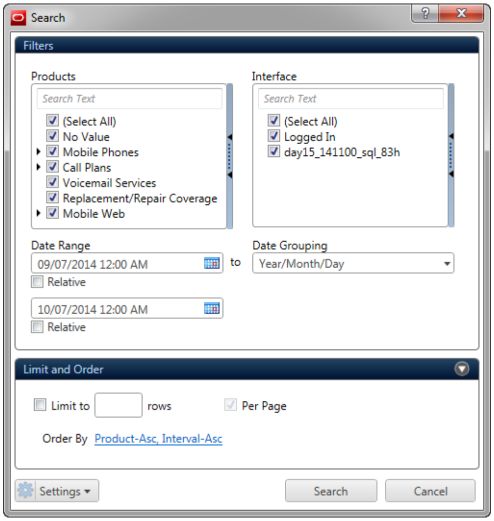
After you perform a search, you may find that the data does not include information from the current day. Certain database tables contain cached data that is updated nightly. Refer to Using cached data.

Important Reports are intended to output only the information you need to view or access for a specific purpose. We recommend that you configure custom reports to include fixed filters or required run-time selectable filters to limit the data they can return. Refer to Specifying filters.

After generating the report using the search criteria you want, you can quickly locate specific content displayed in the report using the Find feature. Refer to Finding content in reports.

To search for records in a report

1. Open the report you want to search in.
2. Click the Home tab.
3. Click the Search button to open the Search window.



4 To change the layout of the Search window, including the sizes and ordering of filters and variables, you need to switch to Search Design Mode.

a Click the Gear button next to Settings.

Or

Click Settings and select Enter Search Design Mode.

b Edit the layout as described in Customizing the Search window.

c Click the Set as Default Layout button to exit Search Design mode and save the layout to your computer.

When you view the Search window when you next open the same report from your computer, the window uses the layout you saved.

d To restore the default layout, click Settings and select Restore Default Layout.

5 To resize the Search window, drag the borders. The window size is saved to your **personal settings** so it will open with the size you specify the next time you open the window when running the same report.

6 Select the filters, sort options, and record limit for the report.

Note Search options often include date range filters and date grouping output variables. Refer to Selecting date ranges and Date grouping output variables.

The options available on the Search window are described in the following table.

Table 282: Search Window Description

Field	Description
Filters	This section displays the report's run-time selectable filters. The methods used to set the filter values vary depending on the filters' data types and operators. For example, the values might be multi-selected from menu lists, specified in date fields, or typed in a text field. Text area fields are not available for use in report filters. Refer to Creating report filters. This section also lists output variables that have been added to the report. Output variables can have the same types of selection methods as run-time selectable filters. Refer to Variables. **Note:** If the filter or variable displays a menu list, you can select all options in the list by selecting the Select All check box, or you can clear all options in the list by clearing the Select All check box. To quickly locate specific values in menu lists, type the first few letters of the value you want in the filter's Search Text field. To view the menu options you have selected from a long menu list, click the splitter bar to the right of the list.
Limit and Order	Options in this section let you limit the number of rows returned in the report and select how the report output should be sorted.
Limit To	Select this check box to limit the number of rows returned on each page of the report's output level or on the entire output level. Limiting the total number of records returned on the output levels prevents reports from returning more records than can be easily viewed or printed. **Note:** The VRL_HARD configuration setting sets a hard limit on the number of rows that can be returned in a report. Values entered in the Limit To field that exceed this are ignored. Refer to Analytics Configuration Settings for information about VRL_HARD and other configuration settings that can impact reports.
Rows	Type the number of rows that should be returned.
Per Page	Select this check box to change the number entered in the Rows text box from a hard limit on the total number of rows returned in the report to a limit on the number of rows returned on each page of the report.

Table 282: Search Window Description (Continued)

Field	Description
Order By	Click the current sort order fields to open the Sort window where you can select different sort options. The report's default sort order is displayed with the primary sort field listed first, followed by any subsequent sort fields. The direction each sort field is ordered in is also indicated (Asc for ascending order and Desc for descending order). Refer to Changing sort options.

7 To save the filter values you select to the **local settings** on your workstation, click Settings and select Save as Default Values. These saved values are used as the defaults when you run the report again when you are logged in with the same staff account.

The default values are overwritten if you select different values and click this button again. If the report is later edited to change filters, the default filter values stored in your local settings are ignored.

8 To restore the search values to the report's default search values, click Settings and select Restore Default Values. This deletes saved search values from personal settings.

This button is disabled if the report's current search parameters were not populated from your personal settings. Refer to Changing your personal settings.

9 To reset the search parameters' values to the default values that were populated when the report was opened, click Settings and select Reset Values.

10 To close the Search window without saving your changes, click the Cancel button.

11 Click the Search button to search the report with the search parameters you selected.

Unique search parameters

While most of the filters and variables you see on the Search window are self-explanatory, there are some unique search parameters that may require more information to use correctly. For information about adding filters and variables to custom reports, refer to Creating report filters and Variables.

Selecting date ranges

Most of the Oracle RightNow Analytics Cloud Service (Analytics) standard reports include **run-time filters** created from date/time fields that allow you to select a time and date range on which to filter the report's data. (Date ranges between January 1, 1901 and January 17, 2038 are supported.) Which records are included in the time period depend on the type of report. For example, the Incident Activity report includes the Date Created run-time filter, which you can use to display incidents created during a particular date range.

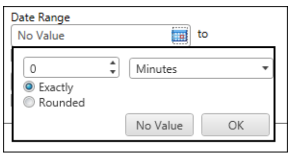
You have several options when selecting a date range. For example, you can select whether you want to use exact dates, a period of time relative to today's date, or even the current time. When the Relative check box is cleared, you can type in a specific date and time, or click the calendar next to the date and time to view a calendar and select a specific date. By selecting the Relative check box, you can define relative times to search on, such as the previous three months, instead of absolute times.

Note The Time Zone report option can be used to change the time zone reflected in the dates and times shown in a report's filters and output columns. By default, the time zone of the interface is used. Refer to Changing report properties.

To select a relative date range in report run-time filters

1 Select the Relative check box on the Search window to toggle from a specific date to a relative date.

2 Click the calendar to display the relative options.



3 Enter the following field information.

Table 283: Relative Date Range Description

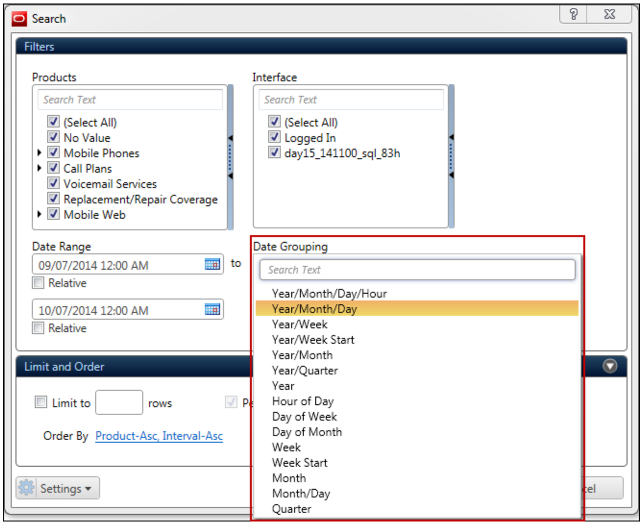
Field	Description
Offset By	Enter the number of time units to use in this field. Values can be positive or negative. For example, use negative values to report on a date range of 6 months ago to 1 month ago.
Time Units	Select the time unit to use from this drop-down menu. The available options are Minutes, Hours, Days, Weeks, Months, Quarters, and Years.
Exactly	Select this radio button to use the exact time period entered. For example, if you run a report at noon on a Wednesday that returns records created from exactly one week ago to the current day, the report returns records created between noon on Wednesday of the previous week and the current day.
Rounded to Beginning of Time Period	Select this radio button to round the selected time period to the beginning of the time period. For example, if you run a report on a Wednesday that returns records created from one week ago rounded to the current day, the report returns records created between 12:01 A.M. on Sunday of the previous week and the current day.

4 Click the OK button to save the relative date period you want to search on.

Date grouping output variables

While most options on the Search window are run-time selectable filters, which limit the returned data, date grouping options are output variables that group the report's data by the time period in which a specified event occurred. This output variable can be added to custom reports and is frequently used in standard reports.

For example, the Agent Activity standard report displays incidents that were assigned to staff members within a certain time range. The default time range is Year/Month/Day, so a row is displayed for each day in the selected date range listing the number of incidents assigned to the agent per day. However, you can select from the options on the Date Grouping menu to group the data by a different time period, such as week or quarter.



Note When date groupings are shown in the report's output, they display as the number associated with the time period. Selecting Year/Week, for instance, displays the year followed by the number of the week (*2015/23*). However, the display format of grouped date columns can be changed with the Group Date Format configuration settings, located at Configuration > Site Configuration > Configuration Settings, in the RightNow Common folder. Refer to Working with the Configuration Settings editor and Analytics Configuration Settings for descriptions of the configuration settings that impact reports.

Incident performance intervals

Incident performance intervals are used as run-time selectable filters in several standard Oracle RightNow Cloud Service (Service) reports, and can be added as filters or output columns to custom reports, using the Incident Performance (*inc_performance*) table. Refer to Creating report filters and Adding columns to reports. Incident performance intervals help you track the length of time between events that occur in the life of an incident. For example, the Create to Initial Response interval tracks the time between the incident's creation and when the first incident response was sent. There are several types of intervals, some of which can overlap others.

Important The content in the Incident Performance (*inc_performance*) table is updated nightly by the **Agedatabase** utility. Refer to Using cached data.

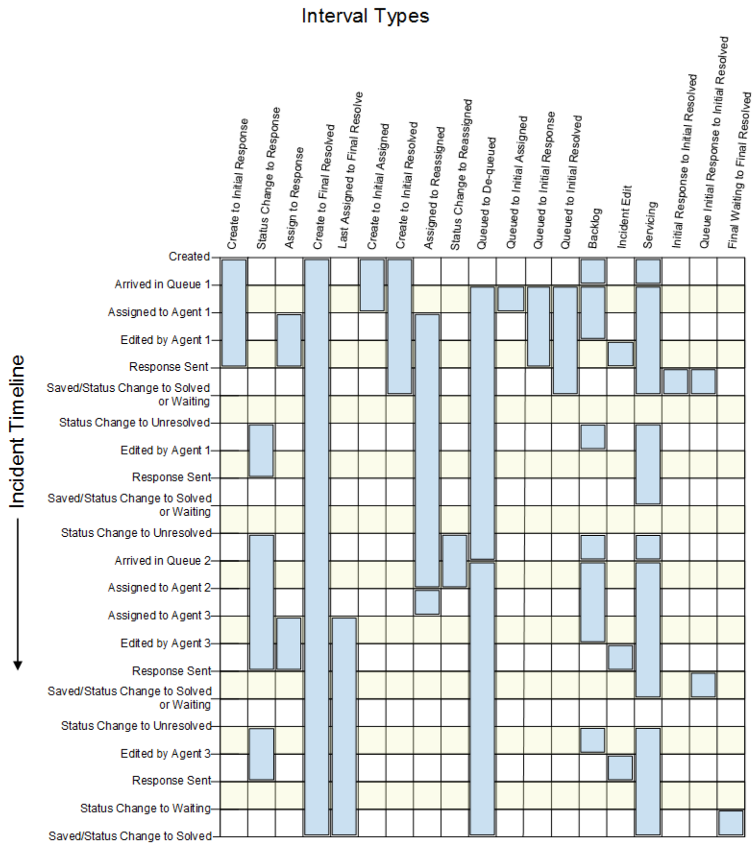
Some intervals can occur more than once in the life of an incident. For instance, the Assign to Response interval records the time between an incident being assigned to an agent and the agent sending a response to the incident. If the incident is assigned to and responded to by several agents, several instances of this interval are recorded for the incident.

The following incident performance intervals are available for use in reports:

- **Create to Initial Response**—Measures the interval between the creation of the incident and the first incident response being sent from an agent.
- **Status Change to Response**—Measures the interval between an incident's **status type** being changed from Waiting or Solved and being set to Unresolved.
- **Assign to Response**—Measures the interval between an incident being assigned to an agent and the first response following the assignment.
- **Create to Final Resolved**—Measures the interval between the creation of the incident and the last time the incident was set to the Solved status type.
- **Last Assigned to Final Resolve**—Measures the interval between the last time the incident was assigned and the last time the incident was set to the Solved status type.
- **Create to Initial Assigned**—Measures the interval between the creation of the incident and the first time the incident was assigned to an agent.
- **Create to Initial Resolved**—Measures the interval between the creation of the incident and the first time the incident was set to the Solved status type.
- **Assigned to Reassigned**—Measures the interval between the incident being assigned to an agent and the incident being assigned to a different agent or to no agent.
- **Status Change to Reassigned**—Measures the interval between the incident being changed from a Waiting or Solved status type to Unresolved and the incident being reassigned to another agent.
- **Queued to De-queued**—Measures the interval between the time an incident enters a **queue** to the time the incident is moved to no queue or a different queue. If the incident's queue does not change, the interval ends when the incident is set to the Solved status type.

- **Queued to Initial Assigned**—Measures the interval between an incident being placed in a queue and the incident being assigned to an agent for the first time.
- **Queued to Initial Response**—Measures the interval between an incident being placed in a queue and being responded to for the first time.
- **Queued to Initial Resolved**—Measures the interval between an incident being placed in a queue and being set to the Solved status type for the first time.
- **Backlog**—Measures the interval between an incident being created, or being changed from the Waiting or Solved status type to the Unresolved status type, or being added to a queue, to the incident being edited (with the edit saved).
- **Incident Edit**—Measures the interval between an incident being edited and the edit being saved.
- **Servicing**—Measures the interval between an incident being created, added to a queue, or changed from the Waiting or Solved status type to the Unresolved status type, to the incident being set to the Waiting or Solved status type or being added to a different queue.
- **Initial Response to Initial Resolved**—Measures the interval between the incident first being responded to and first being set to the Solved status type.
- **Queue Initial Response to Initial Resolved**—Measures the interval between the time an incident that is assigned to a queue is responded to and the time the incident is set to the Solved status type, while in the same queue.
- **Final Waiting to Final Resolved**—Measures the interval between the last time an incident is set to the Waiting status type and the last time the incident is set to the Solved status type.

The following graphic shows the incident performance intervals.



First Contact Resolution Rate

The First Contact Resolution Rate (FCRR) is used in several standard Service reports and can be included in custom reports. This calculation can be used to search by or display the percentage of incidents that were resolved after only one response. To use the FCRR correctly, it is important that you understand how the result is derived.

The FCRR is calculated by taking the number of incidents solved after one response by the agent and dividing this number by the number of incidents that were solved after one or more responses. To ensure your agents' performance is reflected in the FCRR, some incidents and responses are not included in the calculation. If an incident is solved without any responses sent, the incident is not included. In addition, responses automatically appended by rules are not included. If an incident is responded to by a staff member and is then reassigned, only the responses sent by the agent who solved the incident are included.

Using cached data

Some standard reports return data compiled during previous time periods, and you can create custom reports that use data from tables that store this cached information. Reports that use cached data can query a large amount of information in a short amount of time since cached data is stored in only a few database tables. Reports that use cached data are often designed to compare data from one time period to another, such as comparing sales figures from one quarter to another. Before you analyze data returned in reports, it is beneficial to understand how using cached data can affect your reports.

Agedatabase caching

Most cached data is compiled by the **Agedatabase** utility. This utility runs nightly to cache data to prepare for the following day's reporting needs. Cached data remains constant throughout the day and is not updated until the next day, after Agedatabase has compiled the information. For this reason, reports using cached data do not include data for the current day. Understanding which reports use cached data will help you accurately interpret your reports' results. If you view the report definition for the report you want to run and see that the report includes a database table that stores cached data, you know the report uses cached information and may not include data from the current day. Refer to Viewing and exporting report definitions. Information about specific tables that store data compiled by the Agedatabase utility can be found on our support site.

Dataminer caching

Some cached data is compiled by the Dataminer utility instead of the Agedatabase utility. By default, the Dataminer utility runs every four hours or as specified in the VISIT_MAX_TIME configuration setting. Refer to Customizing configuration settings.

Important We do not recommend changing configuration settings unless necessary. Changes made to configuration settings can greatly impact the performance and functionality of your entire site. Before you change any configuration setting, it is important that your organization understands the impact of changing the setting.

The data in the following fields is compiled by the Dataminer utility.

- Answers.Score (*answers.solved_count*)
- All fields in Answer Stats (*ans_stats*) table
- All fields in the Links (*links*) table
- Stats.# Answers Viewed (*stats.ans_viewed*)

- Stats.# Answer Searches (*stats.searches*)
- Stats.Visitor Actions (*stats.hits*)

Information in reports that use these tables or fields is only as current as the last time the Dataminer utility ran.

Finding content in reports

You can search for specific text, numeric values, or special characters in the content displayed in a report using the Find feature. Cells on the report page currently being viewed that contain the values you searched for are highlighted. Content on other pages or drill-down levels in the report must be searched separately.

To find content in a report

1 Open the report you want to find content in.

2 Click the Home tab.

3 Click the Find button on the ribbon to open the Find window.

4 Type the search value you want to find in the report in the Find Text field.

5 To highlight cells in the report only if the content matches the case you use in the search value, select the Match Case check box.

6 To highlight cells in the report only if the cell content exactly matches the search value you enter in the Find Text field, select the Match Entire Cell Contents check box.

7 Click the Find Next button to close the Find window and highlight the first cell in the report that matches the search value you entered.

Or

Click the Find All button to close the window and highlight all the cells in the report that match the search value you entered.

8 To find the next instance of the search value without opening the Find window, click the Find button on the ribbon's Home tab.

9 To clear the search value you entered without opening the Find window, click the Clear button on the ribbon's Home tab.

Queuing reports

Reports, whether opened individually or in dashboards, can take a long time to run if their database queries attempt to query a large amount of information. However, you can queue reports with intense queries so you can continue to work on the **administration interface** while the reports run in the background. When the queued reports have been run, you can open them and immediately view their data.

You can manually queue reports that you think may take a long while to run or that you want to view at a later time. If the application determines that a report will take an excessive amount of time to run, which can result in unnecessary load on your database, you are given the option to queue the report using the report's current search parameters. If you choose not to queue the report, you can select more restrictive search parameters for your report and try to run it again.

Important Reports that attempt to query too many rows in the database will not run. If you queue such a report, the server will still not be able to process it. We recommend using more restrictive filters, removing unnecessary tables, and using inner table joins to allow such reports to run.

If you need a report to return a large amount of information, we recommend that you queue it using the Download Queued Report Results as a CSV File option. This lets you send up to 100MB of data to a comma-separated values (CSV) file. You can then open the file using an external application.

If your site is configured to use a **report database** (also referred to as a replication database) for reporting purposes, queuing works somewhat differently than it does on sites without a report database. Refer to Queuing and report databases.

Manual queuing

You can queue reports or dashboards that you think may query or return large amounts of data. This is also helpful if you want to view a number of reports but do not want to wait for each to generate.

To manually queue a report or dashboard

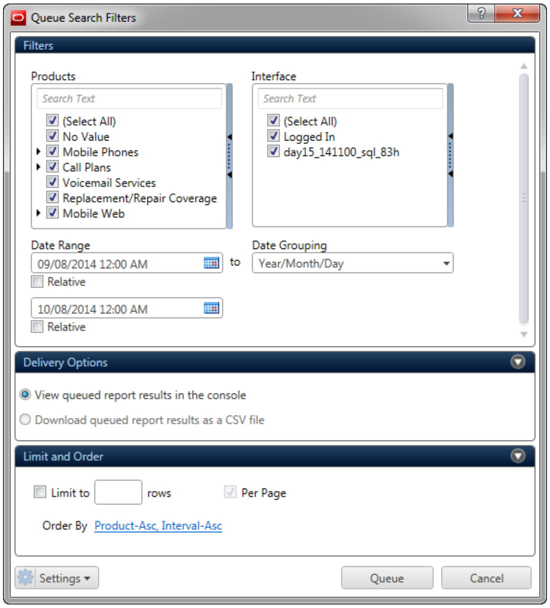
1 Select the report or dashboard on the Reports explorer and click the ribbon's Queue button.

Or

Right-click the report or dashboard, either on the Reports explorer or the navigation list, and select Queue.

Note You can also require dashboards and reports to be queued when they are run by enabling the Set Report to Deferred Execution option. Refer to [Changing report properties](#).

The Queue Search Filters window opens where you specify the search parameters you want to use for the queued report.



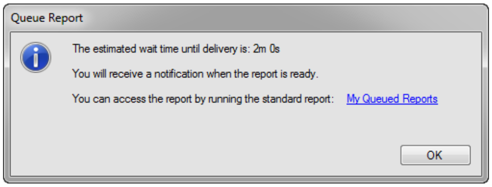
2 Enter the search parameters you want to use. For information about specifying search parameters, refer to [Searching in reports](#).

3 To send the report output to a CSV file instead of to the console, select the Download Queued Report Results as a CSV File radio button. This lets you send up to 100MB of data to a CSV file. Without this option, reports can return up to 10,000 rows of data. After the queued report is generated, you can select a location to save the file to and then open it using an external application. This option is not available when queueing dashboards.

Note This option is not available for all reports since not all reports are appropriate for CSV output. The following restrictions apply.

- The report cannot contain custom scripts.
- The report cannot contain comparison columns.
- The report cannot contain date grouping columns.
- The report's rows must return unique records, such as information about specific incidents, answers, or contacts.
- The first column in the report must be sorted in ascending order and must output data stored in a primary key database column. For instance, the first column could output incident ID numbers or contact ID numbers, and be sorted in ascending order. This restriction helps the data queries more quickly process reports since they use primary keys.

4 Click the Queue button. A message displays an approximation of when the report or dashboard will be generated.



Note The time displayed is an approximation of how long it will take to process the queued report or dashboard. However, if there are other reports or dashboards in the queue, it can take longer than the displayed time to process your queued report or dashboard.

5 Click the OK button to close the window.

For information about viewing reports in the queue and opening queued reports that have processed, refer to Viewing queued reports.

Automatic queuing

When you attempt to open a report, the database query for the report is checked. If the system determines that the query will likely take too long to process, the Unable to Process Report window displays, asking if you want to queue the report. If you want to attempt to run the report using different search parameters, click the Cancel button and the report's Search window will open. If you want to queue the report using the search parameters you selected when you attempted to run the report, click the OK button. If you do so, a message displays an estimate of how long it should take to process the report, just as if you had manually queued the report.

Note Reports that are displayed on workspaces or previewed on the report designer are never queued. If it is determined such a report will take too long to generate, the report is not displayed.

Preventing automatic queuing

Once a report is automatically queued, it is queued every time it is run thereafter, since it is assumed the report's filters and data set result in long run times.

Tip To view reports that will be automatically queued when they are next run, you can run the Deferred Reports standard report. This report is located in the Reports explorer's Common > Site Administration > Reports folder.

If you have a report that is set to be queued, you can prevent it from being automatically queued when it is next run. However, you will still be asked to queue the report when you next run it if the report meets queuing criteria. Refer to To change queuing and data source options for a standard report for information about preventing automatic queuing for a standard report or Changing report properties for information about changing queuing options for a custom report.

Tip When you change queuing options for a custom report, we recommend that you also review the report's fixed filters and table joins to determine if the amount of data the report examines can be reduced to allow it to run more quickly.

Queuing failures

It is possible that a report you queue will not run successfully. There are several reasons why this might happen.

- You already queued the report using the same search parameters and the first queued report has not yet run.
- The original report you queued was deleted after you queued it and before the queued report could be processed.
- The report is deleted from the queue by another staff member before the report can run and you can view it. However, only the staff member who queues the report and staff members with the Analytics Administrator profile permission can remove reports from the queue.
- The queued report processes, but is not opened within the number of days specified in the PURGE_QUEUED_REPORT_DAYS configuration setting. Queued reports and dashboards that have been run but not opened within this time period are automatically removed. The default value for this configuration setting is seven days.
- You manually queue a report or dashboard that cannot run due to the query surpassing a limit on the number of database rows that can be accessed.

Notifications for queued reports that fail to run include information about the cause of the failure. If the recipient has permission to edit the report that failed, links to the report analyzer are also included. Refer to Examining reports with the report analyzer.

Viewing queued reports

After you queue a report, you can use standard reports to see what the report's status is in the queue. Once the report runs and is ready to view, you are notified and you can open it from several locations. When you view the report, you will see that most of the standard options are available on the report's ribbon, though there are some exceptions.

Viewing reports in the queue

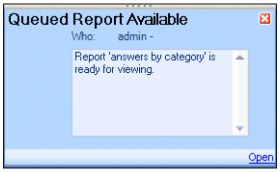
When you queue a report, it is placed in a queue where it will be processed by the server. If there are other reports in the queue that have not yet been processed, your report will be placed at the end of the queue. You can see the reports that are in the queue using the My Queued Reports and Reports Waiting in Queue standard reports, located in the Reports explorer's Public Reports > Common > Site Administration > Reports folder.

- **Reports Waiting in Queue**—This report shows you all the reports that are in the queue waiting to be processed, regardless of who queued the report. Staff members with the Analytics Administrator profile permission can remove reports from the queue using this report if necessary.
- **My Queued Reports**—This report shows you the reports you have queued and not yet viewed. When you view this report, you will see that queued reports can be in one of three states:

- **Waiting**—Reports in this state are waiting to be run on the server. You can remove reports from the queue that are in this state.
- **Processing**—Reports in this state are currently being run on the server. You cannot remove reports from the queue that are in this state.
- **Complete**—Reports in this state have been run on the server and are ready to view. You can remove reports from the queue that are in this state without viewing them.

Opening queued reports

When the database server has run a queued report and it is ready to view, you will receive a message in a toast notification and in your list of notifications. An example of a toast notification is shown here. Refer to Opening your notifications.



To view the report, click Open on the toast notification or double-click the notification in your notifications list. The report opens on the content pane. You can also open reports you queued from the My Queued Reports standard report.

When you open a queued report that was sent to a CSV file, the Save As window opens where you can select a location to save the CSV file. You can then use an external application to view the contents of the file. Refer to Manual queuing.

Important Once a queued report is processed, you have a default of seven days to view it. Reports older than the time period specified in the PURGE_QUEUED_REPORT_DAYS configuration setting are deleted from the list of processed reports by the **Agedatabase** utility. For information about this and other configuration settings that impact reports, refer to Analytics Configuration Settings.

Using queued reports

When you open a report that you queued, it displays and functions just like a report that has not been queued, letting you print the report, change display options, open records from the report, and view drill-down levels.

Note The queries used to return data in drill-down levels are not queued when you queue a report. If your report includes drill-down levels, the queries are run on the server when you open the drill-down levels.

However, some of the standard features you see in reports are not available when viewing a report that was queued. Docked filters are not displayed and the report does not include the optional Action column that shows links such as Open and Delete. In addition, you do not have access to the Search, Refresh, Reset, Definition, and Links buttons on the ribbon.

Note You can view the output from a queued report as many times as you want. However, it is important to remember that the output is static. If you need current information from the report, you need to run or queue the report again.

Report databases

Most Oracle Service Cloud sites have a copy of their database, called a report database, available for reporting purposes. (Report databases are also referred to as replication databases.) Running reports on this database is generally faster than running reports on the operational database where normal activities, such as adding and editing incidents, occur. In addition, since report databases are used only for reporting, they have higher thresholds on the amount of time reports are allowed to run and the number of database rows reports are allowed to query.

Note Reports that you attempt to run on the report database can still encounter limits on the number of database rows that can be queried, though the row limits are considerably higher than those on the operational database.

A report that does not run successfully on your operational database may run successfully on your report database. However, since the data on report databases is copied from the operational database at fixed times, the data displayed on reports run on report databases may not be as current as the data shown on reports run on operational databases.

Specifying the preferred database

By default, reports are configured to run on the operational database although they can automatically switch to the report database (also referred to as the replication database) if they cannot run on the operational database. When you attempt to run a report, the database query generated by the report is automatically reviewed. If it is determined that the query will take longer than 10 seconds to run or if it will query more than 2,000,000 database rows, the report automatically runs on the report database, where reports are allowed to query 5,000,000 rows.

Important When reports are run from editors, such as the incidents editor or the Quick Search menu, they run on the operational database regardless of the reports' configuration. In addition, reports that include the Fill Inbox record command always run on the operational database. Refer to Customizing record commands.

Once a report is modified, either manually or automatically, to run on the report database, it will continue to do so unless you edit the report and specify that it runs on the operational database. You can also specify that the report always runs on the database you select to avoid the report automatically changing to run on a different database. You can also require that the report is queued or not queued when it is next run. The following procedure describes how to change these settings on a standard report. To change these settings on a custom report, open the report's Edit Settings window on the report design center. Refer to Changing report properties.

Note The Administrator Analytics profile permission is required to modify these settings on a standard report. Refer to Analytics permissions.

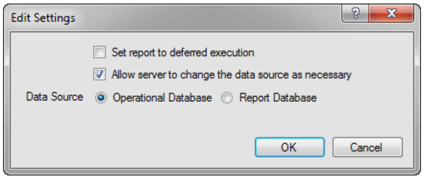
To change queuing and data source options for a standard report

1 Click the Analytics button on the navigation pane.

2 Double-click Reports Explorer.

3 Navigate to the standard report you want to modify, right-click the report, and select Edit.

4 Click the More Options button at the bottom of the console. The Edit Settings window opens.



5 To require the report to be queued when it is next run, select the Set Report to Deferred Execution check box. Refer to Automatic queuing.

Important If this option is not selected but the report is automatically queued the next time it is run due to meeting queuing criteria, the Set Report to Deferred Execution check box is selected automatically. Clear this check box to prevent the report from being automatically queued when it is next run. However, even when this check box is cleared, you will still be asked to queue the report when you next run it if the report meets queuing criteria.

6 Select the database you want the report to run on.

Note This option is available only if your site has a report database. If your site does not have a report database, contact your Oracle account manager.

a To run the report on the report database, select the Report Database radio button. This option is helpful if your report queries a large amount of data since the query size restrictions on report databases are more relaxed than those on operational databases.

b To run the report on the operational database, select the Operational Database radio button. This option is helpful if you need the report to return the most current data available.

7 Click the OK button to save your changes and close the Edit Settings window.

8 Click the Save and Close button on the ribbon to save the changes to the standard report.

Queuing and report databases

Since sites with report databases (also referred to as replication databases) have increased options available for running reports, queuing works slightly different on those sites. If your site has a report database, keep the following considerations in mind when queuing reports.

- Any reports you queue automatically run on the report database unless the report is configured to always run on the operational database. You can select this option when editing the report. Refer to Changing report properties.
- If a report is to be run on the report database and it is determined it will take longer than sixty seconds to run the report's query, you are given the option to queue the report. If you choose not to queue the report, you can attempt to run it again using different search parameters. Refer to Searching in reports.

Distributing reports and dashboards

After you open a report or dashboard, you can print it, forward it to an email address, **publish** it to your folder list, or export the data to be used in an external application. You can also schedule reports and dashboards to be published or emailed at specified times, or when specified data conditions are met. If you have another **interface** and want to create a copy of your report or dashboard on the other interface, you can also export the definition and import it on the other interface.

Important Before you can print, export, or forward reports or dashboards, the Print/Export/Forward Reports permission must be enabled in your profile. Refer to Analytics permissions.

Modifications made to distributed reports

When reports and dashboards are exported, forwarded, printed, published, or sent at a scheduled time, certain changes are made to ensure that they display correctly. Reports and dashboards you open outside Oracle Service Cloud may not display exactly as they do when viewed within the application.

- Drill-down links to other reports, dashboards, or report levels are disabled in distributed reports. Refer to Adding additional output levels for information about drilling down into report levels and Linking reports for information about drilling down into other reports or dashboards.

Important If your report includes multiple output levels, drill down to the information you want to display in the distributed report before you export, forward, or publish it.

- If the report includes the Links column, which contains links to modify the report's records, the column is not shown on the report.

- If the report's width is set to Fit in Window, the report is shown using the Best Fit width setting. Click here for descriptions of these settings.
- Reports shown in the record layout are by default converted to tabular layout when they are exported or scheduled in an Excel format. This ensures that the report's data can be easily read in a column and row format. Refer to Selecting record or tabular layouts for information about layouts.
- If the report lacks a report header or has a blank header, a header containing the report's name is added to the report.
- If the width of a report column is set to a percentage of the report's width, and the report's width is not fixed, the column's width setting is changed to Best Fit. Refer to Editing columns for information about column width settings.
- Forwarded and scheduled reports sent in an HTML format use a relative layout instead of an absolute layout. This ensures maximum compatibility with various browsers, but may impact the display of images or charts in the email.
- Paging is disabled for published reports. Refer to Adding page breaks.
- The dates and times displayed in scheduled reports are adjusted for the time zone of the interface they are sent from, but are not adjusted for staff members' time zone settings in their staff accounts. Refer to Adding and editing staff accounts and Scheduling reports.
- Externally hosted images displayed in columns are not available in scheduled reports. Refer to Displaying external images in columns.

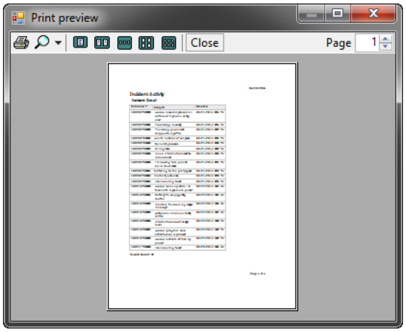
Printing reports

After you run a report, you can preview it to see how it will look on a printed page and then send it to a printer. When previewing a report, you can zoom in and out of the displayed page, view multiple pages, and specify how the pages should display in the preview window. Before you print the report, you can specify print options, including paper size, margin width, and page orientation.

To preview a report

1 Open the report you want to preview.

2 Click **File** and select Print > Print Preview. The Print Preview window opens.



3 Select from the following options.

Table 284: Print Preview Window Description

Field	Description
Print	Click this button to send the report to the printer.
Zoom	Click the down arrow to select the desired zoom percentage and preview the report with the selected zoom level. Click the magnifying glass to reset the zoom level to the default percentage.
Page Buttons	Click these buttons to view one, two, three, four, or six pages of the report on the Print Preview window. These options do not modify the final printout.
Close	Click this button to close the Print Preview window without printing the report.
Page	Select the page number to view on the Print Preview window, either by typing the page number or by scrolling through the available page numbers with the arrows.

To print a report

1 Open the report you want to print and click the Page Setup tab.

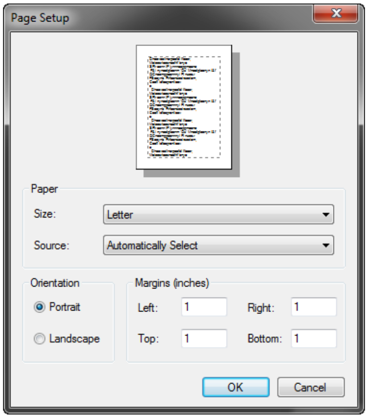
2 To automatically scale the report to your printer's default page width, select the Print to Fit check box.

3 To specify page setup options, such as page margins, click the button to the right of the Print group name to open the Page Setup window where you can set printing options.

Or

Select printing options from the Page Setup tab's Print group. Click here for option descriptions.

Tip If you know the specific options you want, it can be faster to select them from the ribbon. Opening the window gives you an overview of all the available options.



a Enter the following field information.

Table 285: Page Setup Window Description

Field	Description
Paper	This section contains options for selecting paper size and source.
Size	Click the appropriate paper size for the report from this drop-down menu. The available paper sizes depend on your selected printer.
Source	Click the paper source from this drop-down menu. The available paper sources are dependent on the printer that is currently selected.

Table 285: Page Setup Window Description (Continued)

Field	Description
Orientation	Select whether the report should be printed in landscape or portrait mode.
Margins	Define the Left, Right, Top, and Bottom margins for the report. **Note:** The measurement units used for the margin size are determined by your workstation's environment.
Printer	Click this button to select the printer you want to use.

   b Click the OK button to save your page setup settings.

4 Click **File**, select Print, and select your printing preference.

   a Select Print to open your workstation's print window where you can define printer settings and send the report to the printer.

   b Select Quick Print to send the report directly to your default printer using the printer's default settings.

Forwarding reports

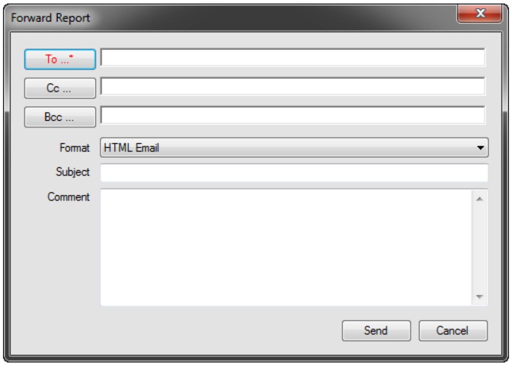
Once you view a standard or custom report, you can immediately forward the report as an HTML email to one or more recipients. You can also forward dashboards using the same procedure. Certain modifications may be apparent when viewing forwarded reports. Refer to Modifications made to distributed reports.

Important Reports can be forwarded as long as the resulting HTML email does not exceed 8 MB.

To forward a report

1 From an open report, click the Home tab.

2 Click the Forward button in the ribbon's Report group to open the Forward Report window.



3 Type one or more email addresses in the To field. Multiple addresses must be separated by semicolons. You can also enter addresses in the Cc field to send copies of the email to other addresses, or enter addresses in the Bcc field to send copies of the email to other addresses that are hidden from the other email recipients.

Or

Click the To, Cc, or Bcc buttons to open the Select Names window. From this window you can add recipient addresses by selecting from a list containing staff members, groups, and distribution lists. Refer to Selecting recipients.

4 Select a format for the forwarded email. The options are HTML Email or HTML Attachment (Images/Charts stored on the server).

Important Not all email clients show HTML emails in the same manner. If email recipients cannot view a forwarded report correctly, select the HTML Attachment (Images/Charts stored on the server) format. Email recipients can then save the image or chart to their hard disk and then open it in a browser. The images and charts used in the email are stored on the server for the number of days specified in the KEEP_EMAILED_IMAGES configuration setting. Refer to Analytics Configuration Settings for information about this and other configuration settings that impact reports.

5 Type a subject for the email.

6 Type any text you want to appear in the email in the Comment text box.

7 Click the Send button to forward the report.

Publishing reports

Publishing a report lets you modify the data and display options of an existing report and then save a copy of the report with these settings which other individuals can then access. Once a report is published, it cannot be modified and the report data remains unchanged even as the knowledge base is updated. This ensures that your audience is presented with the report as you want them to see it.

Published reports can be viewed by staff members who have permissions in their profile. You can change the permissions and published report properties by editing the published report. Refer to Specifying permissions.

Note If the report style the report used when it was published is deleted, a default report style is used when rendering the published report.

The published report appears exactly as it appeared when you published it, with the following exceptions.

- Drill-down links are disabled for report levels and linked reports.
- The report's run-time selectable filters are not available.
- Actions that can be taken on individual records in the report are disabled. Therefore, buttons on the Home tab's Record group are not available, inline editing is disabled, and action links are not displayed.
- Paging is disabled for published reports. Refer to Adding page breaks.
- The Publish option is not available.

You can also automatically publish a report at specific times using the Published format when you schedule a report. Published reports created in this manner are saved in a custom reports folder you select on your site where your audience can access them. If you specify an account or email address when you create the report schedule, a notification or email is sent when the published report is created.

The following procedure describes how to manually publish a report. For information about scheduling a report using the Published format, refer to Scheduling reports.

Tip You can view the published reports you own using the My Published Reports standard report.

To manually publish a report

1 Run the report you want to publish using the same search parameters that you want the published report to use.

2 Click **File** and select Publish to open the Publish As window.

3 Select a directory to store the published report and type the name of the report. The name must be unique.

Tip You can right-click non-standard folders and select New Folder to create a new folder.

4 Click the OK button to save the published version of the report in the location you specified.

Exporting report output

You can export your report's output to be opened in third-party applications. You can choose to export your data in HTML, PDF (Portable Document Format), Excel, XML (Extensible Markup Language), Image, or Delimited formats. You can also export the report output to the clipboard. Dashboards can be exported using the same formats.

Tip If you want to copy the contents from a few cells in your report to another application, you do not need to export the report's data. Instead, you can right-click the cell you want to copy and select Copy Cell to Clipboard. Once the data is on your clipboard, you can copy the data to other applications.

When you export a report, you can choose to export only the information shown on the current page of the report or you can export all the data in the report, up to 100,000 rows.

Note When viewing a report, a maximum of 50,000 characters can be displayed in a single field even if the field contains more characters than this. However, up to 300,000 characters in a field can be exported, though character limitations in third-party applications may still be encountered when viewing the exported report.

The following procedure describes exporting data from reports, but dashboards are exported in the same manner except where noted.

To export report data

1 Run the report to display the data you want to export.

2 Click the Home tab.

3 Click the Export button to display a menu containing export options.

4 Select from the options described in the following table.

Important Reports that are exported and opened in third-party applications are subject to the functionality of those applications. We recommend that you review the version of your application to ensure it supports current functionality. Refer to your software's user manual for information about configuring your application.

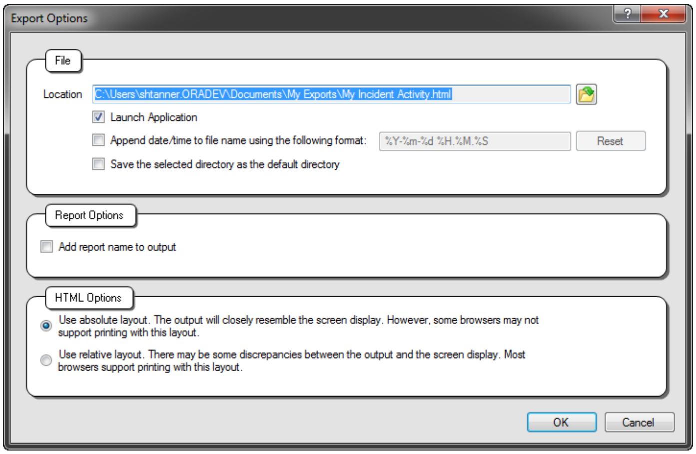
Table 286: Export Format Options

Field	Description
HTML	This option exports the data to an HTML-encoded document, which is compatible with exporting images and charts. Reports can be exported using absolute or relative HTML layouts. Click here for descriptions of export options.
PDF	This option exports the report data as a PDF file, which is compatible with exporting images and charts. When you select this option, you can choose to set the file's page width automatically or use the options on the Page Setup window.
Excel	This option exports the report data in Microsoft Excel format. **Note:** When exporting in this format, the version of Microsoft Excel installed on your workstation is automatically checked and the report is exported as an *.xls* or *.xlsx* file depending on the version.
XML	This option exports the report data in XML format.
Image	This option exports the report data to a *.jpg* image file, which is compatible with exporting images and charts.

Table 286: Export Format Options (Continued)

Field	Description
Clipboard	This option exports the report data to the workstation's clipboard. The data can be exported to the clipboard in HTML, Tab Delimited, or Comma Delimited formats. Once the data is on the clipboard, it can be copied to other applications.
Delimited	This option exports the data to a character-delimited file. When you select this option, the Delimiter Selection window opens, where you can specify the character you want to use as the delimiter. You can choose Comma, Space, Tab, Pipe, Caret, or a custom delimiter you select. The delimited format is intended for use with tabular data only.

When you select a format (with the exception of the Clipboard format), the Export Options window opens where you can specify the file name and location you want for the exported report, whether to include the report name, and whether all the report's data should be returned or only data shown on the current page. The HTML, PDF, and custom delimiter export options include additional export options. The Export Options window for an HTML export is shown in the following figure.



5 Select from the options described in the following table.

Table 287: Export Options Window Description

Field	Description
Location	This field displays the location and file name the exported report is saved to. When the Export Options window is initially opened, a default directory location and file name is displayed.
Save to Folder	Click this button to open the Save As window if you want to specify an alternate location or file name for the exported report.
Launch Application	Select this check box to automatically launch the application associated with the exported report's file type when you close the Export Options window. **Note:** If you are exporting a large amount of data, you may want to clear this check box to prevent the application from attempting to immediately open when you export the report.
Append Date/Time to File Name	Select this check box to append a date/time stamp to the file name that shows when the export file is generated. The date/time stamp is appended to the end of the file name before the file name extension.
Date/Time Format	Type the format you want to use for the date/time stamp you append to the export file name. The default format is `%Y-%m-%d %H.%M.%S`. This creates a date/time stamp with the year listed first, followed by the month, day, hour, minute, and second (such as `2012-02-25 09.43.30`). The format you specify is automatically saved to your personal settings so this becomes your default format the next time you export a report. Refer to Date and Time Format Tokens.
Reset	Click this button to reset the date/time format to the default format (`%Y-%m-%d %H.%M.%S`).
Save the Selected Directory as the Default Directory	Select this check box to make the folder you specify your default export directory. Selecting this check box saves the folder name to your personal settings so future exports are saved to the specified folder.

Table 287: Export Options Window Description (Continued)

Field	Description
Add Report Name to Output	Select this check box to include the report's name in the export file. **Note:** This option is not available when exporting dashboards. Report names display in exported dashboard files if their title bars are enabled in the dashboard's display options. Refer to Changing dashboard options for information about including report title bars on a dashboard.
Data Set	The radio buttons in this group let you choose to export all the data returned by the report's current search criteria or only data shown on the report when the Export button is clicked. **Note:** Data Set options display only if the report's output is restricted by record limits, page limits, slicing, or auto-filters when the Export button is clicked. These options do not display when exporting dashboards, published reports, or queued reports.
Export Current Page	Select this radio button to include only the data currently shown on the report in the export file.
Export All Data	Select this radio button to include all the data from the report, up to 100,000 rows, regardless of the report's current record limits, page limits, slicing, or auto-filters settings. **Note:** This option is not functional for reports that were queued.
HTML Options	Select how you want the HTML file to be generated in this section. **Note:** This section displays only when you select HTML format.
Use Absolute Layout	Select this radio button to format the export file using absolute layout. The exported report will match the display of the original report very closely, though discrepancies may be noticed in some reports. **Note:** Some browsers do not support printing HTML files that use this layout.
Use Relative Layout	Select this radio button to format the export file using relative layout. The exported report will be similar to the original report, though there may be some discrepancies. **Note:** Most browsers support printing HTML files that use this layout.

Table 287: Export Options Window Description (Continued)

Field	Description
PDF Options	Select how you want to specify the width of the PDF document in this section. **Note:** This section displays only when you select PDF format.
Set Page Width to Best Fit the Report	Select this radio button to automatically set the width of the PDF file to best fit the width of the report. This method displays the report in its original width, though the size of fonts may be reduced and the file may use landscape orientation to fit wide reports.
Use Printer Page Setup to Set Page Dimensions	Select this radio button to open the Page Setup window to manually select margins, paper size, and orientation for the PDF file. Click here for information about this window.
Excel Options	Select how you want to format date/time columns for the Excel file in this section. **Note:** This section displays only when you select Excel format.
Convert All Dates into Excel Formatted Dates	Select this check box to convert all the date and time values shown in the report's columns to Excel's MM/DD/YYYY HH:MI AM/PM date format. Selecting this option ensures the date columns in exported reports are consistent with Excel's functionality.
Include Cell Images	Select this check box to include images that are displayed in the report's cells in the exported file. **Note:** This option is selected by default.
Delimiter Options	Select the custom delimiter you want to use in this section. **Note:** This section displays only when you select Delimited format with a custom delimiter.
Custom Delimiter	Type the character you want to use as the custom delimiter in this field.

6 Click the OK button to save the exported report.

Note If you selected the Launch Application check box, the application associated with the specified type on your workstation opens.

Scheduling reports

You can schedule reports to be sent by email to yourself, other staff members, email addresses, or **distribution lists**. You can also create a schedule to automatically publish a report. When you define a schedule, you define the specific times when you want the report to be sent. You can also specify the values you want for the report's filters and variables.

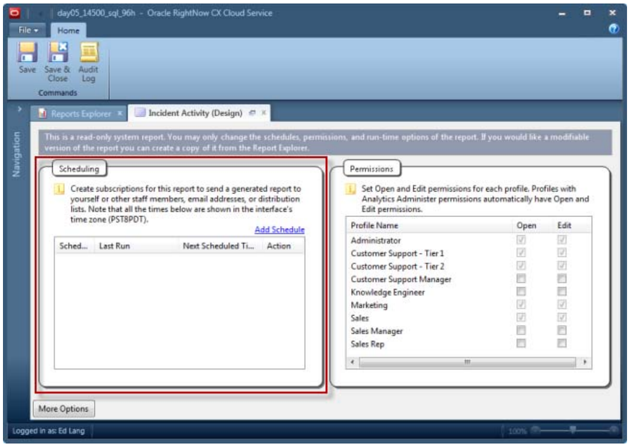
Note Certain modifications may be apparent when viewing reports or dashboards sent in emails. Refer to Modifications made to distributed reports. In addition, if scheduled reports include custom scripts, the scripts must contain initialization information to ensure they run correctly when recipients open the reports. Refer to Adding custom scripts to output levels.

If you need a report sent when certain conditions are met, you can create alerts. Alerts send the scheduled report when criteria you define in **data exceptions** are met. For example, you can create data exceptions to flag incidents that have not been responded to in 24 hours, and then create an alert to send the report when the data exceptions are met. Refer to Adding alerts to schedules.

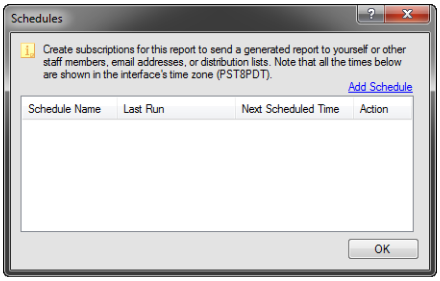
Note The Create/Edit Reports Analytics profile permission must be enabled to schedule reports. Refer to Analytics permissions. In addition, scheduled reports are available only when the option is enabled. For information about enabling scheduled reports, contact your Oracle account manager.

To schedule a report

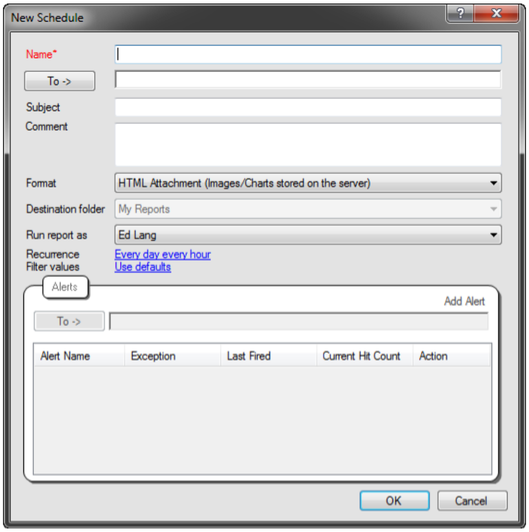
1. Open the Scheduling window (for **standard reports**) or Schedules window (for **custom reports**).
   a. To schedule a standard report, right-click the report and select Edit. The Scheduling window displays on the left side of the content pane. The window displays information about any schedules for the report that have been created.



b To schedule a custom report, open the report, click the Home tab, and then click the Scheduling button. The Schedules window opens, showing schedules that have been created for the report.



2 Click Add Schedule. The New Schedule window opens.



3 Type a name for the new schedule in the Name field. The name should clearly identify the purpose of the schedule.

Note When creating a schedule to publish a report, the report that is created in the destination folder is given the name you specify in the Name field.

4 If using the **Published format**, selected from the Format drop-down menu, skip to step 7. The Published format does not require email information.

5 Type the email addresses the scheduled report email should be sent to in the To field. Separate addresses with semicolons.

Or

Click the To button to open the Select Recipients window where you can add staff members, groups, and distribution lists to the schedule. Refer to Selecting recipients.

Note Scheduled report emails automatically hide the other recipients' email addresses in the email header.

6 Type a subject for the scheduled report email in the Subject field.

7 Type any text you want to include in the body of the scheduled report email in the Comment field.

8 Select the format of the report from the Format drop-down menu. The format options are described in the following table.

Table 288: Scheduled Report Format Options

Format	Description
HTML Attachment (Images/ Charts stored on the server)	Select this option to send the report in an HTML file attached to an email. Images and charts displayed in the report are stored on the server, letting recipients who have access to the server view them.
HTML Email (Images/ Charts stored on server)	Select this option to send the report as an HTML email. Images and charts displayed in the report are stored on the server, letting recipients who have access to the server view them.
HTML Email (Images/ Charts sent in email)	Select this option to send the report as an HTML email that includes the report's images and charts. This lets recipients who do not have access to the server view the report's graphics.
Excel Attachment (Images/ Charts unavailable)	Select this option to send the report output in an Excel file attached to an email. The file does not include the report's images or charts.
Comma Delimited Attachment (Images/Charts unavailable)	Select this option to send the report output in a comma-delimited text file attached to an email. The file does not include the report's images. or charts.
XML Attachment (Images/ Charts unavailable)	Select this option to send the report output in an XML file attached to an email. The file does not include the report's images. or charts.
Image Attachment	Select this option to send an image of the report in a file attached to an email. This lets recipients view the report as it displays in the console, but does not let them work with data.
PDF Attachment	Select this option to send the report in a PDF file attached to an email. This option includes images and charts. **Note:** Non-English characters may not display correctly when sent as a PDF attachment. We recommend instead using an HTML format for such reports.

Table 288: Scheduled Report Format Options

Format	Description
Published	Select this option to publish the report at the scheduled time. Refer to Publishing reports.
Compressed CSV File	Select this option to send the report in a compressed CSV file attached to an email. The recipient can then open the file using third-party software. Images and charts are not available when using this option. Since this option reduces the amount of processing required to run the report, you can send reports that return up to 100MB of data. Without this option, reports can return a maximum of 10,000 rows. There are restrictions on the reports that can be sent to CSV files since not all reports are appropriate for such files. • The report cannot contain custom scripts. • The report cannot contain comparison columns. • The report cannot contain date grouping columns. • The report's rows must return unique records, such as information about specific incidents, answers, or contacts. • The first column in the report must be sorted in ascending order and must output data stored in a primary key database column. For instance, the first column could output incident ID numbers or contact ID numbers, and be sorted in ascending order. This restriction helps the data queries more quickly process reports since they use primary keys. This option is not available for reports that do not meet these requirements. When sending a large CSV file in an email, the file size limits configured on the recipient's mail server may prevent delivery of the file. If you encounter this issue, you can queue the report to save it in a CSV file instead. Refer to Queuing reports. **Note:** This option is not available when scheduling dashboards.

Table 288: Scheduled Report Format Options

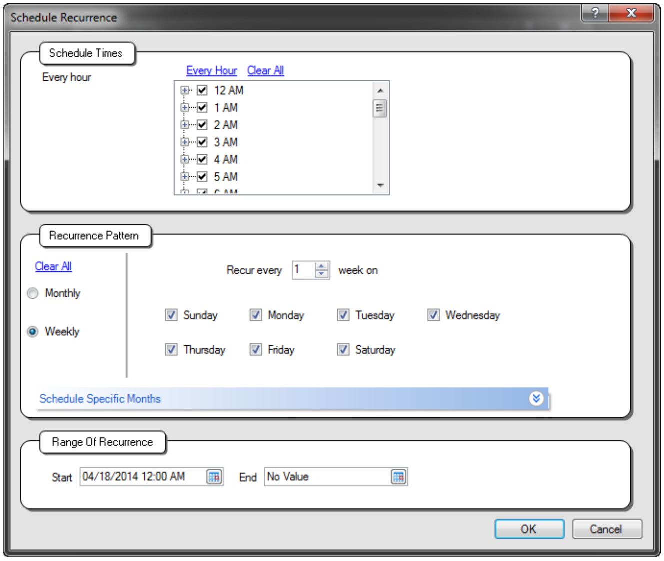
Format	Description
Send Report to Report Queue for Delivery as a CSV File	When you select this option, the report is queued at the scheduled time. However, instead of being sent as an email attachment, the CSV file is accessed in the report queue. You can access the queued report from toast notifications or the My Queued Reports standard report. Refer to Viewing queued reports.

9 To select the folder in the Reports explorer where you want published reports sent, click the Destination Folder drop-down menu and select the folder you want. This drop-down menu is available only when you select the Published format. Refer to Publishing reports.

10 From the Run Report As drop-down menu, select the staff account that would be used if the report were run manually. This lets you specify which account should be used in reports that use the “logged in” filter value.

Since the time zone used in the report depends on the account that runs the report, this impacts the times shown in the report. For example, if a staff member working in the Pacific time zone runs a report, the times shown in the report are adjusted to display in the Pacific time zone. Refer to Adding and editing staff accounts.

11 Click the schedule time next to the Recurrence field to open the Schedule Recurrence window. The underlined text displays the report’s current schedule. This is set to Every Day Every Hour by default.



12 Enter the following field information.

Table 289: Schedule Recurrence Window Description

Field	Description
Schedule Times	Select the times of the day from this menu when the scheduled report should be sent. The available times include fifteen-minute intervals, so a report could be scheduled to send at 6:15 A.M. and 4:45 P.M.
Every Hour	Click this text to automatically select all the hourly check boxes.
Clear All	Click this text to clear all selected schedule time check boxes.
Recurrence Pattern	Select the weekly or monthly interval when the report should be sent. For example, a report could be sent every two weeks on Tuesday, or every month on the 7th and 19th.
Clear All	Click this text to clear all selected recurrence pattern check boxes.
Monthly	Select this radio button to display check boxes for the days of the month. You can then select the days of the month when the report should be sent.

Table 289: Schedule Recurrence Window Description (Continued)

Field	Description
Weekly	Select this radio button to display check boxes for each day of the week. You can then select the check boxes next to the days when you want the report to be sent. When you select this radio button, a Recur drop-down menu displays where you can specify the frequency of the weekly report. For example, if you want the report sent every week on the days selected, enter 1 in the field. If you want the report to be sent every third week on the days selected, enter 3 in the field. This field accepts values from 1 to 99.
Schedule Specific Months	Click the Schedule Specific Months header to display check boxes for the months of the year. Select the months during which the scheduled report should be sent. By default, every month is selected, but if you do not want the report sent during a specific month, you can clear the check box for that month.
Clear All	Click this text to clear all check boxes for the selected months.
Range of Recurrence	Options in this section let you specify a date range during which the scheduled report is sent.
Start	Enter the start date of the schedule or click the Calendar button to open a calendar from which you can select the start date. The current day is the default start date.
End	Enter the end date of the schedule or click the Calendar button to open a calendar from which you can select the end date.

13 Click the OK button to save the recurrence settings and return to the New Schedule window.

14 To specify the values you want to use for the report's filters and variables when the scheduled report is sent, click the underlined text next to Filter Values. This opens the Search window where you can select the values for the report's run-time filters to use when the scheduled report is automatically generated. If you do not specify filter values, the report's default values are used. Refer to Specifying filters.

Note The Ordering feature is not available when selecting filter options for scheduled reports.

15 Click the OK button to save the schedule.

16 To edit an existing schedule, click Edit next to the name of the schedule on the Scheduling or Schedules windows, shown in step 1. The Edit Schedule window opens. The options in the window are identical to those in the New Schedule window, shown in step 2.

17 To delete an existing schedule, click Delete next to the name of the schedule on the Scheduling or Schedules windows, shown in step 1. Click the Yes button on the warning window to confirm the deletion.

Adding alerts to schedules

If a report includes **data exceptions**, you can create an alert to send an email when the data exception criteria is met. You can also specify how many times in a row the exception must be met before the alert is sent. The report's data exception is checked at the times specified in the report's Schedule Recurrence window.

For instance, a report's data exception could be configured to trigger when ten incidents returned in the report meet the criteria you specify, such as the incidents' response times not being met. You could then configure a schedule for the report to trigger once an hour every work day. Once the schedule is created, you could create an alert to be sent if the data exception is met twice in a row. This would result in the report's data exception being automatically checked once every hour each work day, according to the times specified on the Schedule Recurrence window. If the report's data exception is met a single time, the alert would not be sent. However, if the data exception was also met when it was next checked, the alert email would be automatically sent.

The Alerts section of the New Schedule window displays email alerts and their attributes, and lets you create new alerts. Alerts are disabled if the report does not include data exceptions, since alerts are based on data exceptions being met. Refer to Creating data exceptions.

To add an alert to a schedule

1 Open the New Schedule window, as described in To schedule a report.

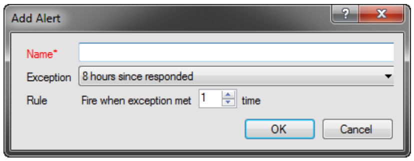
2 Type the email addresses to send the alert to, separated by semicolons.

Or

Click the To button to open the Select Names window where you can add staff members, groups, and distribution lists to the alert. Refer to Selecting recipients.

Important A report schedule needs to be created in order to add an alert. If the report should be sent as a regular scheduled report and as an alert, you must add recipients to both the schedule's To field and the alert's To field. However, if the purpose of the schedule is only to send an alert, do not add recipients in the schedule's To field.

3 Click Add Alert to open the Add Alert window.



4 Enter the following field information.

Table 290: Add Alert Window Description

Field	Description
Name*	Type a name for the alert.
Exception	Click this drop-down menu to select the data exception that is used to trigger the alert. The options that are listed in the menu are those that have been added to the report.
Rule	Enter the number of consecutive times the data exception must be met before the alert is triggered.

5 Click the OK button to save the alert.

Changing output options

When viewing a standard or custom report, you can change the report's colors, fonts, and other display options, and you can adjust the sorting, filtering, **slicing**, and other formatting options of the records returned in the report.

Important Your profile must include the Customize Reports Analytics permission to change output options in reports. Refer to Analytics permissions.

Changing report displays with styles

Styles can be applied to reports to change how the report text and background are displayed. The fonts, colors, backgrounds, spacing, padding, and borders for the different report areas can all be changed by applying a style. If the style is associated with a chart style, the appearance of charts added to reports can also be modified.

You can use one of the predefined styles, edit an existing style, or create your own style and save it to use immediately or for reports you view in the future. For procedures on editing and creating styles, refer to Styles explorer.

Styles you create or default styles can be applied to any report you view. The style you apply to the report impacts the report's appearance when you print it, export it in certain formats, and forward it to others.

To apply a style to a report

1 From an open report, click the Display tab.

2 Click the Auto Format button to open the Auto Format window.

3 To prevent the style from being applied to other levels in the report, clear the Apply Style to All Report Levels check box.

4 Click the style you want to use.

The report is updated to use the style you select.

Selecting record or tabular layouts

Reports can be displayed using a record or tabular layout. Most reports use tabular layouts with column headers across the top of the report and data listed in rows beneath the column headers. However, you can use a record layout to reformat the report to remove the column headers and instead display the field names **inline** with the field's values from each record returned in the report. An incidents report is displayed here with the record layout.

Note When a report total is included in a report with a record layout, the total is shifted to the left of the column that it totals. In addition, since reports displayed in a record layout do not have columns, some options that apply to columns, such as column width, do not apply.

To select a layout

1. From an open report, click the Display tab.
2. Click the Data button.
3. To display the report with a record layout, select Display Data in a Record Layout.
4. To display the report with a tabular layout, select Display Data in a Tabular Layout.

Modifying report display options

Report styles let you change the display options for specific areas of a report, such as the title or data areas. However, if you want to change the margins, width, background, and borders of the entire report, or change how the report output is displayed, you do so by changing the report's display options. These are modified using buttons on the ribbon or by using the tabs on the Display Options window.

Note For descriptions of ribbon buttons, refer to [Ribbon options when viewing reports].

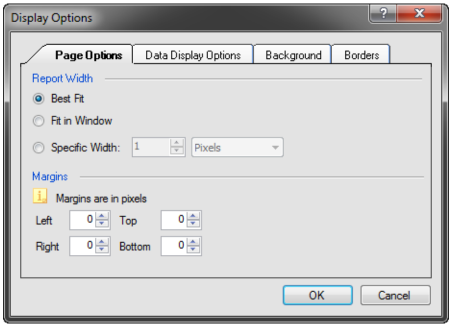
Changing page options settings

The Page Options tab on the Display Options window contains settings which control report width and the margins surrounding the report content.

To change page options

1 From an open report, click the Page Setup tab.

2 Click the button to the right of the Display group name. The Display Options window opens with the Page Options tab selected.



3 Enter the following field information.

Table 291: Page Options Tab Description

Field	Description
Report Width	Define the width of the entire report using the available radio buttons.
Best Fit	Select this radio button to display the report columns within the width of the window if possible. If data would otherwise be truncated, the width of the report spans beyond the open window and a scroll bar is added to the bottom of the page, allowing you to view the entire width of the report.
Fit in Window	Select this radio button to display the report columns within the width of the window. This can result in column names and data being truncated.
Specific Width	Select this radio button to manually specify the report width in pixels, inches, or centimeters.
Margins	Define the left, right, top, and bottom margins for the report.

4 Click the OK button to save the display options.

Changing data display options

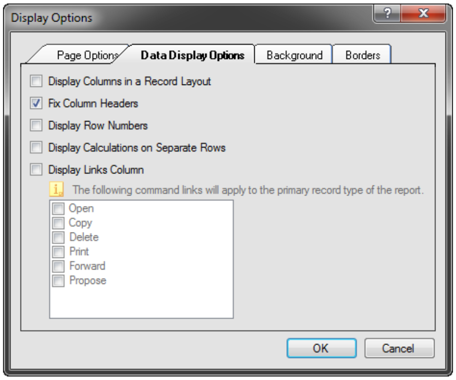
Data display options control a number of features which give you more flexibility in determining how data in your report displays. For example, you can add or remove row numbers and add links to the report, which allow staff members with appropriate permissions to modify records returned in the report. You can also output report data in a record format.

To change data display options

1 From an open report, click the Page Setup tab.

2 Click the button to the right of the Display group name.

3 Click the Data Display Options tab.



4 To format the report in record layout, select the Display Columns in a Record Layout check box. Refer to Selecting record or tabular layouts.

5 To fix the report's column headers at the top of the report so they are always visible when scrolling the report, select the Fix Column Headers check box.

6 To add row numbers to each row of the report, select the Display Row Numbers check box.

7 To display multiple calculations in the report on separate lines, select the Display Calculations on Separate Rows check box. If this check box is not selected and the report displays more than one calculation, the calculations display on the same line.

8 To add a column to your report which displays actions you can take on records in the report, select the Display Links Column check box and select the commands you want to include in the column.

Note If the rows do not refer to unique records, such as a specific incident or contact, the Display Links Column check box is disabled.

9 Click the OK button to save your display options.

Changing report backgrounds

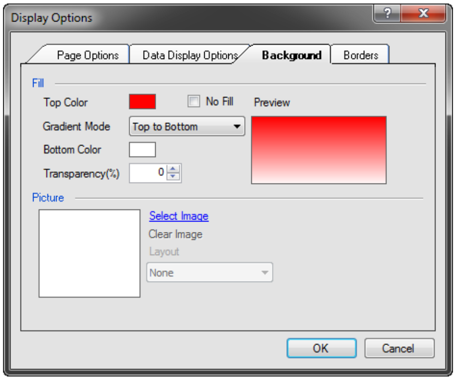
Adding colors or images to a report's background can make it more suitable for presentations or other formal purposes. You can add colors and images from the Background tab of the Display Options window.

To change a report's background

1 From an open report, click the Page Setup tab.

2 Click the button to the right of the Background group name.

3 Click the Background tab.



4 Enter the following field information.

Table 292: Background Tab Description

Field	Description
Fill	This section lets you define the colors to be used for the report's background.
Color/Top Color/Left Color	The text description for this option varies depending on the Gradient Mode you select. Click this box to select a primary color as the background. Refer to [Choosing colors]().
No Fill	Select this check box to clear any fill colors previously selected. If this box is selected, the other options on the Fill window are disabled except Color. Selecting a color automatically clears the No Fill check box, enabling the other options.

Table 292: Background Tab Description (Continued)

Field	Description
Gradient Mode	Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available. • **None**—Select this option to use only the primary color as the fill color. If you select None, the Gradient Color field is disabled. • **Top to Bottom**—Select this option to merge the colors from the top of the background to the bottom. • **Left to Right**—Select this option to merge the colors from the left of the background to the right.
Gradient Color/Bottom Color/Right Color	The text description for this option varies depending on the Gradient Mode you select. Click this box to select a secondary color to merge with the primary color. The fill colors then merge using the method defined in the Gradient Mode menu. Refer to Choosing colors.
Transparency(%)	Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent and prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview field, so you can scroll through the transparency percentages to find a value that best suits your needs.
Preview	This area provides a sample of how the fill colors you select will appear on the report background.
Picture	In addition to adding background colors for a report, you can add a background or watermark image to the report.
Select Image	Click Select Image to select the image to use with the report. Images are added using the Images explorer. Refer to Images explorer.
Clear Image	Click Clear Image to remove a previously selected image from the report.
Layout	Click this drop-down menu to define the placement of the image on the background. Available options are None, Title, Center, and Stretch.

5 Click the OK button to save the background.

Adding borders to a report

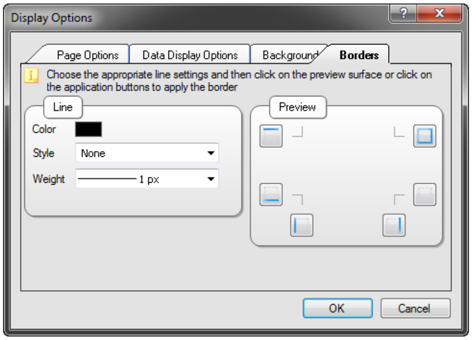
You can also add borders to a report from the Display Options window. Each border can have different colors, styles, and weights applied.

To add a border to a report

1 From an open report, click the Page Setup tab.

2 Click the button to the right of the Display group name.

3 Click the Borders tab.



4 Enter the following field information.

Table 293: Borders Tab Description

Field	Description
Color	Click this box to select a color for the border. Refer to Choosing colors.
Style	Click this drop-down menu to select one of the following border styles: Solid, Dashed, Dotted, Inset, Outset, Double, Groove, Ridge, or Rounded.
Weight	Click this drop-down menu to select the width of the border in pixels. You can choose between 1 and 10 pixels.

Table 293: Borders Tab Description (Continued)

Field	Description
Preview	This area defines the placement of the borders you define. Click any button to place a border or click the area in the Preview white space where you want the border.
 Borders	Click a button to add the selected border attributes to the top, bottom, left, right, or all sides of the component. You can also add or remove borders from all sides of the component.

5 Click the OK button to save the borders.

Showing and hiding report sections

Reports can display a large amount of information in a number of report sections. For example, a report's data area contains the tabular data returned by the report. Other report sections include **docked filters**, headers, descriptions, charts, footers, and **data exceptions**. However, there may be times when you do not want to display all sections in a report, so you are given the option to choose what sections you see in a report.

To show or hide report sections

1 From an open report, click the Display tab.

2 To remove a section from the report, clear its check box in the Sections tab group. The available check boxes are Docked Filters, Charts, Exceptions, Report Header, and Report Footer.

3 To add a section to the report, select the check box next to the section name.

Note If a section is disabled, it cannot be added to the report since it was not included when the report was created.

4 To remove the data section from the report, click the Data button and select Do Not Display Data.

Showing and hiding data exceptions

When you run a report that includes multiple **data exceptions**, you may not want to always display every exception in the report. You can hide any exception included in a report or show hidden exceptions from the Exception Visibility window.

To show and hide data exceptions

1. From an open report, click the Display tab.
2. Click the Exceptions button.
3. To hide an exception, clear the check box next to the exception.
4. To display a hidden exception, select the check box next to the exception.
5. Click the OK button to apply the exception visibility to the report.

Modifying report magnification

To better view report data, you can zoom in and out of reports. You can select magnification levels ranging from 10 percent to 200 percent to shrink or expand the report. You can alter a report's zoom level using the slider on the bottom right of the content pane. The slider is always displayed on the content pane, but is enabled only when a report is shown.

To change report magnification

Drag the slider to the left or right to decrease or increase magnification.

Or

Click the plus or minus sign on either end of the slider.

The current magnification level is shown to the left of the slider.

Changing data options

You can change the way data is shown in your report to present it more clearly. For example, you can sort the data differently, hide certain columns in the report, add page breaks to the report, or filter the data to display only a subset of the records the report returns. The other available features are **slicing**, **cross tabs**, and **rollups**. An option to display **guided assistance** response data in a tree format is also available.

Selecting columns to display

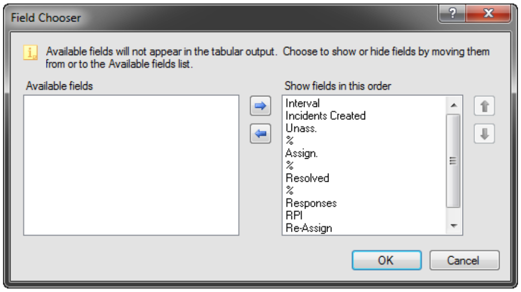
You can hide columns in your report to simplify a report's output without editing the original report. You can then show the hidden columns when you want to view them again.

You can show and hide columns using the Field Chooser or you can select from options available when right-clicking a column in the report.

To show or hide fields with the Field Chooser

1 From an open report, click the Display tab.

2 Click the Field Chooser button to open the Field Chooser window.



3 To hide a column in a report, drag the field from the Show Fields in This Order section to the Available Fields section, or select the field to hide and click the left arrow.

4 To display a column that is currently hidden, drag the field from the Available Fields section to the Show Fields in This Order section, or select the field to display and click the right arrow.

5 Click the OK button to save your changes.

To show and hide columns using the right-click menu

1 To hide a column, right-click the column you want to hide and select Hide Column.

2 To show a hidden column, right-click a visible column, select Insert Hidden Column, and select the column you want shown in the report. The column displays in the report in the column's last location.

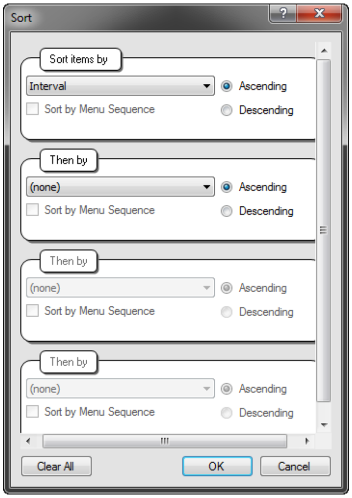
Changing sort options

A report's default sort options are determined by the report's parameters and output. After generating a report, you can change your sort options to sort by any column in the report. You can sort columns from the report's Data tab or, if your report is shown using the report view, by clicking column headers.

To change sort order from the ribbon

1 From an open report, click the Home tab.

2 Click the Sort button to open the Sort window. This button is also on the Design tab, which is available when using the layout view.



3 Select the primary field you want to sort by from the Sort Items By drop-down menu.

4 To sort by the selected field in ascending order, select the Ascending radio button. To sort in descending order, select the Descending radio button. For example, to sort a report's output by date created, with the newest dates at the top of the list, you would sort the output in descending order.

5 To sort menu fields by the sequence of the field's entries, select the Sort by Menu Sequence check box.

Important This option is available only when editing a custom report.

By default, when sorting information in a report using a menu field, the information is sorted by the menu field's entries in alphabetic order. For example, sorting a report by the Incidents Severity field with entries of Severe, Mid-Range, and Unimportant in ascending order lists records with Mid-Range, then Severe, and then Unimportant severities.

However, when editing a custom report and defining the report's default sort order, you can select the Sort by Menu Sequence check box to sort by the order or the menu field's entries. Therefore, sorting the Severity field by sequence in ascending order would result in records with Severe, then Mid-Range, and then Unimportant severities. In this example, this sort order would likely be more helpful for those using the report.

6 To sort on additional fields, select the fields to sort on from the Then By drop-down menus.

When you define multiple sort fields, the records are initially sorted by the first sort field. If any of the records have the same value for the first sort field, those records are then sorted by the subsequent sort fields.

7 To remove all sort options, click the Clear All button.

8 Click the OK button to view the report with the defined sort order.

To change sort order by clicking column headers

1 Click the Views button on the Display tab and verify that your report is shown using the report view.

2 Click the header of the column you want to sort by. The report is sorted by the column you select in ascending order, and an arrow displays on the column's header.

3 To change the direction of the sort, click the column's header again.

4 To add additional levels of sorting to the report, press **Shift** and click the headers of the columns in the order in which they should be added to the sort. The report is sorted by the selected columns in ascending order, and arrows display on the sort columns' headers.

5 To change a column's sort direction when sorting by multiple columns, press **Shift** and click the column's header.

Using Auto Filter

You can use Auto Filter to filter on each column in the report. This provides easy access to filtering on any field included in the report. When this feature is enabled, a down arrow appears in the specified column headings of a generated report. By clicking the down arrow, you can filter the report by a value in that column.

For example, in a column that displays incidents' associated products, you could click the down arrow to select a certain product. Only incidents associated with that product would display in the report.

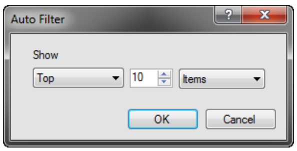
Note Auto filtering hides filtered records but does not remove them from the report output. For this reason, total record counts displayed on the report will not change when auto filtering is used.

To enable auto filters

1. From an open report, click the Home tab.
2. Click the Auto Filter button to display arrows next to each column in the report. The Auto Filter button acts as a toggle. Click the Auto Filter button again to turn off auto filtering.
3. To filter on a column, click the down arrow located in the column's header to open the drop-down menu for the column.

Note When data is filtered by a value in a particular column, the down arrow in that column's header changes from blue to red to show that filtering is active.

4. To show only those records that have a specific value for the column, select the value to filter on. Any records that do not have this value are removed from the report output.
5. To remove any filtering on values in the selected column, select All.
6. To show only those records with values at the top or bottom ranges of the selected field's values, select Top 10. When you select this option, the Top 10 window opens.



a Select Top or Bottom from the Show drop-down menu to define whether the records with the highest or lowest field values are displayed.

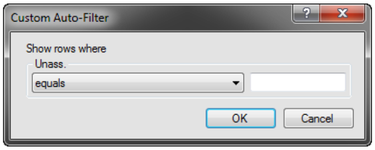
Note The definition of what a high or low value in a field is depends on the type of field. For example, in date fields, the oldest dates are at the top and the newer dates are at the bottom, whereas values in text fields are in descending alphabetical order.

b Select the number of records or the percentage of the total number of records returned in the report to include in the filtered data.

c Select whether the filtered data should include a specific number of items or a percentage of the total number of records.

d Click the OK button to save the Top 10 auto-filter settings.

7 To create a custom filter on the field, select Custom. The Custom Auto Filter window opens. Only records that match your custom filter display in the report.



a Define the custom filter you want to use. The filter options vary somewhat depending on the type of field that is being filtered on. For example, date fields include calendar options, whereas text fields do not. However, every window has a drop-down menu from which you can select the **operator**, and an area to enter the filter value. Refer to Specifying filters.

Note To specify values from menu fields, the value must be typed. When using the In List or Not In List operators, the values must be comma-separated. Text values must be enclosed in single quotation marks. For example, to enter multiple names from the Incidents.Assigned field (*incidents.assgn_acct_id*), type them as 'Bob Jones','Sarah Smith','Tom Payne'.

b Click the OK button to apply your custom filter to the report output.

Adding page breaks

You can add page breaks to your reports to make them easier to use. If page breaks are added to a report, only the specified number of rows display. A report with page breaks includes controls to navigate to other pages.

Note When page breaks are added to a report, the **slicing**, **cross tab**, and **rollups** options are disabled. In addition, page breaks are disabled in **published reports**.

Page breaks can be added from the Search window or from the Display tab when viewing a report. The following procedure describes adding page breaks from the Display tab. Refer to Searching in reports for information about using the Search window.

To add page breaks to a report

1. From an open report, click the Display tab.
2. Click the Page Report button and select the number of rows per page you want.
3. To specify a different number of rows per page, click the Page Report button and select More Options.
   a. Select the Page Report check box. If the report is already paged, this check box is automatically selected when you open the window.
   b. Type the number of rows you want on each page in the Rows per Page field.
   c. Click the OK button to save your changes and view the report.
4. To remove paging from the report, click the Page Report button and select Remove Paging.

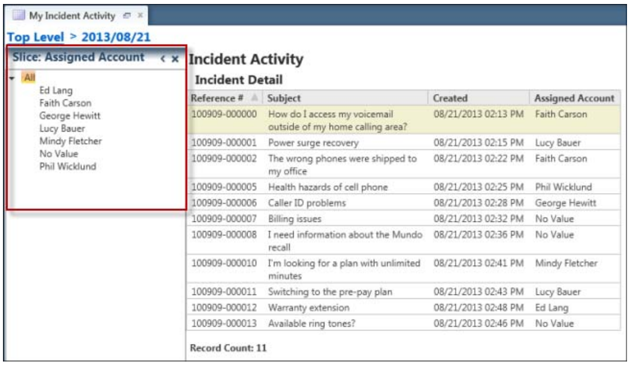
Once you select the number of rows you want, the report displays with a list of page numbers and arrows at the top of the page. Clicking |< or >| takes you to the first or last page of the report. Clicking < or > takes you to the preceding page or the next page of the report. If enough pages are present in the report, you will also see << and >> at the top of the report. Clicking these arrows displays the preceding or next set of page numbers in the report controls.

Slicing report data

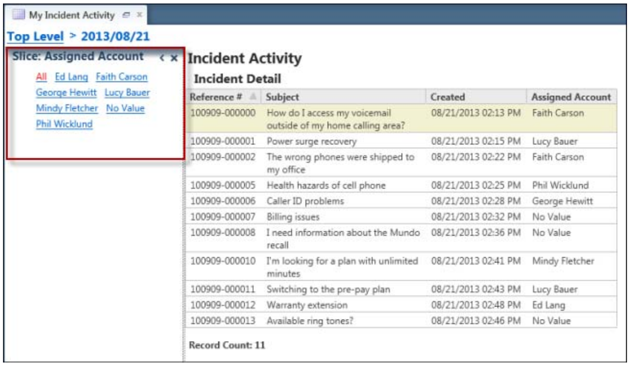
Slicing a report allows you to group tabular data sharing common values in fields included in the report. You can then select from the slice tree or links and view only the report data that matches the selected field values. For example, in an incidents report, you could slice by the assigned staff member to display incidents assigned to that person. You could then further break down the incidents assigned to the staff member by other fields such as status.

Note When slicing and cross tabs are applied to a report at the same time, the cross tab is applied first, followed by slicing.

An example of an incidents report sliced in this manner is shown in the following figure. The slice options are displayed in a tree format.



The next figure shows a report sliced on assigned account with the slice options displayed as links.



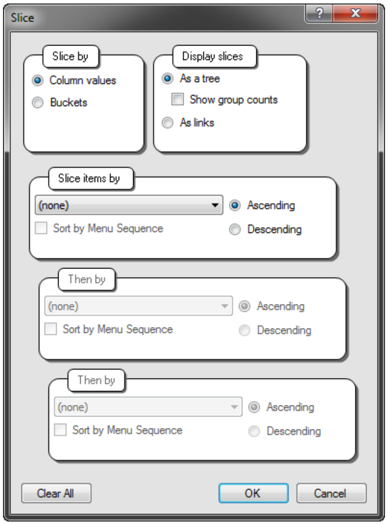
Tip You can hide the slice section in your report by clicking the section's Auto-Hide button or you can remove slicing from the report by clicking the Close button on the slice section's header.

To slice report data

1 From an open report, click the Home tab.

2 Click the Slice button. The Slice window opens.

Tip When viewing a report using the layout view, you can select a column, click the Design tab, and click the Slice button to slice the report by the selected column.



3 Enter the following field information.

Table 294: Slice Window Description

Field	Description
Slice By	Select from the following options to define the slice by column values or buckets.
Column Values	Select this radio button to define slicing by specific values in the fields included in the report. For example, if slicing on the incidents' Status Type field, you can slice on Unresolved, Waiting, or Solved.
Buckets	Select this radio button to define slicing by groupings of values in the fields included in the report, such as Solved AND Waiting incidents. When you select this option, the window changes to let you define the groupings. Refer to Defining slice buckets.
Display Slices	Select from the following options to define how the slice groups selection appears in the report.
As a Tree	Select this radio button to display slice groups in a tree that is docked to the report.

Table 294: Slice Window Description (Continued)

Field	Description
Show Group Counts	Select this check box when displaying slices as a tree to include the number of records in the slice group. The number displays next to each group name in the tree.
As Links	Select this radio button to display the slice groups as links above the data. This option is available only when a single report field is included in the slice.
Slice Items By	Select the fields to slice items by. If more than one field is selected, the first field defines the top slice group, and the subsequent fields selected define sub-groups in the top group. If there are multiple slice fields defined, and the first is set to None, the other slice fields are also cleared.
Ascending/Descending	Select these radio buttons to sort the entries in the slice tree or links in ascending or descending order.
Sort by Menu Sequence	When slicing by a menu field, such as *incidents.status*, select this check box to order the slice groups using the order of the options in the menu field. If this check box is not selected, the slice groups will be ordered alphabetically. **Note:** This option can be configured only when editing the report on the report design center. Refer to Opening the report design center.
Drag and Drop Options	Click this text to configure custom drag-and-drop options for inline editing. Refer to Customizing drag-and-drop slice options. **Note:** This option can be configured only when editing the report on the report design center. Refer to Opening the report design center.
Clear All	Click this button to reset all slice fields to None.

4 Click the OK button to save the settings and display the report with the defined slice groups.

5 To remove slicing from your report, click the Slice button and select Reset.

6 To display the number of records in each slice group displayed as a tree, click the Slice button and select Display Group Counts. The number of records in each slice group displays next to the group names in the slice tree.

7 To switch between displaying slice groups as a tree and as links, click the Slice button and select Display Slice Items > As a Tree or As Links.

Note If you are slicing by more than one column and change the display from a tree to links, only the first slice column displays.

Defining slice buckets

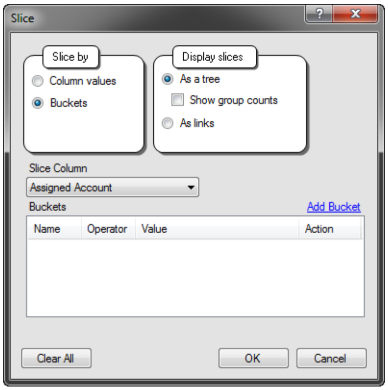
Slicing records by buckets allows you to define groupings of data to sort on that would not be allowed by slicing on specific values in a field. For example, slicing incident reports on the date created values may not be effective since the unique values in date/time fields cover a small span of time. Slicing on such a field would result in very granular slices. However, defining a slice bucket on the date created field would allow you to slice the report output by incidents created during a date range, such as the past seven days.

To define a slice bucket

1 From an open report, click the Home tab.

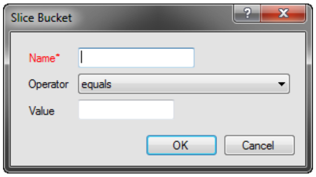
2 Click the Slice button. The Slice window opens.

3 Select the Buckets radio button in the Slice By section of the Slice window. The options on the Slice window change to let you create, edit, or delete buckets.



4 Select the field to slice on from the Slice Column drop-down menu.

5 Click Add Bucket to open the Slice Bucket window.



6 Enter the following field information.

Table 295: Slice Bucket Window Description

Field	Description
Name*	Type a name for the new bucket.
Operator	Click this drop-down menu to select the operator to use. Operator options are the same as those available when defining filter values, described in Specifying filters.
Value	Select the values from this field to add to the bucket. The available values change depending on the field selected. For example, some fields display drop-down menus with various values to select, while other fields display a calendar to select specific dates or date ranges. **Note:** To specify values from menu fields, the value must be typed. When using the In List or Not In List operators, the values must be comma-separated. Text values must be enclosed in single quotation marks. For example, to enter multiple names from the Incidents.Assigned field (*incidents.assgn_acct_id*), type them as 'Bob Jones','Sarah Smith','Tom Payne'.

7 Click the OK button to return to the main Slice window.

Customizing drag-and-drop slice options

One of the methods you can use to edit fields enabled for inline editing is to drag a record from a report to a slice node that is defined by the same field. For example, if a report is sliced by incident status, you can drag an unsolved incident to a slice node grouping solved incidents to change the incident's status to Solved. However, by default, you cannot edit any fields using drag-and-drop that are not used in the slice tree. Refer to Enabling inline editing and Editing data inline.

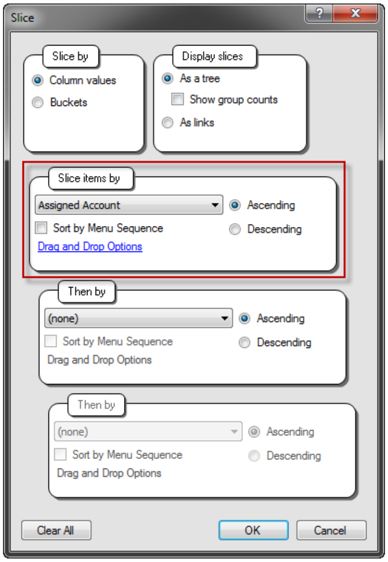
Important It is not possible to customize slice drag-and-drop options when running a report. The options must be configured when editing the report on the report design center. Refer to Opening the report design center.

By customizing slice drag-and-drop options, you change the drag-and-drop behavior to edit fields in a record that are not used in the slice tree. For example, you can associate several tasks with an incident by dragging the tasks from the report output to the slice node that includes the incident you want them associated with.

This feature is also useful when working with custom objects and attributes with record associations. For instance, if you use a custom attribute in incident workspaces to create associations with parent incidents, you can drag incidents listed on a report and drop them on a slice node that contains the parent incident you want them associated with.

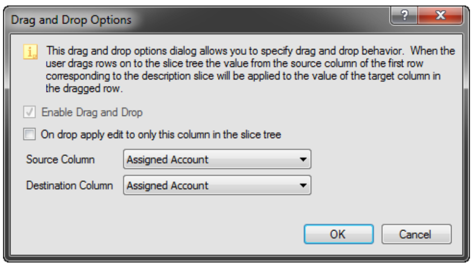
To customize slice drag-and-drop options

1. From an open report, click the Inline Editing button on the Home tab to ensure inline editing is enabled. Refer to Enabling inline editing.
2. Click the Slice button to open the Slice window.
3. Click the Slice Items By drop-down menu and select the column you want to use to slice the report output.



The column you choose to slice by is used to create groups of records. It does not necessarily store the values that are changed when dropping values from other records. The column that stores the values that are changed is selected in step 7.

4 Click Drag and Drop Options. The Drag and Drop Options window opens.



5 Select the Enable Drag and Drop check box if it is not selected. The check box is selected by default but is disabled if the slice column is enabled for inline editing.

Important If you select multiple columns to slice by on the Slice window, you can select the On Drop Apply Edit to Only this Column in the Slice Tree check box to prevent values in the dragged records from being changed automatically. This check box is cleared by default, which results in the records dragged to the slice tree having their values changed to match that in the other slice columns. For example, if you have a second slice on Status and drag an unresolved incident to a slice that groups incidents with a Solved status, the incident you drag will have its status set to Solved. This check box has no impact if only one column is used in the slice.

6 Click the Source Column drop-down menu and select the column containing the values you want to use to populate values in the destination column.

7 Click the Destination Column drop-down menu and select the column you want populated with values from the source column.

The options displayed in the drop-down menu depend on the selected source column since the columns must have the same data type (such as text, currency, or integer).

8 Click the OK button.

9 Click the OK button again to close the Slice window.

10 Save the changes to the report.

When you run the report, you will drag records you want to change to the slice tree. Those records will have their record associations changed to match that of the record included in the slice you drag them to.

Displaying data using cross tabs

The Cross Tab feature lets you display report output in a table to summarize large amounts of data. Using a cross tab table, you can select the fields to define the table's rows, columns, and output fields, essentially grouping the data by both the row and column output. The output fields are a culmination of the row and column data.

For example, if you had a report that returned the number of incidents assigned to each agent and the incidents' statuses, you could designate the assigned account column as a row field, status as a column field, and number of incidents as a data field. The output would be similar to the sample report displayed in the following figure, which shows the number of incidents categorized by assigned staff member and status.

Open Incidents
Status - Created

	Incidents		
Assigned Account	Solved	Unresolved	Waiting
Ed Lang	1	1	0
Mindy Fletcher	1	0	0
Lucy Bauer	2	1	1
Faith Carson	1	2	0
George Hewitt	0	2	0
Phil Wicklund	0	4	0
No Value	0	7	0
Total	5	17	1

Record Count: 7

Once you view your report data using the columns, rows, and output fields you define, you can select different fields to use as the columns, rows, and output fields. This lets you restructure the report to view groupings of different data, such as the number of incidents each staff member has, grouped by category instead of product. Without using cross tabs, the only way to retrieve these different summaries of data would be to use separate reports.

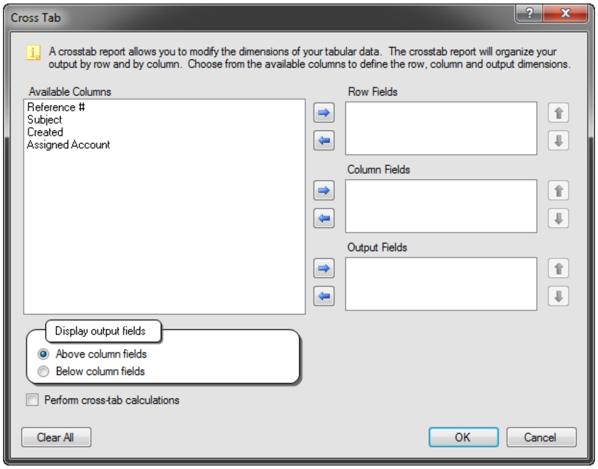
Note When cross tabs and slicing are applied to a report at the same time, the cross tab is applied first, followed by slicing.

To define cross tab reports

1 From an open report, click the Display tab.

2 Click the Cross Tab button.

3 Select Choose Columns to open the Cross Tab window.



4 Enter the following field information.

Table 296: Cross Tab Window Description

Field	Description
Available Columns	This section lists the output fields included in the report available for cross tabs. Fields from this section can be dragged to the row, column, and output fields, or a field can be moved by selecting it and clicking the right arrow.
Row Fields	Move fields to this section to define them as rows in the report.
Column Fields	Move fields to this section to define them as columns in the report.
Output Fields	Move fields to this section to define them as output fields in the report.
Display Output Fields	The options in this section let you define where the headers for the output fields should be in relation to the column fields.
Above Column Fields	Select these options to place the output field above or below the columns' values.
Below Column Fields	
Perform Cross-Tab Calculations	Select this check box to perform cross-tab calculations. An additional column displays for each cross tab calculation.

Table 296: Cross Tab Window Description (Continued)

Field	Description
Clear All	Click this button to clear all fields and reset the cross-tab definition.

5 Click the OK button to save the changes and generate the report.

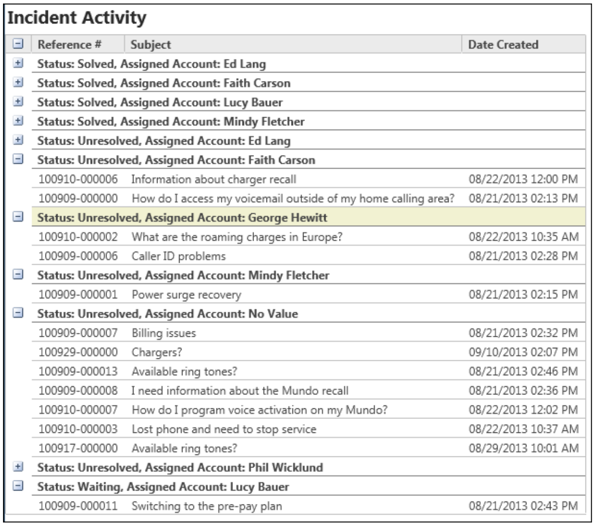
6 To remove cross tabs from your report, click the Cross Tab button and select Reset.

7 To perform cross-tab calculations on the report, click the Cross Tab button and select Perform Cross-Tab Calculations.

8 To switch between displaying output fields above or below column fields, click the Cross Tab button and select Display Output Fields > On Top or On Bottom.

Displaying rollup levels

You can define rollup levels in a report to group data beneath headings in the report. You can add additional rollup levels to further break down the data under each heading by grouping data under sub-headings. Using rollups, you can group rows in a report that share the same value in the columns you select for the rollup levels. For example, you could add rollups to an incident report to group incidents by their status, and then add an additional rollup level to group the incidents that have the same status by their assigned staff account. A sample report using these rollup levels is shown in the following figure.



Incident Activity

Reference #	Subject	Date Created
Status: Solved, Assigned Account: Ed Lang		
Status: Solved, Assigned Account: Faith Carson		
Status: Solved, Assigned Account: Lucy Bauer		
Status: Solved, Assigned Account: Mindy Fletcher		
Status: Unresolved, Assigned Account: Ed Lang		
Status: Unresolved, Assigned Account: Faith Carson		
100910-000006	Information about charger recall	08/22/2013 12:00 PM
100909-000000	How do I access my voicemail outside of my home calling area?	08/21/2013 02:13 PM
Status: Unresolved, Assigned Account: George Hewitt		
100910-000002	What are the roaming charges in Europe?	08/22/2013 10:35 AM
100909-000006	Caller ID problems	08/21/2013 02:28 PM
Status: Unresolved, Assigned Account: Mindy Fletcher		
100909-000001	Power surge recovery	08/21/2013 02:15 PM
Status: Unresolved, Assigned Account: No Value		
100909-000007	Billing issues	08/21/2013 02:32 PM
100929-000000	Chargers?	09/10/2013 02:07 PM
100909-000013	Available ring tones?	08/21/2013 02:46 PM
100909-000008	I need information about the Mundo recall	08/21/2013 02:36 PM
100910-000007	How do I program voice activation on my Mundo?	08/22/2013 12:02 PM
100910-000003	Lost phone and need to stop service	08/22/2013 10:37 AM
100917-000000	Available ring tones?	08/29/2013 10:01 AM
Status: Unresolved, Assigned Account: Phil Wicklund		
Status: Waiting, Assigned Account: Lucy Bauer		
100909-000011	Switching to the pre-pay plan	08/21/2013 02:43 PM

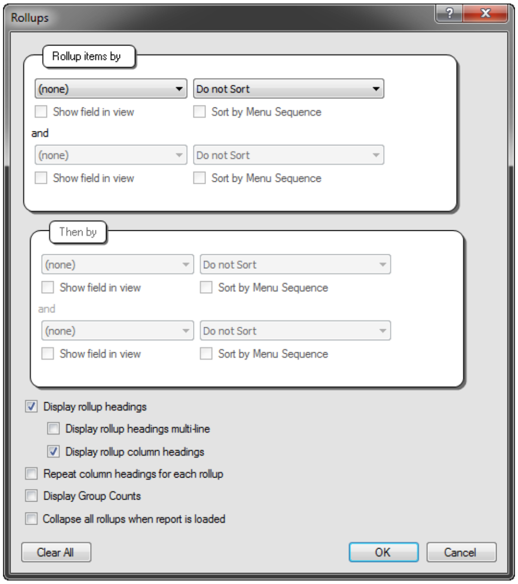
To define rollups

1 From an open report, click the Home tab.

2 Click the Rollups button.

Tip When viewing a report using the layout view, you can select a column, click the Design tab, and click the Rollup button to roll up the report by the selected column.

3 Select Choose Columns to open the Rollups window.



4 Enter the following field information.

Table 297: Rollups Window Description

Field	Description
Rollup Items By	Select output columns from the drop-down menus in this section to use as the primary rollup level. Once you select a column, you can select the sort order for the rollup column. Options include Do Not Sort, Sort Ascending, and Sort Descending. You can add additional columns to the primary rollup level in this section by selecting the columns from the other drop-down menus. When multiple columns are used in a rollup level, the data displayed together under the same rollup heading has the same values in all the columns selected for the rollup level.
Show Field in View	Select this check box to display the rollup column you selected as a column in the report. If this check box is not selected, the column name displays in the rollup heading, but is not included as a column in the report output.

Table 297: Rollups Window Description (Continued)

Field	Description
Then By	Select output columns from the drop-down menus in this section to use as the secondary rollup level. Once you select a column, you can select the sort order for the rollup column. Options include Do Not Sort, Sort Ascending, and Sort Descending. Secondary rollup levels break down the data in the primary rollup level according to the columns selected for the secondary level. Once you define a secondary rollup level, an additional Then By field displays, allowing you to define a third rollup level to further break down the data grouped under the secondary rollup level. **Note:** If records grouped under the secondary rollup have null values for the rolled-up field and if the rolled-up column is formatted to display blanks for records with null values, the header for the secondary rollup level does not display.
Display Rollup Headings	Select this check box to display the rollup headings and sub-headings. If this check box is not selected, the headings do not display, though the report data is still sorted as if the headings were present.
Display Rollup Headings Multi-Line	Select this check box to display each rollup column as a separate heading. If this check box is not selected when using multiple columns in the same rollup level, the columns for the rollup level display in the same heading. **Note:** This check box is disabled if the Display Rollup Headers option is not selected.
Display Rollup Column Headings	Clear this check box to hide the name of the rolled-up column on rollup group headings. By default, the name of the column you roll up is displayed for each rollup group.
Repeat Column Headings for Each Rollup	Select this check box to show the output column headers before each rollup heading and sub-heading. If this option is not selected, the column headers display only at the top of the report.
Display Group Counts	Select this check box to display the number of items under each rollup heading and sub-heading.
Collapse All Rollups when Report is Loaded	Select this check box to collapse all rollups in the report when it initially loads.

5 To remove the rollups you have selected on the Rollups window, click the Clear All button.

6 Click the OK button to generate the report using the rollups settings.

7 To remove rollups from your report, click the Rollups button and select Reset.

8 To display the number of records in each rollup, click the Rollups button and select Display Group Counts.

9 To show or hide headings for each rollup group, click the Rollups button and select Display Rollup Headings to enable or disable the option.

10 To show or hide the name of the rolled-up column in the heading for each rollup group, click the Rollups button and select Display Column Headings to enable or disable the option.

11 To show or hide repeating column headers, click the Rollups button and select Repeat Column Headings to enable or disable the option.

12 To collapse all the rollup headings in a report, click the Rollups button and select Collapse All.

When viewing a report with rollup headings, you can click the minus or plus button next to each heading to collapse or expand the headings to hide or display the rows under the headings.

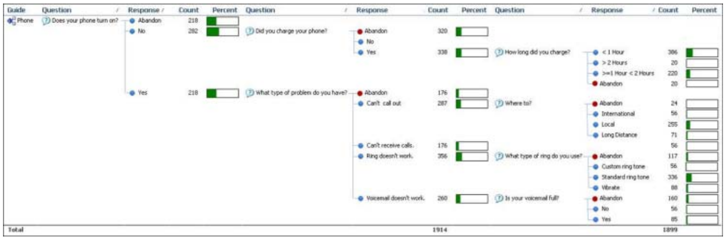
Displaying guided assistance data in trees

Guided assistance allows you to offer help to your customers using questions that then branch to other questions or answers. Refer to Configuring guided assistance.

Displaying the guided assistance questions and responses in a way that clearly shows the relationships between them can be challenging using the standard formats available for reports. However, you can configure reports that output this information to display the report columns in a tree format to clearly show the branching relationships in the data.

Note This option is available only when the report displays information from the Guided Assistance Responses (*decision_tree_responses*) table. This option is disabled when the report is configured to display data using cross tabs. Refer to Displaying data using cross tabs.

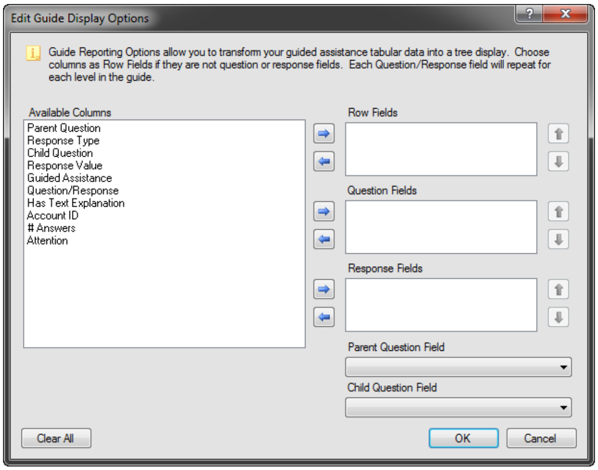
The following report is configured to display guided assistance data in a tree format.



To display guided assistance information in a tree format

1 Open the report that contains the guided assistance information.

2 Click the Display tab and then click the Guide button. The Edit Guide Display Options window opens.



3 Enter the following field information.

Table 298: Edit Guide Display Options Window Description

Field	Description
Available Columns	This section lists the output fields included in the report. Fields from this section can be dragged to the row fields, question fields, and response fields sections, or a field can be moved by selecting it and clicking the right arrow.
Row Fields	Move fields to this section to define them as rows in the report. Row fields generally do not have a parent/child relationship with other data in the report, but instead show data that applies to the entire guide tree. For example, a row field could display the name of the guided assistance guide that includes the question and response fields.
Question Fields	Move fields to this section to define them as question fields in the report. These fields generally display information pertaining to the questions, such as the question description or question type.
Response Fields	Move fields to this section to define them as response fields in the report. These fields generally display information pertaining to the responses, such as the response description or response order.
Parent Question Field	Click this drop-down menu and select the field you want to use to display the parent question in the tree. Only integer or text type fields can be selected.
Child Question Field	Click this drop-down menu and select the field you want to use to display the parent question's child questions. Only integer or text type fields can be selected. In addition, the field type must match that of the field selected for the parent question field.
Clear All	Click this button to clear all fields and reset the guide display options.

4 Click the OK button to save the changes and generate the report.

Saving and resetting report display settings

Once you edit a column or make changes to a report's output options, you can use the Save as Default and Restore options on the Home tab's Default Settings button to preserve the changes or to clear any changes you have made.

Saving display and data settings

When you change display and data settings or column formatting to modify a report's appearance, those changes are lost when you close the report. When you next view the report, it opens using the defaults defined when the report was created. However, using the Save as Default feature, you can save changes to these settings to your workstation so the report uses the display and data settings you previously defined.

If you save default settings for a report and the report's default settings are later changed, your saved settings are removed. Saved settings are user specific, so you must log in as the same staff account to have your saved settings applied to the report. Refer to Changing your personal settings.

To save display and data settings for a report

1. Open a report and change display and data settings.
2. Click the Home tab.
3. Click the Default Settings button and select Save as Default.

Resetting display and data settings

You can remove a report's display and data settings that are stored on your workstation. Once you do so, these settings return to the defaults defined in the report.

To reset display and data settings

1. Open a report which has display and data settings stored on your workstation.
2. Click the Home tab.
3. Click the Default Settings button and select Restore. A warning message asks if you are certain you want to restore the default settings.
4. Click the Yes button to delete your personalized report settings from your workstation.

Editing data inline

When a report displays unique records, such as incidents or opportunities, the Inline Editing feature lets you edit the values in columns shown on the report without opening the records. Individual values can be edited directly from the report, or you can edit values in multiple records. For example, if a report shows the staff member an incident is assigned to, you can change the assigned staff member from the report without opening the record, or you can reassign several incidents shown on the report to a selected staff member.

Important In order for staff members to edit records using inline editing, their profile must include permission to edit the type of records returned in the report. Refer to Customizing profiles. In addition, inline editing must be enabled for the report and the report must display data that can be edited. Refer to Enabling inline editing.

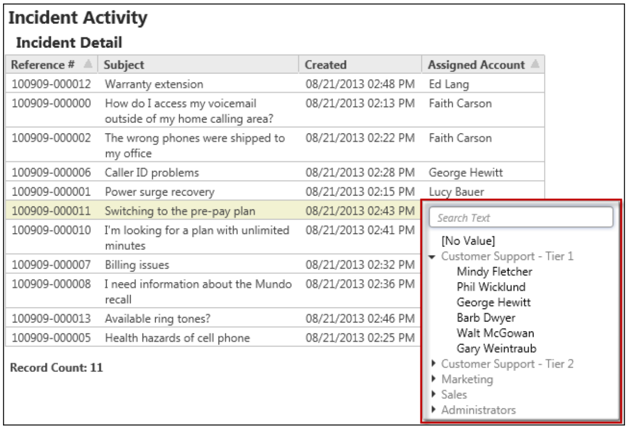
When you edit data inline on a report, the changes you make need to be saved to the server. If this is not done, the information stored in the server's database will not be updated. You can either manually save the changes or use the Auto Save feature to automatically save each change after it is made.

Editing individual values inline

When editing options are enabled in a report, the data shown on the report can be edited by selecting individual values directly on the report. Editing options vary depending on the type of field being edited. For example, a text field presents a text box and a menu field presents a drop-down menu.

Note If a required custom field is selected for inline editing, the field requires a value before the record can be saved.

An example of a menu field being edited inline on a report is shown in the following figure.



To edit an individual value inline

1 Click the row that displays the information you want to edit.

Tip You can see which fields can be edited inline by hovering over the fields on the selected row. Fields that can be edited are highlighted in blue.

2 Click the field that you want to change. Editing options specific to the field's **data type** display. For example, menu options display for menu fields and date options display for date fields.

3 Enter the new value.

4 Press **Enter** or click outside the field you are editing. Changes to some field types are applied automatically when you enter the value.

Tip You can press **Esc** to cancel the edit.

5 If inline edits are not saved to the server automatically, click the Save button on the ribbon's Home tab to save the change to the server. Refer to Saving changes to the server.

Editing values in multiple rows

If your report includes numerous rows with the same value that you want to edit, you can select the rows and change the value using the Edit Selection feature. You can also use **slicing** to group the records by the field you want to edit and then drag the records you want to change to the correct slice group.

To edit values in multiple rows using the ribbon

1. From an open report that allows inline editing, press **Ctrl** while selecting each record.
2. Click the Home tab.
3. Click the Edit Selection button. A menu displays the fields that can be edited in the rows.
4. Select the field that you want to edit. Editing options specific to the field's data type display.
5. Enter the value you want the selected records to have.
6. Click the OK button to apply the change to the selected records.
7. If inline edits are not saved to the server automatically, click the Save button on the ribbon's Home tab to save the changes to the server. Refer to Saving changes to the server.

To edit multiple values using slicing

1. Slice the report to group the records by the field you want to edit, displaying the slices as a tree rather than links.

   For example, if you want to reassign several incidents to a different staff account, slice the report by the report's Assigned Account column. Refer to Slicing report data.
2. Select the folder in the slice tree that contains the records you want to edit.
3. Press **Ctrl** while selecting each record you want to edit.
4. Drag the selected rows to the folder on the slice tree that shows the value you want. Once you drop the rows on the slice tree, the report is updated to show the new values for the selected rows.
5. If inline edits are not saved to the server automatically, click the Save button on the ribbon's Home tab to save the changes to the server. Refer to Saving changes to the server.

Saving changes to the server

When you edit data inline, the changes need to be saved to the server. If the Auto Save feature is enabled, each change is saved automatically. However, you can also disable Auto Save if you want to make several changes and then save the changes to the server. Refer to Enabling inline editing for information about enabling Auto Save.

When data has been edited on a report but the changes have not been saved to the server, a visual indicator displays on the report next to the edited value. Once the data is saved to the server, the visual indicator is removed. This report shows three incidents that have been reassigned to other agents using inline editing. The blue triangles in these fields indicate that the changes have not yet been saved to the server.

Reference #	Subject	Created	Assigned Account
100909-000012	Warranty extension	08/21/2013 02:48 PM	Mindy Fletcher
100909-000000	How do I access my voicemail outside of my home calling area?	08/21/2013 02:13 PM	Phil Wicklund
100909-000002	The wrong phones were shipped to my office	08/21/2013 02:22 PM	George Hewitt
100909-000006	Caller ID problems	08/21/2013 02:28 PM	George Hewitt

To automatically save changes

Click the Home tab and then click the Auto Save button. The button is highlighted when Auto Save is enabled. Any other inline edits made to the report's fields will then be saved to the server automatically until the report is closed again.

To manually save changes

Click the Home tab and then click the Save button.

36

Data Dictionary

The information returned in reports and dashboards is stored in your site's Oracle Service Cloud **database**, allowing you to see vital information about your customers, staff members, and interfaces. Not all the information in the database is accessible to Oracle RightNow Analytics Cloud Service (Analytics), but you have another option for viewing all the tables in the database.

Using the data dictionary, you can access all the tables in the database and view details about each tables' columns.

Viewing the data dictionary

You can access the data dictionary within the **administration interface** to view details about all the tables in the database. You can also view information about each table's columns, such as the columns' names, descriptions, and database types.

Note You can add the Data Dictionary component to any navigation list for quicker access to the data dictionary. Refer to Customizing navigation and configuration lists.

To view the data dictionary

1 Click the Configuration button on the navigation pane.

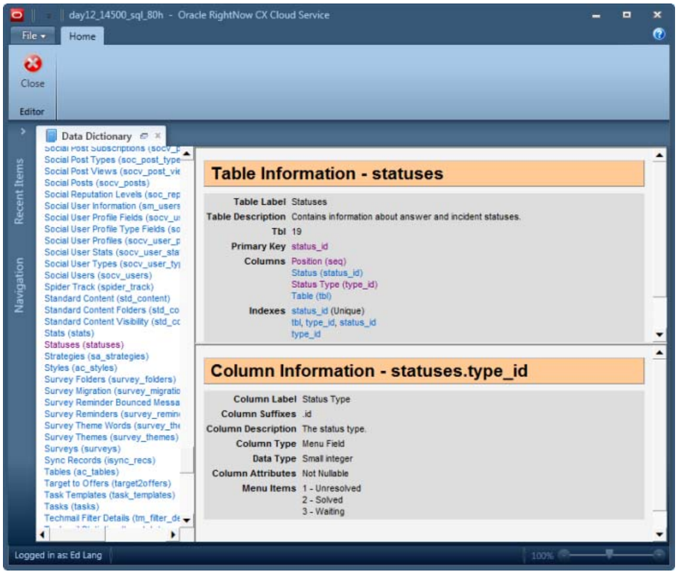
2 Double-click Data Dictionary under Database. The content pane displays a list of all the tables in the database.

3 Click a table on the left to view the table information on the right. The details that display depend on the table you have selected. The following table describes the fields you may see in the Table Information section.

Table 299: Table Information Description

Field	Description
Table Label	Lists the descriptive table name used in the data dictionary throughout Oracle Service Cloud.
Table Description	Displays a description of the table.
Tbl	Displays the table ID number.
Visibility	Indicates the products and components that use the table, such as Service, Offer Advisor, and Chat.
Custom Fields	Indicates whether custom fields are allowed in the table.
Primary Key	Lists the primary key columns. Click a column to view the column information.
Columns	Lists the columns contained in the table. Click a column to view the column information.
Indexes	Lists the indexed columns in the table. Click an indexed column to view the column information.

4 To view column details, click a column in the Table Information section. The details that display depend on the column you select. Here is a sample of the data shown in the data dictionary.



The following table describes the fields you may see in the Column Information section.

Table 300: Column Information Description

Field	Description
Column Label	Displays the descriptive column label used by the data dictionary throughout Oracle Service Cloud.
Column Suffixes	Indicates the suffixes that can be used with this column in analytics, such as *.id* or *.name*.
Column Description	Displays a description of the column.
Column Type	Displays the type of column, such as menu field or major join field.
Data Type	Lists the column data type, such as integer or varchar.
Length	Lists the number of characters allowed in the field.
Column Attributes	Lists the column attributes, such as not nullable or unique.

Table 300: Column Information Description (Continued)

Field	Description
Analytics Usage	Indicates how the column can be used in analytics. • All—Can be used anywhere in the report • Display—Can be used in a display column • Exception—Can be used in an exception • Filter—Can be used in a regular (node) filter • Group—Can be used to group • Group Filter—Can be used in a group filter • Join Filter—Can be used in a join filter • No Search—Can be used in a display column, exception, or group filter, and can be used to group or sort • Search—Can be used in a regular, group, or join filter, and exception • Sort—Can be used to sort
Menu Items	Lists the text and ID numbers of the possible menu values for the column.
Joins	Lists the columns that the selected column is joined to.

37

Analytics Configuration Settings

A number of site **configuration settings** can impact how your reports run, how certain information in them is displayed, and how much information is available for the reports to return. The settings you should be aware of are described in this section, and are organized by the folder and subfolders where they are located. For information about modifying configuration settings, refer to Customizing configuration settings.

Important Changes made to site configuration settings can greatly impact the performance and functionality of your entire site. Before you change any site configuration setting, it is important that your organization understands the impact of changing the setting.

Common settings

Only one setting in the Common category impacts reports: KF_ACTIONABLE_-DATA_PURGE_DAYS, located in the Common > Knowledge Base folder. This setting allows you to specify the number of days that daily actionable knowledge base reporting statistics are stored in the database. To prevent these statistics from being removed, set this value to 0. The default value for this setting is 45 days.

RightNow Common settings

The following settings are located in the RightNow Common folder. These settings let you adjust a number of values that impact what information is available in certain reports, the maximum size of generated reports, date and time formats, and other aspects of reporting.

Table 301: RightNow Common Analytics Settings

To…	Use this setting…
RightNow Common > Service Modules > Clustering Field	
Enable clustering and the use of clustering information by other modules. **Note:** The default value for this setting is enabled (Yes).	CLUST_ENABLED
RightNow Common > General Analytics Options > Server Options	
Specify how many days charts and other images in scheduled reports and forwarded reports are kept. Scheduled reports use the "stored on the server" formats and forwarded reports use the HTML attachment option. The maximum is 90 days. **Note:** The default value for this setting is 14.	KEEP_EMAILED_IMAGES
Specify the maximum file size, in bytes, the Web server can return to the client when generating a report. The maximum value for this setting is 2147483647 (2 GB). **Note:** The default value for this setting is 15728640 (15 MB).	MAX_ANALYTICS_FILE_SZ
Specify the number of days after which report run audit log rows are deleted. **Note:** The default value for this setting is 10.	PURGE_REPORT_RUN_AUDITS
RightNow Common > General Analytics Options > Report Options	
Specify the choice of the From address when a report is emailed as a subscription or when using the Send To feature. The accepted values are: 1 - The From address defined in the default mailbox for the interface. 2 - The email address of the staff member who owns the scheduled report and/or sends the report. **Note:** The default value for this setting is 2.	RPT_FROM_ADDR

Table 301: RightNow Common Analytics Settings (Continued)

To…	Use this setting…
RightNow Common > General Analytics Options > Custom Scripts	
Specify the size of the data buffer (in bytes) used when processing custom scripts in Analytics. **Note:** The default value for this setting is 50000.	CUSTOM_SCRIPT_DATA_SIZE
RightNow Common > General Analytics Options > Group Date Format	
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Year/Month/Day at runtime. **Note:** The default value for this setting is YYYY/MM/DD.	GRP_DT_DATE_DAY_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Year/Month/Day/Hour at runtime. **Note:** The default value for this setting is YYYY/MM/DD/HH24.	GRP_DT_DATE_HOUR_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Year/Month at runtime. **Note:** The default value for this setting is YYYY/MM.	GRP_DT_DATE_MONTH_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Year/Quarter at runtime. **Note:** The default value for this setting is YYYY/Q.	GRP_DT_DATE_QUARTER_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Year/Week at runtime. **Note:** The default value for this setting is YYYY/WW.	GRP_DT_DATE_WEEK_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Year/Week Start at runtime. **Note:** The default value for this setting is YYYY/WWW.	GRP_DT_DATE_WEEK_START_FMT

Table 301: RightNow Common Analytics Settings (Continued)

To…	Use this setting…
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Day of Month at runtime. **Note:** The default value for this setting is DD.	GRP_DT_- DAY_OF_MONTH_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Day of Week at runtime. **Note:** The default value for this setting is DAY.	GRP_DT_DAY_OF_WEEK_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Hour at runtime. **Note:** The default value for this setting is HH24.	GRP_DT_HOUR_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Month/Day at runtime. **Note:** The default value for this setting is MM/DD.	GRP_DT_MONTH_DAY_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Month at runtime. **Note:** The default value for this setting is MM.	GRP_DT_MONTH_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Quarter at runtime. **Note:** The default value for this setting is Q.	GRP_DT_QUARTER_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Week at runtime. **Note:** The default value for this setting is WW.	GRP_DT_WEEK_FMT
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Week Start at runtime. **Note:** The default value for this setting is WWW.	GRP_DT_WEEK_START_FMT

Table 301: RightNow Common Analytics Settings (Continued)

To…	Use this setting…
Specify the format string used in the predefined group date list for output variables, if the user selects grouping by Year at runtime. **Note:** The default value for this setting is YYYY.	GRP_DT_YEAR_FMT

RightNow User Interface settings

The following settings are located in the RightNow User Interface folder.

Table 302: RightNow User Interface Analytics Settings

To…	Use this setting…
RightNow User Interface > Misc. Customization > Query	
Specifies the maximum number of rows that can be displayed in a report. Limiting the number of rows prevents inefficient reports from returning more rows than can be quickly processed and displayed. If the number of rows returned in a report exceeds this number, the remaining results are not displayed. **Note:** The default value for this setting is 10000. This setting is ignored when sending queued or scheduled reports to comma-separated values (CSV) files. Refer to Queuing reports and Scheduling reports.	VRL_HARD
RightNow User Interface > Support > General	
Specifies the number of days after which solved incidents are no longer fully searchable. Solved incidents whose closed dates are older than the number of days specified only support searching on keywords in the subject. Set this value to 0 or to a value greater than the value in ARCHIVE_INCIDENTS to disable this feature. **Note:** Sites with less than 1 million rows in the incidents table are not affected. Default is 366.	PURGE_DELETE_INCIDENT_PHRASES

Agedatabase settings

The Agedatabase utility automatically runs on the server hosting your Oracle Service Cloud site. The utility's main function is to perform automatic maintenance on your knowledge base (for example, aging incidents and answers). However, Agedatabase also caches report data into individual report tables to make report generation more efficient, and it purges old information that is no longer required for reports to help maintain the efficiency of your database.

The following settings are located in the Agedatabase folder. These settings let you set the aggressiveness of the utility's data caching and purging, and specify values used by certain opportunity tracking reports that use cached data.

Important Changes made to configuration settings can greatly impact the performance and functionality of your entire site. Before you change any configuration setting, it is important that your organization understands the impact of changing the setting.

Table 303: Agedatabase Utility Analytics Settings

To…	Use this setting…
Agedatabase > Batch Processing > Miscellaneous Purging	
Define the number of days after which incident performance statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. **Note:** The default value for this setting is 0.	PURGE_DELETE_INC_PERFORMANCE
Define the number of days after which keyword search statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. **Note:** The default value for this setting is 120.	PURGE_DELETE_KEYWORD_SEARCHES
Define the number of days after which queue statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. **Note:** The default value for this setting is 120.	PURGE_DELETE_QUEUE_STATS
Define the number of days after which session summary statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. **Note:** The default value for this setting is 0.	PURGE_DELETE_SESSION_SUMMARY

Table 303: Agedatabase Utility Analytics Settings (Continued)

To…	Use this setting…
Specifies the number of days after which **Techmail** statistics stored in the Techmail Filter Details (tm_filter_details) and Techmail Statistics (tm_stats) tables will be deleted. A value of 0 disables purging of these tables. **Note:** The default value for this setting is 30.	PURGE_DELETE_TM_STATS
Define the number of days after which login/logout sessions are removed from the user_trans table (relative to the logout time). Set this value to 0 to prevent login/logout sessions from being removed from the database. **Note:** The default value for this setting is 0.	PURGE_DELETE_USER_TRANS
Define the number of days after which voice statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. **Note:** The default value for this setting is 90. For sites with multiple interfaces, statistics are removed from all interfaces based on the interfaces' smallest non-zero value for this setting.	PURGE_DELETE_VOICE_STATS
Specify the number of days after which guided assistance session data will be deleted. Set this value to 0 to prevent session data from being deleted. **Note:** The default value for this setting is 30.	PURGE_GUIDE_SESSIONS
Specify the number of days after which guided assistance statistics are removed from the database. Set this value to 0 to prevent statistics from being removed from the database. **Note:** The default value for this setting is 0.	PURGE_GUIDE_STATS
Specify the number of days after which files that store the output from queued reports and dashboards are deleted. **Note:** The default value for this setting is 7 days.	PURGE_QUEUED_REPORT_DAYS
Specify the number of days after which Rule Log entries are deleted. The maximum value for this setting is 180. A value of zero results in the data being deleted after 180 days. **Note:** The default value for this setting is 30.	PURGE_RULE_LOG_FREQ

Table 303: Agedatabase Utility Analytics Settings (Continued)

To…	Use this setting…
Specify the number of days after which data in the **Social Monitor** Statistics (sm_stats) table is deleted. This setting is not interface specific, so Agedatabase will use the smallest value specified in any of your interfaces to determine how often to purge the data. A value of 0 disables purging. The maximum value for this setting is 1825. **Note:** The default value for this setting is 1095.	PURGE_SM_STATS
Agedatabase > Batch Processing > Opportunities	
Specify the day of the week that the opportunities table is cached for the current sales period(s). Values refer to the day of week, with 1 being Sunday, 2 being Monday, and so on. A value of 0 disables opportunity caching. **Note:** The default value for this setting is 6 (Friday).	OPP_SNAPSHOTS_SCHEDULE
Agedatabase > Batch Processing > Gap Analysis	
Specify how frequently (in days) the Information Gap report is generated. **Note:** The default value for this setting is 7.	GAP_FREQUENCY
Specify the time period reported on in the Information Gap report. The report will analyze incidents created during the specified number of days. **Note:** The default value for this setting is 7.	GAP_TIME_PERIOD
Agedatabase > Batch Processing > Sales Performance	
Specify the quota attainment threshold as a percentage that a given salesperson should meet to be classified as a “Top Performer.” **Note:** The default value for this setting is 95.	SALES_TOP_PERFORMER_-THRESHOLD

Table 303: Agedatabase Utility Analytics Settings (Continued)

To…	Use this setting…
Specify the relative value from 1-10 of money versus opportunity counts in reviewing a salesperson or group's current performance. A value of 5 means they are treated equally. A value of 7 means that total monetary value of opportunities is more important than the number of opportunities. A value of 3 means that the number of opportunities is more important than the total value of those opportunities. **Note:** The default value for this setting is 5.	SALES_TP_METRIC_BALANCE
Specify the relative value from 1-10 of a salesperson or group's closed revenue in reviewing current performance. This value is relative to the other SALES_TP_REL_VALUE_* configuration settings. **Note:** The default value for this setting is 5.	SALES_TP_REL_VALUE_CLOSED
Specify the relative value from 1-10 of a salesperson or group's lost revenue in reviewing current performance. This value is relative to the other SALES_TP_REL_VALUE_* configuration settings. **Note:** The default value for this setting is 5.	SALES_TP_REL_VALUE_LOST
Specify the relative value from 1-10 of a salesperson or group's closed revenue of new business in reviewing current performance. This value is relative to the other SALES_TP_REL_VALUE_* configuration settings. **Note:** The default value for this setting is 5.	SALES_TP_REL_VALUE_NEW_BUSINESS
Specify the relative value from 1-10 of a salesperson or group's pipeline in reviewing current performance. This value is relative to the other SALES_TP_REL_VALUE_* configuration settings. **Note:** The default value for this setting is 5.	SALES_TP_REL_VALUE_PIPELINE

38

Transaction Descriptions

Many of the standard reports available in Oracle RightNow Analytics Cloud Service (Analytics) use data from the database's *transactions* table. The information in this table describes the actions taken on records (such as incidents, answers, and contacts) and items (such as mailings, surveys, and quotes) in your database. For example, when an incident is created and then assigned to a staff member, two entries are added to the *transactions* table. The first entry describes when the incident was created, who created it, and where it was created from. The second entry describes who the incident was assigned to and when it was assigned.

Due to the amount of information stored in the *transactions* table, it can be challenging to write custom reports that use information from the table. However, once you understand how to use the data in the table, you can create powerful custom reports to output or filter on almost all actions taken on the records and items in your database.

- Click here for brief descriptions of all the fields in the *transactions* table.
- Click here for descriptions of the types of transactions and the records and items they can apply to.
- Click here for detailed descriptions of the *transactions* table's *attribute 1*, *attribute 2*, *attribute 3*, and *description* fields.

Important You can view additional information about the *transactions* table and information about other database tables in the data dictionary. You can access the data dictionary from the Configuration button on the navigation pane under Database > Data Dictionary.

Transaction field descriptions

This table briefly describes all the fields in the *transactions* table.

Table 304: Transactions Description

Field	Description
Account ID (acct_id)	The staff member who performed the transaction. This field will be NULL for transactions not initiated by a staff member.
Attribute 1 (id1) Attribute 2 (id2) Attribute 3 (id3)	These fields contain information specific to certain types of transactions taken on certain records and items. The field values will be NULL for many transactions. • Click here for descriptions of the Attribute 1 (id1) field's contents. • Click here for descriptions of the Attribute 2 (id2) field's contents. • Click here for descriptions of the Attribute 3 (id3) field's contents.
Attribute 4 (id4)	This field contains the channel type for transactions describing Oracle RightNow Social Monitor Cloud Service (Social Monitor) activity. This field is populated only for the Response Sent (8), Message Sent Failure (15), Cloud Response Queued (37), Cloud Response Received (51), and Cloud Result Appended (53) transaction types. The available values for this field are: • 1 - CSS Email • 2 - MA Email • 3 - Phone • 4 - Fax • 5 - Post • 6 - CSS Web • 7 - MA Web • 8 - Chat • 9 - Email • 10 - Community • 11 - Twitter • 12 - YouTube • 13 - RSS • 14 - Facebook
Date Created (created)	The date and time the transaction occurred.

Table 304: Transactions Description (Continued)

Field	Description
Date/Time (dttm)	The scheduled date and time for a mailing. This value will be NULL for any other record or transaction type.
Description (description)	This field contains information specific to certain types of transactions taken on certain types of records and items. This field will be NULL for many transactions. Click here for descriptions of this field's contents.
Foreign Key (id)	The unique ID number of the record, such as an incident or contact, that the transaction affected.
Interface (interface_id)	The interface the transaction was performed in.
Client IP Address (ip_address)	The IP address where the transaction originated.
Source (source_lvl1—source_lvl2)	The component where the transaction occurred. Level-1 source codes are the general area of Oracle Service Cloud, and level-2 sources are the specific component. Refer to the data dictionary for descriptions of the source codes.
Source Hierarchy (source_hierarchy)	The level-1 and level-2 sources displayed in a hierarchical menu.
Table Association (tbl)	The type of record or item the transaction occurred on, such as an incident, quote, or survey. Click here for a list of record and item types and the types of transactions that can apply to them.
Type (trans_type)	The type of transaction that occurred, such as a record being created or edited. Click here for a list of all transaction types.

Transaction types

The types of transactions stored in the *transactions* table are listed in the following table. The table also shows the types of records and items that the transaction types can apply to. The numbers shown in parentheses after the transaction and record and item types are the numeric codes for the types.

Note Some transaction types listed in the table are intended for use only by Oracle Professional Services.

Transaction Types (trans_type)	Table Associations (tbl)																
	Incidents (1)	Contacts (2)	Organizations (3)	Answers (9)	Meta-answers (10)	Quotes (12)	Documents (51)	Contact Lists (52)	Mailings (53)	Mailing Messages (54)	Segments (79)	Opportunities (87)	Tasks (106)	Flows (126)	Surveys (127)	Campaigns (163)	Assets (542)
Created (2)	●	●	●	●	●	●	●	●	●		●	●	●		●	●	●
Edited (3)	●	●	●	●	●	●	●	●	●	●	●	●	●		●	●	●
Assigned (4)	●			●					●			●	●		●	●	
Access Level Changed (5)				●

Invalid Email Flag Changed (35)		●															

Attribute and description fields

The information contained in the *transactions* table's *attribute 1*, *attribute 2*, *attribute 3*, *attribute 4*, and *description* fields vary depending on the transaction type and the type of record or item the transaction is associated with.

Note These fields are not populated for all types of transactions or all combinations of transactions and records. For example, the *attribute 1* field contains the IP address of the source of an incident creation, but the value in this field will be NULL for an answer creation or an incident escalation.

The following table describes the contents of the *attribute 1* (id1) field for each transaction type. The number in parentheses is the type's ID number.

Table 305: Attribute 1 (id1) Field Values

Transaction Type	Attribute 1 Description
Created (2)	If the **record type** is an incident, this is the IP address of the incident's source for both the Created and Edited transaction types.
Edited (3)	
Assigned (4)	This is the assigned group.
Status Change (6)	This is the new status. **Note:** To filter reports on incident, answer, or opportunity status changes, we recommend using the Status field (*status_id*) in the Incident Statuses (*inc_statuses*), Answer Statuses (*ans_statuses*), or Opportunity Statuses (*opp_statuses*) tables. The Transactions table can be used for this purpose, but additional steps are required.
Response Sent (8)	This is the staff member who sent the response.
Forwarded (14)	This is the staff member who forwarded the record.
Message Send Failure (15)	This indicates the type of transaction that failed: 8–Response sent 14–Forwarded 21–Forwarded by a rule 22–Quote sent
Incident Proposed (16)	This is the answer that was created from the proposed incident.

Table 305: Attribute 1 (id1) Field Values (Continued)

Transaction Type	Attribute 1 Description
Queue Changed (17)	This is the queue the record is assigned to.
Stage Changed (18)	This is the stage the opportunity was moved to.
Quote Sent (22)	This is the staff account that sent the quote.
Opt In (23)	If the value in the transaction's *attribute 2* field is 1, this is the custom field.
Sent (24)	This is the survey that was sent.
Completed (25)	This is the survey that was completed.
Disabled (26)	This indicates if the survey is disabled: 0–Active 1–Disabled
Advanced Mode (27)	This indicates if the survey is in Advanced mode: 0–Not in Advanced mode 1–In Advanced mode
Mailing Error (28)	This is the code associated with the mailing error. For a descriptions of the error codes, refer to the error details (*error_code*) field in the Mailing Messages (*mailing_formats*) table in the data dictionary. You can access the data dictionary from the Configuration button on the navigation pane under Database > Data Dictionary.
Audience Counted (30)	This is the audience count at the time it was counted.
CAN-SPAM Compliance (31)	This is a bit mask that indicates the results of CAN-SPAM compliance testing.
Quote Forecasted (32)	This indicates if the quote was forecasted: 0–Not forecasted 1–Forecasted
Quote Price Schedule Changed (33)	This is the schedule for the associated price schedule.
Quote Template Changed (34)	This is the action that was performed on the template: 1–Add 2–Update 3–Delete

Table 305: Attribute 1 (id1) Field Values (Continued)

Transaction Type	Attribute 1 Description
Invalid Email Flag Changed (35)	This indicates if the primary email address was set to Invalid: 0–Not set to Invalid 1–Set to Invalid
Password (36)	This indicates if the password was manually changed or reset: 0–Changed 1–Reset
Cloud Response Queued (37)	This is the staff member who queued the cloud response.
Country Changed (42)	This is the country the contact's address was changed to.
Province Changed (44)	This is the province (or state) the contact's address was changed to.
Sub-Object Move (47)	This is the ID number of the secondary contact that was merged into the primary contact record.
Cloud Result Appended (53)	This is the ID number of the incident thread the cloud result is appended to.

The following table describes the contents of the *attribute 2* (id2) field for each transaction type. The number in parentheses is the type's ID number.

Table 306: Attribute 2 (id2) Field Values

Transaction Type	Attribute 2 Description
Created (2)	This is the queue the record is assigned to at the time of the transaction for both the Created and Edited transaction types.
Edited (3)	
Assigned (4)	This is the staff member the record is assigned to.
Status Changed (6)	This is the group the staff member who performed the status change belongs to.
Response Sent (8)	This is the group the staff member who sent the response belongs to.
Forward (14)	This is the group the staff member who forwarded the record belongs to.

Table 306: Attribute 2 (id2) Field Values (Continued)

Transaction Type	Attribute 2 Description
Message Send Failure (15)	This indicates the reason for the mailing error: 1–Unknown 2–Message disabled 3–No escalation action 4–Escalation disabled 5–Message queued 6–SMTP error 7–No valid recipients 8–Empty thread
Queue Changed (17)	This is the queue the incident was previously assigned to.
Stage Changed (18)	This is the strategy the opportunity was changed to.
Quote Sent (22)	This is the group the staff member who sent the quote belongs to.
Opt-In (23)	This indicates the type of the opt-in flag: 1–Custom field 2–Global opt-in flag
Sent (24)	This is the account that is assigned to the record when the survey was sent.
Quote Template Changed (34)	This is the template used by the quote.
Invalid Email Flag Changed (35)	This indicates if the first alternate email address was set to Invalid: 0–Not set to Invalid 1–Set to Invalid.
Cloud Result Appended (53)	This is the ID number of the cloud result.

The following table describes the contents of the *attribute 3* (id3) field for each transaction type. The number in parentheses is the type's ID number.

Table 307: Attribute 3 (id3) Field Values

<table>
<tr><th>Transaction Type</th><th>Attribute 3 Description</th></tr>
<tr><td>Created (2)</td><td rowspan="2">If the record was created from a call, this is the call the incident or opportunity was created from for both the Created and Edited transaction types.</td></tr>
<tr><td>Edited (3)</td></tr>
<tr><td>Assigned (4)</td><td rowspan="9">This is the queue the record was assigned to at the time of the transaction for all of these transaction types.</td></tr>
<tr><td>Status Changed (6)</td></tr>
<tr><td>Time Billed Added (7)</td></tr>
<tr><td>Response Sent (8)</td></tr>
<tr><td>Escalated (11)</td></tr>
<tr><td>Forwarded (14)</td></tr>
<tr><td>Message Send Failure (15)</td></tr>
<tr><td>Incident Proposed (16)</td></tr>
<tr><td>Forwarded by a Rule (21)</td></tr>
<tr><td>Opt-In (23)</td><td>This indicates if the flag was enabled or disabled:
0–Disabled
1–Enabled</td></tr>
<tr><td>Quote Template Changed (34)</td><td>This is the template that was changed.</td></tr>
<tr><td>Invalid Email Flag Changed (35)</td><td>This indicates if the second alternate email address was set to Invalid:
0–Not set to Invalid
1–Set to Invalid</td></tr>
</table>

The following table describes the contents of the *description* field for the transaction types that can have values in this field. This field is NULL for most transaction types. The number in parentheses is the type's ID number.

Table 308: Description Field Values

Transaction Type	Description
Created (2)	If the new record is a meta-answer created from a proposed incident, this is the reference number of the incident that was proposed.
Access Level Changed (5)	This is a bit mask describing the answer's new access level(s).
Response Sent (8)	This lists the email addresses (not including BCC) the response was sent to.
Escalated (11)	This is the new escalation level.
Forward (14)	This lists the email addresses the item was forwarded to.
Message Send Failure (15)	This lists the email addresses (not including BCC) that were to receive the message.
Incident Proposed (16)	This is the reference number of the incident that was proposed.
Forwarded by a Rule (21)	This lists the email addresses the record was forwarded to.
Quote Sent (22)	This lists the email addresses (not including BCC) the quote was sent to.
Email Changed (38)	This is the contact's new email address.
Email Alt1 Changed (39)	This is the contact's new Alt1 email address.
Email Alt2 Changed (40)	This is the contact's new Alt2 email address.
City Changed (41)	This is the contact's new city.
Postal Code Changed (43)	This is the contact's new postal code.
Street Changed (45)	This is the contact's new street address.
Proof Message Sent (49)	This lists the email addresses the proof message was sent to.
Document Deployed (50)	This is the name of the deployed document.

Table 308: Description Field Values

Transaction Type	Description
Cloud Response Received (51)	This is the name of the contact who sent the cloud response.
Cloud Result Appended (53)	This is the user name of the contact who posted the entry on Facebook or Twitter.

Service

The following sections are intended for Oracle RightNow Cloud Service (Service) administrators and staff members. They contain information and procedures for configuring and using areas specific to Service.

- Incidents
- Answers
- Content Library
- Service Level Agreements
- Co-Browse Configuration
- Offer Advisor Administration
- Offer Advisor
- Oracle RightNow Wireless
- Mobile Agent App

39

Incidents

When you work with customers to solve their support issues, you are instrumental in creating a positive impression of your organization. As an agent, you are often the customer's first point of contact, and it is important to resolve their concerns quickly and efficiently the first time. Oracle Service Cloud helps you do this by providing comprehensive, accurate, and up-to-date information about all aspects of the customer's communication with your organization.

Besides providing you with all-encompassing information just when you need it, Oracle RightNow Cloud Service (Service) gives you the tools to craft consistent, accurate answers to customer questions. It also allows you to propose **incidents** as **answers**, present **offers** to customers, and create **opportunities** from incidents.

Incidents overview

When customers request help through email or the **Ask a Question page**, or you respond to a social networking post using the **Social Monitor component**, Service automatically creates incidents. Most of the time, these are the incidents you will respond to. At other times, however, you will add incidents. For example, when a customer contacts you by phone, fax, or mail, you will add an incident to create a record of the customer's question.

When you edit or add an incident, you start by answering the customer's question. Service provides help through **standard text**, **suggested answers**, and the ability to search the knowledge base. You define specific information about the incident, such as the staff member it is assigned to, the associated products and categories, and the status and disposition of the incident.

Working with incidents also gives you the ability to add or update contact information, track the amount of billable time you spend on the incident, add or edit tasks related to the incident, attach files to the incident, view all actions taken on the incident, and present promotional offers to the customer. You might also want to propose the incident as a permanent answer in the knowledge base. This allows customers to view the answer without being required to submit an incident.

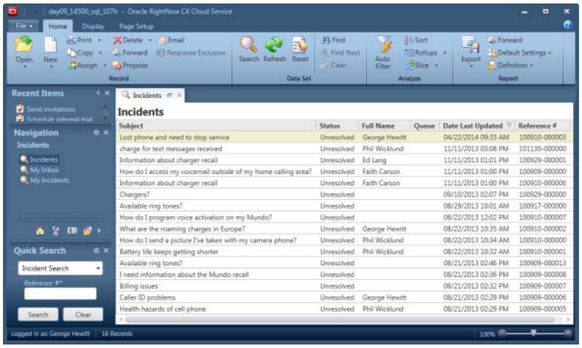
Note Service automatically handles email between separate Oracle Service Cloud sites and the site-specific incidents are accurately updated on each site even if unique reference numbers are used for the same incident. Refer to Cross-site email management.

Incidents reports

When you click the Incidents button on the **navigation pane**, the **navigation list** displays all of the reports and items added to this list by your administrator. The Incidents button, plus all the other buttons you have access to, are part of the **navigation set** defined in your **profile**.

Incidents reports can be placed in other navigation lists, not just the Incidents navigation list. And if you have permission to customize your navigation set, you can add other items, including reports you have permission to access, to your Incidents navigation list or any of your lists. Refer to Customizing navigation and configuration lists.

Double-clicking any incidents report displays the report on the **content pane**. The following figure is an example of the Incidents report.



The incident information displayed on the content pane depends on the incidents report you opened and which fields were defined when the report was created. The Incidents report, for example, displays the incident's subject, **status**, the name of the agent it is assigned to, the **queue** it is assigned to, the date it was last updated, and the associated reference number. The Home tab on the ribbon allows you to open, add, print, copy, assign, delete, forward, and propose incidents. In addition, you can send email to an incident's contact, search for an incident, refresh the report, or reset the search criteria. It also provides data analysis options and options for working with the report. Additional tabs on the report ribbon include options for controlling display and page setup.

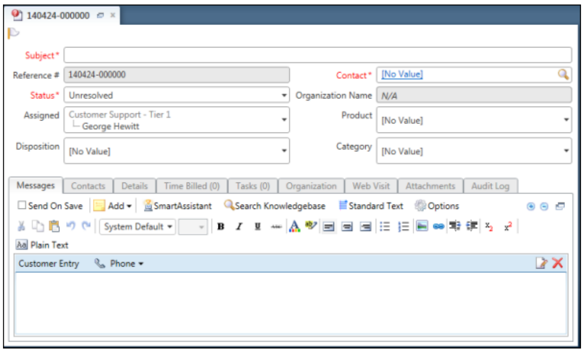
Besides selecting an incident from a report, you can search for incidents from a report or use Quick Search. Refer to Searching for records.

Tip You can right-click any incident and select the same functions that are available on the incidents report **ribbon**.

❖ Searching for records

Standard incident workspace

Service provides a standard **workspace** for working with incidents. The workspace defines which fields are available, which buttons are displayed on the **ribbon**, and how the information is organized on the **content pane**. The following figure is an example of the standard incident workspace.



Your organization can use the standard incident workspace, or your administrator might have created one or more customized workspaces. Your **profile** defines the workspace you see when you work with incidents, whether it is the standard workspace or a customized workspace. If you are using a customized workspace, keep in mind that the workspace your profile uses may display a different combination of fields, or it may display them in a different location on the content pane. Refer to Custom workspaces.

Ribbon

The following table describes the buttons on the **ribbon** of the standard incident workspace.

Table 309: Incident Ribbon Description

Group/Button	Description
Editor	
Undock	Click this button to undock the incident editor from the console and display it in a separate window.
Save	
Save	Click this button to save the incident you are working on. The incident remains open. **Note:** When you save an incident, the rules engine evaluates it. If incident rules exist and the incident matches one or more rules, the record may be modified when you save it. For example, a rule can change an incident's **disposition** or add **suggested answers** to the Response field of the Messages tab. Refer to Choosing actions.
Save and Close	Click this button to save the incident you are working on and close the incident.
Send	Click this button to send the response you are working on to the primary contact and to anyone in the CC and BCC fields if shown.
Actions **Note:** With the exception of the New button, the buttons in this group are not enabled until after you have saved an incident you are adding.	
New	Click this button to add an incident. The procedure to add an incident is covered in Adding incidents.
Refresh	Click this button to refresh the current set of incident records.
Forward	Click this button to forward the incident to any email address, staff account, or group. Refer to Forwarding records.
Print	Click this button to print the incident. Refer to Printing records.
Copy	Click this button to copy the incident. Refer to Copying records.
Delete	Click this button to delete the incident.

Table 309: Incident Ribbon Description (Continued)

Group/Button	Description
Proofing	
Spell Check	Click this button to check the spelling of any incident fields that have spell checking enabled. Refer to Spell checking.
Related Activities	
Guided Assistance	Click this button and either select or search for a **guide** that will ask you questions before directing you to information to help solve the incident. Refer to Finding answers using guided assistance. **Note:** This button will not display until guided assistance is enabled and you have guided assistance permission in your profile.
Propose	Click this button to propose the incident as an answer. Refer to Proposing answers. **Note:** This button is not enabled until after you have saved an incident you are adding.
Offer Advisor	Click the button to open the Offer Advisor window, which allows you to present **offers** to the customer. Refer to Presenting offers. **Note:** This button is enabled when an offer is available.
New Opportunity	Click this button to create an opportunity that provides information about the incident to your sales department. Refer to Creating opportunities from incidents.
Appointment	Click this button to add an Outlook appointment that is associated with the incident.
Links and Info	
Links	Click this button to select a URL from the list of links added by your administrator.
Info	Click this button to see details about the incident, including the incident ID, when it was created and last updated, the date when the initial response was due, the date of the last response, the date of the initial response, the closed date, and the staff member who created it. If the incident has an escalation level or is in a rules state, that information also appears.

- [Working with the ribbon]
- [Displaying shortcut keys on the ribbon]

Record tabs

Using the incident record tabs, you can respond to the customer and add and edit other information relevant to the incident. You can also work on the incident in stages if you choose, letting you save the changes and then return later to complete your work.

Important If you make changes to fields on any of the incident record tabs or any of the sub-tabs or windows opened through the record tabs (for example, the contact editing sub-tab), you must save the incident in order for all changes on the record tabs to take effect. If you close the record without saving changes, those changes are lost.

- **Messages tab**—Contains fields that allow you to add a customer entry, response, or private note to the incident thread and respond to the customer using either HTML or plain text. From this tab, you can also view suggested answers from **SmartAssistant**, search the **knowledge base** for public answers, and insert **standard text** into your response. Refer to [Adding incidents].
- **Contacts tab**—Lists all contacts associated with the incident. The number of contacts associated with the incident displays in parentheses next to the tab name. You can add, open, print, copy, delete, remove, and email contacts from the incident. Refer to [Adding and editing contact information].
- **Details tab**—Contains fields for collecting additional information about the incident, which is beneficial for reporting purposes. Refer to [Adding incident information on the Details tab].
- **Time Billed tab**—Lists all time billed entries for the incident. From this tab, you can add, open, and delete time billed entries. Refer to [Tracking your time].
- **Tasks tab**—Lists all of the tasks associated with the incident. You can add, open, copy, delete, print, and forward tasks and mark tasks complete. The Tasks tab displays a number in parentheses to show how many tasks are associated with the opportunity. Refer to [Adding tasks].
- **Organization tab**—Lists the organization associated with the incident. Refer to [Adding organizations].

- **Web Visit tab**—Lists all actions the customer took before submitting the incident. Also provided are the client IP address, operating system, and browser used by the customer during their visit. Refer to Viewing web visit information.
- **Attachments tab**—Lists all files attached to the incident. For instance, if a customer forwards a document that is associated with the incident, the Attachments tab provides a convenient location where you can store the document for retrieval. You can add, open, download, delete, and view the properties of file attachments from this tab. Refer to Attaching files to records.
- **Audit Log tab**—Contains a permanent list of all actions associated with an incident, including the date of the action, who performed the action, what the action was, and a description of the action. This information is valuable for tracking interactions with customers, especially if more than one staff member works on the same incident. Refer to Audit logs.

Working with incidents

When a customer submits a question, Service automatically creates an incident that contains the subject, customer's question, and contact information. You can complete an incident response in a single editing session, or you might find it useful to work on one part of the response and then return later to complete the rest of the incident.

The standard incident **workspace** enables you to move quickly from one section to the next as you work on incidents. You can edit any part of an incident in any order. The majority of incidents are assigned to you or pulled into your **inbox**. When incidents are assigned to you, some information in the record is populated when you open the incident.

Filling your inbox

If your **profile** has incident editing permission and **queues** assigned to it, you can click the Fill Inbox button on the **ribbon** of any incidents report displayed on the **content pane**.

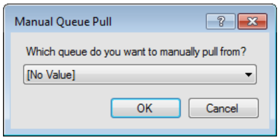
When you click the Incidents navigation button and double-click the default My Inbox report, the incidents that are assigned to you are displayed. As you respond to and solve incidents, their **status** changes to Solved or Waiting. You can continue to refill your inbox to retrieve new unresolved incidents.

To fill your inbox

Click the Fill Inbox button on the ribbon of any incidents report.

If your profile has been set to a manual pull policy, the Manual Queue Pull window opens and you can click the arrow to select the queue to pull incidents from.

Note If only one queue is configured to pull incidents from, the Manual Queue Pull window does not display.



If the displayed incidents report does not display incidents by assigned staff member, you can open the My Inbox report to view incidents that were added when you clicked the Fill Inbox button.

Unresolved incidents in any of the queues designated in your profile are available to be pulled. The order in which you work on incidents is determined by the queue priority and any processes set up by your administrator.

Editing incidents

The fields you see when adding or editing an incident are defined in a **workspace** that is assigned to your **profile**. Some of the fields are required by default, and your administrator may require that other fields also be completed. You must complete any field marked with a red label and asterisk before you can save the incident.

Note Incidents do not have to be completed in any particular order, but you must complete all required fields before you can save an incident.

The following list provides the steps involved when editing an incident.

- Complete the incident fields. Refer to Editing key incident fields.
- Compose your response to the customer. Refer to Responding to incidents.
- To add content to your response, refer to Adding content to responses.
- To add or edit contact information, refer to Adding and editing contact information.

- To track the time you spend editing the incident, refer to Tracking your time.
- To add or edit tasks associated with the incident or its contact, refer to Adding tasks.
- To add or edit organization information, refer to Adding organizations.
- To present an **offer** to a customer who is eligible for one, refer to Presenting offers to customers.
- To create an opportunity for the sales department to follow up, refer to Creating opportunities from incidents.
- Send a response to the customer. Refer to Sending responses.

You can save the incident at any stage of the process and either continue editing or close the incident and return later to complete it.

Important When you save an incident, it is evaluated by the rules engine. Your administrator may have added **business rules** to simplify and automate your work. For example, rules can change incident fields, apply an **SLA instance**, add **suggested answers** to your response, and take many other actions automatically. If you save an incident without closing it and the incident matches one or more rules, it is possible that the incident was automatically modified by the rules engine. If you notice that changes have been made to the incident, you may want to check with your administrator to verify that they are the result of rule actions. Refer to Business rules overview.

Before you start editing incidents, you will benefit from understanding what certain field properties mean in order to provide accurate responses to customers. This includes **incident statuses** and **SLAs**, as they play an important role when you interact with customers.

Incident statuses

Incidents can have one of the four default incident statuses, or they may have a custom status defined by your administrator. The default statuses are Unresolved, Solved, Updated, and Waiting.

Depending on how Service is configured in your organization, the status can change automatically when you or the customer make changes to the incident. You can also change an incident's status manually.

The following example describes how an incident's status can change automatically.

1 A customer submits a question from the Ask a Question page. The new incident has a status of Unresolved.

2 The customer updates the question before you begin working on the incident. The incident remains unresolved, but the incident status changes to Updated to reflect the customer's actions and alert you to the change.

3 You edit the incident and send a response to the customer. Your system may be configured in either of the following ways to automatically change the status, or it may be configured so that no status change occurs.

  ▷ The incident's status changes to Solved.

Important Regardless of how your system is configured, the status of an incident automatically changes to Solved when the customer selects "No, I don't need this question answered now" on the question details page or through the link in the email response. You will receive an incident notification.

  ▷ The incident's status changes to Waiting.

  The Waiting status signifies that you have sent a response and are waiting for the customer to let you know if this answers the question. If your system has this configuration and the customer does not respond within forty-eight hours (the default time), the system automatically changes the status to Solved and sends an email to the customer.

Applying SLAs

Another field you may work with is the SLA Instance field. An SLA is a service level agreement. SLAs allow your organization to assign and track customer service, such as the number of questions a customer can submit through different channels and the duration of support.

Both contacts and organizations can have SLAs, but contacts that are associated with an organization do not have individual SLAs. Instead, their incidents are credited to their organization's SLA. Only contacts that do not have an organization association can have SLAs.

Your administrator creates an SLA, which is a generic service contract that has not been applied to any specific customer. An SLA instance is a copy of the generic SLA applied to a specific customer. SLA instances can be applied manually by staff members whose profiles grant them permission to work with SLAs or automatically through **business rules** in Service. (If you have read-only permissions for contacts, organizations, and incidents, you will see View in the SLA Instance field instead of Add or Edit.)

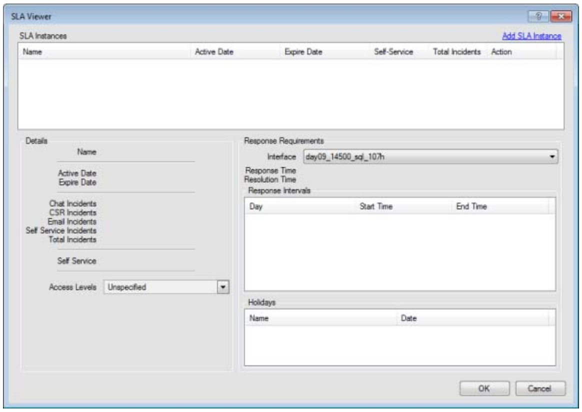
When you work on an incident for a customer who has an SLA, you can credit that incident to the SLA. If the customer does not have an SLA, you must apply an SLA instance before you can credit the incident. The following procedure describes how to apply an SLA instance when you are working on an incident.

To apply an SLA instance to a contact or organization

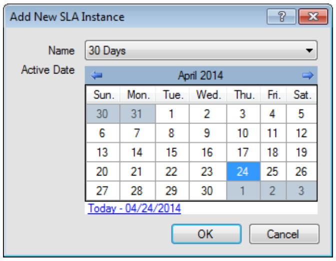
1 From an incidents report, right-click the incident and select Open > Contact or Open > Organization.

2 Click Add (if no SLAs have been applied to the customer) or Edit in the SLA field to open the SLA Viewer window. Any SLA instances that have already been applied to the customer are displayed under SLA Instances.

Note If you select Open > Contact and the contact is associated with an organization, the SLA field contains "See organization for SLA Details." Return to the incidents report on the content pane, right-click the incident, and select Open > Organization.



3 Click Add SLA Instance to open the Add New SLA Instance window.



4 Click the Name drop-down menu and select an SLA.

5 Select an active date by clicking a day on the current month's calendar (or, to change the month, click the right or left arrow in the month heading). Today's date is selected by default.

6 Click the OK button to apply the SLA instance to the customer. The Add New SLA Instance window closes and the SLA instance is added.

7 Click the OK button to close the SLA Viewer window.

Once an SLA instance has been applied to the customer, you can credit incidents submitted by that customer against the SLA instance as long as the incident occurs within the active date period.

To credit an incident to an SLA instance

1 From an incidents report, right-click the incident and select Open > Incident.

2 Click the Details tab.

3 Click the drop-down menu on the SLA Instance field and select an SLA instance. The incident is credited to the SLA instance you select.

Note Every time an incident is credited to an SLA instance, the number of available incidents is reduced. When the last incident is credited, the customer's SLA is disabled.

4 Click the Save button to save the incident.

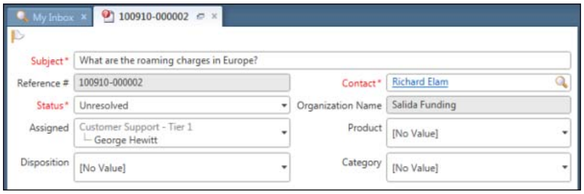
If you have enabled resolution due calculations and the SLA has a response time defined, you will be able to view the resolution due date and time after saving the incident. Refer to Configuring resolution due calculations.

Editing key incident fields

After understanding the role of **incident statuses** and **SLAs**, you can edit the key incident fields. The following procedure describes the standard incident **workspace**. Keep in mind that your workspace may contain different fields. Fields marked with a red label and asterisk are required fields and must be completed before you can save the incident.

To edit key incident fields

1 From an incidents report, right-click the incident and select Open > Incident.



2 Enter the following field information.

Table 310: Incident Fields Description

Field	Description
*Subject	Type a subject for the incident in this field. If the customer originated the incident, this field contains the customer's summary of the question, which you can edit if necessary (for example, to make the question more specific).
Reference #	The incident's reference number is a read-only field with a value assigned by Service.
*Status	Click this drop-down menu and select an incident status. The options include Solved, Unresolved, Updated, and Waiting, as well as any custom incident statuses added by your administrator. Refer to Incident statuses.
Assigned	Click this drop-down menu and select a staff member to assign the incident to. On the standard incident workspace, this field contains your name by default. Refer to Reassigning and re-queuing incidents. **Note:** Use the Find feature at the bottom of the Assigned drop-down menu to locate staff members quickly. Wildcards are supported when searching staff members and groups. You can search strings that include a space by typing `%` [space bar] [character], which is helpful when searching last names. For example, typing `%` [space bar] `b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.

Table 310: Incident Fields Description (Continued)

Field	Description
Disposition	Click this drop-down menu and select a disposition that indicates the resolution of the incident. There may be multiple levels of dispositions for you to select. **Note:** Use the Find feature at the bottom of the Disposition drop-down menu to locate dispositions quickly. Wildcards are supported when searching dispositions. You can search strings that include a space by typing `%` [space bar] [character], which is helpful when searching last names. For example, typing `%` [space bar] `b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.
*Contact	Click the Search button to the right of the Contact field to search for a contact to add to the incident. Refer to To search for a contact from an open record. To add a contact, click the New Contact button on the open Contact Search window. Refer to Adding and editing contact information. **Note:** If this field contains a name, the customer will also be listed as the primary contact on the Contacts tab. Be aware that if you add another contact using the Search button, the existing primary contact is removed from the incident and replaced with the new primary contact. To add a contact to an incident without removing the primary contact, use the Add button on the Contacts tab toolbar.
Organization Name	This read-only field contains the name of the organization for the contact associated with the incident.
Product	Click this drop-down menu and select one or more product levels to indicate the product for the incident. **Note:** Use the Find feature at the bottom of the Product drop-down menu to locate products quickly. Wildcards are supported when searching products. You can search strings that include a space by typing `%` [space bar] [character], which is helpful when searching last names. For example, typing `%` [space bar] `b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.

Table 310: Incident Fields Description (Continued)

Field	Description
Category	Click this drop-down menu and select one or more category levels to indicate the category for the incident. **Note:** Use the Find feature at the bottom of the Category drop-down menu to locate categories quickly. Wildcards are supported when searching categories. You can search strings that include a space by typing `%` [space bar] [character], which is helpful when searching last names. For example, typing `%` [space bar] `b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.

3 To add a **flag** to the incident, click the area next to the white flag at the top of the content pane. Refer to Flagging records.

4 To add other key incident fields, click the Details tab and refer to Adding incident information on the Details tab.

- Incident statuses
- Reassigning and re-queuing incidents
- Adding and editing contact information
- Flagging records
- Adding incident information on the Details tab

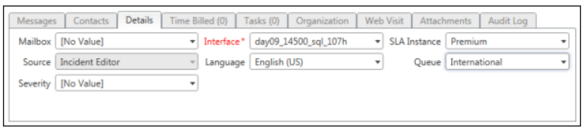
Adding incident information on the Details tab

The standard incident **workspace** contains a Details tab where you can enter additional information about the incident.

To add incident information on the Details tab

1 From an incidents report, right-click the incident and select Open > Incident.

2 Click the Details tab.



3 Enter the following field information.

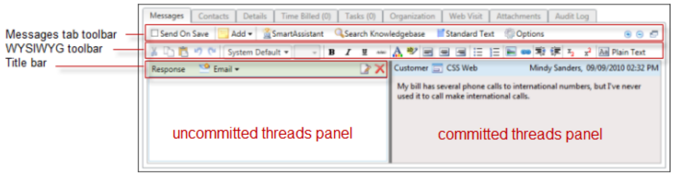
Table 311: Incident Fields on the Details Tab

Field	Description
Mailbox	Click this drop-down menu to select the mailbox to send the incident response from.
Source	This is a read-only field that identifies the source of an incident, whether it is added by a staff member or a customer.
Severity	Click this drop-down menu to select a severity level for the incident. The severity level serves as an importance indicator for any agents that work on the incident. The highest severity incidents are usually solved first. Refer to Adding and editing incident severities.
*Interface	Click this drop-down menu and select an interface. **Note:** By default, the incident's interface is set to the interface where the incident was created. The interface determines the language of the message bases used for automatic responses to the incident.
Language	Click this drop-down menu and select a language. **Note:** If your site has multiple interfaces for different languages, be sure you have also selected the interface that uses the language you want used in the response to the customer.
SLA Instance	Click this drop-down menu to credit the incident to an SLA instance that has been applied to the contact or the organization to which the contact belongs. Refer to Applying SLAs.
Queue	Click this drop-down menu and select a queue into which to move the incident from your inbox. Refer to Reassigning and re-queuing incidents.
Custom Fields	If your administrator has added incident custom fields, you can enter that information on the Details tab.

- Applying SLAs
- Reassigning and re-queuing incidents

Responding to incidents

The **incident thread**, which displays communication between the customer and agent, is located on the Messages tab. Using the Rich Text Incident Thread **control**, you can display, edit, and respond to HTML-formatted emails, resulting in richer interactions with your customers. The following figure shows the thread control on the standard incident workspace (displayed by clicking File and selecting Incident).



Note When using the Rich Text Incident Thread to respond to incidents, you are limited to using one $ at a time. If you place more than one $ consecutively in your response, when the thread is committed only one will display.

Using the Messages tab toolbar, you can choose the type of thread entry—customer entry, response, or private note—when responding to the customer. Because the thread title bars are color coded, it is easy to differentiate between them when adding or editing an incident. On a new incident, the default thread type on the standard incident **workspace** is Customer Entry (the default **channel** is Phone).

Note If the customer submitted the question through the **customer portal**, it also appears as a Customer Entry thread. You can enter the question for the customer if, for example, you are responding to a phone call. This will appear as a Customer Entry as well. Besides adding a Response thread, you can also add a Private Note thread, which can be read by other staff members but not by customers.

When editing an incident, the default is Response (the default channel is Email). To save time and make your responses accurate and consistent, you can add predefined content, including **SmartAssistant** suggested answers or **standard text**. You can also search for answers that are related to the customer's question.

Using the WYSIWYG toolbar, you can apply HTML formatting to threads while they display in the uncommitted threads panel. When you save the incident, all uncommitted (unsaved) threads are moved to the committed threads panel, where all HTML formatting is retained.

Note If the EGW_VISUAL_EMAIL configuration setting is disabled, all incoming email will display as plain text even if it was sent as HTML.

When an incident is created for a customer through the **Social Monitor** (see Social monitoring overview), social channels, such as **Community**, Twitter, and Facebook, will be available when responding. Instead of sending an email response to the customer, you can respond directly to the social networking site where the post originated. Refer to Responding through social channels.

Tip Whenever a valid incident reference number appears in any incident thread (Customer Entry, Response, or Private Note), it is displayed in green text in the thread and is a link that opens the incident in a separate **workgroup** when you click it. In order for Service to create a clickable link from an incident reference number, the number must use the format ######-#######.

The Messages tab lets you send the response to the customer when you save it. You can send the incident response to other recipients as well by adding their email addresses to the CC field. Send response functionality also lets you attach files to the incident and select secure email options.

The following table describes the toolbar buttons that appear on the Messages tab.

Table 312: Messages Tab Toolbar Description

Button	Description
Send on Save	Select this check box to send your response to the customer when you save the incident. Refer to Sending responses.
Add	Click this button and select one of the following options to add a thread to the uncommitted threads panel.
Customer Entry	Select this option to enter information about the customer. For example, select Customer Entry when the customer's question occurs during a phone call. This is the default option when you add an incident.

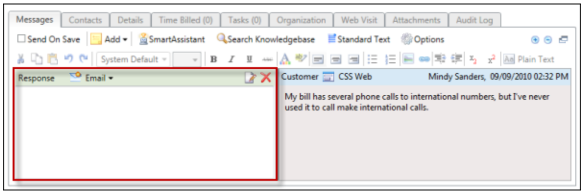
Table 312: Messages Tab Toolbar Description (Continued)

Button	Description
Response	Select this option to type your response to the customer's question. This is the default option when you edit an incident.
Private Note	Select this option to type the text that you want to be viewed only by other staff members. Customers cannot view this information.
SmartAssistant	Click this button to select one or more answers you can insert into your response as either text or a URL link. Refer to Adding SmartAssistant suggested answers.
Search Knowledgebase	Click this button to search for answers to help you respond to the customer. Refer to Searching the knowledge base.
Standard Text	Click this button to select and insert a predefined piece of information into the response. For example, you might select a greeting, closing, or response to a common question. Refer to Inserting standard text.
Options	Click this button to select thread type filters to modify your committed incident thread information display, change the date sorting order for threads on the committed threads panel, and choose message header display options for sending responses.

Note Your administrator controls the functions available on this toolbar. Click here to view the list of individual functions.

To add a response to an incident

1. From an incidents report, right-click the incident and select Open > Incident.
2. If the Message tab is not on top, click Messages. (On the standard incident workspace, this tab is displayed when an incident is opened.)
3. If the Response option is not selected automatically, click the Add button and select Response. The Response title bar displays on the uncommitted threads panel.



Tip You can add multiple threads to the uncommitted threads panel before saving the incident. To edit or delete a thread, click the Edit or Delete button located on the right side of the title bar.

4 To identify a channel for a response, click the Email drop-down menu in the Response title bar and select one of the following options: Phone, Fax, Post, CSS Web, or Email. (Email is the default channel on the Response title bar.)

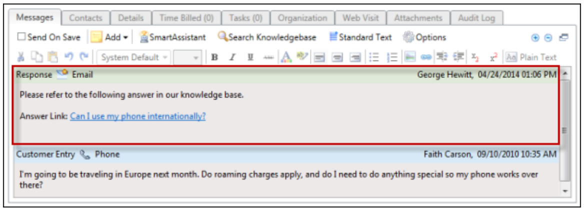
Note If an incident is created through the **Social Monitor** component, the social channel from which it arrived will display by default on the Customer Entry title bar and will be available as an option in the Phone drop-down menu. Refer to Responding through social channels.

5 Type your response to the customer's question. Use the WYSIWYG toolbar to:

- Cut, copy, paste, undo, and redo.
  - ▷ If formatted content is copied from an external source and pasted into the uncommitted threads panel, all formatting is retained. To avoid reformatting pasted content, right-click and select the Paste as Text option or press **Ctrl+Shift+v**.
- Change font style, size, and attributes (bold, italic, underline, strikethrough, text color, highlight).
  - ▷ When entering a response or customer entry thread, any changes to font style, color, or highlighting take precedence over the styling used on the **customer portal**. As a result, contacts using the customer portal to review agent responses may see unexpected font and color combinations. Refer to Editing the question details page.
- Left-justify, center, or right-justify text and images on the page.
- Format text in bulleted or numbered lists.
- Insert images by URL and upload images.

- Insert links.
- Increase and decrease indents.
- Apply specialized formatting, including sub and super script.
- View plain text, which removes all HTML formatting.

When you save the incident, the uncommitted threads panel closes and all uncommitted threads are moved to the committed threads panel. The committed threads panel expands so the incident threads are easier to read.



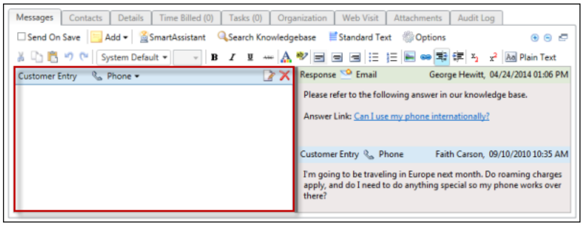
Tip You can right-click in the committed threads panel and choose options for selecting, copying, and finding text. The find feature (which can also be opened by pressing **Ctrl+f**) can be useful for finding information quickly.

The thread control remains in this state until you add another response, customer entry, or private note. At that point, the uncommitted threads panel displays again.

To add a customer entry or private note to an incident

1 From an incidents report, right-click the incident and select Open > Incident.

2 To add a customer entry, click the Add button and select Customer Entry. The Customer Entry title bar displays on the uncommitted threads panel.



Tip You can add multiple threads to the uncommitted threads panel before saving the incident. To edit or delete a thread, click the Edit or Delete button located on the right side of the title bar.

a To identify a channel for a customer entry, click the Phone drop-down menu in the Customer Entry title bar and select one of the following options: No Channel, Phone, Fax, Post, CSS Web, or Email. (Phone is the default channel on the Customer Entry title bar.)

Note If an incident is created through the **Social Monitor** component, the social channel from which it arrived will display by default on the Customer Entry title bar and will be available as an option in the Phone drop-down menu. Refer to Responding through social channels.

3 To add a private note, click the Add button and select Private Note.

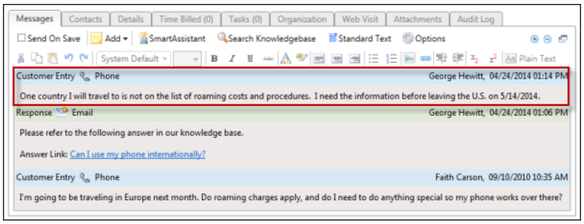
a To identify a channel for the private note, click the No Channel drop-down menu and select one of the following options: No Channel, Phone, Fax, Post, CSS Web, or Email. (No Channel is the default channel.)

4 Type the customer entry or note in the uncommitted threads panel. Use the WYSIWYG toolbar to:

- Cut, copy, paste, undo, and redo.
  - ▷ If formatted content is copied from an external source and pasted into the uncommitted threads panel, all formatting is retained. To avoid reformatting pasted content, right-click and select the Paste as Text option or press **Ctrl+Shift+v**.
- Change font style, size, and attributes (bold, italic, underline, strikethrough, text color, highlight).

- ▷ When entering a response or customer entry thread, any changes to font style, color, or highlighting take precedence over the styling used on the **customer portal**. As a result, contacts using the customer portal to review agent responses may see unexpected font and color combinations. Refer to Editing the question details page.
- Left-justify, center, or right-justify text and images on the page.
- Format text in bulleted or numbered lists.
- Insert images by URL and upload images.
- Insert links.
- Increase and decrease indents.
- Apply specialized formatting, including sub and super script.
- View plain text, which removes all HTML formatting.

When you save the incident, the uncommitted threads panel closes and all uncommitted threads are moved to the committed threads panel. The committed threads panel expands so the incident threads are easier to read.



Tip You can right-click in the committed threads panel and choose options for selecting, copying, and finding text. The find feature (which can also be opened by pressing **Ctrl+f**) can be useful for finding information quickly.

The thread control remains in this state until you add another response, customer entry, or private note. At that point, the uncommitted threads panel displays again.

- ❖ Sending responses
- ❖ Responding through social channels
- ❖ Adding SmartAssistant suggested answers
- ❖ Searching the knowledge base
- ❖ Inserting standard text

Adding content to responses

Service has tools that help you save time, eliminate mistakes, and provide consistent information to customers. These tools include the ability to attach links to answers in the knowledge base, insert the actual text of answers into the response, search the knowledge base for specific answers to include, and insert standard, predefined text.

Adding SmartAssistant suggested answers

SmartAssistant is a tool in Service that helps you find solutions to customer questions. SmartAssistant evaluates the language of a customer's question and suggests possible answers. You can then insert either a link to the answer or the actual text of the answer into your response.

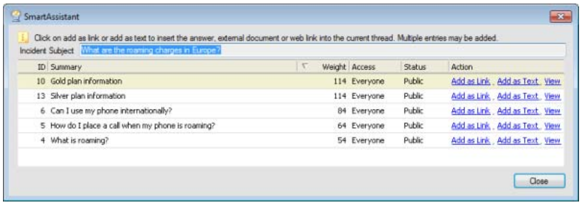
SmartAssistant contains an autotuning feature that reviews the effectiveness of your current configuration and automatically makes adjustments and suggestions to improve results. A tuned, optimized SmartAssistant can improve incident deflection rates and produce information that can be used to refine the knowledge base and provide guidance to agents. The autotuner enhances the search algorithm by closely tracking answers that have been appended to an incident thread as a link or text, or that an agent has explicitly identified as the answer that best resolved an incident. SmartAssistant will then give greater deference to these answers, as they are known to relate to or resolve issues submitted as incidents.

In addition, the autotuner reviews the many configuration settings that influence SmartAssistant results and recommends changes to ensure that they are fully optimized. And to help you understand the value of these recommendations and help you decide whether to accept them, their projected impact is also presented.

Note Before you can use autotuning, you must enable KF_SA_OPTIMIZATION_ENABLE and add the autotuner component to your list of items for the Configuration button. Refer to Editing configuration settings and Creating a navigation set for the administrator.

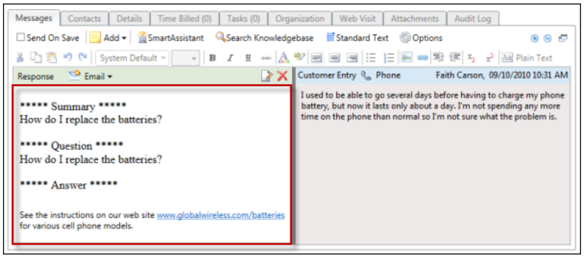
To add SmartAssistant suggested answers

1 Click the SmartAssistant button on the Messages tab toolbar. A list of possible answers displays with columns for ID, Summary, Weight, Access, and Status. You can sort by any of the columns.

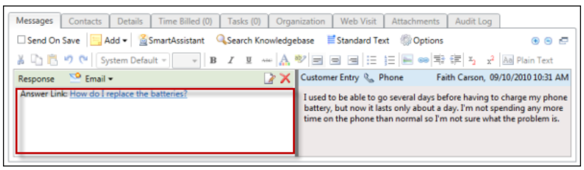


2 To include the text of an answer in the response, click Add As Text in the Action column. The answer content is added to the response.

Tip You can also enter answer text if you know an answer's ID by pressing **F9** from the incident response on the Messages tab, typing the Answer ID number in the Append Answer Text window that opens, and pressing **Enter**. You can edit the answer text before sending the response.



3 To add an answer's URL link to the response, click Add As Link in the Action column on the right.

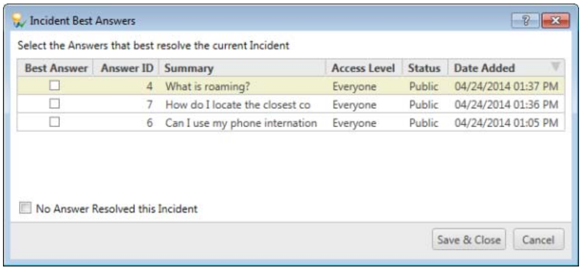


4 To view a suggested answer, click View in the Action column. The View Answer window opens, displaying the answer as it appears on the customer portal. (You can print the answer from this view by clicking the File menu item and selecting Print.)

5 Click the Close button to close the SmartAssistant window.

To mark an answer as the best answer

1 From the open incident, click the Best Answers button. A list of answers that have been added and committed to the incident thread is displayed with columns for ID, Summary, Access Level, Status, and Date Added. You can sort by any of the columns.



2 To choose the best answer (or answers) for the customer's question, select the Best Answer check box.

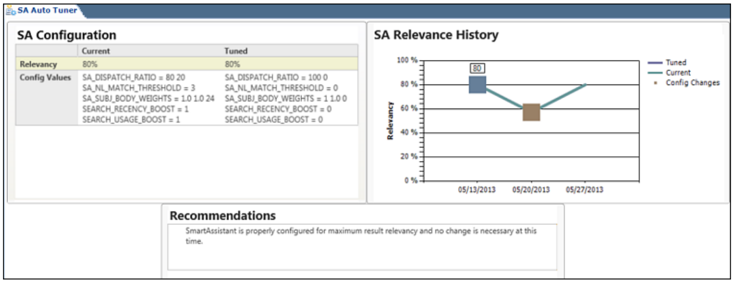
3 To clear all best answer selections, select the No Answer Resolved This Incident check box.

4 Click the Save and Close button.

To review and accept autotuner recommendations

1 Click the Configuration button on the navigation pane.

2 Double-click SA Auto Tuner component in your configuration list. The SA Auto Tuner dashboard display information regarding the current SmartAssistant configuration settings, relevance history, and recommendations.



The dashboard contains the following reports.

- **SA Configuration**—This report contains information about your current SmartAssistant configuration values (in the Current column) and the suggested values for optimizing them (in the Tuned column). The Relevancy row displays the current aggregated relevancy value of SmartAssistant results.
- **SA Relevance History**—This report displays the percentage of answers suggested by SmartAssistant that have been relevant over recent weekly intervals, also indicating when changes were made to SmartAssistant settings. This demonstrates how changes you have applied impact your site's SmartAssistant effectiveness.
- **Recommendations**—This panel displays the autotuner's current recommendation (whether to accept the suggested configuration changes) based on whether sufficient SmartAssistant coverage was available to evaluate and whether the recommendation is made with high, medium, or low confidence.

3 To accept the suggested configuration and update your settings with the recommended values, click the Accept New Configuration button on the ribbon.

Searching the knowledge base

As you respond to a customer's question, you might remember answers that address similar issues. Rather than conducting a time-consuming hunt of the knowledge base to find the relevant answers, Service lets you search for specific answers. Using any of four text searching techniques, you can quickly identify answers to resolve a customer's question. Refer to Appending answer content.

Inserting standard text

When you are busy responding to customers' questions, you will appreciate having the routine parts of your job streamlined as much as possible. For example, you would probably welcome a shortcut as an alternative to typing a standard greeting and closing for every email response you send. Your administrator can create standard text for routine situations so you can insert a text item into a response. Refer to Adding standard text.

You can insert standard text from the Standard Text window or, if you know the hot key sequence for the text item, you can type it without opening the Standard Text window.

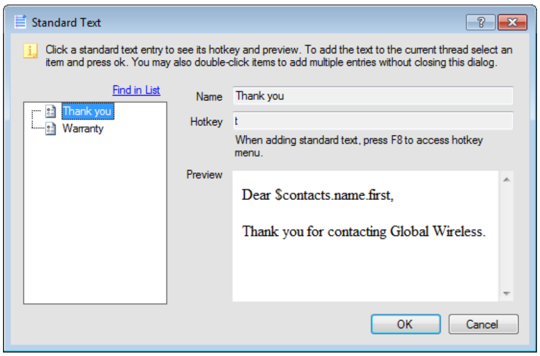
To insert standard text from the Standard Text window

1 In your response, position the cursor where you want to insert the standard text.

2 Click the Standard Text button on the Messages tab toolbar to open the Standard Text window.

3 Select the standard text item you want to insert in your response. If an HTML version of the standard text is available, it displays by default in the Preview section of the window. Otherwise, the plain text version displays.

Tip To search for standard text, click Find in List above the left column.



4 Click the OK button to close the Standard Text window and insert the text into your response.

Or

Drag the standard text item from the left column into the response.

Or

Copy the text in the Preview section and paste it into the response.

5 To add other standard text items to the response, repeat steps 1 through 4.

6 To modify the standard text, edit it as necessary in the response.

Note If the standard text includes one or more variables, the variable is displayed in your response rather than the value of the variable (the contact's first name in the example). The variable is replaced with the data only when you send your response. Then, when you reopen the incident, the data appears where the variable had been inserted. Refer to Adding variables.

To insert standard text using a hot key sequence

Tip To display the hot key sequence for a standard text item, select the standard text in the left column of the Standard Text window. The keystrokes are displayed in the Hotkey field in the right column.

At the location in the incident response where you want to insert the standard text, press **F8** to open a Standard Text field, type the hot key sequence in the field, and press **F8** or **Enter** to insert the text into your response.

- Adding standard text
- Adding variables

Finding answers using guided assistance

Guided assistance is a powerful tool designed to step you through a series of questions and direct you to answers and text responses you can offer your customers. As you work with customers on the phone or respond to incidents, you can quickly find the information that best helps your customers. Guided assistance steers you to the information based on your answers to the questions rather than you having to review SmartAssistant answers or search the knowledge base.

Before you can use guided assistance to work with incidents, your administrator must have enabled the tool on your site, created **guides** for you to use, and added the Guided Assistance control to the incident workspace you use. Refer to Guided Assistance.

The following table describes the buttons on the Guided Assistance window.

Table 313: Guided Assistance Window Description

Button	Description
Expand Navigator	Select this check box to open a panel on the left that displays all the branches used in the guide.
Navigate	Click this button after selecting a question or response on the left panel. The contents of the question or response are displayed on the right panel.
Search for a Guide	Click this button to search for a guide. Refer to To use guided assistance.
Select a Guide	Click this button to select a guide. Refer to To use guided assistance.
Add Text to Thread	Click this button to add the text of the current question and response to the incident thread.

To use guided assistance

1 Open the incident for which you want to use guided assistance.

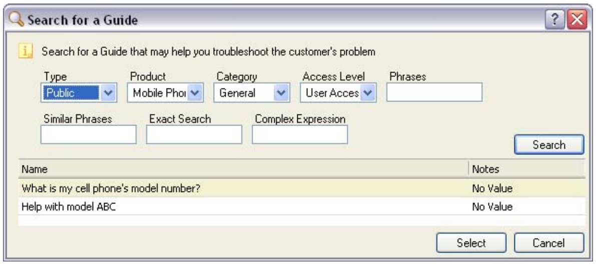
2 To select a guide from a list, click the Guided Assistance button and click Select. The Select a Guide window opens.

  a Select the guide you want from the list.

  b Click the OK button. The Guided Assistance window opens.

3 To search for a guide, click the Search for a Guide button. The Search for a Guide window opens.

Note Before searching for a guide, you should fill out the associated incident's product and category. Only guides that have been associated with an answer can be searched.

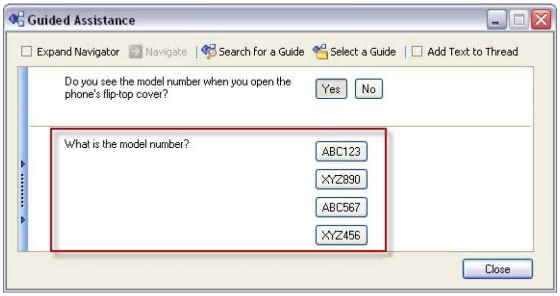


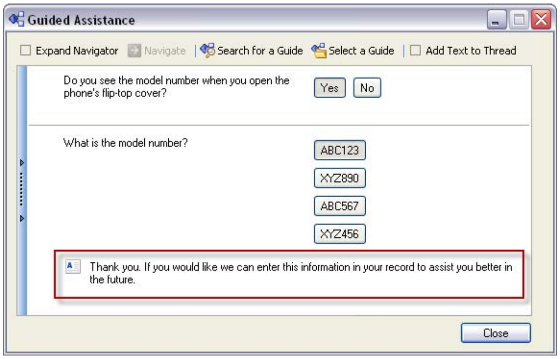
a Define search terms by selecting drop-down menu options or typing phrases in a text field.

b Click the Search button. A list of guides that match your search criteria displays.

c Select the guide you want to use and click the Select button. The window closes and the questions in the guide are displayed.

4 Answer each of the questions that are presented in the guide until you reach an end point, which is in the form of a knowledge base answer or a text explanation.





5 If the results provide answers from the knowledge base, you can add a link to an answer or the text of the answer in the incident thread, or you can view an answer.

a To add a hyperlink to the answer in the incident, click Add as Link.

b To add the text of the answer to the incident, click Add as Text.

c To view the answer, click View.

6 Click the Close button to close the Guided Assistance window.

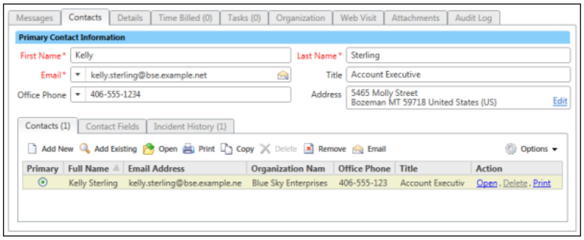
❖ Guided Assistance

Adding and editing contact information

Because Service creates incidents from customer questions, the contact information is usually present when you respond to an incident. Sometimes, however, you will need to add or edit contact information. You can add multiple contacts to an incident, but you must designate only one as the primary contact. Secondary contacts do not have to be associated with the same organization as the primary contact.

To add or edit contact information

1 From an open incident, click the Contacts tab. Information for the primary contact (which includes name, email address, phone, title, and address) displays at the top of the tab, and nested tabs contain additional information.



2 To remove a contact from the incident, select the radio button next to the contact’s name, click the Remove button, and confirm that you want to remove the contact. The contact is disassociated from the incident, but the contact’s record remains in the **knowledge base**.

3 To add a new contact to the incident, click the Add New button. A new contact opens on a sub-tab.

Important Adding a new contact from the Contacts tab does not change the primary contact for the incident. To designate a primary contact, you must manually select the Primary radio button next the contact’s name.

However, adding a new contact using the Search button next to the Contact field of the incident not only replaces the existing primary contact with the new contact, but the existing primary contact is automatically removed from the incident. Refer to Editing key incident fields.

Or

To add an existing contact to the incident, click the Add Existing button, search for the contact you want to add, and select it. To edit this contact, right-click it and select Open.

4 To edit an existing contact for the incident, right-click the contact and select Open. The contact opens on a sub-tab.

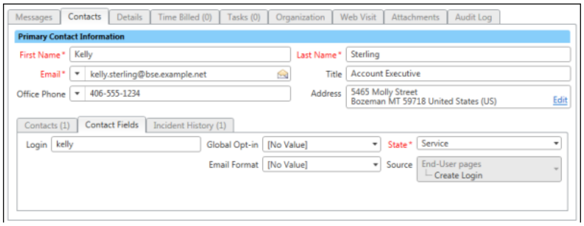
5 Add or edit contact information in the First Name and Last Name fields and make a selection in the State field.

6 To add or edit other contact information, make the changes in the fields or on the record tabs. Refer to Adding contacts.

7 Click the OK button to close the sub-tab and add the contact to the incident.

Important Clicking the OK button on the contact sub-tab closes the contact sub-tab and keeps the contact data in memory, but the contact record is not saved in the knowledge base until you save the incident.

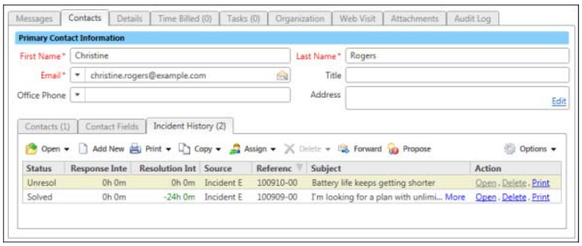
8 To add other information to the primary contact record, click the Contact Fields tab.



a To add or edit the contact's login, type it in the field.

b To select or change the contact's global opt-in choice, email format, or state, click the appropriate drop-down menu and select an option.

9 To view incident information for the primary contact, click the Incident History tab.



10 Click the Save button to save your changes on the Contacts tab.

❖ Editing key incident fields

Tracking your time

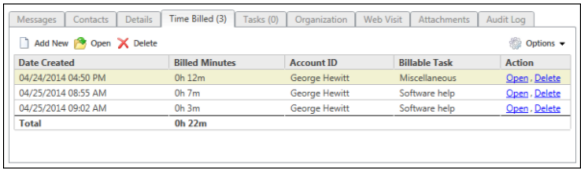
Your organization may collect statistics on the amount of time agents spend solving incidents so that management can plan for better use of staff time. These statistics can also identify products or issues that are causing similar customer questions, allowing answers to be added to the **knowledge base** to reduce the amount of time agents must spend on them.

The Time Billed tab is where you enter the amount of time you spend on an incident. It also lets you see details about the amount of time other agents spent on the incident. Depending on how your administrator has configured your application, you may be required to enter time billed every time you edit an incident or before you can set an **incident status** to Solved.

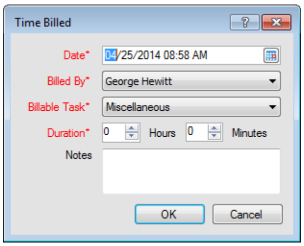
To add time billed to an incident

1 From an incidents report, right-click the incident and select Open > Incident.

2 Click the Time Billed tab. The tab contains the number of time billed entries associated with the incident in parentheses next to the tab name.



3 Click the Add New button to open the Time Billed window.



4 Enter the following field information.

Table 314: Time Billed Window Description

Field	Description
*Date	The default is today's date. Click the drop-down menu to open the current month's calendar and select a date.
*Billed By	Click this drop-down menu and select a staff member. This field defaults to your staff account since you are editing the incident.
*Billable Task	The default billable task is Miscellaneous, but your administrator may have added other billable tasks for you to select. Click this drop-down menu and select a task.
*Duration	Select the value in the Hours or Minutes field, or both, and type a new value. Or use the up and down arrows to adjust the duration.
Notes	Type a note about the time billed for the incident.

5 Click the OK button to close the Time Billed window.

6 Click the Save button to save your changes on the Time Billed tab.

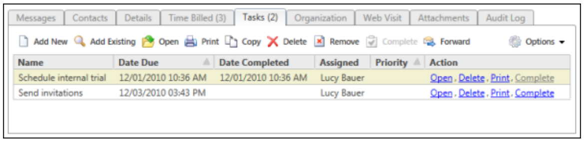
Modifying time billed entries

You can edit and delete time billed entries as necessary. To edit a time billed entry, right-click it and select Open. Make any changes and save the entry. To delete a time billed entry, right-click the entry and select Delete.

Important Deleting a time billed entry can result in inaccurate statistics in reports.

Adding tasks

You can add and edit all tasks associated with an incident by clicking the incident's Tasks tab. When you add or edit a task, you not only define its name, the staff member it is assigned to, relevant dates, and type of task, but you also associate it with new or existing incidents. The tab contains the number of tasks associated with the incident in parentheses next to the tab name.



To add or edit a task for an incident

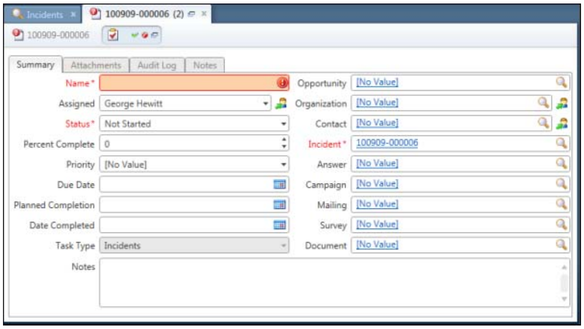
1 From an incidents report, right-click the incident and select Open > Incident.

2 Click the Tasks tab.

3 Click the Add New button to open the new task on a sub-tab. The reference number for the incident appears in the Incident field on the new task editor.

Or

Right-click a task on the Tasks tab and select Open.



4 Add or change the task name in the Name field.

5 Click the Status drop-down menu and select a status for the task. The default status is Not Started.

6 To enter additional task information, complete the fields or select menu options. Refer to Adding tasks.

7 Click the OK button to save the task and close the task sub-tab.

8 Click the Save button to save your changes on the Tasks tab.

Adding organizations

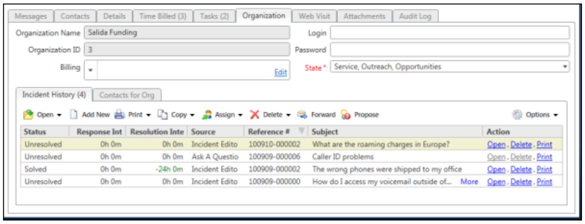
Incidents are associated with contacts. If an incident also has an organization association, it is because the incident's primary contact is associated with an organization. The Organization tab lets you view the name and ID of the organization associated with the incident's primary contact, and you can edit the address, login, password, and state for the organization. But if you want to change the organization associated with an incident, you will have to edit the contact record.

To edit an organization associated with an incident

1 From an incidents report, right-click the incident and select Open > Incident.

2 Click the Organization tab.

Note The Organization Name and Organization ID fields are read-only.



3 To enter an address, click Edit in the lower right corner of the field to display a window for entering the organization's address. Type information in the Street, City, and Postal Code fields, and make selections on the Country and State/Prov fields drop-down menus. When you select the country, the associated states or provinces appear in the State/Prov menu. Press **Enter** when you are finished to close the window and display the address you entered.

4 To enter a login or password, type the information in the appropriate field.

5 To change the organization's **state**, click the drop-down menu and select an option.

6 To view the incident history for the organization, click the Incident History tab.

7 To view the organization’s contacts, click the Contacts for Org tab. You can also open, add, print, copy, assign, delete, and email contacts using the toolbar on this tab. Refer to Contacts overview.

Caution There are usually consequences when a contact is deleted. Refer to Deleting contacts.

8 Click the Save button to save your changes on the Organization tab.

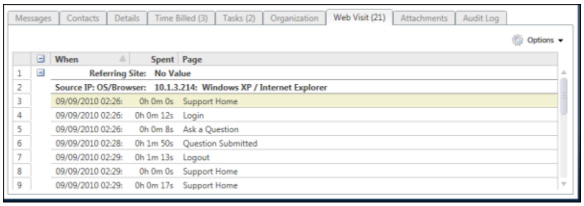
Viewing web visit information

You might find it helpful to know what information contacts viewed on the **customer portal** before they submitted their question. On the Web Visit tab of an incident, you can see what questions they viewed and any searches they performed. In addition, the customer’s referring site (the site they were visiting prior to accessing the customer portal), source IP address, operating system, and browser information are provided.

To view web visit information for an incident

1 From an incidents report, right-click the incident and select Open > Incident.

2 Click the Web Visit tab. The number of actions are listed in parentheses on the tab.



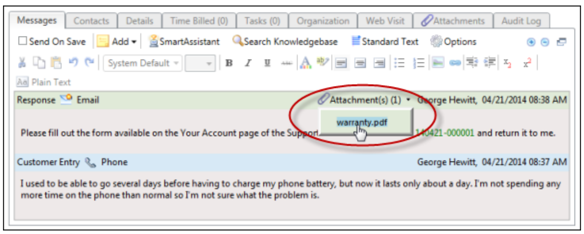
Attaching files to incidents

The Attachments tab lets you add files containing information that may not fit neatly into an incident. For example, you might want to attach a file that contains graphic elements. When you attach a file to an incident, that file becomes permanently attached to the incident. Likewise, any file the customer attaches when submitting a question also becomes permanently attached to the incident.

Note HTML email updates that are larger than the maximum description size are attached to the incident as an HTML file. Refer to Adding and editing mailboxes.

The Attachments tab lists all files attached to the incident and contains the file name, size, dates created and updated, a description, and whether the attachment is private (not visible on the **customer portal**). You and other staff members can access any attached file from the Attachments tab of the incident, while the customer can access it from the Your Account page on the customer portal.

If a file is attached in the same edit a thread is added on the Messages tab (the file attachment and the incident thread are saved at the same time), an Attachments indicator displays in the title bar of the thread on the Messages tab after the incident is saved. Click the Attachments drop-down menu to display attachments added at the time the thread entry was saved, then click a file name to view the file.



Important The Attachments indicator in a thread title bar is not an indication files were sent in your response to the customer—it only helps you identify the point in the incident thread an attachment was added to the incident. If you attach a file and save the incident when there are no uncommitted threads, the attached file will appear on the Attachments tab but not on the Messages tab.

Files that are permanently attached to an incident are not sent in your response to the customer unless you specifically mark them to be sent with the response. This lets the customer open the file directly from the email client instead of having to log in to view it. See To attach files to an incident response.

- To attach files to an incident response
- Attaching files to records

Presenting offers to customers

In your role as an agent, your organization may ask you to present special **offers** to customers because you have a strong understanding of what they need and have earned their trust through your work with them.

When you work with an incident, Service evaluates the customer's information and purchase history. Based on the results, it looks for offers the customer is eligible for. These offers can include promotions, suggestions, or both. Promotions are special offers made to specific groups of customers (called targets), while suggestions are automatically generated based on customer information. An example of a promotion is free shipping on certain products. An example of a suggestion is offering a headset to someone who has recently purchased a cell phone. When the customer is eligible for an offer, the Offer Advisor button is enabled. After you finish responding to the customer's question, you can click the Offer Advisor button to display an Offers window.

The following procedure is a brief overview of presenting an offer to a customer. For the complete procedure, refer to Presenting offers.

To present an offer

1. From an open incident, click the Offer Advisor button to open the Offer Advisor window.
2. Select the offer you want to present to the customer.
3. If you are on a phone call with the customer, read or paraphrase the guide and product information to the customer.

   Or

   If you are responding to an incident, right-click anywhere in the guide text or product information sections and select Copy. Paste the text into the response and modify as necessary before sending.
4. Click Set Response in the Action column for the offer you want to present. The associated drop-down menu in the Response column is activated.

5 Click the drop-down menu and select Yes, Interest, No, or Defer.

6 Click the OK button to return to the incident.

7 Click the Save and Close button to save the incident and record the customer's responses to the offers.

❖ Presenting offers

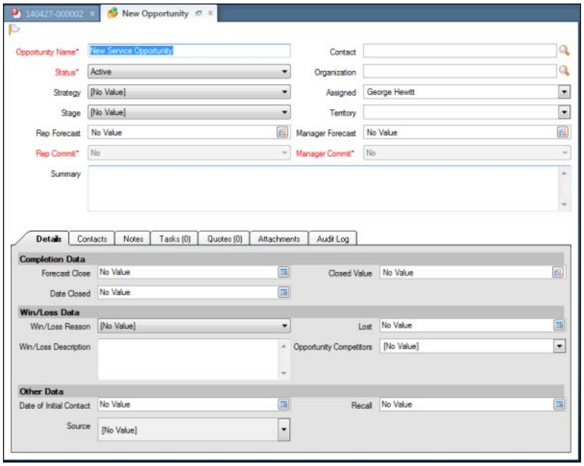
Creating opportunities from incidents

During the course of working with customers, you might discover information that makes them potential customers for other services and products your organization offers. In those cases, you can create **opportunities** and send them to the sales department for evaluation and follow-up.

The **workspace** you use to create an opportunity from an incident may be different depending on your **profile** and any custom workspaces defined by your administrator.

To create an opportunity from an incident

1 From an open incident, click the New Service Opportunity button on the **ribbon**.



2 To edit any information for the opportunity, enter the field information described in Editing key opportunity fields.

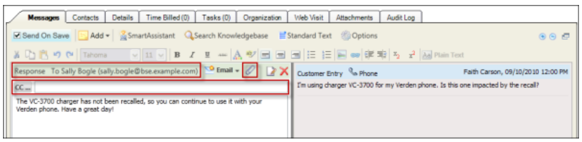
3 Click the Save and Close button to send the opportunity to the sales department.

Sending responses

When you have completed a response to an incident, you are ready to send your reply to the customer. Several options are available when you send a response, including attaching files to the response, copying other recipients, and selecting encryption options.

The behavior for sending responses depends on the settings your administrator selected when creating the incident **workspace** for your profile. The standard incident workspace behaves in the following manner when you add a Response type thread entry to the uncommitted threads panel.

- The Send on Save check box is cleared, so you must select it if you want to automatically send your response to the **primary contact** when you save the incident. For this reason, you might not want to select it until you have finalized your response so you do not send a response each time you save changes while you work on the incident.
- If an uncommitted response thread exists and the Send on Save check box is selected, the Email title bar displays an attachment icon for associating attachments and a CC field for notifying other contacts. BCC and sign/encrypt functionality can be enabled on the Options window (accessed by clicking the Options button on the thread control, which is typically found on the Messages tab toolbar).



- You can save a draft response to an incident without sending it. Click the Options button on the thread control and select the Always Show for Responses check box under Email Message Header. You will then be able to set CC, BCC, and attachments for a response, and save that data until you want to send the response. See To attach files to an incident response and To select additional recipients for an incident response.
- Customer-entered URLs are replaced with `[link removed]` in response emails. This ensures that customer-entered URLs (IP addresses) are not identified as SPAM and blocked. This functionality can be overridden by populating the EGW_ALLOWED_DOMAIN_NAMES and EGW_ALLOWED_TOP_LEVEL_DOMAINS configuration settings located at RightNow Common > Service Modules > RightNow Email. Refer to Customizing configuration settings.
- If a contact is associated with multiple email addresses, service responses are sent to *all* associated addresses by default. You can limit your responses to be sent to a single email address by enabling the site-wide configuration setting OE_SVC_SENDMAIL_SINGLE_ADDRESS (Common > General > Outgoing Email). Refer to Customizing configuration settings. Once enabled, service responses are sent only to the specified email

address and agents can select which one of the contact email addresses they want to send the response to. That email address value remains for the life of the incident. However, any new incidents for that contact will default to the primary email address.

To send a response to the primary contact

Click the Send button.

Or

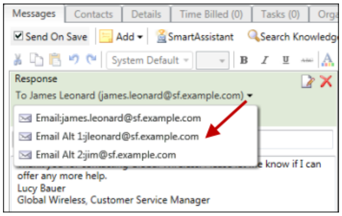
Select the Send on Save check box, then click the Save or Save and Close button to send your response.

Note If a customer does not receive your response, a Viewed Bounced Messages button appears on the Response title bar in the committed threads panel. Refer to Viewing bounced messages.

To send a single response to a contact associated with multiple addresses

Important This procedure assumes you have enabled the site-wide configuration setting OE_SVC_SENDMAIL_SINGLE_ADDRESS (Common > General > Outgoing Email). Refer to Customizing configuration settings.

1. Select the Send on Save check box. The Response title bar expands and displays the primary contact's email address, an Attach button (paperclip icon), and a CC field. See To attach files to an incident response and To select additional recipients for an incident response.
2. Click the drop-down menu to the right of the primary contact's email address and select the address to which you want to send the response.



Note This email address value remains for the life of the incident. However, any new incidents for this contact will default to the primary email address.

3 Click the Save or Save and Close button to send your response.

To attach files to an incident response

1 Click the Options button and select the Always Show for Response check box under Email Message Header. The Response title bar expands and the Attach button displays.

2 Click the Attach button to open the Attachments window.

Caution In contrast to files you permanently attach to an incident (refer to Attaching files to incidents), additional files attached to an incident response are not stored with the incident. Also, while attaching a file to an incident response lets the customer open the file directly from the email client instead of having to log in to view it, there will be no record in the knowledge base or the audit log that a file was sent to the customer.

3 To send the response with one or more files that have been attached to the incident, select the associated check boxes in the Incident Files section of the Attachments window.

4 To attach additional files to the incident response, click the Add Files button and select Browse to view the files and folders on your workstation. Or select Search to open the File Search window.

   a If you selected Browse, select the file and click the Open button to attach it to the response.

   b If you selected Search, specify a directory, all or part of a file name, and the type of file. Click the Search button. Then select one or more of the matching files and click the Add Files button.

5 Click the OK button to upload the selected files and attach them to the response.

To select additional recipients for an incident response

1 Click the Options button and select the Always Show for Response and Show CC check boxes under Email Message Header. The Response title bar expands and the CC field displays.

Note To display the BCC field, you must also select the Show BCC check box on the Options window.

2 Click the CC button. The Select Names window opens.

3 To import your contacts from the default Contacts folder in Outlook, select the Load Outlook Contacts check box. This is useful for displaying contacts that are not included in Oracle Service Cloud.

4 Select a name from the list.

Tip You can type the first few letters of the name in the field at the top of the Select Names window. The first name in the list that matches the letters you typed is highlighted. Notice that this name may be the contact’s first or last name, an email address, or a group or distribution list.

5 Click the CC button to list the name in the CC field or the BCC button to list the name in the BCC field. Names or addresses in the CC field are visible to all recipients of the response. Names in the BCC field are not visible to other recipients.

6 Click the OK button to close the Select Names window.

7 Click the Send button to send the response to the customer, as well as any other recipients you added to the CC or BCC fields.

Note Depending on how your administrator configured your application, the incident status may change to Solved when you save the incident. The incident assignment may also change to your name if the incident was previously assigned to another staff member.

To sign and encrypt an incident response

1 Click the Options button and select the Always Show for Response and Show Sign/Encrypt check boxes under Email Message Header.

Note Email signatures are appended to the thread in which you are responding to instead of to the bottom of the email, as different staff members can be working on the same incident. If your email signature does not populate the thread response, your administrator has not set up email signature information in your staff account. Although we recommend that your email signature is set up through your staff account, it is also possible that your email signature has been configured using **standard text**. Refer to Inserting standard text. Contact your administrator for more information.

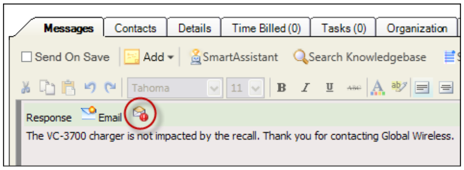
2 Select the Sign check box.

Note You cannot select the Sign check box if the Service mailbox does not have a certificate that allows sending encrypted email. Nor can you select an encryption option if the contact you are responding to does not have a certificate that allows receiving encrypted email. If you select Encrypt Always, you can select only addresses that have certificates associated with them. Refer to Configuring S/MIME security.

3 To encrypt your response to the contact, click the Do Not Encrypt drop-down menu and select Encrypt When Possible or Encrypt Always.

Viewing bounced messages

If a customer does not receive your response due to a bounced message, a View Bounced Message button displays on the Response title bar.



To view a bounced message

1 Click the View Bounced Messages button on the Response title bar. The Bounced Messages window opens, displaying full text copies of each bounced email.

2 Click the OK button to close the Bounced Messages window.

Note The audit log will also contain an entry for the bounced incident response that reads, "From Techmail–Incoming Auto-Reply Message."

Collaborating with other agents

Service Collaboration lets agents collaborate with other agents to more quickly resolve customer questions. From the incident workspace, agents can create conversations containing the details of their findings and post questions to other agents. The ability to collaborate with other agents encourages knowledge sharing among your staff and decreases response time to customers.

Note To enable and configure Service Collaboration, refer to Answer ID 6902 on our support site.

After Service Collaboration is enabled, you will need to assign staff members permission to use collaboration. Refer to Service permissions. In addition, you will need to create a custom incident workspace to include a collaboration relationship item control to start using Service Collaboration with Oracle Service Cloud incidents. Refer to Custom workspaces and Working with controls.

You can add the My Incident Conversations item to the navigation set of agents with collaboration permission. Adding this item allows agents quick access to all conversations in which they are participating.

Oracle Social Network (OSN) can be integrated with the agent desktop using Service Collaboration. Agents can customize their toast preferences for OSN notifications. For the link to the OSN documentation, refer to Oracle Social Network.

Collaborating with external users

Service Collaboration lets agents get assistance from other staff members who are not agent desktop users. These external users, such as engineers, product experts, analysts, and other subject-matter experts (SMEs), can be brought together to answer complex questions or contribute to solving an incident.

You can create a profile specifically for external users. Users with this profile will be able to log in to the collaboration service directly using a web browser or supported mobile device, but will not be able to use the Service Console. You are allowed up to 100 external users for each Service Console license.

To configure collaboration with external users

1 Create a profile that will be used only for external users. Refer to Customizing profiles.

2 On the Other tab of the Profiles editor, select the External User check box.

Note Collaboration must be enabled for the External User check box to be visible.

3 Save and close the new profile.

4 Create staff accounts for the external users, and assign the external user profile to them. Refer to Adding and editing staff accounts.

5 On the Staff Accounts editor, select Disabled from Assignment/Report Filters from the Disabled drop-down menu for each external user staff account.

Co-browsing with customers

With co-browse, you can guide a customer through a web page using your mouse or other pointing device to demonstrate actions. In effect, you take control of the customer's web browser to show the customer how to complete an action. Co-browse helps eliminate the confusion that can arise when giving verbal instructions and is effective for assisting customers in filling out forms or completing a sale.

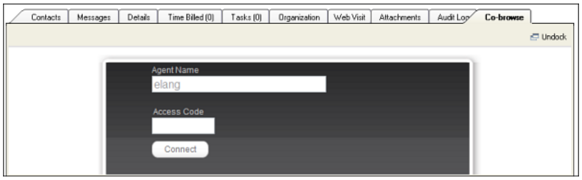
Note Co-browse must be enabled before you can begin a session with a customer. Contact your Oracle account manager. In addition, you can engage in only one co-browse session at a time.

To co-browse with a customer from an incident workspace

1 While speaking with a customer on the telephone, direct the customer to the location of the co-browse link on your **customer portal** and instruct the customer to click it. A message notification opens and provides the customer with an access code number.

2 With the customer's incident open, click the Co-browse tab. If the customer does not have an incident, click File and select Incident.

3 Click the Co-browse tab. The co-browse login page displays and your Oracle Service Cloud login name appears in the Agent Name field.



4 Ask the customer for the access code number and type it in the Access Code field.

5 Click the Connect button. The co-browse toolbar displays and the co-browse session begins. The following table describes the options on the co-browse toolbar.

Table 315: Co-Browse Toolbar Description

Button/Field	Description
Back Arrow	Click this button to view the previous URL. **Note:** This button is available only in Full Control state.
Forward Arrow	Click this button to view the next URL. **Note:** This button is available only in Full Control state.
URL	Click this drop-down menu to select a URL in the customer's history for the active window. **Note:** This button is available only in Full Control state.
CoBrowse State	Click this drop-down menu to select a co-browse state, which specifies how much control you have over the customer's active window.
View Only	Select this option to view the active window.
View + Pointer	Select this option to view the customer's active window and control the movement of the mouse or other pointing device. **Note:** With this option selected, mouse-click functionality does not work on the customer's active window. This option is selected by default.

Table 315: Co-Browse Toolbar Description (Continued)

Button/Field	Description
Full Control	Select this option to view the customer's active window, control all mouse or other pointing device functions (pointer and mouse clicks), and use your keyboard to enter information on the customer's active window (for instance, to help the customer fill out a form).
Advanced Mode	Select this option to have access the customer's entire desktop.
Mode	Click this drop-down menu to select an advanced co-browse state, which specifies how much control you have over the customer's desktop. **Note:** This button is available only in Advanced Mode.
View Only	Select this option to view the customer's desktop. This option is selected by default.
View + Pointer	Select this option to view the customer's desktop and control the movement of the mouse or other pointing device. **Note:** With this option selected, mouse-click functionality does not work on the customer's desktop.
View + True Pointer	Select this option to view the customer's desktop and control the movement of the mouse or other pointing device. **Note:** With this option selected, mouse-click functionality works on the customer's desktop.
Full Control	Select this option to view the customer's desktop, control all mouse or other pointing device functions (pointer and mouse clicks), and use your keyboard to enter information on the customer's desktop (for instance, to help the customer fill out a form).
Client Info	Displays the customer's environment information for operating system, browser version, client version, and escalation mode.
Connection Quality Information	Displays the strength of the connection in a bar graph.
Zoom In	Click this button to zoom in on the customer's desktop. **Note:** This button is available only in Advanced Mode.
Zoom Out	Click this button to zoom out on the customer's desktop. **Note:** This button is available only in Advanced Mode.

6 Click the Disconnect button to end the co-browse session. Both you and the customer are notified when the co-browse session ends. The customer can also disconnect from the co-browse session at any time.

Note Although co-browse information is not recorded to the incident transcript, it is recorded to the knowledge base and can be viewed using standard co-browse reports. Refer to Co-browse session reporting.

- Configuring co-browse on incident workspaces
- Co-browse session reporting

Adding incidents

Incidents are generally submitted by customers from the Ask a Question page or through email. As a result, the majority of your time is probably spent editing incidents. However, Service does not automatically create incidents when customers contact you by phone, mail, or fax, so you may find yourself adding incidents from time to time. When you add an incident, you create a record of both the customer's question and your response, which can help your organization track resolution of the incident.

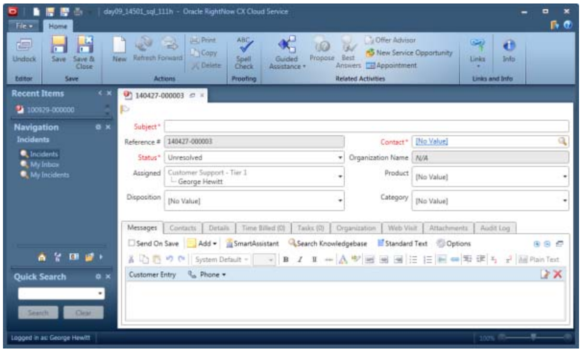
Tip You can add incidents to your **knowledge base** no matter what **navigation list** is active or what kind of record you are working on.

To add an incident

1 Click the New button on the **ribbon**.

Or

If your navigation set is configured to add incidents from the **file menu**, click File and select Incident. See To configure the file menu.



Note Notice that the Reference # and Organization Name are read-only fields. The reference number is automatically assigned by Oracle Service Cloud, and the organization name (if the field contains an entry) is the one associated with the primary contact for the incident.

2 Type the question or issue in the Subject field, to a maximum of 240 characters.

3 Complete the incident fields as described in Editing key incident fields.

4 Click the Customer Entry field and type the customer's question.

5 Click the Add button and select Response.

6 Type your response. Refer to Responding to incidents and Adding content to responses.

7 To add or edit contact information for the incident, click the Contacts tab and complete the information as described in Adding and editing contact information.

8 To enter the time you spend working on the incident, click the Time Billed tab and complete the information as described in Tracking your time.

9 To add or edit task information for the incident, click the Tasks tab and complete the information as described in Adding tasks.

10 To add or edit organization information for the incident, click the Organization tab and complete the information as described in Adding organizations.

11 To attach one or more files to the incident, click the Attachments tab. Refer to Attaching files to records.

12 To present an offer to the customer, click the Offer Advisor button. Refer to Presenting offers to customers.

13 To create an opportunity from the incident, click the New Service Opportunity button. Refer to Creating opportunities from incidents.

14 To send a response, refer to Sending responses.

15 Click the Save and Close button to save the incident.

❖ Managing incidents

❖ Working with records

Managing incidents

Besides editing and adding incidents, you may have other incident management duties as well. For example, you might want to propose that incidents be added as **answers** to the knowledge base, delete incidents, or re-queue or reassign incidents.

For other incident management tasks, including forwarding incidents and updating multiple incidents simultaneously, refer to Common Functionality.

Proposing answers

Sometimes a customer's question is common enough that you believe other customers should also have access to the answer. If you believe this information belongs in the knowledge base, you can propose the incident as a potential answer that customers can view without needing to submit an incident. This helps the knowledge base stay current with the information customers need.

When you propose an incident as an answer, a copy of the incident is submitted to a knowledge engineer, who determines whether it should become an answer. If it should, the knowledge engineer first defines an answer access level, answer status, language, and visibility, and then publishes the answer.

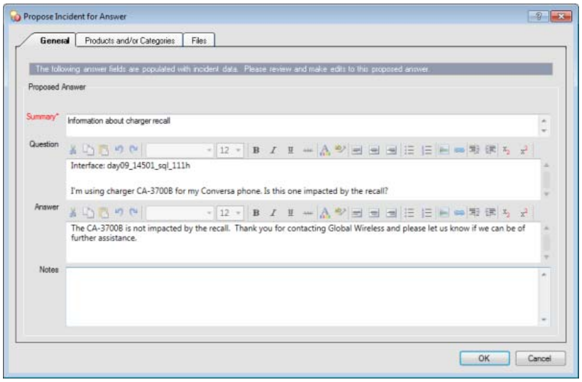
Note Incident custom fields may or may not be included when you propose an incident as an answer. If you propose an incident from an incidents report, by either right-clicking the incident and selecting Propose or by clicking the Propose button on the report's ribbon, the incident custom fields are not added to the Notes tab on the Propose Incident for Answer window. If, however, you click the Propose button from an open incident, the custom fields do appear on the Propose Incident for Answer window.

To propose an answer from an incident

1 From an incidents report, right-click the incident and select Propose Incident. The Propose Incident for Answer window opens.

Or

With the incident open, click the Propose button.



2 Review the proposed answer and make any necessary edits.

3 To add a note to the proposed answer, click in the Notes field and type your comments.

4 To add or remove any products or categories associated with the proposed answer, click the Products and/or Categories tab. Select those you want to associate with the proposed answer, and clear those you do not want to associate with the answer.

Tip The products and categories associated with the incident are selected by default.

5 To remove any files that are permanently attached to the incident from the proposed answer, click the Files tab. Clear the check box next to any file you do not want to propose with the incident.

Note All files permanently attached to the incident are selected to be proposed with the incident by default.

6 Click the OK button to submit the incident as a proposed answer. A confirmation message lets you know that an answer was proposed from the incident.

❖ Adding answers

Deleting incidents

If your **profile** gives you permission to delete incidents, the Delete button is enabled on the **ribbon**. When you delete an incident, you permanently remove it from the **knowledge base**.

To delete an incident

1 To delete an incident when the incident is open, press the Delete button. A message asks you to confirm deletion of the incident.

Or

To delete an incident from an incidents report, right-click the incident and select Delete > Incident.

2 Click the Yes button to delete the incident.

Reassigning and re-queuing incidents

You might need to assign incidents from your **inbox** to another staff member or move them back into an **incident queue**. The following situations commonly require you to move incidents, although your manager may have other guidelines as well.

- **You log out for the day**—To avoid having unresolved incidents sitting in your inbox when you leave for the day, you might want to assign them to another staff member or place them back in a queue.
- **You are assigned an incident you should not have received**—When an incident is incorrectly assigned, you can assign it to another agent or group or move it to the correct queue.

To reassign or re-queue an incident

1 From an incidents report, right-click the incident and select Open > Incident.

2 To reassign the incident, click the Assigned drop-down menu and select the appropriate group or staff member.

Or

To re-queue the incident, click the Details tab, click the Queue drop-down menu, and select the appropriate queue.

3 Click the Save and Close button to reassign or re-queue the incident. The incident is moved from your inbox to the agent inbox or selected queue.

Archiving incidents automatically

As customers submit incidents and staff members create incidents, which might have attachments and responses, your site's database can grow very large, leading to performance issues. To avoid these issues, Oracle Service Cloud archives incidents automatically past a certain period of time after they are solved. Archived incidents can also automatically be purged (deleted permanently).

The following table describes the configuration settings used for archiving incidents.

Table 316: Configuration Settings for Archiving Incidents

Configuration Setting	Path	Description
ARCHIVE_INCIDENTS	Agedatabase > Batch Processing > Incident Archiving	Determines when solved incidents are archived. The default value is 365 days (1 year). To disable automatic archiving, set ARCHIVE_INCIDENTS to 0. **Note:** If you run year-over-year reports routinely, you might want to use a larger value than 365 days.

Table 316: Configuration Settings for Archiving Incidents (Continued)

Configuration Setting	Path	Description
PURGE_ARCHIVED_ INCIDENTS	Agedatabase > Batch Processing > Incident Archiving	Determines when solved incidents are purged. The default value is 1,825 days (5 years). To disable purging, set PURGE_ARCHIVED_INCIDENTS to 0.

Note We recommend that these configuration settings remain enabled (set to values greater than zero) to make sure that data stores are cleansed of unnecessary data and to maintain optimal performance.

To change incident archiving and purging settings

1 Click the Configuration button on the navigation pane.

2 Double-click Configuration Settings under Site Configuration. The Search window opens.

3 Enter `*archive*` in the Key field and click the Search button. The ARCHIVE_INCIDENTS and PURGE_ARCHIVED_INCIDENTS configuration settings are displayed on the content pane.

4 Set ARCHIVE_INCIDENTS to the interval in days that you want. Set it to 0 to disable automatic archiving.

5 Set PURGE_ARCHIVED_INCIDENTS to the interval in days that you want. Set it to 0 to disable purging.

For more information, refer to Editing configuration settings.

Accessing archived incidents

There might be times when you need to reference outdated incidents to better serve your customers. In Oracle Service Cloud, you can search for and view incidents that have been removed from your **knowledge base** and archived.

Important Archived incident information is read-only and cannot be updated. In addition, you must perform a search to display and view archived incidents.

To open the Archived Incidents component

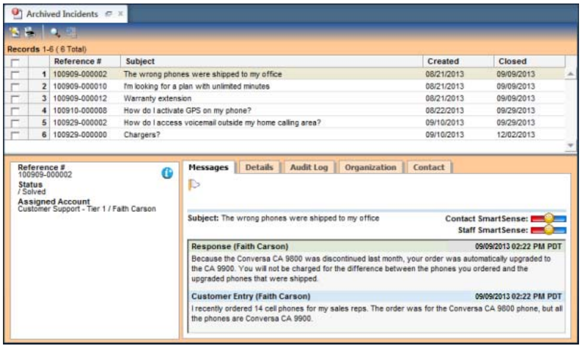
1 Click the navigation button that contains the Archived Incidents component. Contact your administrator if you are unsure of this component's location.

2 Double-click Archived Incidents. The Archived Incidents component opens on the **content pane**.

You can search for, view, print, and export incidents. No incidents display until you perform a search.

In addition to a basic search function, the Archived Incidents component features advanced searching capabilities for retrieving archived incidents based on a broad range of search fields, including the subject, threads, product, category, disposition, contact data, and organization data associated with the incident. You can search ranges for incident creation and closed dates. Custom fields of a string or date data type can also be searched using a specially formatted search value.

After you perform a search, the archived incidents that match your search criteria display on the content pane. Search results are limited to 1,000 incidents rendered in groups of 100. Pagination controls appear when search results exceed 100 incidents. Search results list the reference number, subject, creation date, and closed (solved) date for each incident. To view an incident returned in the search results, double-click an archived incident to open it, or select the incident and click the View Incident button.



Note Oracle Service Cloud **workspaces** do not apply to archived incidents. Therefore, the layout of archived incidents and the location of certain fields are different from the way incidents normally display on the **Service Console**.

If an incident includes HTML formatting when it is archived, the HTML formatting is retained and displays on the content pane.

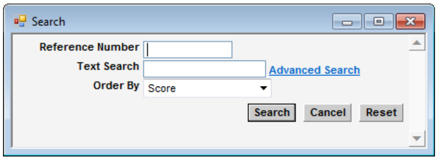
The following table describes field information for archived incidents.

Table 317: Archived Incidents Description

Sidebar/Tab	Description
Incident sidebar	Displays the incident reference number, the staff member and queue the incident was last assigned to, the interface name, and any other information that applies to the incident such as product, category, and disposition.
Messages	Displays the incident thread.
Details	Displays the source of the incident and any custom fields associated with the incident.
Audit Log	Displays the history of all actions taken on the incident by the incident originator and other staff members. Also included is the date of each action.
Organization	Displays organization information, including the organization name, total revenue currency, source level, and CX **state**.
Contact	Displays the contact's information, including name, email address, login, date created, and date updated.

To perform a basic search for an archived incident

1 Click the Search button to open the Search window.



2 Enter search terms as described in the following table.

Table 318: Search Window Description

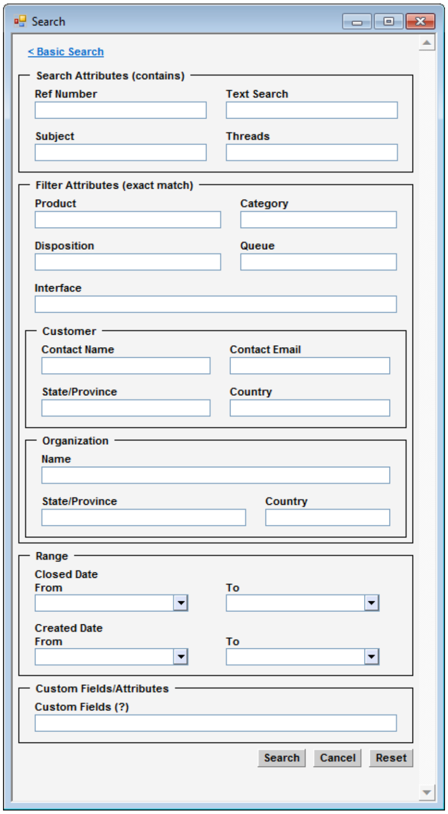
Field/Button	Description
Reference Number	Type the reference number of the incident in this text box.
Text Search	Type a word or phrase in this text box to search all archived incident fields. Because archived incidents have been removed from the knowledge base and converted to a text format, you can only search for incidents with a single text search. Searchable incident fields include Subject, Incident thread, Product (including sub-products), Category (including sub-categories), contact-related fields, organization-related fields, incident custom fields, and incident custom attributes. **Note:** A Boolean OR operator is used between words by default. In addition, there is an implicit wildcard at the end of the search string.
Advanced Search	Click this link to access Advanced Search options. Refer to To perform an advanced search for an archived incident.
Order By	Click this drop-down menu to select a sort order.

3 Click the Search button to query the knowledge base for incidents that meet your search criteria.

To perform an advanced search for an archived incident

1 Click the Search button to open the Search window.

2 Click the Advanced Search link to access advanced searching options.



Note To return to basic search options, click the Basic Search link in the top left corner of the window and refer to To perform a basic search for an archived incident.

3 Enter search terms as described in the following table.

Table 319: Archived Incidents Advanced Search Options

Field/Button	Description
Search Attributes (contains)	Search results contain all or part of the search terms.

Table 319: Archived Incidents Advanced Search Options (Continued)

Field/Button	Description
Ref Number	Type all or part of the reference number of the incident in this text box. You can use wildcards in searching.
Text Search	Type a word or phrase in this text box to search all archived incident fields. Because archived incidents have been removed from the knowledge base and converted to a text format, you can only search for incidents with a single text search. Searchable incident fields include Subject, Incident thread, Product (including sub-products), Category (including sub-categories), contact-related fields, organization-related fields, incident custom fields, and incident custom attributes. **Note:** A Boolean OR operator is used between words by default. In addition, there is an implicit wildcard at the end of the search string.
Subject	Type a word or phrase in this text box to search the Subject field of archived incidents.
Threads	Type a word or phrase in this text box to search the thread content of archived incidents.
Filter Attributes (exact match)	Search results match the search terms exactly.
Product	Use this text box to search the Product field of archived incidents.
Category	Use this text box to search the Category field of archived incidents.
Disposition	Use this text box to search the Disposition field of archived incidents.
Queue	Use this text box to search the Queue field of archived incidents.
Interface	Use this text box to search the Interface field of archived incidents.
Customer	
Contact Name	Use this text box to search contact names in archived incidents.
Contact Email	Use this text box to search contact email addresses in archived incidents.
State/Province	Use this text box to search contact states or provinces in archived incidents.
Country	Use this text box to search contact countries in archived incidents.
Organization	

Table 319: Archived Incidents Advanced Search Options (Continued)

Field/Button	Description
Name	Use this text box to search organization names in archived incidents.
State/Province	Use this text box to search organization states or provinces in archived incidents.
Country	Use this text box to search organization countries in archived incidents.
Range	
Closed Date	Click the From and To drop-down menus and select start and end dates to search archived incidents by a closed date range.
Created Date	Click the From and To drop-down menus and select start and end dates to search archived incidents by a created date range.
Custom Fields/Attributes	
Custom Fields	Type a search string to search custom fields of a string, text, or date type in archived incidents. The search string format is: <custom_field_name>_custom_<search_data_type>: <search_term> [<connector> <custom_field_name>_custom_<search_data_type>: <search_term>] Where: • custom_field_name = name of the custom field or attribute • search_data_type = text, str, or date • connector = AND or OR • search_term = data to search for Examples: c$url_custom_str:"help.example.com" c$RMA_custom_text:RMA12345 AND CO$VarCharText_custom_str:megabyte c$date_custom_date:[20130326T11:37:00Z TO NOW] **Note:** Use quotation marks when searching for a URL value in a text field. Use YYYYMMDDTHH:MM:SSZ format for datetime values. You can join multiple search strings together using the AND and OR operators.

4 To clear all field search values, click the Reset button.

5 Click the Search button to query the knowledge base for incidents that meet your search criteria.

Note Multiple search terms will be joined with AND operators. For example, searching with `14*` in the Ref number field and `Phone` in the Subject field will find only incidents that satisfy both criteria, that is, their reference numbers start with 14 and their subjects include "Phone."

To export archived incidents

1 Select the archived incidents you wish to archive. You can export up to 100 incidents at a time.

2 Click the Export button.

3 Select the location where you want to save the export file, type a name for the file, and click the Save button. The export file will be saved with a *.zip* extension, and will contain each exported incident as an individual XML file.

   You can also open the export file, in which case it will be downloaded to a temporary folder first, then opened.

Managing incident threads

In addition to the tools you have for answering customer questions and maintaining accurate records of all communications with your customers, you also have tools that can help you protect customer information contained in incident threads and, when necessary, convert information from response threads to note threads.

Masking information in incident threads

Your customers and agents may occasionally submit incidents containing sensitive customer information, such as credit card and social security numbers in incident threads. Whether the information appears in a customer entry, response, or private note thread, the security of your customers' personal assets may be compromised.

Our incident thread masking feature can protect this personal data by automatically masking content in incident threads. By default, Oracle Service Cloud contains three predefined system masks for credit card, social security, and telephone numbers. In addition, if our predefined patterns do not satisfy your organization's needs, you can define up to five custom masks to hide other personally identifiable information when new thread entries are created. As you configure incident thread masking for your application, you can test each system and custom mask before finally deploying the configurations to your site.

Caution To mask customer information in incident threads, incident thread masking must be enabled. Contact your Oracle account manager to enable this feature.

Be aware that once incident thread masking is enabled, masking is automatically performed in new thread entries, even if you make no changes to the predefined masks or define custom masks. Masking also occurs in the incident thread data itself, where the masked values are replaced and not recoverable.

Note that predefined text, such as standard text, SmartAssistant responses, and variables, is not masked. Do not include confidential information in predefined text.

For these reasons, you should use extreme caution when configuring masking for your site, and enable the profile permission for this feature only for trusted administrators.

Once incident thread masking is enabled, you must perform the following tasks so you and your staff can configure incident thread masking.

- Add the Incident Thread Masking component to the Configuration button in at least one navigation set. Refer to Creating a navigation set for the administrator.
- Assign the Administration permission on the Administration tab of profiles so specific staff members can configure incident thread masking. Refer to Administration permissions.

To configure incident thread masking

1 Click the Configuration button on the **navigation pane**.

2 Double-click Incident Thread Masking in the **configuration list**. The Incident Thread Masking editor opens on the content pane.

3 Enter the following field information.

Table 320: Incident Thread Masking Editor Description

Field/Button	Description
System Masks	This section contains a list of three predefined system masks, which are enabled by default. In addition, the last four digits of each system mask also display by default. You can edit each system mask to hide the last four digits or disable any system mask you do not need. **Note:** Once incident thread masking is enabled, masking is automatically performed on credit card, social security, and telephone numbers entered in new incident threads with no action required on your part. You can enable or disable these options to suit your business needs.
Credit Card	Clear the Enabled check box to disable the credit card mask, or clear the Show Last 4 Digits check box to hide the last four digits of credit card numbers. This mask matches major credit card numbers including Visa, MasterCard, Discover, American Express, and Diners Club. Hyphens, periods, and spaces are accepted as dividers between number groups, as in the following examples. *Visa (13 and 16 digits):* 4215101992633023 4215 1019 9263 3023 453 939339 6455 *MasterCard:* 5406209167573761 5406-2091-6757-3761 5406.2091.6757.3761 540.620916.757.3761 *American Express:* 373518140296377 3735 181402 96377 *Discover:* 6011891400863425 6011.8914.0086.3425 601.189.140.086.3425 *Diners Club (14 digits):* 30139201272845

Table 320: Incident Thread Masking Editor Description (Continued)

Field/Button	Description
SSN	Clear the Enabled check box to disable the social security numbers mask, or clear the Show Last 4 Digits check box to hide the last four digits of social security numbers. This mask matches the following patterns: AAA-GG-SSSS, AAA GG SSSS, AAA-GG SSSS, AAA GG-SSSS, AAAGGSSSS, AAA-GGSSSS, AAAGG-SSSS, AAAGG SSSS or AAA GGSSSS. Hyphens, periods, and spaces are accepted as dividers between number groups, as in the following examples: 534-14-3154 534.14.3154 534 14 3154
Phone number	Clear the Enabled check box to disable the phone number mask, or clear the Show Last 4 Digits check box to hide the last four digits of telephone numbers. This mask matches the common U.S. phone number format, with the optional country code 1 in the beginning. Hyphens, periods, and spaces are accepted as dividers between number groups, as in the following examples: 1(111)222-3333 1(111)2223333 1(111) 222-3333 1.111-222-3333 1.111.222.3333 1 111 222 3333 +1.111.222.3333 +1.111.2223333 +1.1112223333

Table 320: Incident Thread Masking Editor Description (Continued)

Field/Button	Description
Custom Masks	Double-click in the Value field next to the first custom mask and type the **regular expression** for the pattern you want to mask. The following examples can help you configure custom masks for new incident threads. **Example 1** Suppose you want to mask all account numbers that match the pattern `123-123456`. Type `[0-9]{3}-[0-9]{6}`. As a result, all account numbers that match this pattern will display as `XXXXXXXXXX` in new incident threads. (Notice that all characters are masked, including the hyphen.) **Example 2** In this example, we'll define a mask for Canadian postal codes that match the pattern `K8N 5W6.` Type `[A-Z]{1}[0-9]{1}[A-Z]{1} [0-9]{1}[A-Z]{1}[0-9]{1}`. As a result, all Canadian postal codes that match the pattern `K8N 5W6 will` display as `XXXXXXX.` The space is also masked.
State	This read-only field shows the status of changes you make in any custom mask Value field. Statuses include Valid, Requires Test, and Error. **Note:** The status of this field may change when you type sample text in the Preview Text field, and click the Test/Preview button.

Preview Text	Click in this field to test your mask patterns. Include samples that both match and closely match the custom pattern you configured. For example, to verify that your Canadian postal codes mask is masking only the alphanumeric pattern you configured, type the following postal code samples.
	`K8N 5W6`
	`4J3 P2P`
	`V5T 1Y9`

Test/Preview	Click this button to apply the configured system and custom masks to the sample content in the Preview Text field.

Table 320: Incident Thread Masking Editor Description (Continued)

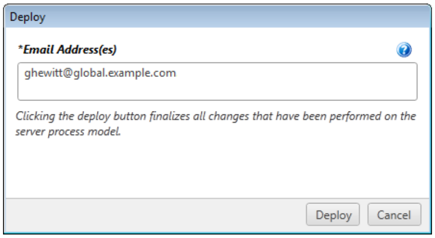
Field/Button	Description

Result Text	This field displays the masked preview text. Sample text that matches an enabled system or custom mask will display as masked. For example, the Canadian postal code samples in the Preview Text field displays the following Result Text values.
	`XXXXXXX`
	`4J3 P2P`
	`XXXXXXX`
	The masks applied to the first and third text samples because they matched the alphanumeric expression that we configured in our custom masks example. The second text sample did not match the pattern.
	Note: Be sure to test a variety of sample values and adjust custom mask values until the Result Text displays text masked as you want. Also be sure to test inexact matches to ensure that masks are not affecting content that should not be masked.

4 Click the Save button on the ribbon to save your changes to system and custom masks.

Important You must deploy mask configurations before they will be committed to the database and applied to new incident threads.

5 Click the Deploy button on the ribbon. The Deploy window opens.



6 Type the email addresses you want to send notifications to in the Email Address field. Multiple addresses must be separated by commas. The logged-in staff account's email address is automatically added. Addresses entered in this field receive emails when deployment completes or when an issue preventing deployment is encountered.

7 Click the Deploy button to deploy your changes. A Deploy message displays.

8 Click the Yes button to confirm the deployment. The Incident Thread Masking editor will be unavailable until the deployment completes.

Testing the accuracy of masking configurations in a test incident thread is an important security procedure. Though securing the customer's personal assets is the most compelling reason to test with incidents, the integrity of your incident information is also at stake. Because incident thread masks apply globally to all incident threads, we strongly recommended that you test the deployed masking configurations in a series of incident thread entries and verify that your masks apply to saved incident entries and incident emails the way you intend. The following procedure is for testing purposes only.

To verify changes to incident thread masking in a test incident

1 Create a test incident.

2 Associate a test contact with the incident.

3 Add a new customer entry, response, and private note. In each entry, type text that both matches and closely matches the mask patterns you have deployed. For example, type `123-45-6789` and `123-45-67890` to test the social security number system mask. Add other examples of text that match and closely match each of the mask patterns you have deployed.

4 Click the Save button on the ribbon.

5 Verify that only the appropriate patterns were masked in the incident thread and in the email response.

If you need to make further changes to your masks, you can return to the Incident Thread Masking editor. See To configure incident thread masking

Converting response threads

There may be times when a response contains incorrect information or was inadvertently sent to a customer. Since thread entries cannot be edited after they are sent to a customer, you can use the Incident Thread Type Correction feature to convert a response thread entry into a note thread entry so it will not be seen by customers in any future response. When using this feature, you can view all responses for a particular incident and select those you want to change to notes. Once a response is converted to a note, it cannot be converted back to a response.

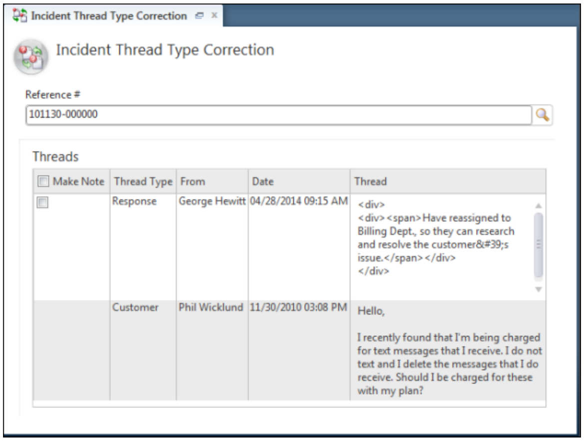
Note To access the Incident Thread Type Correction feature, you must have Administration permissions set in your profile. Refer to Customizing profiles.

To convert a response thread

1 Click the Configuration button on the **navigation pane**.

2 Double-click Incident Thread Type Correction under Database. The Incident Thread Type Correction tree displays on the **content pane**.

3 Type the reference number of the incident containing the thread entry you want to convert and click the Search button. Threads from the incident display on the content pane.



4 Select the Make Note check box next to the response you want to convert to a note and click the Save button.

The next time you open the incident, this information will display as a Note thread.

❖ Responding to incidents

Configuring incident stopwords

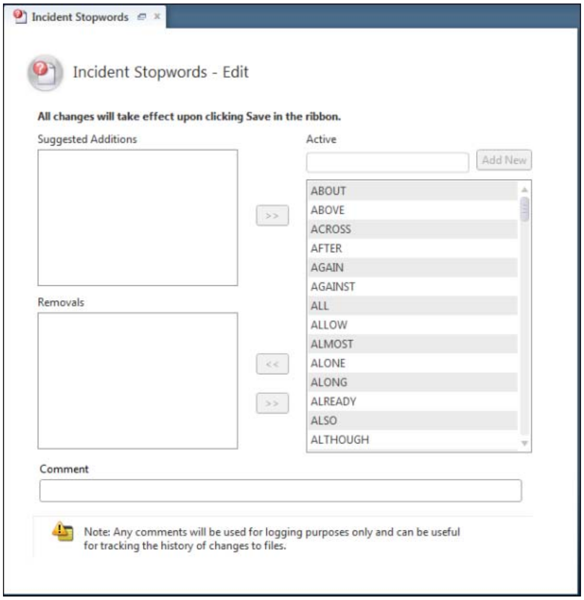
Incident stopwords are common words that are excluded from incident indexing and searching. Service can suggest incident stopwords based on an analysis of incidents. You can then look at the list of suggested stopwords on the Edit Incident Stopword list. Suggested stopwords are commented out unless you decide to include them in the incident stopword list.

Note Incident stopwords can also be managed through the **File Manager** using the *exclude_incidents.txt* file. Refer to Managing files.

To add or edit an incident stopword

1 Click the Configuration button on the **navigation pane**.

2 Double-click Incident Stopwords under Service > Knowledge Base to review incident stopwords. The Incident Stopwords editor displays on the **content pane** and suggested stopwords are listed in the Suggested Additions box.



3 Select the stopwords in the Suggested Additions box and click the top double-right arrow to add the words to the Active list. The words you select are highlighted.

4 To add an additional stopword, type the word in the text box on the Active list and click the Add New button.

5 To remove a stopword from the list, click the word in the Active list and click the double-left arrow. The word is added to the Removals box, where it is highlighted.

6 Click the Save button to add and remove the selected words from the stopword list.

Note Oracle Cloud Operations must run the **Keywordindexer** utility before your changes to the stopwords list are active. To schedule this, submit an incident on our support site.

❖ Searching for records

40

Answers

Customers use your site to find answers to their questions about the services and products your organization provides. To assist your customers in finding the information they are looking for, you can create answers to common questions and post them on your **customer portal**. As a result, you are able to provide a better customer experience because your customers are able to quickly find the answers to their questions.

Oracle RightNow Cloud Service (Service) provides you with the tools for creating and publishing effective answers. You can format answers to include links, tables, graphics, and other features, making your support site more interactive and visually appealing. In addition, Service provides you with a revolutionary method of **knowledge base** management that enables you to overcome the critical problems associated with a manually constructed knowledge base. Maintenance of your knowledge base is minimized because of automated processes that learn from customers using your site, then automatically rank answers and display the most useful answers first.

To learn how to seed your knowledge base and keep it organized and up-to-date, click here. To learn more about answers and how to work with them on the Service Console, click here.

Seeding your knowledge base

Service's ability to start with only fifteen to twenty answers eliminates the need for a comprehensive initial knowledge set, which significantly speeds and simplifies the implementation. Most organizations can build their initial seed from existing online questions and answers, documents, or customer support interactions. Instead of constructing a complete set of answers up front, you can take advantage of the ongoing questions that your customers submit to capture real-world issues.

As customers submit questions and your organization's support staff solves these issues, you are supplied with content that is perfectly suited for public answers. Service's Propose Answer feature enables agents to suggest that certain incidents become public answers, allowing you to seamlessly create public answers from the real issues that your customers are facing. This method of organic growth eliminates the need for a complete initial group of answers, significantly reducing your ongoing maintenance tasks, and ensures that your knowledge base contains useful, effective content. Additionally, as you foresee that upcoming events (for example, a product release, seminar, or conference) may increase queries on your site, you can manually add answers to the knowledge base to answer questions before they are even asked.

Note Agents can propose **incidents** as answers only if they have Propose permission in their **profile**. Refer to Service permissions.

Defining a process for publishing and reviewing answers

Before you develop your **knowledge base**, it is important to understand the process for publishing answers. Frequently, the need for a new public answer will arise from a question submitted by a customer. When agents resolve an issue and recognize the need for an answer, they can propose an incident to become a publicly viewable answer.

Best Practices for Answer Content

Best practices for answer content include how to write answer content, organizing your knowledge base, laying out your content for easy scanning, using rich media, maintaining key content, and creating a style guide. Refer to *Best Practices for Developing Answer Content*.

The following process outlines the steps for efficiently capturing incident information and creating answers.

Step 1—Define a process for proposing new answers. Typically, in order to publish an incident as an answer, the incident threads will need to be summarized to cover a broader topic scope. To take advantage of agents' expertise, we have found the following approach to be successful.

1. An agent modifies the existing incident and writes the new answer as a Note thread with the public audience in mind, following established standards and guidelines. Two key items to include are the incident reference number and the staff member's name.

2. An agent proposes the incident. An answer is created, and the summary and threads from the existing incident are copied to the Question field of the new answer.

3. You then review, edit, and format the proposed answer and publish it. This method uses an agent's knowledge for writing the bulk of the answer, and then you prepare the answer for public viewing.

Step 2—Define an approval review process for new answers. Once an answer has been proposed for public use, you may want managers or staff members from other areas in your organization to review the information to ensure technical accuracy of the methods and procedures defined in the solution.

Step 3—Determine the audience of new answers. Before publishing an answer, determine which **interfaces** and customers you want to be able to view the answer. You can control this **visibility** through the visibility of **answer statuses**, **answer access levels**, **languages**, **products**, **categories**, and **conditional sections**. Refer to Controlling answer visibility.

Step 4—Determine the display position of new answers. You can set the position of a new answer relative to other answers on the Answers page on the customer portal. When adding or editing an answer, you can choose to place new answers at the top, middle, or bottom of the answers list, or fix them at the top, middle, or bottom.

If you want to give added visibility to newly published answers, place them at the top and then allow their historical usefulness to dictate their future placement. In this way, your customers are aware of new answers as you publish them.

Step 5—Notify staff of new answers. Your administrator can use standard reports to show answer notifications by answer, product, category, or subscribers. Standard reports for answer notifications can be scheduled to be sent to other staff members and are located at Public Reports\Service\Site Reports\Answer Notifications. Refer to Scheduling reports.

After following these steps to identify your process for publishing answers to your customers and notifying staff members about new answers, you can begin creating answers.

- Controlling answer visibility
- Scheduling reports

Creating effective answers

Creating useful answers is a straightforward process with a few simple guidelines. By following these guidelines, you will enhance the search process for customers, allowing them to find pertinent information quickly without needing to do multiple searches. A **knowledge base** containing well-crafted answers will also optimize the self-learning features of Service that continually index, group, link, and rank the answers in the knowledge base. These self-learning features are the backbone of self-service, enabling you to present the most historically useful answers first and to suggest answers related to the customer's current question. In addition, effective answers will make your maintenance tasks easier as information ages and changes.

Use the following guidelines to create clear, focused answers:

- **Create one-topic answers**—Think of each public answer in your knowledge base as one topic or the answer to one question. When a customer comes to your site with a question, they want quick resolution. One-topic answers improve searching and grouping, which enable customers to easily find answers. One-topic answers provide brief, pertinent information without clutter. A knowledge base of unique answers also simplifies management and maintenance.
- **Provide adequate detail**—Because Service indexes the text of the Summary, Question, and Answer fields into words and phrases for text searching and answer grouping, answers should contain an adequate amount of text that explains the issue. With limited text, there are very few indexed words for the answer, and the words that are indexed cannot fully represent the context of the answer. As a result, the answer may be difficult to find during text searching. With too much text (over two pages), you run the risk of writing about several topics and covering too broad of a context. The resulting set of indexed words may not span the entire text of the answer. In effect, the answer can be found during dissimilar searches in which that answer is not relevant.
- **Write a concise summary**—The quality of the summary, meaning how closely it summarizes the contents of an answer, is critical to the effectiveness of the answer and affects its display position, how it links to related answers, and how it is grouped with similar answers. On the Answers page, customers will choose to open and read or skip over an answer based on the summary. Without a concise summary, customers may not open the answer, which directly impacts its display position and how it is linked with other answers. The summary should state what the customer can expect to learn by reading the answer or what question will be answered.
- **Create explicit keywords**—Sometimes, you may not be able to capture the entire contents of an answer in the one-sentence summary. The Keyword field is an additional field, not viewable by customers, used during keyword indexing of an answer. You can enter supplemental keywords, phrases, or text that represent the answer's contents. Keywords should be separated by commas, with grouped words separated by spaces (for example, "cell phones, calling plans, accessories"). You should be deliberate with the words you enter because they are weighted higher than indexed words and phrases not in the Keyword field. Be sure to include a thorough, yet concise section of keywords.

After creating a knowledge base of effective answers, you will want to publish the answers to be accessed by customers. By understanding the factors that determine answer visibility, you can effectively control how and when answers are seen on the customer portal.

Controlling answer visibility

When you publish answers, you make them available to the public on your **customer portal**. Answers can be either public or private, as well as have specific **visibility** settings for each **interface** or for contacts based on access levels defined in their **SLAs**. Whether answers are visible on your customer portal is determined by what you specify in certain fields. The five key fields that determine how and where answers are presented are **Answer Status**, **Answer Access Level**, **Language**, **Products** and **Categories**, and **Conditional Sections**.

In order for answers to appear on the customer portal, the Status, Access Level, Language, Product, and Category fields must be set to a visibility that allows access by customers. If even one field does not allow visibility, the answer will not be available on the customer portal. In addition, if you have sections within an answer with restricted visibility, that section must be assigned an access level associated with the answer. The five fields that control answer visibility are described in detail below.

- **Answer status**—The primary factor that determines the visibility of answers is answer status. There can be many custom answer statuses, but all must be either a Public or Private status type, which is determined when the custom status is created. Answers set to a status that has a Private status type can never be viewed on the customer portal, regardless of their access or language assignment. Public answers may be viewable through the customer portal, depending on the other fields selected.
  Two of the default answer statuses are Review and Proposed, both of which have a Private status type. When agents propose an incident to become an answer, it is copied and set to the Proposed status with an access level of Everyone. Since the Proposed status is a Private status type, the answer will not be visible to customers.
  An answer changes to the Review status when its solved count reaches zero or when the date specified when adding or editing an answer is reached. The Review status will automatically remove the answer from the customer portal. Refer to Adding and editing answer statuses.
- **Answer access level**—Access levels determine whether customers can view answers on a per-interface basis. If an answer is set to an access level that has customer visibility on one of the interfaces, then that answer is viewable by everyone on that interface, provided the remaining fields also allow visibility. If an access level does not provide visibility to customers for a certain interface, access can still be given to specific contacts by assigning them SLAs that allow privileged access.
  One of the default access levels for answers is Everyone. This access level allows all customers to have access to the answer on all interfaces. Refer to Adding and editing answer access levels.

- **Language**—Answer visibility is also determined by the language assigned to it. If assigned to a specific language, an answer will only be visible on the interfaces using that language, as long as the answer status and access level also allow visibility.
- **Products and categories**—The visibility settings for the products and categories associated with the answer will also affect the visibility. If the answer is assigned to a product or category that is not visible to customers on a particular interface, the answer will also not be visible to customers, unless it is assigned to another product or category that is visible on the interface. In other words, if you have an answer that is assigned to two products, and one of the products is not visible on the interface, but the other product is, your answer will appear on the interface. However, if the answer is assigned to two products, and neither product is visible on the interface, your answer will not appear on the interface under any circumstances. Refer to Adding and editing products, categories, and dispositions.
- **Conditional sections**—Conditional sections help control visibility of certain sections within an answer. If a section of the answer is assigned an access level that is not visible to customers on a particular interface, but the answer is visible, then customers are able to view the answer but not the conditional section. For more information about conditional sections in answers, refer to Inserting conditional sections.

❖ Adding and editing answer statuses
❖ Adding and editing answer access levels
❖ Adding and editing products, categories, and dispositions
❖ Inserting conditional sections

Troubleshooting when answers are not visible

If an answer (or section within an answer) you want to be accessed by your customers is not appearing on the **customer portal**, answer the following questions to troubleshoot the problem.

- Is your status set to Public or a custom status with a status type of Public?
- Does the access level have visibility for the desired interface?
- Is your language for the answer appropriate? If you have more than one interface with multiple languages, is the answer set to the same language as the interface you are trying to view it on?
- Are your products and categories visible on the interface? Is your answer assigned to at least one product/category that is visible to customers?
- Are the answer sections within the answer visible as you intended?

If the answer to any of these questions is "no," make the appropriate changes and check again to see if the answer appears. If you are unsure of the answer to any of the above questions, contact your administrator.

Note You can preview an answer to view it as customers will see it on the customer portal. Refer to Previewing answers.

Organizing answers

Through click-track analysis and feedback on answers, your answers are automatically organized. Answer rankings are constantly updated using the solved count value and presented to your customers with the most useful information first. Service uses three techniques to gather useful information about answers.

- **Explicit customer feedback**—By default, the Answers page offers customers a way to rate answers through the "Was this answer helpful?" option. Their responses automatically raise or lower the solved count of answers.
- **Explicit ranking of the answers**—You can explicitly rank answers at certain levels in the knowledge base using the Display Position setting. This is often useful when new issues arise.
- **Click-track analysis**—Service analyzes the path each customer takes through the knowledge base. The use and benefits are two-fold:
  - ▷ Answer relatedness—An affinity map is built which relates answers that customers view to other answers viewed during the same visit. Through the SmartAssistant feature, Service suggests answers to them based on the historical relationships of that answer to other answers in the knowledge base. The suggested answers appear as learned links on the Relationships tab. Refer to Managing answer relationships.
  - ▷ Implicit ranking—The click-track data is also used for answer ranking. Each time an answer is viewed by a customer or suggested by an agent, its solved count is increased.

Rating answers through Solved Count

The Solved Count feature collects information about the usefulness of answers in your knowledge base and uses this data to rank your answers. Implicit data is compiled by how customers select and view answers. Explicit data is compiled by how customers rate the effectiveness of individual answers. Both long-term and short-term solved counts are used to calculate the score. Solved counts from the **customer portal** account for 75 percent of an answer's score, and agent solved counts contribute 25 percent. Using the solved count values, Service can dynamically rank the answers by their usefulness and present customers with the most effective answers first.

Note By default, the Solved Count feature is enabled.

An answer's score value is a calculated value equal to the answer's solved count combined with any "fix at" positions specified for the answer in the Display Position drop-down menu when adding or editing an answer. For more information about the options available, refer to Adding answer details.

- **Implicit ratings**—Implicit ratings are gathered as customers view answers. If a customer views an answer, the solved count of the first answer is increased, but not as much as the second viewed answer. In other words, the answer that the customer views last receives the largest solved count increase. Previously viewed answers receive a smaller increase in their solved counts. The solved count is also increased when an agent uses a SmartAssistant suggested answer when responding to a customer's question.
- **Explicit ratings**—Explicit ratings are gathered from the response to the question, "Was this answer helpful?". This question is displayed on the Answers page on the customer portal.

Aging of Solved Count

Over time, an unused answer's solved count will gradually decline or age. For example, if an answer has not been viewed for thirty days (the default setting), the solved count will automatically be reduced. The solved count of unused answers also declines at a constant rate over time. Ultimately, if an answer has not been viewed for an extended period of time, the answer's solved count can reach zero.

When you first create an answer, its rank in the knowledge base is low, thereby making it more difficult to access. Generally, you would not want aging to occur on new answers. By default, new answers will not be aged for thirty days. Your administrator can change the setting to specify an alternate aging period.

Note Your administrator can also control the frequency and aggressiveness of aging on answers depending on your organization's specific needs. Contact your administrator for more information about the Solved Count settings defined in your application.

When an answer's solved count reaches zero, this usually means that the answer has not been viewed for a long time, and it is safe to assume that the information may be outdated or not useful. By default, these aged answers are automatically set to the Review status when their solved count reaches zero. This enables you to easily sort the outdated answers and update them.

Note By default, the Review feature is disabled. Contact your administrator to enable this feature.

Now that you have thought about your processes for publishing answers and understand how the knowledge base grows and presents information, you need to know how to keep your knowledge base accurate and up-to-date.

Maintaining your knowledge base

Many of the maintenance tasks related to organizing the answers in your **knowledge base** are automated in Service. This enables you to focus on improving and maintaining the content of answers. The following list outlines these automated processes and describes the tools designed to aid with answer management.

- **Aging of answers (solved count)**—Just as frequently used answers will rise to the top of the knowledge base, lesser-used answers will move to the bottom through aging of the answers' solved count. Refer to Aging of Solved Count.
- **Answer review and publish feature**—By using the Review feature, you can easily monitor answers without needing to constantly review them. The Review feature will automatically set an answer to the Review status when the solved count reaches zero or on specifically defined dates. You can also manually set a review date, the date that you want the answer to go into review status. In addition, you can set an answer's publish date for a date in the future. In this way, you can schedule an answer to become public automatically without having to publish. Refer to Reviewing answers.
- **Data mining**—The processes of linking similar answers for the Related Answers feature is triggered automatically and occurs periodically when modifications are made to the knowledge base. These processes implement innovative technologies to cluster and link answers containing similar content.
- **Customer feedback**—Service closes the loop by providing customers with a method to submit comments and suggestions on answers. Any feedback submitted through the question, "Was this answer helpful," is turned into a Feedback for Answer incident accessible to agents. You can use this feedback to address content holes and improve answers.

- **Customer visit tracking**—Service tracks customers' actions as they move through your support site, recording where they went, what they searched for, and the answers they viewed. Using the Web Visit feature, agents can view this click-stream data to respond more appropriately to customers' questions. This information can also indicate areas of the knowledge base that need to be tuned. Refer to Viewing web visit information.
- **Knowledge base reports**—A series of standard reports record how customers are navigating the knowledge base, including the products and categories they are searching on, the search text they are entering, and the answers they are viewing. These reports provide a unique and powerful perspective into how the knowledge base is performing and enable you to pinpoint weak areas and tune the knowledge base content. Refer to Evaluating answers using service analytics.

❖ Aging of Solved Count
❖ Reviewing answers
❖ Viewing web visit information
❖ Evaluating answers using service analytics

Evaluating customer feedback

Your customers can provide feedback on answers that do not completely solve their issues (by answering the question, "Was this answer helpful?"). This feedback can be extremely valuable for understanding customer needs and updating your answers accordingly. When a customer submits comments or suggestions from the feedback form, an unresolved incident is automatically created.

Note In some instances, customer feedback can be incorporated directly into an existing answer. In other cases, new answers may need to be created.

Reviewing answers

Over time, the content of your answers can become outdated. Consequently, reviewing answers should become a central part of maintaining your **knowledge base** to ensure that the content is current, relevant, and useful. You may want to review answers at set intervals, such as every six months, or review answers in conjunction with new product releases or upgrades. If you have a group of answers for a particular product or service, you may want to review the answers in bulk. This can help you develop and prepare information in advance.

By using **custom fields**, custom **answer statuses**, and **answer access levels**, you can easily sort and work on answers in different stages of editing. For example, your administrator may have created a private answer status called Manager Review for newly crafted answers that will require manager approval before being published.

When editing an answer, you can set a specific date to review a particular answer. On the review date, the status of the answer will change from Public to Review. Also, by default, if an answer is not viewed by customers, the answer's solved count will reduce to zero, and the status of the answer will change to Review. Refer to Aging of Solved Count.

Tip To maintain information about a particular topic in one answer, use the Notes tab to store upcoming information or material you are currently editing.

Identifying content holes

You should actively investigate material for new answers by reviewing recently submitted **incidents**. Agents may become overwhelmed with assistance requests, and despite their best intentions, they may forget or not have enough time to propose new answers. By continually capturing questions submitted by your customers and crafting new answers that solve those questions, you can publish answers for the most relevant and current issues.

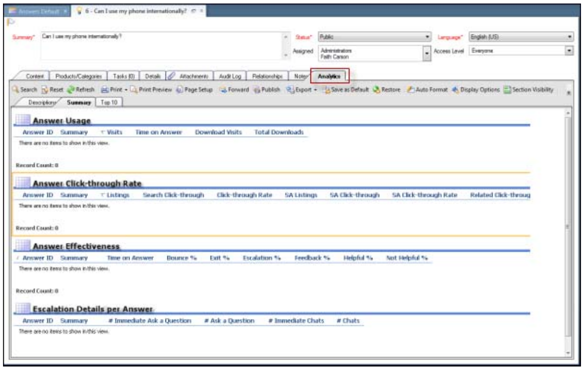
As you search the most recently solved incidents, click the Web Visit tab to see if customers searched or viewed any answers before submitting their incident. In this way, you can locate answers that are incomplete or need updating. Refer to Viewing web visit information.

Note Before creating a new answer, search for existing answers that cover the topic. You can avoid duplication by updating an existing answer, rather than creating a new one.

Evaluating answers using service analytics

Service has several standard reports that track customer activity and provide data on the effectiveness of your **knowledge base**. One of the most useful reports for identifying subject matter holes in your knowledge base is the Information Gaps report which is located at Public Reports > Service > Knowledge Base Reports. This report creates knowledge **clusters** from your existing incidents and compares them to your answers, alerting you when incidents are created that are not closely matched to any answer. By browsing the incidents and their cluster topics, you can evaluate the need for additional answers in your knowledge base.

The Analytics tab on the standard answer **workspace** displays reports about the answer currently being viewed or edited. The reports are located at Public Reports > Service > Site Reports > Actionable Knowledge Foundation. By reviewing the reports on the Analytics tab, you can fine-tune individual answers to make them more relevant for the **customer portal** and ultimately improve customer satisfaction.



The Analytics tab contains a toolbar for performing actions on the reports. Three tabs are located under the toolbar: the Descriptions tab, which provides descriptions for the reports, and the Summary and Top 10 tabs, which display the reports.

By default, the Summary tab opens and displays the following reports.

- **Answer Usage**—This report provides contact usage details on a per-answer basis.
- **Answer Click-through Rate**—This report provides a list of customer portal pages and actions and details about the visits for each.
- **Answer Effectiveness**—This report provides details about the actions performed on individual answers to provide an overall assessment of how effective each answer is.
- **Escalation Details per Answer**—This report provides information about the escalations that occurred after a particular answer was viewed.

The Top 10 tab displays the following reports.

- **Top Searches per Answer**—This report provides the top ten searches that returned an answer which was viewed by a contact.
- **Top Previous Answers by Answer**—This report provides a list of answers viewed during a selected time period, along with the top ten answers that were most often viewed previous to that time period.

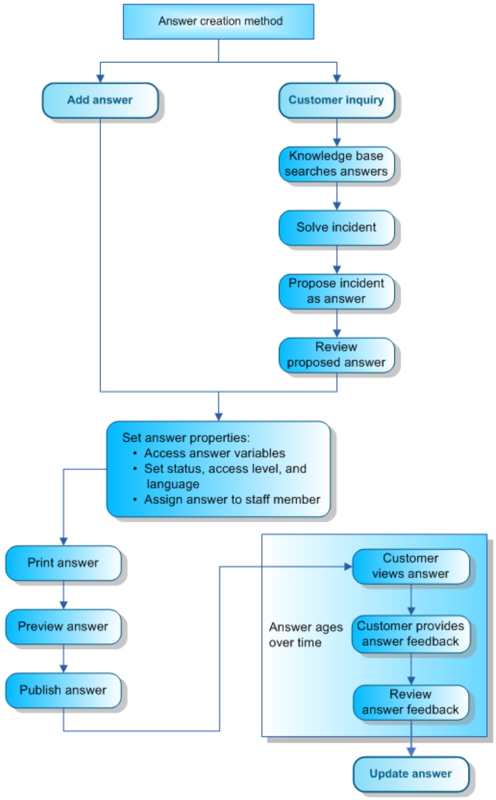
- **Answer Referrers**—This report provides the domain names (www.example.com) that visitors arrive from and the number of times (visits) a given answer was viewed by individuals from those domains.
- **Top Next Answers by Answer**—This report provides a list of answers viewed during a selected time period, along with the top ten answers that were most often viewed after that time period.

Answers overview

One of the greatest ways you can improve your customers' experience is to have answers to common questions readily available on your support site. With Service, you can create answers about your services and products and post them on your site. You can also create public answers from incidents in your **knowledge base**, or agents can propose incidents to become answers.

Once an answer is in your knowledge base, you can update it at any time, making sure your knowledge base contains only the most up-to-date information. For example, you can define specific dates to review an answer and change the answer to Private while you update the details. You can format answers with the HTML editor, which lets you create links, tables, and graphics, and use other HTML features without prior HTML knowledge. As a result, your support site is more interactive and visually appealing.

The following figure shows the actions that can be performed on an answer.

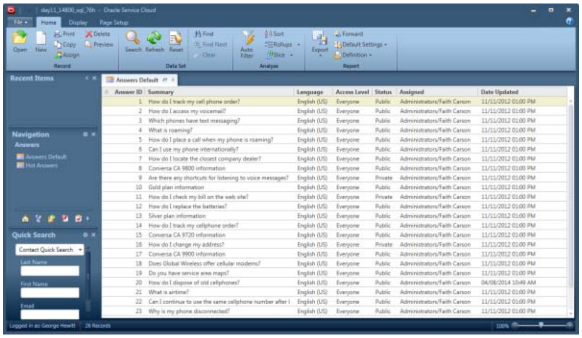


Answers reports

When you click the Answers button on the **navigation pane**, the **navigation list** displays all of the reports and items added to this button by your administrator. The Answers button, plus all the other buttons you have access to, are part of the **navigation set** defined in your profile.

Answers reports can be placed in other navigation lists, not just the Answers navigation list. And if you have permission to customize your navigation set, you can add other items, including any reports you have permission to access, to your Answers navigation list or any of your lists. Refer to Customizing navigation and configuration lists.

The following figure is an example of the Answers Default report.

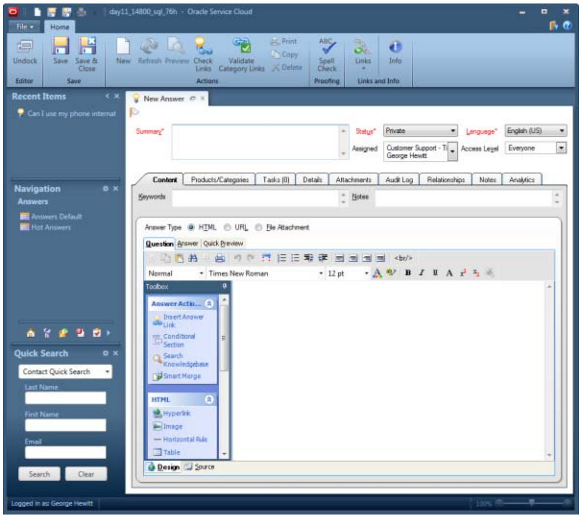


The answer information displayed on the content pane depends on the answers report you opened and which fields were defined when the report was created. The Answers Default report, for example, displays the answer’s ID, summary, language, access level, status, assigned, and date the answer was last updated. The **ribbon** allows you to manage answers and provides data analysis options for working with reports. You can right-click any answer and select the same functions that are available on the ribbon. Refer to [Ribbon](#).

Tip Besides selecting an answer from a report, you can search for answers from a report or use Quick Search. Refer to [Searching for records](#).

Standard answer workspace

Service provides a standard workspace for working with answers. The workspace defines which fields are available, what buttons display on the ribbon, and how the information is organized on the **content pane**. The following figure is an example of the standard answer workspace.



Your organization may use this standard workspace, or your administrator may have created one or more customized workspaces. Your profile defines the workspace you see when you work with answers, whether it is the standard workspace or a customized workspace. The standard workspace is used to describe how you work with answers, but keep in mind that the workspace your profile uses may display a different combination of fields, or it may display them in a different location on the content pane. Refer to Standard workspaces.

Ribbon

A standard ribbon exists for working with answers. The following table provides a description of the buttons available by default on this ribbon.

Table 321: Answer Ribbon Description

Group/Button	Description
Editor	
Undock	Click this button to undock the answer editor from the console and display it in a separate window.

Table 321: Answer Ribbon Description (Continued)

Group/Button	Description
Save	
Save	Click this button to save the answer without closing it. The answer remains open. **Note:** When you save an answer, it is evaluated by the rules engine. If your administrator added answer rules and the answer matches one or more of those rules, it is possible that the answer will be modified by rule actions when you save it. For example, a rule can change an answer's status or answer access level. Refer to Business rules overview.
Save and Close	Click this button to save and close the answer.
Actions **Note:** With the exception of the New button, the buttons in this group are not enabled until after you have saved the answer you are adding.	
New	Click this button to add an answer. Refer to Adding answers.
Refresh	Click this button to refresh the current answer.
Preview	Click this button to view the answer as it will appear to your customers. Refer to Previewing answers.
Check Links	Click this button to check the validity of hyperlinks and answer links in the answer. Refer to Validating answer links.
Validate Category Links	Click this button to check if the products and categories you selected for the answer are linked. If the categories you selected are linked to selected products, a message informs you that all selected categories are linked to at least one selected product. If you select one or more categories that are not linked to the products you selected, a message lists the categories that are not linked to any of the selected products. Refer to Product linking.
Print	Click this button to print the answer. Refer to Printing records.
Copy	Click this button to copy the answer. Refer to Copying records.
Delete	**Caution:** Deleting an answer affects all relationships associated with the answer. Click this button to delete the answer. Refer to Deleting answers.

Table 321: Answer Ribbon Description (Continued)

Group/Button	Description
Proofing	
Spell Check	Click this button to check the spelling of any answer fields that have spell check enabled. **Note:** Text on the answer's Content tab is automatically checked for correct spelling. Refer to Spell checking.
Links and Info	
Links	Click this button to select a URL from the list of links added by your administrator.
Info	Hover over this button to see details about the answer, including when it was created and last updated, the staff member who last edited it, and the date of the last answer update notification. If the answer is in a rules state or has an escalation level, that information also appears.

- ❖ Working with the ribbon
- ❖ Displaying shortcut keys on the ribbon

Record tabs

Record tabs contain fields and options for adding additional information to answers. The organization of these tabs allows you to manage and edit information and quickly move between the tabs as you work with answers. The information you can access on each tab depends on the permissions set in your **profile**.

Important If you make changes to fields on any of the answer record tabs or any of the windows opened through the record tabs, you must save the answer in order for all changes on the record tabs to take effect. If you close the record without saving changes, those changes are lost.

- **Content tab**—Contains the fields for adding and editing answers, including keywords, answer type, question, and answer. Also included is the Toolbox which contains tools for inserting hyperlinks, images, tables, buttons, answer links, and conditional sections. Refer to Adding answers.
- **Products/Categories tab**—Lists all products and categories that are associated with the answer. You can select which products and categories are associated with an answer to enhance search results for customers. Refer to Associating products and categories.
- **Tasks tab**—Lists all tasks associated with the answer. The number of tasks associated with the answer displays in parentheses next to the tab name. For each task, the tab displays the task name, due date, completion date, staff member assigned to the task, and priority. You can open, copy, delete, print, and forward any task and mark tasks complete by clicking a button on the tab's toolbar or by right-clicking the task and making your selection. Refer to Adding tasks.
- **Details tab**—Contains the fields for answer details, including Display Position, Review On, Notify Subscribers, and Publish On. Refer to Adding answer details.
- **Attachments tab**—Lists all attachments associated with the answer. The Attachments tab displays the file name, size, date created, date updated, and a description for each attachment. Refer to Attaching files to records.
- **Audit Log tab**—Lists all actions taken on the answer by all staff members. Also displayed are automatic changes initiated by Oracle Service Cloud that resulted from the application of business rules. When an action is generated by the system, the Who field contains Administrator. You can also see who worked on the answer, when it was added or updated, the actions taken, and descriptions of the actions. Refer to Audit logs.
- **Relationships tab**—Contains the fields and tools necessary to manage answer relationships, including sibling answer relationships, manually relating a new or existing answer with a current answer, and viewing, editing, printing, previewing, and promoting related answers. Refer to Managing answer relationships.
- **Notes tab**—Contains answer notes that can be sorted by date. Remember that customers never see the answer notes added by staff members. Refer to step 12 in To add an answer.
- **Analytics tab**—Contains the Actionable Knowledge Foundation reports, which display information about the answer being viewed or edited. By reviewing these reports, you can learn how your knowledge base is being used and make the necessary adjustments to improve customer satisfaction. Refer to Evaluating answers using service analytics.

- **Model Questions tab**—Lists all **Oracle RightNow Virtual Assistant Cloud Service** (Virtual Assistant) **model questions** that are associated with the open answer. Virtual Assistant must be enabled for this tab to display. Refer to Working with model questions.

Adding answers

When adding answers, you must complete key answer fields located at the top of the **content pane**. The key answer fields are used to specify the answer summary, status, language, access level, and the staff member assigned to the answer. Some of the fields are required. You must complete any field marked with a red label and asterisk before you can save the answer. For a description of the key answer fields, refer to Answer Fields Description.

ORACLE SERVICE CLOUD Watch Tutorial

Note The key answer fields that display on the content pane will vary depending on the permissions set in your **profile**.

You can create different answer types when adding answers to the knowledge base. Answer types allow more flexibility in providing information to your customers. You can add the following types of answers.

- **HTML**—Answers that appear to customers as standard HTML on the **customer portal**. When you create an HTML answer, you can use the HTML editor to view answers as customers will see them. Refer to Adding HTML answers.
- **URL**—Answers that consist of a link to an external URL. The URL address and the content of the web page are displayed. Refer to Adding URL answers.
- **File attachment**—Answers that appear as file attachments. File attachment answers link to information contained in another document and appear to customers on the customer portal as file attachments. Refer to Adding file attachment answers.

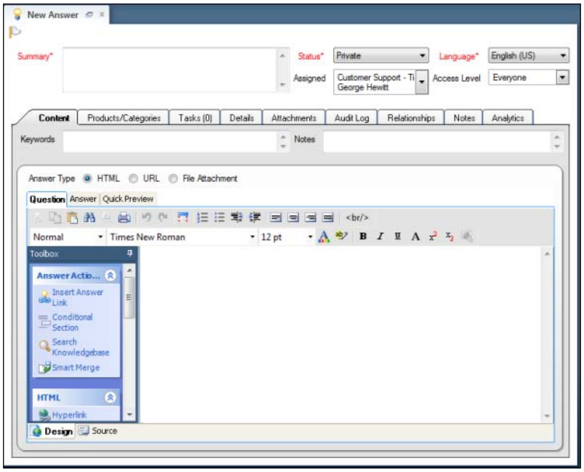
Caution When you change the answer type, certain fields are removed. For example, when you change an HTML answer type to a URL answer type, you will lose the Question, Answer, File Attachments, Manually Related Answers, and Learned Links fields. Read the Confirm Answer Type Change prompt carefully before you continue.

To add an answer

1 Click the New button on the **ribbon**.

Or

If your navigation set is configured to add answers from the **file menu**, click File and select Answer. See [To configure the file menu](#).



2 Enter field information described in the following table.

Table 322: Answer Fields Description

Field	Description
*Summary	Type the subject of the answer in this field.
*Status	Click this drop-down menu to select an answer status.
*Language	Click this drop-down menu to select a language.

Table 322: Answer Fields Description (Continued)

Field	Description
Assigned	Click this drop-down menu to select a staff member to assign to the answer. Only staff members who have permission in their profile to create answers are listed. By default, the staff member who created the answer is selected. **Note:** Use the Find feature at the bottom of the Assigned drop-down menu to locate staff members quickly. Wildcards are supported when searching staff members and groups. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing b in the Find field returns all items containing the letter b.
Access Level	Click this drop-down menu to select an access level. Refer to Associating answers with multiple access levels.

3 To add a **flag** to the answer, click the area next to the white flag above the answer fields. Refer to Flagging records.

4 Select the answer type. Refer to Adding HTML answers, Adding URL answers, or Adding file attachment answers.

5 To add keywords to associate with the answer, click the Content tab and type the words in the Keywords field.

Note Keywords should be separated by commas, with grouped words separated by spaces (for example, `phone, call plan, nationwide`). Keywords are used by the search feature. Any keywords you type are given the greatest weight when a customer is searching on the Answers page. In addition, words in products and categories and their descriptions are used as keywords for answers. Refer to Answers Page.

6 To associate products and categories with the answer, click the Products/Categories tab. Refer to Associating products and categories.

7 To add tasks to the answer, click the Tasks tab. Refer to Adding tasks.

8 To add additional details to the answer, including setting Publish On and Review On fields, click the Details tab. Refer to Adding answer details.

9 To attach files to the answer, click the Attachments tab. Refer to Attaching files to records.

Tip You can attach as many files as needed to associate with an answer or the answer's siblings. Attachments appear as clickable links when a customer views an answer. They can also be indexed as searchable text. Therefore, you can choose whether each document is indexed when managing your file attachments. Refer to Web Indexer overview.

10 To view the answer audit log, click the Audit Log tab. Refer to Audit logs.

11 To manage answer relationships, including sibling answers, manually related answers, and learned links, click the Relationships tab. Refer to Managing answer relationships.

12 To enter notes about the answer, click the Notes tab.

   a Click the Add button.

   b Type the notes in the Answer Note field. Notes will not be visible to customers on the **customer portal**.

13 Click the Save and Close button on the ribbon. The answer is added to the knowledge base.

Important If you set the answer status to Public, the End-User Visibility window opens and displays all interfaces associated with the answer, along with the answer's product and category visibilities. (A green check mark signifies that a product or category is visible on a particular interface, whereas a red X signifies it is not).

- To perform a visibility check when the answer's status is changed to Public, select Only When Status is Changed to Public Type.
- To perform a visibility check every time the answer is saved, select On Every Save.

❖ Adding HTML answers

❖ Adding URL answers

❖ Adding file attachment answers

Adding HTML answers

The default answer type is HTML. You can use the HTML editor to design creative and eye-catching answers. The Content tab contains three additional tabs (Question, Answer, and Quick Preview) that you can move between to create and preview content for answers.

You can design answer content using the design mode or the source mode. With the design mode, you can create dynamic, well-formatted answers without previous HTML experience. You can include special formatting in your text and add graphics, links, and other HTML features. You can also add links that reference other answers. The HTML editor contains many of the same options available in basic word processing applications.

Note For design mode to be available with the HTML editor, the HTML Design Mode permission must be selected in your profile. Refer to Service permissions.

Using source mode, you can create answers using HTML source code. By default, the editor displays your code in colored text to indicate structure and syntax. Regardless of which mode you use to create answers, you can preview how the content will appear to customers on the **customer portal** from the Quick Preview tab.

Important By default, the HTML editor cleans HTML code to meet XHTML compliance specifications. This results in adding XHTML doctype declarations to the resulting HTML code. If this functionality is disabled through the HTML_TIDY_ENFORCE_XHTML configuration setting, the content will not be cleaned upon saving the answer.

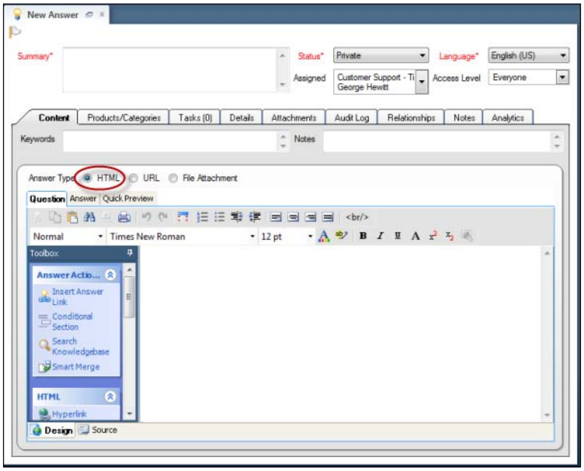
The following procedures show you how to add HTML answers in design mode and source mode.

To add an HTML answer in design mode

1 Click the New button on the **ribbon**.

Or

If your navigation set is configured to add answers from the **file menu**, click File and select Answer. See To configure the file menu. The HTML radio button is selected by default.



2 Type a one-line summary in the Summary text box. This field will display as the subject of the answer on the customer portal.

3 Use the HTML editor to add the question portion of the answer.

Or

Click the Answer tab and use the HTML editor to create the answer content. Functions available on the HTML editor include:

- Cut, copy, and paste
- Search for text
- Print
- Undo and redo changes
- Switch to a full screen
- Format text in bulleted or numbered lists
- Adjust indentation
- Center, left-justify, or right-justify text and images on the page
- Insert line breaks
- Change font style, size, and attributes (highlighting, bold, italic, underline)
- Apply specialized formatting, including super and subscripts
- Copy text formatting
- View HTML source code
- Preview the document

- Insert or clean HTML code

Special functions are accessed through the Toolbox section. The toolbox buttons are described in the following table.

Table 323: Toolbox Description

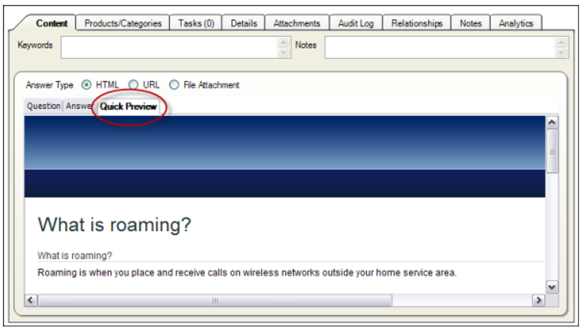
Button	Description
Answer Actions	Buttons in this section are used to insert dynamic content in your HTML.
Insert Answer Link	Click this button to insert a link to another answer. Refer to Inserting answer links.
Conditional Section	Click this button to insert a section with certain visibility restrictions within the answer. Refer to Inserting conditional sections.
Search Knowledge Base	Click this button to search for an answer in the knowledge base or a post in **Oracle RightNow Social Experience communities** and append the content with the current answer. Refer to Appending answer content.
Smart Merge	Click this button to merge answers using **Smart Merge**. Refer to Merging similar answers.
HTML	Buttons in this section are used to insert standard HTML elements in your answer content.
Hyperlink	Click this button to insert a hyperlink. Refer to Inserting hyperlinks.
Image	Click this button to insert an image. Refer to Inserting images.
Horizontal Rule	Click this button to insert a horizontal line.
Table	Click this button to insert a table. Refer to Inserting tables.
Div	Click this button to insert a DIV block, which you can use to group other elements, such as buttons. Refer to Editing style and class attributes.
Field Set	Click this button to insert a field set, which you can use to group a collection of input fields to improve document accessibility.
Button	Click this button to insert a button. Double-click the button on the canvas to edit the button text.

Table 323: Toolbox Description (Continued)

Button	Description
Insert Symbol	Click this button to open the Insert Symbol window and double-click a symbol to insert it at the current cursor position.
Manage Anchors	Click this button to insert an anchor in the answer. Refer to [Managing anchors]().

4 To preview the answer content, click the Quick Preview tab. Customer portal **themes** do not display on the Quick Preview tab.

Tip You can also preview the answer and select assigned access levels to view answer visibility by clicking the Preview button on the ribbon. Refer to [Previewing answers]().



5 Click the Save and Close button to save and close the answer.

To add an HTML answer in source mode

1 Click the New button on the **ribbon**.

Or

If your navigation set is configured to add answers from the **file menu**, click File and select Answer. See [To configure the file menu]().

2 Click the Source tab on the bottom of the Content tab.

Note When adding an HTML answer in source mode, the Syntax Highlighting button displays on the HTML editor toolbar and is active by default. When the button is active, colored text is used to define the structure and syntax of the HTML code for readability purposes. When the Syntax Highlighting button is not active, all HTML code displays in black.

3 Type the HTML code to create question content.

4 Click the Answer tab and type the HTML code to create answer content.

5 Click the Save and Close button to save and close the answer.

❖ Previewing answers

Adding URL answers

When you create a URL answer, an external URL address will display to customers on the **customer portal**. When customers click the URL, an external web page opens in a new window. URL answers are also indexed as searchable text on the customer portal. You can still define many of the same answer fields as in HTML answers. However, some fields (such as the Question and Answer fields) are unavailable when adding a URL answer. The exact fields available depend on the permissions set in your profile.

To add a URL answer

1 Click the New button on the **ribbon**.

Or

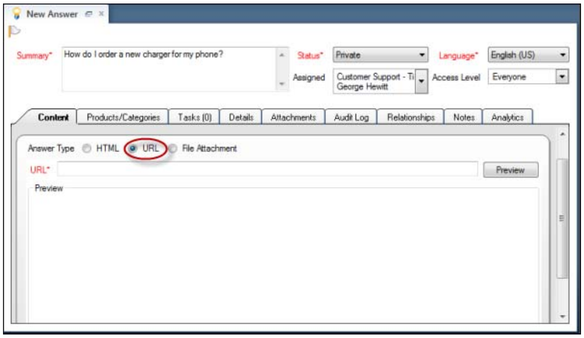
If your navigation set is configured to add answers from the **file menu**, click File and select Answer. See To configure the file menu.

2 Type a one-line summary in the Summary text box. This field will display as the subject of the answer on the customer portal.

3 Select the URL radio button. The Confirm Answer Type Change window opens.

Caution Use caution when you change the **answer type** of an existing answer. Some fields are removed and cannot be restored (for example, the Question and Answer fields when changing from an HTML answer to a URL answer).

4 Click the Yes button in response to the Confirm Answer Type Change message.



5 Type or paste a URL address in the URL field.

6 Click the Preview button to display the URL content. The Preview section displays the link as it will appear in the customer's web browser. It can also display other file types or folder content.

Note URL answers are not flagged as updated on the Answers page when the answer content changes if the URL does not change.

7 Click the Save and Close button to save and close the answer.

Adding file attachment answers

You can add file attachment answers to link to information contained in another document. File attachment answers contain many of the same answer fields as in HTML answers. However, some fields (such as the Question and Answer fields) are unavailable when adding file attachment answers. The exact fields available depend on the permissions set in your **profile**. You can attach only one file for each answer. File attachment answers are also indexed as searchable text on the **customer portal**.

Important File attachment answers appear to customers on the customer portal as file attachments, which is different than HTML answers that contain file attachments within the answer to provide additional information.

To add a file attachment answer

1 Click the New button on the **ribbon**.

Or

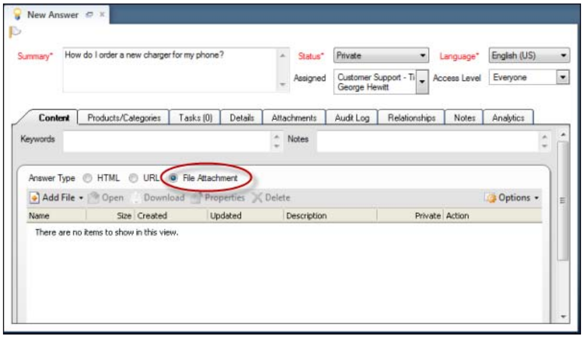
If your navigation set is configured to add answers from the **file menu**, click File and select Answer. See To configure the file menu.

2 Type a one-line summary in the Summary text box. This field will display as the subject of the answer on the customer portal.

3 Select the File Attachment radio button. The Confirm Answer Type Change window opens.

Caution Use caution when you change the **answer type** of an existing answer. Some fields are removed and cannot be restored (for example, the Question and Answer fields when changing from an HTML answer to a file attachment answer).

4 Click the Yes button in response to the Confirm Answer Type Change message.



5 Click the Add File button. Refer to Attaching files to records. Once you attach a file, information about the selected file appears on the Content tab.

The following table describes the file information displayed.

Table 324: File Attachment Answer Description

Field	Description
Name	This field displays the name of the file.

Table 324: File Attachment Answer Description (Continued)

Field	Description
Size	This field displays the size of the file.
Created	This field displays the date and time the file was created.
Updated	This field displays the date and time the file was last updated.
Description	This field displays the description of the file defined on the Properties window. **Note:** You can add or edit the file's description by selecting the file, and then clicking the Properties button and typing the description in the Description field.
Private	This field displays the visibility of the file attachment answer.
Action	After a file has been added to the list, choose one of the following actions: • **Open**—Click Open to open the file. • **Download**—Click Download to download the file. You are prompted to save the file to the location you specify. A File Download window opens displaying the download progress. • **Delete**—Click Delete to delete the file from the answer.

Tip The Content tab contains a paper clip icon when there is a file attached to the file attachment answer.

6 To open the attachment, click the Open button.

7 To download the selected file, click the Download button. You are prompted to save the file attachment to the location you specify. A File Download window opens displaying the download progress.

8 To change the display of the name and description, click the Properties button and make your changes.

9 To remove this file from the answer, click the Delete button.

10 Click the Save and Close button to save and close the answer.

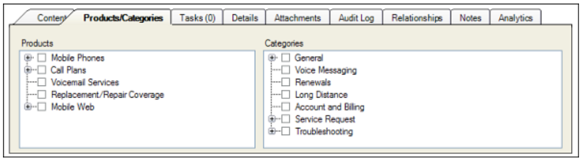
Associating products and categories

You can associate products and categories with answers. By associating products and categories with your answers, you can create rules and facilitate searching.

To associate products and categories to an answer

1 From an answers report, right-click the answer and select Open.

2 Click the Products/Categories tab.



3 Select products and categories to associate with the answer.

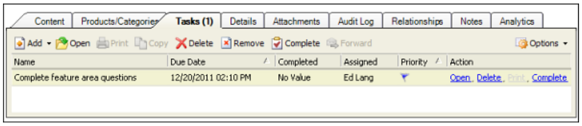
Note Regardless of whether **product linking** is enabled and regardless of what categories are linked to products, all products and all categories are available on the Products/Categories tab when you add or edit an answer. Refer to Product linking.

In addition, product and category values are shared among **sibling answers**. When a product or category is changed for an answer, it is also changed for that answer's sibling answers. Refer to Sibling answers.

4 To associate the answer exclusively with a product or category (without any dependence on sub-products or sub-categories), right click the product or category name. The associated check box displays green and any parent products or categories display a gray check mark to signify they are associated with the answer as well.

Adding tasks

You can add and edit all tasks associated with an answer by clicking the answer's Task tab. When you add or edit a task, you not only define its name, the staff member it is assigned to, relevant dates, and type of task, but you also associate it with new or existing answers.



The Tasks tab contains a toolbar for working with the tasks associated with the open answer. The following table describes the Tasks toolbar buttons.

Table 325: Tasks Tab Toolbar Description

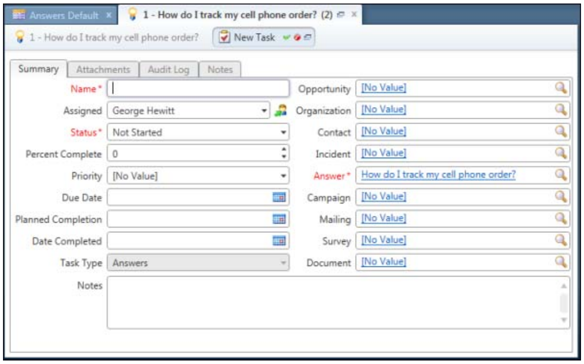
Button	Description
Add	Click this button to add a new or existing task.
Add New	Select this option to add a task.
Add Existing	Select this option to search for a task to add to the answer. Refer to Searching from open records.
Open	Click this button to open or edit the selected task. **Note:** If you have read-only access to tasks, you can open the selected task but all options to edit the task are disabled.
Print	Click this button to print the selected task.
Copy	Click this button to copy the selected task.
Delete	Click this button to delete the selected task.
Remove	Click this button to remove the task association from the answer.
Complete	Click this button to mark the task complete. **Note:** You can set multiple tasks to complete by pressing **Ctrl** while selecting each task and then click the Complete button.
Forward	Click this button to forward the task to the selected recipient.
Options	Click this button to display a drop-down menu of analytics options.

To add or edit a task for an answer

1 Right-click the answer and select Open.

2 Click the Tasks tab.

3 Click the Add button and select Add New to open a new task on a sub-tab.
Or
Right-click a task on the Tasks tab and select Open.



4 Type the task name in the Name field.

5 To enter additional task information, complete the fields or select a menu option. Refer to Adding tasks.

6 Click the OK button.

Adding answer details

The Details tab contains information associated with the selected answer. You can control the display position on the **customer portal**, notify subscribers of changes to the answer, and define the review and publish dates for the answer. The following table describes the fields on the Details tab.

Table 326: Answer Details Tab Description

Field	Description
Display Position	Click this drop-down menu to determine the answer's display position on the customer portal.
Historical Usefulness	Select this option to use customer feedback to adjust the ranking of the answer.

Table 326: Answer Details Tab Description (Continued)

Field	Description
Place at Bottom	Select this option to place the answer at the bottom of the list by changing the score to be equal to the lowest answer score. The score is then adjusted as the solved count changes over time.
Place at Middle	Select this option to place the answer at a level that is 50% of the highest answer score. The score is then adjusted as the solved count changes over time.
Place at Top	Select this option to place the answer at the top of the list on the Answers page by changing the score to be equal to the highest answer. The score is then adjusted as the solve count changes over time.
Fix at Bottom	Select this option to permanently fix the answer at the bottom of the list on the Answers page by changing the score to be equal to the lowest answer score. The answer's score will not increase or decrease over time.
Fix at Middle	Select this option to permanently fix the answer at a level that is 50% of the highest answer score. The answer's score will not increase or decrease over time.
Fix at Top	Select this option to permanently fix the answer at the top of the list on the Answers page by changing the score to equal the highest answer score. The answer's score will not increase or decrease over time.
Review On	Click this drop-down menu to access a calendar and select a date to set the answer to the Review status. Use the left and right arrows at the top of the calendar to select the month, and then click a day.
Guided Assistance	Click this button to open the Select a Guide window, which enables you to select a **guided assistance** guide to associate with the answer. Refer to Configuring guide searching. This button will not display unless your administrator has enabled guided assistance.
Notify Subscribers	Click this drop-down menu to select an option for notifying subscribers when the answer is updated. Options include Do Not Notify, This Hour, End of Today, End of this Week, End of this Month.

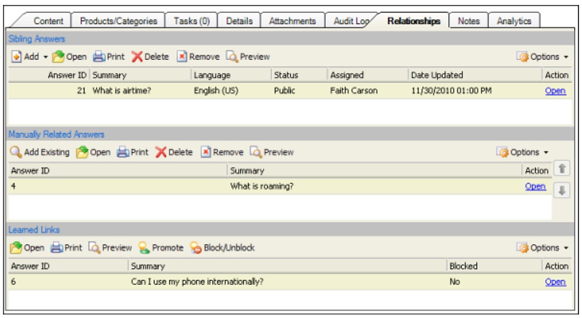
Table 326: Answer Details Tab Description (Continued)

Field	Description
Publish On	Click this drop-down menu to access a calendar and select a date to publish the answer. Use the left and right arrows at the top of the calendar to select the month, and then click a day. On the selected date, the answer status will change to Public, and the answer is available to customers. **Note:** When an answer's status is set to Private, the Publish On date is cleared.

Managing answer relationships

You can relate one answer to other answers that contain similar content. This functionality also provides a way for you to group similar answers, improving the way you keep track of and update answers in your knowledge base. Answer relationships can be managed on the answer's Relationships tab. The answer relationship types available to you depend on how the answer workspace assigned in your **profile** is customized

Tip When two or more answers are related, you can view the relationship from the Relationships tab of any of the answers.



Sibling, manually related, and automatically related answers are displayed on the Relationships tab. The tab is divided into the following sections.

- Sibling answers—Answers that can share the same product, category, or file attachments
- Manually related answers—Two or more answers manually defined by a staff member

- Learned links—Answers that have learned relationships as a result of customer activity

Manually related and learned links are disabled when the answer type is set to either URL or File Attachment. For information about answer types, refer to Adding answers.

Regardless of which types of answer relationships you work with, it is important to note that all relationships between answers are at a peer level and not at a subordinate level. For example, if you have three answers you want to relate (1, 2, and 3), you can relate 2 to 1 and 3 to 2. All three answers are peers, including answers 1 and 3.

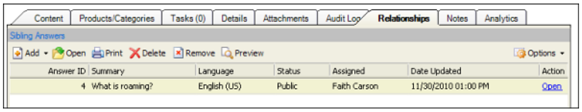
Sibling answers

Sibling answers are those that can share the same product, category, or file attachments. Sibling answers and attachments with access levels that are at or below the contact's SLA are visible to the contact.

Note To display file attachments for the answer's siblings on the Attachments tab, the Siblings Visible property for the File Attachments relationship item in the custom answer workspace must be set to True. Refer to Options properties.

The Sibling Answers section of the Relationships tab consists of a toolbar and a list of sibling answers. The toolbar is located above the sibling answer list. The following figure shows the Sibling Answers section on the Relationships tab.

Important When you add a new answer, the option to add a sibling answer is disabled. You must first save the answer to enable the toolbar buttons on the Sibling Answers section.



The following table describes the buttons on the Sibling Answers section toolbar.

Table 327: Sibling Answers Section Toolbar Description

Button	Description
Add	Click this button and select one of the following options.
Add New	Select this option to add an answer and establish a sibling relationship between the current answer and the new answer.
Add Existing	Select this option to create a sibling relationship between the current answer and an existing answer. The Answer Search window displays so you can search for an existing answer. Refer to Searching for records.
Open	Click this button to open the selected sibling answer.
Print	Click this button to print the selected sibling answer.
Delete	Click this button to delete the sibling answer.
Remove	Click this button to remove the selected sibling answer, which disables the answer relationship.
Preview	Click this button to preview the selected sibling answer.
Options	Click this button to display a drop-down menu of analytics options.

The list in the Sibling Answers section contains answers that share the same product or category as the current answer. Refer to the following table for a description of this list.

Table 328: Sibling List Description

Column	Description
Answer ID	This column displays the ID assigned to the answer.
Summary	This column displays a summary of the answer content. The summary is the answer's subject.
Language	This column displays the language of the answer.
Status	This column displays the status of the answer.
Assigned	This column displays the name of the staff member assigned to the answer.

Table 328: Sibling List Description (Continued)

Column	Description
Date Updated	This column displays the date the answer was last updated.
Action	This column displays a link for opening the sibling answer. **Note:** Right-click the Open link to display Print, Remove, and Preview functionality.

To move an answer to a sibling set

1. Click the Add button, select Add Existing, search for the answer you want to add, and select it. The Move Siblings window opens.
2. Select the appropriate radio button.
3. Click the OK button.

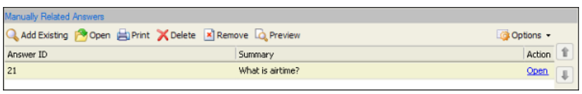
To remove an answer from a sibling set

1. Select the answer that you want to remove from the sibling set.
2. Click the Remove button. The Move Answer window opens.
3. Select the appropriate radio button.
4. Click the OK button.

Manually related answers

Manually related answers are two or more answers that may contain related information. Manually relating answers provides customers with additional options for finding accurate information.

The Manually Related Answers section of the Relationships tab consists of a toolbar and a list of manually related answers. The toolbar is located above the manually related answer list. The following figure shows the Manually Related Answers section on the Relationships tab.



The following table describes the buttons on the Manually Related Answers section toolbar.

Table 329: Manually Related Answers Section Toolbar Description

Button	Description
Add Existing	Select this option to create a relationship between the current answer and an existing answer. The Answer Search window will display so you can search for an existing answer. For more information about searching for answers, refer to Searching for records.
Open	Click this button to open the selected answer.
Print	Click this button to print the selected answer.
Delete	Click this button to delete the selected answer.
Remove	Click this button to remove the selected answer from the list, which disables the answer relationship.
Preview	Click this button to preview the selected answer.
Options	Click this button to display a drop-down menu of analytics options.

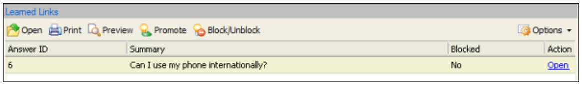
The list in the Manually Related Answers section contains answers that may contain related answer information. The following table provides a description of this list.

Table 330: Manually Related List Description

Column	Description
Answer ID	This column displays the ID assigned to the answer.
Summary	This column displays a summary of the answer content. The summary is the answer's subject.
Action	This column displays a link for opening the manually related answer. **Note:** Right-click the Open link to display Print, Remove, and Preview functionality.

Learned links

Service can automatically link answers based on customer activity. Relationships between answers are established when customers view answers during the same visit.



The Learned Links section of the Relationships tab consists of a toolbar and a list of learned link answers. The toolbar is located above the learned links answer list. The following table describes the buttons on the Learned Links section toolbar.

Table 331: Learned Links Section Toolbar Description

Button	Description
Open	Click this button to open the selected answer.
Print	Click this button to print the selected answer.
Preview	Click this button to preview the selected answer.
Promote	Click this button to promote the learned link to a manually related answer. The answer is added to the Manually Related list.
Block/Unblock	Click this button to block the answer from appearing in the Related Answers section on the **customer portal**. To block more than one answer, press **Ctrl** while selecting each answer. **Note:** Click this button again to allow a blocked answer to appear in the Related Answers section on the customer portal.
Options	Click this button to display a drop-down menu of analytics options.

The list in the Learned Links section contains answers that are related as a result of customer activity. All learned link answers are listed. The following table provides a description of this list.

Table 332: Learned Links List Description

Column	Description
Answer ID	This column displays the answer ID number.
Summary	This column displays a summary of the answer content. The summary is the answer's subject.

Table 332: Learned Links List Description (Continued)

Column	Description
Blocked	This column displays the blocked mode of the answer link on the customer portal. **Note:** If “No” displays, the answer link is not blocked on the customer portal. If “Yes” displays, the answer link is blocked on the customer portal.
Action	This column displays a link for opening the learned link answer. **Note:** Right-click the Open link to display Print, Remove, and Preview functionality.

Tip If the Related Answers feature is enabled, learned links will appear in the Related Answers section on the customer portal when a customer views the answer. The number of related answers (learned links) that display depends on how your site is configured.

Managing answers

Although you can add many answers to your **knowledge base** as your organization provides new products and services, you might also spend a lot of time managing and updating your current answers. You can add information to existing answers, including adding links to other answers, merging similar answers, and adding **conditional sections** within an answer to control visibility of certain information.

When adding and editing answers, the toolbox allows you to perform advanced actions on your answers such as inserting hyperlinks, images, and tables. As your knowledge base grows more complex, you can insert links to other answers, associate answers with multiple access levels, insert conditional sections, and merge similar answers.

- ❖ Adding answers

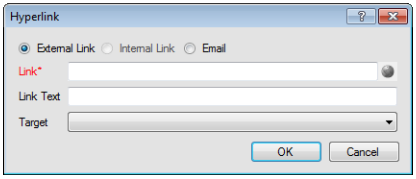
Inserting hyperlinks

You can create a hyperlink in an answer that will link to a URL. When customers view an answer on the **customer portal** that contains a hyperlink, they can click the hyperlink and be directed to either an internal or external URL.

To insert a hyperlink

1 From an answers report, right-click the answer and select Open.

2 Click the Hyperlink button on the toolbox. The Hyperlink editor opens.



3 Enter the following field information.

Table 333: Hyperlink Editor Description

Field	Description
External Link	Select this radio button to add a link to an external web page. **Note:** The External Link radio button is selected by default.
Internal Link	Select this radio button to link to an answer. **Note:** To enable this radio button, you must first add an **anchor** to the answer. Refer to Managing anchors.
Email	Select this radio button to add an email link to the answer content. **Note:** Selecting this answer link creates a message that is addressed to the specified email account.
***Link**	Type a valid URL to the page you are linking to. To verify that the URL you typed is accurate, click the View URL button (to the right of the Link field). A web browser opens to the URL you specified. If you enter an invalid URL, an error message opens. **Caution:** If the link is to a non-HTML page (for instance, a file type), a security warning opens. Verify that the link is directed to a trusted source before you click the Yes button to continue.
Link Text	Type the text you want to appear to customers. **Note:** If this field is left blank, the URL in the Link field displays to customers.

Table 333: Hyperlink Editor Description (Continued)

Field	Description
Target	Click this drop-down menu and select one of the following options.
New Window	Select this option to have the link open in a new window when the customer clicks the link.
Same Window	Select this option to have the link open in the same window when the customer clicks the link.
Parent Window	Select this option to have the link open in the parent window when the customer clicks the link.
Browser Window	Select this option to have the link open in a browser window when the customer clicks the link.

4 Click the OK button to insert the hyperlink at the cursor position in the current answer.

Inserting images

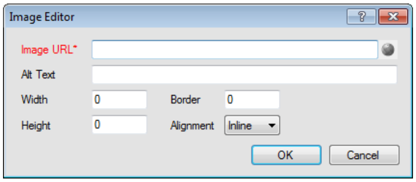
You can insert an image that is accessible through a URL in your HTML. You can also define the size of the image, its border properties, and alignment.

Note Copy and paste functionality is not available when inserting images into answers. Therefore, all answer images must be referenced by URL. As a best practice, we advise you to host your files and graphics on your own web servers and link to those files (through a HTTP address) within your answer content. For information about storing images, refer to Answer ID 4161 on our customer support site.

To insert an image

1 From an answers report, right-click the answer and select Open.

2 Click the Image button on the toolbox. The Image Editor opens.



3 Enter the following field information.

Table 334: Image Editor Description

Field	Description
***Image URL**	Type the URL where the image is located.
View URL	Click this button (globe icon) to view the URL in a web browser.
Alt Text	Type the alternate text for the image.
Width	Type the width, in pixels, you want the image to appear as.
Height	Type the height, in pixels, you want the image to appear as.
Border	Type the width, in pixels, of the image's border.
Alignment	Click this drop-down menu to select the image's alignment: Inline, Left, Middle, Right, Top, or Bottom. The default alignment is Inline.

4 Click the OK button to insert the image.

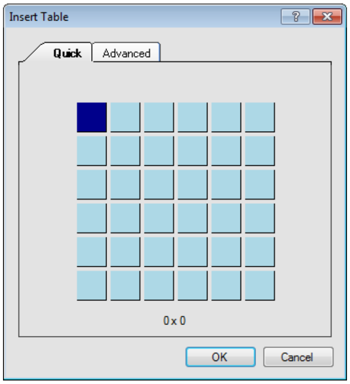
Inserting tables

You can insert a table in your HTML and define the number of rows or columns and its border properties, cell padding, and cell spacing.

To insert a table

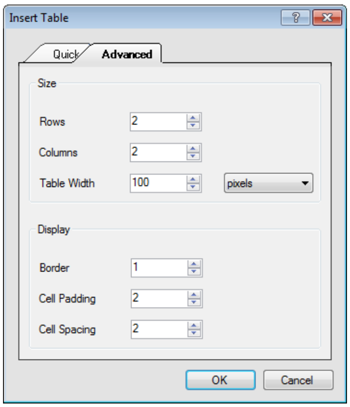
1 From an answers report, right-click the answer and select Open.

2 Click the Table button on the toolbox. The Insert Table window opens.



3 To use the Quick tab to define the number of rows and columns in the table, hover over the grid and click when the number of rows and columns is correct.

4 Click the Advanced tab.



5 Enter the following field information.

Table 335: Advanced Tab on the Insert Table Window

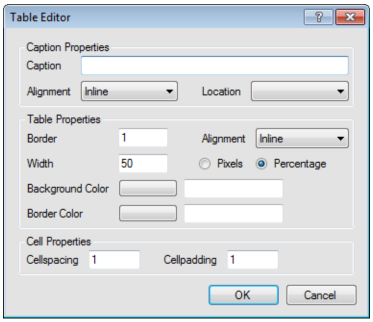
Field	Description
Size	Define the size of the table in this section.
Rows	Enter the number of rows in the table.

Table 335: Advanced Tab on the Insert Table Window (Continued)

Field	Description
Columns	Enter the number of columns in the table.
Table Width	Enter the width of the table and select the unit from the drop-down menu (for example, pixels).
Display	Define the table's attributes in this section.
Border	Enter the width, in pixels, of the table's border.
Cell Padding	Enter the padding, in pixels, of the table's cells.
Cell Spacing	Enter the spacing, in pixels, of the table's cells.

6 Click the OK button to insert the table.

7 To edit the table's properties, right-click the table and select Table Editor > Table Properties. The Table Editor opens.



a Enter the following field information.

Table 336: Table Editor Description

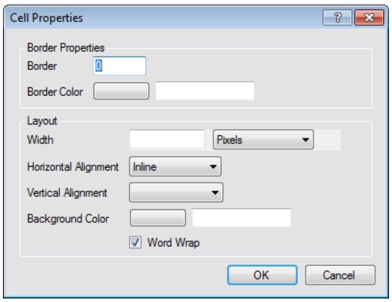
Field	Description
Caption Properties	Define the table's caption in this section.
Caption	Type the caption of the table.

Table 336: Table Editor Description (Continued)

Field	Description
Alignment	Click this drop-down menu to select the alignment of the caption. Your choices are Left, Centered, and Right.
Location	Click this drop-down menu to select the location of the caption in relation to the table. Your choices are Top and Bottom.
Table Properties	Define the table's attributes in this section.
Border	Type the width, in pixels, of the table's border.
Alignment	Click this drop-down menu to select the alignment of the table on the page. Your choices are Left, Centered, and Right.
Width	Type the width of the table and select the unit from the radio buttons (Pixels or Percentage).
Background Color	Click this box to select a color for the table's background.
Border Color	Click this box to select a color for the table's borders.
Cell Properties	Define the table's attributes in this section.
Cellspacing	Type the spacing, in pixels, of the table's cells.
Cellpadding	Type the padding, in pixels, of the table's cells.

b Click the OK button to save your changes.

8 To edit a cell's properties, right-click the table cell and select Table Editor > Cell Properties. The Cell Properties window opens.



a Enter the following field information.

Table 337: Cell Properties Window Description

Field	Description
Border Properties	Define the cell's border properties in this section.
Border	Type the width of the cell's border in pixels.
Border Color	Click this box to select a color for the cell's borders.
Layout	Fill in the following fields to specify the cell's layout properties.
Width	Type the width of the cell and select the Pixels or Percent radio button.
Horizontal Alignment	Click this drop-down menu to select the horizontal alignment of the text in the cell. Your choices are Left, Centered, Right, and Justify.
Vertical Alignment	Click this drop-down menu to select the vertical alignment of the text in the cell. Your choices are Top, Middle, Bottom, and Baseline.
Background Color	Click this box to select a color for the cell's background.
Word Wrap	Select this check box to allow text to wrap in the cell.

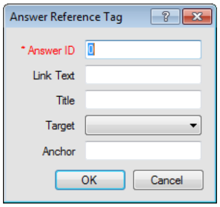
b Click the OK button to save your changes.

Inserting answer links

You can create a link in an answer that references an existing answer. Service provides you with the flexibility to easily create links to existing answers by using the answer ID number instead of typing a long URL to the answer.

To insert an answer link

1. Right-click the answer on the content pane and select Open.
2. Click the Insert Answer Link button. The Answer Reference Tag window opens.



3 Enter the following field information.

Table 338: Answer Reference Tag Window Description

Field	Description
*Answer ID	Type the answer ID of the answer you want to link to.
Link Text	Type the text you want to appear to customers. **Note:** If this field is left blank, Answer Link will display to customers.
Title	Type the text you want to appear to customers when they hover over the link title.
Target	Select the target location where you want the contents of the link to display. The choices are: • New Window • Same Window • Parent Window • Browser Window
Anchor	Type the anchor in this field to link to a specific location in a long string of text in an answer. This allows the customer to link to the exact location. Refer to Managing anchors.

4 Click the OK button to insert the answer link at the cursor position in the current answer.

Note Answers containing links to other answers will not display the link as active on the Answers page on the customer portal, but the link is active when the individual answer is displayed.

Managing anchors

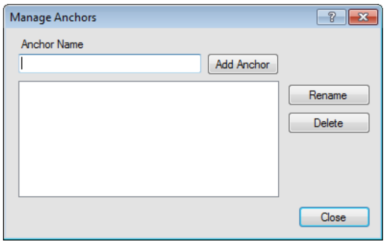
When you insert an answer link, you may also need to insert an anchor in the answer you are linking to if you want the answer link to open to a specific location within the answer. For example, you may have an answer that contains several paragraphs of text, but the first paragraph does not contain information that will answer the customer's question. Using an anchor, you can quickly link to a specific location.

To insert an anchor

1 Right-click the answer on the content pane and select Open.

2 Insert the cursor in the exact location of the answer you want to link to.

3 Click the Manage Anchors button on the toolbox. The Manage Anchors window opens.



4 Type a name for the anchor in the Anchor Name field.

5 Click the Add Anchor button to add the anchor at the cursor position in the answer.

6 To rename an anchor, select the anchor and click the Rename button.

7 To delete an anchor, select the anchor and click the Delete button.

8 Click the Close button to save the anchor and close the Manage Anchors window.

Associating answers with multiple access levels

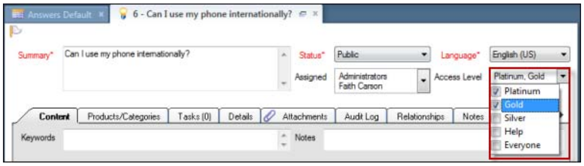
You can associate multiple access levels with an answer. If any of the access levels have customer visibility, the answer is visible on the **customer portal**. In addition, you can control the answers returned in a customer's search by assigning them **SLAs** that allow privileged access to specific answers. For example, a customer assigned an SLA with Gold access is able to view all answers with the assigned access levels of Gold, Everyone, or Gold and Everyone.

Access levels are just one way of controlling answer visibility. For information about other ways to control answer visibility, refer to Controlling answer visibility.

To associate an answer with multiple access levels

1 Right-click the answer on the **content pane** and select Open.

2 Click the Access Level drop-down menu and select the check box next to each access level you want to assign to the answer.



3 To view the answer as customers will see it on the customer portal, click the Quick Preview tab.

4 Click the Save and Close button to save your changes and close the answer.

❖ Controlling answer visibility

Inserting conditional sections

Conditional sections control the visibility of specific sections within your answers, allowing customers with only the appropriate **SLA** to view the conditional sections. One scenario for using conditional sections is when you are working on an answer and you want to add information that is not yet approved for public visibility. You can create an **access level** that has no customer portal visibility and assign it to the conditional section you do not want customers to view.

Conditional sections can also be used with **privileged access** levels assigned to specific SLAs. Those customers assigned an SLA with a privileged access level are able to view the conditional sections assigned to the privileged access level. For example, a customer assigned an SLA with Gold access is able to view conditional sections with access levels of Gold, Everyone, or Gold and Everyone. This provides more flexibility to customize and personalize answers for customers.

Note Conditional sections can also be nested. Although answers allow unlimited nesting levels, we strongly recommend that you limit the nesting levels to three inner sections.

To insert a conditional section

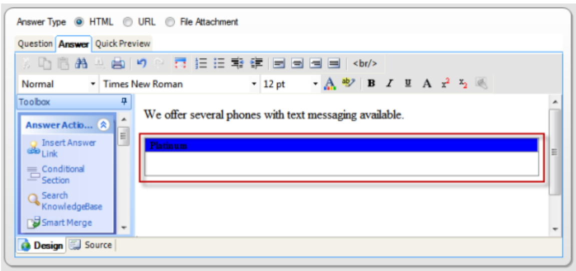
1 Right-click the answer on the content pane and select Open. By default, the Question tab is active.

2 To add your conditional section to the answer portion, click the Answer tab.

3 Click the Conditional Section button on the toolbox. The Access Levels window opens.

4 Select the access levels you want to assign to the conditional section.

5 Click the OK button. The Conditional Section text box displays on the Answer tab.



When conditioning a section of an answer with an access level not associated with the answer, the section will never be visible to customers.

6 Type the information in the Conditional Section text box.

7 Click the Save button to save the answer with the conditional section.

To modify conditional sections

1 To edit the text of a conditional section, click the conditional section and type your text in the Access Level Conditional text box.

2 To nest a conditional section in the current conditional section, click inside the answer section and then click the Conditional Section button on the toolbox. Refer to To insert a conditional section.

3 To change the access level of a conditional section, double-click the conditional section to open the Access Levels window and select the access level or multiple access levels.

a Click the OK button to assign the selected access levels and close the Access Levels window.

4 Click the Save and Close button to save your changes to the answer.

Tip If the answer contains conditional content and the customer has access to that level of privileged answer, the conditional content is visible on the Answers page. Refer to Answers Page.

You can see how the answer will appear to customers with different access levels on the customer portal using the Preview functionality. Refer to Previewing answers.

- Answers Page
- Previewing answers

Merging similar answers

You can effectively manage the answers in your knowledge base by merging similar answers or merging the content of one answer with another answer. In addition, merging answers will also merge any conditional sections. Conditional sections will display as text in the appropriate fields of the answer. Refer to Inserting conditional sections.

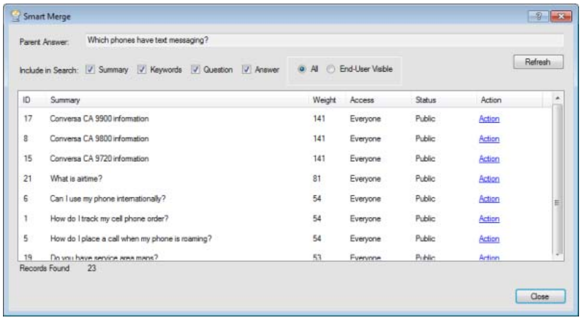
Answers can be merged with similar answers found in the knowledge base using the Smart Merge feature. Smart Merge helps you to identify similar answers and merge them. Merging answers provides your customers with more complete information and can help you eliminate duplicate answers.

Note Smart Merge relies on the configuration settings used for the SmartAssistant feature. Changing these configuration settings may change the weight given to the relevant answers displayed for both Smart Merge and SmartAssistant. Refer to Modifying SmartAssistant relevancy.

To merge similar answers

1 Right-click the answer on the content pane and select Open.

2 Click the Smart Merge button on the toolbox.



3 Enter the following field information.

Table 339: Smart Merge Window Description

Field	Description
Parent Answer	The parent answer is the current answer you are merging an answer to. This field displays the summary of the open answer. Refer to Managing answer relationships.
Include in Search	Define your search criteria with any of the following areas of the answer. **Note:** All options are selected by default.
Summary	Select this check box to search the Summary field for answers you can merge.
Keywords	Select this check box to search the Keywords field for answers you can merge.
Question	Select this check box to search the Question field for answers you can merge.
Answer	Select this check box to search the Answer field for answers you can merge.
All	Select this radio button to return all answers, regardless of status.

Table 339: Smart Merge Window Description (Continued)

Field	Description
End-User Visible	Select this radio button to return only public answers.

4 Click the Refresh button. The results display on the Smart Merge window.

Tip The results display matched answers sorted by relevance.

5 Click Action next to each answer you want to merge and select from the merge options described in the following table.

Table 340: Merge Answer Options

Option	Description
Merge	Select this option to merge the answer with the answer you are editing.
Merge and Make Private	Select this option to merge the answer with the answer you are editing and set the status to Private. A warning will prompt you to verify the action.
Merge and Delete	Select this option to merge the answer with the answer you are editing and then delete the answer once it has been merged. **Caution:** Selecting this option will permanently delete the selected answer from the knowledge base. Use caution when selecting this option.
Show	Select this option to view the answer in a separate window before you merge it with the answer you are editing.
Cancel	Select this option to cancel the current selection.

Tip Once you select an option, the underlined text next to the answer will change. For example, if you select Merge, the text will change from Action to Merged.

6 Click the Close button to close the window and return to the answer.

7 To view the merged answer as it will appear on the **customer portal**, click the Quick Preview tab. Refer to Previewing answers.

8 Click the Save and Close button to save your changes to the answer.

Appending answer content

While editing an answer, you can search for other answers in the knowledge base. If answers are returned that match your search criteria, you can append them to the answer you are editing.

If **Oracle RightNow Social Experience communities** are enabled on your site, the Community tab displays on the Search Knowledge Base window and search results are split between answers in the knowledge base and posts in the communities.

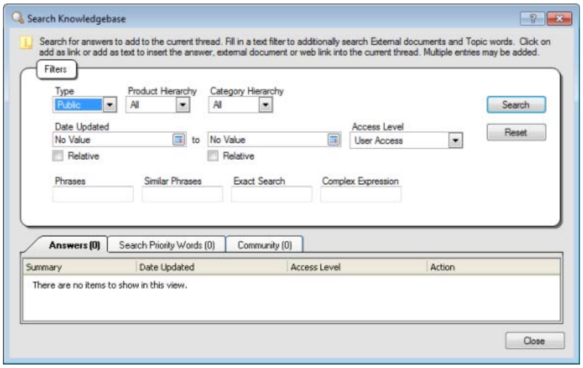
The Search Knowledge Base window contains the following tab set.

- **Answers**—Contains links to answers in the knowledge base that match your search phrases.
- **Search Priority Words**—Contains links to answers in the knowledge base that correspond to search priority words in Service. Refer to Configuring search priority words.
- **Community**—Contains links to posts in the communities that match your search phrases.

To append answer content

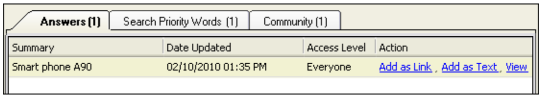
1 Right-click the answer on the **content pane** and select Open.

2 Click the Search Knowledge Base button on the toolbox. The Search Knowledge Base window opens.



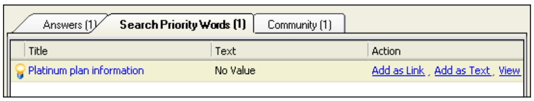
3 Enter your search criteria in the appropriate fields and click the Search button. Refer to Searching for records.

4 Click the Answers tab.



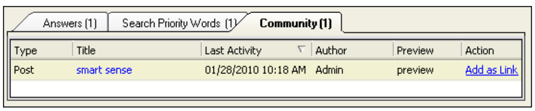
a To append an answer link to the answer you are editing, click Add as Link next to the answer. The answer title and a link to the answer are appended to the selected field of the answer at the cursor position.
b To append the answer text to the answer you are editing, click Add as Text. The text of the answer is appended to the answer at the cursor position.
c To view the answer, click View.

5 Click the Search Priority Words tab.



a To append an answer link to the answer you are editing, click Add as Link next to the answer. The answer title and a link to the answer are appended to the selected field of the answer at the cursor position.
b To append the answer text to the answer you are editing, click Add as Text. The text of the answer is appended to the answer at the cursor position.
c To view the answer, click View.

6 Click the Community tab.



a To append a post link to the answer you are editing, click Add as Link next to the post. The post title and a link to the post are appended to the selected field of the answer at the cursor position.

7 To view the answer as it will appear on the **customer portal**, close the Search Knowledge Base window and click the Quick Preview tab. Refer to Previewing answers.

8 Click the Save and Close button to save and close the answer.

❖ Searching for records

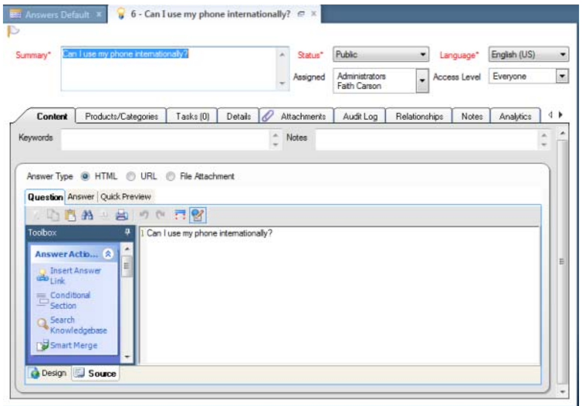
❖ Previewing answers

Editing answers and related answers

You can edit answers and **related answers**, including sibling, manually related, and learned links. When you edit an answer, you can also change the information in related answers, but keep in mind that editing answers can affect other answers associated with it. You can also edit multiple answers at one time (refer to Other answer actions).

To edit an answer

1 From an answers report, right-click the answer and select Open.



2 To change the answer type, select the radio button next to the answer type. In this case, select the HTML answer type. Refer to Adding answers.

Caution When you change the answer type in an existing answer, all answer relationships and certain answer fields are removed. Use caution when changing an answer's type.

3 Edit the answer fields. Refer to Adding answers.

4 To search the answer for a word or phrase to replace, click the Find Text button on the HTML toolbar. The Find and Replace window opens. You can search for a word or phrase using case sensitive or whole word only search criteria.

5 Edit the fields on each of the answer record tabs. Refer to Record tabs.

6 To notify answer subscribers of the change, click the Details tab and then click the Notify Subscribers drop-down menu and select from the following options: No Change, Do Not Notify, This Hour, End of Today, End of this Week, End of this Month.

7 Click the Save and Close button to save your changes and close the answer.

To edit a related answer

1 From an answers report, right-click the answer and select Open.

2 Click the Relationships tab.

3 Click Open next to the answer you want to edit. The related answer opens in a new window.

4 Make the appropriate changes.

5 Click the OK button.

6 Click the Save and Close button to save your changes and close the answer.

Note Editing a related answer will affect all answers associated with it.

Inserting variables into answers

Answer variables are predefined shortcuts for entering information into an answer instead of a long string of text. When an answer is displayed on the **customer portal**, the variable is replaced with whatever value was specified by your administrator.

Variables are also helpful to use for information that may change. When your administrator changes the value of the variable, all answers containing that variable will also change.

To insert a variable into an answer

In the Question or Answer field of an answer, type a dollar sign ($) followed by the variable name. For example, if your administrator added a variable for a support email address at your organization called contact, you could insert the variable for the email address in the answer, such as `$contact`. If the email address changes, all answers containing the contact variable are updated.

The assigned value displays when customers view the answer.

Important Because variables are case sensitive, you must type the variable name exactly as it is defined. Refer to Adding variables.

Contact your administrator for a list of variables defined for your application.

Previewing answers

Before making an answer available to customers, you can preview it on the **customer portal** to ensure everything is accurate. You can verify that the answer and answer sections appear as you anticipated by viewing the answer with different access levels selected. Refer to Controlling answer visibility.

Note Customer portal **themes** are not applied when previewing answers on the **content pane**. Refer to Defining themes.

To preview an answer

1 From an answers report, right-click the answer and select Preview Answer.

2 Select the access levels from the Access Level drop-down menu and click the Preview button. Only the sections of the answer with the selected access level will appear on the Answer Preview window.

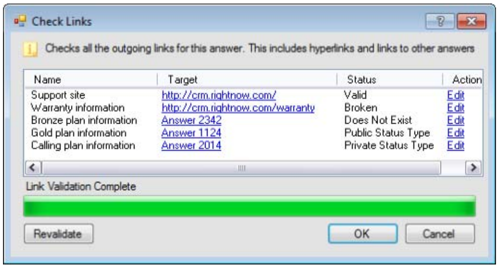
Validating answer links

You can check for broken links in HTML and URL answers. This functionality applies to hyperlinks and links to other answers. The broken links checker functions on a per-answer basis.

Note When validating an HTML answer, the broken links checker scans text on the Question and Answer tabs. When validating a URL answer, the broken links checker scans the URL field.

To validate links in an answer

1 While editing an answer, click the Check Links button on the ribbon. The Check Links window opens and link validation begins.



The following table describes the columns and buttons on the Check Links window.

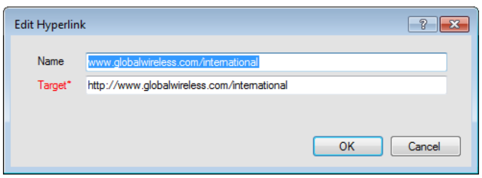
Table 341: Check Links Window Description

Column/Button	Description
Name	This column displays the name of the links that have been checked for validity. **Note:** If a link does not have a name, this column is empty. Because links in URL answers do not have names associated with them, this column is empty for all URL answers.
Target	This column displays the links that have been checked for validity. **Note:** Hyperlinks open in a new browser, whereas answer links open on the Answer Preview window.

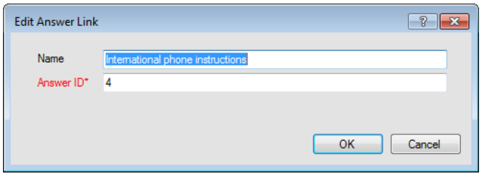
Table 341: Check Links Window Description (Continued)

Column/Button	Description
Status	This column displays the status of the links. The following statuses will display depending on the type of link being validated. • **Valid**—This status is used only for hyperlinks and signifies that the links checker successfully visited the link destination. • **Broken**—This status is used only for hyperlinks and signifies that the links checker attempted to visit the link destination, but was unsuccessful. • **Does Not Exist**—This status is used only for answer links and signifies that the links checker did not find the answer ID in the knowledge base. • **Public Status Type**—This status is used only for answer links and signifies that the answer was found in the knowledge base and is associated with a Public status type. • **Private Status Type**—This status is used only for answer links and signifies that the answer was found in the knowledge base and is associated with a Private status type.
Action	This column displays the actions that can be performed on the link. Currently, Edit is the only action available.
Status Bar	The status bar shows the progress of the validation process. It is not an indicator of the validity of the links. Rather, it is an indicator of the number of links being validated by the links checker.
Revalidate	Click this button to restart the validation process for all links displayed on the Check Links window.

2 To edit a link, click Edit in the link's Action column. If you are editing a hyperlink, the Edit Hyperlink window opens.



If you are editing an answer link, the Edit Answer Link window opens.



Note Although you can update fields (such as changing the Target field), you cannot leave a field blank. If a link does not have a name associated with it, the Name field is disabled.

3 Type your changes in the appropriate fields.

4 Click the OK button. The Edit Hyperlink or Edit Answer Link window closes and all links are automatically revalidated and displayed on the Check Links window.

5 Click the OK button on the Check Links window. The Check Links window closes.

Deleting answers

You can delete answers from Service when they become outdated. However, use extreme caution when deleting answers because deleting an answer will also delete all associated relationships.

Caution Deleting is permanent and cannot be undone.

To delete an answer

1 Right-click the answer on the content pane and select Delete.

2 Click the Yes button to delete the answer.

Other answer actions

Besides editing and adding answers, you may have other answer management duties as well. You might, for example, want to print an answer, copy an answer, or make the same change to multiple answers.

- **Printing answers**—You can create a printable version of your answers. When using this function, the answer opens in a new window. The print command is then launched through your web browser and you can choose to print the contents of the page. Refer to Printing records.
- **Copying answers**—You can copy an existing answer to make a new answer or sibling answer. When copying an answer, the language and access level are retained, but the status is set to Private to prevent you from accidentally publishing it. Refer to Copying records.
- **Updating multiple answers**—You can edit more than one answer at the same time and edit various fields such as status, assigned staff member, review and publish on dates, products, categories, and custom fields. This feature saves you time when you want to make the same change to multiple answers. Refer to Updating multiple records.

Working with model questions

Using functionality in Oracle Service Cloud and **Oracle RightNow Virtual Assistant Cloud Service** (Virtual Assistant), you can offer your customers a better experience when they search for answers by guiding them directly to the information they need. Virtual Assistant uses best-in-class semantic search technology combined with industry-specific linguistic dictionaries and advanced algorithms to ensure your customers' questions are matched to deliver the right answers immediately.

From the Model Questions tab of a custom answer **workspace** or from the standard Answers Default report, you can link answers in the **knowledge base** to **model questions** in Virtual Assistant.

Note Configuration options will not be visible until Virtual Assistant is enabled. Contact your Oracle account manager.

In addition, foreign languages are not supported when working with model questions.

Creating a custom answer workspace

Before working with **model questions**, a custom answer **workspace** must be created and the Model Questions tab and **control** added to it. This is not necessary if you are adding model questions from the Answers Default report, as the Model Questions button displays on the **ribbon** after Virtual Assistant is enabled. See To add a model question from the Answers Default report.

To create a custom answer workspace for model questions

1 Click the Configuration button on the **navigation pane**.

2 Double-click Workspaces / Workflows under Application Appearance. The Workspaces explorer displays on the **content pane**.

3 Expand the Standard folder, right-click Answer workspace, and select Copy. The Copy Answer As window opens.

4 Type a name for the copied workspace in the Name field and click the OK button.

5 Open the copy of the answer workspace.

6 Right-click on the Notes tab and select Add Tab Before.

7 Click the Design tab on the ribbon.

8 In the Label section of the ribbon, click the Text drop-down menu and rename the tab Model Questions.

9 Click the Insert Control tab on the ribbon.

10 In the Relationship Items section of the ribbon, drag the Model Question control under the Model Questions tab on the workspace.

11 Click the Save and Close button on the ribbon.

Now you need to update staff members' **profiles** by selecting the Model Questions check box on the Service tab of the Permissions page. Refer to Service permissions. You must also assign this custom answer workspace to staff member profiles. Refer to Customizing profiles.

Adding and associating model questions

You can create **model questions** from existing answers, associate existing answers in Oracle Service Cloud with existing model questions in Virtual Assistant, and create one or more model questions from the Answers Default report. All options are discussed in the following procedures.

To add a model question from an existing answer

1 Right-click an answer in an answers report and select Open. The answer displays on the **content pane**.

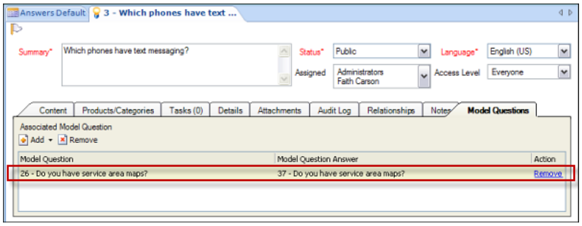
2 Click the Model Questions tab.

3 Click the Add button and select Add New to open the Choose a Model Question Category window.

4 Click the category drop-down menu and select a **leaf** category.

5 Click the OK button. The new model question and answer are added to the list.

6 Click the Save button on the ribbon. IDs are assigned to the model question for association and validation purposes.



7 To remove the association between the answer in Oracle Service Cloud and the model question in Virtual Assistant, select the model question in the list and click the Remove button on the toolbar or click the Remove link under the Action column.

8 Click the Save and Close button on the ribbon.

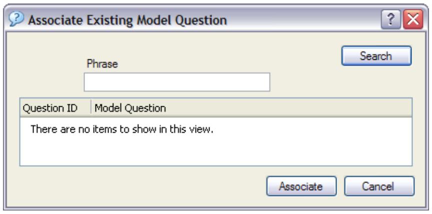
9 Log in to Virtual Assistant and validate the model question. This ensures that an association is made between the answer in the Oracle Service Cloud **knowledge base** and the model question in the Virtual Assistant database. Refer to the Virtual Assistant documentation.

To associate an existing answer with an existing model question

1 Right-click an answer in an answers report and select Open. The answer displays on the **content pane**.

2 Click the Model Questions tab.

3 Click the Add button and select Add Existing. The Associate Existing Model Question window opens.



4 Type a single word value in the Search field and click the Search button.

Note Searches are performed against only the Question field (title) of model questions. To view the Question field for model questions, you must log in to Virtual Assistant. Refer to the Virtual Assistant documentation.

In addition, wildcards are not supported when searching for model questions.

5 Select one or more model questions to associate with the answer in Oracle Service Cloud.

6 Click the Associate button. The model question is added to the list.

7 To remove the association between the answer in Oracle Service Cloud and the model question in Virtual Assistant, select the model question in the list and click the Remove button on the toolbar or click the Remove link under the Action column.

8 Click the Save and Close button on the ribbon.

9 Log in to Virtual Assistant and validate the model question. This ensures that an association is made between the answer in the Oracle Service Cloud **knowledge base** and the model question in the Virtual Assistant database. Refer to the Virtual Assistant documentation.

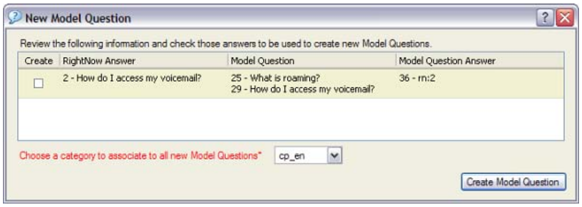
To add a model question from the Answers Default report

1 Open the Answers Default report located at Public Reports > Service > Views–Service > Answer Views.

2 Select one or more answers in the list.

3 Click the Model Questions button on the **ribbon**. The New Model Question window opens, displaying the answer and its associated Virtual Assistant model questions.

Tip For the Model Questions button to display on the ribbon, the Model Questions check box must be selected on the Service tab of staff members' profiles. Refer to Service permissions.



4 Select the check box under the Create column to associate an answer with an existing model question.

Note If an answer does not have an existing model question association, the check box under the Create column is selected by default to signify that a model question association will be made.

5 Click the category drop-down menu and select a **leaf** category.

6 Click the Create Model Question button. The New Model Question window closes.

7 Click the Save and Close button on the ribbon.

8 Log in to Virtual Assistant and validate the model question. This ensures that an association is made between the answer in the Oracle Service Cloud **knowledge base** and the model question in the Virtual Assistant database. Refer to the Virtual Assistant documentation.

41

Content Library

Your agents will frequently use the same words, phrases, and replies when responding to customer questions. Standard text can be inserted in incident responses or in chat sessions, or added as a **business rule** action, making the information your organization presents more consistent. You can also add variables as shortcuts to insert into your answers, incident responses, or chat sessions.

Both standard text and variables save time and eliminate errors when responding to incidents, chatting with customers, and creating answers. You can also add folders to organize standard text and variables and organize folders in the tree.

Adding standard text

In addition to saving time and eliminating errors, creating standard text will help your agents respond to similar incidents with consistent information. For example, you may want to create standard text for commonly used information about your products and pricing, or to relay standard troubleshooting or contact information to customers.

You can embed variables as shortcuts in standard text, including variables defined on the Variables editor or system-defined variables. You can also assign a hot key to any standard text. Agents can use a hot key as a shortcut for inserting standard text when working on incidents or engaged in a chat session. Refer to Inserting standard text.

To add or edit standard text

1 Click the Configuration button on the **navigation pane**.

2 Double-click Standard Text under Service. The Standard Text tree displays on the **content pane**.

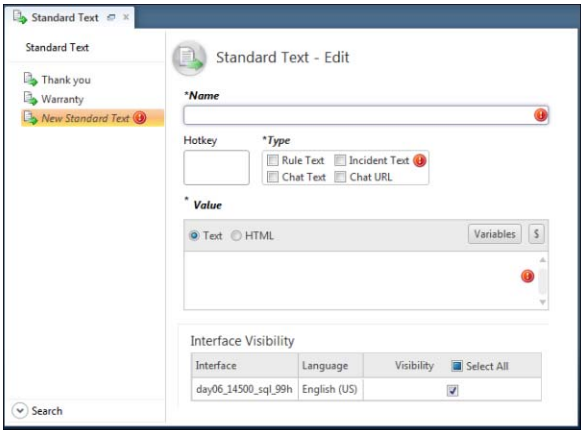
Tip You can search for standard text by clicking Search at the bottom of the tree. Refer to Working with configuration items.

In addition, folders can be added to the Standard Text tree to help organize standard text. Refer to Adding folders.

3 To add standard text, click the New button on the **ribbon** to display the editor.

Or

To edit standard text, click it in the tree.



4 Enter the following field information.

Table 342: Standard Text Editor Description

Field	Description
***Name**	Type the name of the standard text. The item name in the Standard Text tree on the left side of the content pane is populated or revised as you type.
Hotkey	Type the hot key letters, numbers, or both in this field. Agents can quickly insert standard text by pressing **F8** and the hot key when working on an incident or during a chat session. Refer to Inserting standard text. **Note:** To locate the shortcut keys, agents can right-click a standard text response and select Find.
***Type**	Select at least one of the following check boxes for the standard text type.
Rule Text	Select this check box to include the standard text as a rule action.
Chat Text	Select this check box to enable this text to be accessed by agents when engaged in a chat session. Refer to Inserting standard text. **Note:** This check box appears only when Oracle RightNow Chat Cloud Service (Chat) is enabled.
Incident Text	Select this check box to include this text in the Standard Text list when adding or editing an incident.
Chat URL	Select this check box to enable this URL to be accessed by agents when engaged in a chat session. Agents can push this URL to customers, which opens a browser on their computer displaying the URL. Refer to Inserting standard text. **Note:** This check box appears only when Chat is enabled.
***Value**	Select the appropriate radio button for adding standard text in plain text or HTML format. **Note:** If both plain text and HTML versions of a standard text entry are available, the HTML version displays by default in the Preview section on the Standard Text window. Refer to Inserting standard text.
Text	Select this radio button to add the standard text in plain text.

Table 342: Standard Text Editor Description (Continued)

Field	Description
HTML	Select this radio button to add standard text in HTML. For information on how HTML fields in standard text are displayed in responses, refer to Answer ID 1434. **Note:** All standard text images must be referenced by URL.
Variables	Click this button to select a variable defined on the Variables editor. Refer to Adding variables.
$	Click this button to choose from the following system-defined variables. When the standard text is appended, the variable is replaced with the related data. **Note:** If you type a period immediately after the variable, and then an alphabetic character, the period becomes part of the variable name.
SmartAssistant Solutions	Select this option to append the SmartAssistant Solutions variable. `$solutions` will appear in the Value text box.
Response Link	Select this option to append the Response Link variable. `$response_link` will display in the Value text box.
Incidents	Select Incidents and then one of the variables on the list. For the list of available standard content variables, refer to Answer ID 6529. Custom fields and attributes defined in your system are also on the list. **Note:** For a description of the standard content variables on the list, refer to the Incidents table information in the data dictionary (Configuration > Database > Data Dictionary).
Contacts	Select Contacts and then one of the variables on the list. For the list of available standard content variables, refer to Answer ID 6529. Custom fields and attributes defined in your system are also on the list. **Note:** For a description of the standard content variables on the list, refer to the Contacts table information in the data dictionary (Configuration > Database > Data Dictionary).

Table 342: Standard Text Editor Description (Continued)

Field	Description
Orgs	Select Orgs and then one of the variables on the list. For the list of available standard content variables, refer to Answer ID 6529. Custom fields and attributes defined in your system are also on the list. **Note:** For a description of the standard content variables on the list, refer to the Organizations table information in the data dictionary (Configuration > Database > Data Dictionary).
Interface Visibility	Select the individual interfaces where you want to display the standard text. **Note:** All interfaces are selected by default. You can prevent standard text from appearing on all interfaces by clearing the Select All check box.

5 Click the Save and Close button on the ribbon.

Caution You can delete standard text at any time by selecting the standard text entry in the tree and clicking the Delete button on the ribbon. However, when you delete standard text, all instances of the standard text will also be deleted.

- Adding folders
- Inserting standard text

Adding variables

A variable is a predefined shortcut for entering a long string of text when adding an answer, responding to an incident, engaging in a chat session, or creating standard text. Variables can be entered in the Question and Answer fields of an answer. When the answer is displayed on the answer details page of the **customer portal**, the variable is replaced with whatever value you specify. Variables can also be **indexed** to make the answer contents more searchable. Agents can copy a variable and paste it or type the variable inline when responding to a customer in a chat session or an incident response.

Variables are also helpful to use for information that may change. By updating the value of the variable, you will also update all answers that contain that variable. For example, suppose you want to add a contact variable for a support email address at your organization. Instead of staff members typing the email address every time, you can add the address as a variable. If the email address changes, all answers containing the contact variable are updated.

To add or edit a variable

1 Click the Configuration button on the **navigation pane**.

2 Double-click Variables under Service. The Variables tree displays on the **content pane**.

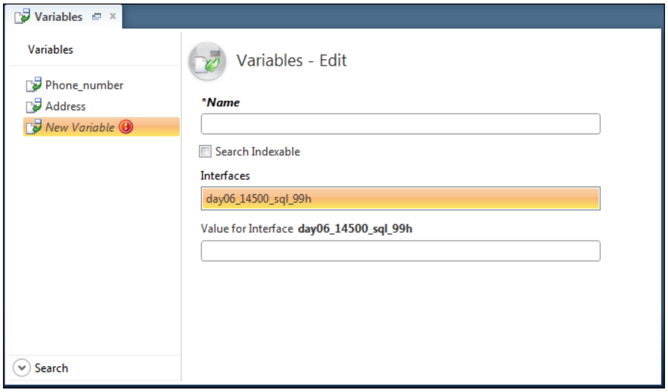
Tip You can search for variables by clicking Search at the bottom of the tree. Refer to Working with configuration items.

In addition, folders can be added to the Variables tree to help organize variables. Refer to Adding folders.

3 To add a variable, click the New button on the **ribbon** to display the editor.

Or

To edit a variable, click it in the tree.



4 Enter the following field information.

Table 343: Variables Editor Description

Field	Description
*Name	Type the name of the variable. The item name in the Variables tree on the left side of the content pane is populated or revised as you type. **Note:** Variable names cannot include spaces. We suggest using an underscore character (_) instead.
Search Indexable	Select this check box to index the text for searching on the customer portal.
Interfaces	Select the interfaces where this variable can be used.
Value for Interface	Type the text of the variable. **Note:** Variables are case sensitive.

5 To view answers that are dependent on the variable, click the Dependencies button on the ribbon. The Dependencies button is active only when you edit a variable.

6 Click the Save and Close button on the ribbon.

Caution You can delete variables at any time by selecting the variable in the tree and clicking the Delete button on the ribbon. A dependency check will then be performed and any answers that contain the variable will display on the Dependency Conflict window. To delete all instances of the variable, click Yes. Otherwise, update the applicable answers before deleting the variable.

For information about adding a variable to **standard text**, refer to Adding standard text. Also see Inserting variables into answers.

❖ Adding folders
❖ Inserting variables into answers

42

Service Level Agreements

Service level agreements (SLA) in Oracle RightNow Cloud Service (Service) control the type and amount of support you offer your customers. Using response requirements, you can track the effectiveness of your customer service and determine whether staff members are meeting defined service goals for initial response and incident resolution times.

You can also meter the service and support your customers receive. For example, you can control how many incidents an organization can submit based on the number of incidents defined in their assigned **SLA instance**.

Configuring service level agreements

Before you create SLAs, you need to add the holidays your organization observes and define default response requirements so you can track staff members' response and resolution times. Default response requirements are used for SLAs that do not have custom response and resolution requirements. See To add custom response requirements to an SLA.

Adding and editing holidays

To ensure your organization meets its service goals, you need to add all holidays observed by your organization. Holidays work in conjunction with your default **response requirements** and any custom response requirements defined in individual SLAs. That is, by adding holidays, you can temporarily suspend response requirements for those days when staff members are not available to respond to customer inquiries and answer their questions.

For example, if your organization observes Independence Day, add it as a holiday so the defaults you set for response and resolution times are suspended for that day. Failing to add the holidays your organization observes will present an inaccurate picture of how staff members are meeting their service goals.

To add or edit a holiday

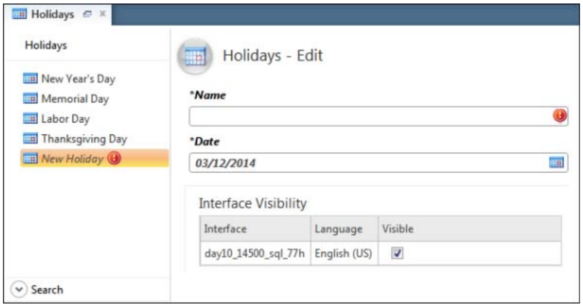
1 Click the Configuration button on the **navigation pane**.

2 Double-click Holidays under Service > Service Level Agreements. The Holidays tree displays on the **content pane**.

3 To add a holiday, click the New button on the **ribbon** to display the editor.

Or

To edit a holiday, click it in the tree.



4 Enter the following field information.

Table 344: Holidays Editor Description

Field	Description
*Name	Type the name of the holiday.
*Date	Click in this field and type the month, day, and year. (The current date appears in this field.) Or Click the calendar to select a different day in the month. Use the left and right arrows at the top of the calendar to change the month, and then click a day.

Table 344: Holidays Editor Description (Continued)

Field	Description
Interface Visibility	Select the check box next to each interface for which this holiday applies. **Note:** When you have multiple interfaces for different countries, you can make a holiday active in one interface but not in another. For example, since July 4 is a holiday in the United States but not in Canada, you would select only your U. S. interfaces for this holiday. However, if your support is handled from the United States, you may want to make the holiday an option in both Canadian and U. S. interfaces.

5 Click the Save and Close button on the ribbon.

Note You must add an entry for all holidays that occur yearly. For example, you must add separate entries for July 4, 2014, and July 4, 2015.

Defining response requirements

The next step in setting up your SLAs is to define your response requirements. Response requirements are the maximum times allowed for incident response and resolution during your organization's operating hours. For example, you may have a service goal of initially responding to all customer inquiries within one business day (8 work hours) and resolving all incidents within three business days (24 work hours). By defining these default response requirements, you can measure staff member performance in responding to and solving incidents. You can also use the response requirements for those SLAs that do not have customized response requirements.

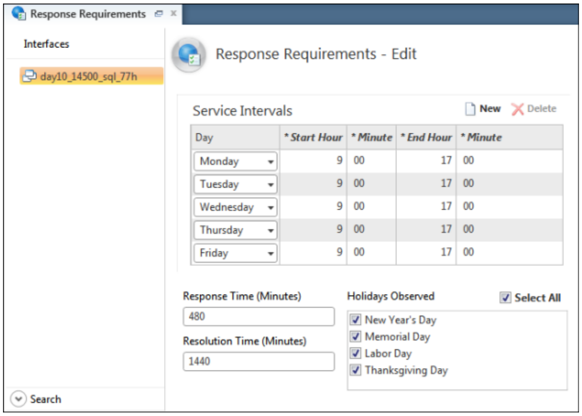
Because Service supports both default and custom response requirements, you have flexibility in offering different levels of support to customers. For example, if you want your levels of service to be based on how quickly customers receive an initial response and their incidents are solved, you can set up custom response requirements for each SLA. Refer to To add custom response requirements to an SLA.

To define default response requirements

1 Click the Configuration button on the **navigation pane**.

2 Double-click Response Requirements under Service > Service Level Agreements. The Response Requirements tree displays on the **content pane**.

3 Click the appropriate **interface** in the tree to display the editor.



4 Enter the following field information for the first service interval. Press **Tab** to move between interval fields.

Table 345: Response Requirements Editor Description

Field	Description
Service Intervals	Use these fields to select the day and time **intervals** for the default response requirements.
New	Click this button to add a new row for the default response requirements.
Delete	Click this button to delete the selected default response requirement.
Day	Click this drop-down menu to select a day of the week. Press **Tab** to move between fields.
*Start Hour	Type the start hour using a 24-hour clock (for example, if your business day starts at 8:00 A.M., type 8 in this column).
*Minute	Type the start minute from 0 to 59.
*End Hour	Type the end hour using a 24-hour clock (for example, if your business day ends at 5:00 P.M., type 17 in this column). **Note:** The end hour must be a number greater than the start hour.

Table 345: Response Requirements Editor Description (Continued)

Field	Description
*Minute	Type the end minute from 0 to 59.
Response Time (Minutes)	Type the maximum number of minutes (between 1 and 99999) that staff members have to initially respond to a new incident. For example, if you require staff members to initially respond within 4 hours, type 240 in this field.
Resolution Time (Minutes)	Type the number of minutes (between 1 and 99999) that staff members have to solve incidents assigned to them. For example, if you require that incidents be resolved within 8 hours, type 480 in this field.
Holidays Observed	Select the holidays that will suspend the response requirements. **Note:** Select the Select All check box to select all holidays in the Holidays Observed section.

5 Click the Day drop-down menu to select the day for the next service interval and press **Tab**.

Tip You can have the same day of the week listed in two intervals. For example, if your organization has both day and afternoon shifts, you can add separate intervals for each shift.

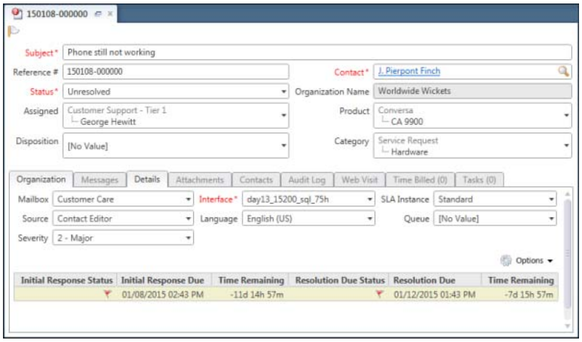
6 Click the Save and Close button on the **ribbon**.

❖ [To add custom response requirements to an SLA]

Configuring resolution due calculations

For SLAs that have response times defined, you can have resolution due dates and times calculated automatically when an SLA instance is added to an incident. This saves you from having to perform complex calculations to account for holidays and service hours.

To display resolution due calculations, you must create a custom incident milestones report and add it to a custom incident workspace. The following figure shows an incident workspace that has been configured to display resolution due calculations.



To create the incident milestones report

1 Create a new report with the following column definitions. Refer to Custom Reports.

Table 346: Custom Incident Milestones Report Columns

Heading	Definition
Initial Response Status	if(incidents.status_type=2,100,round(((date_diff(sysdate(), incidents.rel_due))*-1)/60,0))
Initial Response Due	incidents.rel_due
Time Remaining	if(incidents.status_type=2,0,round(((date_diff(incidents.rel_due, sysdate())))/60,0))
Resolution Due Status	round(((date_diff(sysdate(), milestone_instances.due_date))*-1)/60,0)
Resolution Due	milestone_instances.due_date
Time Remaining	if(incidents.status_type=2,0,round(((date_diff (milestone_instances.due_date,sysdate())))/60,0))

2 Use the following conditional formatting for the Initial Response Status and Resolution Due Status columns.

Table 347: Conditional Formatting for Status Flags

Condition	Display	Image	Color
Greater than 15	Image Only	Flag	Green

Table 347: Conditional Formatting for Status Flags (Continued)

Condition	Display	Image	Color
Less than or equals 0	Image Only	Flag	Red
Less than or equals 15	Image Only	Flag	Yellow

3 Use the Minutes (Days, Hours, Minutes) format for both Time Remaining columns.

4 Set the following report options to refresh the data regularly:
- Refresh report when data shown is changed in the editor
- Automatically refresh report at regular interval > Auto-Refresh enabled by default > Interval 55 Seconds

5 Clear all of the check boxes in the Customize Record Commands window so that no commands will be available at runtime.

6 Click the Save and Close button to save the custom report and exit the report design center.

To add the incident milestones report to a custom incident workspace

1 Copy the standard incident workspace and name it, for example, Incident Milestones. Refer to Creating custom workspaces.

2 Open the custom incident workspace. Refer to Editing workspaces.

3 Click the Details tab.

4 Add the custom incident milestones report to the Details tab.

5 Click the Save and Close button to save the custom workspace and exit the workspace editor.

6 Edit your staff members' profiles to use the new Incident Milestones workspace. Refer to To add or edit a profile.

After an SLA instance is applied to an incident, you can view the resolution due date and time. See To credit an incident to an SLA instance.

Setting up SLAs

After adding your holidays and defining default **response requirements** for your staff members, you can configure SLAs for your application. Begin by deciding what type of SLAs to offer. For example, you could offer certain customers a premium SLA that provides them with unlimited support for a period of time, and offer other customers a standard SLA that limits the number of incidents they can submit during a specified time period.

In addition, you can control whether customers without an SLA can access your support site, or submit incidents through email or the Ask a Question page. You can also add business rules to automatically assign SLAs to specific customers.

Setting up SLAs consists of the following actions.

- Create the SLAs you want to offer. Refer to Creating SLAs.
- Set up **business rules** to automatically assign SLAs to customers. Refer to Using business rules to automatically issue SLAs. Also, review how staff members can manually assign SLAs when working on incidents and editing organizations and contacts. Refer to Manually issuing SLAs.

Creating SLAs

SLAs are designed to allow you flexibility in providing support to your customers. When you create an SLA, you can choose the duration of the SLA and limit the SLA based on the number of incidents that can be submitted.

You can also assign custom **answer access levels** to an SLA so that customers have **privileged access** to special groups of answers. Additionally, you can define custom response requirements for each SLA or use the default response requirements already defined.

To create an SLA

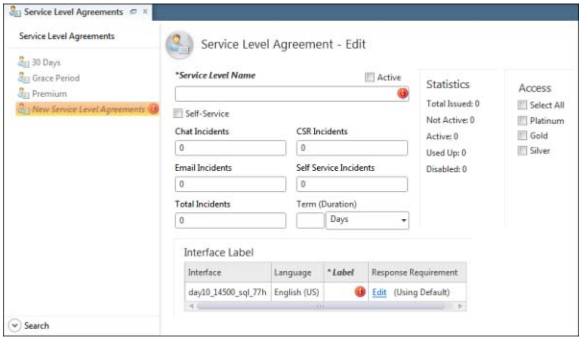
1 Click the Configuration button on the **navigation pane**.

2 Double-click Service Level Agreements under Service > Service Level Agreements. The Service Level Agreements tree displays on the **content pane**.

3 To add a service level agreement, click the New button on the **ribbon** to display the editor.

Or

To edit a service level agreement, click it in the tree.



4 Enter the following field information.

Table 348: Service Level Agreements Editor Description

Field	Description
***Service Level Name**	Type the name of the SLA. When you move to another field, the Label field in the Interface Label section is populated with the name you typed in the Service Level Name field.
Active	Select this check box to allow **instances** of the SLA to be applied to contacts or organizations. When selecting or clearing this check box, the name of the SLA (in the tree) changes from black to orange and displays in italicized font. After clicking the Save button on the ribbon, the name changes from orange to light gray and displays in normal font. **Note:** If this check box is cleared, the SLA is considered inactive and cannot be used with business rules.
Self-Service	Select this check box to allow customer access to the Answers page on the customer portal. **Note:** If this check box is cleared, customers will not be able to view answers and may be directed to a permission denied page.
Chat Incidents	Type the maximum number of allowable chat incidents. Enter a zero if no incidents are allowed or leave the field blank to allow an unlimited number of incidents.

Table 348: Service Level Agreements Editor Description (Continued)

Field	Description
CSR Incidents	Type the maximum number of allowable incidents that can be created by a staff member for the contact or organization (for example, when customers contact your organization by phone). Enter a zero if no incidents are allowed or leave the field blank to allow an unlimited number of CSR incidents.
Email Incidents	Type the maximum number of allowable email incidents. Enter a zero if no incidents are allowed or leave the field blank to allow an unlimited number of email incidents. **Note:** If the SLA_SUBMIT_EMAIL **configuration setting** is enabled, a valid, active SLA must exist for contacts and organizations to send emails to Service. If the EU_SLA_VISIBLE configuration setting is enabled, SLA information will be visible in email responses. Refer to Customizing configuration settings.
Self-Service Incidents	Type the maximum number of allowable incidents created from the Ask a Question page. Enter a zero if no incidents are allowed or leave the field blank to allow an unlimited number of incidents.
Total Incidents	Type the total number of incidents allowed from all incident sources. **Note:** The number in the Total Incidents field must be greater than or equal to the value of any single incident field. For example, if the number of chat incidents equals 10, and all other incidents have a field value of 5, then the total number of incidents allowed must be 10 or more. The number in the Total Incidents field must also be less than or equal to the sum of the values of all of the single incident fields. For example, if the sum of the field values is 50, then Total Incidents cannot be greater than 50.
Term (Duration)	Type a number in this field and select days, weeks, months, or years from the drop-down menu. Leave the field blank to indicate there is no time limit on the SLA. If you specify a number, the start date is the date of issue.
Statistics	The following fields describe the statistics for an SLA.
Total Issued	The number of times this SLA has been issued.
Not Active	The number of instances of this SLA in the Not Active state.

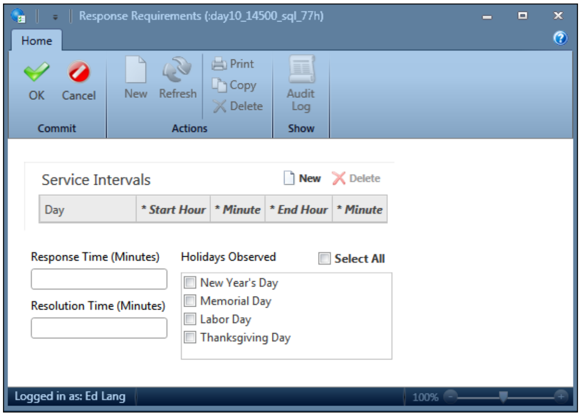
Table 348: Service Level Agreements Editor Description (Continued)

Field	Description
Active	The number of instances of this SLA in the Active state.
Used Up	The number of instances of this SLA in the Used Up state.
Disabled	The number of instances of this SLA in the Disabled state. Refer to Viewing disabled SLA instances.
Access	Select the answer access levels assigned to the SLA. **Note:** Answer access levels will display only if they have been added to the application. Refer to Adding and editing answer access levels.
Interface Label	This section contains the names of all available interfaces, the languages they are implemented in, and the language-specific label of the SLA. Click Edit next to an interface to change response requirements for the SLA. If you do not change response requirements, the default response requirements are used. Refer to To add custom response requirements to an SLA. **Note:** When using multiple-language interfaces, you must type the label in the Label field in the language of the interface.

5 Click the Save and Close button on the ribbon.

To add custom response requirements to an SLA

1 When adding or editing an SLA, click Edit next to the interface in the Interface Label section. The Response Requirements window displays.



2 Fill in the Service Intervals, Response Time, Resolution Time, and Holidays Observed fields. Refer to Defining response requirements.

3 Click the Save and Close button on the **ribbon**.

❖ Using business rules to automatically issue SLAs

❖ Manually issuing SLAs

Using business rules to automatically issue SLAs

Once you create SLAs, they can be automatically issued to organizations and contacts with no organization association using **business rules**. Once an SLA has been automatically applied to an organization or contact, a unique **SLA instance** is associated with the organization or contact. Refer to Applying SLAs and crediting incidents to SLAs.

Note Contacts associated with an organization cannot be assigned an SLA instance, as the SLA instance is applied to the organization.

❖ Manually issuing SLAs

Manually issuing SLAs

Staff members can manually apply SLAs to organizations and contacts when editing incidents associated with an organization or contact. Once a staff member has applied an SLA, a unique **SLA instance** is associated with that organization or contact.

If an organization or contact has more than one active SLA, staff members can select which SLA to apply to an incident. For example, a contact may have two active SLAs, one that allows unlimited incidents and lasts for thirty days, and another that allows ten of each type of incident and lasts for one year. If a new incident is applied to the limited incident SLA, the staff member can re-assign the incident to the unlimited incident SLA to more efficiently use the customer's entitlements. Refer to Applying SLAs.

Maintaining SLAs

Maintaining your SLAs is an important part of your customer service solution, and Service provides you with tools for evaluating the performance of your SLAs and how they are meeting your customers' needs. You can also edit SLAs as necessary.

Analyzing SLAs

With analytics, you can track and report on staff members' performance and service level achievements. You can see the usage status of SLAs as well as generate specific reports regarding performance and achievement requirements of each SLA. Analytics can assist you in evaluating and monitoring agent performance, SLA usage and performance, and customer support levels. SLA analytics are located at Public Reports > Service > SLA Reports.

For statistical information about individual SLAs, refer to Creating SLAs.

Editing SLAs

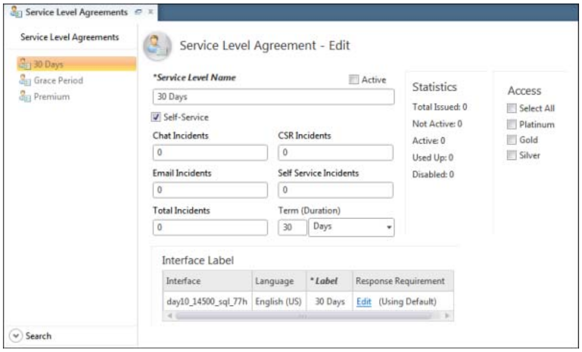
Analyzing your SLAs can help you pinpoint the most effective ones and the ones that may need to be changed. You can edit your SLAs at any time. However, once an **SLA instance** is applied to an organization or contact, it cannot be changed. When you edit an SLA, the changes will not affect the instances of the SLA that have already been applied to organizations or contacts. Changes will affect only future instances of the SLA applied to a contact or organization. For your reference, a view-only version of the SLA instance is archived. Refer to Viewing disabled SLA instances.

To edit an SLA

1 Click the Configuration button on the **navigation pane**.

2 Double-click Service Level Agreements under Service > Service Level Agreements. The Service Level Agreements tree displays on the **content pane**.

3 Click the appropriate service level agreement in the tree to display the editor.



4 Edit field information as necessary. Refer to Creating SLAs.

5 Click the Save and Close button on the **ribbon**.

The next time you assign this SLA to contacts and organizations, the changes will apply to all instances of the SLA.

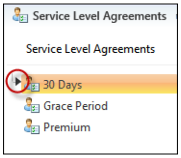
Viewing disabled SLA instances

If an SLA is edited after an instance of the SLA has been assigned to contacts or organizations, the assigned instance is converted to read-only mode to prevent editing. The read-only version of the **SLA instance** is archived, allowing you to view the settings for the previous, or "disabled," instance of the SLA.

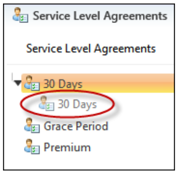
To view disabled SLA instances

1 Click the Configuration button on the **navigation pane**.

2 Double-click Service Level Agreements under Service > Service Level Agreements. The Service Level Agreements tree displays on the **content pane**. If a disabled SLA exists, an arrow displays next to the active SLA it is associated with.



3 Click the arrow to view the disabled SLA. Disabled SLAs display in a light gray font.



4 Select the disabled SLA. The Service Level Agreement editor displays on the content pane and the disabled SLA opens in read-only mode.

SLA samples

The following SLA samples show you how to meter service and offer different levels of support to your customers. SLA samples are provided for a 30-day SLA, a grace period SLA, and a premium SLA.

Sample 1: 30 Days SLA

In this example, the 30-day SLA restricts support to 30 days, but allows contacts and organizations to submit an unlimited number of incidents during that time period. Support begins when the SLA is assigned and automatically ends after 30 days. In this sample, the default response requirements are used.

To add a 30-day SLA

1 Click the Configuration button on the **navigation pane**.

2 Double-click Service Level Agreements under Service > Service Level Agreements. The Service Level Agreements tree displays on the **content pane**.

3 Click the New button on the **ribbon** to display the editor.

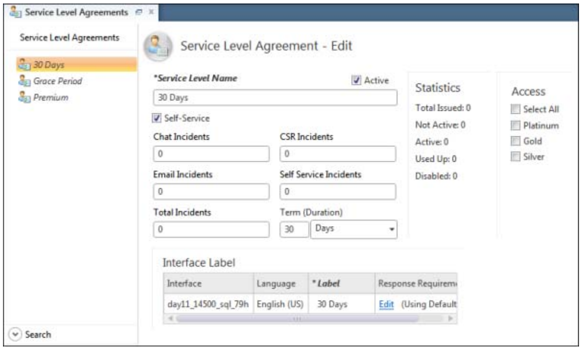
4 Type **30 Days** in the Service Level Name field.

5 Select the Active check box.

6 Select the Self-Service check box to allow access to the **customer portal**.

7 Type **30** in the Term (Duration) field and select Days from the drop-down menu.

Note Do not enter any number in the Chat Incidents, CSR Incidents, Email Incidents, Self-Service Incidents, and Total Incidents fields. Leaving these fields blank, or null, will allow contacts and organizations assigned this SLA to submit an unlimited number of each type of incident until the 30-day term has expired.



8 Click the Save and Close button on the ribbon.

Sample 2: Grace Period SLA

This sample is for a two-incident SLA that could be assigned to contacts or organizations whose SLAs have recently expired. The duration is defined using the Total Incidents field. The Term (Duration) field is left blank because the defining measure is the number of incidents, not the length of time. In this SLA, the default response requirements are also used.

To add a grace period SLA

1 Click the Configuration button on the **navigation pane**.

2 Double-click Service Level Agreements under Service > Service Level Agreements. The Service Level Agreements tree displays on the **content pane**.

3 Click the New button on the **ribbon** to display the editor.

4 Type **Grace Period** in the Name field.

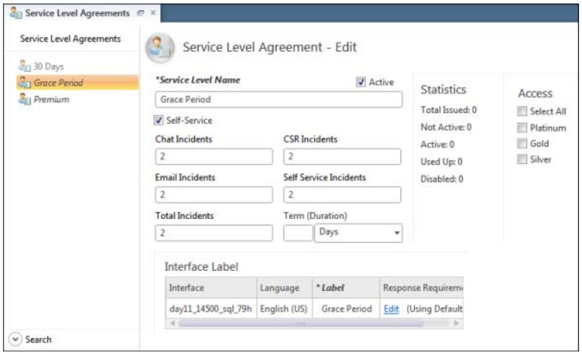
5 Select the Active check box.

6 Select the Self-Service check box to allow access to the **customer portal**.

7 Type **2** in the Total Incidents field.

Note Leaving the Chat Incidents, CSR Incidents, Email Incidents, and Self-Service Incidents fields blank, or null, will allow contacts and organizations assigned this SLA to submit an unlimited number of incidents. By typing the number 2 in the Total Incidents field, you are allowing customers to submit 2 of any incident type, but limit the total number of incidents the contact or organization can submit to 2.

The Term (Duration) field is blank because there is no time limit on the SLA. Contacts and organizations may submit the incidents at any time, until they have submitted two incidents, at which time the SLA will expire.



8 Click the Save and Close button on the ribbon.

Sample 3: Premium SLA

This type of SLA could be offered to organizations or contacts who request premium service. It is set up to provide faster incident response and resolution times than standard SLA entitlements. For example, staff members must initially respond within four hours and resolve incidents within two working days (sixteen hours).

The SLA has a duration of one year and will allow forty total incidents comprised of ten chat incidents and thirty CSR incidents. In this SLA, custom response requirements are used. Refer to To add custom response requirements to an SLA.

To add a premium SLA

1 Click the Configuration button on the **navigation pane**.

2 Double-click Service Level Agreements under Service > Service Level Agreements. The Service Level Agreements tree displays on the **content pane**.

3 Click the New button on the **ribbon** to display the editor.

4 Type **Premium** in the Name field.

5 Select the Active check box.

6 Select the Self-Service check box to allow access to the **customer portal**.

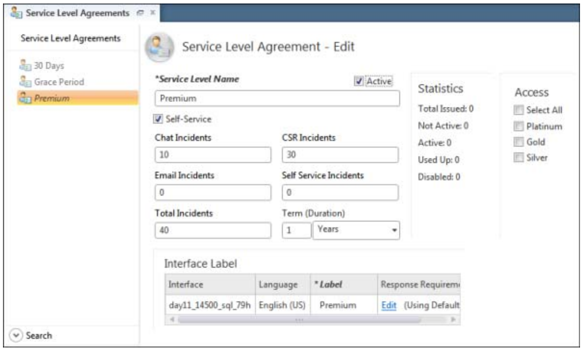
7 Type **10** in the Chat Incidents field.

8 Type **30** in CSR Incidents, Email Incidents, and Self-Service Incidents fields.

9 Type **40** in the Total Incidents field.

Note The number in the Total Incidents field must be greater than or equal to the sum of all incident fields. For example, if the sum of all incident fields equals 40, then the total number of incidents allowed must equal 40 or less. The number in the Total Incidents field must also be greater than or equal to any single incident field. For example, if the number of chat incidents equals 5, and all other incidents have a field value of 10, then the total number of incidents allowed must be 5 or more.

10 Type **1** in the Term (Duration) field and select Years from the drop-down menu.



11 Click the Save and Close button on the ribbon.

43

Co-Browse Configuration

Co-browsing lets customers share their desktop with agents who are helping them on the telephone or during a chat session. Staff members can guide customers through web pages using their mouse or other pointing device to demonstrate actions. In effect, they take control of the customer's browser to show the customer how to complete an action. Co-browse helps eliminate the confusion that can arise when giving instructions to customers through dialog or text. Co-browse is also effective for assisting customers in filling out forms or completing a sale.

Best Practices for Co-browse

Best practices for co-browse include clearly defining the business problem you are solving, investing in a pilot program, making a good first impression, ensuring security requirements are met, knowing when to engage a customer, providing a good customer experience, and making continuous improvements. Refer to *Best Practices for Oracle RightNow Co-browse Cloud Service*.

Configuring co-browse on incident workspaces

Co-browse configuration for incident **workspaces** consists of creating a custom incident workspace with a tab where agents can co-browse with customers. In addition, a co-browse link must be added to the **customer portal** before agents can co-browse with customers. Refer to Adding the CobrowsePremium widget to the sidebar.

Note Before you can configure co-browse, it must be enabled. To enable co-browse, contact your Oracle account manager.

To configure co-browse on an incident workspace

1 Click the Configuration button on the **navigation pane**.

2 Double-click Workspaces under Application Appearance. The Workspaces explorer displays on the **content pane**.

3 Expand the Standard folder, right-click the incident workspace, and select Copy. The Copy Incident As window opens.

4 Type a name for the copied workspace in the Name field and click the OK button.

5 Open the copy of the incident workspace.

6 Right-click next to the Audit Log tab and select Add Tab.

7 Click the Design tab on the **ribbon**.

8 In the Label section of the ribbon, click the Text drop-down menu and rename the tab Co-browse.

9 Click the Insert Control tab on the ribbon.

10 In the Relationship Items section of the ribbon, drag the Co-browse **control** under the Co-browse tab on the workspace.

11 Click the Save and Close button on the ribbon.

Now you need to assign this custom incident workspace to **profiles**. Refer to Customizing profiles. For information about using co-browse on incident workspaces, refer to Co-browsing with customers.

- Adding the CobrowsePremium widget to the sidebar
- Co-browsing with customers

Configuring co-browse on chat workspaces

Co-browse configuration for Oracle RightNow Chat Cloud Service consists of creating a custom chat sessions **workspace** with a tab where agents can co-browse with customers. In addition, a co-browse control must be added to the workspace ribbon so staff members can invite customers to co-browse when they are chatting with them.

Note Before you can configure co-browse, it must be enabled. To enable co-browse, contact your Oracle account manager.

To configure co-browse on a chat workspace

1 Click the Configuration button on the **navigation pane**.

2 Double-click Workspaces under Application Appearance. The Workspaces explorer displays on the **content pane**.

3 Expand the Standard folder, right-click the chat sessions workspace, and select Copy. The Copy Chat Sessions As window opens.

4 Type a name for the copied workspace in the Name field and click the OK button.

5 Open the copy of the chat sessions workspace.

6 Right-click next to the Incidents tab and select Add Tab.

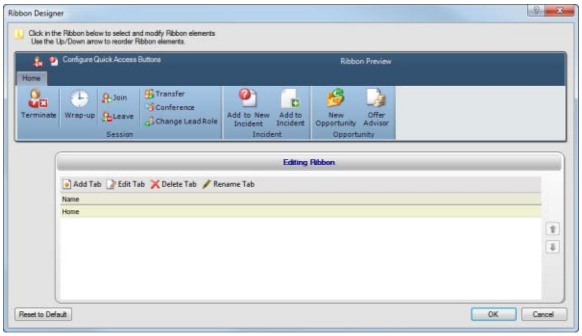
7 Click the Design tab on the **ribbon**.

8 In the Label section of the ribbon, click the Text drop-down menu and rename the tab Co-browse.

9 Click the Insert Control tab on the ribbon.

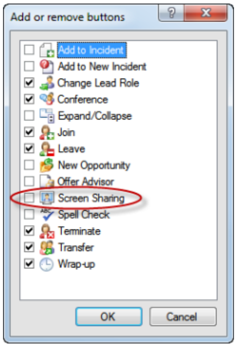
10 In the Relationship Items section of the ribbon, drag the Co-browse **control** under the Co-browse tab on the workspace.

11 Click the Home tab on the ribbon and click the Ribbon button. The ribbon designer opens.



12 Click a button in the Session group to activate the buttons.

13 Click the Add Buttons button on the ribbon designer toolbar. The Add or Remove Buttons window opens.



14 Select the Screen Sharing check box and click the OK button. The Screen Sharing button displays on the ribbon designer.

15 Click the OK button. The ribbon designer closes.

16 Click the Save and Close button on the ribbon.

Now you need to assign this custom chat sessions workspace to **profiles**. Refer to Customizing profiles. For information about using co-browse on chat workspaces, refer to Co-browsing with customers.

- ❖ Customizing profiles
- ❖ Co-browsing with customers

Adding co-browse permission to profiles

Co-browse is not fully functional until staff members have been assigned co-browse permissions in their **profile**. Once you create or edit a profile containing co-browse permissions, you can then assign the profile to individual staff members. This lets you designate which staff members have access to co-browse. You can assign co-browse permissions to one or more profiles based on your organization's needs.

To add co-browse permissions to a profile

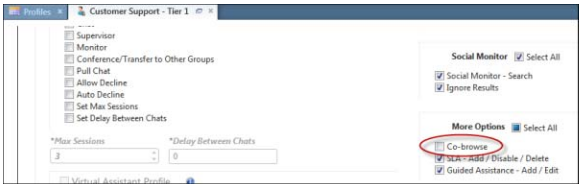
1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management. The report opens on the **content pane**.

3 Double-click the profile you want to edit. The Profile editor opens.

4 Click the Permissions button on the **ribbon**. The Permissions page opens.

5 Click the Service tab.



6 Select the Co-browse check box.

7 Click the Save and Close button on the ribbon.

Note Before agents can use co-browse, you must assign a profile containing co-browse permissions to their staff account. Refer to Adding and editing staff accounts.

Co-browse session reporting

The Co-Browse Summary report displays co-browse activity from all sources and shows detailed information about each co-browse session such as agent and contact names, when the session started and ended, and what caused the session to end. With this information, you can spot trends and implement steps to improve customer satisfaction.

The Co-Browse Summary report is available at Public Reports > Service > Co-Browse. Before staff members can use the report, it must be added to their **navigation sets**. Refer to Modifying navigation sets.

Tip All co-browse data is stored in the *cobrowse_sessions* table. Although the table is used for the Co-Browse Summary report, it can also be used for custom reports. Refer to Creating reports.

- Modifying navigation sets
- Creating reports

44

Offer Advisor Administration

When agents work with your customers, they are in a perfect position to provide information about new and upgraded products and services. The Offer Advisor feature helps both you and your agents. First, you can create promotions and define which groups of customers are eligible for each promotion. Second, it provides agents with solid information to successfully present offers to customers and contribute to increased revenue for your organization.

Product promotions are a natural use of Offer Advisor. But you can also use the feature to provide personalized service notices that enhance your levels of customer support. For example, Offer Advisor can help agents remind customers about soon-to-expire warranties or notify them about product recalls. Besides the promotions that you create, Offer Advisor also automatically generates product suggestions based on a customer's purchase history.

To learn how agents use Offer Advisor when they work with customers, refer to Opening Offer Advisor.

What is Offer Advisor

Offer Advisor provides offers—that is, promotional information and product suggestions—your agents can present to customers who contact your customer support group. With Offer Advisor's specifically targeted offers, an agent has the ability to cross-sell (by offering products compatible with those the customer has already purchased) or up-sell (by offering a premium version of a product the customer currently owns). You can also use Offer Advisor to offer SLAs and renewals, remind customers about warranties, add customers to a newsletter mailing list, provide information about product recalls, or deliver other messages to your customers. Offer Advisor includes settings that automatically create sales opportunities when a customer expresses interest in a promotion or suggestion.

Offer Advisor delivers the following types of offers.

Promotion

A promotion is a program defined by a staff member, usually from the marketing department, that specifies the effective dates, the product (if applicable to the promotion), the promotion's priority, and the target eligible for the promotion. The promotion description contains information for the agent, such as a text guide to help the agent present the promotion to the customer. The promotion also defines which targets are eligible for the offer. Targets are created using Offer Advisor target rules, a unique type of business rule. Customers who meet the conditions specified in a target rule are automatically added to the defined target.

When an agent responds to a customer's question, Offer Advisor retrieves information about the customer and the incident. Offer Advisor then applies the target rules and evaluates the customer information to determine if the customer belongs to a target. If the customer belongs to one or more targets, Offer Advisor searches for promotions the target is eligible for and displays them to the agent.

The displayed list of available promotions includes the assigned priority ranking and acceptance rate for each promotion. Also shown is the date of the most recent positive response, if any. (Previously refused offers are not displayed to avoid repeating an offer in which the customer has already expressed no interest.)

Suggestion

A suggestion is an automated product recommendation that predicts customer interest based on purchase history (if data is integrated into the Oracle Service Cloud application). Unlike promotions, which are created by marketing personnel, suggestions for recommended products are automatically generated. Offer Advisor uses a predictive model to develop product suggestions based on the customer's purchase history.

Offer Advisor first identifies groups of customers who have similar purchasing behavior. When a customer submits an incident, Offer Advisor assigns the customer to the best matching group. Then Offer Advisor compares products the customer has already purchased to products purchased by other members of the group. For example, the customer may belong to the group of customers who have purchased cruise vacations. If many members of that group have taken Alaskan cruises, but the customer has not, Offer Advisor may recommend an Alaskan cruise as the customer's next purchase.

Offer Advisor ranks a product suggestion based on the strength of the recommendation (that is, the probability that the customer is interested in the offer). Offer Advisor does not generate suggestions when it does not have enough information for the customer or when it predicts a low likelihood of the customer accepting the offer.

Text matching

When the Offer Advisor window displays promotions and suggestions, an agent can search for specific terms that best express the customer's interests. The search reorders the offers, ranking each according to its match weight.

Match weight depends on where the search term is found in an offer. For example, if the agent-entered search term matches a keyword for the promotion, the offer has a higher match weight than it would if the search term were found in the product description. Match weights are high (best match), medium, or low. The highest weight occurs when the agent-entered search terms match promotion keywords. Medium weights are assigned when the search term matches the promotion or product name or the text in the promotion's summary field. Low weights result when terms match the promotion guide or product description.

Setting up Offer Advisor

Configuration settings are used to enable Offer Advisor and configure its functionality. After Offer Advisor has been enabled and configured, staff members can use it while assisting customers. Configuration options will not be visible until Offer Advisor is enabled. Contact your Oracle account manager.

Important Even with Offer Advisor enabled, you must be sure that the Offer Advisor button appears on the **ribbon** of the **workspace** that agents use when they work with **incidents**. By default, it appears on the standard incident workspace. If agents use a custom incident workspace and the Offer Advisor button is not available on the ribbon, they will not be able to tell if a customer is eligible for offers. Refer to Customizing ribbons and Quick Access toolbars.

Once Offer Advisor is enabled, complete the following steps to configure Offer Advisor.

1 Integrating purchase history data—If you want Offer Advisor to use purchase history, you must integrate that data. For help with this, contact your Oracle account manager.

2 Creating targets—Every promotion needs an intended audience, which is its target. You can create unique targets for specific promotions as well as general targets you can use for multiple promotions.

3 Adding promotions—Once you have enabled Offer Advisor, integrated purchase history day, and created targets, you can create promotions that include dates, products, information for the agent, and targets.

❖ Integrating purchase history data

- ❖ Creating targets
- ❖ Adding promotions

Integrating purchase history data

Offer Advisor must have a customer's purchase history before it can generate product suggestions and apply target rules that have conditions based on purchase history. When sales information resides in an external application, you can integrate sales transaction information into your database, including customer information, purchased products, price, and purchase dates. For information about integrating purchase history data, contact your Oracle account manager.

Creating targets

Every promotion is associated with at least one target, the group of customers to whom you want to present your promotion. You can create a target to use for a single promotion, or you can create general targets to be used with multiple promotions.

Targets are created with target rules, which are one type of business rule. Business rules automate your workflow by establishing a set of conditions and a resulting action. If the conditions are met, the action is taken. Refer to Business rules overview.

Target rules single purpose is to define targets—groups of customers—that meet the conditions you specify. You add a rule to specify the conditions you want a customer to meet and if the conditions are met, the customer automatically becomes part of the target.

For example, you might want to promote SLAs. Using target rules, you can use product purchase dates to identify customers with expiring warranties who constitute your target. In another example, you might want to promote a premium calling plan for cellular phone customers in a specific region. You can use target rules to specify geographical limits and identify those customers who currently have basic calling plans. In another situation, you might create a target consisting of all your customers. In that case, you simply name the target and save the rule without setting any conditions.

For information about how agents interact with Offer Advisor, refer to Opening Offer Advisor.

Creating target rules

Because only one state is permitted for target rules, this state—called Targets—is automatically added when you open target rules.

Note You cannot add states or functions in target rules.

Regardless of the conditions you select, the default action is always "Contact will match this target." You cannot add an action for the Else clause of a target rule.

When you define the conditions of a target rule, you can use fields from the incident, contact, and organization tables in the database. This lets you define targets in terms of a large number of attributes, including demographic information you can gather using custom fields. You can also create a target that includes all of your customers by creating a rule that has no conditions. For lists of the fields allowed for incident, contact, and organization objects, refer to Choosing conditions.

You can also select a unique Purchased Products condition for target rules. The Purchased Products condition is actually a combination of three conditions, all of which must be met in order for the Purchased Products condition to be met. These criteria are product, price, and date purchased. In the Purchased Products condition, you can include or restrict products, define the price range, and specify the time frame of purchases.

To create a target rule with a Purchased Products condition

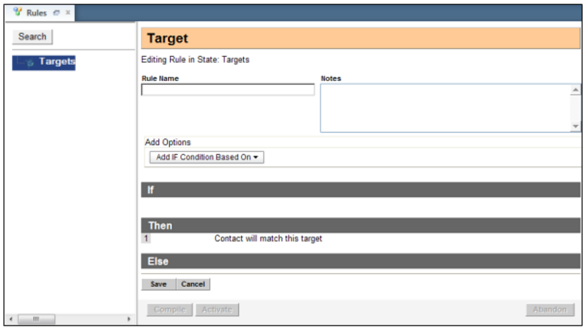
1 Click the Configuration button on the **navigation pane**.

2 Double-click Rules under Site Configuration. The Rules tree and editor display on the **content pane**.

3 Click the Offer Advisor button on the **ribbon**. The Browse Targets editor opens.

4 Click the Edit button on the ribbon. The Target editor opens.

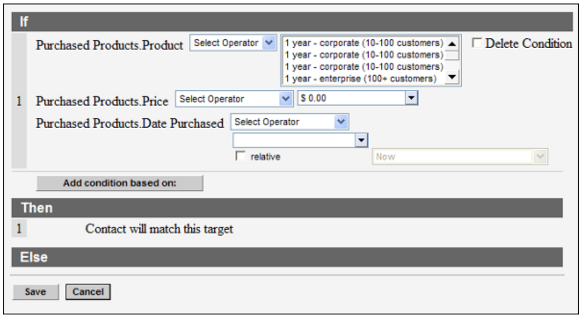
5 Right-click Targets in the tree and select New Rule. The Targets editor is activated.



6 Type the name of the target rule in the Name field.

7 To add notes to the rule, type them in the Notes field.

8 Click the Add IF Condition Based On button and select Purchased Products.



9 Enter the following field information.

Table 349: Purchased Products Condition Description

Field	Description
Product	Select a product from the menu. To select multiple products, press **Ctrl** while selecting each product. For information about adding sales products, refer to Adding and editing sales products.

Table 349: Purchased Products Condition Description (Continued)

Field	Description
Price	Click this drop-down menu and type a value in the Amount field. Click the Currency drop-down menu and select the currency.
Date Purchased	Click the drop-down menu to open the current month's calendar and select a purchase date. Use the arrows at the top to change the month if necessary. Or select the Relative check box to select a relative time condition. Refer to Relative time conditions.

10 Select the operator for the Product, Price, and Date Purchased conditions from the Select Operator drop-down menu. The available operators are described in the following table.

Table 350: Operators for Purchased Products

Field	Description
Equals	Select this operator if you want the product, price, or purchase date to exactly match the selection.
Not equals	Select this operator if you do not want the product, price, or purchase date to exactly match the selection.
Less than	Select this operator if you want the price to be lower than the entered price or the date to occur before the selected date.
Greater than	Select this operator if you want the price to be higher than the entered price or the date to occur after the selected date.
Less than or equal to	Select this operator if you want the price to be lower than or equal to the entered price or the date to occur before or on the same date as the selected date.
Greater than or equal to	Select this operator if you want the price to be higher than or equal to the entered price or the date to occur after or on the same date as the selected date.
In range	Select this operator if you want the price or purchase date to fall within the range you specify.
Not in range	Select this operator if you want the price or purchase date to fall outside the range you specify.

Table 350: Operators for Purchased Products (Continued)

Field	Description
Is null	Select this operator if you want the price or purchase date to contain no value.
Is not null	Select this operator if you want the price or purchase date to contain a value.

11 Click the Save button to save the target rule.

12 Click the Activate button to compile and activate the target rule base. Refer to Compiling and activating rule bases if you need help with this step.

Note If you click the Compile button instead of the Activate button, the rule is checked for errors, but not activated. Offer Advisor does not apply this target rule to customer information until it has been activated.

- ❖ Choosing conditions
- ❖ Compiling and activating rule bases

Relative time conditions

The Purchased Products condition lets you select a value for the Date Purchased part of the condition. There may be times when you want to set a specific date and time, which you can do by opening the calendar and selecting them. At other times, however, you might want that value to be relative. For example, you may want a condition "If the purchase date is less than 24 hours from the time the contact was acquired." In that case, you can select a relative time for the rule's condition. Relative time calculates the number of minutes or hours from the current time or from a specific event, such as the time the contact or incident was created.

The following procedure shows you how to set a relative time condition using the time a contact was acquired, but the procedure is the same for setting other relative time conditions.

To select the relative time condition for Date Purchased

1 Click the Configuration button on the **navigation pane**.

2 Double-click Rules under Site Configuration. The Rules tree and editor display on the **content pane**.

3 Click the Offer Advisor button on the **ribbon**. The Browse Targets editor opens on the content pane.

4 Click the Edit button on the ribbon.

5 Right-click the rule you want to add the relative time condition to and select Edit. The Target editor is activated.

6 Click the Add IF Condition Based On button and select Purchased Products. In this example, assume you want the target group to include those contacts who purchased a product within twenty-four hours of being acquired as a contact.

7 Select the Relative check box for Date Purchased. The calendar drop-down menu is removed and the Relative time field displays.

8 Click the Relative Time drop-down menu above the Relative check box. The Relative Time window opens.

9 Complete the fields in the Relative Time window.
   a Click the Directions drop-down menu and select + (Future).
   b Type 24 in the Offset field.
   c Click the Unit drop-down menu and select Hours.
   d Click the Save button to save your settings and close the Relative Time window.

10 Click the Event drop-down menu to the right of the Relative check box and select Contact.Acquired.

11 Click the Select Operator drop-down menu and select Less Than.

12 Click the Save button to save the new relative time condition for the rule.

Creating and modifying promotions

Promotions include the product or message you want agents to present to customers who belong to a specific target group. Promotions also define the active dates, the promotion's priority, URLs to open when customers express interest in or accept a promotion, and scripts and tips for agents.

You may find it helpful to use existing promotions as the basis for new promotions. In those cases, you can save the promotion with a new name and then make any changes. Even if you do not intend to make any changes, you should rename the promotion so it is possible to distinguish between them in reports.

Adding promotions

Because every promotion requires at least one target, you must define the promotion's target before you can complete the promotion. When you add a promotion, you may already have a target you want to present the promotion to, or you may decide to create a target specifically for this promotion. If you begin creating a promotion before defining a target, you can save the promotion and return later to assign a target. Refer to Creating targets.

If your promotion applies to a sales product, you must also be sure the product is in the product catalog. For example, you might create promotions that offer a discount on a new model of cell phone or a free warranty with a purchase. In these examples, the sales products are the cell phone and warranty. In another example, you might want to offer free shipping on all purchases or create a promotion that simply makes an announcement to your customers. In those cases, do not specify a sales product when you create the promotion. Refer to Adding and editing sales products.

After you know what product and targets are included in your promotion, you can add the remaining details. These include start and end dates, priority, URLs for taking the next action, and information to guide the agent in presenting the promotion to customers.

Important Even though the Promotions editor lets you create a promotion, it does not make other changes that may be necessary to enact the promotion. For example, if you create a promotion that offers an extended service agreement, you must also change the customer's **SLA** to reflect acceptance of the promotion.

- ❖ Creating targets
- ❖ Adding and editing sales products

To add or edit a promotion

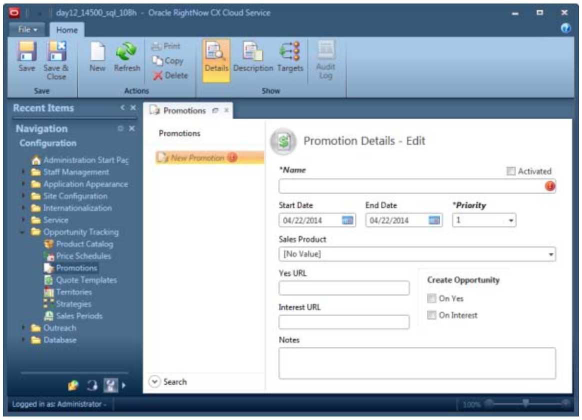
1 Click the Configuration button on the **navigation pane**.

2 Double-click Promotions under Opportunity Tracking. The Promotions tree displays on the **content pane**.

3 To add a promotion, click the New button on the **ribbon** to display the editor.

Or

To edit a promotion, click it in the tree.



4 Type the name of the promotion in the Name field.

5 To define properties, refer to Selecting details for promotions.

6 To enter a summary, guide, and keywords, refer to Providing promotion information to agents.

7 To specify targets, refer to Selecting targets for promotions.

8 Click the Save and Close button on the ribbon to save the promotion.

❖ Selecting details for promotions

❖ Selecting targets for promotions

Selecting details for promotions

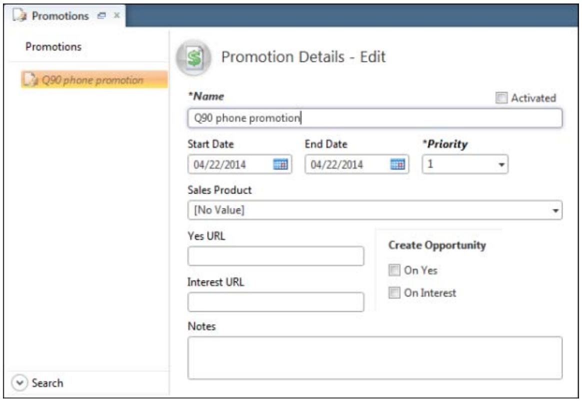
You can define the start and end dates, the product associated with a promotion, its priority, and the URLs that agents are directed to based on customer response.

To select details for a promotion

1 Click the Configuration button on the **navigation pane**.

2 Double-click Promotions under Opportunity Tracking. The Promotions tree displays on the **content pane**.

3 Click the promotion in the tree to display the editor.



4 Enter the following field information.

Table 351: Promotions Editor Description

Field	**Description**
Activated	Select this check box to activate the promotion. To discontinue a promotion during its active period (between the start and end dates), clear the check box.
Start Date	Click this drop-down menu to open the current month's calendar and select a start date for the promotion. Use the arrows at the top to change the month, if necessary, and then select the date.
End Date	Click this drop-down menu to open the current month's calendar and select an end date for the promotion.
*Priority	Click this drop-down menu to select a priority for this promotion. 1 is the highest priority and 10 is the lowest. Priority determines the promotion's order in the list seen by agents. **Note:** If two or more promotions with the same priority are offered to the customer, their positions in the promotions list are random.
Sales Product	Click this drop-down menu and select the sales product (if you want the promotion to have a sales product). **Note:** Promotions do not require a sales product. For example, you might want to offer free shipping on all orders, so you would not make a sales product selection.

Table 351: Promotions Editor Description (Continued)

Field	Description
Yes URL	Type the URL the agent is directed to if the customer accepts the promotion. For example, you might direct the agent to an order form with a discounted price. **Note:** You can pass variables through this URL to populate the page with contact information or other fields you select.
Interest URL	Type the URL the agent is directed to if the customer expresses interest in the promotion. For example, you might direct the agent to a form for entering leads. **Note:** You can pass variables through this URL to populate the page with contact information or other fields you select.
Create Opportunity on Yes	Select this check box to add an opportunity when the customer accepts the promotion. The opportunity is added automatically with no input required from the agent presenting the offer.
Create Opportunity on Interest	Select this check box to add an opportunity when the customer expresses interest in the promotion. The opportunity is added automatically with no input required from the agent presenting the offer.
Notes	Type comments, reminders, and other information about the promotion.

❖ Selecting targets for promotions

Providing promotion information to agents

You can provide information to help agents present promotions to customers. In addition, you can add a summary of the promotion and keywords associated with the promotion.

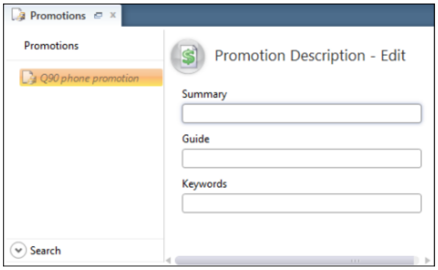
To provide promotion information

1 Click the Configuration button on the **navigation pane**.

2 Double-click Promotions under Opportunity Tracking. The Promotions tree displays on the **content pane**.

3 Click the promotion in the tree to display the editor.

4 Click the Description button on the **ribbon** to open the Description page.



5 Enter the following field information.

Table 352: Promotion Description

Field	Description
Summary	Type the text the agent will see in the list of promotions displayed on the Offer Advisor window.
Guide	Type a script, sales tips, or other guidelines to help the agent present the promotion to the customer.
Keywords	Type keywords in this field. Offer Advisor compares these keywords, along with other words associated with the promotion, to the search terms the agent enters to find offers matching the customer's interests.

6 Click the Save and Close button on the ribbon.

Selecting targets for promotions

You can assign one or more of the available targets to the promotion you are adding. If you want to define a new target for this promotion, refer to Creating targets.

Note If you define a new target before you finish creating the promotion, you must activate the target rule and reopen the Promotions editor. The new target then appears in the Available Targets list so you can assign it to the promotion.

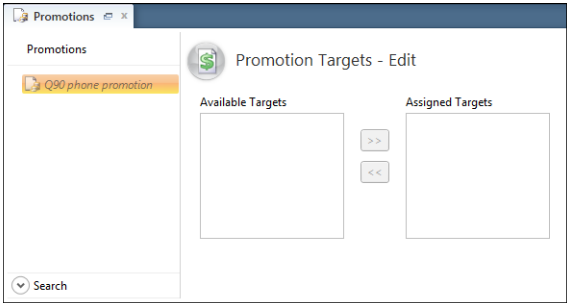
To select targets for a promotion

1 Click the Configuration button on the **navigation pane**.

2 Double-click Promotions under Opportunity Tracking. The Promotions tree displays on the **content pane**.

3 Click the promotion in the tree to display the editor.

4 Click the Targets button on the **ribbon** to open the Targets page.



5 Select a target for this promotion in the Available Targets list and click the right arrow. The target displays in the Assigned Targets list. Refer to Creating targets.

6 To assign additional targets, repeat step 5.

7 To remove a target, select it in the Assigned Targets list and click the left arrow. The target now displays in the Available Targets list.

8 Click the Save and Close button on the ribbon.

❖ Selecting details for promotions

Modifying promotions

You can edit and delete promotions as necessary. To edit a promotion, click it in the tree. Make your changes and save the promotion. You can also copy a promotion, modify it, and save it with a new name. The default name is Copy of [Promotion Name].

If you want to modify an existing promotion to use as a new promotion, it is good practice to open the promotion and save it with a new name. If you merely edit the properties of a promotion and do not change the name, your historical data regarding the effectiveness of that promotion may become skewed, preventing accurate reporting.

For example, if you create a Holidays 2013 promotion by renaming the Holidays 2012 promotion, you can distinguish statistics from each promotion, even if everything else in the two promotions is identical. If, however, you do not change the name, two years' worth of data are combined in one report, making it impossible to distinguish between them.

This practice also allows agents to present the Holidays 2013 promotion to customers who were not interested in the 2012 promotion. If the name does not change, the promotion is not available to customers who said no to the previous year's promotion.

To delete a promotion, click the Delete button on the ribbon. A message asks you to confirm the deletion.

Note Deleting a promotion may prevent accurate reporting by causing some reports to be incomplete. It is good practice to delete only old promotions that are no longer required for historical purposes. You can also add a folder for archiving purposes.

45

Offer Advisor

When working with customers, you are in a unique position to anticipate their needs and provide them with specifically targeted information. Offer Advisor identifies current promotions that customers are eligible for and generates product suggestions based on their purchase histories.

Offer Advisor does more than simply provide you with a list of offers. It also displays guides to help you present the offer or information to the customer. It may contain product information and direct you to URLs to enter information about orders or leads. Offer Advisor can help you deliver high levels of personalized customer service by providing customers with reminders and service opportunities.

What is Offer Advisor

Promotions are special offers made to specific groups of customers. Examples of promotions include free shipping for customers who buy certain products, extended warranties for customers whose basic warranty is about to expire, and discounted prices on accessories for products customers have already purchased. A staff member in your organization, usually from the marketing department, defines a promotion.

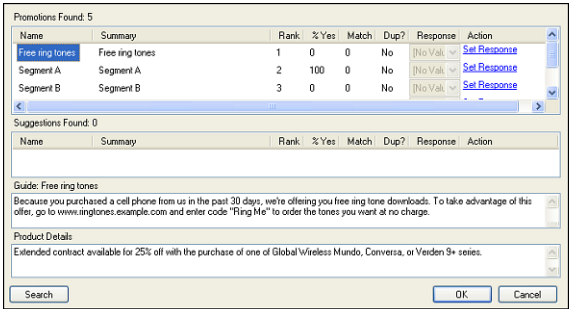
Suggestions, on the other hand, are generated automatically. These are product recommendations based on customer characteristics and purchase history. Just as SmartAssistant searches the knowledge base and suggests possible answers to a customer's questions, Offer Advisor searches for customer characteristics and past purchases to suggest possible products they may be interested in. For example, Offer Advisor may suggest a Caribbean cruise to a customer who has previously purchased a Mexican cruise vacation.

- Opening Offer Advisor
- Presenting offers

Opening Offer Advisor

Offer Advisor evaluates customer information when you open an incident, searching for **promotions** the customer is eligible for and product suggestions that the customer might be interested in. If it finds promotions, product **suggestions**, or both, the Offer Advisor button is enabled on the **ribbon**.

After you solve the incident, click the Offer Advisor button on the ribbon. The Offer Advisor window displays and contains promotions and suggestions.

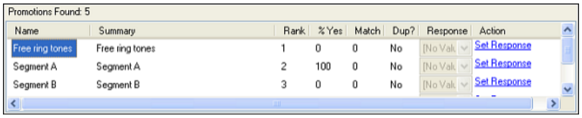


- Promotions Found
- Suggestions Found

Promotions Found

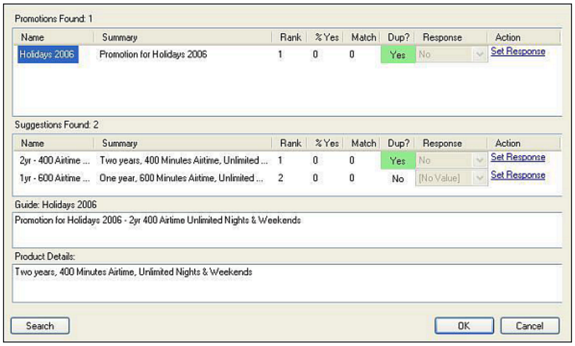
The Promotions Found section of the Offer Advisor window displays promotions the customer is eligible for. The maximum number of displayed promotions has been set by your administrator, so it is possible that the customer is eligible for other lower-ranking promotions that do not appear unless you scroll down.

Note If the customer previously expressed no interest in a promotion, the promotion does not appear on the Offer Advisor window, and you will not be put in the position of presenting a promotion the customer has already rejected. Nor will the product associated with the rejected promotion appear in the Suggestions Found list.



When working with promotions, keep the following points in mind.

- You can revise the order of the promotions using any of the column headings in the Promotions Found section, although the Rank, % Yes, and Match columns are the most useful. The Name column is simply the name assigned to the promotion by the marketing staff member who developed it. The Summary column provides a brief overview of the promotion.
- Promotions are initially ranked by priority, which is the relative importance assigned to it by the staff member who created it. These values appear in the Rank column. Although a rank of 1 indicates the highest priority, multiple promotions that have the same priority are not differentiated by rank in this list, so lower promotions may have the same priority as the first promotion.
- The % Yes column lists the historical response rate, which is the percentage of times customers have accepted this promotion. To rearrange the promotions in order of acceptance, click the column heading.
- You can enter search terms that indicate the customer's interest. The Match column prioritizes promotions based on how well your search terms match keywords and other text of the promotion or product. To list the promotions in order of match, where a high value indicates a strong match, click the Match column heading. Lower-ranking promotions that did not appear when the list was prioritized by rank may now be displayed based on their match with the search terms you entered. To learn how to search for matches, refer to To enter search terms.
- The column titled Dup? is used to indicate whether the product in the promotion is duplicated in a suggestion. If the same product appears in Promotions Found and Suggestions Found, the Dup? value in the row is Yes and is highlighted in green.



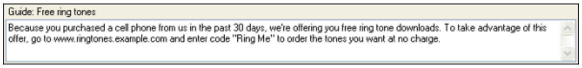
Suggestions Found

The Suggestions Found section of the Offer Advisor window displays recommendations for products that Offer Advisor has determined are a good fit for the customer. The maximum number of displayed suggestions has been set by your administrator, so it is possible that other lower-ranking suggestions are available even though they may not appear until you scroll down. Just as you can with promotions, you can revise the order of suggestions using the Rank, % Yes, and Match columns.

Guide

The guide section of the Offer Advisor window contains information about a selected promotion. This information was entered for your use by the marketing staff member who created the promotion. Depending on your organization's practices, the information may be a script for a phone conversation, text you can enter into an email response, or simply talking points for the promotion. For example, if most of your customer support requests come through phone calls, the marketing staff member may write a general script for you to use when talking with a customer. If your main channel of communication with customers is through email, the guide may contain text you can copy or append to the response.

Note The guide section displays "Offer Guide is unavailable" if you have selected a suggestion instead of a promotion or if marketing personnel did not enter information when creating the promotion.



To copy information in the guide to paste in the response, right-click in the Guide section and select Copy. Or you can append the information to the response by right-clicking and selecting Append To Thread.

Product Details

The Product Details section contains information from the Sales Product Catalog about the selected product suggestion or the product for the selected promotion. (Promotions do not require an associated product. If the selected promotion does not involve a product, this section displays “Product Details are unavailable.”)

To copy information in the Product Details section to paste in the response, right-click in the Product Details section and select Copy. Or you can append the information to the response by right-clicking and selecting Append To Thread.

Presenting offers

After you have opened the Offer Advisor window and reviewed the **promotions** and **suggestions**, you can select one to present to the customer. You can revise the order of the lists of promotions and suggestions to help you decide which offer has the highest potential of success. You can select the offer’s rank or its acceptance rate, or you can enter search terms to determine how well the offer matches the customer’s interests and use the match value as your selection criterion.

Tip You should strongly consider any offer with Yes displayed on a green background in the Dup? column. This indicates a product that appears in both promotions and suggestions.

To select a promotion or suggestion

To use rank as the selection criterion, select the promotion or suggestion ranked 1.

Or

To use acceptance rate, click the % Yes column heading to list the promotions in order of acceptance rate.

To enter search terms

1 Click the Search button on the bottom of the Offer Advisor window. The Offer Advisor Search window opens.

2 Type the search terms, separated by a space or comma, and click the OK button. The list of offers is automatically ranked according to match value.

Note The search terms you enter are applied only to the promotions and suggestions available to this customer, not to all promotions and suggestions.

To present an offer

1 If you are on a phone call with the customer, read or paraphrase the guide and product information to the customer.
Or
If you are responding to an incident, right-click in the guide or product information section to copy the text or append it to the response. Modify as necessary before sending the response.

2 Click Set Response in the Action column for the offer you want to present. The associated drop-down menu in the Response column is activated.

3 Click the drop-down menu and select one of the following options.

Table 353: Offer Advisor Response Options

Option	Description
Yes	Select this option if the customer accepts the offer. Depending on how the promotion is defined or how Offer Advisor is configured, this button may take you to a URL for follow-up action (for example, an order form).
Interest	Select this option if the customer expresses interest in the offer but is not ready to accept it. Depending on how the promotion is defined or how Offer Advisor is configured, this button may take you to a URL for follow-up action.

Table 353: Offer Advisor Response Options (Continued)

Option	Description
No	Select this option to indicate the customer's lack of interest in the offer. The promotion or suggestion is disabled in the Offer Advisor window, and the response is recorded to prevent the offer from being made to this customer in the future.
Defer	Select this option when you are sending the offer by email and do not yet know the customer's response.

4 Click the OK button to return to the incident.

5 Click the Save and Close button on the ribbon to save the incident and record the customer's responses to the offers. If you do not save the responses, the reports generated by managers and marketing staff will not account for these responses, and the historical information with this customer will not be accurate for future interactions.

Note If you send an email to a customer who replies with an indication of interest, you can reopen the incident, open the Offer Advisor window, select the promotion or suggestion, and select Yes, Interest, or No to document the response appropriately.

46

Oracle RightNow Wireless

Customers can access Oracle RightNow Cloud Service (Service) with a wireless device that supports the wireless application protocol (WAP). The Oracle RightNow Wireless (Wireless) interface provides access to the Support Home page where customers can search for answers and manage their questions.

Note Generic terms are used for features and functions that may vary depending on your brand of wireless device. Consult your manufacturer's user manual for specific operating instructions.

Options in Wireless

Customers can access your support site using their WAP device or any device with a WAP browser, such as a PDA. After entering the URL, customers can access a limited Support Home page for viewing and searching for answers and asking questions. The customer support site is accessed through the following URL:

http://<your_site>.custhelp.com/cgi-bin/<your_interface>.cfg/php/wap/enduser.php

If your site requires customers to log in with a user ID and password, the Wireless interface will also require them to log in. Customers can then access their customer account in addition to all public features through the Wireless interface.

Note If customers have forgotten their user ID or password, they can scroll down and click the Account Assistance link. From there, customers can retrieve their User ID or reset their password.

If **email address sharing** is enabled, multiple contacts can share the same email address when using Wireless. Refer to Email address sharing.

If your site does not require customers to log in, the Support Home page opens after entering the URL and pressing the Submit button. Customers can access all public features, but not restricted functions such as My Questions.

The functions on the Support Home page depend on the configuration of your customer support site, and can include the following options.

- **Find Answers**—To search the knowledge base. Refer to Finding answers.
- **Ask a Question**—To submit questions. Refer to Asking a question.
- **Login**—To log in to My Questions. Refer to My Questions.
- **Create a New Account**—To create an account. Refer to Creating an account.

❖ Finding answers

❖ Asking a question

❖ My Questions

❖ Creating an account

Finding answers

The Find Answers option allows customers to search for answers by product, category, or keyword. When customers search by product or category, they can view a list of question summaries related to the specific product or category. Then they can view a specific question description and answer. When searching by keyword, customers can type a word or phrase to search the knowledge base. Wireless then returns a list of question summaries containing the keyword or phrase, and customers can view question descriptions and answers.

Note Menu-type custom fields display on answers reports on the Wireless interface, but other custom field types do not. Refer to Custom Fields Data Types.

- **Searching for answers by product or category**—To search for answers by product or category, customers must first select Find Answers on the Support Home page and then select Product Hierarchy or Category Hierarchy. After selecting a product or category, a list of related answers displays. After scrolling through the list of answers and selecting one to display, customers can select Solution to display the answer. At this point, customers have the following three options.
  - ▷ Select Related Answers and press the Select button to view a list of **SmartAssistant** suggested answers.
  - ▷ Select Answers and press the Select button to return to the Find Answers page.
  - ▷ Select Submit Feedback and press the Select button to submit feedback about the answer.
- **Searching for answers by keyword**—Customers can also choose to search for an answer using a word or phrase. To search for answers by a keyword, customers first select Find Answers on the Support Home page and then select Keyword. After customers enter keywords, a list of answers displays. Customers can then select an answer to view.

Note When viewing answers, customers can rate answers and submit feedback on how an answer can be improved. From the answer details page, customers can select Submit Feedback to see the list of feedback options.

Asking a question

When customers cannot find an answer to their question in your knowledge base, they can submit their questions to your support staff. Customers select Ask a Question on the Support Home page and select a product and category to open the Ask a Question page. Customers then enter their question, enter their email address, and submit the question.

If there is not a contact record in the knowledge base that matches an email address entered by a customer, a record is added using only the email address. You must edit the contact record to add more information.

Note Wireless does not apply data validation to custom fields.

My Questions

My Questions contains your customers' personal account information where they can view and edit any questions they have submitted and update their profile information. To access My Questions, customers must log in with their user ID and password or create an account.

Note The information on the My Questions page can also be accessed through the Support History page on the **customer portal**. Refer to Editing the Support History page.

After logging in, customers open the Support Home page with My Questions options. From this page, the following options are available.

- View a question
- Update a question
- Access account profile information

To view a question, customers first select My Questions and then select the question to view. From the open question, they can select options to update the question, return to the questions list, or return to the Support Home page.

To update a question while viewing it, customers select Update Question and then enter additional information about the question in the text field. The I No Longer Need An Answer To This Question option can be cleared on this page.

To access account profile information, customers select Account Profile on the Support Home page. On the Edit My Profile page, customers can update first and last names and email addresses.

Creating an account

When customers visit your Support Home page for the first time, they can create an account to use when updating or tracking questions from their WAP device.

Important If a password is required on the Support Home page, customers cannot create a new account from their WAP device.

To create an account, customers select Create a New Account from the Support Home page and enter the following information.

- **User ID**—The customer-defined user ID that can be any combination of numbers and characters except spaces and quotation marks.
- **Password**—The customer-defined password for the account.
- **Email Address**—The customer's email address.
- **First Name**—The customer's first name.
- **Last Name**—The customer's last name.

47

Mobile Agent App

You can manage incidents, tasks, and contacts on the go using your Apple iPad or iPhone device, the Oracle Tap application, and your Oracle Service Cloud credentials. You can also view, create, assign, escalate, forward, and add to the threads of incidents from anywhere, and you can search and view organization records, staff accounts, and answers. Additionally, you can create and edit contacts, tasks, and notes.

Note Because Oracle often revises the Oracle Tap application to enhance its functionality, screens and procedures may not always match this documentation.

All figures showing mobile content were captured using an Apple iPad device.

Getting started

Once enabled and configured, you can view and manage your Oracle Service Cloud data on your device. You will need to complete the following tasks to start using the mobile agent app.

1 Modify configuration settings on the Service Console to enable the mobile agent app and configure its functionality. The mobility configuration settings are located at RightNow Common > Mobility. Refer to Customizing configuration settings.

2 Assign staff members permission on the Service Console to access the mobile agent app. Refer to Assigning mobile agent app permission.

3 Install the Oracle Tap application from the business category of the Apple App Store on your device.

4 Configure the Customer Service and Support cloud option on your mobile device by entering the following URL to your Oracle Service Cloud application:

https://<your virtual host>/cgi-bin/<your interface>.cfg/php/tap/v1

The Oracle Tap application uses the same field names you are familiar with from the Service Console, making it easy to learn the menu structure and locate information. By customizing message bases with the Message Bases editor on the Service Console, you can modify the descriptive text strings seen in the mobile application as well. The main menu of the mobile device displays staff, incidents, answers, contacts, organizations, or tasks based on the mobile **navigation set** for each profile defined on the Service Console. When you view the audit log on the Service Console, you will see activity from a mobile device labeled as such.

Assigning mobile agent app permission

Administrators can specify which profiles have permission to use the mobile agent app on the Service Console.

To assign mobile agent app permission in profiles

1. Click the Configuration button on the **navigation pane**.
2. Double-click Profiles under Staff Management. The report opens on the **content pane**.
3. Double-click the profile you want to edit. The Profile Editor opens.
4. Click the Permissions button on the **ribbon**. The Permissions page opens.
5. Select the Account Authentication check box in the Mobile Agent App section on the Administration tab.
6. Click the Save and Close button on the ribbon.

Editing mobile navigation sets

The mobile agent app provides a default mobile navigation set. The default navigation set gives you access to staff, incidents, answers, contacts, organizations, tasks, and custom objects. You can copy and customize a mobile navigation set to meet staff member needs. Refer to Modifying navigation sets.

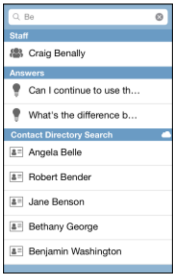
Searching for records

Located on the main menu, the search function makes it easy to locate a specific contact, organization, staff member, or incident.

To search for a record

1 Tap the Search field to type all or part of a search term. There is an implied wildcard when searching, so typing `be` in the Search field returns all records containing the letters `be`.

2 Swipe up to view the remainder of the results.



Viewing staff details

When you tap the Staff button on the main menu, a report of all staff members displays. Additionally, you can filter the report by name, group, phone number, or email address to quickly locate a staff account. Tap the staff member's name to view details, including manager, group, profile, account locked status, phone numbers, and email addresses. Tap the Directs, Incidents, or Tasks button on the Staff Summary screen to view the staff member's direct reports, assigned incidents, and assigned tasks.

Locking and unlocking staff accounts

Administrators can lock and unlock staff accounts using the mobile agent app. From a Staff/ Summary page, tap Edit, tap the Account Locked control, and tap Save.

Resetting staff passwords

Administrators can reset staff account passwords. From a Staff/Summary page, tap Actions, tap Reset Password, type the new password, type the new password again to confirm, and tap Save.

Editing incidents

Being able to view and edit key incident fields while on the go increases your effectiveness. You no longer have to wait to update incidents—you can do it immediately.

When you tap the Incidents button on the main menu, a report of your open incidents displays. Three standard reports, including Open Incidents, My Inbox (default), and Incidents Open Longer Than x Days, make finding an incident quick and easy.

Note By default, the Open Longer Than x Days filter is set to five days. To change the number of days, modify the MOBILITY_LONG_OPEN_INC_DAYS configuration setting on the Service Console.

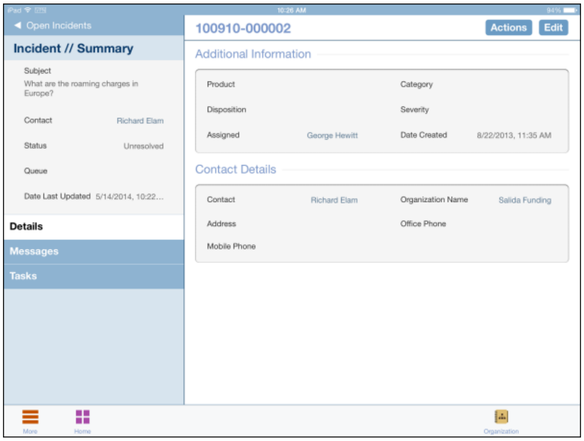
Additionally, you can filter the incidents by subject, contact's full name, status, reference number, date last updated, queue, agent's assigned account, severity, and product ID. The Incidents report displays the incident's subject, contact, status, its reference number, the date it was last updated, agent, severity, and attachments. Tap New Incident to create an incident. In addition, incidents can be created from the staff, contact, and organization workspaces. Tap the incident to display details including reference number, subject, contact, status, queue, date last updated, product, product, category, disposition, severity, assigned agent, date created, organization, address, phone numbers, and attachments. Tap the Messages or Tasks button on the Incident Summary screen to view the messages and tasks associated with that incident. Tap Actions to create a task or message.

Note By default, the application retrieves incidents updated during the past thirty days. To change the number of days, modify the MOBILITY_INCIDENTS_-DAYS_LIMIT configuration setting on the Service Console.

Mobile incident workspace

The mobile agent app provides a standard workspace for working with incidents. The workspace defines which fields are available, which buttons are displayed, and how the information is organized on the content pane. The following figure is an example of the standard incident workspace for the mobile agent app.

Note The mobile incident workspace has line display limitations which may result in truncated field names or information.



Your organization may use the standard mobile incident workspace, or your administrator may have created one or more customized workspaces. Your **profile** defines the workspace you see when you work with incidents on your mobile device, whether it is the standard workspace or a customized workspace. If you are using a customized workspace, keep in mind that the workspace your profile uses may display a different combination of fields, or it may display them in a different location. Refer to Custom workspaces.

Note: Custom objects and custom fields may be displayed on custom mobile workspaces. Refer to Custom Objects and Custom Fields.

Editing key incident fields

The fields you see when viewing or editing an incident are defined for the incident mobile workspace. Key fields may be edited.

To edit key incident fields

1. From an incidents report, tap the incident.
2. Tap Edit.

3 Review and edit the following field information.

Table 354: Incident Fields Description

Field	Description
Reference #	The incident's reference number is a read-only field with a value assigned by Oracle Service Cloud.
Subject	This field contains the subject of the incident.
Contact	This field contains the name of the contact associated with the incident.
Status	Tap this pop-over menu and select an incident status.
Queue	Tap this pop-over menu and select a queue into which to move the incident.
Date Last Updated	This read-only field contains the date and time the incident was last updated.
Product	Tap this pop-over menu and select the product associated in the incident. **Note:** Use the Search feature at the top of the pop-over to locate the product quickly. Wildcards are implied, so typing b in the Search field returns all items containing the letters b.
Disposition	Tap this pop-over menu and select a disposition that indicates the resolution of the incident. **Note:** Use the Search feature at the top of the pop-over to locate a disposition quickly. Wildcards are implied, so typing b in the Search field returns all items containing the letters b.
Assigned	Tap this pop-over menu and select a staff member to assign the incident to. **Note:** Use the Search feature at the top of the pop-over to locate staff members quickly. Wildcards are implied, so typing b in the Search field returns all items containing the letters b.
Category	Tap this pop-over menu and select the category for the incident. **Note:** Use the Search feature at the top of the pop-over to locate categories quickly. Wildcards are implied, so typing b in the Search field returns all items containing the letters b.

Table 354: Incident Fields Description (Continued)

Field	Description
Severity	Tap this pop-over menu to select a severity level for the incident. The severity level serves as an importance indicator for any agents that work on the incident. The highest severity incidents are usually solved first.
Date Created	This read-only field contains the date and time the incident was created.
Address	This read-only field contains the address of the contact associated with the incident.
Mobile Phone	This read-only field contains the mobile phone number of the contact associated with the incident.
Organization Name	This read-only field contains the name of the organization for the contact associated with the incident.
Office Phone	This read-only field contains the office phone number of the contact associated with the incident.
Attachments	Tap the plus sign to add a file or tap the red X to delete an attachment.

4 Tap the Save button to commit changes or tap the Cancel button to discard changes.

To create an incident from a staff, contact, or organization summary

1 Tap Actions.

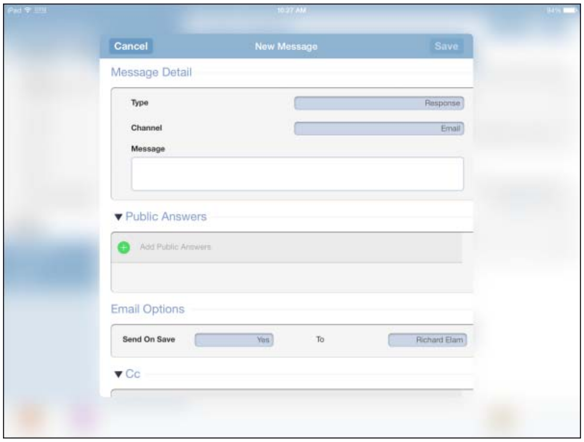
2 Tap New Incident.

3 Enter incident field information.

4 Tap the Save button to save the incident or tap the Cancel button to discard the incident.

Adding messages

The Messages button displays the incident thread communication. When you tap the message or tap Actions and New Message, the message pop-over displays. The following figure shows the message pop-over.



The following table describes the buttons and fields that appear on the Message pop-over.

Table 355: Message Pop-over Description

Button/Field	Description
Cancel	Tap this button to cancel the message without saving changes.
Save	Tap this button to save the message. This button is available only when creating a message.
Type	Tap this drop-down menu and select one of the following options to add a message to an incident.
Private Note	Select this option to type the text that you want to be viewed only by other staff members. Customers cannot view this information.
Response	Select this option to type your response to the customer's question. This is the default option when you create a message.
Customer Entry	Select this option to enter information for the customer. For example, select Customer Entry when the customer's question occurs during a phone call.
Channel	Tap this drop-down menu and select one of the following options to identify a channel for a response.
No Channel	Select this option if no channel is specified. This is the default option when you create a message.

Table 355: Message Pop-over Description (Continued)

Button/Field	Description
CSS Web	Select this option to specify the channel as a web communication.
Email	Select this option to specify the channel as an email communication.
Fax	Select this option to specify the channel as a fax communication.
Phone	Select this option to specify the channel as a phone communication.
Post	Select this option to specify the channel as a social communication.
Message	Type a response.
Public Answers	Tap the plus sign to add a public answer to the message.
Send On Save	Tap this drop-down menu to select yes or no to automatically send your response to the primary contact when you save the message. **Note:** This menu is available only if the Send Response permission is selected for your profile.
To	This read-only field contains the name of the primary contact associated with the incident.
Cc	Tap this button to open the Add Cc pop-over, tap the name of the recipient. **Note:** All recipients are able to see the email addresses in the Cc field.
Bcc	Tap this button to open the Add Bcc pop-over, tap the name of the recipient. **Note:** No recipients are able to see the email addresses in the Bcc field.

To add a message to an incident

1 From an incidents report, tap the incident.

2 Tap Actions.

3 Tap New Message.

4 To identify a type for a message, tap the Type drop-down menu and select one of the following options: Private Note, Response, or Customer Entry. (Response is the default.)

5 To identify a channel for a response, tap the Channel drop-down menu and select one of the following options: No Channel, CSS Web, Email, Fax, Phone, or Post. (No Channel is the default.)

6 Tap the message panel to display the keypad and type your message.

Note The message pop-over supports an inline spell checker that automatically identifies misspelled words as you type.

7 Tap the Save button to save the message or tap the Cancel button to discard the message.

Adding time billed

Once added to a custom incident workspace, the time billed button displays on the incident summary. When you tap time billed or tap Actions and New Time Billed, the time billed pop-over displays. The following figure shows the time billed pop-over.

The following table describes the buttons and fields that appear on the Time Billed pop-over.

Table 356: Time Billed Window Description

Field	Description
Cancel	Tap this button to cancel the time billed without saving changes.
Save	Tap this button to save the time billed.

Table 356: Time Billed Window Description (Continued)

Field	Description
Date	Tap the drop-down menu to open the select a date. The default is today's date.
Billed By	Tap this drop-down menu and select a staff member.
Billed Minutes	Enter the time billed value in minutes.
Billable Task	The default billable task is Miscellaneous, but your administrator may have added other billable tasks for you to select. Tap this drop-down menu and select a task.
Notes	Type a note about the time billed for the incident.

Adding SmartSense emotive rating

SmartSense can help you determine the attitude of customers and staff members in incident correspondence. You can use SmartSense to determine which customers need immediate attention and when to notify supervisors or other staff members about specific incidents or situations.

Two SmartSense ratings can be placed on a custom mobile incident workspace: one for the customer and one for the staff member editing the incident. SmartSense scans the text and rates the words and phrases in all customer entries for the customer rating and all responses for the staff member rating. Refer to SmartSense Emotive Rating.

Editing contacts

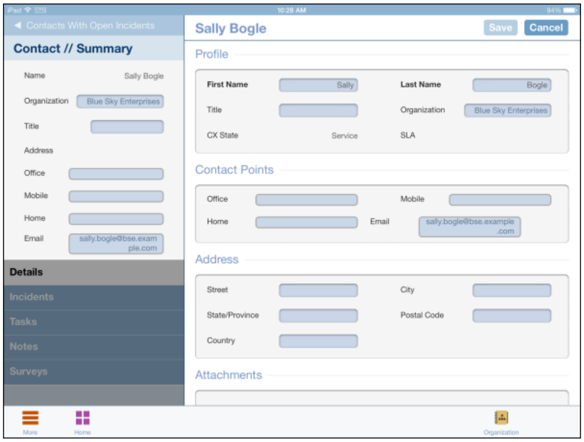
When you tap the Contacts button on the main menu, a report of all contacts with open incidents displays. Additionally, you can filter the list by name, organization, title, phone numbers, or email address to quickly locate a contact. Tap the contact's name to view details, including title, organization, CX State, SLA, phone numbers, email addresses, and street address. Tap the Incidents, Tasks, Notes, or Surveys button on the Contact Summary screen to view the associated incidents, tasks, notes, and surveys.

Note By default, the Incidents filter associated with a contact is set to ninety days. To change the number of days, modify the MOBILITY_INCIDENTS_CONTACTS_ORGS_DAYS_LIMIT configuration setting on the Service Console.

Mobile contact workspace

The mobile agent app provides a standard workspace for working with contacts. The workspace defines which fields are available, which buttons are displayed, and how the information is organized on the content pane. The following figure is an example of the standard contact workspace for the mobile agent app.

Note The mobile contact workspace has line display limitations which may result in truncated field names or information.



Your organization may use the standard mobile contact workspace, or your administrator may have created one or more customized workspaces. Your **profile** defines the workspace you see when you work with contacts on your mobile device, whether it is the standard workspace or a customized workspace. If you are using a customized workspace, keep in mind that the workspace your profile uses may display a different combination of fields, or it may display them in a different location. Refer to Custom workspaces.

Note Currently, not all custom objects are supported on the contact mobile workspace.

To edit key contact fields

1 From a contacts report, tap the contact.

2 Tap Edit.

3 Enter the following field information.

Table 357: Contact Fields Description

Field	Description
First Name	Type the contact's first name in this field.
Last Name	Type the contact's last name in this field.
Title	Type the contact's title in this field.
Organization	Tap this field to open the Organization search pop-over and search for an organization to associate with the contact.
CX State	This read-only field classifies how the contact was added, whether through Oracle RightNow Cloud Service (Service) when working on an incident, Oracle RightNow Outreach Cloud Service (Outreach) when adding contacts, or Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking) when working on an opportunity, and what areas of Oracle Service Cloud the contact has since had activity in.
SLA	This read-only field displays the service level agreement. **Note:** This field applies only to Service and only to contacts that do not have an organization association. If the contact is associated with an organization, you must apply SLA instances to the organization, not the contact.
Office Phone	Type the contact's office phone number in this field.
Mobile Phone	Type the contact's mobile phone number in this field.
Home Phone	Type the contact's home phone number in this field.
Email	Type the contact's email address in this field. **Note:** If you enter an email address that is already in the knowledge base, you will receive an error message and not be able to save the contact. If email address sharing is enabled, meaning multiple contacts can share the same email address, an icon with an exclamation point displays when you type an email address that is associated with a different contact in the system. If this icon appears, you can save the contact without changing the contact's email address. Email address sharing validation begins when the Email address field receives focus and ends when the field loses focus. Refer to Email address sharing.

Table 357: Contact Fields Description (Continued)

Field	Description
Address	Type information in the Street, City, and Postal Code fields, and make selections on the State and Country fields' pop-over menus.
Attachments	Tap the plus sign to add a file or tap the red X to delete an attachment.

4 Tap the Save button to save the contact or tap the Cancel button to discard the contact.

To add a contact

1 From the contact report, tap New Contact.

or

From the contact report, tap a contact and tap Actions.

2 Tap New Contact.

3 Enter contact field information.

4 Tap the Save button to save the contact or tap the Cancel button to discard the contact.

Viewing organizations

When you tap the Organizations button on the main menu, a report of all organizations with open incidents displays. Additionally, you can filter the list by name, industry, or parent organization to quickly locate an organization. Tap the organization's name to view details, including billing address, parent organization, CX state, industry, SLA, and attachments. Tap the Contacts, Incidents, Tasks, or Notes button on the Organization Summary screen to view the associated contacts, incidents, tasks, and notes. Tap Edit on the Organization Summary screen to add or remove attachments.

Note By default, the Incidents filter associated with an organization is set to ninety days. To change the number of days, modify the MOBILITY_INCIDENTS_CONTACTS_ORGS_DAYS_LIMIT configuration setting on the Service Console.

Editing tasks

When you tap the Tasks button on the main menu, a report of your incomplete tasks displays. A second standard report, All Incomplete Tasks, provides quick access to incomplete tasks. Additionally, you can filter the list by name, due date, status, assigned, organization, incident, or contact to quickly locate a task. Tap the task to view details, including assigned staff member, status, priority, due date, contact, and associated incident. Tap the Notes button on the Task Summary screen to view the associated notes. Tap New to create a task. In addition, tasks can be created from the staff, incident, contact, and organization workspaces.

Note By default, the Tasks filter is set to thirty days. To change the number of days, modify the MOBILITY_TASKS_DAYS_LIMIT configuration setting on the Service Console.

To edit task fields

1 From a tasks report, tap the task.

2 Tap Edit.

3 Review and edit the following field information.

Table 358: Task Fields Description

Field	Description
Name	Type the name of the task.
Assigned	Tap the pop-over menu to assign the task to a staff member.
Due Date	Tap this field to open the calendar and select the date the task is due. The default is seven days from today.
Status	Tap this pop-over menu and select a status. The status options include Not Started, In Progress, Completed, Waiting, and Deferred. **Note:** To set the status to completed, tap Actions. Tap Mark As Complete to set the Status to Completed and the Percentage Complete to 100% in a single step.

Table 358: Task Fields Description (Continued)

Field	Description
Percentage Complete	Tap this pop-over menu and use the slider to select the percentage of the task that is complete. **Note:** To set the status to completed, tap Actions. Tap Mark As Complete to set the Status to Completed and the Percentage Complete to 100% in a single step.
Notes	Type any notes about the task in this field.
Priority	Tap this pop-over menu and select Low, Normal, or High as the task's priority.
Planned Completion	Tap this field to open the calendar and select the task's planned completion date.
Date Complete	Tap this field to open the calendar and select a completion date for the task.
Task Type	Tap this pop-over menu to select a task type.
Contact	Tap this pop-over menu to select the contact associated with the task.
Incident	Tap this pop-over menu to select the incident associated with the task.
Organization	Tap this pop-over menu to select the organization associated with the task.
Attachments	Tap the plus sign to add a file or tap the red X to delete an attachment.

To add a task from a staff, incident, contact, or organization summary

1 Tap Actions.

2 Tap New Task.

3 Enter task field information.

4 Tap the Save button to save the task or tap the Cancel button to discard the task.

Adding notes

Keeping track of comments, reminders, and details concerning customers and projects ensures all the information is easily accessible to you and other staff members. Notes are not visible to customers.

To add a note from a contact, organization, or task

1. Tap Actions.
2. Tap Add Note.
3. To identify a channel for a response, tap the Channel drop-down menu and select one of the following options: No Channel, CSS Web, Email, Fax, Phone, or Post. (No Channel is the default.)
4. Tap the note panel to display the keypad and type your message.

Note The note pop-over supports an inline spell checker that automatically identifies misspelled words as you type.

5. Tap the Save button to save the note or tap the Cancel button to discard the note.

Viewing answers

When you tap the Answers button on the main menu, a report of all public answers displays. Three standard reports, including All Answers, Public Answers (default), and Internal Answers, make finding an answer quick and easy. Additionally, you can filter the list by summary, status, access level, language, keywords, category, or product to quickly locate an answer. Tap the question to view details, including question, answer, answer notes, answer ID, status access level, language, agent, product, category, date created, and date last updated.

Forwarding incidents

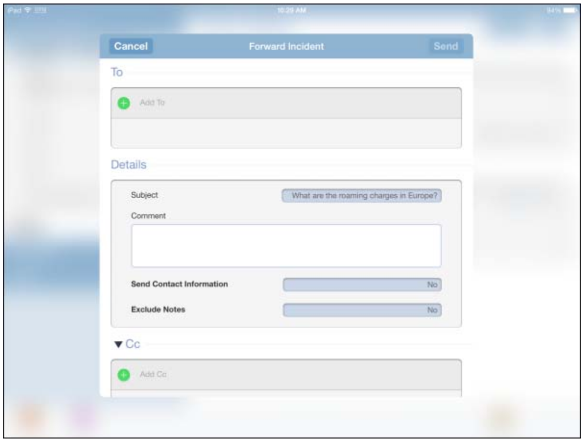
There may be times when you need to forward an incident to a staff member. For example, you might need information from another staff member before you can reply to a customer's incident. When you forward an incident, you can forward any files that are attached to the incident, send contact information, and add comments.

Note If you are adding an incident instead of editing an existing one, you must first save the incident before you can forward it.

To forward an incident

1 Tap Actions.

2 Tap Forward Incident.



3 Enter the following field information.

Table 359: Forward Fields Description

Field/Button	Description
Add To	Tap this button to open the Add To pop-over and tap the name of the recipient.

Table 359: Forward Fields Description (Continued)

Field/Button	Description
Subject	The subject for the incident appears in this field.
Send Contact Information	Select this check box to send the primary contact information with the record. The information that is sent includes the contact's email address, first and last names, contact type, title, any phone numbers that have been entered, and any custom field information.
Exclude Notes	Select this check box to exclude any notes in the incident thread from being forwarded with the incident.
Cc	Tap this button to open the Add Cc pop-over and tap the name of the recipient. **Note:** All recipients are able to see the email addresses in the Cc field.
Bcc	Tap this button to open the Add Bcc pop-over and tap the name of the recipient. **Note:** No recipients are able to see the email addresses in the Bcc field.
Comment	Type any comments you want to forward with the record in this field. **Note:** Text entered in the Comment field will display as the body of the email that is sent to recipients.

4 Click the Send button to forward the incident.

Editing settings

When you tap the Settings button on the main menu, the Settings pop-over displays. You can specify if login credentials are saved, how long the app will wait for a server response, if the data cache is cleared when the application is closed or restarted, and which server is used. Additionally, you can view the version and the license agreements.

Table 360: Settings Pop-over Description

Button/Field	Description
Done	Tap this button to save changes.
Device	
Remember Login Details	Tap this button to enable or disable the storing of login credentials.
Network Request Timeout	Displays the designated time the app will wait for a response from the server. You can edit this value.
Flush Data Cache	Tap this button to enable or disable the clearing of the data cache when the app is closed or restarted. Note: Selecting On will flush the data cache and logout the agent immediately.
Appearance	
Theme	Select a theme for your display.
Show Presentation Taps	Tap this button to enable or disable showing presentation taps.
About	
Version	Displays the version of Oracle Tap being used.
EULA	Displays the End User License Agreement terms and conditions.
Third Party Attributions	Displays the third-party attributions, including copyright information, licensing, and terms and conditions.

You can also specify the time periods used to initiate an automatic logout and to maintain offline authentication of Oracle Service Cloud.

- By default, the number of seconds the agent can leave the application idle before being logged out of Oracle Service Cloud is 300 (5 minutes). To change the number of seconds, modify the MOBILITY_IDLE_TIMEOUT configuration setting on the Service Console.
- By default, the number of seconds the application will store the agent's credentials for offline authentication of Oracle Service Cloud is 28800 (8 hours). To change the number of seconds, modify the MOBILITY_SESSION_TIMEOUT configuration setting on the Service Console.

Customer Portal

The following sections are intended for administrators, designers, and developers using Oracle RightNow Customer Portal Cloud Service. They contain information and procedures for implementing the customer portal.

48

Getting Started with the Customer Portal

The Oracle RightNow Customer Portal Cloud Service (Customer Portal) is your customer support interface. Your customers can search for information, review the contents of your **knowledge base**, ask questions of your support staff, request a **chat** session, ask your **community** for answers to their questions, and manage their account information. Because the Customer Portal is integrated with your Oracle Service Cloud application, customers have access to your knowledge base for immediate self-service. Likewise, any information they enter by submitting an incident, updating account information, or providing feedback on an answer is immediately available to your support staff on the Oracle Service Cloud **administration interface**.

You'll configure your customer portal by editing the **template**, **pages**, and **widgets** that make up the customer interface. Additional configuration work occurs on the administration interface, so it's as important to have an understanding about Oracle Service Cloud as it is to understand the structure of the Customer Portal and how to work with the code it uses.

Here are a few basic points to keep in mind as you begin working with your customer portal.

- The reference implementation is the set of default pages and files that make up the Customer Portal as it exists before you configure and customize it for your specific needs. There are three default reference implementations: one for the standard pages typically displayed on desktop browsers, one for display on mobile devices, and a basic page set for devices with limited or no JavaScript capability. You'll edit these default files so they meet your organization's support goals and maintain the appearance of the rest of your organization's website. After working with the default pages, you should understand the concepts well enough to create custom pages for your site.
- You'll use a text editor such as TextPad, NotePad, WordPad, or Adobe Dreamweaver to build and modify your customer portal pages. You'll also need a WebDAV client such as Cyberduck.

- You use **configuration settings** on the Oracle Service Cloud administration interface to set up certain functionality for your customer portal, such as SmartAssistant and search options. But you'll use the Customer Portal Administration site, WebDAV, and widgets to configure the actual customer portal pages.

Note This section contains basic information about your customer portal, but you can find more technical information for developers, including sample code, API references, and the framework overview, in the Developer Overview.

Opening your customer portal

When your customers go to your support site, they'll see the customer portal pages you've created and modified. You can view changes as you're working on them or you can open the page set that your customers see on your production site.

Open your customer portal by typing the URL in your web browser, or select it from the **file menu** on the **Service Console**.

Note When you open your customer portal, you might be looking at the **development** pages you're working on but haven't yet **staged** and **promoted**. Or you may be viewing the same **production pages** your customers see. If there's a page header that says Customer Portal Development Area, you're looking at your development pages. The set of pages that opens depends on which area you've selected to view on the Customer Portal Administration site: production, staging, development, or the reference implementation. To view development pages, go to `https://<your_site>/ci/admin` and select View Development Area on the dashboard.

To open your customer portal through a URL

Launch your web browser and type the following URL.

```
https://<your_site>/app
```

The Support Home page opens.

To open your customer portal from the Service Console

1. Log in to Oracle Service Cloud.
2. Click File.

3 Select Links > [your_site] > End-user. The Support Home page opens.

Understanding the Customer Portal file structure

The **templates**, **pages**, **widgets**, and other assets used to create your website are available through WebDAV.

WebDAV for the Customer Portal

The customer portal uses WebDAV to help you manage your website files. WebDAV offers a familiar file structure, easy uploading and downloading of multiple files, and file security through login access. After you set up a WebDAV connection to upload and download files, you can use any text editor you want to create and edit files for your customer portal, or you can use Adobe Dreamweaver, which uses its own WebDAV protocol for site management and configuration.

Oracle recommends using Cyberduck for WebDAV access to Customer Portal files. Download Cyberduck.

Important You must enable MOD_CP_DEVELOPMENT_ENABLED before you can make changes to your development site. If you do not enable this setting, you cannot make changes to your customer portal and your customers will see the default reference implementation with no customization. Refer to Enabling the development area.

Note If you use special characters in any PHP file, you must use a text editor that lets you save the file with UTF-8 encoding without the leading Byte Order Mark (BOM) character.

Viewing files from a URL

To view your customer portal files from the **Customer Portal Administration site**, use the following procedure.

To view files from a URL

1 In a web browser, type `http://<your_site>/dav.` The Index Of window opens.

Note If you have not already logged on to the Customer Portal Administration site, you'll need to enter your Oracle Service Cloud user name and password.

2 Click the *cp* link to display the folders.

3 Click the folder you want to display files for and continue drilling down through subfolders to display the file you want. When you click an individual file name, you are asked if you want to open or save the file.

Important Although you can edit files directly on the server, we recommend downloading files to your local workstation, making your changes locally, and then uploading them back to the server.

Page sets

The Customer Portal contains four sets of pages, each of which can be viewed from the Customer Portal Administration site.

- **Development files**—These are the files you work with when you want to make changes to your customer portal. They cannot be seen by your customers until you stage and promote them. The page and template files are in the */cp/customer/development/views* folder, and your custom widgets are in */cp/customer/development/widgets/custom*.
- **Staging files**—After editing your development pages, you can stage them, which means they are compiled and optimized to look and perform as they will on the production site. These files, located in */cp/generated/staging*, are not editable, nor are they visible to your customers.
- **Production files**—The production files, located in */cp/generated/production*, have been promoted from the staging site and are visible to your customers.
- **Reference implementation files**—These are the default, read-only files that make up the original customer portal reference implementation before you modify them. They are located in */cp/core/framework/views* and */cp/core/widgets*. If you've made changes to one of your development files that you don't want to keep, you can revert to the original file by copying the original from its reference implementation folder and pasting it to the appropriate subfolder in */cp/customer/development*, effectively overwriting your changes.

Review the folder structure here.

Folder structure

The Customer Portal incorporates an intuitive, easy-to-navigate file structure that lets you clearly identify the files you can edit. The main directory is called *cp*, and it includes the following main folders.

Note Some procedures in this documentation include in using a root */euf/* folder, which is correct even though you cannot see the folder in your WebDAV file structure.

- The core folder—All the non-editable Customer Portal files.
- The customer folder—The Customer Portal files you can edit, including all pages and custom widget files used on your development site, as well as assets (CSS, images, and themes) and error pages.
- The generated folder—All staged files and all files you have promoted to your production site.
- The logs folder— Logs for each staging, promoting, and rollback operation.

The core folder

The *core* folder contains all of the underlying Customer Portal code. You cannot add or remove files in this folder, nor can you edit any of the folder names or files.

- **assets**—The *core/assets* folder contains all web assets used by the Customer Portal Administration site, organized in the following subfolders: *debug-js, default, ejs, images,* and *thirdParty*. The *default* subfolder contains the CSS, images, and themes for the pages, templates, and widgets in the reference implementation. You can always use these files to view and revert to the reference implementation.
- **framework**—This folder is the core of the Customer Portal code base and contains all view files for the standard pages, templates, and view partials. It also contains files and information about version changes, controllers, libraries, models, and utilities.
- **widgets**—The *widgets* folder contains the files for all standard widgets, including controllers, views, CSS, images, logic, and YAML information files. You can use these files to the view the code for the standard widgets.

The customer folder

The *customer* folder contains all the Customer Portal files you can modify, organized in the following subfolder structure.

- **assets**—This folder contains the assets you can add, edit, and delete, including the subfolders *css, images,* and *themes.* Assets include all files for your customer portal that are not **pages**, **templates**, or **widgets,** including CSS, JavaScript, images, video, and other rich web media. You can add, remove, edit, and execute files and add subfolders to the *assets* folder. In addition to the *css* and *images* subfolders, the *assets* folder includes a *feedback* folder and the *default* subfolder that contains default versions of the asset files provided in the **reference implementation**. If you make changes to any of the assets and then decide to revert to the standard assets, you can copy them from the *default* subfolder.

With the exception of the *themes* subfolder, all other files in the *assets* folder are shared by development and production files. Even if you don't stage and promote your development pages, changes you make may affect the look and function of your production pages. For example, if production pages call a file in the *assets* folder and you modify that file in the course of your development work, the change will be immediately visible to your customers.

Note Although all other files in the */cp/customer/assets/* folder are shared between the production and development areas, files in the *themes* subfolder of */cp/customer/assets/* are used strictly by the development files. When you **stage** the development pages, these files are copied to a time-stamped folder in the staging directory and called from that folder. The themes you develop are kept in this isolated sandbox that cannot be accessed by production files. The themes are applied to your production site only when you **promote** the staged files into production.

- **development**—The *development* folder is your working folder, containing all templates and pages to create and update your customer portal. It contains the following subfolders.
  - ▷ **config**—Contains files to define model extensions, hooks that extend functionality, and mappings to convert page names from previous frameworks to the current one. You can edit these files but you cannot delete them. The file *hooks.php* lets you define a PHP array of functions that is executed before and after the API calls of your choice. The file *mapping.php* redirects page requests and defines parameter mapping when you are migrating from Customer Portal Framework Version 1 (previously referred to as the Classic or November 07 end-user interface).

- ▷ **controllers**—Contains a custom controller file, *AjaxCustom.php,* which provides sample code that you can edit. You cannot delete or rename this file. However, you may add other controller files to the *controllers* folder.
- ▷ **errors**—Contains two PHP scripts used to display customized error pages: *error_-general.php* and *error_php.php.* Besides customizing the appearance of these pages, you can also use information provided by the customer portal (which includes severity, message, file name, and line number of the error) to provide more specific information to customers than the standard 404 error page delivered by the web server. You can edit these files but you cannot add any files to this folder.
- ▷ **helpers**—Contains the *sample_helper.php* file and can be used for storing PHP utility function files. Refer to Creating custom helpers.
- ▷ **javascript**—Contains a single javascript file, *autoload.js,* which you can edit, although you cannot delete or rename this file. The file as it is configured in the reference implementation contains no code. When you add content to it, such as common functions and event declarations, it will be automatically loaded on every page. This lets you make common changes without having to manually load them on individual pages.
- ▷ **libraries**—Contains the *Sample.php* file and can be used for storing singleton PHP class files. Refer to Creating custom libraries
- ▷ **models**—Contains a *custom* subfolder, which contains two sample model files, *ExtendedSample.php* and *Sample.php,* and any models you create.
- ▷ **views**—Includes all display files that do not contain logic. The *admin* pages are used to display answer previews on the **Service Console**. The *pages* folder contains all customer portal pages. The *templates* folder includes *standard.php* used for the reference implementation pages, *mobile.php* for the mobile page set, *basic.php* for the basic page set, and *agent.php* for previewing a guide on the Oracle Service Cloud administration interface. The *Partials* folder contains custom view partials, files you can create to minimize code duplication. Refer to View partials.
- ▷ **widgets**—Contains a folder for custom widgets.

- **error**—Contains a *splash.html* page and the following static HTML pages that you can customize to provide additional information when the following error types are returned. These pages can contain only HTML elements and cannot contain any customer portal tags, such as widgets or fields. The default message is "There has been an error with your request."
  - ▷ *error404.html*—Displayed when an **HTTP 404 Not found** error code is returned.
  - ▷ *error413.html*—Displayed when an **HTTP 413 Request entity too large** error code is returned.

- *error500.html*—Displayed when an **HTTP 500 Internal server** error code is returned.
- *splash.html*—Displayed when your site is being upgraded. For information, refer to Splash page for maintenance mode.

The generated folder

The *generated* folder contains two subfolders: *production* and *staging*, which mirror the structure of the */cp/customer/development* subfolders. The *staging* subfolder contains the development files that you have staged through the Service Console or the Customer Portal Administration site. Your customers cannot see the files in the *staging* folder. The *production* subfolder contains the staged files that have been promoted into production. Those files are visible to your customers.

Both subfolders also have a *backup* subfolder that contains the original source code from the previous staging and promoting activities. The *staging* folder includes a *themes* subfolder that is copied from your development site when you stage the development pages. These folders allow the rollback function.

None of the files in the *generated* folder can be edited or deleted. Nor can you add any files.

The logs folder

The *logs* folder contains logs for every stage, promote, and rollback operation performed on your site as well as a log that documents changes made to Customer Portal files so you can see when and by whom the files were modified.

General file information

This section contains general information about working with your customer portal files.

Editing customer portal files

After you've configured Customer Portal functionality on the administration interface (explained in these instructions), most of the remaining procedures in this guide involve editing the files that make up your customer portal. These procedures generally begin by telling you to open the file and end with instructions to save the edited file.

That's a bit of oversimplification, so let's talk about what we're assuming in these cases. First, unless otherwise noted, we're always assuming that you're working with the **templates** and **pages** in your *development* folder. Once your development site functions as you want it to, you can **stage** the pages from the **administration interface** or the **Customer Portal Administration site**. The resulting staging environment represents what your customers will see when you **promote** the staged pages into production. But you can modify files all you want on your development site without worrying that your customers will see something you're not ready to make public.

Important You must enable MOD_CP_DEVELOPMENT_ENABLED before you can make changes to your development site, which means it must be enabled in order to make changes to the customer portal. If you do not enable this setting, your customer portal will be the out-of-the-box reference implementation, and it cannot be edited. Refer to Enabling the development area.

Before you can work with a development file, the recommended practice is that you download it from the server so you can edit it. Once you've downloaded the file to your workstation, you can make your edits in a text editor and save the file. After that, you'll need to upload it again to see your changes in a web browser. The download and upload processes are done through a WebDAV connection.

So whenever you follow a procedure for editing a file, remember that the procedure is really just one part—step 2—of the following overview for all file-editing procedures.

1 First, download the file to your workstation, where you can open it.

2 Edit the file as described in the procedure and save it.

3 Upload the file to the server.

4 View and verify your changes on your development site.

Query string parameters

The Customer Portal does not use query string parameters within URLs. When question marks are encountered in a URL, the content in the query string is ignored and the page is rendered as if the content is not in the URL. For example, if you use the following URL expecting to display only those answers associated with the product that has an ID of 55, what actually happens is that the Answers page will load normally without any search filters.

```
http://<your_site>/app/answers/list?p=55
```

To achieve your original intention, use the following code instead.

```
http://<your_site>/app/answers/list/p/55
```

Although they are not used in the URLs, you can still access the values stored in the query string. The PHP superglobal $_GET array is populated with any query string key/value pairs that are found. For example, in the previous URL, the $_GET array would contain `['p'] => 55`.

File naming conventions

When you create custom files for your customer portal, you can use upper and lowercase alphanumeric characters and the underscore symbol to name them. Paths are case insensitive, so a mix of upper and lowercase characters is allowed but ignored. Valid file names begin with a letter or an underscore and can be followed by alphanumeric or underscore characters.

Note The native WebDAV client in an English version of Windows does not handle file names that contain multi-byte characters.

CSS and JavaScript files are namespaced with an "rn_" prefix to avoid naming conflicts with any custom files you might create.

Framework versioning

Let's start by distinguishing between **migration** and **upgrading.** Migration is the process of moving from one version of the Customer Portal framework to a newer one. Upgrading is the process of moving from one release of Oracle Service Cloud to a newer release, such as upgrading from November 2012 to February 2015.

Because Framework Version 3.2 offers independence between the framework of your customer portal and your version of the Oracle Service Cloud application, your customer portal maintains all of your prior customization efforts even when you upgrade to newer versions of Oracle Service Cloud. The Customer Portal "floats" on top of the application, which means you can take advantage of new Oracle Service Cloud product releases without being required to adopt customer portal changes you may not be ready to undertake.

The versioning system of the Customer Portal framework lets you upgrade to newer versions of Oracle Service Cloud while leaving your customer portal site untouched because the Customer Portal version is independent of the Oracle Service Cloud release version. This gives you control to migrate to a new Customer Portal framework when it's convenient for your schedule rather than being forced to migrate because of your organization's upgrade to Oracle Service Cloud.

Note Widget versioning is handled separately from framework versioning and is discussed in Widget version management.

The Customer Portal uses three levels of versions: major, minor, and nano. Each version level implies a varying degree of change to the framework. The version numbering scheme follows a pattern such as 3.1.4.

- **major**—A major version change usually involves a fundamental change in a core component of the Customer Portal and will require work on your part to migrate from one version to the next. The current version, Framework Version 3.2, for example, is a major change to the Framework Version 2, previously known as the November 09 framework. (Framework Version 1 is also known as the Classic or November 07 end-user interface.) Major version changes are indicated by a a change to the first digit of the version number (for example, the "3" in 3.1.4). You have complete freedom to decide whether you want to migrate to the new major version or remain on your current version.
- **minor**—A minor change is not backward compatible. These changes may or may not affect you, depending on the area and extent of the change and how it impacts your customizations. Still, you have the choice of opting in to the change rather than risking the possibility of breaking any of your custom code through an automatic update. Minor version changes are indicated by the second digit in the version number, for example, the "1" in 3.1.4.
- **nano**—Nano changes are fully backward compatible so theses changes will be applied automatically to your customer portal code with no impact to your site. This means you will always have the most current nano version of the framework being used by your customer portal, giving you the benefit of enhancements and bug fixes without having to do any work to consume them. Nano changes are indicated by the third digit of the version number, that is, the "4" in 3.1.4.

If your installation of Oracle Service Cloud is a new installation, it includes Customer Portal Framework Version 3.2. If you're upgrading from an earlier version of Oracle Service Cloud, Framework Version 3.2 will be available for you to migrate to whenever you're ready, but your customer portal site will continue to use whatever framework version you're currently using.

Important Although widget versions are not tied to framework versions (there is not a specific set of widgets that must be used with a specific framework), widgets do have framework dependencies. So it's possible that some of the widgets you used when your customer portal was on Framework Version 2 will not work with Framework Version 3.2. If any of your existing widgets are not compatible with the new framework version you are migrating to, you will see a warning message on the Customer Portal Administration site during the migration process.

Versioning in the development, staging, and production areas

The Customer Portal Administration site clearly defines the version of framework and widgets being used by the development, staging, and production modes of your customer portal. You'll be able to identify out-of-date versions as well as understand the differences between that version and the current version.

Each area of your customer portal can use a different version of framework. For example, your development site probably contains the newest framework, which you customize and test before staging it. Then once you've confirmed that your staged pages are correct, you can promote them to your production site where they will have public visibility.

Dependency checks are run when you select a version update to ensure that your Oracle Service Cloud application supports the selected customer portal framework. Dependency checks also let you know if any of your current widgets must be migrated in order to function on the newer framework.

You will see only the version being used for your development, staging, and production areas if your installation of the Customer Portal is new. If you have migrated from a previous framework, that version (Framework Version 1 or 2) will also be displayed.

Framework versions

The Recent Changes tab on the Framework Versions page of the Customer Portal Administration site will provide details of the changes from one framework version to another to help you decide whether you want to use the newer version. Refer to Framework tab for information about the Framework Versions page.

Overview of Oracle Service Cloud elements

If you are not an **administrator** or have not previously worked with the Oracle Service Cloud application, this section provides a brief overview of the elements you can use to create your organization's customer portal.

The knowledge base is the term we use to describe how information in the database is presented. This is the information staff members see on the **agent desktop** and customers see on your customer portal. Some of the information in the knowledge base includes the following.

- **Contacts**—Each of your customers has a contact record in the knowledge base that includes basic information, such as name, email address, and phone number. Contact records also include information about any support issues or questions the customer has submitted as well as any other information your organization asks customers to provide.
- **Answers**—Answers are the heart of your knowledge base. Whether your organization calls them FAQs, help topics, or something else, an answer is the information in the knowledge base that provides a solution to a common customer support question. Your customers can search for answers to their questions, and you can create new answers from questions your customers commonly submit.
- **Incidents**—Incidents are created automatically when your customers submit a request for help through the Ask a Question page of your customer portal or when they provide feedback on your site or a specific answer.
- **Reports**—A report is simply a list of records. The application offers a full range of **standard reports**, and you can also create **custom reports**. The list of answers that is returned when a customer conducts a search is simply a report that has been filtered on the search terms. Customer Portal reports are listed on the **administration interface** and can be accessed by clicking the Analytics button and then opening the Reports explorer to find Public Reports/Service/Views–Service/Customer Portal.
- **Configuration settings**—You can accomplish most of the configuration of your customer portal by editing code for the templates, pages, and widgets that make up your site. There are, however, certain properties that are configured through the administration interface using configuration settings that define behavior on your customer portal. Refer to Defining configuration settings.
- **Message bases**—A message base is an editable text string that lets you customize headings, labels, buttons, and other text on your customer portal. When you reference a message base by its standard name in a line of code, the page automatically displays the text of the message base.

- **Data dictionary**—The data dictionary lists the available database tables and fields that can be used for many input and output widgets. You can also use the Business Objects link on the Customer Portal Administration site (Framework > Business Objects) to look up field and table names for contacts, answers, and incidents.

Editing message bases

Many widgets and page headings use message bases, which are unique text strings that support internationalization. You can identify message bases in Customer Portal code because they use an `rn:msg#...#` tag. The label between the # symbols points to the specific message base to be used. When you reference a message base in the code, the page automatically displays whatever text is associated with it.

For example, when customers are logged in, the template code that generates the Welcome message is `#rn:msg:WELCOME_BACK_LBL#`. You can edit the message that appears (in this case, it is simply the word "Welcome") in one of three ways.

- **Change the value of the message base**—Every place in the code that calls the message base will then use the new value you defined for the message base.
- **Reference a different message base**—If another message base uses the language you want, you can reference that message base instead of the one that appears in the default code.
- **Type whatever message you want**—If you want the change to appear only once and if internationalization is not a concern, you can simply type whatever you want into the code for the page or widget.

We'll assume for the sake of this example that you want to change the `#rn:msg:WELCOME_BACK_LBL#` label that is called by default in the template code.

Note Message base labels appear in uppercase text with the words separated by an underscore character.

To change the value of a message base

1. Log in to Oracle Service Cloud.
2. Click the Configuration button.
3. Double-click Message Bases under Site Configuration. The Search window opens.
4. Type `welcome` in the Text field and click Search.

5 Locate WELCOME_BACK_LBL in the list of message bases and type the new message in the Text field.

6 In the Message column of the WELCOME_BACK_LBL row, type whatever you want the message base to say.

7 Click the Save button on the ribbon.

Now, whenever you refer to the WELCOME_BACK_LBL label in customer portal code (or anywhere else it might be used on the **Service Console**), instead of saying "Welcome," it uses your new definition for the message base.

To reference a different message base

1 Log in to Oracle Service Cloud.

2 Click the Configuration button.

3 Double-click Message Bases under Site Configuration. The Search window opens.

4 Enter search criteria to help you find the message base you want to use as a replacement. (See Searching message bases if you need help.)

5 When you have located the replacement message base you want, note its name.

6 Open the *standard.php* file in the */views/templates* folder.

7 Locate the following line of code.

```
#rn:msg:WELCOME_BACK_LBL#
```

8 Edit the code with the name of the message base you want to use as a replacement. Your code will resemble the following.

```
#rn:msg:WELCOME_TO_RIGHTNOW_LBL#
```

9 Save *standard.php*.

To type a new message

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
#rn:msg:WELCOME_BACK_LBL#
```

3 Type the new message, replacing `#rn:msg:WELCOME_BACK_LBL#` with whatever text you want to appear. Your code will resemble the following.

```
Welcome to the Global Wireless Support Site
```

Note If you're typing an original message, you don't need to use quotation marks or type #rn:msg: in the code.

4 Save *standard.php*.

Customer Portal reports

The following site reports track visits to your customer portal. You can find these reports in the Reports explorer (often found in the Analytics navigation list) under Public Reports > Service > Site Reports > Customer Portal.

- **Referring Sites**—This report provides a list of sites that referred customers to your customer portal and includes a percentage of customers referred from each site.
- **Visits by Browser**—This report shows the percentage of visits to your customer portal by browser type so you can identify the browsers your customers are using.
- **Visits by Browser and Operating System**—This report shows a table of browser and operating system combinations and the percentage of visits by each combination.
- **Visits by Operating System**—This report shows the percentage of visits to your customer portal by operating system to identify which operating systems are used most frequently by your customers.
- **Visits by Page Set**—This report shows the Customer Portal page set mapping usage by percentage of sessions that accessed each page set: standard, mobile, and any other page set defined by page set mapping on the Customer Portal Administration site. Drilling down lets you view browsers and operating systems used to access a page set.
- **Visits by Time**—This report provides the number of visits that occurred during each defined unit of time as well as a percentage of visits per time unit.

Refer to Visit information for an explanation of visits, including how to maintain data when linking to another page within a single customer visit.

Visit information

A visit is defined as the time a customer spends on your support site, beginning when a customer who does not already have an open visit navigates to a page on your site through a browser. A visit ends under any of the following circumstances.

- The customer is inactive for a time longer than that specified by the VISIT_INACTIVITY_TIMEOUT **configuration setting**. The default value for the setting is 30 minutes. (Learn how to edit configuration settings here.)
- The length of the customer's visit has exceeded the time specified in VISIT_MAX_TIME. The default value for the setting is four hours.
- The customer closes the browser.
- The customer's browser does not have cookies and the customer navigates away from your customer portal and then returns.

Note Customer visits that result from clicking the PollingSyndication widget are tracked as **Oracle RightNow Feedback Cloud Service** visits, not as Customer Portal visits. For information about this **syndicated widget**, refer to Offering customers a survey.

Visit management and click tracking

By default, visit management and click tracking are handled for you. However, when you create custom files, you must manually define click tracking with the Clickstream page meta tag. When you make changes to custom files, you may not see the results you expect within **Oracle RightNow Analytics Cloud Service** because your changes could affect this reporting. The best practice is to test your changes with reporting to ensure your results are reflected correctly.

Passing visit information in custom pages

Within all links on the standard pages and widgets, **visit** information from cookies is automatically appended. However, if cookies are disabled (either because you have set CP_COOKIES_ENABLED to No or the customer's browser has disabled them), a URL is used to pass visit and profile information through the application.

Note The HTTPOnly flag is set for all cookies.

To pass visit information in links to custom pages

When you generate new links to custom pages, pass this visit information by adding `#rn:session#` at the end of each page URL.

Important If you do not add the tag to a link and cookies are disabled, customers generate a new visit ID every time they click a link. Additionally, if the customer is logged in, they are logged out each time they click a link that does not pass the visit information. To prevent this from occurring, you must make changes to maintain the visit data in links.

Modification of cookie information

If you disable cookies, **visit** data is determined by URL parameters, which you must define in individual lines of code to prevent new visits from being initiated each time the customer navigates away from a page. Cookies are set by default.

To turn off cookies on customer browsers

1 Log in to Oracle Service Cloud.

2 Use the procedure described in To locate and edit configuration settings to locate CP_COOKIES_ENABLED under RightNow User Interface > Customer Portal > Login.

3 Click the drop-down menu in the Value field and select No.

4 Click the Save button on the ribbon.

Next, review information about maintaining visit data in links when cookies are turned off.

Maintaining visit data in links

Pages, templates, and widgets can modify cookie header information in both the development and production pages. They can call the `setcookie()` PHP function or interact with and add to the existing visit data by using the `$CI>session>setSessionData($data)` function.

If a customer's browser does not have cookies enabled and the customer clicks a link on a page, visit data can be lost. You can prevent this by editing the link in one of the following ways to maintain visit data when cookies are turned off.

- **PHP links**—Add `\RightNow\Utils\Url::sessionParameter()` to the end of your link, as shown in the following example.

```
link .= \RightNow\Utils\Url::sessionParameter()
```

- **JavaScript links**—Send the result of this function to the JavaScript and append it to the link. If you are using a widget, you can create a variable such as the following.

```
$data['js']['session'] =
\RightNow\Utils\Url::sessionParameter()
```

Then reference the variable in the logic file.

```
link + data.js.session
```

Note If cookies are enabled, this variable is blank. If cookies are disabled, the variable contains the string to append to the URL, for example, `"/session/L3NpZC9mMU9ERGRhag=="`.

49

Configuring Oracle Service Cloud for the Customer Portal

Before you get started working with **pages** and **widgets**, you'll want to do some basic configuration for the Oracle RightNow Customer Portal Cloud Service (Customer Portal) on the **administration interface**. You'll need to assign appropriate permissions to staff members who will be working with your customer portal. You'll also want to review the **configuration settings** to be sure you don't need to change any of the defaults. Additionally, there are configuration options you'll want to set up for features that are accessed through your customer portal, such as search options, **SmartAssistant**, and **related answers**. Finally, if you want to let your customers search for external documents in addition to the answers that are in your knowledge base when they search on your site, you can set up **web indexing**.

Important You must enable MOD_CP_DEVELOPMENT_ENABLED before you can make changes to your development site. If you do not enable this setting, you cannot make changes to your customer portal, and your customers will see the default reference implementation with no customization. Refer to Enabling the development area.

Assigning permissions

All of your staff members have staff accounts that have been set up by you or your **administrator**. Every staff account is assigned a **profile**, which is a set of permissions for working on the administration interface.

Because you want to control who can modify your customer portal, you can define profile permissions to determine who can edit, stage, and promote the pages into production. You can grant the following types of permissions through a staff member's profile, including your own, if you have administrative privileges.

- CP Edit permission lets staff members with this profile access the **Customer Portal Administration site** and edit customer portal pages in the development area using WebDAV. Staff members with CP Edit permission, but not CP Stage or CP Promote permission, cannot access the Customer Portal editor on the **administration interface**. Nor can they access the Deploy tab on the Customer Portal Administration site.
- CP Stage permission lets staff members copy the development files to the staging area. Staff members with CP Stage permission but not CP Promote permission will not have the Promote and Rollback buttons enabled on the Customer Portal editor on the administration interface.
- CP Promote permission lets staff members promote the pages from the staging area to the production area where customers can view them.

Note Staff members who have CP Stage permission automatically have CP Edit permission as well. Staff members with CP Promote permission automatically have CP Edit and CP Stage permissions.

First, decide which staff members need edit permissions. This group may include your administrator and the designers or developers who create and maintain your customer portal. Then either edit an existing profile or create a new profile (see To add or edit a profile if you need help) and edit the profile to assign customer portal permissions.

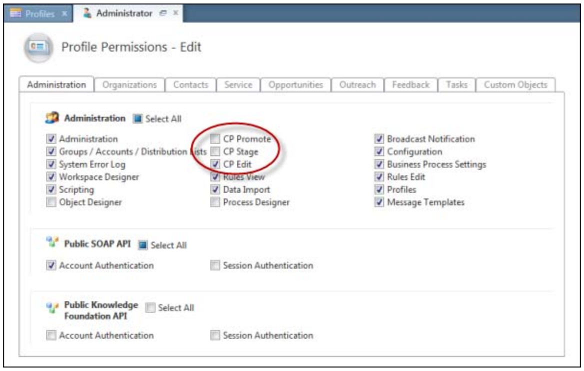
To assign permissions for your customer portal

1. Log in to Oracle Service Cloud.
2. Click the Configuration button on the **navigation pane**.
3. Double-click Profiles under Staff Management. The report opens on the content pane.
4. Double-click the profile you want to assign permissions to. The Profiles editor opens.
5. Click the Permissions button on the ribbon. The Administration tab is displayed by default.

6 To give staff members with this profile full permission to work on your customer portal (which includes editing, staging, and promoting pages to your production site), select the CP Promote check box. The CP Stage and CP Edit check boxes are selected automatically.

7 To give staff members with this profile permission to edit and stage your customer portal pages, but not promote them, select the CP Stage check box. The CP Edit check box is selected automatically.

8 To give staff members with this profile permission to edit your customer portal pages using WebDAV, but not to stage or promote them, select the CP Edit check box. Staff members with this permission can also access the Customer Portal Administration site.



9 Click the Save and Close button on the ribbon.

Defining configuration settings

The Customer Portal gives you complete flexibility in creating **templates**, **pages**, and **widgets** that meet the needs of your organization. Most of this configuration is accomplished by editing the PHP and JavaScript files that comprise your customer portal.

However, other configuration must occur on the **administration interface**. You'll use **configuration settings** to define common features of your customer portal. In addition, configuration settings let you control functionality on specific pages, although you'll configure the pages themselves by editing the files for the template, pages, and widgets.

Working with configuration settings

This section contains procedures for modifying several sets of configuration settings related to your customer portal. The procedures assume that you're familiar with locating and editing configuration settings, as described in the following procedure. (For more detailed information about searching for and editing configuration settings, refer to Searching configuration settings.)

To locate and edit configuration settings

1 Log in to Oracle Service Cloud.

2 Click the Configuration button on the **navigation pane**.

3 Double-click Configuration Settings under Site Configuration. The Search window opens.

4 To open a specific configuration setting, type its name in the Key field and click Search.

5 To display all configuration settings, click the Search button. The Configuration Settings editor opens.

Tip To avoid opening the Search window in future procedures, click the Save As Defaults button before you click Search. You can always refine your search using the filters on the report instead of the filters in the Search window.

a If you know the name of the setting, type it in the Key field and click Search.

Tip You can also enter just the first few letters and append either * or % to serve as a wildcard before clicking Search. All settings that begin with the letters you typed will be returned in the report.

b If you know the location of the setting, expand the folder hierarchy until the tree displays the folder containing the setting. Click the folder and then double-click the setting you want to edit.

Tip Many configuration settings for the Customer Portal are located in one of the subfolders under RightNow User Interface > Customer Portal.

6 In the Values table for the row that contains the Configuration Base (interface name), click the Value field.

7 Type or select the new value.

After you click the Save button on the ribbon, the new value is underlined or it displays a small triangle in the upper left corner of the field to indicate a change from the default value.

Enabling the development area

Important You must enable MOD_CP_DEVELOPMENT_ENABLED before you can make changes to your development site. If you do not enable this setting, you cannot make changes to your customer portal, and your customers will see the default reference implementation with no customization.

To enable the development area

1 Use the procedure described in To locate and edit configuration settings to locate MOD_CP_DEVELOPMENT_ENABLED. (The setting is in the Common > Oracle Products > Modules folder.)

2 In the row for the configuration setting, click the drop-down menu in the Value column and select Yes.

3 Click the Save button on the ribbon.

Now that you have enabled your development area, you can begin editing other configuration settings that affect your customer portal.

Common configuration settings

Before you walk through the steps of configuring specific pages and features for your customer portal, you'll want to review the **configuration settings** that set up common features. These settings let you specify URLs for various pages, define cookie expiration, validate email formats, and define other functionality.

Important Besides impacting your development pages, changes you make to these configuration settings can also affect the reference implementation pages. As a result, the behavior of the reference implementation may not correspond to the descriptions in the online documentation if you have changed the default configuration settings.

Note, however, that none of the URL configuration settings, described in Modifying page settings, modify the reference implementation. The reference implementation always uses the default values for these settings.

Tip You can probably leave all these settings at their default values to get started, especially if you haven't yet added any custom pages. You can come back later and update these if, for example, you create your own login form or other pages.

Modifying page settings

Important None of the changes you make to the page configuration settings modify the **reference implementation**, which always uses the default values for these settings.

To modify page settings

1 Use the procedure described in To locate and edit configuration settings to locate the list of page settings under RightNow User Interface > Customer Portal > Pages.

2 To change any of the default pages, which are defined in the following table, click the Value field and type the name of the new page in the field.

Table 361: Customer Portal Pages Configuration Settings

Setting	Description	Default
CP_404_URL	The page that is loaded when customers navigate to a non-existent page where a 404 error occurs.	error404
CP_ACCOUNT_ASSIST_URL	The page where customers retrieve their user name and password.	utils/account_assistance
CP_ANS_NOTIF_UNSUB_URL	The page where customers unsubscribe from an **answer update notification**.	account/notif/unsubscribe
CP_ANSWERS_DETAIL_URL	The page that displays answer details.	answers/detail
CP_CHANGE_PASSWORD_URL	The page where customers can change their password.	account/change_password
CP_CHAT_URL	The page where customers can submit a request for a **chat session**.	chat/chat_launch
CP_HOME_URL	The home page for your customer portal.	home
CP_INCIDENT_RESPONSE_URL	The page that displays individual questions submitted by customers when they select one from a list of all their questions.	account/questions/detail
CP_LOGIN_URL	The page used to log in to your customer portal.	utils/login_form
CP_WEBSEARCH_DETAIL_URL	The answer details page used to display results from the External Search page.	answers/detail

3 Click the Save button on the ribbon.

Modifying security, login, and syndicated widget settings

For a discussion about session data security and recommended practices, refer to Session data. For a discussion about password controls, refer to Password protection.

Refer to the following sections for additional information about security practices.

- Security-Related Configuration Settings.
- Developing a Security Plan.
- Recommendations for Security-Related Configuration Settings.

To specify outside hosts allowed in a redirect URL parameter

1 Use the procedure described in To locate and edit configuration settings to locate CP_REDIRECT_HOSTS under Common> General > Security.

Note By default, the Value field is blank, which prevents redirection to any outside hosts from a redirect URL parameter.

2 To allow all outside hosts, type * in the Value field.

3 To specify selected outside hosts, enter a comma-separated list of allowed domain names with wildcards (for example, *.oracle.com).

Note You do not need to enter redirects within your interface domain because they are allowed implicitly. Nor do you need to enter redirects to hosts specified in related configuration settings, such as COMMUNITY_BASE_URL.

4 Click the Save button on the ribbon.

To modify login and syndicated widget settings

1 Use the procedure described in To locate and edit configuration settings to locate the configuration settings under RightNow User Interface > Customer Portal > Login.

2 To change any of the default values, defined in the following table, click the Value field and type the new value in the field.

Table 362: Customer Portal Login Configuration Settings

Setting	Description	Default
CP_CONTACT_LOGIN_REQUIRED	If enabled, Customer Portal will require a contact to be logged in when accessing most pages or controls. Notable exceptions include login, password recovery, account creation, and PTA. If your site is password-protected, you should enable this setting. You should also enable it if only the answer pages are password-protected. If you enable this setting, you can override it for individual pages by setting the page meta tag *login_required* attribute to false. **Note:** Changing the value of this setting affects only the development mode. You must stage and promote your customer portal files for this setting to take effect on your production site. To view the value of the setting in the development, staging, and production environments, click the Settings tab on the Customer Portal Administration site and select Sandboxed Configurations. Refer to Sandboxed configurations.	No
CP_COOKIES_ENABLED	Defines whether the Customer Portal tries to set cookies on a customer's browser.	Yes
CP_FORCE_PASSWORDS_OVER_HTTPS	Enabled by default, this setting requires all logged in activity to occur over HTTPS to provide protection from password theft, phishing, and other security threats. When enabled, logged in users will interact entirely on HTTPS. **Note:** If the response to an incident submitted on the customer portal contains an HTTP link to an image, your customer will be prompted to accept the content since the link is not secure.	Yes

Table 362: Customer Portal Login Configuration Settings (Continued)

Setting	Description	Default
CP_LOGIN_COOKIE_EXP	The time before the Customer Portal login cookie expires. Set the value to -1 if you want the cookie to expire when the browser is closed. Set the value to 0 if you never want the cookie to expire.	60 minutes
CP_MAX_INVALID_LOG-INS	Defines the total number of consecutive incorrect logins a customer can attempt before the contact record is disabled. A value of 0 means there is no limit.	10
CP_MAX_LOGINS	Defines the total number of customers that can be logged in to your support site at any given time. The default is 0, which means there is no limit. If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_-MAX_TIME.	0
CP_MAX_LOGINS_PER_-CONTACT	Defines the total number of active, concurrent logins a customer can be logged in with. The default is 0, which means there is no limit. If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.	0

3 To restrict what external hosts can install syndicated widgets, type a comma-separated list of domain names using wildcards in the WIDGET_INSTALLATION_HOSTS setting under RightNow User Interface > Customer Portal > Syndicated Widgets. For example, you might type the following in the setting's Value field.

```
*.example.com,*.example.net,*.example.org
```

4 Click the Save button on the ribbon.

Modifying general customer portal settings

To modify general settings that affect your customer portal

1 Use the procedure described in To locate and edit configuration settings to locate the general settings you want to change.

2 To change any of the default values, defined in the following table, click the Value field and type the new value in the field. (The settings all appear under RightNow User Interface.).

Table 363: General Customer Portal Configuration Settings

Setting	Description
General > End-User EU_CUST_PASSWD_ENABLED	Enables the display of the Password field on the customer portal. The default value is Yes. To prevent the Password field from displaying on the Log In and Create Account pages, set the value to No and edit the message bases that refer to passwords.
General > Security VISIT_INACTIVITY_TIMEOUT	Defines the amount of time a customer can be inactive on the customer portal without needing to log in again. The default is 30 minutes.
General > Security VISIT_MAX_TIME	Defines the maximum amount of time a customer **web visit** can last before a new visit and a new session ID are generated. The default is 240 minutes (four hours).
End-User Interface > General EU_SLA_VISIBLE	Allows **SLA** information to be visible in email responses. The default is No.

3 By default, when customers submit questions on your customer portal, any replies are sent to every email address on file for that customer. To send replies only to the address specified on the Ask a Question page, change the default value of OE_SVC_SENDMAIL_SINGLE_ADDRESS, located under Common > General > Outgoing Email, to Yes. (For information, see Single-send email response logic.)

4 Click the Save button on the ribbon.

Open login configuration settings

Before the Customer Portal open login can work with Facebook, Twitter, and Google APIs, you must first register with the sites. After registering, you have the information you need to set values for each of the following configuration settings. These settings provide the application IDs and secret keys for requesting customer credentials for authentication. By default, all of these values are blank.

- FACEBOOK_OAUTH_APP_ID
- FACEBOOK_OAUTH_APP_SECRET
- TWITTER_OAUTH_APP_ID
- TWITTER_OAUTH_APP_SECRET

- GOOGLE_OAUTH_APP_ID
- GOOGLE_OAUTH_APP_SECRET

The Login page will not display the logos associated with Facebook, Twitter, and Google unless these configuration settings contain values.

To register with Facebook

1 Go to the Facebook Developers page.

Note If you are not logged in to your Facebook account, the login page opens. After you have logged in, the Apps page opens.

2 Click the Create a New App button in the upper right corner and follow the Facebook requirements until you see the App ID and App Secret values.

3 Enter values for the FACEBOOK_OAUTH_APP_ID and FACEBOOK_OAUTH_APP_SECRET configuration settings.

   a Use the procedure described in To locate and edit configuration settings to locate the settings under RightNow User Interface > Open Login > OAuth Apps.
   b Click the Value field for FACEBOOK_OAUTH_APP_ID and type the App ID from the Facebook page in the field.
   c Click the Value field for FACEBOOK_OAUTH_APP_SECRET and type the App Secret from the Facebook page in the field.
   d Click Save.

4 On the Facebook page, enter your site's domain in the App Domain field.

Note This must be a valid domain because Facebook uses it to verify that the OAuth requests come from the application. If the domain is not correct, authentication will fail.

5 Click the Website With Facebook Login line under the heading **Select how your app integrates with Facebook.** A site URL field opens.

6 Type your site's URL in the field.

7 Click the Save Changes button.

To register with Twitter

1 Go to the Twitter Create an Application page.

Note If you are not logged in to your Twitter account, the sign in page opens. After you have logged in, the Create an Application page opens.

2 Type the application name and description in the fields.

3 Type the URL for the home page of the application in the Website field.

4 Type a URL in the Callback URL field. This URL is overwritten by the customer portal, so the only requirement is that it not be a URL from your customer portal site. Any other URL will work.

5 Select the check box to indicate your agreement with the terms of service.

6 Type the text displayed in the CAPTCHA.

7 Click the Create Your Twitter Application button. The application details page opens, displaying the consumer key and consumer secret values.

8 Enter values for the TWITTER_OAUTH_APP_ID and TWITTER_OAUTH_APP_SECRET configuration settings.
   - a Use the procedure described in To locate and edit configuration settings to locate the settings under RightNow User Interface > Open Login > OAuth Apps.
   - b Click the Value field for TWITTER_OAUTH_APP_ID and type the consumer key from the Twitter Application Details page in the field.
   - c Click the Value field for TWITTER_OAUTH_APP_SECRET, type the consumer secret from the Twitter Application Details page in the field.
   - d Click Save.

To register with Google

1 Go to the Google Developers Console.

Note If you are not logged in to your Google account, the login page opens. After you have logged in, the Google Developers Console page opens.

2 Click the Create Project button, enter a name for the project, accept the terms of service, and click Create.

3 When the project has been created, click APIS & AUTH in the left sidebar, and then click Credentials.

4 Click the Create a New Client ID button.

5 Select Web Application if it is not already selected.

6 Make no changes to the Authorized JavaScript Origins section.

7 In the Authorized Redirect URI section, type the following, substituting your site name for `site.com.`

```
https://site.com/ci/openlogin/oauth/callback/google
```

8 Click Create Client ID and note the Client ID and Client Secret values.

9 Enter values for the GOOGLE_OAUTH_APP_ID and GOOGLE_OAUTH_APP_SECRET configuration settings.

   a Use the procedure described in To locate and edit configuration settings to locate the settings under RightNow Common > 3rd-Party Applications > URLs.

   b Click the Value field for GOOGLE_OAUTH_APP_ID and type the Client ID from the Google page in the field.

   c Click the Value field for GOOGLE_OAUTH_APP_SECRET and type the Client Secret from the Google page in the field.

   d Click Save.

Modifying settings for pages on your customer portal

A big part of configuring the look and feel of your customer portal involves configuring the specific components of each page by editing the files (**template**, **pages**, and **widgets**) that comprise the page. However, some general **configuration settings**, accessed through the **administration interface**, also control functionality. For example, these settings let you configure searches, including how search results are returned, whether suggested searches are enabled, and whether search text feedback is given to customers.

You can configure the following pages.

- Answers page—Configuration options include **answer solved count**, search results, **search-field weighting**, suggested searches, search text feedback, the aliases word list, **search priority words**, and **stopwords**.
- Answer details page—The configuration option for the answer details page is the **privileged answers** feature.

- Ask a Question page—You can configure **SmartAssistant** suggested answers for the Ask a Question page as well as specify an expiration time during which the form must be submitted.
- Your Account pages—Configuration options include disabling an email link to a customer's incident in confirmation emails, letting customers see all incidents from their organization, defining the length of time an answer subscription stays active, and allowing duplicate email addresses.
- Log In, Create an Account, and Change Password pages—You can configure the security and strength of customer passwords.

Important All procedures regarding editing configuration settings are performed on the administration interface.

Configuring the Answers page

By default, the Answers page lists the answers having the highest **solved count**. The list, which is a report, includes the summary for each answer, the beginning of the answer text, and the date the answer was last updated. Customers can use the search field, including the Advanced Search option that lets them select **products** and **categories**, to find answers to their specific question. Clicking an answer in the list takes customers to the answer details page for that answer.

Note If the beginning of an answer's text contains a link to another answer, the link is not active on the Answers page, but it is active on the answer details page.

You can configure several aspects of the Answers page using configuration settings.

- General search options—Options include whether privileged access is enabled and the maximum year for date searching.
- Answer solved count—You can configure how quickly an answer's solved count ages and how the weighting between long-term and short-term solutions affects the solved count.
- Search results—Configuration options include setting answer filtering thresholds and limits on answers that are returned from a search.
- Customized search-field weighting—These settings let you assign variable weights to different parts of an answer to define how an answer's fields influence its score.
- Suggested searches—You can configure suggested searches that suggest search terms to your customers based on their entries in the search field.

- Search term feedback—You can disable the default search term feedback feature, which provides information to customers regarding misspellings, stopwords, or words that are not found in the knowledge base.
- Aliases word list—You can add words to the *aliases.txt* file to link terms so that entering one term returns the results for all terms that are defined as aliases (synonyms).
- Search priority words—When you use search priority words, you ensure that specific answers are always returned when an associated search term is entered.
- Stopwords—Stopwords let you add words to the list of those that are excluded from indexing and searching.

General search options

The following general search options can be configured.

Enabling privileged access to answers

Customer access to **privileged answers** is disabled by default. If you want to allow privileged access answers, enable the setting using this procedure.

To enable privileged access to answers

1. Use the procedure described in To locate and edit configuration settings to locate ANS_PRV_ENABLED under RightNow User Interface > End-User Interface > Answers.
2. Click the drop-down menu in the Value field and select Yes.
3. Click the Save button on the ribbon.
4. To configure the privileged access option now, click here.

Setting the maximum year for drop-down menus

By default, any drop-down date menus you add to your customer portal will display the current year as the highest year option. If you want to change the latest year listed in the menu, use the following procedure.

To set the maximum year for date drop-down menus

1. Use the procedure described in To locate and edit configuration settings to locate EU_-MAX_YEAR under Common > Knowledge Base > Answer Search.
2. Set the maximum year.

a To set the maximum value to the current year, clear any existing value so the Value field is blank.
b To set a specific year, type that year in the Value field.
c To set an offset (for example, five years from this year), type the offset value in the Value field. In this example, type `+5`.

3 Click the Save button on the ribbon.

Learn how to add a date field to a page or continue configuring the Answers page.

Adding a date field on a page

The following example assumes that you want to add a custom field where customers can tell you how quickly they need an answer to a question they submit on the Ask a Question page. Because that is not a standard incident field, you'll first need to add it as a **custom field**. Then you'll add the custom field to a page.

To add an incident custom date field

1 Click the Configuration button on the **navigation pane**.

2 Double-click Custom Fields under Database. The Custom Fields tree displays on the content pane.

3 Click Incident in the Custom Fields tree.

4 Click the New button on the ribbon to display the editor.

5 In the Name field, type `Answer Needed By`. This is the label that appears on the Ask a Question page.

6 Click the Data Type drop-down menu and select Date Field (or Date/Time if you want to let customers enter a time as well as a date).

7 In the Column Name field, type `answer_needed`. This is the field's name in the database.

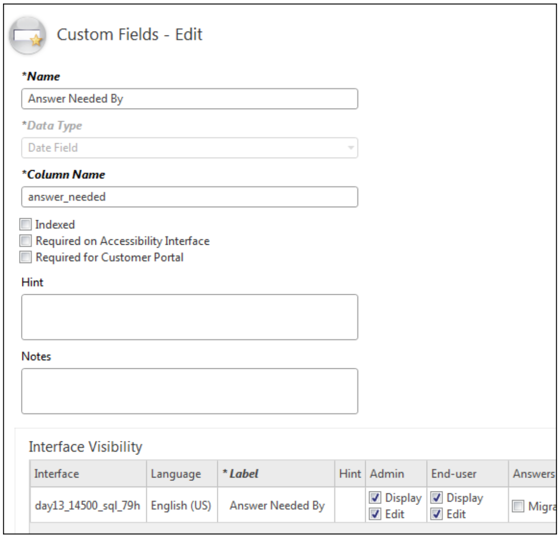
Note The Column Name can include alphanumeric characters and the underscore symbol. It cannot contain spaces.

8 To require customers to complete the field, select the Required for Customer Portal check box.

9 If the Visibility check boxes for End-user Display and Edit are not selected, select both of them.

10 Click the Save and Close button on the ribbon.

Click to view



Adding a custom field to a page

By default, the Ask a Question page displays all incident **custom fields**, so it will display any custom date field. But you might have other custom fields you don't want to display on the Ask a Question page, or you may need to specify parameters for a specific custom field. In that case, you can delete the code that adds all the custom fields and then add code to add the date field back in. The following procedure describes how to do this.

To add a date widget to the Ask a Question page

1 Open the *ask.php* file in the */views/pages* folder.

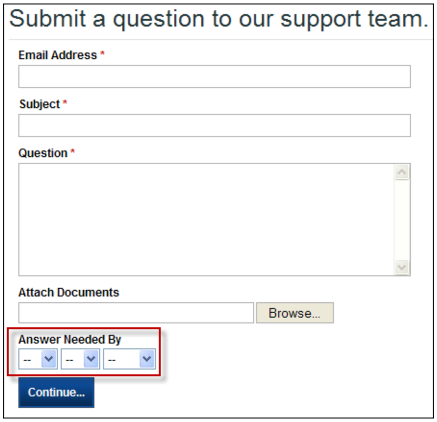
2 Delete the following line of code and leave a blank line where it was.

```
<rn:widget path="input/CustomAllInput"
table="Incident"
always_show_mask="true"/>
```

3 Add the following code to the blank line.

```
<rn:widget path="input/DateInput"
name="Incident.CustomFields.c.answer_needed" />
```

4 Save *ask.php*.



Configuring answer solved count

The Solved Count feature collects information about the usefulness of answers in your knowledge base and uses this data to rank the answers. The feature compiles explicit and implicit data based on how customers use your site.

Explicit data is gathered when customers respond to “Was this answer helpful?” on the answer details page.

Implicit data is compiled when customers view answers. The solved count increases or decreases based on customer activity. An answer’s solved count also increases when it is a SmartAssistant-suggested answer that agents use to respond to an incident.

By default, customer influence on an answer’s ranking accounts for 75 percent of an answer’s score, and agents affect 25 percent. Over time, an answer’s solved count gradually declines as it is viewed less frequently.

You can configure the solved count in these ways.

To define the number of days the solved count is not aged

1 Use the procedure described in To locate and edit configuration settings to locate ANS_NEW_INC_DURATION and ANS_UPD_INC_DURATION under RightNow User Interface > End-User Interface > Answers.

2 To change the number of days a new answer's solved count is not aged, type a value in the Value field for ANS_NEW_INC_DURATION. This is the number of days the answer will be considered new.

3 To change the number of days an updated answer's solved count is not aged, type a value in the Value field for ANS_UPD_INC_DURATION. This is the number of days an answer will be considered updated.

4 Click the Save button on the ribbon.

To define how quickly the solved count ages

1 Use the procedure described in To locate and edit configuration settings to locate SA_AGE_FREQ under Agedatabase > Batch Processing > SmartAssistant.

2 Type a value in the Value field. To disable aging, type 0. To set aging to its maximum value, type 400. Or enter any value between 0 and 400, based on the setting description.

3 Click the Save button on the ribbon.

To specify weighting between long-term and short-term solved counts

1 Use the procedure described in To locate and edit configuration settings to locate SA_-SOLVED_WEIGH_PREF under Common > Knowledge Base > Answer Search.

2 Type the value in the Value field. Refer to the Description field for the options.

3 Click the Save button on the ribbon.

Configuring search results

There are several ways to configure how answers are returned in a search. One way is to specify a threshold, which is a filtering criteria for what answers are returned. A high threshold restricts returned answers to those that have a strong fit, while a low threshold allows more returned answers. You can also determine how match weights are configured to return only the best search results.

Additionally, you can truncate search results if too many matches are returned. The following factors affect the number of returned results.

- **Number of words in the query**—If more words are used, fewer results are generally returned.

- **Number of words matched**—For a search query containing four words, enough results may match three or four words, so answers that match only one or two words can be dropped.
- **Match weight distribution**—If a significant drop occurs in match weight of the answers returned, the results can be truncated.
- **Type of search performed**—For example, similar phrases searching and exact searching have different numbers of expected results.

Select from the following configuration options for search results.

To define the threshold for returned answers

1. Use the procedure described in To locate and edit configuration settings to locate ANS_SRCH_THRESHOLD under RightNow User Interface > End-User Interface > Answers.
2. Type a number between 0 and 100 in the Value field to specify the minimum matching value for answers that are returned in a search.
3. Click the Save button on the ribbon.

To return answers when the minimum threshold is not met

1. Use the procedure described in To locate and edit configuration settings to locate ANS_SRCH_SUB_THRESHOLD under RightNow User Interface > End-User Interface > Answers.
2. Click the drop-down menu in the Value field and select Yes.
3. Click the Save button on the ribbon.

To base search weights on answer clusters and topics

1. Use the procedure described in To locate and edit configuration settings to locate SEARCH_RELEVANCE_FOCUS under RightNow User Interface > End-User Interface > Answers.
2. Type a number between 0 and 3 in the Value field to specify a value based on the setting's description.
3. Click the Save button on the ribbon.

Customizing search-field weighting

You can assign variable weights to the different parts of an answer to indicate how the answer's fields influence its score. For example, you might want keywords and products associated with an answer to carry more weight than words in the body of the answer or any files attached to the answer. The answer search configuration settings let you define the weights of several answer fields.

The minimum value for each setting is 0. Although there is no maximum value, it's a good idea to keep the value for each setting between 0 and its default value.

Note Changing these configuration settings can significantly impact your site's searching performance. You'll want to make changes in small steps and assess site performance after each change.

To customize search-field weighting

1 Use the procedure described in To locate and edit configuration settings to locate the configuration settings under Common > Knowledge Base > Answer Search.

2 To edit any of the following configuration settings, click the Value field and type a value or use the drop-down menu's up or down arrow keys to adjust the default value.

- **a** To edit the weight of the answer's body text (the Answer field), set SRCH_BODY_-WEIGHT.
- **b** To edit the weight of the answer's description (the Question field), set SRCH_DESC_-WEIGHT.
- **c** To edit the weight of the answer's Summary field, set SRCH_SUBJ_WEIGHT.
- **d** To edit the weight of the answer's keywords, set SRCH_KEY_WEIGHT.
- **e** To edit the weight of the answer's products, set SRCH_PROD_WEIGHT.
- **f** To edit the weight of the answer's categories, set SRCH_CAT_WEIGHT.
- **g** To edit the weight of the answer's file attachments, set SRCH_ATTACH_WEIGHT.

3 Click the Save button on the ribbon.

Configuring suggested searches

The suggested searches feature builds links between search words and phrases based on similar answer search results. Then it displays suggested search terms on the Answers page. Suggested searches help your customers search for answers by suggesting terms they might not think of or know the proper terminology for. The suggested search terms are displayed above the list of answers. Customers can then click the suggested search terms to search on those terms without having to type them in the search text field.

Select from the following configuration options for suggested searches.

To disable suggested searches

1 Use the procedure described in To locate and edit configuration settings to locate EU_-SUGGESTED_SEARCHES_ENABLE under RightNow User Interface > End-User Interface > General.

2 Click the drop-down menu in the Value field and select No.

3 Click the Save button on the ribbon.

To return suggestions for related products and categories

1 Use the procedure described in To locate and edit configuration settings to locate SEARCH_SUGGESTIONS_DISPLAY under RightNow User Interface > End-User Interface > Suggestions.

2 If you want to return only recommended product suggestions, type 1 in the Value field. To return only category suggestions, type 2. To return both product and category suggestions, type 3.

3 Click the Save button on the ribbon.

To set a maximum number of suggested products and categories

1 Use the procedure described in To locate and edit configuration settings to locate MAX_-SEARCH_SUGGESTIONS under RightNow User Interface > End-User Interface > Suggestions.

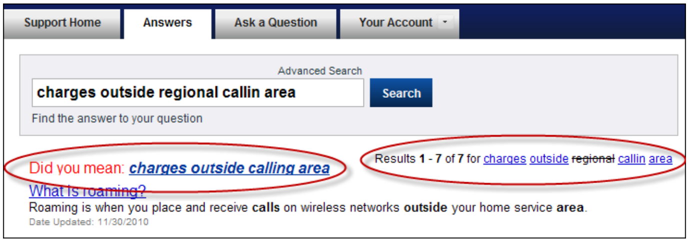
2 Select the Value field and type the maximum number of suggestions you want returned on the Answers page for each product and category.

3 Click the Save button on the ribbon.

Disabling search term feedback

When your customers search for answers, their search terms might include misspellings, very common words, or words that are not found in any answers. By default, answer feedback is provided if any of these situations occur to help your customers refine their search and receive more useful results.

Misspelled words are flagged with a “Did you mean” suggestion for correct spelling. Common words (stopwords) are not included in the search, and you can customize the stopword list to include additional terms. Stopwords that were not used in the search and any search terms that were not found are marked with a strikethrough on the Answers page to indicate that they are not part of the search results.



To disable search term feedback

1 Use the procedure described in To locate and edit configuration settings to locate EU_-SEARCH_TERM_FEEDBACK_ENABLE under RightNow User Interface > End-User Interface > General.

2 Click the drop-down menu in the Value field and select No.

3 Click the Save button on the ribbon.

Configuring answer stopwords

Stopwords are common words that are excluded from indexing and searching. Incidents and answers are analyzed for suggested stopwords, that is, words that occur frequently and widely across incidents or answers. Even if a word occurs multiple times in a single answer, for example, it is not suggested as a stopword unless it is found in other answers as well. You can review the list of suggested stopwords and decide which ones to include.

To add and remove answer stopwords

1 Click the Configuration button on the **navigation pane**.

2 Double-click Answer Stopwords under Service > Knowledge Base. Any suggested stopwords are listed in the Suggested Additions field.

3 To add words from the Suggested Additions list of stopwords to the Active stopword list, select the stopwords you want and click the top >> arrow.

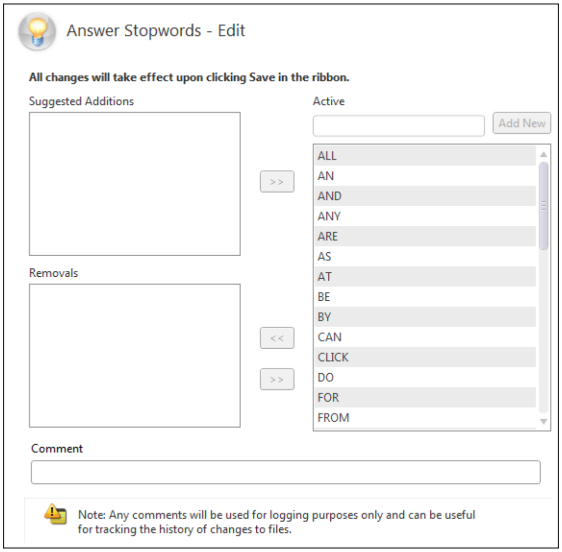
4 To add a stopword that is not in the Suggested Additions field, type the word in the field at the top of the Active list on the right and click the Add New button.

5 To remove a stopword, click the word in the Active list and click the << arrow. The word is added to the Removals field. (To restore a word from the Removals field to the Active list, click the bottom >> arrow.)

Tip We recommend that you remove any words in the Active list that are orange to improve searching performance.

6 Click the Save and Close button on the ribbon to save your added and removed stopwords.

Note The Agedatabase utility must be run before your changes to the stopwords list become active.



Editing the aliases word list

You can use aliases (synonyms) to enhance searching. Adding aliases lets you link terms that are specific to your industry or organization to similar terms your customers may search for. For example, a customer might search for an acronym, such as "GPS," but all of your answers regarding GPS might spell out the full term "global positioning system." Creating an alias word list lets you link these two terms and save time because you need to create this link only once instead of adding it as a keyword to multiple answers.

In this example, you would add the following line to the *aliases.txt* file.

```
GPS,GLOBAL POSITIONING SYSTEM,NAVIGATIONAL SYSTEM
```

The *aliases.txt* file contains no default alias terms. To use this capability, you must customize the file with the terms you want. The *aliases.txt* file can be edited through the **File Manager** on the **administration interface**.

Multiple-word aliases do not work if ANS_AND_SEARCH is enabled, so we recommend that you do not enable this setting. Refer to Best Practices for Knowledge Base and Search Effectiveness and Knowledge Base and Search Tune-Up Checklist.

To edit the aliases word list

1 Click the Configuration button on the **navigation pane**.

2 Double-click File Manager under Site Configuration.

3 In the Switch To drop-down menu, select wordlist files. The list of files in the directory is displayed.

4 Click the Download button in the Action column for *aliases.txt*.

5 Click Save and select a location for the file. The file is downloaded to the location you selected so you can make your edits locally.

6 Using the following example, edit the downloaded file to add aliases.

```
GPS,GLOBAL POSITIONING SYSTEM,NAVIGATIONAL SYSTEM
```

Enter each alias on a separate line using comma-delimited terms in uppercase text. The search terms in the line can contain spaces, so you can use phrases as synonyms for the search word. When a customer enters the first word in a line as a search term, all answers containing that word or any other term on the line are returned.

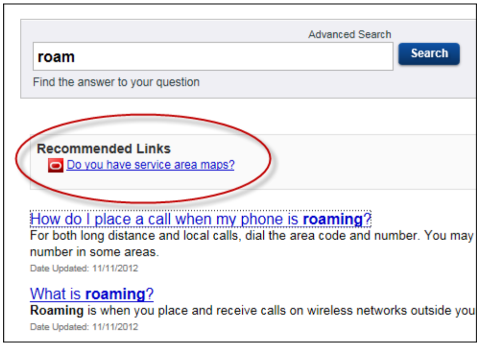
7 Save the edited file.

8 On the File Manager, click the Browse button (next to the Upload field at the bottom of the page) to locate the edited file and click Open. The file is listed in the Upload field.

9 Click Go to upload the file. Click OK to acknowledge that the existing file will be replaced by the one you just edited.

Configuring search priority words

Search priority words let you associate a specific answer or document with specific search terms to ensure that the answer (or document) will always be returned when a customer enters the search term. When you've assigned a search priority word to an answer and the customer enters the search priority word, the answer is displayed in the Recommended Links section on the Answers page.



To add search priority words

1 Click the Configuration button on the **navigation pane**.

2 Double-click Search Priority Words under Service > Knowledge Base. The Search Priority Words tree displays on the content pane.

3 Click the New button on the ribbon to display the editor.

4 Type a name in the Search Priority Word Name field to identify the keyword you plan to enter as a search term.

Note This is not the search term itself, merely the identifier for it. If a customer enters the Name field value as a search term, the associated answer is not returned unless that term is also entered in the Keywords field.

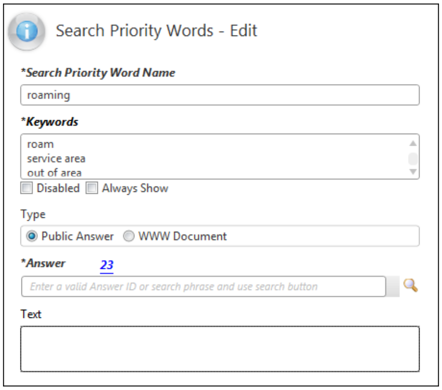
5 In the Keywords field, type search terms, separating each one with a comma, semicolon, or line break. Customers must enter one of the keywords exactly in order for the answer to be returned.

6 If you always want the answer to appear in the Recommended Links section of the Answers page regardless of the search terms customers enter, select the Always Show check box.

7 If you want to associate the search priority word with an answer, select the Public Answer radio button. If you want to associate it with a document, select WWW Document.

8 Type the Answer ID for the answer you want to associate with the search priority words. Or type a title and URL for a document.

9 Click the Save and Close button on the ribbon.



Configuring the answer details page

When customers click the summary of an answer on the Answers or Support Home page, the answer details page opens. From this page, your customers not only can view the answer, but they can also provide feedback on the answer and open any related and previously viewed answers. Additionally, they can share the answer on social networking sites, print it, email to another person, and request notification when the answer is updated.

You can configure **privileged access** for the answer details page. Privileged access lets you give certain customers access to information that is not available to all customers. For example, you might want to give customers who have purchased a premium support contract access to a greater level of information.

An answer's Access Level field controls who can view it, but all answers that you want to appear on your customer portal must have a **Public** answer status.

The following steps are required to configure privileged access.

- Enable privileged access.
- Add privileged answer access levels.
- Add privileged answers.
- Assign access levels to SLAs.
- Assign SLAs to your customers.

Enabling privileged access

To enable privileged access

1 Use the procedure described in To locate and edit configuration settings to locate ANS_PRV_ENABLED under RightNow User Interface > End-User Interface > Answers.

2 Click the drop-down menu in the Value field and select Yes.

3 Click the Save button on the ribbon.

Adding privileged answer access levels

There are two default **answer access levels**, Help and Everyone. In order to use **privileged access**, you must first add custom access levels that let your customers view only certain groups of answers.

If you assign an answer an access level that has visibility on an interface, all customers on that interface can view the answer. If you assign an answer to an access level that does not have visibility on an interface, you can still offer access to certain customers by assigning them an **SLA** that allows privileged access.

You can also tag parts of an answer with different access levels by creating conditional sections within an answer. Customers who are assigned an SLA with a privileged access level can view the conditional sections assigned to that level. Refer to Associating answers with multiple access levels.

To add a custom answer access level

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance.

3 Expand the System Menus folder by clicking the arrow to the left of the folder.

4 Click Answer Access Levels to display the editor.

5 Click the New button on the ribbon.

6 Type the name of the answer access level in the Label field.

7 If you do not want the answer access level to be visible on the interface, clear the Visible check box.

8 Click the Save and Close button on the ribbon to save the answer access level and close the editor.

Adding privileged answers

You can add answers and assign them to the custom access levels or add conditional sections to answers and assign them to the access levels you created. Refer to Inserting conditional sections.

Assigning access levels to SLAs

After you create custom access levels, you must assign the access levels to SLAs. When you create or edit an SLA, you can select one or more access levels for the customers assigned to the SLA. Refer to Creating SLAs.

Assigning SLAs to customers

The last step is to assign **SLAs** to your customers. By assigning an SLA to a group of customers (either organizations or contacts without an organization association), your customers can view **privileged answers** from your customer portal pages. You assign SLAs to customers when you add or edit contacts and organizations. Refer to Applying SLAs.

Configuring the Your Account pages

The Your Account pages contain customers' personal account information. They can change their password and view and edit questions they've submitted, **answer notifications** they've subscribed to, and account settings.

Clicking the Your Account tab opens the Account Overview page, and there are three additional subpages for Your Account: Support History, Account Settings, and Notifications. Most of these pages are configured using page code and widgets, but you can configure the following functionality with configuration settings.

Disabling the email link to a question

By default, a link is included in the confirmation email that is sent to a customer who has submitted a question on the Ask a Question page. When the customer clicks the link in the email message, the question details page opens with the incident, which can then be viewed or updated.

To disable the email link to a question

1 Use the procedure described in To locate and edit configuration settings to locate MYQ_ENABLED under RightNow User Interface > Contact Services > Questions.

2 Click the drop-down menu in the Value field and select No.

3 Click the Save button on the ribbon.

Allowing customers to see all incidents from their organization

By default, customers can see only their own **incidents** on the Support History page. If you want them to be able to view other incidents submitted by members of their **organization**, you need to edit a **configuration setting** and place the OrgList widget on the Support History page.

To let customers view incidents from others in their organization

1. Use the procedure described in To locate and edit configuration settings to locate MYQ_VIEW_ORG_INCIDENTS under RightNow User Interface > Contact Services > Questions.
2. Type 1 if you want customers to see incidents from others in your organization, or type 2 if you want customers to see incidents from others in your organization and all its subsidiaries.
3. Click the Save button on the ribbon.
4. Now, add the OrgList widget to the Support History page.

Specifying the time an answer notification remains active

To specify how long answer notifications remain active

1. Use the procedure described in To locate and edit configuration settings to locate ANS_NOTIF_DURATION under RightNow User Interface > Contact Services > Answer Notification.
2. Type the number of days you want answer notifications to remain active. If you don't want notifications to expire, type 0.
3. Click the Save button on the ribbon.

Allowing duplicate email addresses

If you want to allow your customers to create multiple accounts using a single email address, you can enable **email address sharing**. This feature allows the creation of individual accounts for multiple people who share one email address. This can be useful for multiple staff members (for example, support@example.com) or family members (hendersons@example.net).

Important Email sharing is disabled by default, and you should consider the implications carefully before you enable it. When email address sharing is disabled, safeguards prevent the creation of duplicate contacts to protect your organization's reputation when sending mailings and surveys. Enabling email sharing removes these safeguards. Additionally, if you enable the feature and then later disable it, the application can develop conflicts in the database when duplicate email addresses are encountered.

If email address sharing is enabled and a customer creates an account using an email address that is already in the knowledge base, they see a message referring them to the Account Assistance page.

When the customer enters the email address on the Account Assistance page, a message is sent to the email address. It lists the known users of the email address and contains a link for creating a new account using the same email. Clicking the link takes the customer to the Finish Account Creation page, which asks for a user name and password. After submitting that information, the customer is directed to the Account Settings page, where additional contact information can be entered.

To enable email address sharing

1 Click the Configuration button on the **navigation pane**.

2 Double-click Email Address Sharing under Database. The Email Address Sharing editor displays on the content pane.

3 Select the Enabled radio button.

4 Click the Save and Close button on the ribbon. A message warns you that safeguards for duplicate email addresses will be removed.

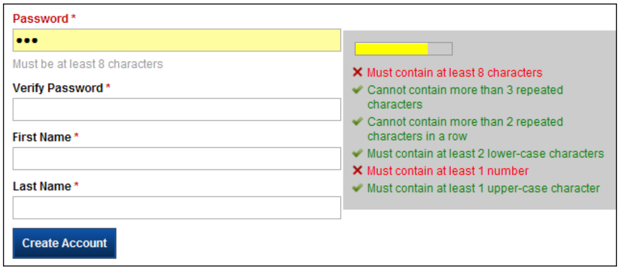
5 Click OK to accept the warning message.

Configuring password requirements

For a discussion about password controls, refer to Password protection.

You can set password requirements that can strengthen customer passwords entered on the Log In, Create an Account, and Change Password pages. The administration interface includes an editor that lets you define the minimum length, the maximum number of character repetitions and occurrences, the number of previous passwords that are stored so they cannot be used for a new password, and the minimum number of upper and lowercase characters, numbers, and special characters. By requiring a defined level of password complexity, you can help your customers protect their information.

The password requirements you define on the administration interface appear to your customers on your customer portal when they are creating or changing their password. The password requirements are displayed on the page when the cursor is moved to the Password field. When the customer begins typing the password, requirements that have been met are marked with a green check mark. Incomplete requirements are marked with a red X. If customers submit the form without meeting the password requirements, they will receive an error notification.



By default, no password requirements are defined, so you must define the password strength requirements you want your customers to meet.

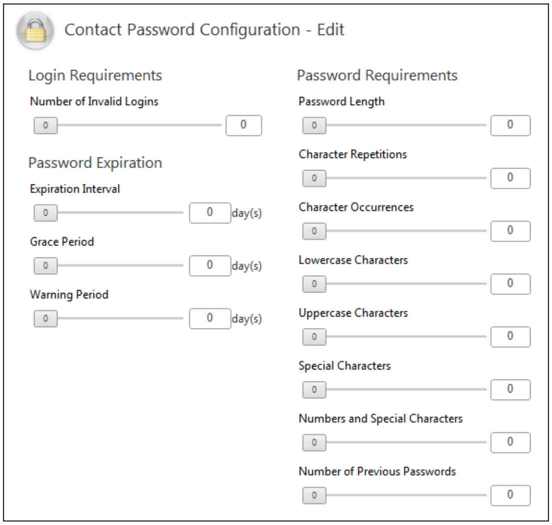
To define customer password requirements

1 Log in to Oracle Service Cloud.

2 Add the Contact Password Configuration item to your configuration list for the Configuration button. (Refer to Creating a navigation set for the administrator if you need help with this step.)

3 Click the Configuration button on the navigation pane.

4 Double-click Contact Password Configuration in the configuration list. The Contact Password Configuration editor opens.



5 Edit the password requirements by either moving the slider to the desired value or by typing the value in the field to the right of the slider.

Table 364: Contact Password Configuration Description

Field	Description
Login Requirements	Establishes a limit on invalid login attempts.
Number of Invalid Logins	The number of invalid login attempts a customer can make before the account is locked. If you don't want to lock customer accounts, leave the value at its default of 0.
Password Expiration	Defines how and when passwords expire.
Expiration Interval	The number of days until the password expires.
Grace Period	The time period in days after password expiration during which customers can enter a new password and still log in.
Warning Period	The number of days prior to expiration that the customer is notified of the impending expiration. Customers can still log in during the warning period.

Table 364: Contact Password Configuration Description (Continued)

Field	Description
Password Requirements	Contains options for defining password requirements and limiting their frequency of use.
Password Length	The minimum number of characters a password must contain. The maximum is 20. If the customer exceeds the maximum number of characters, they will see a message on the customer portal informing them that their password is too long.
Character Repetitions	The maximum number of consecutive repeated characters the password can contain.
Character Occurrences	The maximum number of times a character can be repeated anywhere within the password.
Lowercase Characters	The minimum number of lowercase characters a password must contain.
Uppercase Characters	The minimum number of uppercase characters a password must contain.
Special Characters	The minimum number of special characters a password must contain. Special characters include !, @, ^, $, %, and spaces. **Note:** Best practice recommends defining the Special Characters *or* the Numbers and Special Characters field, but not both.
Numbers and Special Characters	The minimum number of special characters, including numbers, a password must contain. Any combination of special characters and numbers will meet this requirement. **Note:** If you are willing to let numbers count as special characters, set this field. If you do not want to let numbers count as special characters, use the Special Characters field instead of the Numbers and Special Characters field.
Number of Previous Passwords	The number of previous passwords that are stored so they cannot be reused for the new password.

6 To provide hints to your customers regarding password requirements, see Editing the password label to specify password length.

7 Click the Save and Close button.

Using Sitemap

Search engines use web crawlers (**spiders**) to explore your website and index the pages that will be available when searches are conducted. They usually find the pages from links within your site and from other sites. But you may have pages that are not accessible by browsing on the interface (for example, pages that are accessed only when customers complete a form). The spider will not be able to index those pages because it cannot access them. Content in iFrames is not searched and indexed either.

Sitemap lets you inform search engines about all the pages that are available on your site, including those that are not accessible through links. Sitemap is an XML-based protocol used by the major search engines, including Yahoo! and Google. By using the Sitemap protocol, you can identify all the web pages on your customer portal instead of waiting for the search engine spiders to find them.

A Sitemap page is simply a document on a web server that lists all the URLs for a site along with metadata for each URL, including the priority of each page and when it was last updated. Spiders use the page to crawl your customer portal pages more intelligently rather than relying solely on links within the site.

By default, Sitemap is enabled so a Sitemap page is created and registered with Yahoo and Google. The XML output of the page is available at:

https://<your_site>/ci/sitemap

The HTML output of the page is at:

https://<your_site>/ci/sitemap/html

Indexing web pages

You may want documents that are not part of your **knowledge base**, such as web pages, PDFs, and Microsoft Word documents, to be indexed. Indexing lets your customers find indexed documents as well as answers when they search from your customer portal or from an external site using the KnowledgeSyndication widget.

Indexing and searching of external documents are possible if you store the documents on a web server so they are available through a URL. Typically, this limits files to those within the document root, CGI root, or FTP root directories.

Important Because the Web Indexer engine provides support for the Sitemap protocol, it can be pointed to a page that uses Sitemap to better index web pages outside of Oracle Service Cloud. When a Sitemap-formatted page is the starting point for the Web Indexer, all pages identified by the Sitemap page are indexed, not just those available through links. To have the Web Indexer index a site using Sitemap, simply use the Sitemap URL as the root URL in the Web Indexer wizard. Learn about Sitemap here.

In addition to using Sitemap to provide better spidering of your customer portal pages, Web Indexer can index sites that use a Sitemap page. Here's how Web Indexer works.

Web Indexer overview

When customers access Web Indexer documents by searching on your customer portal, an initial list of answers is displayed on the Answers page. The Web Indexer feature displays the answers in the same way as the standard answers search.

After you configure a root URL to be indexed and searchable, a **web spider** is used to follow the hyperlinks contained within the web page, indexing each consecutive page. If any of the consecutive web pages contain hyperlinks, those hyperlinks are followed and those web pages are indexed as well. By using filters, the web spider can be set up to follow only those hyperlinks that are within specified domains, but are not among the excluded domains, subdomains, or URLs. Specified and excluded domains are configurable.

It is possible to have multiple URLs directed to the same document through URL masking and redirection, or the use of query parameters in a URL. During indexing, URLs are normalized to prevent a document from being indexed more than once. For example, the following two URLs can point to the same document in the same location on the web server:

```
http://WWW.EXAMPLE.org/pubs/docs1.txt
http://www3.example.org/pubs/docs1.txt?_user=321&_pass=@Qs!Xa
```

Both of these URLs would be normalized to:

```
http://www.example.org/pubs/docs1.txt
```

This normalization allows the spider to index the document a single time, which saves drive space on the server, increases search performance, and prevents customers from getting the same document returned twice during a search.

You can also create SED (stream editor) statements that rewrite URLs to find and replace strings within the URL or remove portions of a URL before the URL is stored in the index. This function lets you automatically remove query parameters or further normalize URLs. (SED is a stream editor commonly used to find and replace or find and remove patterns in text strings.)

External documents are not re-indexed if they are edited. They will be re-indexed the next time the **Keywordindexer** utility runs. The keyword indexes for external documents are stored in a file on the web server rather than in a database table.

Configure the Web Indexer.

Configuring the Web Indexer

External document searching is enabled through the Configuration Wizard. The wizard lets you set the root URLs, the maximum number of hops (from one hyperlink to another) from the root URLs, and a variety of filters to help restrict the Web Indexer to the selected areas of your website.

Important You must also edit the Answers page if you intend to use web indexing. Refer to Displaying web indexing results.

To configure the Web Indexer

1. Log in to Oracle Service Cloud.
2. Click the Configuration button on the **navigation pane**.
3. Double-click External Search Configuration under Service > Knowledge Base. The Configuration Wizard opens on the content pane.
4. Use the prompts in the Configuration Wizard to configure the Web Indexer. Click the Next button on the ribbon when you have finished configuring each page.
5. Click Save when you are finished.

View external search logs or Return to configuration options for the customer portal.

Viewing external search logs

To view external search logs

1. Log in to Oracle Service Cloud.
2. Click the Configuration button on the **navigation pane**.
3. Double-click Logs under Site Configuration. The Log Viewer page opens.
4. Click External Search Logs on the ribbon.
5. Click the Details link for the log you want to view.

50

Customer Portal Template and Page Set

The Oracle RightNow Customer Portal Cloud Service (Customer Portal) is a set of files that control the look and functionality of your organization's support site. The Customer Portal's reference implementation is the standard template, pages, and widgets that are used to create the default site using our best practices for customer support. You have complete flexibility to customize these files for your organization's needs and business practices.

The reference implementation includes a standard template on which all the default pages of the standard Customer Portal are built. (A mobile template also exists for creating pages to be displayed on mobile devices. Refer to Mobile template configuration. An additional basic template exists for devices and browsers with limited JavaScript capability. Refer to Basic template configuration.) In this section, we'll focus on the standard template configuration, common functionality across all pages, and working with the page set.

Note All pages in the Customer Portal reference implementation and all standard widgets conform to the HTML5 specification.

In this section, you'll learn about:

- Configuring the template
- Editing the page set from the template
- Configuring login functionality
- Configuring the Provide Feedback dialog
- Defining themes
- Using page tags
- Standard page files

When you're finished editing the template and are ready to begin configuring individual pages, select a page below to get started.

- Support Home Page

- Answers Page
- Answer Details Page
- Ask a Question Page
- Your Account Pages
- Log In page
- Live Help page or Chat page

Configuring the template

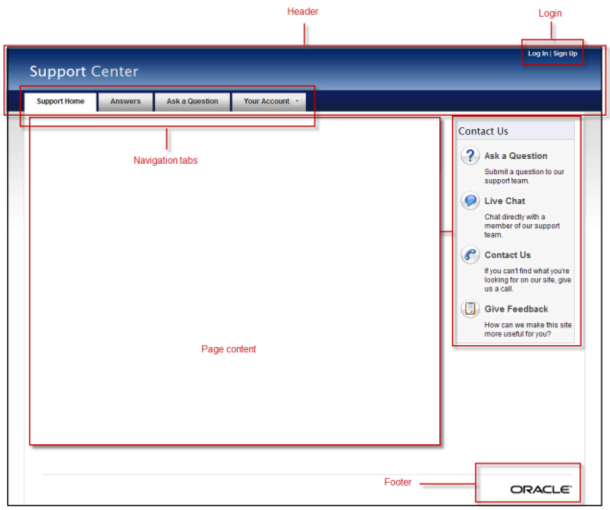
The template for the **reference implementation** of the Customer Portal includes the sidebar, the footer, and the header, which includes login functionality. The navigation tabs for the basic page set—Support Home, Answers, Community (only if enabled), Ask a Question, and Your Account—are defined on the template as well.

Important Any changes you make to configuration settings may affect the reference implementation pages. As a result, the behavior of the reference implementation may not correspond to the descriptions in this section if you have changed the default configuration settings.

Select a template configuration option.

- Configuring security
- Configuring the navigation tabs
- Configuring the sidebar
- Configuring the header
- Configuring the footer
- Adding an announcement to the template

When you finish configuring the template, you can return to other configuration options for the template and page set.



Using iFrames

If you run your customer portal in an iFrame on your organization's website, you should consider a few points prior to implementation. Best practice recommends against using iFrames, so the reference implementation includes a removable widget that prevents your customer portal from being presented in an iFrame.

The use of iFrames can pose several issues. Search engine optimization (SEO) is problematic because content in iFrames is not indexed by web crawlers. As a result, search engines will not display your knowledge base content to customers who are searching for specific information. Security is also a concern in iFrames because clickjacking—that is, misleading your customers into clicking a concealed link—is possible. (To remove the widget that prevents your site from being put into an iFrame, see ClickjackPrevention widget.)

An additional consideration against the use of iFrames is the inability to set cookies in Internet Explorer 11. Although your customers can unblock third-party cookies, requiring them to do so is not an optimal customer experience.

Configuring security

Clickjacking is an attack on browser security that can mislead your customers into clicking a concealed link. To prevent clickjacking, you cannot let your site be put into an iFrame on another site. If you do not use iFrames, make the following edits to the template file.

Note If you intentionally run your customer portal inside an iFrame, do not use the following procedure.

To configure the template for security

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following first lines of code.

```
<!DOCTYPE html>
<html lang="#rn:language_code#">
<rn:meta javascript_module="standard"/>
<head>
```

3 Immediately after the `<head>` tag you located in step 2, add the following code.

```
<script>
if (top!= self) top.location.href = self.document.location;
if (parent!= self) top.location.href = location.href;
if (top.frames.length!=0) top.location=self.document.location;
if (window!= window.top) top.location.href = location.href;
</script>
```

4 Save *standard.php*.

5 Open the *hooks.php* file in the */customer/development/config* folder.

6 Add the following code to the pre_page_render hook to prevent clickjacking in modern browsers. Refer to Adding hooks.

```
header("X-Frame-Options:deny");
```

7 Save *hooks.php*.

Configuring the navigation tabs

The template for the **reference implementation** includes navigation tabs for the Support Home, Answers, Community, Ask a Question, and Your Account pages. The Your Account tab has a drop-down menu that lets customers navigate directly to the Account Overview, Support History, Account Settings, and Notifications subpages. A visual indicator shows which tab a customer is hovering over. When the tab is selected, it changes color to match the page background.

Note The Community tab is enclosed in a condition that checks to see if **Oracle RightNow Social Experience** (Social Experience) is enabled on your site. By default, it is not enabled so the tab does not appear. For information about this condition tag, refer to Config Setting Check condition.

The following options are available for configuring the navigation tabs.

- Adding navigation tabs, including a Chat tab or tab for a URL
- Defining a URL for the Community tab
- Changing navigation tab labels
- Removing navigation tabs
- Changing the Your Account drop-down menu

Adding navigation tabs

You can add navigation tabs that open a customer portal page, described in the following example of adding a Change Password tab, or you might want to add a tab that opens a URL.

To add a navigation tab for a customer portal page

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following lines of code for the navigation tabs and the Your Account sub-menu.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:SUPPORT_HOME_TAB_HDG#"
link="/app/#rn:config:CP_HOME_URL#"
pages="home, "/></li>
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ANSWERS_HDG#"
link="/app/answers/list"
pages="answers/list, answers/detail, answers/intent"/></li>
<rn:condition config_check="COMMUNITY_ENABLED == true">
    <li><rn:widget path="navigation/NavigationTab"
    label_tab="#rn:msg:COMMUNITY_LBL#"
    link="#rn:config:COMMUNITY_HOME_URL:RNW##rn:community_token:?#"
    external="true"/></li>
</rn:condition>
```

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask"
pages="ask, ask_confirm"/></li>
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:YOUR_ACCOUNT_LBL#"
link="/app/account/overview"
pages="utils/account_assistance, account/overview, account/profile,
account/notif, account/change_password, account/questions/list,
account/questions/detail, account/notif/list, utils/login_form,
utils/create_account, utils/submit/password_changed, utils/submit/
profile_updated"
```

3 Add the following line of code where you want it to be displayed on the template navigation. For example, if you want the tab to appear between the Support Home and Answers tabs, add the code after the Support Home tab code and before the Answers tab code.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="New Tab"
link="/page_to_open"
pages="home, "/></li>
```

a Edit the code you just added to replace `New Tab` with the label you want to appear on the navigation tab.

b Edit the code to replace `page_to_open` with the page that you want to open when the tab is clicked.

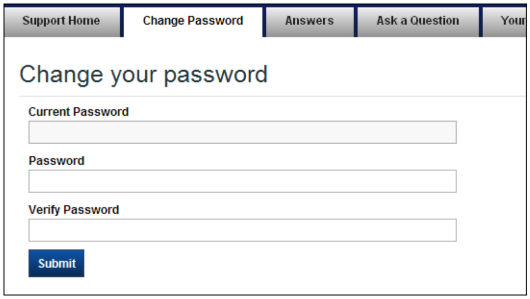
c Edit the code to replace `home` with the page or pages on which the CSS class of the tab should change. In other words, add the page where the tab will appear selected.

Your final edited code might resemble the following.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="Change Password"
link="/app/account/change_password"
pages="account/change_password, "/></li>
```

4 Save *standard.php*.

Click to view



Note In this figure, the Change Password page was also removed from the *page* attribute of the Your Account navigation tab code so that it would remain the same color as the other non-selected tabs when the Change Password tab is clicked. The modified code for the Your Account tab is the following.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:YOUR_ACCOUNT_LBL#"
link="/app/account/overview"
pages="utils/account_assistance, account/overview, account/
profile, account/notif, account/questions/list, account/
questions/detail, account/notif/list, utils/login_form,
utils/create_account, utils/submit/password_changed, utils/
submit/profile_updated"
```

Adding navigation for Chat

When **Oracle RightNow Chat Cloud Service** (Chat) is enabled, customers can request a chat using the Live Chat link in the sidebar, which tells them if agents are available and what the expected wait time is. However, you might also want to add a navigation tab that opens the Live Help page. (Refer to Configuring the Live Help page if you want to make any changes to the page itself.)

To add Live Help navigation

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the code for the navigation tabs. The first line of this code is:

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:SUPPORT_HOME_TAB_HDG#"
link="/app/#rn:config:CP_HOME_URL#"
pages="home, "/></li>
```

3 Add the following code for the Live Help page navigation. Add the code to correspond to the position where you want it to appear. For example, if you want it to be the left most tab, add it before the code for the Support Home tab, and if you want it on the right, add it after the Your Account tab.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:LIVE_HELP_HDG#"
link="/app/chat/chat_launch"
pages="chat/chat_launch"/></li>
```

4 To check that Chat is enabled before displaying the Live Help tab, add condition tags around the code for the tab, as shown here.

```
<rn:condition config_check="MOD_CHAT_ENABLED == true">
    <li><rn:widget path="navigation/NavigationTab"
    label_tab="#rn:msg:LIVE_HELP_HDG#"
    link="/app/chat/chat_launch"
    pages="chat/chat_launch"/></li>
</rn:condition>
```

5 Save *standard.php*.

Adding navigation tabs for URLs

To add a navigation tab for a URL

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the code for the navigation tabs.

3 Using the following sample code, add the navigation tab where you want it to be displayed on the template navigation.

```
<rn:widget path="navigation/NavigationTab"
label_tab="Oracle Service Cloud"
link="http://www.oracle.com/us/products/applications/rightnow/
overview/index.html"
pages="http://www.oracle.com/us/products/applications/rightnow/
overview/index.html"
external="true" /></li>
```

4 Save *standard.php*.

Defining a URL for the Community tab

Note The Community tab is enclosed in a condition that checks to see if **Social Experience** communities are enabled on your site. If they are not, the tab does not appear. For information about this condition tag, refer to Config Setting Check condition.

By default, the URL for the Community tab is void to prevent you from inadvertently linking to a site you don't want to link to. To activate the link, you'll need to specify a URL that takes customers to your community page.

To define a URL for the Community tab

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:COMMUNITY_LBL#"
link="#rn:config:COMMUNITY_HOME_URL:RNW##rn:community_token:?#"
external="true"/></li>
```

3 Replace `link="#rn:config:COMMUNITY_HOME_URL:RNW#"` with the URL for your community page. Your edited code will resemble the following.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:COMMUNITY_LBL#"
link="http://community.example.com/pages/
home#rn:community_token:?#"
external="true"/></li>
```

4 Save *standard.php*.

Continue configuring navigation tabs or Continue configuring the template.

Changing navigation tab labels

To change navigation labels

1 Open the *standard.php* file in the */views/templates* folder.

2 Change the label for each tab listed in the following table by finding its associated code and replacing the value for the *label_tab* attribute.

Table 365: Editing Navigation Tab Labels

To change this tab's label	Locate the following code	Replace this section with the new label
Support Home	`<li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:SUPPORT_HOME_TAB_HDG#" link="/app/#rn:config:CP_HOME_URL#" pages="home, "/></li>`	`#rn:msg:SUPPORT_HOME_TAB_HDG#`
Answers	`<li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ANSWERS_HDG#" link="/app/answers/list" pages="answers/list, answers/detail"/></li>`	`#rn:msg:ANSWERS_HDG#`
Community (if **Social Experience** is enabled)	`<li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:COMMUNITY_LBL#" link="#rn:config:COMMUNITY_HOME_URL:RNW##rn:community_token:?#" external="true"/></li>`	`#rn:msg:COMMUNITY_LBL#`
Ask a Question	`<li><rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ASK_QUESTION_HDG#" link="/app/ask" pages="ask, ask_confirm"/></li>`	`#rn:msg:ASK_QUESTION_HDG#`
Your Account	` <rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:YOUR_ACCOUNT_LBL#" link="/app/account/overview" pages="utils/account_assistance, account/overview, account/profile, account/notif, account/change_password, account/questions/list, account/questions/detail, account/notif/list, utils/login_form, utils/create_account, utils/submit/password_changed, utils/submit/profile_updated"`	`#rn:msg:YOUR_ACCOUNT_LBL#` To change the Your Account drop-down menu labels, click here.

3 Save *standard.php*.

Removing navigation tabs

To remove navigation tabs

1 Open the *standard.php* file in the */views/templates* folder.

2 Remove a tab by finding its associated code, defined in the following table, and deleting it.

Table 366: Deleting Navigation Tabs

To remove this tab	Delete the following code
Support Home	<rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:SUPPORT_HOME_TAB_HDG#" link="/app/#rn:config:CP_HOME_URL#" pages="home, "/>
Answers	<rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ANSWERS_HDG#" link="/app/answers/list" pages="answers/list, answers/detail"/>
Community (if **Social Experience** is enabled)	<rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:COMMUNITY_LBL#" link="#rn:config:COMMUNITY_HOME_URL:RNW##rn:community_toke n:?#" external="true"/>
Ask a Question	<rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:ASK_QUESTION_HDG#" link="/app/ask" pages="ask, ask_confirm"/>
Your Account	<rn:widget path="navigation/NavigationTab" label_tab="#rn:msg:YOUR_ACCOUNT_LBL#" link="/app/account/overview" pages="utils/account_assistance, account/overview, account/profile, account/notif, account/change_password, account/questions/list, account/questions/detail, account/ notif/list, utils/login_form, utils/create_account, utils/ submit/password_changed, utils/submit/profile_updated"

3 Save *standard.php*.

Changing the Your Account drop-down menu

To change the Your Account drop-down menu

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

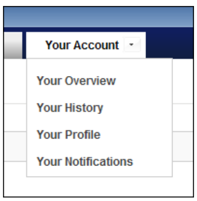
```
subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile,
#rn:msg:NOTIFICATIONS_LBL# > /app/account/notif/list"/></li>
```

3 Change the message base code (`#rn:msg:[subpage name]_LBL#`) to the text you want for the new label. Your code might resemble the following. (Learn about editing message bases here.)

```
subpages="Your Overview > /app/account/overview,
Your History > /app/account/questions/list,
Your Profile > /app/account/profile,
Your Notifications > /app/account/notif/list"/></li>
```

4 Save *standard.php*.

Note If you change the labels on the Your Account drop-down menu, you'll probably also want to change the labels on the Account Overview page as well as the page headings for the affected pages (Support History, Account Settings, and Notifications).



Configuring the sidebar

The default sidebar lets customers ask questions, submit a question to your community (if **Social Experience** is enabled), request a chat session (if **Chat** is enabled), find your organization's phone number, and provide feedback. You can customize the messages that appear in the sidebar. The sidebar also includes a search field on all pages except Support Home, Answers, and Support History, which already contain a main search control.

Note If the CP_DEPRECATED_CORE **configuration setting** is enabled and you are reviewing customer portal pages in the development or **reference implementation** mode, you may see a JavaScript error on the page when you submit site feedback through the Give Feedback sidebar link. This error does not appear in the production mode.

Sidebar configuration includes the following options.

- Defining a URL for the Contact Us link
- Defining a URL for the Ask the Community link
- Removing the search field from the sidebar
- Removing the search field from specific pages
- Removing sidebar elements
- Editing sidebar messages
- Adding the CobrowsePremium widget to the sidebar
- Adding elements to the sidebar
- Removing the sidebar

Defining a URL for the Contact Us link

By default, the URL for the Contact Us sidebar link is void to prevent you from inadvertently linking to a site you don't want to link to. To activate the link, you'll need to specify a URL that takes customers to a web page containing contact information for your organization.

If you prefer to display your phone number in the sidebar, you can change the message base to add the phone number.

To define a URL for the Contact Us link

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

```
<a href="javascript:void(0);">#rn:msg:CONTACT_US_LBL#</a>
```

Note Be sure you select the line for the Contact Us link. The link for the Ask the Community link also begins with `<a href="javascript:void(0);`.

3 Replace `javascript:void(0);` in the second line of code with the URL for your contact page. Your edited code will resemble the following.

```
<a href="http://www.oracle.com/us/products/applications/rightnow/overview/index.html">#rn:msg:CONTACT_US_LBL#</a>
```

4 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.

Adding a phone number to the sidebar

To add a phone number to the sidebar

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

```
<a href="javascript:void(0);">#rn:msg:CONTACT_US_LBL#</a>
<span>#rn:msg:CANT_YOURE_LOOKING_SITE_CALL_MSG#</span>
```

3 Edit the code to replace the Contact Us message base with a unique message that includes your phone number. (Learn about editing message bases here.) Your edited code will resemble the following.

```
<a href="javascript:void(0);">#rn:msg:CONTACT_US_LBL#</a>
<span>If you do not see what you want, call us at (406) 555-5555.</span>
```

4 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.

Customizing the sidebar

You can customize the sidebar in any of the following ways.

- Define a URL for the Ask the Community link.
- Remove the search field.
- Remove one or more elements.
- Edit one or more of the messages that appear.

- Add the CobrowsePremium widget to the sidebar.
- Add other elements to the sidebar.

When you're finished customizing the sidebar, continue configuring the template.

Defining a URL for the Ask the Community link

Note The Ask the Community link is enclosed in a condition that checks to see if **Social Experience** communities are enabled on your site. If they are not, the link does not appear in the sidebar. For information about this condition tag, refer to Config Setting Check condition.

By default, the URL for the Ask the Community sidebar link is void to prevent you from inadvertently linking to a site you don't want to link to. To activate the link, you'll need to specify a URL that takes customers to the community forum page where they can submit their questions.

You can also add an Ask the Community link to any customer portal page.

To define a URL for the Ask the Community link

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

```
<a href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#</a>
```

3 Replace `javascript:void(0);` with the URL for your community forum page that lets customers submit questions, being sure to append the community token (`#rn:community_token#`)to the end. Your edited code will resemble the following.

```
<a href="http://community.example.com/resources/b1248fb2a1/
summary#rn:community_token#"> #rn:msg:ASK_THE_COMMUNITY_LBL#</a>
```

4 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.

Adding an Ask the Community link to any page

To add an Ask the Community link to any customer portal page

1 Open the file for the page you want to add the Ask the Community link to.

2 Type the following code in the location on the page where you want the link to appear, replacing `community.example.com/resources/b1248fb2a1/summary` with the link to your site.

```
<rn:condition config_check="COMMUNITY_ENABLED == true">
    <div class="rn_Community">
        <a href="http://community.example.com/resources/b1248fb2a1/
        summary#rn:community_token#">
        #rn:msg:ASK_THE_COMMUNITY_LBL#</a>
    </div>
</rn:condition>
```

Note The Ask the Community link in the sidebar is contained within `rn:condition` tags that check to see if **Social Experience** communities are enabled on your site before displaying the link. This example also includes the conditional tags.

3 Save the file.

Continue customizing the sidebar or Continue configuring the template.

Removing the search field from the sidebar

By default, the search field appears in the sidebar on all pages that use the standard template, except for Support Home, Answers, and Support History. The sidebar search field does not appear on these pages because they already have a search field. Best practice recommends only one search field per page.

To remove the search field from the sidebar

1 Open the *standard.php* file in the */views/templates* folder.

2 Delete the following code.

```
<rn:condition hide_on_pages="answers/list, home, account/questions/
list">
<div class="rn_Module" role="search">
    <h2>#rn:msg:FIND_ANS_HDG#</h2>
    <rn:widget path="search/SimpleSearch"/>
</div>
</rn:condition>
```

3 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.

Removing the search field from specific pages

To remove the search field from specific pages

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:condition hide_on_pages="answers/list, home, account/questions/
list">
```

3 Edit the *hide_on_pages* attribute to include any other pages where you don't want the search field to appear in the sidebar. As an example, your code would look like the following if you decided not to display the search field on the Ask a Question page in addition to the pages where it already doesn't appear by default.

```
<rn:condition hide_on_pages="answers/list, home, account/questions/
list, ask">
```

4 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.

Removing sidebar elements

To remove sidebar elements

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code. The code for the sidebar elements follows these lines of code.

```
<h2>#rn:msg:CONTACT_US_LBL#</h2>
<div class="rn_HelpResources">
```

3 Use the following table to elect the element you want to remove and delete the associated text.

Table 367: Deleting Sidebar Elements

To remove this element	Delete the following code

Ask a Question	`<div class="rn_Questions">`
	`  <a href="/app/ask#rn:session#">#rn:msg:ASK_QUESTION_LBL#</a>`
	`  <span>#rn:msg:SUBMIT_QUESTION_OUR_SUPPORT_TEAM_CMD#</span>`
	`</div>`

Table 367: Deleting Sidebar Elements (Continued)

To remove this element	Delete the following code

Ask the Community	`<rn:condition config_check="COMMUNITY_ENABLED == true">`
	`  <div class="rn_Community">`
	`    <a`
	`    href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#<`
	`    /a>`
	`    <span>#rn:msg:SUBMIT_QUESTION_OUR_COMMUNITY_CMD#</span>`
	`  </div>`
	`</rn:condition>`

Live Chat	`<rn:condition config_check="MOD_CHAT_ENABLED == true">`
	`  <rn:widget path= "chat/ConditionalChatLink" min _sessions_`
	`  avail="1"/ >`
	`</rn:condition>`

Contact Us	`<div class="rn_Contact">`
	`  <a href="javascript:void(0);">#rn:msg:CONTACT_US_LBL#</a>`
	`  <span>#rn:msg:CANT_YOURE_LOOKING_SITE_CALL_MSG#</span>`
	`</div>`

Give Feedback	`<rn:condition config_check="CP_CONTACT_LOGIN_REQUIRED`
	`== false" logged_in="true">`
	`  <div class="rn_Feedback">`
	`    <rn:widget path="feedback/SiteFeedback" />`
	`    <span>#rn:msg:SITE_USEFUL_MSG#</span>`
	`  </div>`
	`</rn:condition>`

4 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.

Editing sidebar messages

The following procedure shows how to add a phone number to the Contact Us link in the sidebar. Use it as an example for modifying any of the other messages that appear in the side-bar.

To add a phone number to the Contact Us link

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

```
<div class="rn_Contact">
    <a href="javascript:void(0);">#rn:msg:CONTACT_US_LBL#</a>
    <span>#rn:msg:CANT_YOURE_LOOKING_SITE_CALL_MSG#</span>
</div>
```

3 Replace `#rn:msg:CANT_YOURE_LOOKING_SITE_CALL_MSG#` message base with the message you want to add. (Learn about editing message bases here.) Your code may resemble the following.

```
<span>If you cannot find what you are looking for on our site, give us
a call at (406) 555-5555.</span>
```

4 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.

Adding the CobrowsePremium widget to the sidebar

The CobrowsePremium widget lets customers share their desktop with agents who are helping them on the phone. Agents direct customers to the location of the link on your customer portal and ask them to click it. After the customer clicks the link, a window opens to display an access code. The customer provides the number to the agent, who enters it on the **Co-Browse** tab of an open incident to begin viewing the customer's desktop. (To learn more, see Co-browsing with customers.)

Note The Co-Browse Premium feature must be enabled before the widget displays. Contact your Oracle account manager to enable Co-Browse Premium.

The incident **workspace** must be customized to add the Co-Browse tab so the agent can use the feature. Refer to Configuring co-browse on incident workspaces.

If you want to allow co-browsing with Chat, refer to Configuring co-browse on chat workspaces and place the ChatCobrowsePremium widget on the Chat page.

You can add the CobrowsePremium widget to any page. The following procedure puts it on the template so it appears at the bottom of every page that uses the standard template.

To add the CobrowsePremium widget to the template

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following lines of code.

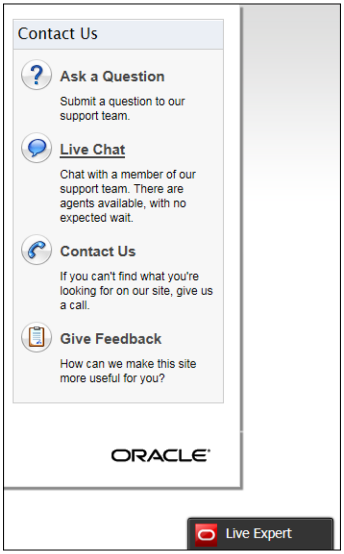
```
    <div class="rn_Feedback">
        <rn:widget path="feedback/SiteFeedback" />
        <span>#rn:msg:SITE_USEFUL_MSG#</span>
    </div>
</rn:condition>
</div>
```

3 Add the following lines of code immediately after the last line you located in step 2.

```
<div>
    <rn:widget path="utils/CobrowsePremium" />
</div>
```

4 Save *standard.php*.

Continue customizing the sidebar or Continue configuring the template.



Adding elements to the sidebar

You can add whatever element you want to the sidebar. Here are two examples.

- Adding an announcement to the template
- Adding the CommunityPosts widget to the template

Removing the sidebar

To remove the sidebar

1 Open the *standard.php* file in the */views/templates* folder.

2 Delete the following code. This code spans approximately 38 lines and includes the <div> classes for the search field and the Ask a Question, Live Chat, Contact Us, and Give Feedback links.

```
<div id="rn_SideBar" role="navigation">
    <div class="rn_Padding">
        <rn:condition hide_on_pages="answers/list, home, account/
        questions/list">
        <div class="rn_Module" role="search">
            <h2>#rn:msg:FIND_ANS_HDG#</h2>
.
.
.
</div>
```

Note Two </div> tags remain in the file immediately below the code you deleted.

3 Save *standard.php*.

Continue configuring the template.

Configuring the header

The header section of the template contains the main heading (Support Center) and login/ logout links.

- Changing the default heading
- Configuring login functionality

By customizing the code, you can also add your organization's logo, a search field, site navigation links, and any other elements you want to appear in the header of every page that uses the template.

When you're finished configuring the header, you can continue configuring other elements of the template.

Changing the default heading

To change the default heading in the header

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<div id="rn_Logo"><a href="/app/
#rn:config:CP_HOME_URL##rn:session#"><span
class="rn_LogoTitle">#rn:msg:SUPPORT_LBL# <span
class="rn_LogoTitleMinor">#rn:msg:CENTER_LBL#</span></span></a></div>
```

3 Edit the code to add the heading text you want to appear, as shown in the following example. (Learn about editing message bases here.)

```
<div id="rn_Logo"><a href="/app/
#rn:config:CP_HOME_URL##rn:session#"><span
class="rn_LogoTitle">Global Wireless <span
class="rn_LogoTitleMinor">Support</span></span></a></div>
```

4 Save *standard.php*.

Configure login functionality or Continue configuring the template.

Configuring the footer

The footer in the **reference implementation** template contains the PageSetSelector widget and the Oracle logo. The PageSetSelector widget lets your customers switch between the standard, mobile, and basic page sets.

By customizing the code, you can also add site navigation links, a copyright statement, contact information, and other elements you want to appear in the footer of every page that uses the template. This example procedure shows you how to add a copyright statement to the footer.

To add a copyright to the footer

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code within the `<div>` tags for `rn_Footer`.

```
<rn:widget path="utils/PageSetSelector"/>
```

3 Add the following code just below the code you located in step 2.

```
<p>&copy Copyright 2014 Global Wireless </p>
```

4 Save *standard.php*.

Continue configuring the template.

Adding an announcement to the template

You might want to add an announcements section to the template's sidebar, where you can provide information for your customers. You can accomplish this by adding the standard AnnouncementText widget to the sidebar. Because you can call whatever file you want, you can change the displayed information at will.

You might want to use this widget when another staff member defines what information should be displayed, but does not (or should not) have access to Customer Portal code. The staff member can modify the file that the AnnouncementText widget calls without modifying any files. Because the widget pulls the file from */cp/customer/assets*, where files are shared between development and production, you are not required to stage and promote your customer portal after editing the file called by the AnnouncementText widget. Instead, its content is immediately available on your production site.

You might also consider setting conditions to determine which file is called by the widget. For example, you could display one announcement to customers who have an SLA and different information to those who do not have an SLA.

- Add an announcement to the sidebar.
- Define conditions for displaying an announcement.

After you've finished adding an announcement, continue configuring the template.

Adding an announcement to the sidebar

To add an announcement to the sidebar

1 First, create the file you want to use as an announcement. For the sake of this procedure, create a custom subfolder called *announcements* in the */cp/customer/assets* folder, and name the file *announcement.html*.

2 Open the *standard.php* file in the */views/templates* folder.

3 Locate the following code.

```
            <div class="rn_Feedback">
                <rn:widget path="feedback/SiteFeedback" />
                <span>#rn:msg:SITE_USEFUL_MSG#</span>
            </div>
        </rn:condition>
        </div>
    </div>
```

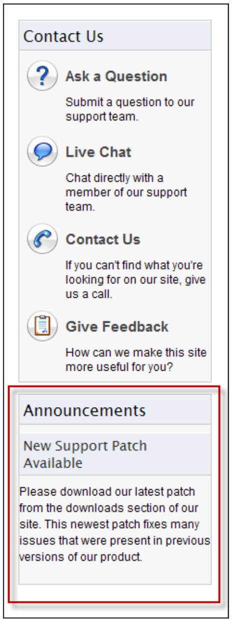
4 Add the following code immediately after the code you found in step 3.

```
<div class="rn_Module">
    <rn:widget path="utils/AnnouncementText"
    file_path="/cp/customer/assets/announcements/announcement.html" /
    >
</div>
```

Note The *file_path* attribute is required for the AnnouncementText widget in order for the announcement to have any content.

5 Save *standard.php*.

Define conditions for displaying the announcement widget or Continue configuring the template.



Defining conditions for displaying an announcement

In this example, we'll assume that you want to show your standard announcement to customers who do not have an SLA. We'll also assume that you have a different announcement, which we'll call *announcement_sla.html*, in the */cp/customer/assets/announcements* folder for customers with an incident SLA.

To define conditions for the AnnouncementText widget

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

```
            <div class="rn_Feedback">
                <rn:widget path="feedback/SiteFeedback" />
                <span>#rn:msg:SITE_USEFUL_MSG#</span>
            </div>
        </rn:condition>
        </div>
    </div>
```

3 Add the following code immediately after the code you found in step 2.

```
<rn:condition sla="incident">
    <div class="rn_Module">
        <rn:widget path="utils/AnnouncementText"
        file_path="/cp/customer/assets/announcements/
        announcement_sla.html" />
    </div>
<rn:condition_else />
    <div class="rn_Module">
        <rn:widget path="utils/AnnouncementText"
        file_path="/cp/customer/assets/announcements/
        announcement.html" />
    </div>
</rn:condition>
```

4 Save *standard.php*.

Continue configuring the template.

Editing the page set from the template

The standard page set included in the Customer Portal **reference implementation** contains a set of standard pages that let your customers search for information in your **knowledge base**, view **answers**, ask a question, and update their **contact** information.

This section helps you configure the page set. It shows you how to remove any of the standard pages that you don't want to display on your customer portal, add other pages, or hide the Ask a Question tab until certain conditions are met. Select one of the following options to configure the page set.

Configuring the page set

- Remove pages
  - ▷ Support Home
  - ▷ Answers
  - ▷ Ask a Question
  - ▷ Your Account
- Add pages
- Require customers to conduct searches or view answers before displaying the Ask a Question tab

See a listing of all Customer Portal pages in the reference implementation, including their file names and descriptions.

When you finish configuring the template, you can return to other configuration options for the template and page set.

Configuring individual pages

To configure a specific page, select the page you want to configure from the following options. These standard pages are highly flexible, so you can configure the pages to meet the specific needs of your organization without having to create custom pages.

- Support Home Page
- Answers Page
- Answer Details Page
- Ask a Question Page
- Your Account Pages
- Log In page
- Live Help page or Chat page

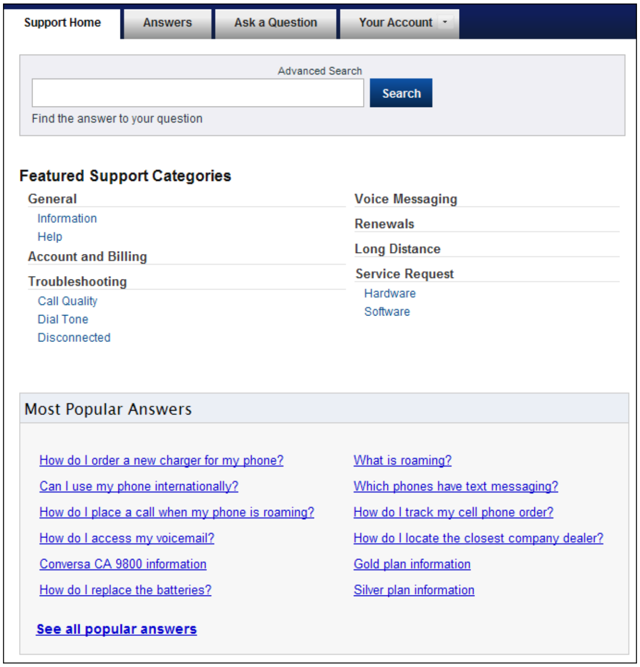
Support Home page

By default, your customers enter your support site through the Support Home page. It contains a search field, a list of featured support categories, and the Most Popular Answers report. If you remove the Support Home page, you'll need to specify another entry point into your customer portal.

Do you want your customers to use the Support Home page to access your customer portal?

- **Yes.** This is the default, so you can continue configuring the page set.

- **No.** Show me how to remove the Support Home page.



Removing the Support Home page

If you remove the Support Home page from your customer portal, you'll want to remove the navigation tab that points to it. You'll also need to go to the **administration interface** and edit the **configuration setting** that defines which page opens by default. The following procedure shows you how to perform these steps.

To remove the Support Home page

1 Delete the *home.php* file from the */views/pages* folder.

2 Edit the *standard.php* file, located in the */views/templates* folder, to delete the following line of code.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:SUPPORT_HOME_TAB_HDG#"
link="/app/#rn:config:CP_HOME_URL#"
pages="home, "/></li>
```

3 Save *standard.php*.

4 Change the configuration setting that determines what page first opens on your customer portal.

   a Log in to Oracle Service Cloud.

   b Use the procedure described in To locate and edit configuration settings to locate CP_HOME_URL under RightNow User Interface > Customer Portal > Pages.

   c In the Value field, type the name of the page you want customers to be directed to when they first access your customer portal. Begin at the */views/pages* folder level and omit the PHP file name extension. For example, to specify the Ask a Question page, type `ask`. To specify the Answers page, type `answers/list`.

   d Click the Save button on the ribbon.

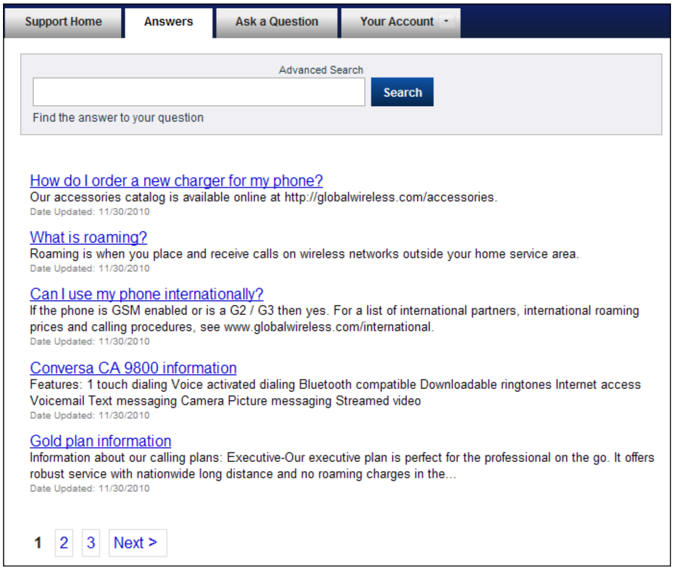
Continue configuring the page set.

Answers page

The Answers page lets your customers search your **knowledge base** using basic and advanced search methods. The search results page displays a list of **answers** that match the customer's search terms. The page contains links to individual answers that are displayed in the **report**.

Do you want your customers to have access to the Answers page?

- **Yes.** This is the default, so you can continue configuring the page set.
- **No.** Show me how to remove the Answers page.



Removing the Answers page

If you're going to remove the Answers page, you'll also want to remove the answer details page, which displays a selected answer, as well as the navigation link to it in the template. The following procedure shows you how to perform these steps.

To remove the Answers page

1 Delete the *list.php* and *detail.php* files from the */cp/customer/development/views/pages/answers* folder.

2 Edit the *standard.php* file, located in the */views/templates* folder, to delete the following line of code.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ANSWERS_HDG#"
link="/app/answers/list"
pages="answers/list, answers/detail"/></li>
```

3 Save *standard.php*.

It also makes sense to delete the following features that are associated with answers.

- The Search field in the sidebar on pages that don't have another search field
- The Notifications section on the Account Overview page

- The Notifications option on the Your Account tab's drop-down menu

You may want to delete the Support Home page as well, since it includes links to answers.

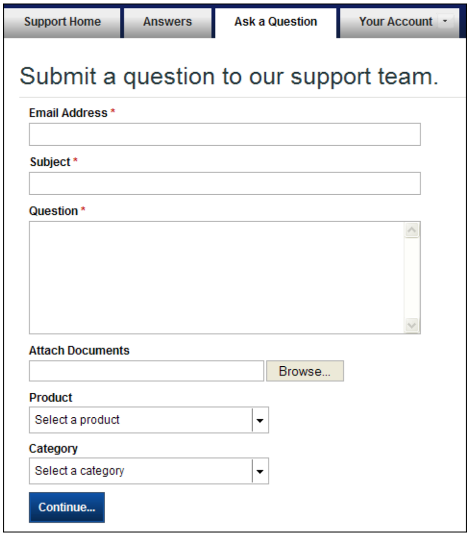
Continue configuring the page set.

Ask a Question page

The Ask a Question page lets your customers submit questions to your support team when they can't find the answer they are looking for. If you want, you can hide the page link until after customers have searched for information or viewed answers in your **knowledge base**.

Do you want your customers to have access to the Ask a Question page?

- **Yes.** This is the default, so you can continue configuring the page set.
- **Yes,** but I want them to first try to find the answer themselves. Show me how to require customers to conduct a search or view an answer before they can access the Ask a Question page.
- **No.** Show me how to remove the Ask a Question page.



Requiring a search or answer view

You might want to encourage your customers toward increased self-service instead of having them automatically submit every question they have to your support team. One way you can accomplish this is by turning off the Ask a Question tab until customers have conducted a specified number of searches or viewed a specified number of answers.

The RN Condition page tag lets you hide part of the page if the condition specified in the tag is not met. Among the attributes of this tag are *searches_done* and *answers_viewed*. You can use one or the other or both.

Note Before you implement this requirement, you should consider the usability issues of conditionally hiding and exposing page navigation. Particularly for customers using screen readers, the presence of a new navigation tab may not be evident when the conditions that trigger its appearance have occurred.

View other uses of the RN Condition tag here.

To display the Ask a Question page based on searches done or answers viewed

1 Open the *standard.php* file in the */views/templates* folder.

2 Select the condition you want to use to determine when the Ask a Question is displayed.

- Answers viewed only
- Searches done only
- Answers viewed or searches done
- Answers viewed and searches done

3 Save *standard.php*.

Continue configuring the page set or Continue configuring the Ask a Question page.

Answers only condition

To use answers only as a condition

1 In the *standard.php* file, locate the following line of code that defines the Ask a Question navigation tab.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask" pages="ask, ask_confirm"/></li>
```

2 Add the following code on a separate line above the code for the Ask a Question tab.

```
<rn:condition answers_viewed="3">
```

Note In this example, customers must view three answers before the tab is displayed. Replace `"3"` in the code with the number of answers you want them to view.

3 Add the following code on a separate line below the code for the Ask a Question tab.

```
</rn:condition>
```

Return to the procedure.

Searches only condition

To use searches only as a condition

Note We recommend using the NavigationTab widget *searches_done* attribute instead of the RN Condition *searches_done* attribute if your only criteria for displaying the Ask a Question page is the number of searches your customers perform.

Because the RN Condition tag identifies a search only when a page is turned or refreshed, this is a less ideal option for displaying the Ask a Question page. Assume you set the *searches_done* attribute for RN Condition to 2. Now assume a customer conducts one search, reviews the list but does not click an answer or otherwise leave or refresh the answers list page, and then conducts a second search. In this case, the Ask a Question tab will not be displayed until another page is opened or the current page is refreshed.

To count searches performed by the customer regardless of whether page turns occur (that is, regardless of whether an answer resulting from a search is viewed), use the *searches_done* attribute of the NavigationTab widget rather than the *searches_done* attribute of the RN Condition tag.

1 In the *standard.php* file, locate the following line of code that defines the Ask a Question navigation tab.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask"
pages="ask, ask_confirm"/></li>
```

2 Add the *searches_done* attribute to the NavigationTab widget.

```
<li><rn:widget path="navigation/NavigationTab"
```

```
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask"
pages="ask, ask_confirm"
searches_done="2" /></li>
```

Return to the procedure.

Answers or searches condition

To use either answers or searches as a condition

Note This example uses the *searches_done* attribute of the NavigationTab widget instead of the *searches_done* attribute of the RN Condition tag in order to count searches regardless of whether the customer opens an answer after conducting a search.

1 In the *standard.php* file, select the following line of code that defines the Ask a Question navigation tab.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask"
pages="ask, ask_confirm"/></li>
```

2 Type the following code to replace the selected line of code.

```
<rn:condition answers_viewed="3">
    <li><rn:widget path="navigation/NavigationTab"
    label_tab="#rn:msg:ASK_QUESTION_HDG#"
    link="/app/ask"
    pages="ask, ask_confirm"/></li>
<rn:condition_else/>
    <li><rn:widget path="navigation/NavigationTab"
    label_tab="#rn:msg:ASK_QUESTION_HDG#"
    searches_done="2"
    link="/app/ask"
    pages="ask, ask_confirm"/></li>
</rn:condition>
```

Return to the procedure.

Answers and searches condition

To use both answers and searches as a condition

1 In the *standard.php* file, select the following line of code that defines the Ask a Question navigation tab.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask"
pages="ask, ask_confirm"/></li>
```

2 Type the following code to replace the selected line of code and place conditions on the display of the Ask a Question tab.

```
<rn:condition answers_viewed="3">
    <li><rn:widget path="navigation/NavigationTab"
    label_tab="#rn:msg:ASK_QUESTION_HDG#"
    link="/app/ask"
    pages="ask, ask_confirm"
    searches_done="2"/></li>
</rn:condition>
```

Return to the procedure.

Removing the Ask a Question page

If you want to remove the Ask a Question page, you'll need to perform a couple of steps.

- First, you'll remove the page and edit the template to remove the following elements.
  - ▷ The Ask a Question navigation tab
  - ▷ The Support History option on the Your Account tab's drop-down menu
  - ▷ The Ask a Question link in the sidebar
- Then, you'll remove the Support History section of the Your Account Overview page.

To remove the Ask a Question page and edit the template

1 Delete the *ask.php* and *ask_confirm.php* files from the */cp/customer/development/views/pages* folder.

2 Open the *standard.php* file, located in the */views/templates* folder.

3 Delete the following line of code to remove the page navigation.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
```

```
link="/app/ask"
pages="ask, ask_confirm"/></li>
```

4 Edit the following line of code to delete `#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list`. This removes the Support History menu item on the Your Account navigation tab.

```
subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile,
#rn:msg:NOTIFICATIONS_LBL# > /app/account/notif/list"/></li>
```

5 Delete the following lines of code to remove the Ask a Question option from the sidebar.

```
<div class="rn_Questions">
    <a href="/app/ask#rn:session#">#rn:msg:ASK_QUESTION_LBL#</a>
    <span>#rn:msg:SUBMIT_QUESTION_OUR_SUPPORT_TEAM_CMD#</span>
</div>
```

6 Save *standard.php*.

To remove the Support History section from the Account Overview page

1 Open the *overview.php* file in the */views/pages/account* folder.

2 Delete the following lines of code.

```
<h2><a class="rn_Questions" href="/app/account/questions/
list#rn:session#">#rn:msg:QUESTIONS_HDG#</a></h2>
<div class="rn_Questions">
    <rn:widget path="reports/Grid"
    report_id="196"
    per_page="4"
    label_caption="<span class='rn_ScreenReaderOnly'>
    #rn:msg:YOUR_RECENTLY_SUBMITTED_QUESTIONS_LBL#</span>" />
    <a href="/app/account/questions/
    list#rn:session#">#rn:msg:SEE_ALL_QUESTIONS_LBL#</a>
</div>
```

3 Save *overview.php*.

Continue configuring the page set.

Your Account pages

When customers click the Your Account tab, the Log In page opens if they are not logged in. If they are logged in, the Account Overview page opens. The Account Overview page displays the customer's support history in a list of recently submitted questions and a link to a page that displays all their submitted questions. It also provides a link for updating **account** settings and changing the customer's password. Up to four **answer notifications** are displayed on the overview page along with a link for all answer and product/category notifications.

Do you want to give your customers access to the Your Account pages, including Account Overview, Support History, Account Settings, and Notifications?

- **Yes.** This is the default, so continue configuring the page set.
- **Yes,** and I'd like to make some changes to the Account Overview page.
- **Yes,** and I'd like to make some changes to a subpage.
- **No.** Show me how to remove one or more of the Your Account pages.

Removing the Your Account pages

You have the following options for removing Your Account pages.

- Remove all of the Your Account pages, including the Account Overview, Support History, Account Settings, and Notifications.
- Keep the Account Overview page and remove one or more subpages: Support History, Account Settings, or Notifications.

When you're finished removing the pages, continue configuring the page set.

Removing all of the Your Account pages

When you want to remove the Your Account pages, you'll need to remove the pages from the file structure and remove the template navigation to the pages.

To remove all Your Account pages

1. Delete the *overview.php* and *profile.php* files from the */cp/customer/development/views/pages/account* folder.
2. Delete the *list.php* file from the */views/pages/account/notif* folder.
3. Delete the *list.php* file from the */views/pages/account/questions* folder.
4. Edit the *standard.php* file, located in the */views/templates* folder, to delete the following two lines of code.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:YOUR_ACCOUNT_LBL#"
link="/app/account/overview"
pages="utils/account_assistance, account/overview, account/profile,
account/notif, account/change_password, account/questions/list,
account/questions/detail, account/notif/list, utils/login_form,
utils/create_account, utils/submit/password_changed, utils/submit/
profile_updated"
subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile,
#rn:msg:NOTIFICATIONS_LBL# > /app/account/notif/list"/></li>
```

5 Save *standard.php*.

Continue configuring the page set.

Removing Your Account subpages

This example procedure demonstrates removing the Support History subpage and navigation. Use the same steps to remove the Account Settings or Notifications subpages: remove the page from the file structure, change the drop-down menu on the Your Account tab, and remove the section from the Account Overview page.

To remove the Support History subpage

1 Delete the *list.php* file from the */views/pages/account/questions* folder.

2 Open the *standard.php* file, located in the */views/templates* folder.

3 Locate the following line of code.

```
subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile,
#rn:msg:NOTIFICATIONS_LBL# > /app/account/notif/list"/></li>
```

4 Edit the code to delete `#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list`. The following code shows the edited line.

```
subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile,
#rn:msg:NOTIFICATIONS_LBL# > /app/account/notif/list"/></li>
```

5 Save *standard.php*.

6 Next, you'll remove the Support History section on the Account Overview page. Open the *overview.php* file in the */views/pages/account* folder.

7 Delete the following lines of code.

```
<h2><a class="rn_Questions" href="/app/account/questions/
list#rn:session#">#rn:msg:QUESTIONS_HDG#</a></h2>
<div class="rn_Questions">
    <rn:widget path="reports/Grid"
    report_id="196"
    per_page="4"
    label_caption="<span class='rn_ScreenReaderOnly'>
    #rn:msg:YOUR_RECENTLY_SUBMITTED_QUESTIONS_LBL#</span>"/>
    <a href="/app/account/questions/
    list#rn:session#">#rn:msg:SEE_ALL_QUESTIONS_LBL#</a>
</div>
```

8 Save *overview.php*.

Continue configuring the page set.

Adding pages to your customer portal

You can add any other page to your customer portal and configure the navigation controls to point to the page. For example, you may want to add a Browse page to let your customers **browse** products and categories. This lets them view specific areas of interest without conducting a search.

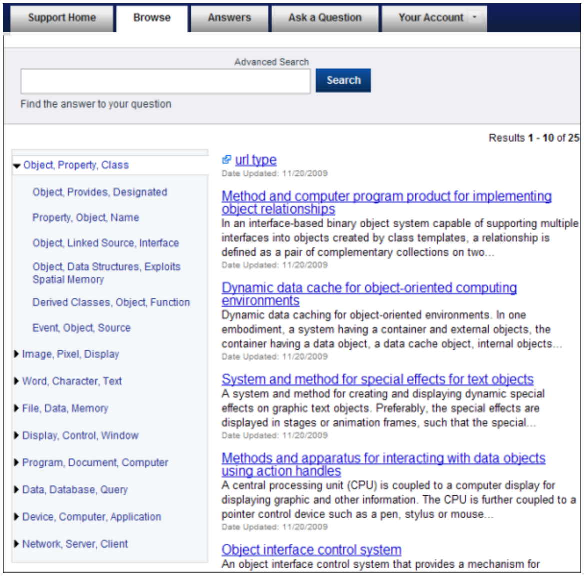
Does the reference implementation contain the pages you want to provide on your customer portal?

- **Yes.** This is the default, so you can continue editing the page set.
- **No,** I want to add a Browse page to the page set.
- **No,** I want to add a different page to the page set.

Adding a Browse page

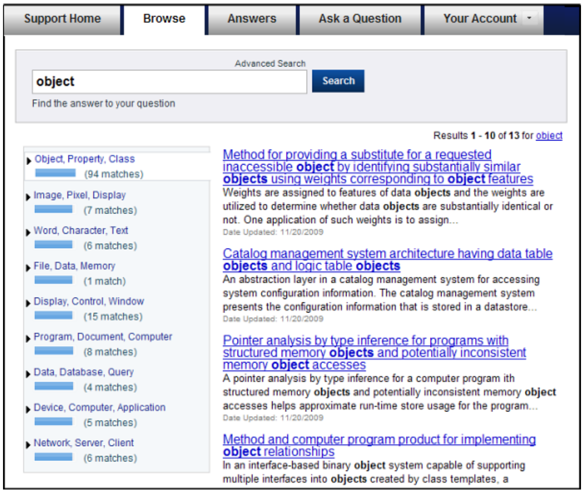
You might want to offer your customers the option of **browsing** for answers by topic rather than searching on the Answers page. If this is the case, you can use the TopicBrowse widget, which displays a topics tree on the left and the answers associated with a selected topic on the right.

Click to view



If customers enter a search term in the search field, the topics associated with the search term are listed.

Click to view



The TopicBrowse widget is not part of the **reference implementation**, and we recommend that you create a separate page for it, which means you'll also need to add a new navigation tab for it on the template.

Note If you want to replace the default Answers page with the Browse page, simply edit the *list.php* file as described in the following procedure, omitting step 2. You will not need to edit the template file to add Browse page navigation because your page can use the existing Answers page navigation tab.

To add a custom Browse page

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Save the file with a new name in the */views/pages/answers* folder. This file will become your Browse page. For the sake of example, name the file *browse.php*.

3 Locate the following line of code and replace `report_id="176"` with `report_id="178"`.

```
<rn:container report_id="176">
```

4 Locate the following lines of code.

```
<div class="rn_SearchInput">
```

```
    <rn:widget path="search/AdvancedSearchDialog"/>
    <rn:widget path="search/KeywordText"
    label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#"
    initial_focus="true" />
</div>
<rn:widget path="search/SearchButton" />
```

5 Add the following line above the first line of code you located in step 4.

```
<fieldset>
```

6 Add the following line below the last line of code you located in step 4.

```
</fieldset>
```

7 Locate the following line of code.

```
<rn:widget path="knowledgebase/TopicWords"/>
```

8 Add the following lines of code below the code you located in step 7.

```
<div class="rn_FloatLeft">
    <rn:widget path="knowledgebase/TopicBrowse" />
</div>
```

9 Save *browse.php*.

To add Browse page navigation

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the block of NavigationTab widgets and add the following line of code where you want it displayed on the template. For example, if you want the tab to appear between the Support Home and Answers tabs, add the code after the Support Home tab code and before the Answers tab code.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="Browse"
link="/app/answers/browse"
pages="answers/browse, answers/detail"/></li>
```

3 Save *standard.php*.

Change the topic labels that are displayed on the Browse page or Continue editing the page set.

Changing topic labels

You may prefer to change the topic labels that are displayed to your customers so they use terminology that is more consistent with what your organization uses. You can edit the labels on the **administration interface**.

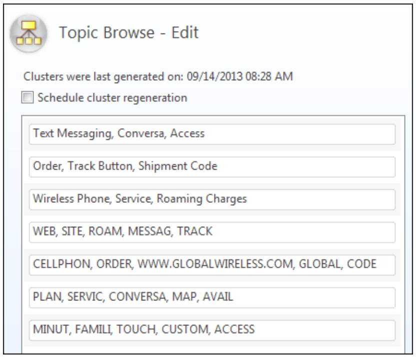
To change topic labels

1 Log in to Oracle Service Cloud.

2 Click the Configuration button on the navigation pane.

3 Double-click Topic Browse under Service > Knowledge Base. The Interfaces tree displays on the content pane.

4 Click the interface in the left column to display the Topic Browse editor.



5 Click the label you want to edit under the Cluster Labels heading. The cursor is placed in the label field.

6 Edit the current label or type a new one.

7 To schedule your changes so they take effect the next time the **Agedatabase** utility runs, select the Schedule Cluster Regeneration check box.

8 Click the Save and Close button on the ribbon.

Return to Adding a Browse page or Continue editing the page set.

Adding other pages

If you want to add a page from the **reference implementation** to your customer portal, you'll simply need to add template navigation to the page. Click here to see an example of adding the Change Password page and navigation tab to the template.

The procedure is similar for any custom page you want to add. After you create the page, add it to the */development/views/pages* folder or one of its subfolders and use that path to call the page. As an example, if you add a page named *new_page.php* to the *utils* folder, define it as */app/utils/new_page* in your code.

Note If your custom page is a PHP file, as it most likely is, it will be compiled during the **staging** process with the rest of the page files in the *development* folder. Non-PHP files are not compiled during staging.

When you edit reference implementation files or create custom pages, we recommend that you don't add PHP to your page and template files. This practice lets non-developers edit the pages without affecting server-side scripting.

Continue editing the page set.

Configuring login functionality

Customers who already have an **account** with your organization can click the Log In link to log in to their account. Customers who do not yet have an account can click the Sign Up link to create an account.

Important Customers must have their browsers set to accept cookies or they will not be able to log in to the customer portal.

You may also want to require that customers log in to some or all of your customer portal pages.

When customers are logged in, the login section of the header displays a welcome message, their full name, organization name if the customer is associated with one, and the Logout link.

Do you want the Log In and Sign Up links to appear in the header?

- **Yes.** This is the default, so you can continue configuring the login section.
- **Yes,** I want to display both links, but I want to change the link labels.
- **No,** I want to display the Log In link, but not the Sign Up link.

- **No,** show me how to remove both links in the header.

Important If pass-through authentication is enabled (that is, if the value of PTA_EXTERNAL_LOGIN_URL is not null), the Log In and Sign Up links will be inactive. You may want to edit them or remove them.

To configure the login dialog that opens when customers click the Log In link, refer to Login-Dialog widget.

Changing link labels

To change the Log In and Sign Up link labels

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<a href="javascript:void(0);" id="rn_LoginLink">#rn:msg:LOG_IN_LBL#</
a> | <a href="/app/utils/
create_account#rn:session#">#rn:msg:SIGN_UP_LBL#</a>
```

3 Edit the code to change the labels. Your code will resemble the following example.

```
<a href="javascript:void(0);" id="rn_LoginLink">New Log In</
a> | <a href="/app/utils/create_account#rn:session#">New
Sign Up</a>
```

4 Save *standard.php*.

Continue configuring the login section.

Removing only the Sign Up link

To remove the Sign Up link

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<a href="javascript:void(0);" id="rn_LoginLink">#rn:msg:LOG_IN_LBL#</
a> | <a href="/app/utils/
create_account#rn:session#">#rn:msg:SIGN_UP_LBL#</a>
```

3 Edit the line to delete the code that begins with the first ` `. The following code is the edited version.

```
<a href="javascript:void(0);" id="rn_LoginLink">#rn:msg:LOG_IN_LBL#</
a>
```

4 Save *standard.php*.

Continue configuring the login section.

Removing the Log In and Sign Up links

To remove the Log In and Sign Up links

1 Open the *standard.php* file in the */views/templates* folder.

2 Delete the following lines of code.

```
<rn:condition_else />
    <rn:condition config_check="PTA_ENABLED == true">
        <a href="javascript:void(0);"
        id="rn_LoginLink">#rn:msg:LOG_IN_LBL#</a> | <a
        href="javascript:void(0);">#rn:msg:SIGN_UP_LBL#</a>
    <rn:condition_else>
        <a href="javascript:void(0);"
        id="rn_LoginLink">#rn:msg:LOG_IN_LBL#</a> | <a
        href="/app/utils/
        create_account#rn:session#">#rn:msg:SIGN_UP_LBL#</a>
        <rn:condition hide_on_pages="utils/create_account, utils/
        login_form, utils/account_assistance">
            <rn:widget path="login/LoginDialog"
            trigger_element="rn_LoginLink"/>
        </rn:condition>
        <rn:condition show_on_pages="utils/create_account, utils/
        login_form, utils/account_assistance">
            <rn:widget path="login/LoginDialog"
            trigger_element="rn_LoginLink"
            redirect_url="/app/account/overview"/>
        </rn:condition>
    </rn:condition>
```

Note Don't delete the last closing condition tag for the `logged_in="true"` condition.

3 Save *standard.php*.

Continue configuring the login section.

Additional login configuration

When a customer is logged in, do you want to display "Welcome [First Name] [Last Name] [Organization]" in the login section?

- **Yes.** This is the default, so you can continue configuring the template.
- **No,** I want to change the welcome message.
- **No,** I want to display only the customer's first name.
- **No,** I want to remove the organization name from the welcome message. (If your contacts are not associated with **organizations**, you do not need to remove the organization name from the template because it won't appear.)
- **No,** I want to remove the entire message.

When you're finished configuring the login, continue configuring the template or return to other configuration options for the template and page set.

Changing the welcome message

To change the welcome message

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
#rn:msg:WELCOME_BACK_LBL#
```

3 Replace the entire line of code with your new welcome message. Your code will resemble the following.

```
New Welcome Message
```

4 Save *standard.php*.

Continue configuring the login section or Return to other configuration options for the template and page set.

Displaying first name only

To display only the customer's first name

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:field name="Contact.LookupName"/><rn:condition language_in="ja-JP">#rn:msg:NAME_SUFFIX_LBL#</rn:condition>
```

3 Edit the field name as shown in the following line of code.

```
<rn:field name="Contact.Name.First"/><rn:condition language_in="ja-
JP">#rn:msg:NAME_SUFFIX_LBL#</rn:condition>
```

4 Save *standard.php*.

Continue configuring the login section or Return to other configuration options for the template and page set.

Removing the organization from the welcome message

If the customer is not associated with an **organization**, no organization name appears in the header even if this code remains in the template file.

To remove the organization

1 Open the *standard.php* file in the */views/templates* folder.

2 Delete the following line of code.

```
    <rn:field name="Contact.Organization.LookupName"/>
```

Note Leaving the `<div>` tags above and below the organization name keeps the Logout link on the line after the welcome message.

3 Save *standard.php*.

Continue configuring the login section or Return to other configuration options for the template and page set.

Removing the welcome message

To remove the welcome message

1 Open the *standard.php* file in the */views/templates* folder.

2 Delete the following lines of code.

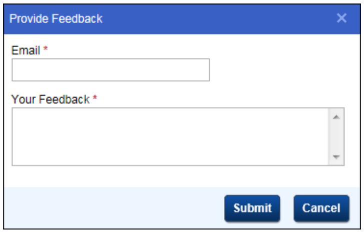
```
#rn:msg:WELCOME_BACK_LBL#
<strong>
    <rn:field name="Contact.LookupName"/><rn:condition
    language_in="ja-JP">#rn:msg:NAME_SUFFIX_LBL#</rn:condition>
</strong>
<div>
    <rn:field name="Contact.Organization.LookupName"/>
</div>
```

3 Save *standard.php*.

Continue configuring the login section or Return to other configuration options for the template and page set.

Configuring the Provide Feedback dialog

The Provide Feedback dialog opens when customers click the Give Feedback sidebar link. If the customer is not logged in, the dialog contains two required fields: the email address and a feedback field. If the customer is logged in, the incident created by the feedback is automatically associated with the customer and only the Your Feedback field appears on the dialog.



Do you want to use the default Provide Feedback dialog?

- **Yes.** This is the default so you can continue configuring the template.
- **No,** I'd like to customize how customers provide feedback.
- **No,** I want to remove the option of providing feedback.

When you're finished with the feedback dialog, return to other configuration options for the template and page set.

Customizing how customers provide feedback

When customers click the Give Feedback sidebar link, the Provide Feedback dialog opens by default. This dialog is generated with the SiteFeedback widget. You can modify the attributes of the widget to change the dialog, or you can open a different page instead of opening the dialog.

- Define the page that should open instead of the feedback dialog.
- Change labels on the dialog. (Cancel button, Your Feedback label, Provide Feedback window header, Email label, feedback confirmation message, Give Feedback, Submit button)

Opening a different feedback page

You can create a different feedback page and use the SiteFeedback widget to point your customers to that page instead of the default Provide Feedback window. The page must be part of your customer portal. You cannot point, for example, to an external URL.

To open a different page instead of the Provide Feedback window

1 Create the page you want to open, name it, and place it in */cp/customer/development/views/pages* folder or a subfolder.

2 Open the *standard.php* file in the */views/templates* folder.

3 Locate the following line of code:

```
<rn:widget path="feedback/SiteFeedback" />
```

4 Edit the code to add a value for the *feedback_page_url* attribute. The value must begin with `/app`. Your code will resemble the following example.

```
<rn:widget path="feedback/SiteFeedback"
feedback_page_url="/app/utils/your_custom_feedback_page" />
```

5 Save *standard.php*.

Edit feedback dialog labels or Return to other configuration options for the template and page set.

Editing feedback labels

To edit feedback labels

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code:

```
<rn:widget path="feedback/SiteFeedback" />
```

3 Edit the code to add a value for the label you want to change.

a To change the label on the Give Feedback link, add `label_link="New Give Feedback Link Label"` to the widget code.

b To change the Provide Feedback header of the window, add `label_dialog_title="New Provide Feedback Header Label"` to the widget code.

c To change the Email label, add `label_email_address="New Email Address Label"` to the widget code.

d To change the Your Feedback label, add `label_comment_box="New Your Feedback Label"` to the widget code.

e To change the Submit button label, add `label_send_button="New Submit Button Label"` to the widget code.

f To change the Cancel button label, add `label_cancel_button="New Cancel Button Label"` to the widget code.

g To change the confirmation message, add `label_feedback_confirmation="New Confirmation Message"` to the widget code.

Your code will resemble the following example.

```
<rn:widget path="feedback/SiteFeedback" label_link="New Give Feedback
Link Label" label_dialog_title="New Provide Feedback Header Label"
label_feedback_confirmation="New Confirmation Message" />
```

4 To change the default message for the Give Feedback sidebar link (“How can we make this site more useful for you?”), locate the following line of code.

```
<span>#rn:msg:SITE_USEFUL_MSG#</span>
```

a Edit the code to replace the **message base** with your new message. (Learn about editing message bases here.) Your code will resemble the following example.

```
<span>Your new text for the Give Feedback sidebar link.</span>
```

5 Save *standard.php*.

Return to other configuration options for the template and page set.

Defining themes

A theme is a collection of files that change the appearance of your customer portal without impacting its functionality. Themes are created from CSS files, which can affect typeface, color, and borders. Themes may also include graphics, JavaScript, flash animations, and other types of files.

All the **reference implementation** theme files are called from the */euf/assets/themes/standard* folder. The */cp/customer/assets/themes/standard* and */cp/customer/assets/themes/mobile* also contain copies of the reference implementation theme files

Note The root */euf/* folder is correct even though you cannot see the */euf/* folder in your WebDAV file structure.

When you create custom themes, you must place them in the */cp/customer/assets/themes* subfolder. If you try to **stage** development files containing theme paths that are not fully qualified with */cp/customer/assets/themes,* you will see a warning in the deployment log.

Important Although all other files in the */cp/customer/assets/* folder are shared between the production and development sites, the files in the *themes* subfolder of */cp/customer/assets/* are used strictly by the development files. When you stage the development pages, these files are copied to a time-stamped folder in the staging directory and called from that folder. This keeps the themes you develop in an isolated sandbox that cannot be accessed by production files. The themes are applied to your production site only when you **promote** the staged files into production.

Any CSS files that are referenced by a theme but which are not located in the *themes* folder will be copied into a special directory in the production copy of the theme when the staged files are promoted into production.

Read-only copies of the reference implementation asset files are available in the */cp/core/assets/default/themes/standard* folder. By selecting Reference Implementation on the View Site menu at the upper right of the Customer Portal Administration site, you can see exactly how the customer portal appears using the default CSS files. You can also copy the files in this folder if you want to overwrite the changes you've made and restore the reference implementation CSS.

Review information about the RN Theme tag.

RN Theme tag

The RN Theme tag is used on a page or template to define what theme should be used. If a page that defines a theme uses a template that defines a different theme, the page theme takes precedence. Pages can specify more than one theme. If this is the case, the page uses the first theme unless the page code indicates otherwise.

You can define multiple themes and write logic to select a theme at run time based on any combination of database variables, web visit variables, URL attributes, or other elements.

Theme tags have two attributes: the location of the theme directory and one or more CSS files to be included on the page. The reference implementation template, *standard.php,* uses the default theme, *site.css,* located in the */euf/assets/themes/standard* folder, as shown in this code.

```
<rn:theme path="/euf/assets/themes/standard" css="site.css,
    {YUI}/widget-stack/assets/skins/sam/widget-stack.css,
    {YUI}/widget-modality/assets/skins/sam/widget-modality.css,
```

```
{YUI}/overlay/assets/overlay-core.css,
{YUI}/panel/assets/skins/sam/panel.css" />
```

Note The root */euf/* folder specified in this code is correct even though you cannot see the */euf/* folder in your WebDAV file structure.

The reference implementation uses a single main CSS file to define basic layout, structural and style rules, fonts, borders, and colors. You can copy this file and modify it to create a variety of themes that can be applied to pages using the RN Theme tag, letting you change the appearance of the template or a page by changing only the theme that is applied to it.

Note Rather than specifying a specific YUI version number, you can substitute the value `{YUI}` at the beginning of the file name to use the current YUI version, as shown in the preceding reference implementation template code.

Widgets have their own CSS files. The base CSS file for a widget controls its functionality, while the presentation for the widget is contained in its own file. This lets you control the appearance of a single widget without impacting any other widgets.

- Create a custom theme.
- Apply a theme to a page or template.

Creating themes

To create a theme

1 Create a folder in */cp/customer/assets/themes*.

2 Copy the files in */cp/customer/assets/themes/standard* and paste them into the folder you created in step 1.

3 Open the *site.css* file in your new custom subfolder.

4 Make whatever edits you want to modify the CSS file.

5 If you want to add images, place them in the */cp/customer/assets/themes/[your_custom_folder]/images* folder.

6 If you want to modify widget presentation CSS to match the changes you made to the *site.css* file, make your changes to the corresponding CSS file in the */cp/customer/assets/themes/[your_custom_folder]/widgetCss* folder.

Simple theme changes

The following example shows you how to make basic changes to the standard theme.

To make simple theme changes

1 Create a new folder in */cp/customer/assets/themes*. This example assumes the new folder is *theme_new*.

2 Copy the files in */cp/customer/assets/themes/standard* and paste them into the *theme_new* folder you created in step 1.

3 In order to check your work as you make edits to the theme, change the template to use the new theme.

a Open the *standard.php* file in the */views/templates* folder.

b Locate the following line of code:

```
<rn:theme path="/euf/assets/themes/standard" css="site.css,
```

c Change the code to the following:

```
<rn:theme path="/euf/assets/themes/theme_new" css="site.css,
```

4 Open *theme_new/site.css*.

5 To change the background color and font, locate the following lines of code, beginning at approximately line 73. Edit the code to change the font family and the color definition described by `#FFF url(images/layout/royalGrayBackground.png)`.

```
html {
    background:#FFF url(images/layout/royalGrayBackground.png)
    repeat-x;
    font-family:Helvetica, Arial, sans-serif;
}
```

Change the code to something that resembles the following:

```
html {
    background:#99FFCC repeat-x;
    font-family:Georgia, Times, serif;
}
```

6 To change the colors of the header, footer, and main column, locate the following lines of code and change the color definitions. These lines are not sequential and are located at approximately these lines: 217, 224, 281, and 293.

```
#rn_Header {
#rn_Header a {
#rn_Footer, #rn_Body {
```

```
#rn_MainColumn {
```

7 To change the style of headings, locate the following lines of code (approximately line 88).

```
h2, h3, h4, h5, h6 {
    font-family:Arial, sans-serif;
    font-weight:bold;
}
```

Change this code to something that resembles the following:

```
h2, h3, h4, h5, h6 {
    font-family:Georgia, Times, serif;
    font-style:italic;
}
```

8 To change the relative widths of the main column and sidebar, locate the following code (starting around line 293) and replace the width percentages so that the total is 97% (to account for padding).

```
#rn_MainColumn {
background:#CCFFFF;
float:left;
margin-right:8px;
min-height:650px;
height:auto !important;
height:650px;
overflow:visible;
padding:0px 0px 10px 6px;
width:74%;
}
#rn_SideBar {
float:right;
margin-right:12px;
width:23%;
}
```

9 To change the way widgets are displayed, open the widget's presentation file in your new themes folder, */cp/customer/assets/themes/theme_new,* and edit to make your changes. The following code changes the color of the button and the text on the SearchButton widget.

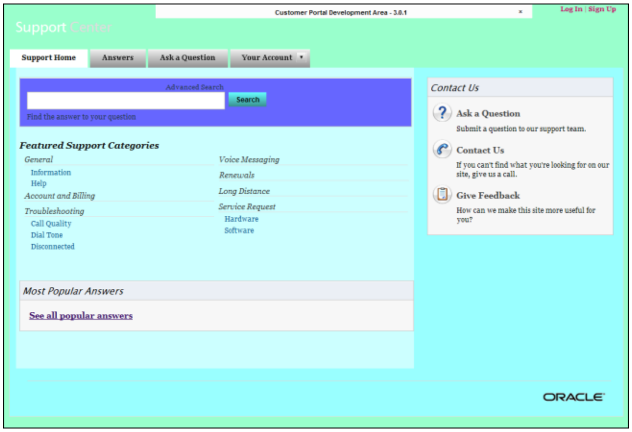
```
.rn_SearchButton .rn_SubmitButton {
    background-color:#66FFFF;
    color:#000000;
    cursor:pointer;
```

```
font-weight:bold;
```

10 To learn more about the wide variety of CSS changes you can make to your customer portal template, pages, and widgets, [review one of the websites listed here](#).

11 Save *site.css*.

Click to view



[Apply a theme to a page or template](#) or [Return to other configuration options for the template and page set.](#)

Applying themes

To apply a theme to a template

Note The root */euf/* folder specified in this code is correct even though you cannot see the */euf/* folder in your WebDAV file structure.

1 Open the page or template file you want to apply a custom theme to.

2 Locate the following line of code.

```
<rn:theme path="/euf/assets/themes/standard" css="site.css,
```

3 Edit the *path* attribute for the RN Theme tag to specify the new theme. If you want to specify a different CSS file for the theme to use, change the *css* attribute as well. Your code will resemble the following.

```
<rn:theme path="/euf/assets/themes/custom_01" css="site_01.css,
```

4 Save the file.

Return to other configuration options for the template and page set.

Using page tags

The Customer Portal offers page tags and page meta tags that let you control functionality through tags instead of writing PHP code. (We recommend that you don't add PHP to your page and template files. This lets non-developers edit the pages without affecting server-side scripting.) Page meta tags control page options, such as the template, whether **SLAs** are required to view the page, and if customers need to be logged in to access the page. Page tags control specific sections of the page, with one particularly useful tag that lets you display or hide page content based on specific conditions.

- Learn about page meta tags.
- Learn about page tags and how to use conditions to control visibility of page content.

Page meta tags

The following page meta tags are available. To use them, add the attributes to the <rn:meta…> code for the page. The following is an example of a page that uses the standard template, includes a chat application, and displays an error message to customers who do not have a chat SLA.

```
<rn:meta title="Gold Service Chat Customers"
template="standard.php"
clickstream="chat_request"
include_chat="true"
sla_required_type="chat"
sla_failed_page="/app/error/error_id/2" />
```

Table 368: Page Meta Tag Descriptions

Page Meta Tag	Description	Attribute Name
Account Session ID Required	Allows the page to be accessed only by logged-in staff accounts. This meta tag is used on the **Guided Assistant** page so guides can be previewed by staff members who are designing guides on the **administration interface**. Refer to Previewing guides. This tag can also be used to create a custom tab with a browser on an agent desktop workspace. When the browser points to a customer portal page, the page requires a valid ID to ensure that only logged-in staff members can access the page.	account_session_required
Answer Details	Defines the page as an answer details page, displaying it only if customers have the required permissions.	answer_details
Clickstream Tag	Defines the type of page for clickstream and page statistics collection.	clickstream
Force HTTPS	Forces the page to use HTTPS when CP_-FORCE_PASSWORDS_OVER_HTTPS is enabled.	force_https
Include Chat	Denotes whether the page contains a **Chat** application, which defines whether the page includes all required Chat JavaScript files.	include_chat
JavaScript Module	Defines the JavaScript module that should be loaded on the page.	javascript_module
Login Required	Specifies whether customers must be logged in to view the page.	login_required
Page Title	Defines the title that appears on the page.	title
Redirect If Logged In	Specifies the page where customers will be redirected if they are already logged in.	redirect_if_logged_in

Table 368: Page Meta Tag Descriptions (Continued)

Page Meta Tag	Description	Attribute Name
SLA Failed Page	Indicates where customers are redirected if they do not have the kind of **SLA** specified in the SLA Required Type page meta tag.	sla_failed_page
SLA Required Type	Defines the type of SLA a customer must have to view the page.	sla_required_type
Template	Identifies the template the page uses.	template

Use page meta tags to perform the following tasks.

- Require customers to log in
- Require customers to have an SLA

Define page tags or return to the other configuration options for the template and page set.

Requiring customers to log in

You can require your customers to log in before they can access any or all of your customer portal pages. By default, the Account Overview page, accessed by clicking the Your Account tab, requires login, but you may also want to require customers to log in before they can view answers in your **knowledge base**. Or you may decide to require login for your entire customer portal page set.

Note If you want to keep the answers in your knowledge base from being available to the general public, you must require login on both the Answers and the answer details pages. If both pages do not have the same login requirement, a warning will appear when you stage and promote your customer portal. The most secure way to do this is to require login on all pages of your customer portal.

Do you want your customers to be able to visit your site without logging in?

- **Yes.** This is the default, so you can decide if you want to set other page meta tags.
- I want them to log in only to specific pages. Show me how to change a page to require login.
- **No,** I want them to log in to every page. Show me how to change the template to require login on all pages.

Set additional page meta tags or
Set page conditions or
Return to other configuration options for the template and page set.

Requiring login on specific pages

This example uses the Ask a Questions page, but the steps are the same for requiring customers to log in to any other page as well. By default, the *login_required* attribute is false, so setting it to true requires you to add the attribute to the page code. After you've completed the following procedure, customers who click the Ask a Question tab when they're not logged in will be redirected to the Login page. After logging in, the customer is directed back to the Ask a Question tab.

Note The Ask a Question confirmation page should have the same value for the *login_required* page meta tag as the Ask a Question page. Set *login_required* to `"true"` on both pages or to `"false"` on both pages.

To require login on the Ask a Question page

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code at the top of the file.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="standard.php"
clickstream="incident_create"/>
```

3 Edit the code to add the *login_required* page meta tag.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="standard.php"
clickstream="incident_create"
login_required="true" />
```

4 Save *ask.php*.

Set additional page meta tags or
Set page conditions or
Return to other configuration options for the template and page set.

Requiring login on all pages

The simplest and most reliable way to require login on a site is to handle it with a configuration setting. This protects all your answers and answer file attachments, as well as prevents access to the other pages of your customer portal. (You can also require login on the customer portal template.)

The CP_CONTACT_LOGIN_REQUIRED configuration setting requires customers to be logged in to access most customer portal pages and controllers. Even with this setting enabled, login is not required on the Log In, Reset Your Password, Finish Account Creation, Create an Account, and error pages because those pages have the page meta tag *login_required* set to false by default. Login is also not required when pass-through authentication is used.

If your site is password protected, you should enable this setting. You should also enable it if only the answer pages are password protected. If you enable this setting, you can override the setting for individual pages by setting the page meta tag *login_required* attribute to false.

To require login with a configuration setting

1 Log in to Oracle Service Cloud.

2 Use the procedure described in To locate and edit configuration settings to locate CP_-CONTACT_LOGIN_REQUIRED under RightNow User Interface > Customer Portal > Login.

3 Click CP_CONTACT_LOGIN_REQUIRED.

4 Click the drop-down menu in the Value field and select Yes.

5 Click the Save button on the ribbon.

Important This setting is now enabled for your development pages. You must **stage** and **promote** the customer portal before this setting takes effect on your production site.

Requiring login on the template

By setting the *login_required* attribute on the template to true, all pages that use the template will also require login. However, you don't want to require customers to log in before they open the Login page. To prevent requiring login when it doesn't make sense, the default Log In, Reset Your Password, Finish Account Creation, Create an Account, and error pages have the *login_required* page meta tag set to false, which overrides the template setting.

To require login on all customer portal pages

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the `<rn:page_content/>` line and add the following line of code immediately above it.

```
<rn:meta login_required="true"/>
```

3 Save *standard.php*.

Set additional page meta tags or
Set page conditions or
Return to other configuration options for the template and page set.

Requiring customers to have an SLA

You can require that your customers have an **SLA** (service level agreement) before they can access any or all of your customer portal pages.

Do you want your customers to be able to visit your site without an SLA?

- **Yes.** This is the default, so you can decide if you want to set other page meta tags.
- **No,** I want to require SLAs on specific pages. Show me how to change a page to require an SLA.

Set additional page meta tags or
Set page conditions or
Return to other configuration options for the template and page set.

Requiring an SLA on specific pages

This example uses the Ask a Questions page, but the steps are the same to require customers to have an **SLA** before accessing any other page. When a customer without an SLA of the required type clicks the Ask a Question tab, the Permission Denied page opens.

To require an SLA on the Ask a Question page

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code at the top of the file.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="standard.php"
clickstream="incident_create"/>
```

3 Edit the code to change the *login_required* page meta tag to "true" and add the *sla_required_type* and *sla_failed_page* meta tags.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="standard.php"
login_required="true"
clickstream="incident_create"
sla_required_type="incident"
sla_failed_page="/app/error/error_id/2" />
```

4 Save *ask.php*.

Set additional page meta tags or
Set page conditions or
Return to other configuration options for the template and page set.

Page tags

You'll use page tags to position information on a page, output information from the **database**, define themes for a page, and hide or display page content conditionally.

Pound tags (`#rn:`) are also included in page tags and let you display or output language codes, message base labels, visit parameters, configuration setting values, session parameters, community tokens, URL parameters and parameter values, and widget attribute PHP code.

Select from the following procedures that use page tags.

- Position page titles, head content, and page content
- Output data fields
- Apply a theme to a page
- Applying common attributes to multiple widgets
- Set page conditions to display or hide content based on:
  - ▷ The customer's login status
  - ▷ Whether the customer is logged in with pass-through authentication
  - ▷ The specific page where content is placed
  - ▷ The number of answers viewed by a customer
  - ▷ The number of searches performed by a customer
  - ▷ The amount of time that has elapsed since an incident was solved
  - ▷ The customer's SLA
  - ▷ The language of the interface
  - ▷ The value of a configuration setting
  - ▷ The value of a URL parameter
  - ▷ Chat availability

Note When you use page tags, do not try to comment them out with HTML commands. Comments do not stop widgets from rendering and may cause rendering problems. They may also stop other tags from being converted. If you want to test a page without a page tag, remove it instead of commenting it out.

Return to other configuration options for the template and page set.

Positioning information on a page

The following page tags let you position information on a page.

- **Page Title**—Place this tag where you want the page's title to be inserted when the page and template are merged. Use this format:

```
<title>
    <rn:page_title/>
</title>
```

- **Head Content**—Place this tag between the opening and closing head tags where the page's head content will be inserted. This content is a combination of widget CSS files, page CSS files, no-cache meta tags, and any other content added to the head by widgets (using the $this->addHeadContent function). When the page is rendered, global CSS is loaded first, followed by any other page/widget level CSS. As a result, the correct CSS hierarchy is preserved. Use this format:

```
<head>
    <rn:head_content/>
</head>
```

- **Page Content**—Place this tag where you want the page's content to be inserted when the page and template are merged. Use this format:

```
<div>
    <rn:page_content/>
</div>
```

Apply other page tags.

Outputting database fields

When you want a page to display information from the database, you can use the Field page tag to output the value. (Also see Input and output widgets.) The Field tag has two attributes: Highlight for highlighting content that matches the keyword parameter in the URL and Name to identify the business object type and field to be displayed. Click Business Objects on the Customer Portal Administration site to find the names of the fields you can use and how to label them in the code.

For example, the answer details page, *detail.php* in the */views/pages/answer* folder, uses the following code to display information about the answer being viewed. (The Field tags are highlighted. They display the answer summary, the created and updated dates, and the answer description.)

```
<div id="rn_PageTitle" class="rn_AnswerDetail">
    <h1 id="rn_Summary"><rn:field name="Answer.Summary"
    highlight="true"/></h1>
    <div id="rn_AnswerInfo">
        #rn:msg:PUBLISHED_LBL# <rn:field name="Answer.CreatedTime" />
          |   
        #rn:msg:UPDATED_LBL# <rn:field name="Answer.UpdatedTime" />
    </div>
    <rn:field name="Answer.Question" highlight="true"/>
</div>
```

Apply other page tags.

Applying common attributes to multiple widgets

The RN Container page tag lets you create a set of widget attributes that can be referenced by multiple widgets. For example, when a page combines search navigation with an answers report (as the Answers page does), all of the related widgets—the search field, button, and filters as well as the report and its display options—must use the same *report_id* attribute. You could just add the attribute to each line of widget code, but the RN Container tag offers a more efficient method of coding.

You can use this tag in one of two ways. The first way is to use the container tags as a wrapper around a group of widgets. The tag defines the values for one or more widget attributes that all of the enclosed widgets share. Here's an example of its use on the Answers page. Each one of the highlighted widgets use report ID 176 because they are all enclosed within the `<rn:container report_id="176">` tags.

```
<rn:container report_id="176">
<div id="rn_PageTitle" class="rn_AnswerList">
    <div id="rn_SearchControls">
        <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
        <form onsubmit="return false;">
            <div class="rn_SearchInput">
                <rn:widget path="search/AdvancedSearchDialog" />
                <rn:widget path="search/KeywordText"
                label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#
                " initial_focus="true"/>
            </div>
            <rn:widget path="search/SearchButton"/>
        </form>
        <rn:widget path="search/DisplaySearchFilters"/>
```

```
    </div>
</div>
<div id="rn_PageContent" class="rn_AnswerList">
    <div class="rn_Padding">
        <h2 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_RESULTS_CMD#</h2>
        <rn:widget path="reports/ResultInfo" />
        <rn:widget path="knowledgebase/TopicWords"/>
        <rn:widget path="reports/Multiline"/>
        <rn:widget path="reports/Paginator"/>
    </div>
</div>
</rn:container>
```

The second way you can use the RN Container tag is as a widget attribute that references the attribute-value definitions of the container. That is, you assign the container an ID value and then define attributes within the container. All widgets that reference the container ID then inherit the other attributes defined in the container. For example, you could use the following code to define the container.

```
<rn:container rn_container_id="1" report_id="196" per_page=2"/>
```

Note Although the value for the *rn_container_id* is an integer in this example, it does not have to be an integer. Instead, it can be any string except those that begin with `rnc_` because that prefix is used by the Customer Portal.

When a container is defined this way, any widget on the page can then use the *rn_container_id* attribute as a shortcut for assigning all the attributes defined in the container to the widget that calls the container in its code. For example, each of the following widgets uses a *report_id* value of 196 and a *per_page* value of 2 because those are the values assigned to the attributes in the container definition.

```
<rn:widget path="reports/Multiline"
label_text=""
initial_focus="true"
rn_container_id="1"/>
<rn:widget path="reports/Paginator"
icon_path="images/icons/search.png"
rn_container_id="1"/>
```

Note If the widget code specifically defines an attribute that is defined in the container, the value for the attribute in the widget code overrides the value in the container.

Applying page conditions

You may want to hide or display content on the template or on an individual page based on whether certain conditions apply. For example, you might want to hide the Ask a Question tab on the template until the customer has viewed a certain number of answers or conducted a certain number of searches. Or maybe you want to prevent part of a page from being displayed unless the customer is logged in or has an **SLA** (service level agreement).

Note You should consider the usability issues of conditionally hiding and exposing page navigation before implementing page conditions. Particularly for customers using screen readers, the presence of a new navigation tab may not be evident when the conditions that trigger its appearance have occurred.

The code structure for the RN Condition page tags looks like this.

```
<rn:condition attribute="value">
[Content is displayed when condition attribute is met]
</rn:condition>
```

The content between the condition tags is displayed only if the specified condition is met. Otherwise it is hidden. The following situations can control whether information is displayed or not.

- Is the customer logged in?
- Did the customer log in from an external site?
- Is the page defined as one on which the content should be displayed or hidden?
- How many answers has the customer viewed?
- How many searches has the customer performed?
- How much time has elapsed since the customer's incident was closed?
- Does the customer have the required type of SLA?
- What language is being used on the customer portal?
- Does a specified configuration setting match a defined value?
- Does a specified URL parameter match a defined value?
- Is the current time within Chat operating hours?

The conditional page tag also includes an RN Condition Else tag to provide if/then logic for displaying or hiding content. Learn how to use the Else condition page tag.

Set additional page conditions or Return to other configuration options for the template and page set.

Logged In condition

If the customer is logged in (`<rn:condition logged_in="true">`), the content within the condition tags is displayed on the page. The template uses the Logged In page condition tag to display the Welcome Back message and customer's name in the upper right corner of the page.

Note Although you can use the Logged In page condition tag to show or hide the entire contents of a page, it might be more efficient to use the Login Required page meta tag instead. Learn about the Login Required page meta tag here.

Return to page conditions overview.

External Login Used condition

When customers log in to your customer portal using pass-through authentication (PTA), the input fields on the Account Settings page are set to read-only by default. If you want to let PTA customers change just one or two fields, you can add an attribute to the widget code for the individual input fields.

However, if you have a block of input fields that you want to let customers edit, you can enclose them in condition tags rather than editing each widget's code separately. Use the following condition code before the first input widget in the block of input fields, and add the closing condition tag (`</rn:condition>`) after the last widget.

```
<rn:condition external_login_used="true">
```

Return to page conditions overview.

Hide on Pages/Show on Pages conditions

The Hide on Pages tag lets you specify the pages on which the content between the tags is hidden. The Show on Pages tag lets you specify the pages where the content appears.

The **reference implementation** template uses these pages to control page redirection after login. After customers log in by clicking the Log In link, they are redirected to the page they originally tried to access. However, if they log in from Create an Account, Login, or Account Assistance, they are redirected to the Account Overview page since it doesn't make sense for them to land back on the original page.

The template also uses the Hide On page condition to prevent the navigation tabs from appearing on the Search Tips page and to prevent the sidebar search widget from appearing on pages that already have a search field, namely Support Home, Answers, and Support History.

Return to page conditions overview.

Answers Viewed condition

The Answers Viewed tag lets you hide content until the customer has viewed the number of answers you specify. You might want to use this tag to hide the Ask a Question tab to require your customers to first view existing answers instead of automatically submitting a question to your support team.

Learn how to use this page condition tag to hide the Ask a Question tab.

Return to page conditions overview.

Searches Done condition

This page condition tag works the same way that the Answers Viewed tag does: It hides content until the customer has conducted the specified number of searches. If you want to use this for displaying the Ask a Question tab, however, it's better to use the Searches Done attribute of the NavigationTab widget.

Use the Searches Done page tag to hide specific content on a page.

Return to page conditions overview.

Using the Searches Done page condition tag

The following example assumes you want to hide the **Live Chat** link in the sidebar until the customer has conducted two searches.

To hide the Live Chat link in the sidebar unless searches have been conducted

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following section of code.

```
<rn:condition config_check="MOD_CHAT_ENABLED == true">
    <rn:widget path= "chat/ConditionalChatLink"
    min _sessions_ avail="1"/ >
</rn:condition>
```

3 Add the following line of code immediately above the first line of the section you found.

```
<rn:condition searches_done="2">
```

4 Add the following line of code immediately below the last line of the section you found.

```
</rn:condition>
```

5 Save *standard.php*.

Note The RN Condition tag identifies a search only when a page is turned or refreshed. For example, assume a customer conducts one search and reviews the list but does not click an answer or otherwise leave or refresh the answers list page. When the second search is made, the Live Chat link will not be displayed in the sidebar until another page is opened or the current page is refreshed.

Return to page conditions overview.

Incident Reopen Deadline Hours condition

This page condition tag lets you define how many hours after an **incident** is closed that the content within the tags remains visible. For example, the default question details page (the page that customers access by clicking one of their questions on the Support History page) hides the section of the page that lets the customer update the question after one week (168 hours). After that time has elapsed, the content is hidden and the Condition Else tag is used to display a message that the question can no longer be updated.

Learn how to hide the update field immediately after an incident is closed.

Return to page conditions overview.

SLA condition

Use this page condition tag to hide content on the page unless the customer has the type of **SLA** (service level agreement) specified on the page. When you want to control access to an entire page based on the customer's SLA, use the SLA Required Type page meta tag.

- Use the SLA condition tag to hide navigation tabs.
- Use the SLA condition tag to hide specific content on a page.

Return to page conditions overview.

Hiding navigation tabs with the SLA condition

You might want to restrict access to certain pages of your customer portal to only those customers who have a specific type of **SLA**. The following procedure displays the Answers navigation tab only if customers have a self-service SLA.

To restrict the Answers navigation tab to customers with SLAs

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the code for the Answers navigation tab.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ANSWERS_HDG#"
link="/app/answers/list"
pages="answers/list, answers/detail"/></li>
```

3 Add the following code directly above the line for the Answers tab code.

```
<rn:condition sla="selfservice">
```

4 Add the following code directly below the line for the Answers tab code.

```
</rn:condition>
```

5 Save *standard.php*.

Return to page conditions overview.

Hiding page content with the SLA condition

The following example assumes you want to hide the Most Popular Answers section on the Support Home page unless customers have an SLA.

To hide Most Popular Answers for customers without an SLA

1 Open the *home.php* file in the */views/pages* folder.

2 Find the following line of code.

```
<div class="rn_Module">
```

3 Add the following code on a separate line immediately above the code you found in step 2.

```
<rn:condition sla="incident" >
```

4 Add the following code on a separate line immediately above the last line of the file, which is `</div>`.

```
</rn:condition>
```

5 Save *home.php*.

Return to page conditions overview.

Language In condition

You can display content based on the language defined in the page's content-language meta tag. For example, the default Account Settings page on an English-language page displays the address fields in this order: Street, City, Country, State/Province, and Postal Code. On pages that use Japanese, Korean, and Chinese languages, the order is Postal Code, Country, State/Province, City, and Street. The use of this condition is demonstrated in this code from the *profile.php* page.

```
<rn:condition language_in="ja-JP,ko-KR,zh-CN,zh-HK,zh-TW">
    <rn:widget path="input/FormInput"
    name="Contact.Address.PostalCode"
    label_input="#rn:msg:POSTAL_CODE_LBL#" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Country" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.StateOrProvince"
    label_input="#rn:msg:STATE_PROV_LBL#" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.City" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Street" />
<rn:condition_else />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Street" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.City" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Country" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.StateOrProvince"
    label_input="#rn:msg:STATE_PROV_LBL#" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.PostalCode"
    label_input="#rn:msg:POSTAL_CODE_LBL#"/>
</rn:condition>
```

Return to page conditions overview.

Config Setting Check condition

You may want to display content based on the value of a configuration setting that was defined on the **administration interface**. For example, the **reference implementation** template uses this tag to hide the Community navigation tab and the Ask the Community sidebar link if **Social Experience** communities are not enabled on your site. It also hides the Live Chat sidebar link if **Chat** is not enabled.

The attribute for this condition is more complex than most other conditions. The format is:

```
{CONFIG_BASE:CONFIG_SLOT} {OPERATOR} {VALUE}
```

The elements of the attribute include the following.

- CONFIG_BASE—One of the following configuration bases in Oracle Service Cloud. The CONFIG_BASE element is not case sensitive.

- ▷ Common (which corresponds to the Common folder on the Configuration Settings editor)
- ▷ RNW (RightNow Common folder)
- ▷ RNW_UI (RightNow User Interface folder)
- ▷ RNL (Chat folder)
- ▷ MA (Outreach and Feedback)

- CONFIG_SLOT—The name of the configuration setting as it appears in the Configuration Settings editor. These names are case sensitive.
- OPERATOR—The logical operator. Acceptable values are == (equals), != (not equal), > (greater than), < (less than), >= (greater than or equal to), and <= (less than or equal to).
- VALUE—The value to compare the parameter to. Values include true, false, null, an integer, or a quoted string.

For example, to set a condition that Chat is enabled, the attribute is the following.

```
<rn:condition config_check="MOD_CHAT_ENABLED == true">
```

Return to page conditions overview.

URL Parameter Check condition

The URL Parameter Check condition lets you display or hide content based on the value of a parameter in the page URL. For example, you might want to display a specific message base to customers who enter the search term you define in the condition. The standard Ask a Question confirmation page uses this condition to retrieve the incident's reference number.

The attribute for this condition is more complex than most other conditions. The format is:

```
{URL_KEY} {OPERATOR} {VALUE}
```

The elements of the attribute include the following.

- URL_KEY—The parameter key to be checked in the URL. For example, to check the keyword URL parameter, type `kw` for this value.
- OPERATOR—The logical operator. Acceptable values are == (equals), != (not equal), > (greater than), < (less than), >= (greater than or equal to), and <= (less than or equal to).
- VALUE—The value to compare the parameter to. Values include true, false, null, an integer, or a quoted string.

For example, to set a condition if the keyword parameter is "roaming," the attribute is the following.

```
"<rn:condition url_parameter_check="kw == 'roaming'">
```

Return to page conditions overview.

Chat Available condition

The conditional page tag also includes an Chat Available tag that can be used to determine whether the current time is within the chat operating hours and not currently a holiday. Used primarily on the launch page for displaying the chat session request form, it could be used in conjunction with an Else condition tag to display alternate content during hours when chat is unavailable, as described in the following procedure.

To display alternate content when chat is unavailable

1. Open the *chat_launch.php* file in the */views/pages/chat* folder.
2. Locate the following code.
```
</rn:condition>
<rn:widget path="chat/ChatStatus"/>
<rn:widget path="chat/ChatHours"/>
```
3. Add the following code directly above the code you found in the previous step.
```
<rn:condition_else/>
[Content to be displayed when chat hours are not available]
```
4. To remove the chat availability status text, delete the following line of code.
```
<rn:widget path="chat/ChatStatus"/>
```
5. Save *chat_launch.php*.

Return to page conditions overview.

Using the Else condition tag

The conditional page tag also includes an RN Condition Else tag to provide if/then logic for displaying or hiding content. The RN Condition Else tag has no attributes and requires no closing tag. The code will follow this structure.

```
<rn:condition attribute="value">
[Content to be displayed if condition is met]
<rn:condition_else/>
[Other content to be displayed when condition is not met]
</rn:condition>
```

Return to page conditions overview.

Standard page files

Each standard customer portal page has a title that appears in your browser when the page is displayed, and each page is also defined by its page name. The following table lists each page file name and its corresponding page title and description.

Table 369: Description of Page Files

Page File Name	Page Title and Description
account/change_password	**Change Your Password page**—Allows customers to change their password. Refer to the Change Your Password page.
account/overview	**Account Overview page**—Provides an overview of **account** information, where customers can view the questions they have submitted, the notifications they have subscribed to, and their service contracts. The Account Overview page also lets customers link to their account settings and the Change Your Password page.
account/profile	**Account Settings page**—Allows customers to change their user name and enter contact information. Refer to the Account Settings page.
account/reset_password	**Reset Your Password page**—Contains a form where customers can reset their password. The page is accessed only through an email link sent to their primary email address when they request account assistance to reset their password. The link expires after a specified period of time (24 hours by default). If customers do not have a complete **contact** record, they are taken to the Profile page when they are finished on this page so they can finish setting up an account.
account/setup_password	**Finish Account Creation page**—Displays a page with a link to the Account Assistance page. This page is displayed when customers click an email link to reset their password and the link has already expired or when a customer wants to create an account using an email address that is already in the knowledge base.
account/notif/list	**Notifications page**—Displays all answers customers have subscribed to as well as product/category notifications they have subscribed to. The page allows customers to delete and renew notifications and add product/category notifications. Refer to the Notifications page.

Table 369: Description of Page Files (Continued)

Page File Name	Page Title and Description
account/notif/unsubscribe	**Your Notification Requests: Unsubscribe Results page**—Displays a message to customers who have clicked an email link to unsubscribe to an **answer notification**. This page can be accessed only through the email link.
account/questions/detail	**Question details page**—Displays the details of a specific question submitted by a customer and allows the question to be updated. This page also contains a print button. Refer to the question details page.
account/questions/list	**Support History page**—Displays all questions submitted by a customer, including the subject, reference number, status, and date created. Selecting an incident in the list opens the details of the customer's question. Refer to the Support History page.
agent/guided_assistant	**Guided assistant page**—Displays a guide on the **guided assistance** designer of the administration interface as it will appear on the customer portal.
agent/polling_preview	**Polling preview page**—Displays a preview of the polling widget to the staff member creating a survey to show how it will appear on the customer portal.
answers/detail	**Answer details page**—Displays details about a specific answer and includes options for sharing, printing, emailing, and subscribing to the answer. The default page also lets customers submit answer feedback and view **related** and previously viewed answers. Refer to the Answer Details Page.
answers/list	**Answers page**—Displays a list of answers that meet the customer-entered search criteria. The page contains a search field with advanced search options. Refer to the Answers Page.
ask	**Ask a Question page**—Allows customers to submit a question. Refer to the Ask a Question Page.
ask_confirm	**Ask a Question confirmation page**—Confirms the submittal of a customer's question and displays the reference number of the incident that was created. Refer to the Configuring the confirmation page.

Table 369: Description of Page Files (Continued)

Page File Name	Page Title and Description
basic/ask	**Basic Email Us page**—Lets customers submit a question using their basic device. Refer to the basic Email Us page.
basic/ask_confirm	**Basic question confirmation page**—Confirms the submittal of a customer's question and displays the reference number of the incident that was created. Refer to the description of the basic confirmation page.
basic/error404	**Basic error 404 page**—Displays a Page Not Found error. Refer to the Error 404 page.
basic/error	**Basic error page**—Displays one of several error messages, depending on the circumstances that caused the error. The `error_id` parameter is passed in the error page URL. Refer to Error codes and messages.
basic/home	**Basic home page**—The entry point for customers using basic devices to access the customer portal. It includes the top popular answers and support categories. Refer to this description of the basic home page.
basic/account/change_password	**Basic change password page**—Lets customers change their password using a basic device. Refer to the basic change password page.
basic/account/overview	**Basic account overview page**—Provides an overview of **account** information, where customers can view the questions they have submitted. The account overview page also lets customers link to their account settings and the change password page.
basic/account/profile	**Basic account settings page**—Lets customers change their account information using a basic device. Refer to the basic account settings page.
basic/account/reset_password	**Basic reset password page**—Contains a form where customers can reset their password. The page is accessed only through an email link sent to their primary email address when they request account assistance to reset their password. The link expires after a specified period of time (24 hours by default). If customers do not have a complete contact record, they are taken to the account settings page when they are finished on this page so they can finish setting up an account.

Table 369: Description of Page Files (Continued)

Page File Name	Page Title and Description
basic/account/setup_password	**Basic finish account creation page**—Displays a page with a link to the basic account assistance page. This page is displayed when customers click an email link to reset their password and the link has already expired or when a customer wants to create an account using an email address that is already in the knowledge base.
basic/account/questions/detail	**Basic question details page**—Displays the details of a specific question submitted by a customer and allows the question to be updated using a basic device. Refer to the basic question details page.
basic/account/questions/list	**Basic questions list page**—Displays all questions submitted by a customer, including the subject, reference number, status, and date created. Selecting an incident in the list opens the details of the customer's question. Refer to the basic questions list page.
basic/answers/detail	**Basic answer details page**—Displays the details of an answer to customers using a basic device. Refer to this description of the basic answer details page.
basic/answers/list	**Search results page**—Includes a multiline report that has been optimized for basic devices and product and category search filters. Refer to this description of the basic search results page.
basic/answers/submit_feedback	**Submit feedback page**—Lets customers submit feedback regarding specific answers on the basic page set. Refer to the answer feedback page.
basic/utils/account_assistance	**Basic account assistance page**—Displays a page that lets customers using a basic device request an email containing either their user name or a link to a page for resetting their password. If the customer is logged in, the email address field is populated. Refer to the description of the account assistance page.
basic/utils/create_account	**Basic create account page**—Displays a page that lets customers using a basic device create an account (which creates a contact record in the knowledge base) by entering their email address, user name, password, and first and last names. Refer to the basic create account page.

Table 369: Description of Page Files (Continued)

Page File Name	Page Title and Description
basic/utils/login_form	**Basic login page**—Displays the login page where customers using a basic device can enter their user name and password. Refer to the basic login page.
basic/utils/submit/password_changed	**Basic password change confirmation**—Displays a message that a customer's password change was successful.
chat/chat_landing	**Chat page**—When a customer is waiting for an agent, this page displays position in queue and estimated and average wait times, along with a search field. When an agent is available, the Chat window opens. Refer to the Chat page.
chat/chat_launch	**Live Help page**—Lets customers request customer support using **Chat**. Refer to the Live Help page.
error404	**Error 404 page**—Displays a Page Not Found error. Refer to the Error 404 page.
error	**Error page**—Displays one of several error messages, depending on the circumstances that caused the error. The `error_id` parameter is passed in the error page URL. Refer to Error codes and messages.
home	**Support Home page**—Serves as customers' main entry into the customer portal. Refer to the Support Home Page.
mobile/ask	**Mobile ask a question page**—Lets customers submit a question using their mobile device. Refer to the mobile ask a question page.
mobile/ask_confirm	**Mobile ask question confirmation page**—Confirms the submittal of a customer's question and displays the reference number of the incident that was created. Refer to the description of the mobile confirmation page.
mobile/error404	**Mobile error 404 page**—Displays a Page Not Found error. Refer to the Error 404 page.
mobile/error	**Mobile error page**—Displays one of several error messages, depending on the circumstances that caused the error. The `error_id` parameter is passed in the error page URL. Refer to Error codes and messages.

Table 369: Description of Page Files (Continued)

Page File Name	Page Title and Description
mobile/home	**Mobile home page**—The entry point for customers using mobile devices to access the customer portal. It includes the top six most popular answers and the top-level support categories. Refer to this description of the mobile home page.
mobile/account/change_-password	**Mobile change password page**—Lets customers change their password using a mobile device. Refer to the mobile change password page.
mobile/account/profile	**Mobile account settings page**—Lets customers change their account information using a mobile device. Refer to the mobile account settings page.
mobile/account/reset_password	**Mobile reset password page**—Contains a form where customers can reset their password. The page is accessed only through an email link sent to their primary email address when they request account assistance to reset their password. The link expires after a specified period of time (24 hours by default). If customers do not have a complete contact record, they are taken to the mobile account settings page when they are finished on this page so they can finish setting up an account.
mobile/account/setup_password	**Mobile finish account creation page**—Displays a page with a link to the mobile account assistance page. This page is displayed when customers click an email link to reset their password and the link has already expired or when a customer wants to create an account using an email address that is already in the knowledge base.
mobile/account/questions/detail	**Mobile question details page**—Displays the details of a specific question submitted by a customer and allows the question to be updated using a mobile device. Refer to the mobile question details page.
mobile/account/questions/list	**Mobile support history page**—Displays all questions submitted by a customer, including the subject, reference number, status, and date created. Selecting an incident in the list opens the details of the customer's question. Refer to the mobile support history page.

Table 369: Description of Page Files (Continued)

Page File Name	Page Title and Description
mobile/answers/detail	**Mobile answer details page**—Displays the details of an answer and allows customers to provide answer feedback using a mobile device. Refer to this description of the mobile answer details page.
mobile/answers/list	**Mobile answers list page**—Includes a multiline report that has been optimized for mobile devices and product and category search filters. Refer to this description of the mobile answers list page.
mobile/chat/chat_landing	**Mobile chat page**—Displays chat wait information and a transcript of the chat on a mobile device. Refer to the mobile chat page.
mobile/chat/chat_launch	**Mobile chat launch page**—Lets customers request customer support using Chat on their mobile device. Refer to the mobile chat launch page.
mobile/utils/account_assistance	**Mobile account assistance page**—Displays a page that lets customers using a mobile device request an email containing either their user name or a link to a page for resetting their password. If the customer is logged in, the email address field is populated.
mobile/utils/create_account	**Mobile create account page**—Displays a page that lets customers using a mobile device create an account (which creates a contact record in the knowledge base) by entering their email address, user name, password, and first and last names. Refer to the mobile create account page.
mobile/utils/guided_assistant	**Mobile guided assistant page**—Opens the page containing a guide that asks customers using a mobile device a series of questions designed to lead them to a solution specific to their situation. Refer to the mobile guided assistance page.
mobile/utils/login_form	**Mobile login page**—Displays the login page where customers using a mobile device can enter their user name and password or click a button to create an account. Refer to the mobile login page.
mobile/utils/submit/password_changed	**Mobile password change confirmation**—Displays a message that a customer's password change was successful.
mobile/utils/submit/profile_updated	**Mobile profile update confirmation**—Displays a message that the customer's profile was successfully updated.

Table 369: Description of Page Files (Continued)

Page File Name	Page Title and Description
utils/account_assistance	**Account Assistance page**—Displays a page that lets customers request an email containing either their user name or a link to a page for resetting their password. If the customer is logged in, the email address field is populated.
utils/create_account	**Create an Account page**—Displays a page that lets customers create an account (which creates a contact record in the knowledge base) by entering their email address, user name, password, and first and last names. Refer to the Create an Account page.
utils/help_search	**General Search Tips page**—Displays a page of search tips to help customers understand the best way to conduct a search. Refer to Editing the Search Tips page.
utils/login_form	**Log In page**—Displays the Log In page where customers can enter their user name and password or click a button to create an account. Refer to the Log In page.
utils/submit/pass-word_changed	**Password Change Succeeded page**—Displays a message that a customer's password change was successful.
utils/submit/profile_up-dated	**Profile Update Succeeded page**—Displays a message that the customer's profile was successfully updated.

Error codes and messages

Depending on the parameter passed in the error page URL, various error messages are displayed to the customer. For example, the URL http://<your_site>/app/error/error_id/2 displays, "We're sorry. Your account doesn't have the service level agreement required to view this document." The following table lists the error codes and their corresponding messages.

Also refer to the Error 404 page.

Table 370: Error Codes and Messages

Error Code	Error Heading and Message
1	**Not available** This answer is no longer available.

Table 370: Error Codes and Messages (Continued)

Error Code	Error Heading and Message
2	**Not available** We're sorry. Your account doesn't have the service level agreement required to view this document.
3	**File Download Error** Sorry, there was an error downloading the file.
4	**Permission Denied** You do not have permission to access this document.
5	**Operation Failed** Submission Failed. The page could not be submitted and the operation timed out. Use the Back button to return to the page. Then refresh the page so that you can resubmit the information.
6	**Permission Denied** Illegal parameter.
7	**Cookies are required** You'll need to enable cookies in your browser before you can continue.
sso9	**Incomplete Account Data** Sorry, to create an account within the community, you must specify an email address. Please update your account.
sso10	**Incomplete Account Data** Sorry, to create an account within the community, you must specify a first and last name. Please update your account.
sso11	**Duplicate Email** Sorry, the email address you specified already exists within the community. You might already have an account with that email address. Please visit the account assistance page for further help.

Table 370: Error Codes and Messages (Continued)

Error Code	Error Heading and Message
sso13 sso14 sso15 sso16 sso17	**Authentication Failed** The link you clicked contained an authentication parameter that failed to authenticate. This might have happened because: 1 – The link was intended for you, but has expired. Refresh the previous page and try the link again. 2 – This authentication parameter has already been used by you. Refresh the previous page and try the link again. 3 – The link you clicked was not intended for you, but was meant for another user and was given to you erroneously.
404	**Not found** Page not found.

Error 404 page

The CP_404_URL configuration setting has a default value of *error404*, which is the page that opens if customers try to access a non-existent page. The page content is loaded without modifying the URL, so any incorrect characters in the URL can be replaced instead of requiring the entire URL to be re-entered. You can also add conditions, widgets, or other customer portal elements to the page to help the customer.

If the value for CP_404_URL is blank, the browser's generic error page opens instead.

51

Customer Portal Widgets

A widget is an element of the Oracle RightNow Customer Portal Cloud Service (Customer Portal) that performs a specific function. The Customer Portal contains more than one hundred widgets in its standard widget collection. A few examples of standard widget functionality include the following.

- An information field for input of customer information
- A button that launches a search or submits customer information
- A report that returns all answers containing a customer's search terms
- A dialog for customer feedback
- A topics tree for browsing specific topics
- A link to let customers share their desktop with an agent on the phone
- A panel that displays posts from your **community** site
- An offer to chat with an agent

You can configure the functionality of standard widgets by editing their attributes to achieve different results. A standard widget on one page may function differently than the same widget on a different page, depending on the attribute settings.

You can also create custom widgets by extending the functionality of a standard widget, or you can create custom widgets from scratch. Both processes use the Customer Portal's widget builder.

By their nature, widgets are highly diverse elements, and we won't be going into all the details of each one. For widget-specific information, first type `https://<your_site>/ci/admin/docs/widgets/standard` in your web browser. (Or select Browse Widgets on the Widgets tab of the Customer Portal Administration site and select Standard Widgets on the page that opens.) Then you can select a folder and widget to see its definition, including a preview, description, default code, attributes, and all other relevant information about configuring it.

You'll find the following information about widgets in this section.

General widget information

- Review widget code and file structure.
- Manage widget versions.
- Edit widget attributes, including changing the report ID.
- Review the widget information page.
- Learn how to build a new widget or extend an existing one.

Standard widgets

- Learn which standard widgets are used in the reference implementation and how they're used on the page.
- Review standard widgets that are not part of the reference implementation.

Special case widgets

- Define input and output widgets.
- Display a challenge on form submission to verify a valid user.
- Let your customers search the Oracle knowledge base from an external page.
- Offer customers a survey.

Widget accessibility

The Customer Portal widgets have been designed to comply with Oracle Accessibility Guidelines. For current information regarding our approach to accessibility, refer to Oracle's Accessibility Program.

When you create custom widgets, you are responsible for ensuring that your changes do not impact accessibility. Labels require particular attention. Input labels support accessibility by providing content for screen readers, and they should be used. However, if you choose to use an empty string for a label, the following widgets will not include the asterisk that indicates the input field is required. even if you set the required attribute to true.

- chat/ChatAttachFileButton
- input/ChannelAllInput
- input/DateInput
- input/FileAttachmentUpload
- input/MobileProductCategoryInput
- input/PasswordInput

- input/ProductCatalogInput
- input/ProductCategoryInput
- input/SelectionInput
- input/TextInput
- notifications/ProdCatNotificationManager
- search/AdvancedSearchDialog
- search/ProductCatalogSearchFilter
- search/ProductCategorySearchFilter

Widget files and code

A widget is simply a collection of files that work together to provide a specific functionality. Widgets communicate with the Oracle **database** and the server through AJAX requests. They also communicate with other widgets through events. When you add a widget to a page or a template, you add code that resembles the following example.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
initial_focus="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```

Note All standard widgets and pages in the Customer Portal reference implementation conform to the HTML5 specification.

The widget code contains the following elements.

- **rn:widget**—Identifies the object as a widget to be rendered on the page. The `rn:` prefix identifies the widget as a standard Customer Portal element.
- **path**—Locates the widget in the file structure by specifying the folder and widget name (`input/FormInput` in the example). For information about specifying standard and custom folders, click here.
- **attributes**—Defines widget parameters that control appearance and function. The attributes in the example are *name, required, initial_focus,* and *label_input.*

Widget files are stored in widget group subfolders (*chat, feedback, input,* etc.) in the */cp/core/widgets/standard* folder. Under the widget group, each widget has its own subfolder containing all the files for that widget. A widget may contain some or all of the following files:

- *info.yml*—Provides information about a widget's dependencies, requirements, attributes, and URL parameters. Every widget has a YAML file. Refer to YAML file.
- *controller.php*—Constructs the widget and calls the data it needs. Refer to Controller file.
- *view.php*—Contains the HTML required to display the widget. Refer to View file.
  - **.html.php*—Defines a view partial, which is a subset of the widget's view and is called from the *view.php* file. Refer to Multiple view partials within one widget.
- *logic.js*—Contains the display logic and events the widget subscribes to or fires. This file also contains logic for updating the widget's HTML when new information is received from an event. Refer to Logic file.

Note The *controller.php, view.php,* and *logic.js* files for each standard widget identify the originating release in the first line of code.

- **.ejs*—Embedded JavaScript template files that combine variables and the template to produce HTML. Refer to Embedded JavaScript files.
- *base.css*—Provides the non-editable CSS for a widget. Refer to Widget CSS files.
- *presentation.css*— Controls the stylistic elements that determine how the widget displays on a page. Refer to Widget CSS files.

Note The presentation CSS files are located in the */cp/core/assets/defaults/themes/standard (or mobile)/widgetCss* folder and include the widget name, for example, *AdvancedSearchDialog.css.*

- *preview/preview.png*—Displays an example of what the widget will look like when it is added to a page.

YAML file

Every widget has an information file written in YAML format, which contains no executable code. The following example is the *info.yml* file for the KeywordText widget.

```
version: "1.0.2"
requires:
    framework: ["3.0", "3.1", "3.2"]
    jsModule: [standard, mobile]
attributes:
    report_id:
        name: rn:msg:REPORT_LBL
```

```
        type: STRING
        description: rn:msg:ID_RPT_DISP_DATA_SEARCH_RESULTS_MSG
        default: rn:def:CP_NOV09_ANSWERS_DEFAULT
    source_id:
        name: rn:msg:SOURCE_ID_LBL
        type: STRING
        description: rn:msg:NAMED_SRC_WIDGET_FIRE_SRCH_EVENTS_LBL
    label_text:
        name: rn:msg:LABEL_LBL
        type: STRING
        description: rn:msg:STRING_LABEL_DISP_WARN_MODIFICATION_LBL
        default: rn:msg:SEARCH_BY_KEYWORD_CMD
    initial_focus:
        name: rn:msg:INITIAL_FOCUS_LBL
        type: BOOLEAN
        description: rn:msg:SET_TRUE_FIELD_FOCUSED_PAGE_LOADED_MSG
info:
    description: rn:msg:WIDGET_DISP_INPUT_TXTBOX_ALLOWS_MSG
    urlParameters:
        kw:
            name: rn:msg:KEYWORD_LBL
            description: rn:msg:SETS_TXT_KEYWORD_BOX_URL_PARAM_VAL_LBL
            example: kw/roam
```

The elements of this file include the following:

- **version**—Defines the widget's version number. Custom widgets must have a major and minor version specified, while standard widgets also include a nano version. Refer to Widget version management.
- **requires**—Defines the required framework version number, the required JavaScript module, and any YUI modules that need to be loaded for widget functionality. (The Customer Portal Framework Version 3.2 uses the YUI 3.13 library. Several standard YUI modules are available on every page, and any module is available to widgets that declare dependency on that module. Refer to YUI.)
- **attributes**—Defines the widget's attributes and their values. Note that if a custom widget inherits attributes of a standard widget when it is created, only the inherited attributes that have been removed or edited are listed in *info.yml*. The others are implied because the custom widget was created by extending the standard widget.
- **extends**—Identifies the standard widget that was used as the parent widget if this widget was created by extending another.

- **info**—Provides a description of the widget's functionality and an array of URL parameters the widget gets information from, including name, description, an example, and whether the parameter is required.

Note The Widget Info page, accessed at https://<your_site>/ci/admin/docs/widgets/info, is an additional source of information about the *info.yml* file when you're on the Customer Portal Administration site.

Controller file

The *controller.php* file renders and previews the widget. Its functions are constructing the widget and getting the data it needs. The get data function of *controller.php* instantiates the widget. In the KeywordText widget, for example, the get data function loads a report model that gets report data, creates other functions, gets data, and then returns data and passes it to the view file.

Note The controller files of standard widgets have been intentionally written to omit the closing PHP tag (`?>`). Additionally, code has been added to automatically remove the closing PHP tag from the end of widget controllers during the **staging** operation. If you add a closing tag to a widget controller file, the widget will display and work properly on the development site, but parsing errors might occur on the staging site.

View file

The *view.php* file contains blocks of code that indicate the elements of the code that you can edit. Every block in a widget has a unique ID that describes its context. Although standard widgets don't actually use the block tags, the tags identify where the code is editable. They serve as customization hook points where you can add custom code to the standard widget to create a custom widget. (Not every element of every widget is exposed as a block if modifying the element would cause problems with the standard code.)

Only the code within blocks can be edited. If you add code outside of block tags, your code will be ignored. If you don't specify the ID of a standard block or if the ID you specify doesn't exist in the standard widget's view, your code will also be ignored.

When a standard widget undergoes a nano change, that is, a fully backward compatible change, the change is automatically applied to the widget in your customer portal files so that you can take advantage of the bug fix or enhanced functionality. Additionally, any custom widgets that were created by extending that standard widget will also be updated. This benefit of automatic updating of custom code is possible whenever you extend a standard widget's view instead of overriding it when you create a custom widget. For additional information, refer to Extending and overriding the view.

View partials

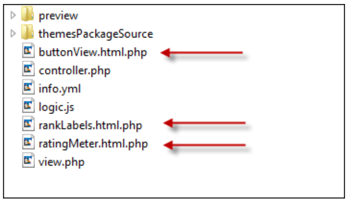
Many widget *view.php* files include duplicate sections of code that are used throughout the widget. Other widgets share sections of code, and each widget calls out the same code section. In an effort to avoid code duplication within and among widgets, the Customer Portal includes view partials, which are sections of code that can be used multiple places within a widget or shared across multiple widgets.

The *Partials* folder contains these view partial files that can minimize code duplication by letting you reuse common view elements, such as the red asterisk and screen reader label to indicate a field is required.

If a widget is within a view partial, the widget is rendered in the view.

Multiple view partials within one widget

Rather than a single large *view.php* file, some widgets now have partial view files that are smaller subsets of the view. The *view.php* is still the main widget view, but it renders the partial view files, which also appear in the widget's folder. For example, the AnswerFeedback widget was split into three view partials. These view partials use the `*.html.php` naming convention.



The *view.php* file for the AnswerFeedbackWidget contained 79 lines of code in Framework Version 3.2.1, while the same file in Version 3.2.5 contains only 40 lines, including three lines that call the widget's view partials to render the various feedback options: Yes/No buttons, up to five stars, and a numerical ranking scale.

When you extend a standard widget and choose to extend its view, the extended widget contains the standard widget's *view.php* file and all of its view partial files. When you do not change the standard widget's view (both View questions are answered No) or when you override the view instead of extending it (by answering Yes to "Does this widget modify the parent widget's view?" and selecting the Override radio button), the standard widget's view partials are not included in the view of the extended widget.

The view partials within a single widget have all the functionality of regular views. They can reference other widgets with the `$this` context, and they can use `<rn:block>` and `#rn:#` tags.

Multiple widgets sharing the same partial

The Customer Portal provides view partials that can be used by any widget. For example, the SiteFeedback widget contains the following code.

```
<label for="rn_<?=$this->instanceID?>_FeedbackTextarea">
    <?= $this->data['attrs']['label_comment_box'] ?>
    <?= $this->render('Partials.Forms.RequiredLabel') ?>
</label>
```

This code calls the view partial *RequiredLabel.html.php* in the */cp/core/framework/views/Partials/Forms* folder, which contains the following code:

```
<span class="rn_Required"><?= $requiredLabel ?:
\RightNow\Utils\Config::getMessage(FIELD_REQUIRED_MARK_LBL) ?></span>
<span class="rn_ScreenReaderOnly"> <?= $screenReaderLabel ?:
\RightNow\Utils\Config::getMessage(REQUIRED_LBL) ?></span>
```

Instead of duplicating the same HTML across different widgets to create the red asterisk and screen reader label to indicate a required field, this single shared view partial can be reused by any widget that needs it by simply calling:

```
$this->render('Partials.Forms.RequiredLabel')
```

If you want to override contents of a standard view partial, you must register a custom view in */cp/customer/development/config/extensions.yml* by adding the following text to the file.

```
partialViewExtensions:
    - Partials.Forms.RequiredLabel
```

Then whenever the Required.Label view partial is called, the custom file located in */cp/customer/development/views/Partials* will be used instead of the standard one in the *core* folder.

Unlike view partials within a single widget, which have the same functionality as regular view files, view partials that are shared among several widgets have limited functionality. They cannot render widgets or use `rn:` tags. Nor can they use the `$this` context to access widget properties.

Overriding standard view partials

If you want different functionality for a standard view partial (if, for example, you want to use two blue asterisks instead of a single red one to indicate that a field is required or you want to use a different screen reader label for a required field), you can create a custom view partial file with the same name as the standard. Using the Required.Label view partial as an example, you would create the new view file, name it *RequiredLabel.html.php*, and place it in */cp/customer/development/views/Partials/*.

After creating the custom view and placing it in the */cp/customer/development/views/Partials* folder, you must register the view. You do that by adding the following text to the */cp/customer/development/config/extensions.yml* file.

```
viewPartialExtensions:
    - Partials.Forms.RequiredLabel
```

Now, calling the RequiredLabel view partial will call the custom view from your development site instead of the standard view partial.

Creating custom view partials

To create a new view partial that can be shared among widgets, create the file and add it to */cp/customer/development/views/Partials*. If your new file is named *mySharedPartial.html.php*, for example, you would add the following code to the custom widget's *view.php* file.

```
<?=$this->render('Partials.MySharedPartial') ?>
```

Because you are not overriding a standard view partial, you do not have to register your custom view partials in the *extensions.yml* file as you do when you want to replace a standard view partial.

Logic file

The *logic.js* file contains the display logic and events for the widget. The widget may subscribe to or fire custom events to and from the event controller. This file also calls any JavaScript templates the widget might use. The logic file is optional.

Embedded JavaScript files

The *ejs* files in a widget folder are embedded JavaScript templates that produce HTML by using the variables that the view expects. It then can loop, perform conditions, or output variable data.

Widget CSS files

Some widgets have a base CSS file, others have a presentation CSS file, and many standard widgets have both. The base CSS file for a widget controls its functionality, while the presentation CSS controls the appearance of a widget. By having separate presentation files, you can control the appearance of one widget without impacting the appearance of any other widgets.

You cannot edit the base CSS files for standard widgets, which are stored in the folders with the other files that make up each widget, for example, */cp/core/widgets/standard/chat/ChatAttachFileButton*.

Widgets that have a corresponding CSS file in the */cp/customer/assets/themes/standard/widgetCss* folder use that CSS file to control the presentation, or appearance, of the widget when it is rendered on a page. This file contains the rules for adding stylistic elements to the widget. (The presentation CSS files for widgets that can be used on your mobile customer portal are in */cp/customer/assets/themes/mobile/widgetCss*. Refer to Mobile widgets.) The file name is *[WidgetName].css*, for example, *AdvancedSearchDialog.css*. The changes you make to presentation CSS files are sandboxed in the *themes* folder, so you can view them on your development site, but you must **stage** and **promote** the customer portal before you can see those changes on your production site. Click here for more information about how the files in the */cp/customer/assets/themes/* folders are sandboxed.

Standard and custom widget folders

All of the standard widgets that are part of the Customer Portal **reference implementation** are stored in the */cp/core/widgets/standard* folder, and all custom widgets that you create should be stored in the */cp/customer/development/widgets/custom* folder.

Note Although it's best practice to add custom widget folders to */widgets/custom folder*, you can add a widget to the root directory.

The page code of the standard reference implementation files defines widgets without specifying whether they are in the *standard* or *custom* folder. (Because the reference implementation uses only standard widgets, they are all stored in the *standard* folder.)

When you modify page code to add or edit a widget, you do not have to specify a folder for the widget path. If you explicitly indicate either the *standard* or *custom* widget folder, the code will call the widget from that folder. If you do not specify a folder, the *custom* widget folder is searched first. If no widget with that name exists in the *custom* folder, the *standard* folder is searched.

If you want to create a custom widget that replaces a standard widget everywhere on your customer portal where the standard one appears, you have two options for doing so. The hard way is to find every instance of the standard widget in the code for all pages and replace each instance with the name of the new custom widget.

However, there's an easier way. Because the *custom* folder is searched before the *standard* folder, you can replace a standard widget with a custom one that uses the same name without having to find and replace all calls to the new widget in all customer portal pages.

Important When you give a custom widget the same name as a standard widget, the custom path must be the same as the standard path. For example, if you create a custom AdvancedSearchDialog widget, you must create a subfolder called *search* under the *custom* widget folder and place the widget in that subfolder so the relative path for the custom widget is the same as that of the standard widget. In other words, the path for the standard widget is *standard/search/AdvancedSearchDialog*. Therefore, the path for the custom widget must be *custom/search/AdvancedSearch-Dialog*.

When you give a custom widget the same name as a standard widget, you must be aware of controller issues, described in the following section. The standard widgets that are comprised of multiple widgets (such as ChannelAllInput, ContactNameInput, and CustomAllInput) reference the FormInput widget in their *view.php* files. If two input widgets use different controllers that have the same class name, such as FormInput or DataDisplay, deployment failures will occur.

Custom widget controllers

A deployment failure will occur if two different widgets on the same page use the same widget folder name. When that happens, the widgets have the same class name in the controller. If you copy a widget and use the same widget name for the custom widget (for example, you create a custom input widget, name it FormInput, and put it in the *widgets/custom/input* folder, the custom widget uses the custom controller. However, because it has the same name as the standard widget's controller, a failure occurs if both widgets are placed on the same page. The error message lists the two widgets using different controllers that have the same class name and identifies the page where they are found. This lets you correct the problem by copying the *view.php* files of the custom widget to the appropriate folders.

Widget AJAX requests

When widgets require data, they make an AJAX request to the server. You define where a widget's request goes by setting a value for a specifically named AJAX endpoint attribute. For example, the ConditionalChatLink widget has an attribute called *get_chat_info_ajax* that lets you define where the request for chat availability will be sent. The default value is */ci/ajax_Request/getChatQueueAndInformation*. All requests are sent to */ci/ajaxRequest/*, which loads the ajaxRequest controller so it can execute the specified function, which is getChatQueueAndInformation in this example.

For a detailed explanation of AJAX requests, refer to Making AJAX requests to the server.

YUI

The Customer Portal uses YUI 3.13, but you can substitute the value `{YUI}` at the beginning of a file name to use the most current YUI version. The following default YUI modules are included on each page, so you don't need to call them out specifically in the widget code.

- anim-base
- anim-easing
- escape
- event-base
- history
- node-core
- node-event-delegate
- node-screen
- node-style

You can also use the following YUI requirements in jsModule.

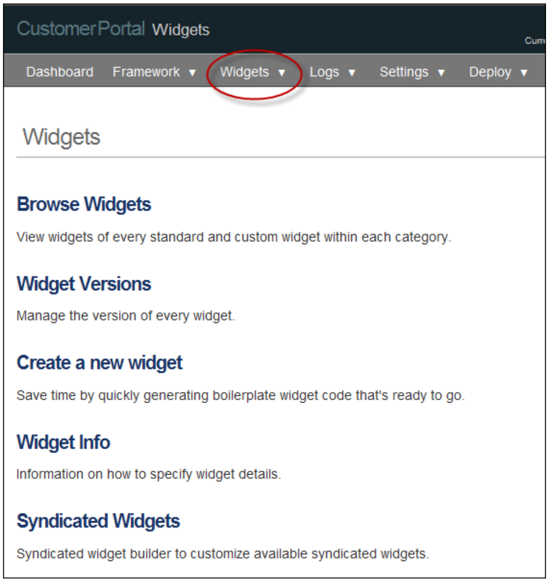
- `yui: [panel, autocomplete, autocomplete-highlighters]`
- ```
  yui:
     standard: [overlay]
  ```
  ```

Managing widgets

You can open the Widgets page of the Customer Portal Administration site by typing http://<your_site>/ci/admin/docs/widgets. You must log in with your user name and password, so make sure your profile includes the CP Edit permission. (Learn how to assign permissions here.)

You can also access this page from anywhere on the Customer Portal Administration site (http://<your_site>/ci/admin) by clicking the Widgets tab.

Click to view



The Widgets page lets you select the following options.

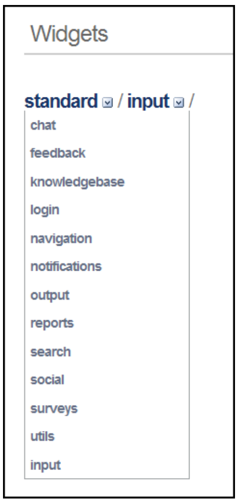
- **Browse widgets**—Opens a page where you can select standard and custom widgets to view all widget categories. Refer to Navigating folders and searching for widgets.

- **Widget versions**—Displays a page that lets you select a widget in the left column and open detailed information for that widget, including a preview image, documentation, where the widget is used, and any version changes. You can also deactivate or delete the widget on this page. Refer to Widget version management and Widget information page.
- **Create a new widget**—Opens the widget builder where you can create a custom widget by extending an existing standard widget or building a new one. Refer to Widget builder.
- **Widget info**—Defines the elements of the *info.yml* file. Refer to YAML file.
- **Syndicated widgets**—Lets you select and modify syndicated widgets, those widgets that let you add Customer Portal functionality to pages that are not part of your support site. Refer to Syndicated widgets.

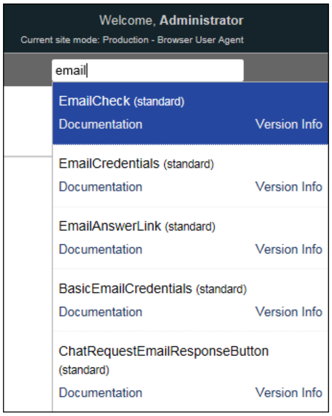
Learn how to navigate the widget folders and search for widgets.

Navigating folders and searching for widgets

You can quickly navigate among the different widget folders. After you click Browse Widgets, select Standard Widgets, and select a folder, you can click the drop-down menu associated with the folder level and select a different folder.



Or, if you know the widget's name, you can type the first few letters or any part of the name in the Search Widgets field in the upper right corner of the page to display a menu of widgets that match your entry.



Widget version management

Every widget in Customer Portal Framework Version 3.2 has a version number. When a widget is changed, for example, by the addition of a new attribute that increases functionality, you'll be able to incorporate only that widget without being required to use an entire widget set or a new Customer Portal framework version.

The version level system for widgets includes major, minor, and nano changes.

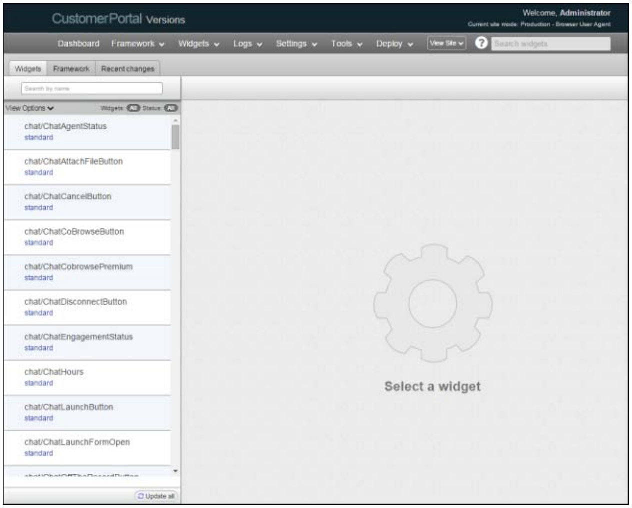
- **major**—A significant change to a widget's functionality, which you may or may not choose to adopt.
- **minor**—A widget change that is not backward compatible.
- **nano**—A fully backward-compatible change that will be applied automatically to your widget files with no impact.

The Customer Portal Administration site provides a comprehensive overview of widgets and their versions.

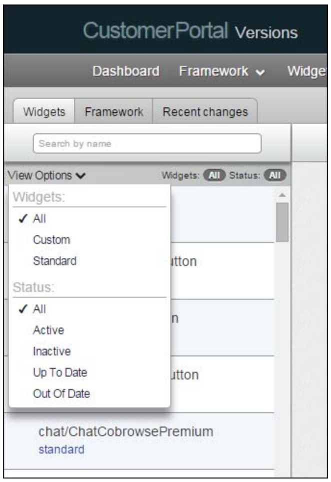
To display and manage widget versions

1 Type `https://<your_site>/ci/admin` to log in to the Customer Portal Administration site. You will be asked for your Oracle Service Cloud user name and password.

2 Click Widgets, and then select Widget Versions. The Customer Portal Versions page opens with the Widgets tab on top and the list of widgets in the left column.



3 To filter the list of widgets by widget type, click the View Options drop-down menu and select one of the widget type filters. The options include all widgets, custom widgets only, and standard widgets only.



4 To filter the list of widgets by widget status, click the View Options drop-down menu and select one of the widget status filters.

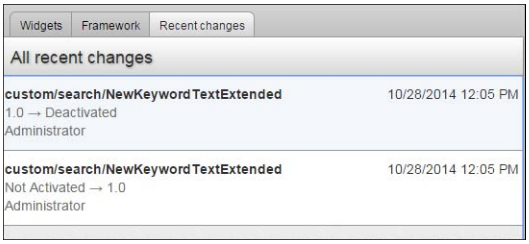
a To display all widgets that are currently activated on your customer portal, select Active.

b To display all widgets that have been deactivated, select Inactive.
c To select all widgets being used in their most current version, select Up To Date.
d To select all widgets for which newer versions are available, select Out Of Date.

5 To search for a specific widget, type the first few letters of the widget name in the Search field above View Options. A list of matching results is displayed. Refer to Available Versions tab for a discussion about a widget's different versions.

6 To update all widgets to their most recent version for the Customer Portal framework being used by your site, click the Update All button at the bottom right of the column.

7 To see all recent version changes, click the Recent Changes tab. Recent actions related to widgets and frameworks are shown in a list. Information includes whether a different version is now being used or if a widget was activated or deactivated. It also includes the staff member who made the change and the date and time the change occurred.



Deploying widget versions

If you migrate versions for multiple widgets on your development site and then decide to stage and promote your customer portal, you are required to deploy every migrated widget during the process. In other words, you cannot selectively deploy widget versions during the staging and promoting processes.

Additionally, if you migrate a widget when a newer version is available because you want to use it on a page, the new version will be used for every instance of that widget on your customer portal.

Widget information page

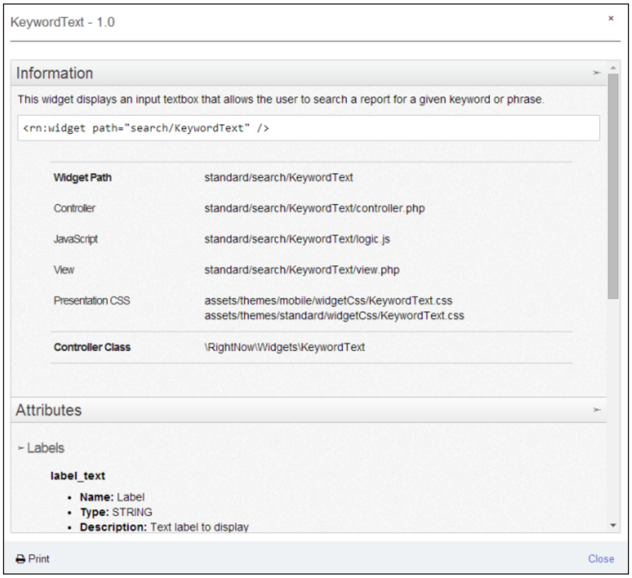
All of the information you need for each widget is defined in detail when you select the widget on the Customer Portal Administration site.

To select a widget

1 Type https://<your_site>/ci/admin to log in to the Customer Portal Administration site. You will be asked for your Oracle Service Cloud user name and password.

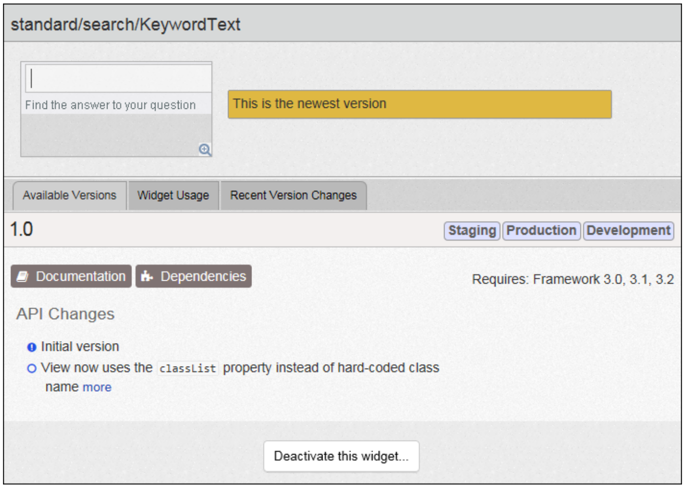
2 Click the Widgets tab. The Widgets page opens.

3 Select Browse Widgets, select Standard Widgets or Custom Widgets, select the widget folder, and then select the widget name. The widget page opens with the Documentation view opened.



Or

Select Widget Versions and select the widget you want to open from the list on the left. The description and overview of the widget opens.

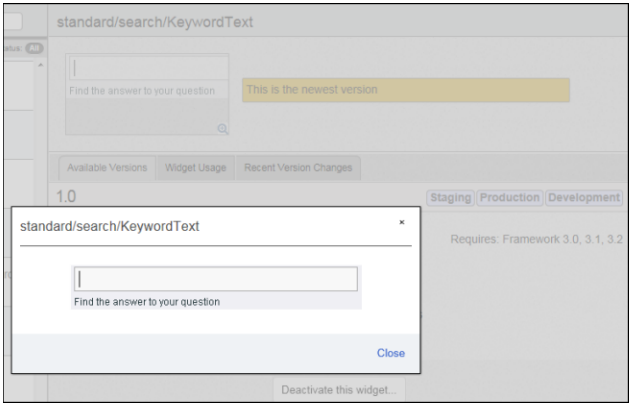


Or

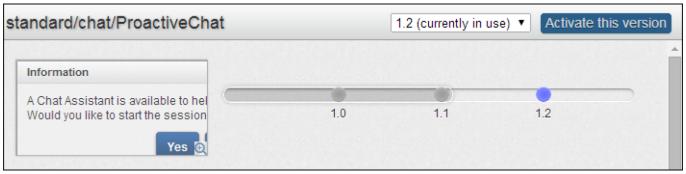
Type the widget name in the Search Widgets field on any page of the Customer Portal Administration site. The description and overview of the widget opens.

Three tabs appear on the widget information page: Available Versions, Widget Usage, and Recent Version Changes. The following elements appear on the page regardless of the selected tab.

- **Preview**—The preview shows you an example of what the widget looks like on a page. If the widget is larger than the preview window and the display provides only a partial view, you can click the preview window to display an expanded view of the widget, as shown here. Close the expanded preview window by clicking the Close link in the lower right corner of the window or the X in the upper right corner. (To add a preview to a custom widget, click here.)



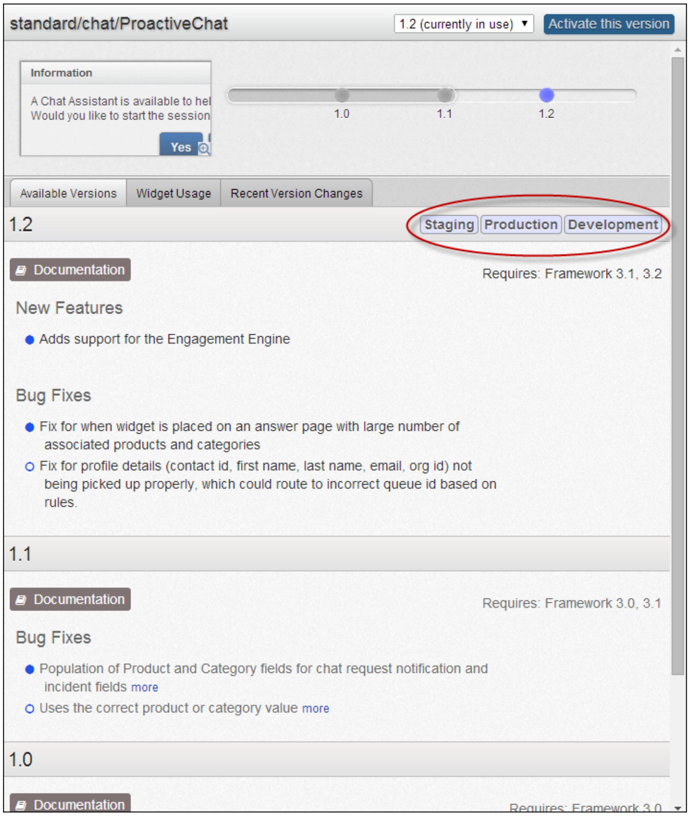
- **Widget history timeline**—A timeline at the top of the page shows the available versions of the widget and the version currently in use. If the widget version is 1.0, the message says, "This is the newest version."



Available Versions tab

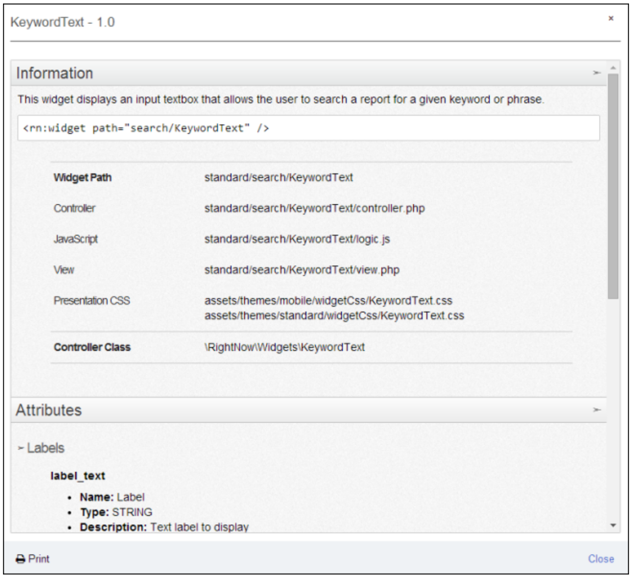
The following elements appear on the Available Versions tab of the widget information page.

- **Staging/Production/Development**—When multiple versions of the widget exist, the areas using each version are noted. In the following figure, the development, staging, and production areas are all using version 1.2 of the widget.

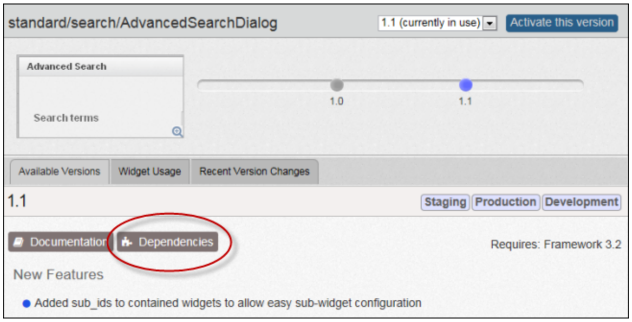


- **Framework requirements (dependency information)**—The page includes the framework version that must be installed to support the widget version.
- **Widget version information**—Each version of the widget is listed on the page, with the newest listed first. The version section describes the changes that were made from the previous version. The changes are categorized as likely impact, possible impact, or no impact to custom code, determined by hovering over the bullet for each change. Changes are further classified as new features, removal of functionality, API changes that impact the widget, or bug fixes.
- **Documentation**—Clicking Documentation opens a page of information specific to the widget, including description, default code, attributes by category (such as labels, image paths, and AJAX endpoints), the controller class, path information, and URL

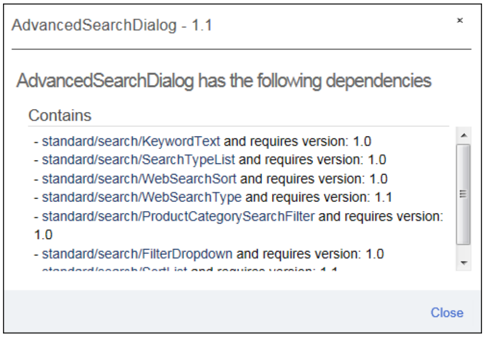
parameters. (If the page describes a custom widget that was extended from another widget, it will also list the parent widget.) Print this page by clicking the Print link at the bottom of the window.



- **Dependencies**—When a standard or custom widget has dependencies, the Dependencies button appears on the widget information page next to the Documentation button. Dependencies include the following:
  - ▷ A widget contains other widgets (for example, AdvancedSearchDialog contains KeywordText and other widgets)
  - ▷ A widget is extended from another widget (for example, ChatAttachFileButton extends from FileAttachmentUpload)
  - ▷ A widget is the parent of a widget (FileAttachmentUpload is the parent of ChatAttachFileButton)

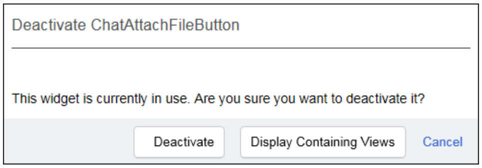


Clicking the Dependencies button opens a window that displays the dependencies to other widgets.

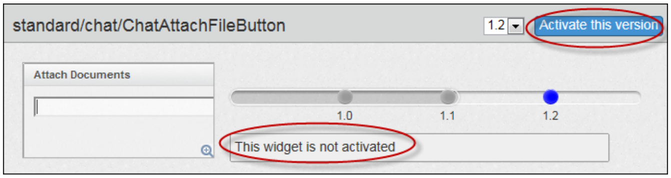


- **Deactivate this widget**—When you click this button at the bottom of the page, the widget is no longer available for use on your site. Then, when you filter on only the Active widgets, your list displays only the activated widgets. (Even deactivated widgets will appear in the list of widgets if you do not select the Active filter.) For example, if you do not use Oracle RightNow Chat Cloud Service (Chat), you may want to deactivate each of the chat widgets. When you click the button for a widget that is currently in use on your site, you are asked to verify that you want to deactivate the widget and offered a chance to see where it is being used.

Note In this example, even though you are not using Chat, the reference implementation includes Chat pages that use the chat widgets.



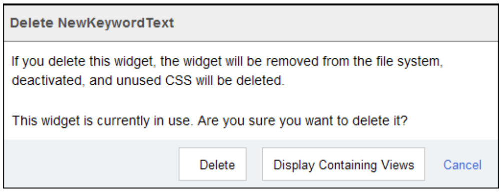
Widgets are not actually removed from the code when you deactivate them, but they are made unavailable for use. After you have deactivated a widget, it does not appear in the list of widgets when you use the Active filter. It does appear in the list when no filter is used, but it is grayed out to indicate that it is deactivated. If you click a deactivated widget, you can reactivate it. An Activate This Version button appears, and you can select the version you want from the drop-down menu.



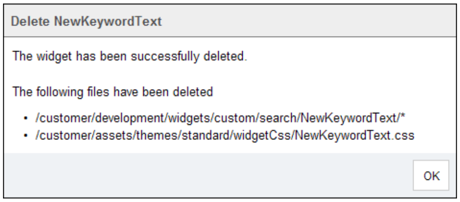
After selecting the version and clicking the button, the widget is activated once again.

Important When new widgets are added in future releases, they are not automatically activated. Instead, you'll need to specify which version of the widget you want when you decide to start using it. This prevents the possibility of using a widget that was activated earlier but hadn't been used yet if a newer version becomes available before you decide to use it on your customer portal.

- **Delete this widget**—The Delete This Widget button appears only for custom widgets. When you click the button, a confirmation message appears. If the widget is being used on your customer portal, a Display Containing Views button appears on the confirmation message. Click the button to display a list of pages and/or widgets that use the widget you want to delete.

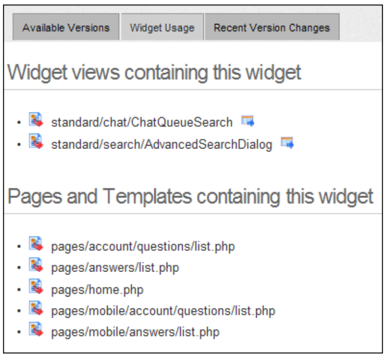


When you click Delete in the confirmation message, the widget is deactivated and deleted from the left panel that contains a list of all the widgets. All of the widget's associated files are also deleted from the file structure, so they no longer appear in the WebDAV file structure. The deleted files are listed in the message that tells you the widget was deleted. You cannot reactivate the widget after deleting it.



Widget Usage tab

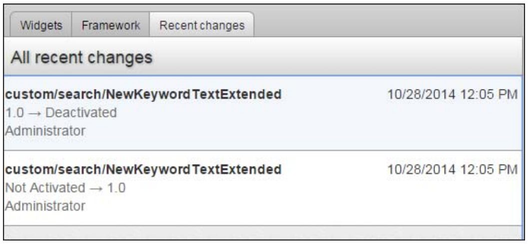
Selecting the Widget Usage tab displays the widgets, pages, and templates that use the widget.



Select a widget or page from the list to view the snippet of page code where the widget appears, highlighted for easy location. Click the Close link or X to close the snippet.

Recent Version Changes tab

Selecting the Recent Version Changes tab displays a list of recent updates to the widget. Information includes whether a different version is now being used or if the widget was activated or deactivated. It also includes the staff member who made the change and the date and time the change occurred.



Widget attributes

Each widget has properties, or attributes, that are specific to the instance of the widget. A widget can look or behave one way on one page and differently on another. You might even have two instances of the same widget on one page with different attributes. For example, you could add a second ProductCategoryList widget to the Support Home page to display a list of featured support products in addition to the featured support categories list that appears on the page by default.

When a widget contains other widgets, you can use the attributes of the contained widgets in the widget definition. For example, the DataDisplay widget contains, among other widgets, the FileListDisplay widget. The code for the DataDisplay widget can include attributes of the FileListDisplay widget, even if those attributes are not available on the DataDisplay widget. The attribute value specified in the DataDisplay widget code is passed on to the FileListDisplay widget. See an example here.

Additionally, you can create an RN Container page tag to define a set of attributes and their values that are common to multiple widgets. Then, instead of having to add every attribute to the code for each of the affected widgets, you can use the container to define the attributes. Refer to Applying common attributes to multiple widgets.

Note If the widget code specifies an attribute that is also defined in the container, the value for the attribute in the widget code overrides its value in the container.

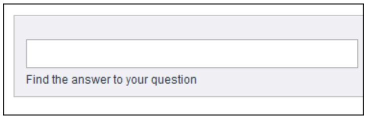
The page for each widget on the administration site lists and explains the attributes of the widget and tells you how to define the attribute in the widget's code.

For example, here is the code for the standard search widget KeywordText.

```
<rn:widget path="search/KeywordText"/>
```

And here is the KeywordText widget code on the Support Home page.

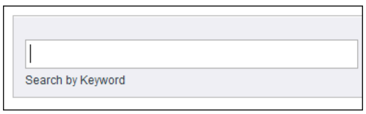
```
<rn:widget path="search/KeywordText"
label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#"
initial_focus="true" />
```



(For clarity, the AdvancedSearchDialog and SearchButton widgets that usually appear with the KeywordText widget have been removed in the widget figures on this page.)

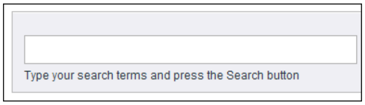
In the widget definition, you can see that the default text for the *label_text* attribute is "Search by Keyword." But the widget code on the Support Home page uses a message base to replace the default label. If you want to use the default label, you can simply delete the attribute from the code since all attributes are automatically assigned to their default unless the widget code changes it.

```
<rn:widget path="search/KeywordText"
initial_focus="true" />
```



Or you can define a new label.

```
<rn:widget path="search/KeywordText"
label_text="Type your search terms and click the Search button"
initial_focus="true" />
```



Sub-widgets and attributes

Several Customer Portal widgets contain other widgets. For example, the DataDisplay widget contains the FileListDisplay, ProductCategoryDisplay, IncidentThreadDisplay, FieldDisplay, and ProductCatalogDisplay widgets.

Often a widget that is contained in a parent widget has attributes with the same name as the attributes of another contained widget. The AdvancedSearchDialog widget, for example, contains two instances of the ProductCategorySearchFilter, one for products and one for categories. Because you want to be able to specify unique labels for each, both instances of the ProductCategorySearchFilter widget have their own ID value to let you use the widget's *sub_id* attribute to accomplish this, as shown in the example procedure below. Before you follow the example, review the Containing Widgets section of the documentation page for the AdvancedSearchDialog widget at https://<your_site>/ci/admin/versions/manage/#widget=standard%2Fsearch%2FAdvancedSearchDialog&docs=true&version=1.1 (or select the widget, click Documentation, and scroll down to the Containing Widgets section. Notice that each of the widgets that are part of the AdvancedSearchDialog widget now contains a *sub_id* attribute.

Containing Widgets

The following widgets are used within this widget view. Selecting a widget name from the list below will take you to the detailed documentation for that widget.

To set any of the contained widget's attributes, you can use the 'sub_id' attribute specified in the widget tag. The convention for addressing these attributes is:
sub:{sub_id}:{contained_widget_attribute}="Value being set"
For example, with the AdvancedSearchDialog widget, to set the label_input attribute for the Product field, you would use:
sub:prod:label_input="Custom Product Label"

```
<rn:widget path="search/KeywordText"
          label_text="#rn:msg:SEARCH_TERMS_UC_CMD#"
          sub_id="keywordText"/>

<rn:widget path="search/SearchTypeList"
          filter_list="#rn:php:$this->data['searchTypeFilters']#"
          sub_id="searchTypeList"/>

<rn:widget path="search/WebSearchSort"
          sub_id="webSearchSort"/>

<rn:widget path="search/WebSearchType"
          sub_id="webSearchType"/>

<rn:widget path="search/ProductCategorySearchFilter"
          filter_type="products"
          sub_id="prod"/>

<rn:widget path="search/ProductCategorySearchFilter"
          filter_type="categories"
          sub_id="cat"/>
```

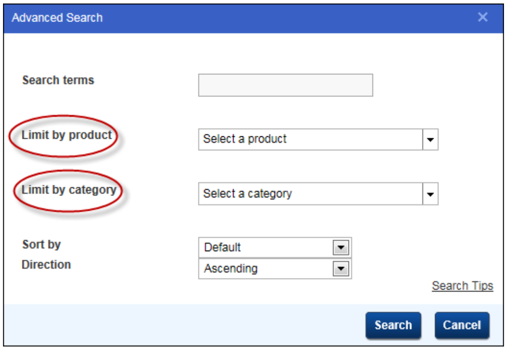
Setting a sub-widget's attribute requires the format:

```
sub:{sub_id}:{widget_attribute}="Value being set"
```

For example, the following procedure uses this syntax to set the label_input attribute for the Product field:

```
sub:prod:label_input="Your Product"
```

The following procedure provides an example of how you can use sub-widgets for greater flexibility and reduced code duplication. The example assumes you want to change the “Limit by product” and “Limit by category” labels that appear on the AdvancedSearchDialog widget. Those labels and their associated drop-down menus are created using the sub-widgets for ProductCategorySearchFilter.



To configure the AdvancedSearchDialog widget with sub-widgets

1 Open the *home.php* file in the */views/pages* folder.

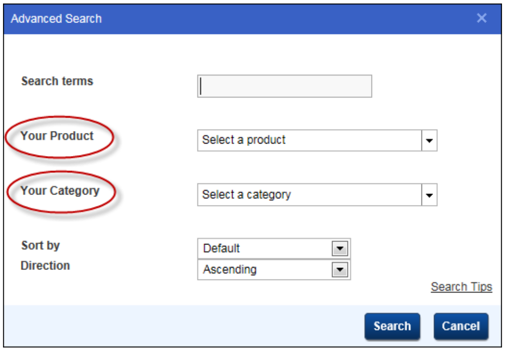
2 Locate the following code.

```
<rn:widget path="search/AdvancedSearchDialog"
report_page_url="/app/answers/list"/>
```

3 Edit the code you located in step 2 as follows.

```
<rn:widget path="search/AdvancedSearchDialog"
report_page_url="/app/answers/list"
sub:prod:label_input="Your Product"
sub:cat:label_input="Your Category" />
```

4 Save *home.php*.



Affected widgets

This release of the Customer Portal assigns sub_id values to widgets that are contained in other parent widgets. The following widgets that contain other widgets now have assigned values for each of their sub-widgets.

- AdvancedSearchDialog (*search*)
- BasicCustomAllInput (*input*)
- BasicFormInput (*input*)
- BasicResetPassword (*login*)
- ChannelAllDisplay (*output*)
- CustomAllDisplay (*output*)
- ChannelAllInput (*input*)
- CustomAllInput (*input*)
- DataDisplay (*output*)
- ProdCatNotificationManager (*notifications*)
- FormInput (*input*)
- ResetPassword (*login*)

Other sub-widget examples

When several of a widget's sub-widgets have the same attribute, you can set the attribute for all of them in the widget code, as you could before. Now, however, you can make an exception based on a specific sub-widget. In the following example, the default hint value is used for all custom fields except the Priority custom field, which has its own hint.

```
<rn:widget path="input/CustomAllInput"
hint="hint for every field except Priority"
```

```
sub:input_Incident.CustomFields.c.priority:hint="Priority hint"/>
```

FormInput examples

The CustomAllInput contains the FormInput widget, and the FormInput widget contains the SelectionInput, DateInput, TextInput, and PasswordInput widgets. Because there are different types of input widgets in FormInput, each sub-widget has its own ID, which you can use to set attributes for all sub-widgets of that particular type, similar to the example shown here.

```
<rn:widget path="input/CustomAllInput"
hint="hint for every field except date fields"
sub:date:hint="hint for all date fields"/>
```

If the code sets an attribute based on type (text, selection, date) and that attribute is set to a specific value by default, you should explicitly override the attribute using the sub-widget code format:

```
sub:<id>:<attribute_name>="attribute_value"
```

This ensures that the value you specify takes precedence over attributes set in the widget's view. For example

```
<rn:widget path="input/CustomAllInput" table="Incident"
sub:text:required="true"
sub:input_Incident.CustomFields.c.text1:text:required="false"
sub:selection:hint="Hint for selection field"
sub:input_Incident.CustomFields.c.priority:selection:hint="Hint for
Priority field" />
```

Notice that you must include the type after the field name only if the code also has an attribute with sub:type:<attribute_name>. That is, you can set specific attributes such as the required or hint value for a specific field using the format below.

```
<rn:widget path="input/CustomAllInput" table="Incident"
sub:input_Incident.CustomFields.c.text1:required="true"
sub:input_Incident.CustomFields.c.priority:hint="Hint for Priority
field" />
```

ChannelAllDisplay and ChannelAllInput examples

The ChannelAllDisplay and ChannelAllInput widgets work similarly, where you can use sub-widgets to define custom labels for each channel, as shown in this example.

```
<rn:widget path="output/ChannelAllDisplay"
sub:display_FACEBOOK:label="Custom Facebook username"
sub:display_TWITTER:label="Custom Twitter username"
sub:display_YOUTUBE:label="Custom YouTube username" />

<rn:widget path="input/ChannelAllInput"
sub:input_FACEBOOK:label_input="Custom Facebook input field"
```

```
sub:input_TWITTER:label_input="Custom Twitter username"
sub:input_YOUTUBE:label_input="Custom YouTube input field" />
```

Reports in widget attributes

You might have noticed that several widgets include a *report_id* attribute. This attribute defines the **report** to be displayed by the widget. When you reference a report (for example, the Answers report for the KeywordText widget), you must know the report's ID number. The following procedure tells you how to find the report ID.

Important Answers reports that are used on the Customer Portal must contain the answers.special_settings filter. All **standard answers reports** include this filter, but you must be sure any custom answers reports you want to use also include it. One way to be sure the special_settings filter is included in a custom answers report is to copy one of the standard answers reports and edit the copy to create your custom report. Refer to Checking for the answers.special_settings filter in an answers report.

To find report IDs

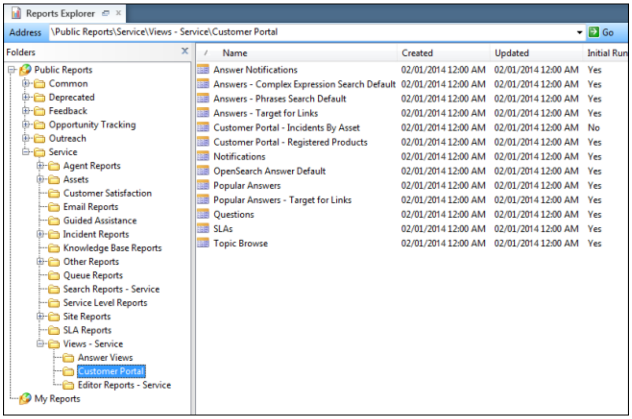
1 Log in to Oracle Service Cloud.

2 Click the Analytics button on the **navigation pane**.

3 Double-click Reports Explorer.

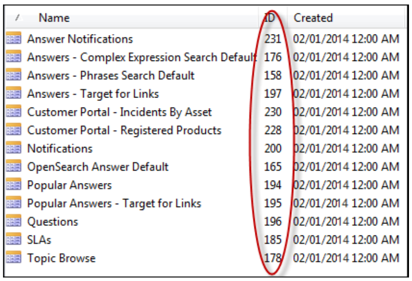
4 Drill down through the reports in the tree until the report you want is displayed in the list on the right. (Alternately, you can search for the report by clicking Find on the report ribbon, selecting Name or other field, and typing what you're looking for in the search field.)

Note You can find Customer Portal reports under \Public Reports\Service\Views – Service\Customer Portal.



5 On the report ribbon, click the Choose Details button in the Display group. The Hide or Display Details window opens.

6 Select the check box for ID and click OK. The report ID now appears in the list of reports.



Editing widgets to change reports

When a page includes search navigation with an answers report, multiple widgets are used to control the functionality. On the Answers page, for example, these widgets include the following.

- Elements of the search tool:
  - ▷ Link to the advanced search dialog
  - ▷ Search field

  - ▷ Search button
  - ▷ Search filters
- Elements of the returned search results:
  - ▷ The report itself
  - ▷ The display of total number of results
  - ▷ Pagination control

In all, seven widgets on the Answers page make up the search field and report, and each of these widgets must call the same report in order for the page to display meaningful information. The reference implementation uses a container page tag to define this report ID as 176, which is the Answers–Complex Expression Search Default report.

Important If you change the default report on the Answers page, you must also change the answers report in the Contact Visible Answers Report field on the **administration interface**.

The same thing is true for any other customer portal page that uses the combination of search field and report, whether it is a page of the **reference implementation** or a custom page that you've created. That is, all widgets that make up these elements must call the same report using one of the following methods.

- Use the RN Container page tag to identify one or more common attribute values and then embed a group of widgets within the container tags or specify the container as a widget attribute. Refer to Applying common attributes to multiple widgets. The reference implementation uses this method.
- Edit every search and report widget on the page by adding the *report_id* attribute to the widget code and setting its value to the ID of the report you want to use. The attribute format resembles the following.

```
report_id="194"
```

Changing the answers report

When your customers conduct a search, the answers are returned in the report that is identified in the code for the Answers page (*/answers/list.php*). By knowing what report is being used, Oracle Service Cloud can correctly use answer **clustering**, **SmartAssistant**, and external document indexing to return the appropriate answers.

However, the report you specify in Customer Portal code is not stored where the **knowledge base** can use it. As a result, you need to identify the report on the Interfaces editor so the knowledge base knows what report you want to use on your customer portal.

If you use the standard Answers page, the default report is Answers–Complex Expression Search Default, which is also the default report on the Interfaces editor. If that's the case, you don't need to change anything. But if you change the report used on your customer portal, you must also change the Contact Visible Answers Report on the Interfaces editor so the knowledge base returns the correct answers.

[Learn how to change the answers report in the Answers page code.]

To change the answers report on the Interfaces editor

1 Log in to Oracle Service Cloud.

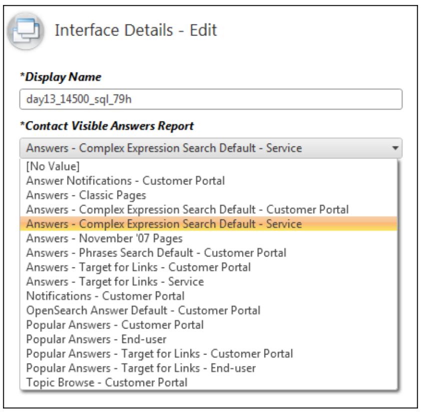
2 Click the Configuration button on the navigation pane.

3 Double-click Interfaces under Site Configuration. The Interfaces tree displays on the content pane.

4 Click the interface you want to edit in the tree. (You may have just one interface.) The Interfaces editor opens.

5 Click the Contact Visible Answers Report drop-down menu, and select the report you are using from the menu options.

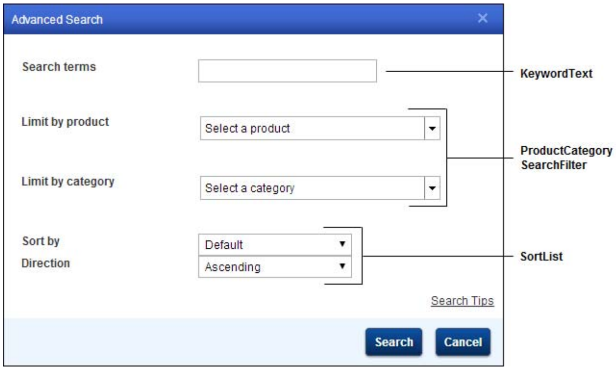
6 Click Save and Close.



Specifying additional report filters

By default, the standard filters defined in a report are displayed when the AdvancedSearchDialog widget is opened. If you have added custom filters to custom reports, you may want those filters to display on your customer portal as well. (To add filters to a custom report, refer to [Creating report filters](#).)

The AdvancedSearchDialog widget includes an *additional_filters* attribute that lets you define a comma-separated list of additional run-time filters to add to the report. Menu-type filters are added in the order you specify in the attribute below the ProductCategorySearchFilter widgets and above the SortList widget, shown in the default configuration here. Text and integer filters display as drop-down menus immediately below the KeywordText widget.



To add custom filters to the AdvancedSearchDialog widget, add code resembling the following to the Support Home page, Answers page, or any other page where you've placed the AdvancedSearchDialog widget.

```
<rn:widget path="search/AdvancedSearchDialog"
additional_filters="Custom Menu, Custom Integer, Custom Text, Status"
/>
```

The widgets appear on the AdvancedSearchDialog widget in the order you list them.

If any of the filters you have added in the *additional_filters* attribute are text or integer filters, the AdvancedSearchDialog widget outputs the SearchTypeList widget, which also lets you define a list of report filters that appear in a drop-down menu on the report. These filters are specified in the *filter_list* attribute of the SearchTypeList widget. If no filters are specified in the attribute, the widget uses the filters defined in the report.

Important If you are using multiple reports on a page, each with its own runtime filter, the reports seen by customers who access the page using an older browser (including Internet Explorer 8 and Internet Explorer 9) will be filtered by the combination of all selected filters. To avoid this situation when searching is intended for only one of the reports, edit the remaining reports to remove any runtime filters.

Hiding reports when no results are returned

Several report widgets include a *hide_when_no_results* attribute that prevents the widget from displaying if no search results match the entered terms. These widgets include Multiline, Grid, MobileMultiline, and CommunitySearchResults. To hide the widget, simply add the attribute and set its value to true. Here's an example of adding the attribute to the Multiline widget.

```
<rn:widget path="reports/Multiline" hide_when_no_results="true"/>
```

Date and time formats in reports

The Multiline, Grid, MobileMultiline, and CommunitySearchResults reports let you format the output of date columns in the report. The following table shows the output for each allowable value of the *date_format* attribute for the reports.

Table 371: Values for the *date_format* Attribute of Report Widgets

Value	Format	Example
short (default value)	m/d/Y	09/14/2012
date_time	m/d/Y h:i A	09/14/2012 11:08 AM
long	l, M d, Y	Wednesday, Sep. 14, 2012
raw	unformatted UNIX time stamp	1347620880

Defining the number of search results

You can define the number of displayed search results when the report is created on the Service Console, as shown in Adding row limits and page breaks. You can also limit report results by adding the *per_page* attribute, for example, as shown in the following code.

```
<rn:widget path="reports/Multiline" per_page="5" />
```

If the report definition on the Service Console includes row limits and the report widget defines the *per_page* attribute, the widget attribute overrides the report definition.

Widget builder

The Customer Portal widget builder can create a new widget by extending the functionality and attributes of an existing widget and generating custom code files for the new widget. The code contains placeholders that you can modify to achieve the behavior you want for the new widget.

When functional changes or bug fixes are added to a standard widget, the widget undergoes a nano versioning change. As you would expect, the standard widget on your customer portal automatically migrates to the new nano version. Additionally, any custom widgets that have been extended from that standard widget are also modified to incorporate the enhancement or fix.

The widget builder generates custom widget code when you answer a series of questions about the widget you want to create. By creating placeholders for additional code you'll add to further define the custom widget, it reduces the amount of code you must write and minimizes the possibility of errors because it creates the widget's basic code structure.

Building custom widgets

Using the Customer Portal's widget builder, you can create custom widgets to suit your own business needs. Each custom widget can be designed from scratch as a standalone widget, or it can inherit and extend the functionality and attributes of another widget (referred to as the parent widget).

When you create a new widget from scratch, the widget builder creates the files you need based on your responses to the questions it poses. The files may contain placeholders where you'll need to add content, or they may be blank.

Important You can also create code for a custom widget and add it to your customer portal through WebDAV without using the widget builder. The widget will appear in the list on the Widget Versions page, but you must manually activate it by selecting it and then clicking Activate This Version in the upper right section of the page.

When you create a new widget by extending the functionality of an existing standard or custom widget, you can define whether the new widget will have its own controller, view, CSS, and JavaScript files or whether it will extend the corresponding file from the existing widget that the new widget is being extended from.

To define the behavior of a custom widget, you can include or modify attributes for the following components.

- **Controller**—Initializes and processes data required for widget output. Controllers can also contain AJAX-handling functions.
- **View**—Displays the PHP output generated by a controller, rendered as HTML. The file contains a top level div to simplify your coding work.
- **CSS**—Defines the style and appearance of the view.
- **JavaScript**—Produces specific behavior and renders dynamic HTML views.
- **YUI**—Defines the YUI modules to be used with the new widget.
- **Additional widget details**—Lets you add a widget definition, specify inherited URL parameters, and define JavaScript framework compatibility.

To simplify the process of creating a new widget, the widget builder steps you through a series of basic questions about your widget. Once complete, the utility generates the widget information file along with all of the necessary supporting files based on your responses, which you then edit to meet your needs. Refer to Customizing widget behavior.

Extending and overriding the view

If you indicate that the new widget will modify the parent widget's view, you'll be asked if you want to extend the view or override it. This is an important question, and you should think carefully before selecting the override option.

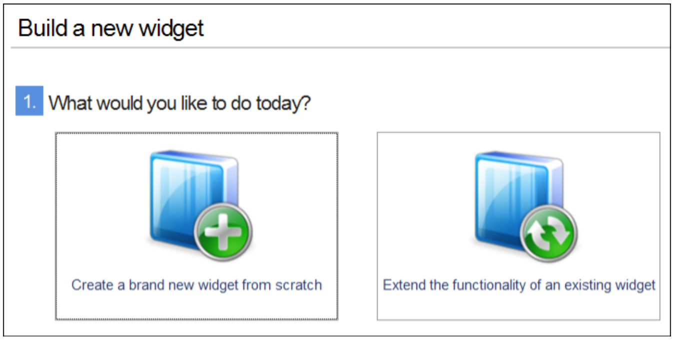
We highly recommend that you choose to extend the parent's widget view instead of overriding it. When you extend a standard widget's view, any future changes to the standard widget will be automatically applied to the custom widget that was created by extending it. If you choose to override the view instead of extending it, your custom code will not be updated. Refer to View file for a discussion of blocks, which make the automatic updates to custom widgets possible.

Note You can extend widget views past the child level. For example, if you extend widget A's view to create the view for custom widget B, you can also extend the view of widget B to create widget C's view. The parent widget's view can be extended in the child's view, which can be extended for the grandchild, and then the great-grandchild.

To create a widget from scratch

1 Type `https://<your_site>/ci/admin` to log in to the Customer Portal Administration site. You will be asked for your Oracle Service Cloud user name and password. Refer to Opening the Customer Portal Administration page.

2 Click the Create a New Widget shortcut. (Or, click the Widgets tab and select Create a New Widget.) You'll be asked if you want to create a new widget or extend an existing standard widget.



3 Click Create a Brand New Widget From Scratch. The widget summary area on the right is updated to indicate you are creating a new widget, and the Naming section appears.

4 Type the name of the custom widget in the What Is Its Name field. (The name cannot contain spaces.)

5 Type the name of the custom widget's parent folder in the And Its Parent Folder field.

6 Click the Continue button. The widget summary is updated with the widget naming information, and the Components section displays questions about the new widget's components.

7 To enable specific widget components, select the Yes radio button for the corresponding question.

Table 372: Components Description for New Custom Widgets

Question	Description
Does this widget have a controller?	Select the Yes radio button if you will create a controller file for the widget.

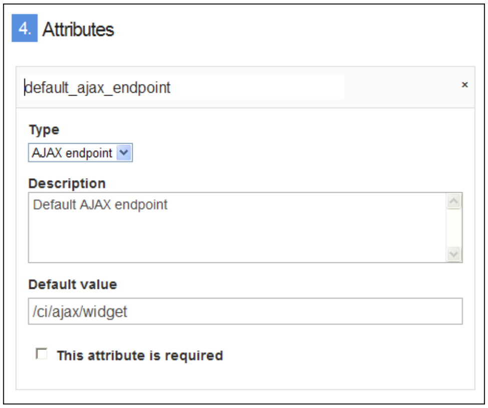
Table 372: Components Description for New Custom Widgets (Continued)

Question	Description
Will it be doing any AJAX-handling?	Select the Yes radio button if the widget's controller will handle AJAX requests. **Note:** You can respond to this question only if you answered Yes to the preceding widget controller question. Otherwise the question is disabled.
Does this widget have a view?	Select the Yes radio button if the widget will display HTML from the controller file's PHP.
Does this widget have JavaScript?	Select the Yes radio button if the widget will contain JavaScript. **Note:** This option is automatically enabled when the AJAX-handling option is enabled.
YUI Modules	If you have selected Yes for the preceding JavaScript question, the Add Module link is active. Click Add Module and begin typing the name of the YUI module you want to have loaded on the page containing the widget and passed to the widget's constructor. A list of modules that match the text you enter appears so you can select the one you want. To add more YUI modules, click Add Module and type the name. **Note:** By default, several YUI modules are already included on each page. Click here to view the list.
JavaScript templates too?	Select the Yes radio button if the widget will display dynamic HTML content rendered by JavaScript. **Note:** You can respond to this question only if the preceding widget JavaScript question is marked Yes.

Note A custom widget must include at least one of the listed components. A widget without any of these components is nonfunctional and therefore invalid.

8 Click the Continue button. The widget summary is updated with the widget component information, and the Attributes section appears.

9 If you answered Yes to the question about AJAX handling, you can define the *default_ajax_endpoint* attribute by editing the name, selecting AJAX for the type, creating a description, and setting a default value.



10 To add another attribute, click the Add an Attribute button at the bottom of the attributes section and enter the following field information.

Note Attribute names cannot contain uppercase characters.

Table 373: Custom Widget Attributes Description

Attribute	Description
Header	Type the name of the attribute in the header field.
Type	Select the type of attribute you want to define. Available types include string, Boolean, AJAX endpoint, option, file path, and integer.
Description	Type a description for the attribute. **Note:** This text describes the attribute when you click Documentation on the custom widget page.
Options	Click Add Option and type an option value to add one or more values to an option-type attribute. **Note:** This field is available only when the attribute Type is set to Option.
Default Value	Type a default value for the attribute. **Note:** By default, a Boolean-type attribute is set to true. Select the False check box if you want the value to default to false.
This Attribute Is Required	Select this check box to make the attribute required.

11 To add more attributes, repeat step 10.

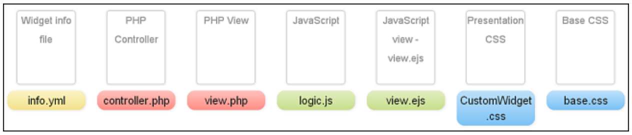
12 When you are finished adding attributes, click Continue. You now have the option of adding details to the widget or creating the widget without adding details.

13 To add details to the widget, click Add Additional Details and enter the following field information.

Table 374: Additional Custom Widget Details

Field	Description
Widget description	Type a description for the widget that appears in the *info.yml* file and on the widget's definition page.
URL Parameters	To add a URL parameter, click Add a URL Parameter and complete the Name, Description, and Example fields. (The Name field cannot contain spaces or forward or backward slashes.) To remove a parameter you added, click the X to the right of the parameter header.
Compatibility	If you want the widget to work with a specific Customer Portal JavaScript framework, select Standard or Mobile or both. Or select No Framework JavaScript is Required. **Note:** This section does not appear if the widget does not have a JavaScript component.

14 Click the Create Widget button. The widget summary is updated with attribute information, and the Generated Widget section displays links to the parent directory and files created for the widget. The widget is now active and available for use in Development mode.



15 Edit the files that were generated so that the custom widget looks and performs as you intend it to. Refer to Customizing widget behavior.

Important To use the new widget in the staging environment, you must not only be sure you select Copy to Staging in the first step of the staging process, but you must also push the widget version change in the second step of the staging process, Version Changes. Refer to To stage your customer portal pages.

To create a custom widget by extending the functionality of another widget

Note Remember that if you want to modify only the appearance of a widget, you do not need to create a custom widget by extending the original widget. Instead, you can change the appearance of the original widget by editing its CSS file.

1 Type `https://<your_site>/ci/admin` to log in to the Customer Portal Administration site. You will be asked for your Oracle Service Cloud user name and password. Refer to Opening the Customer Portal Administration page.

2 Click the Create a New Widget shortcut. (Or, click the Widgets tab and select Create a New Widget.) You'll be asked if you want to create a new widget or extend an existing standard widget.

3 Click Extend the Functionality of an Existing Widget.

Important If the existing widget is a custom widget that has already extended the view of a standard widget, you will receive a staging error if your new widget extends the view of the existing widget.

4 Start typing the name of the widget you want to extend in the Which Widget Shall It Extend From field. A drop-down menu lists the names of all standard and custom widgets that match what you have typed.

5 Select the widget you want to extend. The field is populated with the widget's full path and name.

6 Type the name of your new custom widget in the What Is Its Name field. (The name cannot contain spaces.)

7 Type the name of the custom widget's parent folder in the And Its Parent Folder field.

Note If you're creating the custom widget to substitute for a standard widget, you'll want to be sure the name and folder match the widget you want to replace. Refer to Standard and custom widget folders.

8 Click the Continue button. The widget summary is updated with the widget naming information, and the Components section displays questions about the new widget's components.

9 To enable specific widget components, select the Yes radio button for each correlating question.

Table 375: Custom Widget Components Description

Question	Description
Does this widget have a controller of its own?	Select the Yes radio button if you will include a controller file for the widget. **Note:** The new widget is not required to have its own controller. However, you can extend the parent widget's controller so the new widget can inherit and modify the behavior of its parent.
Will it be doing any of its own AJAX-handling?	Select the Yes radio button if the widget's controller will handle its own AJAX requests. **Note:** The widget will automatically inherit any AJAX-handling functionality of its parent. This option allows you to add new AJAX-handling capabilities or modify the functionality inherited from the parent.
Does this widget modify the parent widget's view?	Select the Yes radio button if the widget will modify or override blocks of content within the view of its parent.
Extend the view	**This is the recommended option.** By extending the view of a standard widget, the custom widget you create will be automatically updated when nano changes are made to the standard widget in the future. No effort will be required on your part to consume the new functionality or bug fix.
Override the view	**Important:** Selecting this option means that you will be required to manually update the custom widget to take advantage of any future changes to the parent widget. Refer to View file for a discussion about code blocks and automatic widget updates.

Table 375: Custom Widget Components Description (Continued)

Question	Description
Include the parent widget's CSS?	Select the Yes radio button if you want the widget to include the CSS style attributes defined for its parent.
Does this widget have its own JavaScript?	Select the Yes radio button if the widget will extend the JavaScript functions defined for its parent.
YUI Modules	If you have selected Yes for the preceding JavaScript question, the Add Module link is active. Click Add Module and begin typing the name of the YUI module you want to have loaded on the page containing the widget and passed to the widget's constructor. A list of modules that match the text you enter appears so you can select the one you want. To add more YUI modules, click Add Module and type the name. **Note:** By default, several YUI modules are already included on each page. Click here to view the list.
JavaScript templates too?	Select the Yes radio button if the widget will modify blocks of content within the parent's JavaScript view.

Note A custom widget must include at least one of the listed components to be a valid, functional widget.

10 Click the Continue button. The widget summary is updated with the widget component information. The Attributes section lists all attributes inherited from the parent and a form for creating new attributes.

11 To edit an inherited attribute, scroll down to the attribute and modify its type, description, default value, or whether it is required.

12 To remove an inherited attribute, click the X on the right side of the header that includes the attribute name.

13 To add an attribute, click the Add an Attribute button at the bottom of the list of inherited attributes and enter the following field information.

Note Attribute names cannot contain uppercase characters.

Table 376: Custom Widget Attributes Description

Attribute	Description
Header	Type the name of the attribute in the header field.
Type	Select the type of attribute you want to define. Available types include string, Boolean, AJAX endpoint, option, file path, and integer.
Description	Type a description for the attribute. **Note:** This text describes the attribute when you click Documentation on the custom widget page.
Options	Click Add Option and type an option value to add one or more values to an option-type attribute. **Note:** This field is available only when the attribute Type is set to Option.
Default Value	Type a default value for the attribute. **Note:** By default, a Boolean-type attribute is set to true. Select the False check box if you want the value to default to false.
This Attribute Is Required	Select this check box to make the attribute required.

14 To add another attribute, repeat step 13.

15 When you are finished adding attributes, click Continue. You now have the option of adding details to the widget or creating the widget without adding details.

16 To add details to the widget, click Add Additional Details and enter the following field information.

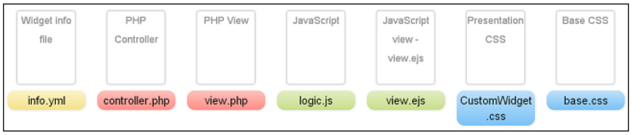
Table 377: Additional Custom Widget Details

Field	Description
Widget description	Type a description for the widget that appears in the *info.yml* file and on the widget's definition page.

Table 377: Additional Custom Widget Details (Continued)

Field	Description
URL Parameters	**Note:** If the parent widget contains URL parameters, they will be listed in this section as inherited parameters for the new widget. To remove an inherited parameter or one you added, click the X to the right of the parameter header. To add a URL parameter, click Add a URL Parameter and complete the Name, Description, and Example fields. (The Name field cannot contain spaces or forward or backward slashes.)
Compatibility	If you want the widget to work with a specific Customer Portal JavaScript framework, select Standard or Mobile or both. Or select No Framework JavaScript is Required. **Note:** This section does not appear if the widget does not have a JavaScript component.

17 Click the Create Widget button. The widget summary is updated with attribute information, and the Generated Widget section displays links to the parent directory and files created for the widget. The widget is now active and available for use in Development mode.



18 If necessary, edit the files that were generated. For example, if CSS files are created, they include the placeholders for code but contain no style definitions. Refer to Customizing widget behavior.

Important To use the new widget in the staging environment, you must not only be sure you select Copy to Staging in the first step of the staging process, but you must also push the widget version change in the second step of the staging process, Version Changes. Refer to To stage your customer portal pages.

Customizing widget behavior

When you create a custom widget using the widget builder, some or all of the following files are stored in the parent folder that you defined in the */widgets/custom* folder. Each file is used to enable certain functionality within the widget, which can vary based on whether the widget is a standalone widget or if it extends the functionality of another widget. Refer to Creating custom widgets.

Table 378: Widget Builder Output Description

File	Description
info.yml	Contains information about the widget, including its version and attribute values. If the widget extends the functionality of another widget, this file also contains the name of that widget and any components that are extended. **Note:** By default, the *info.yml* file does not include a framework dependency. As a result, the widget's information page on the Customer Portal Administration site has the notation "This widget supports all framework versions." If you want to require a framework dependency, add the following code under the `Requires:` line in *info.yml*. `framework: ["3.0" , "3.1"]` When you migrate to a new Customer Portal framework, test your custom widgets to be sure no unintended framework dependency exists.
controller.php	Initializes and processes the data required for the widget output. This file can also contain AJAX-handling functions or modify AJAX functionality inherited from the parent, if any exists.
view.php	Receives the PHP output generated by the controller and renders it as HTML. If the widget extends the functionality of another widget, this file modifies or overrides blocks of content within the view of the parent.
logic.js	Defines JavaScript functions used by the widget to produce dynamic behavior.
view.ejs	Defines JavaScript functions used by the widget to render dynamic views.
<widget_name>.css	Defines the style and appearance of the view.

Table 378: Widget Builder Output Description (Continued)

File	Description
base.css	Contains any style information that extends the CSS of the parent widget, if applicable.

Displaying custom widget previews

The Customer Portal Administration site describes the custom widgets you create as well as the standard widgets. Follow this procedure to include a screen capture of a custom widget in the widget definition.

To display a preview of a custom widget

1. Add a new subfolder called *CustomWidget/preview* to the */cp/customer/development/widget/custom* folder, where *CustomWidget* is the name of the widget you want to add a preview for.
2. Add a *.png, .jpg, .jpeg,* or *.gif* file to the subfolder you created in step 1 and name it *preview.png* (or *preview.jpg, preview.jpeg,* or *preview.gif*). When you select the widget on your *ci/admin/versions/manage* page, the associated preview file will be rendered.

Input and output widgets

Although many of the input and output widgets are described when we tell you how to edit the pages on which they appear, it might be helpful to review the common characteristics of these widgets in this overview.

When you put input widgets on a page, your customers can enter and update information that gets stored in incidents and contact records. Output widgets are used to display information about incidents, contacts, and answers in read-only form.

You can help your customers enter the information you request by defining field lengths, adding hints to input widgets, and displaying the format that should be used. This section also defines how to input and output custom fields, discusses using widget attributes, URLs, and POST parameters to define default values, and describes a page tag that can also be used for outputting field values.

The fields you can use for input and output widgets and the Field page tag are listed on the Business Objects page of the Customer Portal Administration site (Framework > Business Objects). The page lists the names for the answer, contact, and incident fields as they are defined in the Connect PHP API. For additional information, refer to Business objects.

The following table shows code samples for widgets using the fields.

Table 379: Code Samples for Widgets Using Data Fields

Widget	Data Field	Code Sample
FormInput	Incident.Subject	`<rn:widget path="input/FormInput" name="Incident.Subject" required="true" />`
DataDisplay	Answer.Products	`<rn:widget path="output/DataDisplay" name="Answer.Products" />`
Field page tag	Contact	`<rn:field name="Contact.LookupName"/>`

Note You will see an error in development mode if your code for an input widget includes a primary sub-object, that is, if you try to use an input widget on a primary object that is the child of another object. For example, the following code will display an error message in the development area:

```
<rn:widget path="input/FormInput"
name="Incident.PrimaryContact.Name.First" />
```

The exceptions to this limitation include Incident.Product, Incident.Category, and Contact.Address.Country.

Note When you create a custom object with custom menu attributes (refer to Creating menu-only custom objects), the attributes can be used with FormInput and DataDisplay widgets and the `rn:field` tags for Contact and Incident objects. Custom menu attributes can be used with the DataDisplay widgets for Answer objects. All custom menu attributes appear on the Business Objects page of the Customer Portal Administration site.

The following topics apply to input and output widgets.

- Defining field lengths
- Adding hints
- Displaying mask characters
- Requiring field validation
- Custom fields input and output
- Defining input field values
- Outputting field values with the Field page tag

- Allowing customer edits after PTA and open login
- Using system attributes

Input widgets

The following widgets are used to enter information for contacts or incidents.

- **ChannelAllInput**—Adds Twitter, YouTube, and Facebook fields where customers can enter their user names for those channels.

Note You can also define input fields for single channels. Type `<rn:widget path="input/FormInput" name="Contact.ChannelUsernames.TWITTER.Username" />` to add the Twitter channel. Change the *name* attribute to `Contact.ChannelUsernames.YOUTUBE.Username` for YouTube and `Contact.ChannelUsernames.FACEBOOK.Username` for Facebook.

- **ContactNameInput**—Adds First Name and Last Name fields.
- **CustomAllInput**—Displays all contact custom fields on customer entry forms. Also displays incident custom fields on the Ask a Question page. You must specify the data table (*Contact* or *Incident*) for the custom fields you want to display. You can also add individual custom fields by deleting this widget and adding only the ones you want using the FormInput widget.
- **DateInput**—Displays a date drop-down menu where customers can enter date information you have requested.
- **FileAttachmentUpload**—Displays a field and Browse button where customers can enter or select files to attach to an incident.
- **FormInput**—Displays a field that can be used to input system fields listed under Business objects on the Customer Portal Administration site. You must add the *name* attribute to this widget.

Note The exceptions are Incident.FileAttachments, which is input with the FileAttachmentUpload widget, and Incident.Category and Incident.Product, which are input with the ProductCategoryInput widget.

- **FormSubmit**—Generates the button on an input form that submits customer entries. On the reference implementation, labels for this button include Submit, Continue, Save Changes, and Create Account.

- **MobileProductCategoryInput**—Displays product and category menus for customer selection on the **mobile customer portal**.
- **ProductCategoryInput**—Displays product and category menus for customer selection on the standard reference implementation.
- **SelectionInput**—Functions like the FormInput widget for menu and yes/no fields.
- **SmartAssistantDialog**—Displays a list of suggested answers and includes the Finish Submitting Question button for customers to submit the question they entered on the Ask a Question page.
- **TextInput**—Functions like the FormInput widget for text, text area, and integer fields.

Output widgets

The following widgets display read-only fields on the customer portal.

- **ChannelAllDisplay**—Displays Twitter, YouTube, and Facebook user names that were entered by customers.

Note You can also define output fields for single channels. Type `<rn:widget path="output/FieldDisplay" name="Contact.ChannelUsernames.TWITTER.Username" />` to add the Twitter channel. Change the *name* attribute to `Contact.ChannelUsernames.YOUTUBE.Username` for YouTube and `Contact.ChannelUsernames.FACEBOOK.Username` for Facebook.

- **ContactNameDisplay**—Displays the customer's first and last names.
- **CustomAllDisplay**—Displays the data entered into any of the contact or incident custom fields being displayed on the page. You can also add individual custom fields by deleting this widget and adding only the ones you want using the DataDisplay widget.
- **DataDisplay**—Displays the label and value of the field defined by the *name* attribute in the widget code.
- **FieldDisplay**—Displays the label and value of the field defined by the *name* attribute in the widget code. This widget cannot display File Attachment, Hiermenu, or Thread data types.
- **FileListDisplay**—Displays file attachments for an incident or answer.
- **IncidentThreadDisplay**—Displays all correspondence associated with an incident.
- **ProductCategoryDisplay**—Displays the product or category hierarchy associated with the answer, incident, or contact.

For a list of all table and field names you can use for defining input and output widgets, refer to Business objects.

Defining field lengths

You can use the *maximum_length* and *minimum_length* attributes of the TextInput widget to restrict the number of characters entered in a text field. Because the TextInput widget is contained in the FormInput widget, you can also add these attributes to the FormInput widget even though they aren't listed as attributes of that widget.

Note Many fields have a maximum field size defined in their database definitions, which you can view by clicking the field name on the Business Object page of the Customer Portal Administration site (Framework > Business Objects). If you set the maximum_length attribute of a TextInput or FormInput field to a value larger than the database maximum field size, the attribute value will be ignored.

Setting the *minimum_length* attribute to a value greater than 0 automatically makes the field required.

Edit the widget code to add the *maximum_length* or *minimum_length* attribute to the widget, as shown in this example.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true"
maximum_length="200" />
```

Adding hints

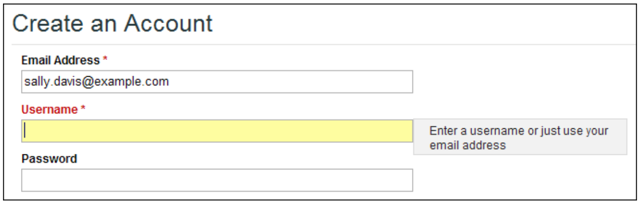
You can add a hint to help customers complete a field that is created using the CustomAllInput, DateInput, FormInput, ProductCategoryInput, SelectionInput, or TextInput widget. By default, the hint appears when the cursor is in the input field. (To display the hint regardless of cursor location, set the *always_show_hint* attribute of the FormInput widget to true. To hide the hint, set the *hide_hint* to true.) If you add the *hint* attribute to a widget that calls a **custom field**, the customer portal hint overrides any hint that was defined for the field on the **administration interface**. The *hide_hint* attribute can be used with CustomAllInput and CustomAllDisplay widgets.

Note The *always_show_hint* attribute is not supported on the mobile page set.

You can also define and display product and category selection hints by using the *hint* and *always_show_hint* attributes for the ProductCategoryInput widget.

Edit the widget code to add the *hint* attribute to the widget, as shown in this example.

```
<rn:widget path="input/FormInput"
name="Contact.Login"
required="true"
validate_on_blur="true"
label_input="#rn:msg:USERNAME_LBL#"
hint="Enter a username or just use your email address" />
```



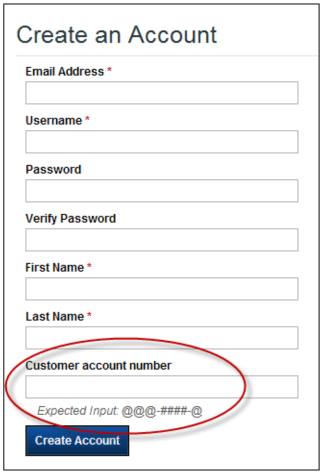
Depending on the length of your hints, you may want to consider editing your page to accommodate them. You can also edit the width of the hint box by changing the `max-width` definition in the CSS files for the DateInput, SelectionInput, and TextInput widgets. As an example, the default *base.css* file for the TextInput widget uses the following code.

```
.rn_TextInput .rn_HintBox {
    border:1px solid #DBDBDB;
    max-width:200px;
    padding:4px 16px 2px;
    word-wrap:break-word;
}
.rn_TextInput .rn_HintBox.rn_AlwaysVisibleHint {
    max-width:300px;
    opacity:1.0;
    z-index:0;
}
```

Displaying mask characters

Custom fields may have **masks** that define their format for correct data entry. For example, you might want to ensure that serial numbers have the correct sequence of letters, numbers, and formatting characters. The system phone number and postal code fields can be defined on the Countries editor of the **administration interface** to use masks as well. (Refer to Input masks.)

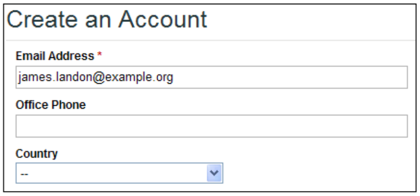
On the reference implementation, the CustomAllInput, FormInput, and TextInput fields have an *always_show_mask* attribute that displays the expected (and allowable) input format to help the customer enter the value correctly. By default, the attribute is set to true.



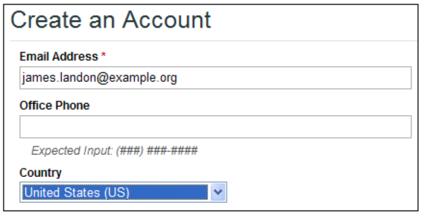
To hide the mask, set the attribute to false as shown in this code.

```
<rn:widget path="input/CustomAllInput"
table="Contact"
always_show_mask="false"/>
```

Important If you add a phone number or postal code input field to a page and set the *always_show_mask* attribute to true, you must also include the Country field on the page. Without a customer selection in the Country field, the phone number and postal codes fields have no way to be associated with the correct mask.



Office Phone field with no country selection:
mask information is not displayed



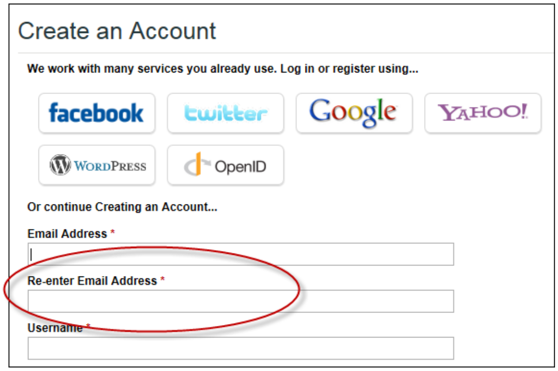
Office Phone field with country selected:
mask information appears

Requiring field validation

You may want your customers to validate a field entry by re-entering their information. For example, it's not uncommon to require customers to add their email address a second time as a way of verifying it. Rather than placing a second FormInput widget on the page for the email address confirmation, you can add the *require_validation* attribute to the first widget. (The *require_validation* attribute is an attribute of the TextInput widget, which is contained in the FormInput widget. That's why you can add the attribute to the FormInput widget even though it isn't listed as one of the FormInput widget's attributes.)

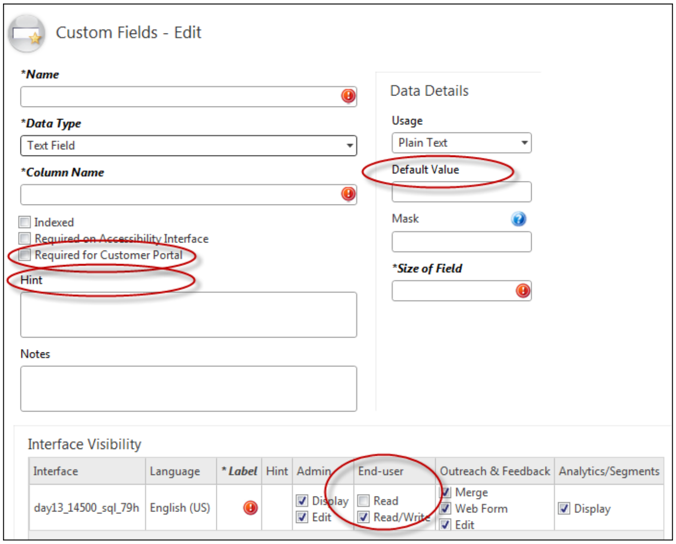
The following code is an example of its use on the Create an Account page.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
validate_on_blur="true"
initial_focus="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"
require_validation="true" />
```



Custom fields input and output

Contact, incident, and answer **custom fields** can be input and displayed on the customer portal. Custom fields are defined on the **administration interface**, and they can be defined as read-only (which means they can only be displayed as an output widget) or they can be marked Read/Write, meaning they can be used for both input and output fields. They can also be set to be required on the customer portal, and a hint can be added to the custom field to provide information to customers who are entering data in the field. When the custom field data type is integer, menu, text area, text field, yes/no, or opt-in, you can also set a default value that automatically populates the field. (Refer to Adding and editing custom fields to work with custom fields on the administration interface.)



These four elements of a custom field—hint, default value, customer portal read-only or read/write visibility, and whether it's required—that are defined on the administration interface can be modified through attributes of the input widget used to display the custom field.

- **Hints**—If you define the *hint* attribute of an input widget for a custom field, the hint attribute definition defined in the widget code will override whatever hint was defined on the administration interface.
- **Default value**—If you define the *default_value* attribute of an input widget for a custom field, that attribute value will override whatever value was defined on the administration interface.
- **Visibility**—Custom fields marked Read can be used with output widgets, but you will get a widget error message on the page if you try to use them with an input widget. Custom fields marked Read/Write can be used for both input and output widgets.

Note If you don't want any custom input fields to be visible on a page, delete the code for the CustomAllInput widget on the page.

- **Required**—If you set the *required* attribute of an input widget for a custom field to false in the widget code when the custom field is marked as required on the administration interface, you cannot override the requirement with Customer Portal code. If the custom field is not defined as required on the administration interface, you can require it on your customer portal if you set the *required* attribute of the input widget to true. In other words, the *required* widget attribute can only make a non-required field required, but it cannot make a required field not required.

Defining input field values

When a page containing any of the following input widgets opens, the input field is either blank or populated with a value, depending on how you defined it.

- DateInput
- FormInput
- MobileProductCategoryInput
- ProductCategoryInput
- SelectionInput
- TextInput

Customers can enter data in blank input fields, and they can override default values in fields that are already populated. (If you don't want customers to change the value of a field, use one of the read-only output widgets instead of an input widget.)

There are multiple ways the value of an input widget can be set.

- If the input widget is used with a custom field, the field's default value may be set on the **administration interface** when the custom field is added. See To add or edit a custom field.
- The value can be defined using the *default_value* attribute of the input widget when you add the widget code to a page. In this case, the input field always contains the defined default value when the page opens. If the field is a custom field with a default value that was defined when it was created, the widget's *default_value* attribute overrides the value set on the administration interface. Refer to Setting the default value with widget code.
- You can pass the input field's value in the URL that opens the page. You might want to use this option if you have multiple ways to open a page. Here's a simple example: Assume your organization sells printers and monitors. You have one web page just for printers and another for monitors, each with a link to the Ask a Question page on your customer portal. You want to populate the Product field to identify whether customers accessed the Ask a Question page from the printer page or the monitor page. You can define the product type in the page's URL so that the Product field is populated correctly based on which link was clicked to open the page. Refer to Setting default values with URL parameters.

If you pass a field's value through the page URL when the field's value was already defined with the input widget's *default_value* attribute, the URL value overrides the widget attribute.

You can also pass the default value of the input field through a POST parameter. Refer to Setting default values with POST parameters.

- The customer enters a value for the field. This value overrides any other predefined value.

Setting the default value with widget code

Use these procedures to set default values for input widgets when you always want the value to be the same, regardless of how the page is accessed.

To populate the Subject field

This example populates the Subject field on the Ask a Question page.

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following lines of code. These lines are not sequential.

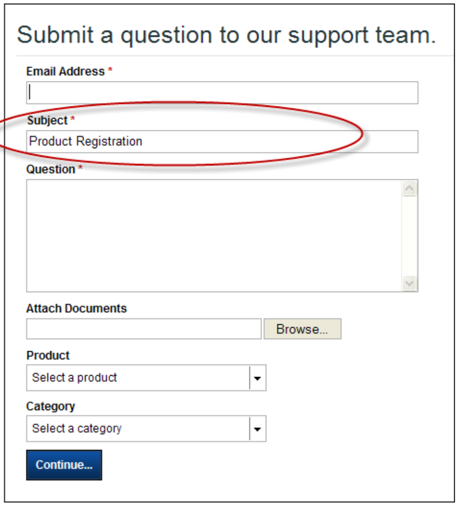
Note One FormInput field is defined for the condition when customers are not logged in, and the second is for logged-in customers.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true" />
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true"
initial_focus="true"/>
```

3 Add the *default_value* attribute to the FormInput widget to define the value in the Subject field. Your code will resemble the following.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true"
default_value="Product Registration" />
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true"
initial_focus="true"
default_value="Product Registration"/>
```

4 Save *ask.php*.



To populate default product and category values

This example populates the product and category fields on the Ask a Question page. If you need help finding the ID numbers for products and categories, use this procedure, omitting step 6.

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/ProductCategoryInput" />
```

3 Add the *default_value* attribute to the ProductCategoryInput widget to define the value for the product drop-down menu. Your code will resemble the following.

```
<rn:widget path="input/ProductCategoryInput"
default_value="21,47" />
```

4 Locate the following line of code.

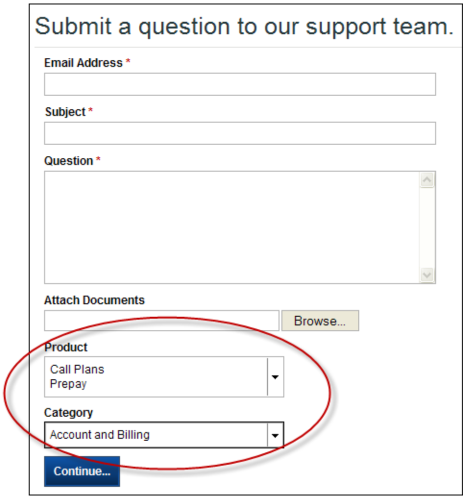
```
<rn:widget path="input/ProductCategoryInput"
data_type="Category" />
```

5 Add the *default_value* attribute to the widget to define the value for the category drop-down menu. Your code will resemble the following.

```
<rn:widget path="input/ProductCategoryInput"
```

```
data_type="Category"
default_value="98"/>
```

6 Save *ask.php*.



Setting custom field values

By default, all incident custom fields are displayed on the Ask a Question page. If custom fields have been created on the administration interface of the Oracle Service Cloud application and set with end-user visibility (refer to Adding and editing custom fields), they will appear automatically on the page. If you want to set values for custom fields through the code for *ask.php*, you may want to delete the following line of code and then add individual lines for each custom widget as described in these procedures. (Because only incident custom fields are displayed, you will need to add a widget for any contact custom field you want to add to the Ask a Question page.)

```
<rn:widget path="input/CustomAllInput"
table="Incident" />
```

To set a date/time value

You can set a value for a custom date or date/time field. (The standard date/time fields are read-only, so you cannot set values for those.) The following example assumes you've added a custom Answer Needed By field to the Ask a Question page using this procedure. If you want to set a default value for the field, add code that resembles the following to the Ask a Question page.

```
<rn:widget path="input/DateInput"
name="Incident.CustomFields.c.answer_needed"
default_value="1355853091"/>
```

Note The value can be generated using a UNIX date/time stamp converter.

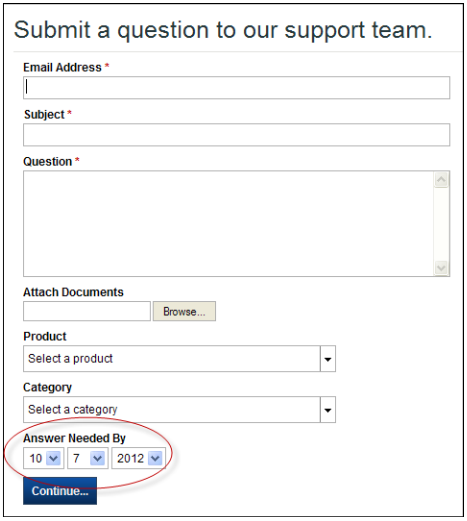
You can also enter absolute and relative dates, which will be converted to a UNIX time stamp format using the PHP strtotime( ) function. Absolute dates must be entered using the English date format of dd/mm/yyyy, **not** the United States date format of mm/dd/yyyy. If, for example, you specify a default value of 3-7-2014, the date is July 3, 2014.

Any of the following values for the *default_value* attribute of a DateInput widget are valid, and more examples can be found in the PHP strtotime( ) documentation.

- Now
- 18-12-2014
- December 18, 2014
- Tomorrow
- Today + 2 months
- First day of next month
- Next Wed + 4 days

If you want the value of a custom field to be populated automatically relative to the current date/time, use code that resembles the following when adding the custom field to the page.

```
<rn:widget path="input/DateInput"
name="Incident.CustomFields.c.answer_needed"
default_value="tomorrow" />
```



To set a Yes/No field

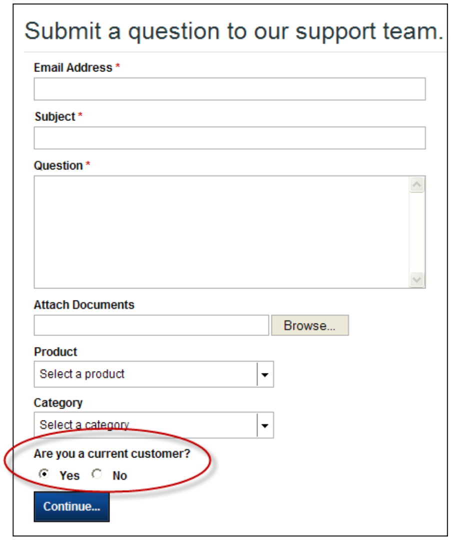
The SelectionInput widget is used to display Yes/No radio buttons for a custom field. The following example assumes you've added a custom field to the Ask a Question page that asks if the person submitting the question is a current customer. It also assumes you want to set the default value of the widget to Yes. (To set it to No, set the *default_value* attribute to 0 or false.) Add code that resembles the following to the Ask a Question page.

```
<rn:widget path="input/SelectionInput"
name="Contact.CustomFields.c.current_cust"
default_value="1"/>
```

Alternately, you could set the value to true.

```
<rn:widget path="input/SelectionInput"
name="Contact.CustomFields.c.current_cust"
default_value="true"/>
```

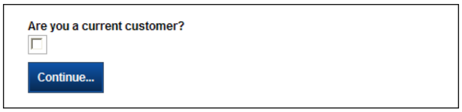
Note If *default_value* is set to anything other than 1, 0, true, or false, neither selection appears.



To change radio buttons to a check box

If you'd prefer to display yes/no fields as a single check box instead of as radio buttons, simply add the *display_as_checkbox* attribute to the SelectionInput widget. When this attribute is set to true, the customer's response is saved as Yes if the check box is selected and No if the check box is not selected. Your code will resemble the following.

```
<rn:widget path="input/SelectionInput"
name="Contact.CustomFields.c.current_cust"
display_as_checkbox="true" />
```



To set a menu option

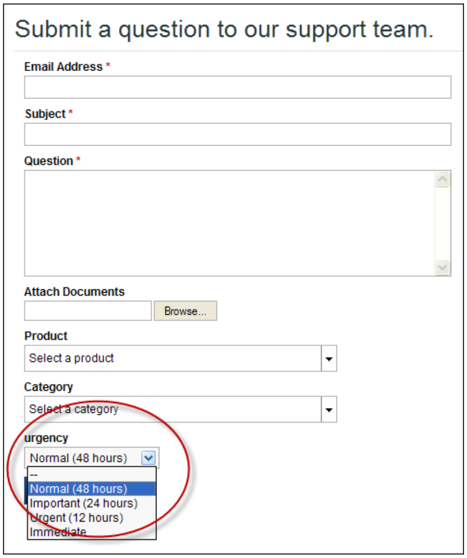
You might want to populate a menu option on a drop-down menu. In that case, you'll use the FormInput widget and set the default value by using the ID of the option. This example includes a menu custom field to define the urgency of the incident, and it sets the urgency to Normal. (Refer to [Adding and editing custom fields]() if you need help defining a menu custom field.)

To find the ID of a custom field option, open the Ask a Question page in source code view, search for the menu custom field, note the <option> tags, and find the value you want to set.

```
</div>
        <div id="rn_SelectionInput_19" class="rn_SelectionInput rn_Input">
    <label for="rn_SelectionInput_19_Incident.CustomFields.c.urgency" id="rn_SelectionInput_19_Label"
    class="rn_Label">urgency </label>
    <select id="rn_SelectionInput_19_Incident.CustomFields.c.urgency" name="Incident.CustomFields.c.urgency">
                 <option value="">--</option>
                    <option value="1" >Normal (48 hours)</option>
                    <option value="2" >Important (24 hours)</option>
                    <option value="3" >Urgent (12 hours)</option>
                    <option value="4" >Immediate</option>
    </select>
</div>
```

Add code that resembles the following to the Ask a Question page. (Use this line to replace the default `<rn:widget path="input/CustomAllInput" table="Incident"/>` line.)

```
<rn:widget path="input/FormInput"
name="Incident.CustomFields.c.urgency"
default_value="1"/>
```



Setting default values with URL parameters

Besides being able to set a default value with the code for an input widget, you can also define a default value for an input field in the URL that opens the page containing the field. If you define a field's value in the URL that calls the page and if that default value is also defined in the code for the input widget, the value in the URL overrides the value specified in the widget code.

Important You cannot use URL parameters to define password field values.

You can use this method of populating an input widget when you call a page from within the customer portal. The following example populates the Subject field on the Ask a Question page, defining the field with one value when the page is opened by clicking the navigation tab and a different value when the page is opened through the sidebar link.

To populate the Subject field using a URL

1 Open the *standard.php* file in the */views/templates* folder.

2 Edit the navigation tab for the Ask a Question page.

  a Locate the following line of code.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask"
pages="ask, ask_confirm"/></li>
```

  b Edit the *link* attribute to use the URL to populate the Subject field. Your code will resemble the following.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:ASK_QUESTION_HDG#"
link="/app/ask/Incident.Subject/From the Navigation Tab"
pages="ask, ask_confirm"/></li>
```

3 Edit the sidebar link to the Ask a Question page.

  a Locate the following line of code.

```
<a href="/app/ask#rn:session#">#rn:msg:ASK_QUESTION_LBL#</a>
```

  b Edit the *link* attribute to use the URL to populate the Subject field. Your code will resemble the following.

```
<a href="/app/ask/Incident.Subject/From the Sidebar
Link"#rn:session#">#rn:msg:ASK_QUESTION_LBL#</a>
```

4 Save *standard.php*.

Although this example shows you how to populate a field with a URL within your customer portal, you're more likely to populate an input field value to access the Ask a Question page from an external page. Click here for examples of links to the Ask a Question page that use the URL to populate different fields on the Ask a Question page.

Populating fields with URLs from external pages

Although these examples populate fields on the Ask a Question page when you link to the page from outside the customer portal, you can use them for writing code to link to other pages of the customer portal as well.

To populate the Subject field through a URL

```
<a href="http://<your_site>/app/ask/Incident.Subject/From External
Page/">Name of Link</a>
```

To populate default product and category values through a URL

```
<a href="http://<your_site>/app/ask/Incident.Product/1,2,19/
Incident.Category/33/">Name of Link</a>
```

To populate a date field through a URL

This example assumes you've added a custom date field to the Ask a Question page using this procedure. If you want to set a default value when the Ask a Question page opens, use a link that resembles the following.

```
<a href="http://<your_site>/app/ask/
```

```
Incident.CustomFields.c.answer_needed/1355853091">Name of Link</a>
```

Note The value can be generated using a UNIX date/time stamp generator.

You can also enter absolute and relative dates, which will be converted to a UNIX time stamp format using the PHP strtotime( ) function. Absolute dates must be entered using the English date format of dd/mm/yyyy, **not** the United States date format of mm/dd/yyyy. If, for example, you specify a default value of 3-7-2014, the date is July 3, 2014.

Any of the following default values are valid, and more examples can be found in the PHP strtotime( ) documentation.

- Now
- 18-12-2014
- December 18, 2014
- Tomorrow
- Today + 5 days
- Today + 2 months
- First day of next month
- Next Wed + 4 days

To populate a custom Yes/No field through a URL

```
<a href="http://<your_site>/app/ask/
Contact.CustomFields.c.current_cust/1/">Name of Link</a>
```

To populate a menu option through a URL

To find the ID of a custom field option, open the Ask a Question page in source code view, search for the menu custom field, note the <option> tags, and find the value you want to set. Add code that resembles the following to the Ask a Question page.

```
<a href="http://<your_site>/app/ask/Contact.CustomFields.c.urgency/1/
">Name of Link</a>
```

Setting default values with POST parameters

Similar to using URL parameters to populate contact and incident input fields, you can also use POST parameters from forms you create to populate those fields. As with URL parameters, the POST parameter must use the *Table.Field* format, for example, *Incident.Subject*.

Outputting field values with the Field page tag

When you don't need a label or any special formatting, you might find it easier to use the Field page tag to output the value of the field. All you need to do is specify the table and field names just as you do when defining an output widget. For example, the following code is used in the *standard.php* template file to display the customer's name in the template header.

```
<rn:field name="Contact.LookupName"/>
```

The Field tag has two attributes: *name* to identify the database table and field for the tag's output value and *highlight* to identify content that matches the keyword parameter in the URL. For a list of all table and field names you can use for defining fields, refer to Business objects.

Allowing customer edits after PTA and open login

When customers log in to your customer portal using pass-through authentication (PTA) or open login, the input fields on the Account Settings page are set to read-only by default. However, an attribute called *allow_external_login_updates* is available on the SelectionInput, DateInput, and TextInput widgets that are incorporated in the FormInput widget. This attribute lets you change these fields so customers can edit them. The default value for the attribute is false, which prevents customers from updating any of the Account Settings fields when they log in with PTA or open login. If you add this attribute to the input widget and set its value to true, the field can be edited by customers.

Note As long as PTA is enabled, customers will not be able to change their user name, regardless of the value of the *allow_external_login_updates* attribute.

The following procedure assumes you want to let customers update their email address on the Account Settings page after logging in with PTA or open login.

To allow customer edits to input fields after PTA or open login

1 Open the *profile.php* file in the */views/pages/account* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FormInput"
```

```
name="Contact.Emails.PRIMARY.Address"
required="true"
validate_on_blur="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#" />
```

3 Edit the code to add the *allow_external_login_updates* attribute. Your code will resemble the following.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
validate_on_blur="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"
allow_external_login_updates="true" />
```

4 Save *profile.php*.

If you have a block of input fields that you want to let customers edit, you can enclose them in condition tags rather than editing each widget's code separately. Click here for the procedure.

Using system attributes

System attributes can be added to standard data objects, such as answers, contacts, and incidents, and can be displayed on your customer portal using the FormInput and DataDisplay widgets as well as the Field page tag. Refer to Creating system attributes to learn how the attributes are created on the Service Console.

To find the field name of a system attribute, use the Business objects page on the Customer Portal Administration site. The format used is [table].CustomFields.CO.[field], for example, Contact.CustomFields.CO.product_registration.

Important System attributes that include a dynamic value, such as the current date or time, cannot be used on customer portal pages.

To use a system attribute with the FormInput widget

Note This example adds a contact system attribute to the Ask a Question page. The system attribute is a yes/no field that asks customers if they have used a previous version of the product. The *usedpreviousproducts* attribute was defined on the Service Console. Refer to Creating system attributes.

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

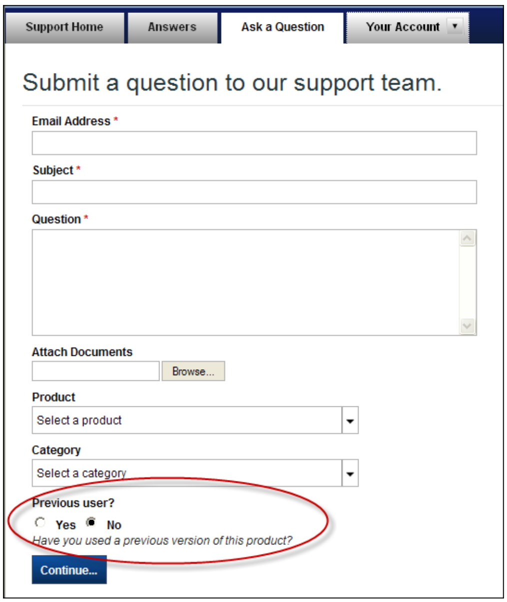
```
<rn:widget path="input/CustomAllInput"
table="Incident"/>
```

3 Add the following code just below the line you located in step 2.

```
<rn:widget path="input/FormInput"
name="Contact.CustomFields.CO.usedpreviousproducts"
always_show_hint="true"
hint="Have you used a previous version of this product?" />
```

Note It's always good practice to include a hint when you ask customers to enter data into an object with a system attribute. Likewise, you will want to set the *always_-show_hint* attribute to `"true."` This is especially true if your system attribute requires a regular expression with a specified format, such as a product registration number or a catalog number. Refer to To use system attributes with regular expressions.

4 Save *ask.php*.



To use a system attribute with the DataDisplay widget

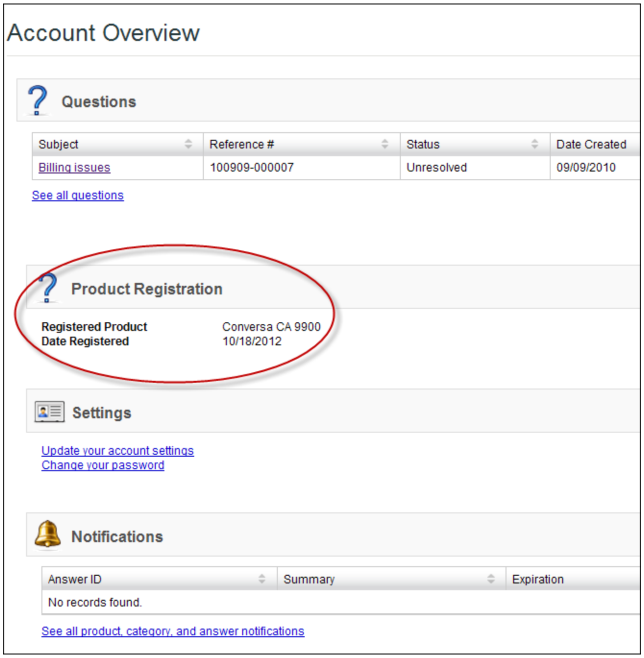
Note This example adds a Product Registration section to the Account Overview page. The *product_registration* system attribute is a text field, and the *date_registered* attribute is a date field. Both were defined on the Service Console. Refer to Creating system attributes.

1 Open the *overview.php* file in the */views/pages/account* folder.

2 Add the following code where you want it to appear on the page. This example places after the closing div for the Questions section.

```
<div class="rn_Overview">
    <h2><a class="rn_Questions" href="/app/account/questions/
    list#rn:session#">Product Registration</a></h2>
    <div class="rn_Questions">
        <rn:widget path="output/DataDisplay"
        name="Contact.CustomFields.CO.product_registration"
        label="Registered Product"/>
        <rn:widget path="output/DataDisplay"
        name="Contact.CustomFields.c.date_registered"
        label="Date Registered"/>
    </div>
```

3 Save *overview/php*.



To use system attributes with regular expressions

Note For the sake of this example, we'll assume that you've added an *RMA* system attribute to incidents so that you can match the incident with your organization's Return Merchandise Authorization process. We'll also assume that you've defined the format of the *RMA* system attribute to use the pattern AA-#####, for example, CX-49935. (Refer to Creating system attributes for help with this step.)

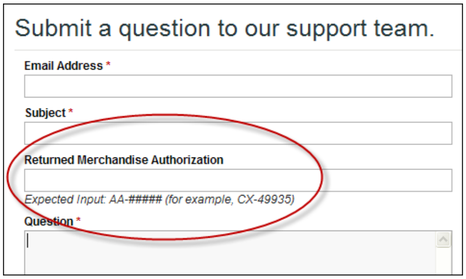
1 Open the page where you want to add the incident's system attribute.

2 Add the FormInput widget to the code so it appears where you want it to on the page. Your code will resemble the following.

```
<rn:widget path="input/FormInput"
name="Incident.CustomFields.CO.RMA"
always_show_hint="true"
hint="Expected Input: AA-##### (for example, CX-49935)"
```

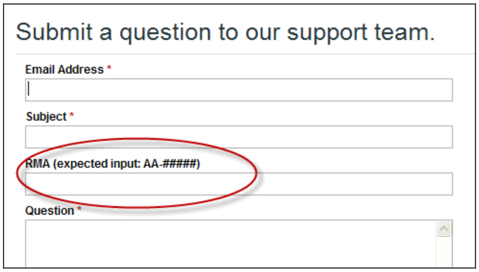
```
validate_on_blur="true"
label_input="Returned Merchandise Authorization" />
```

Note If the regular expression (the AA-##### pattern) is not met, the *validate_on_blur* attribute indicates an error as soon as customers move to a different field. Without this attribute, the error is not pointed out until customers click the Continue button.



Alternately, you could add the hint directly to the field name. In that case, your code would resemble:

```
<rn:widget path="input/FormInput"
name="Incident.CustomFields.CO.RMA"
label_name= validate_on_blur="true"
label_input="RMA (expected input: AA-#####)" />
```



3 Save the page.

Web form security

When customers submit information to websites, it is common to verify that the information originates from a human rather than a bot (an automated software program) being run for malicious purposes. The Customer Portal includes web form security on the FormSubmit widget that automatically requires human validation when abuse is suspected, for example, when a spammer automatically submits repeated incidents in a short amount of time.

Validation is accomplished through the use of a CAPTCHA, a dialog containing distorted words that the customer is asked to type. When the words are typed correctly, a human is assumed to be on the client side. Once customers have correctly entered a CAPTCHA, they will not be asked for verification again as long as the visit has not ended or does not exceed an hour.

You may also want to require CAPTCHAs to prevent user name enumeration, that is, the automatic harvesting of user names from your database. Refer to Preventing user name enumeration for that procedure.

Click to view

By default, a CAPTCHA opens on the customer portal only when the system detects abuse, but you can configure a form to always require human validation. You can also configure a form to open a CAPTCHA wherever you want on the form instead of in a dialog, where it opens by default.

Important CAPTCHAs are not used with pass-through authentication.

Nor are they used on the basic page set. CAPTCHAs require JavaScript to display and the basic page set does not support JavaScript. Therefore, if an abuse situation is detected on your basic page set, customers will see a generic error message rather than a CAPTCHA.

To require a CAPTCHA validation on every submit

1. Open the page containing the form where you want a CAPTCHA to always appear and locate the code for the FormSubmit widget.

2. Edit the FormSubmit widget code to add the *challenge_required* attribute. Your edited code will resemble the following, where the attribute is used on the Create an Account page.

```
<rn:widget path="input/FormSubmit"
label_button="#rn:msg:CREATE_ACCT_CMD#"
on_success_url="/app/account/overview"
error_location="rn_ErrorLocation"
challenge_required="true" />
```

3. Save the page.

Note If you want to test a CAPTCHA on a page, you can temporarily set the *challenge_required* attribute to true, as shown in this example. When your testing is complete, you can remove the attribute from the widget code so that a CAPTCHA appears only when abuse is detected.

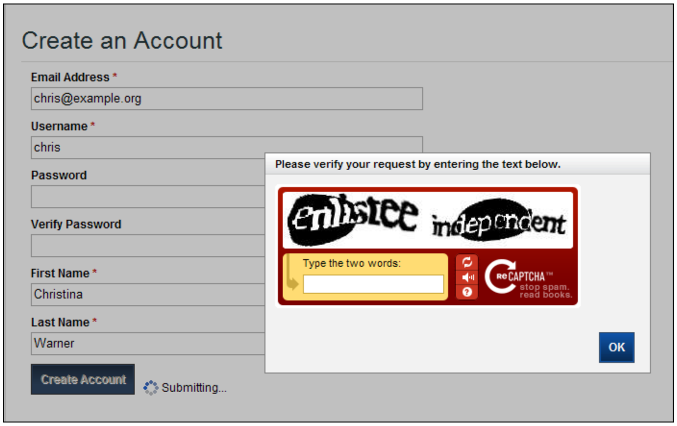
To open the CAPTCHA within a form instead of a dialog

1. Open the page containing the form where you want the CAPTCHA to appear and locate the code for the FormSubmit widget.

2. Edit the widget code to add the *challenge_location* attribute. Set the attribute equal to the div ID in which you want the CAPTCHA to appear.

3. Save the page.

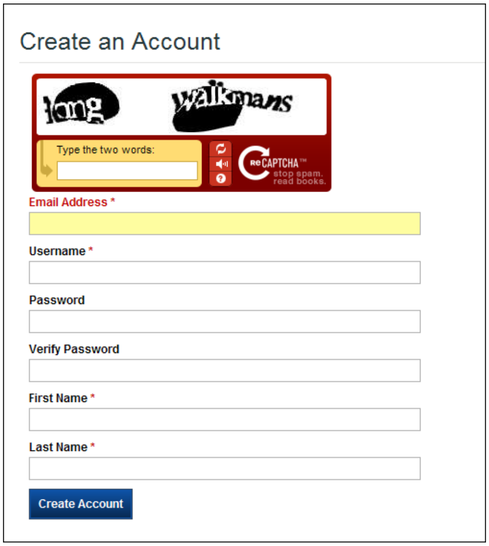
For example, assume you want to place the CAPTCHA on the Create an Account page below the Create an Account heading. By default, the CAPTCHA appears in a dialog, as shown in the following figure.



To place the CAPTCHA below the Create an Account heading, edit the widget code as follows. (If the location you specify is invalid, the CAPTCHA appears above the submit button on the form.)

```
<rn:widget path="input/FormSubmit"
label_button="#rn:msg:CREATE_ACCT_CMD#"
on_success_url="/app/account/overview"
error_location="rn_ErrorLocation"
challenge_required="true"
challenge_location="rn_ErrorLocation" />
```

The CAPTCHA appears in the form, as shown in the following figure.



Simulating abuse situations

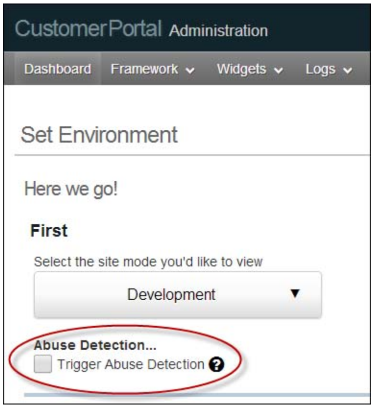
An abuse scenario is hard to create deliberately for testing purposes, so the Customer Portal includes a cookie that makes your site behave as if it is under abuse when the cookie is set. It works only in development mode for testing purposes, so it does not affect customers on your production site.

To set the abuse detection cookie from the Customer Portal Administration site

1 Go to your Customer Portal Administration site at https://<your_site>/ci/admin.

2 Click the Set Environment shortcut.

3 Select the Trigger Abuse Detection check box.

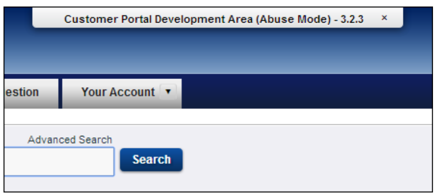


To set the abuse detection cookie from the development header

1 On your development site, click the header to display the main headings.

2 Click Links and Resources to expand the list of options.

3 Click Toggle Abuse Detection. The header indicates that your development site is now in abuse mode.



4 To turn off abuse detection, click the development header, expand Links and Resources, and click Toggle Abuse Detection again.

ClickjackPrevention widget

Clickjacking is an attack on browser security that can mislead your customers into clicking a concealed link. To prevent clickjacking, you must not allow your site to be put into an iFrame or frameset on another site. The new ClickjackPrevention widget, included by default on the standard, mobile, and basic templates, ensures that your customer portal cannot be viewed inside a frame.

The ClickjackPrevention widget does not have a view, so it does not appear on the pages your customers see. Whenever it appears in template or page code, that page cannot be loaded in an iFrame or frameset. If your site must run in frames (see Using iFrames), remove the ClickjackPrevention widget from the templates.

To remove the ClickjackPrevention widget from the template

1 Open the *standard.php* file in the *customer/development/view/template* folder.

2 Delete the following line of code.

```
<rn:widget path="utils/ClickjackPrevention"/>
```

3 Save *standard.php*.

4 Repeat steps 1 through 3 for the mobile (*view/template/mobile.php*) and basic (*view/template/basic.php*) templates.

Syndicated widgets

A syndicated widget lets you access the Oracle knowledge base using a customer portal widget that you add to a web page that is not part of your customer portal. Syndicated widgets include the following.

- ConditionalChatLink
- KnowledgeSyndication
- PollingSyndication
- ProactiveChat
- ProactiveSurveyLink

The syndicated widgets are generated with JavaScript code that can be placed within another web page. You can configure the widgets by modifying the JavaScript or by using the widget definition page to define the configuration options and settings.

The widgets can be completely styled with their CSS files, which are found in the */cp/customer/assets/css/syndicated_widgets/standard* folder. You can select one of the syndicated widgets to review and modify its settings at https://<your_site>/ci/tags/syndicated_widgets.

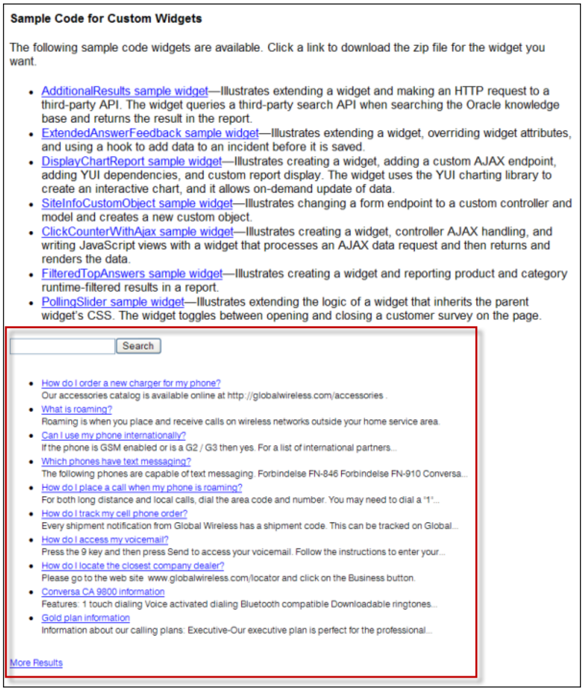
KnowledgeSyndication widget

The KnowledgeSyndication widget functions like the search fields and reports on the Support Home and Answers pages of your customer portal, but you can place this widget on any page of your website rather than restricting it to customer portal pages. This lets your customers search the Oracle **knowledge base** from your organization's home page, for example, instead of requiring them to go to your support site.

By default, the KnowledgeSyndication widget displays a search field, a list of answers from the knowledge base, and a link to additional results on the customer portal pages. This widget can be configured to display spelling corrections and suggestions, recommended documents, and other suggested searches. It can open an answer in a page overlay or on a new page. You can also edit labels and configure the number of displayed answers, whether to display a description of each answer and, if so, the length of the description.

- Adding the KnowledgeSyndication widget
- Configuring the KnowledgeSyndication widget

Note If you have enabled **web indexing**, the KnowledgeSyndication widget will also search external documents. Refer to Configuring the Web Indexer.



Adding the KnowledgeSyndication widget

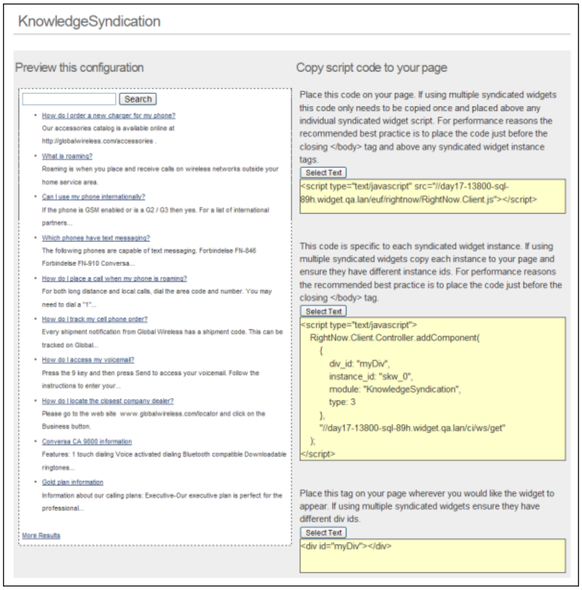
The widget information page gives you everything you need to add the KnowledgeSyndication widget to any page on your website. As you modify the attributes of the widget, the page displays a preview of the widget and modifies the widget code to reflect the changes you make. When you're done, all you have to do is select and copy the code to your page to place the syndicated widget on it.

To add the KnowledgeSyndication widget to a web page

1 Type `https://<your_site>/ci/tags/syndicated_widgets/standard/KnowledgeSyndication` to open the page for the KnowledgeSyndication widget. The page displays a preview of the widget and the code you will add to your page.

Note Your profile must have the CP Edit permission enabled, and you must log in to the Customer Portal Administration site if you are not already logged in.

Click to view



2 Scroll down to the Configure Widget section and begin modifying the widget attributes as you choose. The attribute is on the left, the value is in the center, and a description of the attribute is on the right. For specific information about the attributes, refer to [Configuring the KnowledgeSyndication widget](#).

Click to view

Configure Widget

The CSS file for this widget may be edited. It is located at:
cp/customer/assets/css/syndicated_widgets/standard/standard/KnowledgeSyndication.css

c		Category hierarchy in a comma separated chain. Multiple categories may be specified with a semicolon. Example: 1,2;33,44,55;6
context		Comma-separated context HTML elements for preprocessor. The content of the elements will be used for content-sensing. Document, title, meta, and any div ID may be used. Example: title,meta,productDiv
correction	☑ Enabled	A flag to enable or disable spelling corrections
description	☑ Enabled	A flag to enable or disable answer description/blurb
display_answers_in_overlay	☐ Enabled	If the value is true then answer content will be shown in an overlay. Otherwise, for false, it will be shown in a new window
div_id	myDiv	The div element on your page where you want the code to appear
ext_docs	☐ Enabled	Perform searches against the external document index (must be enabled)
hide_initial_answers	☐ Enabled	If set to true, only the search box is initially displayed. Answers will appear following a search.
instance_id	skw_0	Widget instance_id must be unique for each widget on a page
label_correction	Did You Mean:	Displays spelling suggestions. EU_SEARCH_TERM_FEEDBACK_ENABLE must be set to yes
label_created	Created: %s	Label to display next to answer created time when using the 'display_answers_in_overlay' attribute.
label_documents	Recommended Documents	Label for recommended documents
label_more_results	More Results	Label for more results. Link will go to page specified in the CP_HOME_URL config setting
label_no_results	No Results Found	Displays when no results are found
label_related_searches	Other Suggested Searches:	Displays the message when suggested searches are found. EU_SUGGESTED_SEARCHES_ENABLE must be set to yes
label_search_button	Search	Label for search button
label_updated	Updated: %s	Label to display next to answer updated time when using the 'display_answers_in_overlay' attribute.
navigation	☑ Enabled	A flag to enable or disable more results link
number_answers	10	Number of answers to display
p		Product hierarchy in a comma separated chain. Multiple products may be specified with a semicolon. Example: 1,2;33,44,55;6
payload_size	150	Maximum content size for Content-Sensing functionality
persist_prodcat	☐ Enabled	Persist the product and category through to subsequent searches
preprocess	pagescraper	Handler for page preprocessing
q		Keyword for search query
recommended	☑ Enabled	A flag to enable or disable recommended documents
related	☑ Enabled	A flag to enable or disable suggested searches
search_box	☑ Enabled	A flag to enable or disable the keyword search box
target	_self	Defines the target where the linked document will be opened. It should be a valid target value of the HTML anchor tag.
truncate_size	100	Number of characters to truncate to if the column is answers.solution or answers.description

Apply

3 To preview your changes, click Apply at the bottom left of the Configure Widget section. Continue to configure the widget until you are satisfied with the result.

Note You can also modify the widget's appearance by editing its CSS file, which you can find at */cp/customer/assets/css/syndicated_widgets/standard/KnowledgeSyndication.css*. If you modify the CSS file, you must reload the page to see your changes.

4 Open the source code for the web page you want to add the widget to.

5 To ensure the page renders correctly in Internet Explorer 7, add the following code to the top of the page before your first HTML tag.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http:/
/www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
```

6 On the right side of the widget page, click the top Select Text button to select the code in the first yellow box and press **Ctrl+c** to copy the code.

7 Paste the code into your page file just before the closing </body> tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.

8 Click the second Select Text button and copy the code that defines the widget.

9 Paste the copied code just below the code you copied in step 7.

10 Add the following line to the page code wherever you want the widget to appear.

```
<div_id="myDiv"></div>
```

Note You can also copy this line from the widget page by pressing the third Select Text button, copying the code, and pasting it where you want the widget to appear.

11 Save your web page.

Configuring the KnowledgeSyndication widget

You can configure the following attributes of the KnowledgeSyndication widget.

- External document searching
- Answer displayed as a page overlay

- Product and category IDs
- Retention of product and category search filters
- Ability to determine search results based on page information
  - ▷ Maximum content size for content sensing
- Hiding answers until search is performed
- Keyword for search query
- Flag settings to enable or disable the following:
  - ▷ Spelling corrections
  - ▷ Answer description
  - ▷ The More Results link
  - ▷ Recommended documents link
  - ▷ Related searches
  - ▷ Keyword search box
- Labels
  - ▷ Spelling suggestions
  - ▷ Recommended documents
  - ▷ More results
  - ▷ No results found
  - ▷ Related searches
  - ▷ Search button
  - ▷ Time created and time updated
- The target window where linked documents and additional search results will open
- Truncate answer description length
- Number of displayed answers
- Div element
- Instance ID

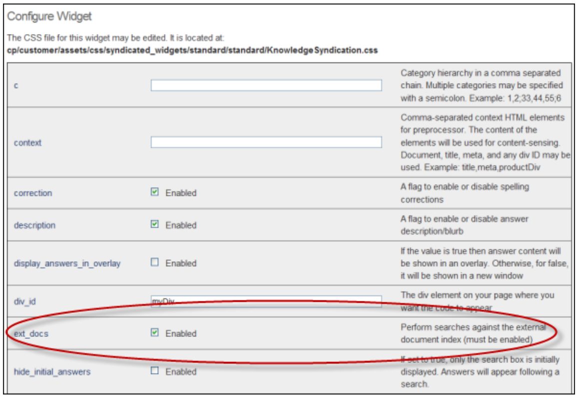
Enabling external document searching

In order to return external documents from a search, web indexing must first be enabled. Refer to Configuring the Web Indexer.

To enable external document searching

With the page for the KnowledgeSyndication widget open, scroll to the Configure Widget section of the page, find the attribute called *ext_docs*, and select the check box.

Continue configuring attributes for the KnowledgeSyndication widget.



Opening answers with a page overlay

By default, any answers your customers click on the KnowledgeSyndication widget open on a new page. However, you may not want your customers leaving the page they are on to view an answer if, for example, they are in the middle of a transaction. You may decide it's better to keep customers on the page and simply display the answer in an overlay.

To open answers in an overlay instead of a separate window

Locate the attribute called *display_answers_in_overlay* and select the check box.

Note If an answer has file attachments, they appear on the overlay, but answers that use guided assistance will not display the guide on the overlay.

Continue configuring attributes for the KnowledgeSyndication widget.

Defining product and category IDs

You can specify one or more **products** and **categories** to be associated with the report, and these can be products and categories at any level of the hierarchy. To determine the IDs of products and categories, refer to Finding product ID numbers.

To define products for a KnowledgeSyndication widget report

Note This procedure describes how to specify the products used for a search with the KnowledgeSyndication widget. The procedure to specify categories is identical, but the attribute name is **c** for categories instead of **p** for products.

1 With the page for the KnowledgeSyndication widget open, scroll to the Configure Widget section of the page, and find the attribute called **p**.

2 To specify a single product for the search report to search on, type the product ID in the field. Click here to learn how to find the product ID number.

Note If you specify a sub-product, the product ID will be a comma-separated series of the ID numbers in the product hierarchy, with the highest level product first and the specified sub-product last. Any intermediate levels should be listed in descending order.

3 To specify additional products for the search report, type a semicolon between product IDs.

For example, assume the product attribute field contains “1,2;33,44,55;6.” There are three products being specified in this example. The first product is “1,2” and it defines the sub-product with ID 2 under the top-level product with ID 1. The second product is “33,44,55.” This defines a third-level product with ID 55 under a second-level product with ID 44, which is a sub-product of the top-level product with ID 33. The third product in this example is a top-level product with ID 6.

Continue configuring attributes for the KnowledgeSyndication widget.

Finding product ID numbers

The ID numbers for products and categories are defined on the administration interface, so you’ll need to log in to find these values.

Note The procedure is the same for categories.

To find a product ID number

1 Log in to Oracle Service Cloud.

2 Click the Configuration button on the navigation pane.

3 Double-click Products/Categories/Dispositions under Service.

4 Expand the products tree if necessary to display the product you want to select.

5 Hover over the product name to display its ID, as shown here, where the ID number for the Prepay call plan is 47.

  a If the product is a sub-product, hover over the parent product to also get its ID. In the example, the ID for the parent product Call Plans is 421.

6 Type the full path of the product hierarchy into the p attribute field of the KnowledgeSyndication widget. The highest level product ID is listed first and the sub-product you selected is last in the comma-separated series. In this example, you would type 421,47. If the product was a fourth-level product, the ID would resemble 313,420,425,293.

Return to the procedure for defining product and category IDs or Continue configuring attributes for the KnowledgeSyndication widget.

Retaining product and category search filters

If you have defined default products or categories (or both), these products or categories are cleared when customers enter a keyword search term. If you want to restrict customer searches to the default products and categories, you can enable the *persist_prodcat* attribute.

To retain product and category search filters when customers enter search terms

Select the check box for *persist_prodcat*.

Continue configuring attributes for the KnowledgeSyndication widget.

Determining search results based on page information

The KnowledgeSyndication widget can “read” the content of the page and use context-sensitive information to determine what answers should be returned. It does this when you specify the HTML tags on the page that you want the widget to evaluate for context sensitivity. If you leave the field for this attribute blank, the KnowledgeSyndication widget will not use page content to determine what answers should be returned. You can also define the amount of content you want the widget to evaluate.

When you specify the page tags, the content within those tags is passed to the server for evaluating answers that are relevant to the page content. You might, for example, want to place the KnowledgeSyndication widget on your product pages so the specific product information from each page is used to return product-specific answers to your customers.

If you enter information in the *context* attribute's field, the keyword for the search query defined in the *q* attribute is overridden. If the HTML tags you define are not found on the page, the widget defaults to the empty string, and top answers will be returned.

You can list any div ID, as well as *title, document*, and *meta* tags in the field for the *context* attribute. If you list a *meta* tag, only meta elements that are named *description* and *keywords* will be evaluated. If you use a *document* tag, the entire contents of the page will be evaluated.

To define HTML tags for sensing content

Type comma-separated HTML tags in the *context* field. The content within those tags will be used to determine search results.

Continue configuring attributes for the KnowledgeSyndication widget.

Defining content size for evaluation

The *payload_size* attribute defines the number of characters for each tag identified in the *context* attribute that will be sent to the server for evaluation to determine page content and influence context sensitivity of the returned answers. The default value is 150 characters (approximately 25 English words), and the maximum value is 300 characters.

To define the number of characters for content evaluation

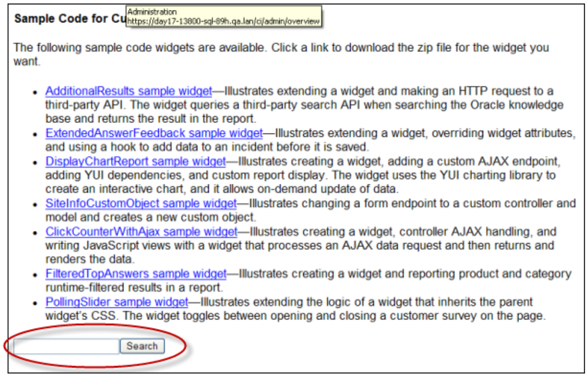
Type the number of characters you want evaluated in the field for the *payload_size* attribute.

Hiding answers until a search is performed

By default, the KnowledgeSyndication widget displays the top ten most popular answers until a search is performed, at which time it displays the search results. If you prefer, you can hide all answers until customers enter a search term on the external page.

To hide answers until a search is performed

Select the check box for *hide_initial_answers*. The widget appears as a search field and button on the external page.



Setting the keyword for the search query

You can define the search term automatically so that the answers returned by the KnowledgeSyndication widget are related to that keyword. The default is blank.

Note If you've entered HTML tags in the context attribute, any values in the *q* attribute will be overridden.

To set a keyword for a search query

Type the search word in the field for the *q* attribute of the KnowledgeSyndication widget.

Continue configuring attributes for the KnowledgeSyndication widget.

Flag settings

By default, all of the following attributes are enabled.

- *correction*—When this attribute is enabled, the widget offers spelling suggestions if the search term appears to be misspelled.
- *description*—When enabled, the widget displays answer descriptions in the list of returned answers. The description includes the beginning of the answer summary. (You can set the description length by editing the *truncate_size* attribute.)
- *navigation*—When enabled and the number of answers that meet the search criteria is greater than the number of displayed answers, the More Results link appears on the widget. (You can set the number of displayed answers by editing the *number_answers* attribute.)
- *recommended*—When enabled, the KnowledgeSyndication widget displays a link to any recommended documents.

- *related*—When enabled, the widget displays a list of related searches.
- *search_box*—When enabled, the widget displays the keyword search box so customers can enter search terms.

To disable a flag setting

1. To disable spelling corrections and suggestions, clear the check box for the *correction* attribute.
2. To disable answer descriptions in the search results, clear the check box for the *description* attribute.
3. To disable the More Results link, clear the check box for the *navigation* attribute.
4. To disable recommended documents, clear the check box for the *recommended* attribute.
5. To disable suggested searches, clear the check box for the *related* attribute.
6. To disable the keyword search box to prevent customers from entering search terms, clear the check box for the *search_box* attribute.

Continue configuring attributes for the KnowledgeSyndication widget.

Editing labels

You might want to change the wording of messages on the KnowledgeSyndication widget. You can do so by editing any of the following *label* attributes.

- Spelling suggestions
- Recommended documents
- More results
- No results found
- Related searches
- Search button
- Time created and time updated

Continue configuring attributes for the KnowledgeSyndication widget.

Editing the spelling suggestion label

The default label for displaying spelling suggestions is Did You Mean, and the message is followed by a list of possible spelling corrections.

Note EU_SEARCH_TERM_FEEDBACK_ENABLE (RightNow User Interface > End-User Interface > General) must be set to Yes to display spelling suggestions. This setting is enabled by default so you shouldn't have to edit it unless it has been disabled using this procedure.

To edit the spelling suggestion label

Type the new label in the field for the *label_correction* attribute.

Editing the Recommended Documents label

When the KnowledgeSyndication widget lists recommended documents, it uses the label Recommended Documents.

To edit the label for recommended documents

Type the new label in the field for the *label_documents* attribute.

Editing the More Results label

If the number of returned answers exceeds the number defined in the *number_answers* attribute, the More Results link appears at the bottom of the list of answers. (Click here to change the number of displayed answers. To disable the More Results link, go to step 3 in the To disable a flag setting procedure.)

Note The behavior you define in Editing the target window is used to determine the behavior of the More Results link. For example, defining `target="_blank"` means that the additional search results will display in a new window just as linked documents do.

To edit the label for the More Results link

Type the new label in the field for the *label_more_results* attribute.

Edit other labels or Continue configuring attributes for the KnowledgeSyndication widget.

Editing the No Results Found label

To edit the No Results Found label

Type the new label in the field for the *label_no_results* attribute.

Editing the related searches label

The related searches feature builds links between search words and phrases based on similar answer search results and suggests terms your customers might not have thought of or known the terminology for. When the KnowledgeSyndication widget displays suggested search terms, it uses the label Other Suggested Searches.

Note EU_SUGGESTED_SEARCHES_ENABLE (RightNow User Interface > End-User Interface > General) must be set to Yes to display related searches. This setting is enabled by default so you shouldn't have to edit it unless you disable suggested searches.

To edit the related searches label

Type the new label in the field for the *label_related_searches* attribute.

Editing the Search button label

To edit the Search button label

Type the new label in the field for the *label_search_button* attribute.

Editing the created and updated button labels

When you enable the ability to display an answer on a page overlay instead of opening it on a separate page (refer to Opening answers with a page overlay), the overlay displays the time the answer was created and the time it was last updated. The default labels for these display fields are Created and Updated, but you can edit them.

To edit the Created label

Type the new label in the field for the *label_created* attribute.

To edit the Updated label

Type the new label in the field for the *label_updated* attribute.

Edit other labels or Continue configuring attributes for the KnowledgeSyndication widget.

Editing the target window

The *target* attribute defines where linked documents and additional search results (the More Results link) should be opened. The default value is "_self" to open the linked document or the additional search results in the same window.

To change the target window

Type one of the following target values for the HTML anchor (<a>) tag in the field for the widget's *target* attribute.

_blank—Opens the link in a new window.

_self—Opens the link in the current window.

_parent—Opens the link in the parent frameset.

_top—Opens the link in the full window.

Truncating answer descriptions

The default length of answer descriptions is 100 characters, but you can edit that value.

To edit the length of answer descriptions

Type a numerical value in the field for the *truncate_size* attribute.

Editing the number of displayed answers

By default, ten answers are displayed when customers conduct a search using the KnowledgeSyndication widget.

To change the number of displayed answers

Type an integer in the field for the *number_answers* attribute.

Continue configuring attributes for the KnowledgeSyndication widget.

Editing the div element

The default div element that defines where you want the KnowledgeSyndication widget to appear on the page is myDiv. If you change the *div_id* attribute, the code you add to the page also changes.

To edit the div element

Type a new name for the div element in the field for the *div_id* attribute. The new code for the div element will resemble the following.

```
<div id="newDiv"></div>
```

Editing the instance ID

If you have more than one KnowledgeSyndication widget on a page, you must have unique ID values for each of them. The default value is skw_0.

To edit the instance ID

Replace the “0” in “skw_0” in the *instance_id* attribute with another value for each widget you add to the page. Each instance of the widget must have a unique value.

Continue configuring attributes for the KnowledgeSyndication widget.

Offering customers a survey

You may want to offer your customers a survey on one of your customer portal pages or an external web page. The Customer Portal contains the following standard survey widgets.

- **Polling**—Lets you add a one-question survey to any customer portal page. Refer to Polling widgets.
- **SurveyLink**—Displays a link your customers can click to open a survey. Refer to SurveyLink widgets.
- **ProactiveSurveyLink**—Opens a window on your customer portal to offer customers the opportunity to take a survey. Refer to ProactiveSurveyLink widget.

Besides the standard survey widgets, two syndicated survey widgets are also available for adding to an external page.

- **PollingSyndication**—Lets you add a one-question survey to an external page. Refer to Polling widgets.
- **ProactiveSurveyLink (syndicated)**—Opens a window on an external page to offer customers the opportunity to take a survey. Refer to Syndicated ProactiveSurveyLink widget.

Polling widgets

The Polling widget is located in the standard widgets folder in the *surveys* subfolder. The PollingSyndication widget can be found on the Customer Portal Administration site by clicking the Widgets tab and selecting Syndicated Widgets.

The polling widgets let you add a single-question poll from surveys that have been created on the **agent desktop**. This section describes the common functionality of these widgets, while the procedure for creating surveys is at Creating polling surveys.

The available question types include choice, text, and matrix, and you can use any of these question types in your poll, although the choice question type probably offers the most usefulness to your organization. (Refer to Creating questions for a description of each type of question.) When customers answer a choice question by selecting a menu item, radio button, check box, or list item, they see a chart displaying the responses to date. (This chart can be a horizontal bar chart, vertical bar chart, or pie chart.) When customers respond to text and matrix questions, they see a thank-you message.

If the survey you have associated with the polling widget contains multiple questions, one of the questions will be selected at random to appear to customers for a one-hour time period. Every customer who is offered the poll during that time sees the same question. At the end of an hour, a new question is selected at random.

Widget attributes

The question, answers, and some styling options are defined on the **agent desktop** when surveys and associated questions are created. Additional styling and other attributes are defined with customer portal code. If widget styling attributes are different than the styling defined when the survey was created, the widget attributes are used.

The following attributes are available for the standard Polling widget and the PollingSyndication widget.

- **Chart Style**—Sets the styling for the chart using the YUI Charts Control. You can specify backgrounds, borders, colors, fonts, and many other chart attributes. The default is blank. Refer to Chart attributes.
- **Chart Type**—Specifies the chart type. Options include none, horizontal bar, vertical bar, pie chart, and simple. The default is a horizontal bar chart. Refer to Chart type.
- **Cookie Duration**—Defines the number of days until the cookie expires. The default is ten days. Refer to Cookie duration.
- **Instance ID**—Defines the ID for the widget instance. You can specify this value, or it will be selected automatically. Refer to Instance ID.

- **Frequency**—Defines what percentage of visitors are offered the poll. This attribute is used only when modal polls are enabled. Refer to To enable and configure modal polls for the Polling widget or To enable and configure modal polls for the PollingSyndication widget.
- **Modal**—Sets the survey dialog to be modal. This mode requires customer interaction to close the dialog. By default, the modal poll is disabled. Refer to Enabling and configuring modal polls.
- **Poll Logic**—Prevents the survey dialog from opening unless the *evt_showPoll* event is fired. This attribute is used only when modal polls are enabled. You must add code to define the condition that triggers the event. Refer to Poll logic.
- **Seconds**—Used only with modal polls to specify the time in seconds until the dialog is opened. The default value is 0.
- **Series Style**—Sets the styling for the chart's bars or pie wedges with the YUI Charts Control. Refer to Chart attributes.
- **Survey ID**—Required to identify the polling survey the widget uses. Refer to Survey ID.
- **Test**—Puts the widget in test mode so results are not recorded. Refer to Test mode.

Adding a polling widget

The Polling widget and the PollingSyndication widget have the same attributes, although the methods for defining those attributes are different. You configure the Polling widget by placing widget code on the customer portal page where you want it to appear and then editing its attributes. You configure the PollingSyndication widget by selecting widget attributes on the Customer Portal Administration site, where the code is automatically generated for you to copy and paste on the external web page where you want the widget to appear.

The following procedures describe the general process for editing each widget. The specific procedures for defining individual attributes are described in later sections.

To add the Polling widget to a customer portal page

1 Open the file for the page on which you want to place the Polling widget.

2 Add a blank line in the code in the location where you want the widget to appear on the page.

3 Type the code for the Polling widget in the blank line you added. The most basic widget code is as follows, where the value of the *survey_id* attribute is the ID of the survey containing the polling question you want to use.

```
<rn:widget path="surveys/Polling" survey_id="8" />
```

Important Every Polling widget must include a value for the *survey_id* attribute. If it does not, an error message appears on the customer portal page.

4 Save the file.

The following figures show the default formatting of the Polling widget. In this example, it has been added to the Account Settings page. The first figure shows the poll being offered to a customer. The second figure shows the results that appear when the customer submits a response.

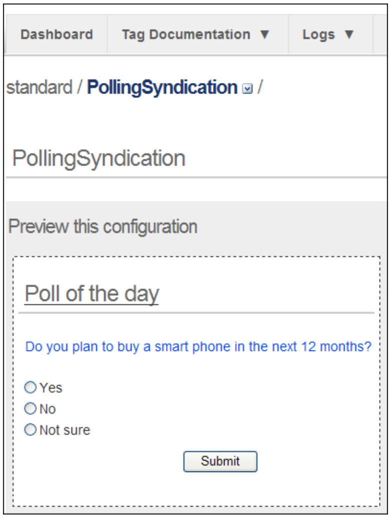
To add the PollingSyndication widget to an external page

1. Type https://<your_site>/ci/tags/syndicated_widgets/standard/PollingSyndication to open the page for the PollingSyndication widget.

2. Scroll to the Configure Widget section of the page and edit the widget attributes.

Important Every PollingSyndication widget must include a value for the *survey_id* attribute. If you do not enter one, code is not generated for the widget.

3. To preview your changes, click Apply at the bottom left of the Configure Widget section. Continue to configure the widget until you are satisfied with the result.



4. Open the source code for the web page you want to add the widget to.

5. To ensure the page renders correctly in Internet Explorer 7, add the following code to the top of the page before your first HTML tag.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http:/
/www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
```

6. On the right side of the widget page, click the top Select Text button to select the code in the first yellow box and press **Ctrl+c** to copy the code.

7. Paste the code into your page file just before the closing </body> tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.

8 Click the second Select Text button and copy the code that defines the widget.

9 Paste the copied code just below the code you pasted in step 7.

10 Click the third Select Text button, copy the code, and paste it where you want the widget to appear.

11 Save your web page.

Configuring polling widgets

Configuration options for the polling widgets include defining the survey ID (required), setting the cookie duration, enabling and configuring modal polls, specifying the chart type, setting chart and series styles, setting the instance ID and div ID, and enabling the test mode.

Survey ID

Every polling widget must be associated with a polling survey that was designed on the Service Console. If the survey ID is missing from the Polling widget code, you will see an error on the page where you are trying to place the widget. If it is missing from the PollingSyndication widget, you will not be able to generate code to paste on an external page.

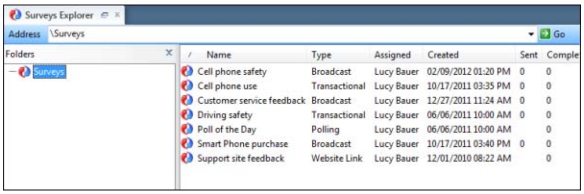
To determine the ID for a survey

1 Log in to Oracle Service Cloud.

2 Click the Surveys button on the **navigation pane**.

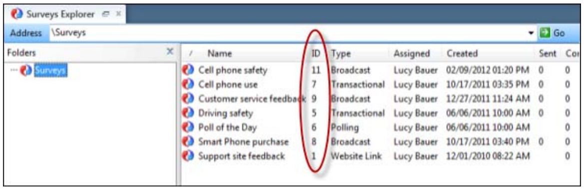
3 Double-click Surveys Explorer. The explorer opens on the content pane.

Note This procedure assumes you access the Surveys explorer from the Surveys **navigation list**. However, this explorer might reside in another navigation list. For help adding the Surveys explorer to a navigation list, refer to [Customizing navigation and configuration lists](#).



4 On the ribbon, click the Choose Details button in the Display group. The Hide or Display Details window opens.

5 Select the check box for ID and click OK. The survey ID appears in the list of surveys.



To define the survey ID for the Polling widget

Add the *survey_id* attribute to the widget code so it resembles the following.

```
<rn:widget path="surveys/Polling" survey_id="5" />
```

To define the survey ID for the PollingSyndication widget

With the page for the PollingSyndication widget open, scroll to the Configure Widget section of the page, find the attribute called *survey_id*, and type the ID number of the survey you want to use in the text field.

Cookie duration

After a customer has answered the poll, a cookie is set to prevent the survey from being offered again when the customer visits the page in the future. You can define the life of the cookie, which is ten days by default, or you can prevent a cookie from being set.

With modal polls (that is, when the poll opens in a separate dialog instead of as an element on the page), the survey is not presented again after the customer has responded once, even if the randomization process now presents a different question to customers. In the non-modal mode after a customer has answered the poll, subsequent visits to the site when the cookie is active will display only the survey results instead of the survey question that appeared on the first visit.

To define the cookie duration for the Polling widget

Add the *cookie_duration* attribute to the widget code and set its value for the number of days you want the cookie to remain active. Your code will resemble the following.

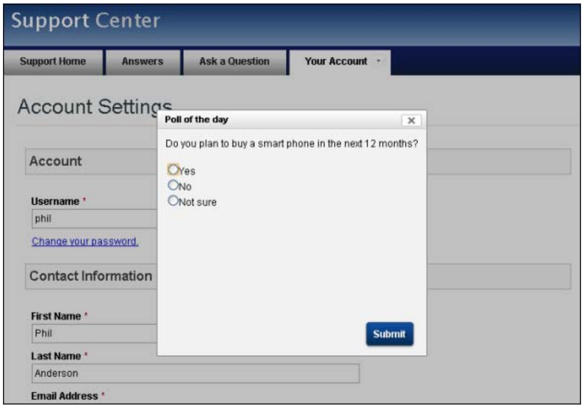
```
<rn:widget path="surveys/Polling"
survey_id="5"
cookie_duration="5"/>
```

To define the cookie duration for the PollingSyndication widget

With the page for the PollingSyndication widget open, scroll to the Configure Widget section of the page, find the attribute called *cookie_duration*, and type the number of days you want the cookie to remain active in the text field.

Enabling and configuring modal polls

By default, the poll is not modal, but is instead an element on the page that customers can choose to respond to or ignore. You can define the poll to be modal so customers must deliberately close the window to reactivate the page they were on. The survey dialog remains in the middle of the page even if scrolling occurs.



Other attributes influence the behavior of the polling widgets when modal polls are enabled. The following attributes apply only to modal polls.

- **Frequency**—You can define what percentage of visitors to your site will be offered the poll.
- **Poll logic**—If you enable this attribute, the survey dialog does not appear unless the JavaScript event *evt_showPoll* is triggered. You must add code to define the condition that triggers the event. Refer to Poll logic.

- **Seconds**—This attribute defines the number of seconds before the survey dialog opens on the page.

To enable and configure modal polls for the Polling widget

1 Add the *modal* attribute to the widget code, which will resemble the following.

```
<rn:widget path="surveys/Polling"
survey_id="5"
modal="true" />
```

2 To offer the poll to only a percentage of your customers instead of all of them, add the *frequency* attribute to the widget code. Your code will resemble the following.

```
<rn:widget path="surveys/Polling"
survey_id="5"
modal="true"
frequency="50"/>
```

3 To trigger the dialog on the event defined in *evt_showPoll*, add the *poll_logic* attribute to the widget code. Your code will resemble the following.

```
<rn:widget path="surveys/Polling"
survey_id="5"
modal="true"
poll_logic="true"/>
```

   a Add the necessary poll logic as described in To use poll logic with the Polling widget.

4 To trigger the dialog after the page has been open a specified number of seconds, add the *seconds* dialog to the widget code. Your code will resemble the following.

```
<rn:widget path="surveys/Polling"
survey_id="5"
modal="true"
seconds="3" />
```

To enable and configure modal polls for the PollingSyndication widget

1 With the page for the PollingSyndication widget open, scroll to the Configure Widget section of the page, find the attribute called *modal*, and select the check box.

2 To offer the poll to only a percentage of your customers instead of all of them, find the attribute called *frequency* and enter a percentage value in the field.

3 To trigger the dialog on the event defined in *evt_showPoll*, find the attribute called *poll_logic*, and select the check box.

a Add the necessary poll logic as described in [To use poll logic with the PollingSyndication widget](#).

4 To trigger the dialog after the page has been open a specified number of seconds, find the attribute called *seconds* and type the number of seconds in the text field.

Poll logic

A JavaScript event, *evt_showPoll*, lets you use logic to display the polling widget when modal polls are enabled. When the *poll_logic* attribute is set to true, the polling dialog does not display unless the *evt_showPoll* event is triggered.

Note You must add code to define the condition that triggers the event.

To use poll logic with the Polling widget

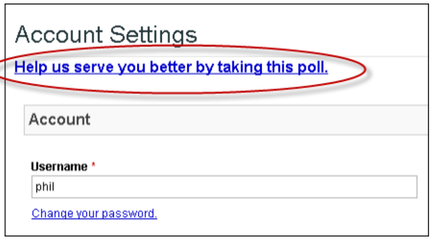
Add the *poll_logic* attribute to the widget code. Your code will resemble the following.

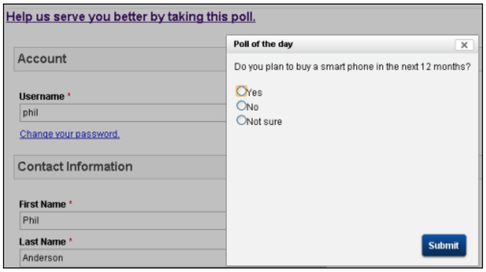
```
<rn:widget path="surveys/Polling"
survey_id="4"
modal="true"
poll_logic="true" />
```

Then add code to trigger the *evt_showPoll* event. If, for example, you want to trigger the poll after customers click a link on the widget, you could add the following code to the page containing the widget. (Notice that the widget code prevents cookies from being set so the link will remain active.)

```
<rn:widget path="surveys/Polling" survey_id="4" modal="true"
poll_logic="true" cookie_duration="0" />
<script type="text/javascript">
function pollLogic() {
    RightNow.Event.fire('evt_showPoll');
}
</script>

<a href="#" onclick="pollLogic()"><h2>Help us serve you better by
taking this poll.</h2></a>
```





To use poll logic with the PollingSyndication widget

Add the logic code to the external page below the code you added for the PollingSyndication widget. The following example shows the code you might add if you want to display the poll 500 milliseconds after the page opens.

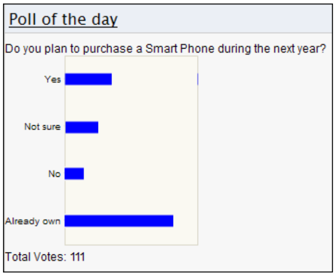
```
<script type="text/javascript">
var rnTimer;
startCheck();
// check to see when the RightNow javascript is loaded and ready to use
function startCheck()
{
    rnTimer = setInterval(checkLoaded, 500); // this is milliseconds
}
// when loaded fire the poll
function checkLoaded()
{
    if (RightNow && RightNow.Client && RightNow.Client.Event &&
    RightNow.Client.Event.evt_showPoll)
    {
```

```
            clearInterval(rnTimer);
            RightNow.Client.Event.evt_showPoll.fire();
    }
}
</script>
```

Chart type

When the polling widget uses a survey with a choice type question, the page displays a chart with the results of the poll. By default, a horizontal bar chart is used, but you can change that to a vertical bar chart, pie chart, or simple chart instead. You can also select None if you do not want to display the results in a chart.

Note The simple chart type is styled with the widget's CSS file. If you define attributes for the widget in the code on the page where it appears, they are not applied to the widget.



To edit the chart type on the Polling widget

1 To display a vertical bar chart, add the *chart_type* attribute to the widget code and set its value to vertical_bar. Your code will resemble the following.

```
<rn:widget path="surveys/Polling"
survey_id="5"
chart_type="vertical_bar" />
```

2 To display a pie chart, add the *chart_type* attribute to the widget code and set its value to pie. Your code will resemble the following.

```
<rn:widget path="surveys/Polling"
survey_id="5"
chart_type="pie" />
```

To edit the chart type on the PollingSyndicated widget

With the page for the PollingSyndication widget open, scroll to the Configure Widget section of the page, find the attribute called *chart_type*, and select vertical_bar, pie, or simple to change the chart from the default horizontal_bar option.

Chart attributes

The polling widgets use the YUI Library's Charts module to generate the charts that display poll results for choice type questions. Although the YUI chart attributes are not displayed on the Customer Portal Administration site for either of the polling widgets, you can change the YUI default attributes directly in the widget code. If you do not enter chart attributes, the YUI defaults will be used. Refer to the Yahoo Developer Network for specific details.

Instance ID

The *instance_id* is used as a unique identifier of the polling widget. Each instance of a polling widget on a customer portal page or an external page must have its own instance ID. You can enter a value for *instance_id* in the Polling widget code or type a value in the field for the PollingSyndication widget. If you do not enter a value, one will be assigned automatically.

div_id

The *div_id* attribute is used only with the PollingSyndication widget. You can use the default value myDiv or enter one of your choosing. If you have multiple PollingSyndication widgets on an external page, each widget must have a unique *div_id* value.

Test mode

When the test mode is enabled, you can test the polling widgets without worrying that your sample poll selections will skew actual customer results. No statistics will be collected in test mode.

To set the test mode for the Polling widget

Add the *test* attribute to the widget code and set it to true. Your code will resemble the following.

```
<rn:widget path="surveys/Polling"
survey_id="5"
test="true" />
```

To set the test mode for the PollingSyndication widget

With the page for the PollingSyndication widget open, scroll to the Configure Widget section of the page, find the attribute called *test*, and select the check box.

Randomized survey questions

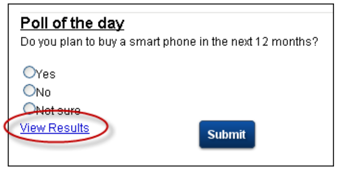
If the survey used by the polling widget has multiple questions, the survey question is selected at random. During a one-hour period, every customer who is presented with the survey will see the same question. After one hour, another question is selected at random.

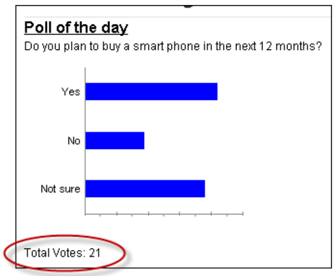
Anonymous responses

If customers are logged in, their responses to the survey question will be associated with their contact record. If customers are not logged in, they can still respond to the survey because polling surveys allow anonymous responses.

Other configuration options

Other polling survey options are available when the survey is created. (Refer to To create a polling survey.) The following figures show a Polling widget that displays a View Results link and the total number of results.





Viewing results without participating

When you create or edit a survey with choice-type questions, you can add the ability for customers to see survey results even if they do not participate in the survey.

Displaying the total number of votes

You can set the survey results to display the total number of votes when you create or edit a survey.

End of survey actions

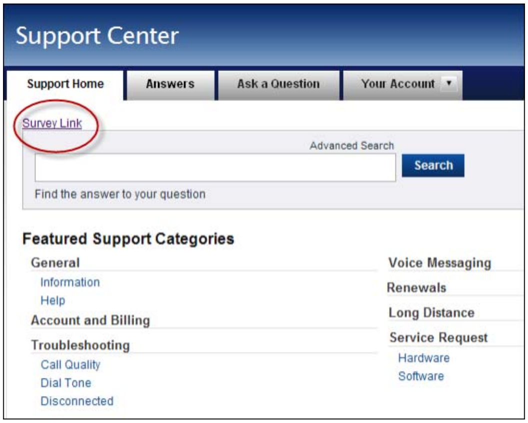
If the survey used by the polling widget includes end of survey actions, those actions will occur only when customers are logged in. If customers are not logged in, no action will occur. These actions are defined when the survey is created.

SurveyLink widgets

The SurveyLink, ProactiveSurveyLink, and syndicated ProactiveSurveyLink widgets provide a link your customers can click to open a survey. The SurveyLink widget is a static link, while both proactive widgets open a separate survey invitation on the page. The syndicated ProactiveSurveyLink widget lets you offer a survey invitation on a non-customer portal page.

Adding the SurveyLink widget

You can add a link to any customer portal page that opens broadcast and website link types of surveys. (Click here to create a broadcast survey, and click here for website link surveys.) Customers who click the survey link for a broadcast survey must be logged in. The following figure shows the SurveyLink widget at the top of the Support Home page.



Important You must know the survey ID value and specify it in the *survey_id* attribute so the widget knows what survey to open. Refer to To determine the ID for a survey.

To add the SurveyLink widget to a page

1 Open the customer portal page that you want to add the SurveyLink widget to.

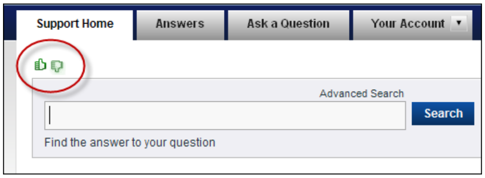
2 Add the following code in the location on the page where you want the widget to display, defining the *survey_id* attribute with the ID value of the survey you want to use.

```
<rn:widget path="surveys/SurveyLink"
survey_id="11"/>
```

3 To use a graphic element instead of the text link to the survey, add the *icon_path* attribute to the widget so that your code resembles the following.

```
<rn:widget path="surveys/SurveyLink"
survey_id="11"
icon_path="images/cp_survey_icon.png" />
```

Note When you use the *icon_path* attribute, the default label that is read by screen readers is “Follow this link to take a survey.” If you want to change this label, add the *label_icon_alt* attribute and set the value to whatever you want the screen reader to read.



4 To open the survey in a separate window instead of on the same page, add the *target* attribute to the widget code and set it to `_blank`.

```
<rn:widget path="surveys/SurveyLink"
survey_id="11"
target="_blank" />
```

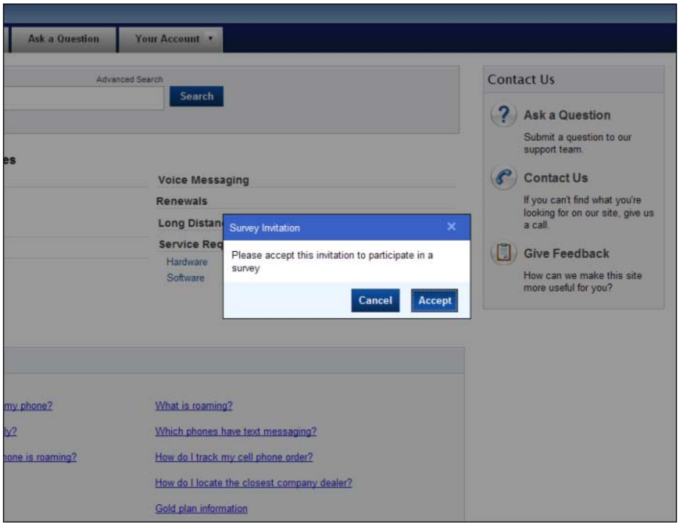
5 To change “Survey Link” to different text, add the *link_text* attribute to the widget.

```
<rn:widget path="surveys/SurveyLink"
survey_id="11"
link_text="Click here to take our survey" />
```

6 Save the page file.

ProactiveSurveyLink widget

Besides displaying the static SurveyLink widget to offer your customers a survey, you can also offer a survey when your customers have been on a page for a defined number of seconds or when an event that you have defined occurs. The ProactiveSurveyLink widget can be placed on any customer portal page, and it is shown on the Support Home page in this figure. The widget is modal, which means that it opens in a separate window that must be closed before resuming operations on the page it was opened from.



To add the ProactiveSurveyLink widget to a page

1 Open the customer portal page that you want to add the ProactiveSurveyLink widget to.

2 Add the following code to the page. Because the widget opens in the center of the page, you can simply add the code as the last line on the page.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"/>
```

Important You must include the *survey_id* attribute so the widget knows what survey it should link to. Refer to To determine the ID for a survey.

3 To change the labels on the Accept and Cancel buttons, add the *label_accept_button* and *label_cancel_button* attributes. Your code will resemble the following.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
label_accept_button="Yes please"
label_cancel_button="No thanks" />
```

4 To open the survey in a separate window instead of on the same page, add the *target* attribute to the widget code and set it to `_blank`.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
target="_blank" />
```

5 To set the cookie duration to anything other than the default value of ten days, add the *cookie_duration* attribute and set it to the number of days you want to avoid presenting the survey offer again. If you set the value to 0, no cookie is set.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
cookie_duration="0"/>
```

6 To change the width of the window that opens when the link is clicked from its default value of 300 pixels, add the *dialog_width* attribute and set it to the value you want.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
dialog_width="200" />
```

7 To define a percentage of visitors who will be offered the survey (instead of the default value of 100), add the *frequency* attribute and set it the value you choose.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
frequency="50" />
```

8 To change the default invitation to participate in the survey, add the *intro_paragraph* attribute with the text of your choice.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
intro_paragraph="Complete this survey and be entered in a drawing to
win an iPad!" />
```

9 To open the window after a specified number of seconds, add the *seconds* attribute.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
seconds="10" />
```

10 To change the survey title from the default “Survey Invitation,” add the *title* attribute.

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
title="Tell us what you're thinking" />
```

11 To open the widget only when an event is fired, add the *wait_for_event* attribute to the widget and then add the code to fire the event.

Note A JavaScript event, *evt_showOffer*, lets you use logic to display the ProactiveSurveyLink widget. You must add code to fire *evt_showOffer* in order for the widget to open. If you have defined the *seconds* attribute, the widget opens after the event has fired and the number of seconds has elapsed.

Your code will resemble the following. (Notice that the widget code prevents cookies from being set so the link will remain active.)

```
<rn:widget path="surveys/ProactiveSurveyLink"
survey_id="11"
wait_for_event="true"
cookie_duration="0" />
<script type="text/javascript">
function dialogLogic()
{
    RightNow.Event.fire('evt_showOffer');
}
</script>
<a href="#" onclick="dialogLogic()"><h2>Help us serve you better
by taking this survey.</h2></a>
```

12 Save the page.

Syndicated ProactiveSurveyLink widget

The syndicated ProactiveSurveyLink widget performs the same function as the standard ProactiveSurveyLink widget but on an external page rather than a customer portal page. The code for the syndicated ProactiveSurveyLink widget is generated on the Customer Portal Administration site, so you must copy the code and then paste it into the code for the external page.

To add the syndicated ProactiveSurveyLink widget to a web page

1 Type `https://<your_site>/ci/tags/syndicated_widgets/standard/ProactiveSurveyLink` to open the page for the syndicated ProactiveSurveyLink widget.

2 Scroll to the Configure Widget section and edit the widget attributes. Refer to [To configure the syndicated ProactiveSurveyLink widget]().

Important Every syndicated ProactiveSurveyLink widget must include a value for the *survey_id* attribute. If you do not enter one, code is not generated for the widget.

3 To preview your changes, click Apply at the bottom left of the Configure Widget section. Continue to configure the widget until you are satisfied with the results.

4 Open the source code of the external page you want to add the widget to.

5 To ensure the page renders correctly in Internet Explorer 7, add the following code to the top of the page before your first HTML tag.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http:/
/www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
```

6 On the right side of the widget page, click the top Select Text button to select the code in the first yellow box and press **Ctrl+c** to copy the code.

7 Paste the code into your page file just before the closing </body> tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.

8 Click the second Select Text button and copy the code that defines the widget.

9 Paste the copied code just below the code you pasted in step 7.

10 Click the third Select Text button, copy the code, and paste it where you want the widget to appear on the page.

11 Save your web page.

To configure the syndicated ProactiveSurveyLink widget

1 With the page for the syndicated ProactiveSurveyLink widget page open, scroll to the Configure Widget section of the page, find the attribute called *survey_id*, and type the ID number of the survey you want to use in the text field.

2 To set the cookie duration to anything other than the default value of ten days, type the number of days you want to avoid presenting the survey offer again in the *cookie_duration* attribute. If you set the value to 0, no cookie is set.

3 To change the width of the window that opens when the link is clicked from its default value of 300 pixels, type the new value in the *dialog_width attribute.*

4 To open the widget only when an event is fired, select the Enabled check box for the *display_logic* attribute.

Note A JavaScript event, *evt_showLink*, lets you use logic to display the syndicated ProactiveSurveyLink widget. You must add code to fire *evt_showLink* in order for the widget to open. If you have defined the *seconds* attribute, the widget opens after the event has fired and the number of seconds has elapsed.

a Add the following code just below the widget code on the page where you're placing the widget.

```
<script type="text/javascript">
function dialogLogic()
{
    RightNow.Client.Event.evt_showLink.fire();
}
</script>
<a href="#" onclick="dialogLogic()"><h2>Help us serve you better
by taking this survey.</h2></a>
```

5 To change the *div_id* attribute from its default of `myDiv`, type a new name for the div in the field.

Note It doesn't matter if you use the default value or enter one of your choosing. If you have multiple ProactiveSurveyLink widgets on an external page, each widget must have a unique *div_id* value.

6 To define a percentage of visitors who will be offered the survey (instead of the default value of 100), set the percentage value you want in the *frequency* attribute.

7 To rename the *instance_id* attribute, replace the "0" in "psl_0" with another value.

Note Each instance of the widget on a page must have a unique value.

8 To change the default invitation to participate in the survey, type text for the new introduction in the *intro_paragraph* attribute.

9 To change the labels on the Accept and Cancel buttons, type new values for the *label_accept_button* and *label_cancel_button* attributes.

10 To open the survey link window after a specified number of seconds, type the value in the *seconds* attribute. The default value of 0 means the window opens immediately.

11 To open the survey in a separate window instead of on the same page, click the drop-down arrow for the *target* attribute and select "_blank."

12 To change the survey title from the default "Survey Invitation," type the new title in the *title* attribute.

Standard widgets

The following table lists all the widgets included in both the standard and mobile customer portal reference implementations, the pages on which they are used, and their functionality on the page.

Click here for a list of standard widgets that are not used in the reference implementation pages or templates.

A | B | C | D | E | F | G | K | L | M | N | O | P | R | S | T | U | V

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
Accordion	mobile/account/questions/detail	Expands and collapses the Update This Question, Communication History, and Additional Details sections.
	mobile/answers/list	Expands and collapses the + Search Options section, which displays product and category filters.
	mobile/home	Expands and collapses the Most Popular Answers, Featured Support Categories, and Contact Us sections.
AdvancedSearchDialog	account/questions/list	Displays the advanced search options, which include search terms, product and category filters, and sorting options. Also includes Search and Cancel buttons and a link to Search Tips.
	answers/list	
	home	

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
AnswerFeedback	answers/detail	Displays the Was This Answer Helpful? section of the page, including the Yes/No buttons, and feedback dialog.
AnswerNotificationIcon	answers/detail	Displays the Notify Me link on the answer details page.
AnswerNotificationMan-ager	account/notif/list	Opens the list of answers to which a customer is subscribed and displays the Renew and Delete buttons.
BasicAnswerFeedback	basic/answers/detail	Displays the Was This Answer Helpful? section of the page, including the Yes/No buttons, and the Submit Feedback button.
BasicCustomAllInput	basic/ask	Displays input fields for incident cus-tom fields.
	basic/account/profile	Displays input fields for contact cus-tom fields.
	basic/utils/create_account	Displays input fields for contact cus-tom fields.
BasicDisplaySearchFilters	basic/account/questions/list	Displays the search filters that were used to restrict a search by products, categories, or both.
	basic/answers/list	
BasicEmailCredentials	basic/utils/account_assis-tance	Displays the fields and buttons for cus-tomers to enter their email address or user name and request to have their user name emailed to them or have their password reset.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
BasicFormInput	basic/ask	Displays the Email Address, Subject, and Question fields.
	basic/account/change_-password	Displays the Current Password, Password, and Verify Password fields.
	basic/account/profile	Displays the Username, First Name, Last Name, Email Address, Street, City, Country, State/Province, Postal Code, and phone number fields.
	basic/account/questions/detail	Displays the field for adding information to a question being updated and the Do You Want a Response? field and menu.
	basic/answers/submit_-feedback	Displays the Email Address and Feedback fields for submitting feedback on an answer.
	basic/utils/create_account	Displays the Email Address, Username, Password, Verify Password, First Name, and Last Name fields.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
BasicFormStatusDisplay	basic/ask	Displays status and error messages from form submissions on the basic page set.
	basic/account/change_password	
	basic/utils/create_account	
	basic/account/profile	
	basic/account/reset_password	
	basic/account/setup_password	
	basic/account/questions/detail	
	basic/answers/detail	
	basic/answers/submit_feedback	
	basic/utils/account_assistance	
BasicFormSubmit	basic/ask	Displays the Submit button.
	basic/account/change_password	
	basic/account/profile	
	basic/account/questions/detail	
	basic/answers/submit_feedback	
	basic/utils/create_account	Displays the Create Account button.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
BasicKeywordSearch	basic/home	Displays the Search field.
	basic/account/questions/list	
	basic/answers/list	
BasicLoginForm	basic/utils/login_form	Displays the Username and Password fields and the Log In button.
BasicMultiline	basic/home	Displays the Most Popular Answers report.
	basic/account/overview	Displays the customer's incidents in the Questions section.
	basic/account/questions/list	Displays the customer's incidents, filtered by product or category if selected.
	basic/answers/list	Displays the list of answers that meet customer-entered search terms.
BasicPaginator	basic/account/questions/list	Displays a list of page numbers that customers can select when the length of a report exceeds what can be displayed on a single page.
	basic/answers/list	
BasicProductCategoryInput	basic/ask	Lets customers select a product and category when they submit a question.
BasicProductCategorySearchFilter	basic/ask	Displays the Select a Product and Select a Category pages that appear before customers submit a question.
	basic/account/questions/list	Displays the Limit by Product and Limit by Category search filters.
	basic/answers/list	
BasicResetPassword	basic/account/reset_password	Displays the Password and Verify Password fields and the Submit button. This widget is accessed only through a link in an email sent to the customer.
	basic/account/setup_password	

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
BasicResultInfo	basic/account/questions/list	Displays the number of matching answers displayed in the search results.
BrowserSearchPlugin	templates/standard	Provides a link that can be output to a browser search engine plug-in.
ChatAgentStatus	chat/chat_landing mobile/chat/chat_landing	Displays the **status of the chat agent** (absent, listening, or responding).
ChatAttachFileButton	chat/chat_landing	Displays the Attach File button.
ChatCancelButton	chat/chat_landing mobile/chat/chat_landing	Displays the Leave button.
ChatDisconnectButton	chat/chat_landing mobile/chat/chat_landing	Displays the Disconnect button.
ChatEngagementStatus	chat/chat_landing mobile/chat/chat_landing	Displays the status of the **chat session**.
ChatHours	chat/chat_launch mobile/chat/chat_launch	Lists the chat hours defined on the **administration interface** and the current date and time.
ChatLaunchButton	chat/chat_launch mobile/chat/chat_launch	Displays the Submit Request button.
ChatOffTheRecordButton	chat/chat_landing	Displays the Chat Off the Record button.
ChatOffTheRecordDialog	chat/chat_landing	Opens the dialog for sending an off-the-record message when the Chat Off the Record button is clicked.
ChatPostMessage	chat/chat_landing mobile/chat/chat_landing	Displays the area where customers enter chat messages.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
ChatPrintButton	chat/chat_landing	Displays the Print button for printing the chat transcript.
ChatQueueSearch	chat/chat_landing	Adds a Search button and field where customers can search for an **answer** while waiting for a chat session.
ChatQueueWaitTime	chat/chat_landing mobile/chat/chat_landing	Displays a message to let customers know their position in the **chat session queue**, the estimated wait time, the average wait time, or all three.
ChatRequestEmailResponseButton	chat/chat_landing mobile/chat/chat_landing	Displays the Request Email Response button that appears when no agents are available.
ChatSendButton	chat/chat_landing mobile/chat/chat_landing	Displays the Send button that submits customer chat messages.
ChatServerConnect	chat/chat_landing mobile/chat/chat_landing	Displays the message customers see while the chat connection is being established and when other events occur during the chat session.
ChatSoundButton	chat/chat_landing	Produces an audible signal to indicate when customers are connected to an agent and when agents post a response. Customers can turn the audio on or off.
ChatStatus	chat/chat_launch mobile/chat/chat_launch	Displays a message to let customers know if chat sessions are currently available.
ChatTranscript	mobile/chat/chat_landing chat/chat_landing	Contains a record of the customer and agent messages that comprise the chat session.
ConditionalChatLink	templates/standard	Displays the Live Chat link in the template's sidebar when Chat is enabled.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
CustomAllDisplay	account/questions/detail	Displays the read-only **incident custom fields** in the Additional Details section.
	basic/account/questions/detail	
	mobile/account/questions/detail	
CustomAllInput	chat/chat_launch	Displays input fields for incident custom fields with chat visibility.
	utils/create_account	Displays input fields for **contact custom fields**.
	account/profile	Displays input fields for contact custom fields.
	ask	Displays input fields for incident custom fields.
	mobile/account/profile	Displays input fields for contact custom fields.
	mobile/ask	Displays input fields for incident custom fields.
	mobile/utils/create_account	Displays input fields for contact custom fields.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
DataDisplay	account/questions/detail	Displays the following read-only incident fields: incident thread, customer's email address, reference number for the incident, incident status, the dates the incident was created and last updated, the product and category associated with the incident, and file attachments.
	answers/detail	Displays an answer's file attachments with links to the files.
	basic/account/questions/detail	Displays the following read-only incident fields: incident thread, customer's email address, reference number for the incident, incident status, the dates the incident was created and last updated, the product and category associated with the incident, and file attachments.
	mobile/account/questions/detail	Displays the following read-only incident fields: incident thread, customer's email address, reference number for the incident, incident status, the dates the incident was created and last updated, the product and category associated with the incident, and file attachments.
	mobile/answers/detail	Displays an answer's file attachments with links to the files.
DisplaySearchFilters	account/questions/list	Displays the search filters that were used to restrict a search by products, categories, or both.
	answers/list	
EmailAnswerLink	answers/detail	Displays the Email This Page link.
	mobile/answers/detail	

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
EmailCredentials	mobile/utils/account_assistance	Displays the fields and buttons for customers to enter their email address or user name and request to have their user name emailed to them or have their password reset.
	utils/account_assistance	
FileAttachmentUpload	account/questions/detail	Displays the field and Browse button for attaching additional documents to a question being updated.
	ask	Displays the field and Browse button for attaching documents to a question being asked.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
FormInput	account/profile	Displays the user name, email address, street, city, country, state, postal code, and phone number fields.
	account/questions/detail	Displays the field for adding information to a question being updated and the Do You Want a Response? field and menu.
	ask	Displays the Email Address, Subject, and Question fields.
	chat/chat_launch	Displays the Email Address field.
	mobile/account/change_-password	Displays the current password, new password, and password confirmation fields.
	mobile/account/profile	Displays the user name, email address, street, city, country, state, postal code, and phone number fields.
	mobile/account/questions/detail	Displays the field for adding information to a question being updated and the Do You Want a Response? field and menu.
	mobile/ask	Displays the Email Address, Subject, and Question fields.
	mobile/chat/chat_launch	Displays the Email Address field.
	mobile/utils/create_account	Displays the Email Address, Username, Password, and Verify Password fields.
	utils/create_account	Displays the Email Address, Username, Password, and Verify Password fields.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
FormSubmit	account/change_password	Displays the Submit button.
	account/questions/detail	Displays the Submit button.
	ask	Displays the Continue button.
	mobile/account/change_-password	Displays the Submit button.
	mobile/account/profile	Displays the Save Changes button.
	mobile/ask	Displays the Continue button.
	mobile/utils/create_account	Displays the Create Account button.
	utils/create_account	Displays the Create Account button.
	account/profile	Displays the Save Changes button.
	mobile/account/questions/detail	Displays the Submit button.
Grid	account/overview	Displays reports of recently submitted questions, recent **answer notifications**, and **service contracts**.
	account/questions/list	Displays the Support History report.
GuidedAssistant	agent/guided_assistant	Opens a preview of the guide on the **administration interface**.
	answers/detail	Opens the first question of the guide associated with the answer.
	mobile/answers/detail	Displays the Launch the Troubleshooter button.
	mobile/utils/guided_assistant	Opens the first question of the guide associated with the answer.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
KeywordText	account/questions/list	Displays the search field.
	answers/list	
	home	
	mobile/account/questions/list	
	mobile/answers/list	
LoginDialog	templates/standard	Opens the login dialog when customers who are not logged in click the Log In link. After customers click the link and log in from the Create Account, Log In, or Account Assistance pages, or from an external site, they are redirected to the Account Overview page or another customer portal page.
LoginForm	mobile/utils/login_form	Displays the Username and Password fields and the Log In button.
	utils/login_form	
LogoutLink	templates/mobile	Displays the Logout link.
	templates/standard	
	mobile/chat/chat_landing	
MobileAnswerFeedback	mobile/answers/detail	Displays the Was This Answer Helpful? question, the Yes and No buttons, and feedback dialog.
MobileMultiline	mobile/account/questions/list	Displays the list of customer's **incidents**.
	mobile/answers/list	Opens a list of answers when See All Popular Answers is clicked on the home page.
	mobile/home	Displays the Most Popular Answers report.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
MobileNavigationMenu	templates/mobile	Displays the Menu and Search buttons and their associated menus.
	mobile/chat/chat_landing	Displays the Menu button and its associated menu.
MobileProductCategoryInput	mobile/ask	Displays the Select a Product and Select a Category buttons and their associated menus.
MobileProductCategoryList	mobile/home	Displays the list of Featured Support Categories.
	basic/home	
MobileProductCategorySearchFilter	mobile/answers/list	Displays the product and category search filters.
MobileSimpleSearch	templates/mobile	Displays the search field and Search button that open when the primary Search button is clicked.
Multiline	answers/list	Displays the list of answers that meet customer-entered search terms.
	home	Opens the Most Popular Answers report.
NavigationTab	templates/standard	Displays the Support Home, Answers, Community, Ask a Question, and Your Account navigation tabs.
OpenLogin	mobile/utils/login_form	Displays the third-party sites that can authenticate customers, allowing them to be logged in to the customer portal. The default providers include Facebook, Twitter, Google, Yahoo, WordPress, and OpenID.
	utils/login_form	
	utils/create_account	
PageSetSelector	templates/mobile	Displays the option for selecting the desktop, mobile, or basic page set.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
Paginator	account/questions/list	Displays a list of page numbers that customers can select when the length of a report exceeds what can be displayed on a single page.
	answers/list	
	mobile/account/questions/list	
	mobile/answers/list	
PasswordInput	account/change_password	Displays the Current Password, Password, and Verify Password fields.
PreviousAnswers	answers/detail	Displays the list of answers previously viewed by the customer.
PrintPageLink	account/questions/detail	Displays the Print link.
	answers/detail	
	answers/intent	
ProdCatNotificationManager	account/notif/list	Opens the list of products and categories to which a customer is subscribed and displays the Renew, Delete, and Add Notifications buttons.
ProductCategoryInput	ask	Displays the drop-down menus of products and categories that can be selected when submitting a question.
ProductCategoryList	home	Displays the Featured Support Categories list.
RelatedAnswers	answers/detail	Displays the Answers Others Found Helpful heading with links to related answers.
	basic/answers/detail	
	mobile/answers/detail	

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
ResetPassword	account/reset_password	Displays the Password and Verify Password fields and the Submit button. This widget is accessed only through a link in an email sent to the customer.
	account/setup_password	
	mobile/account/reset_-password	
	mobile/account/setup_-password	
ResultInfo	account/questions/list	Displays the number of matching answers displayed in the search results.
	answers/list	
	mobile/account/questions/list	
	mobile/answers/list	
RightNowLogo	templates/standard	Displays the Oracle logo and link.
	chat/chat_landing	
RssIcon	answers/list	Although added to the default Answers page, the *icon_path* attribute is set to null (" "). As a result, the RSS icon does not display on the page.
SearchButton	account/questions/list	Displays the Search button or icon.
	answers/list	
	home	
	mobile/account/questions/list	
	mobile/answers/list	
SimpleSearch	templates/standard	Displays the Search field on the sidebar of all pages except Support Home, Answers, and Support History.

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
SiteFeedback	templates/standard	Displays the Give Feedback link on the sidebar of all pages and opens the dialog when the link is clicked.
SmartAssistantDialog	ask	Displays a list of suggested answers when customers click the Continue button on the Ask a Question page (unless they have viewed two answers or conducted one search).
	mobile/ask	
SocialBookmarkLink	answers/detail	Displays the Share link that opens a menu of social networking sites.
	answers/intent	
TopAnswers	pages/basic/home.php	Displays a list of suggested top answers that can be filtered by product or category.
	pages/home.php	
	pages/mobile/home.php	
TopicWords	answers/list	Displays a list of links to recommended answers.
Unsubscribe	account/notif/unsubscribe	Lists the notifications a customer is subscribed to. This widget is accessed only through a link in an email sent to the customer.
VirtualAssistantAvatar	chat/chat_landing	Displays the virtual assistant avatar during the chat engagement.
	mobile/chat/chat_landing	
VirtualAssistantBanner	chat/chat_landing	Displays the virtual assistant banner during the chat engagement.
	mobile/chat/chat_landing	
VirtualAssistantFeedback	chat/chat_landing	Displays the Was This Response Helpful? section of the page, including the Yes/No buttons, and the Submit Feedback button during the chat engagement.
	mobile/chat/chat_landing	

Table 380: Standard Widgets and Their Functionality on the Reference Implementation

Widget	Page	Widget functionality on the page
VirtualAssistantSimilar-Matches	chat/chat_landing mobile/chat/chat_landing	Displays links to content that is similar to the phrases used in the chat engagement.

Widgets not used in reference implementation

The following standard widgets are not used in the **reference implementation** but are available for you to add to your pages. If the widgets are referenced in the documentation, a link to the relevant section is provided.

- *chat*
  - ChatCoBrowseButton in prior Customer Portal frameworks)
  - ChatCobrowsePremium
  - ChatLaunchFormOpen (used in prior Customer Portal frameworks)
  - ProactiveChat
- *input*
  - AssetCheck
  - ChannelAllInput
  - ContactNameInput (used in prior Customer Portal frameworks)
  - DateInput
  - EmailCheck
  - ProductCatalogInput
  - SelectionInput
  - TextInput
- *knowledgebase*
  - SearchSuggestions
  - TopicBrowse
- *mobile*
  - MobileEmailAnswerLink
- *output*
  - ChannelAllDisplay
  - ContactNameDisplay

  - ▷ FieldDisplay
  - ▷ FileListDisplay (used in */views/admin/answer_full_preview.php* for displaying the print version of an answer on the **agent desktop**)
  - ▷ IncidentThreadDisplay
  - ▷ ProductCatalogDisplay
  - ▷ ProductCategoryDisplay
- *search*
  - ▷ AssetOrgList
  - ▷ CombinedSearchResults
  - ▷ FilterDropdown
  - ▷ OrgList
  - ▷ ProductCatalogSearchFilter
  - ▷ ProductCategorySearchFilter (contained in AdvancedSearchDialog on the Support Home and Answers pages)
  - ▷ SearchTypeList (contained in AdvancedSearchDialog)

Note You should add the SearchTypeList widget to any page containing a custom report that uses an integer filter. Without the widget, your customers can search only by answer ID. Adding the widget lets your customers select a different search type so they can enter text search terms.

  - ▷ SortList (contained in AdvancedSearchDialog)
  - ▷ WebSearchSort (also contained in AdvancedSearchDialog on the Answers page)
  - ▷ WebSearchType (also contained in AdvancedSearchDialog on the Answers page)
- *social*
  - ▷ AnswerComments
  - ▷ CommunityPostDisplay
  - ▷ CommunityPosts
  - ▷ CommunityPostSubmit
  - ▷ CommunitySearchResults
  - ▷ CommunityUserDisplay
- *surveys*
  - ▷ Polling
  - ▷ SurveyLink

    - ▷ ProactiveSurveyLink
- *utils*
    - ▷ AnnouncementText
    - ▷ Blank
    - ▷ CoBrowsePremium
    - ▷ ProgressBar (adding to the Ask a Question page and adding to the Create an Account page)

52

Logging in to the Customer Portal

Depending on how you set up the Oracle RightNow Customer Portal Cloud Service (Customer Portal), your customers can log in directly or they can log in through an external site that verifies their identity. The following list summarizes the various login methods.

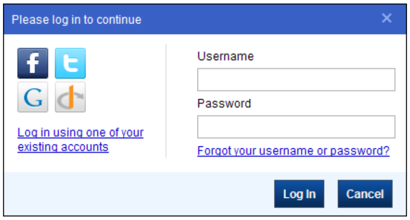
- **Standard login**—Customers use standard login when they log in to your customer portal using the user name and password assigned to them in Oracle Service Cloud instead of logging in through an external service provider, such as Facebook or PingFederate. Clicking the Log In link in the upper right corner of any customer portal page opens the LoginDialog widget so customers can log in. Clicking the Your Account tab when not logged in automatically takes customers to the Log In page, where they are asked for their Oracle Service Cloud user name and password. And customers who do not yet have an account can open the Create an Account page by clicking the Sign Up link on the Log In page or in the upper right corner of any customer portal page.
- **Open login**—The LoginDialog widget, the Log In page, and the Create an Account page also let your customers log in to the customer portal through an external service provider where they already have an account. You can accept verified customer logins from Facebook, Twitter, Google, Yahoo, WordPress, and most other OpenID sites. Refer to Customer portal open login.
- **Pass-through authentication (PTA)**—You can integrate the customer portal with your organization's website so your customers can automatically log in to your support site. Although your organization's web pages may be external to the customer portal, they can pass login parameters through the URL of the customer portal page. As a result, your customers do not have to complete a second login procedure to access your support site. Information sharing between your external site and the customer portal can be used to create and update contact records. To enable pass-through authentication, contact your Oracle account manager.
    - ▷ **Encrypted pass-through authentication**—Data encryption transmits customer information even more securely through the customer portal page URL using one of several encryption options. You can configure encrypted PTA so your customers can log in directly to the customer portal as well as log in with pass-through authentication from your external site. You also have the option of requiring cus-

tomers to log out through the external site or allowing them to log out from the customer portal. Your Oracle account manager can provide information about encrypted PTA.

- **SAML 2.0 open login (single sign-on)**—Instead of logging in to the customer portal with their Oracle Service Cloud user name and password, customers can log in to a third-party identity provider, such as PingFederate or Windows ADFS, which authenticates their identity. Then they select a connection to the customer portal. The identity provider verifies their login, sends an assertion to the customer portal, which verifies the signature and (if successful) logs the customer in. Contact your **administrator** to enable SAML 2.0 open login, and review Customer login for an overview of the feature.

LoginDialog widget

The LoginDialog widget, accessed by clicking the Login link from any customer portal page, lets customers log in using their Oracle Service Cloud user name and password or through open login. When customers click the “Log in using one of your existing accounts” link, they are taken to the Log In page.



Configuration options for the LoginDialog widget include the following.

- Remove the open login option.
- Edit labels on the widget.
- Remove the Password field.

Removing the open login option

To remove the open login option from the LoginDialog widget

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
<rn:condition hide_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"/>
</rn:condition>
<rn:condition show_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"
    redirect_url="/app/account/overview"/>
</rn:condition>
```

3 Add the *open_login_url* attribute to both LoginDialog widgets and set it to a null value. Your code will now look like the following.

```
<rn:condition hide_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink" open_login_url="" />
</rn:condition>
<rn:condition show_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"
    redirect_url="/app/account/overview"
    open_login_url="" />
</rn:condition>
```

4 Save *standard.php*.

Editing labels on the LoginDialog widget

To edit labels on the LoginDialog widget

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
<rn:condition hide_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"/>
</rn:condition>
<rn:condition show_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
```

```
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"
    redirect_url="/app/account/overview"/>
</rn:condition>
```

3 The code you located in step 2 contains two LoginDialog widgets. Edit both widgets to make any of the following changes.

a To edit the “Please log in to continue” message, add the *label_dialog_title* attribute and set its value to your new message.

b To edit the “Log in using one of your existing accounts” message, add the *label_open_login_link* attribute and set its value to the new label.

c To edit the Username label, add the *label_username* attribute and set its value to the new label.

d To edit the Password label, add the *label_password* attribute and set its value to the new label.

e To edit the “Forgot your username or password?” message, add the *label_assistance* attribute and set its value to the new message.

4 Save *standard.php*.

Removing the Password field

To remove the Password field from the LoginDialog widget

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
<rn:condition hide_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"/>
</rn:condition>
<rn:condition show_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"
    redirect_url="/app/account/overview"/>
</rn:condition>
```

3 Add the *disable_password* attribute to both instances of the LoginDialog widget and set its value to true, as shown in the following code.

```
<rn:condition hide_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink" disable_password="true"/>
</rn:condition>
<rn:condition show_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"
    redirect_url="/app/account/overview"
    disable_password="true"/>
</rn:condition>
```

4 Save *standard.php*.

5 Next, you'll want to change message bases that refer to passwords.

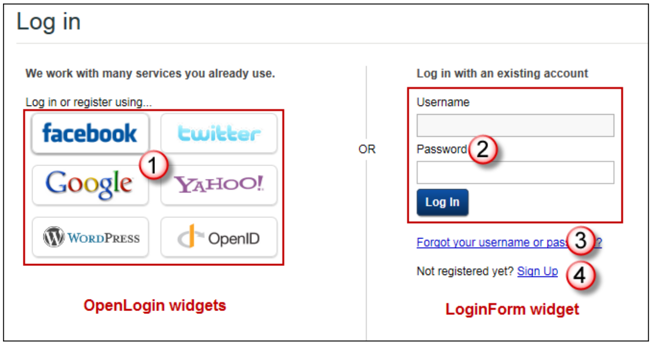
Log In page

When customers are logged in, they can access their account profile, previously submitted questions, and notifications. They can also change their password and view any **SLAs** associated with their account.

Important Customers will not be allowed to log in if their browsers do not accept cookies. Additionally, if CP_FORCE_PASSWORDS_OVER_HTTPS is enabled, as it is by default on new installations, customers will be redirected to the SSL version of your site for the duration of their visit.

When customers who are not logged in click the Your Account tab, the Log In page opens. Notice that the page contains OpenLogin widgets and the LoginForm widget.

Note The code for the default Log In page includes six OpenLogin widgets, but your page may not display all of these widgets if your site is not configured for Facebook, Twitter, and Google. The Facebook logo appears only if FACEBOOK_OAUTH_APP_ID and FACEBOOK_OAUTH_APP_SECRET have been defined on the **administration interface**. The Twitter logo appears only if TWITTER_OAUTH_APP_ID and TWITTER_OAUTH_APP_SECRET have been defined. And the Google logo appears only if GOOGLE_OAUTH_APP_ID and GOOGLE_OAUTH_APP_SECRET have been defined. Refer to Open login configuration settings.



On the Log In page, customers can perform the following tasks.

1. Use open login to log in with an existing external account from a third-party provider, such as Facebook, Twitter, or Google.
2. Enter their user name and password.
3. Request account assistance if they have forgotten their user name or password.
4. Create an account if they do not have one.

Once they have logged in, customers do not need to log in again during the current **web visit** as long as cookies are enabled and the visit has not expired. If cookies are disabled, customers must log in again whenever a visit ends (for example, if a customer closes the web browser or opens a different website and then returns to the customer portal). However, you can edit the code to maintain visit information when cookies are disabled.

The configuration options for the Log In page include the following.

- Edit the LoginForm widget.
  - ▷ Edit the Username, Password, and Log In button message bases.
  - ▷ Remove the Password field.
- Modify the open login widgets.
- Edit the other message bases on the page.
- Remove the Sign Up link.
- Edit the Sign Up link.
- Change the minimum password length.

If you are finished editing this page and want to configure another page on your customer portal, select the page you want to edit.

- Support Home Page
- Answers Page
- Answer Details Page
- Ask a Question Page
- Your Account Pages
- Live Help page or Chat page

Editing the LoginForm widget

The configuration options for the LoginForm widget include the following.

- Edit the Username, Password, and Log In button message bases.
- Remove the Password field.

When you're finished configuring the LoginForm widget, you can continue configuring the Log In page.

Editing LoginForm message bases

To edit LoginForm message bases

1 Open the *login_form.php* file in the */views/pages/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/overview"
initial_focus="true"/>
```

3 To change the Username label, add the *label_username* attribute to the LoginForm widget and set the value equal to the replacement label you want to use.

4 To change the Password label, add the *label_password* attribute to the LoginForm widget and set the value equal to the replacement label you want to use.

5 To change the Log In button's label, add the *label_login_button* attribute to the LoginForm widget and set the value equal to the replacement label you want to use. Your edited code may resemble the following.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/overview"
initial_focus="true"
label_username="Your name"
label_password="Your password"
```

```
label_login_button="Log In Now" />
```

6 Save *login_form.php*.

Continue configuring the LoginForm widget or Continue configuring the Log In page.

Removing the Password field

If your organization does not require your customers to have passwords, you may want to remove the Password field from the Log In page. You can easily remove the Password field from the Log In and Create an Account pages by setting the value of EU_CUST_PASSWD_ENABLED to No. If you want to remove the Password field from only the Log In page, leave the configuration setting at its default value of Yes and remove it from the page using the following procedure. The value of the LoginForm widget's *disable_password* attribute overrides the value of the configuration setting.

Note If you remove the Password field, any customers who already have passwords will still be able to log in with only their user name.

To remove the Password field from the Log In page

1 Open the *login_form.php* file in the */views/pages/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/overview"
initial_focus="true"/>
```

3 Add the *disable_password* attribute to the LoginForm widget and set its value to true, as shown in the following code.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/overview"
initial_focus="true"
disable_password="true"/>
```

4 Save *login_form.php*.

5 Next, you'll want to change message bases that refer to passwords.

Changing message bases after removing the Password field

Removing the Password field on the Log In page (by setting the LoginForm widget attribute, by removing it from the LoginDialog widget, or by setting EU_CUST_PASSWD_ENABLED to No) does not automatically change the message bases within the customer portal that still refer to passwords. You will want to edit or remove the following links to remove password references when you remove the Password field.

- Forgot Your Username or Password? link on the Log In page
- Forgot Your Username or Password? link on the LoginDialog widget
- Change Your Password link on the Account Overview page
- Change Your Password link on the Account Settings page

Continue configuring the LoginForm widget or Continue configuring the Log In page.

Changing the password link on the Log In page

To change the password link on the Log In page

1 Open the *login_form.php* file in the */views/pages/utils* folder.

2 Locate the following line of code.

```
<a href="/app/
#rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">#rn:msg:FORGOT_YOUR_
USERNAME_OR_PASSWORD_MSG#</a>
```

3 Edit the message base to resemble the following.

```
<a href="/app/#rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">Forgot
your username?</a>
```

4 Save *login_form.php*.

Continue changing messages to remove password references or Continue configuring the LoginForm widget.

Changing the password link on the LoginDialog widget

To change the password link on the LoginDialog widget

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
<rn:condition hide_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
```

```
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"/>
</rn:condition>
<rn:condition show_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink" redirect_url="/app/account/
    overview"/>
</rn:condition>
```

3 Add the *label_assistance* attribute to both instances of the LoginDialog widget. Your code will resemble the following.

```
<rn:condition hide_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"
    label_assistance="Forgot your username?"/>
</rn:condition>
<rn:condition show_on_pages="utils/create_account, utils/login_form,
utils/account_assistance">
    <rn:widget path="login/LoginDialog"
    trigger_element="rn_LoginLink"
    redirect_url="/app/account/overview"
    label_assistance="Forgot your username?"/>
</rn:condition>
```

Note There are two LoginDialog widgets in the template code. The second instance, containing the *redirect_url* attribute, is displayed when invoked from the Login Form, Create Account, and Account Assistance pages. If you want to change the link text only when the dialog is invoked from these three pages, add the *label_assistance* attribute only to the second instance. The first instance is used on all other pages.

4 Save *standard.php*.

Continue changing messages to remove password references or Continue configuring the LoginForm widget.

Removing the password link on the Account Overview page

To remove the password link on the Account Overview page

1 Open the *overview.php* file in the */views/pages/account* folder.

2 Delete the following lines of code.

```
<rn:condition external_login_used="false">
    <rn:condition config_check="RNW_UI:EU_CUST_PASSWD_ENABLED ==
    true">
        <a href="/app/account/
        change_password#rn:session#">#rn:msg:CHANGE_YOUR_PASSWORD_CMD
        #</a>
    </rn:condition>
</rn:condition>
```

3 Save *overview.php*.

Continue changing messages to remove password references or Continue configuring the LoginForm widget.

Removing the password link on the Account Settings page

To remove the password link on the Account Settings page

1 Open the *profile.php* file in the */views/pages/account* folder.

2 Delete the following lines of code.

```
<rn:condition external_login_used="false">
    <rn:condition config_check="RNW_UI:EU_CUST_PASSWD_ENABLED ==
    true">
        <a href="/app/account/
        change_password#rn:session#">#rn:msg:CHANGE_YOUR_PASSWORD_CMD
        #</a>
    </rn:condition>
</rn:condition>
```

3 Save *profile.php*.

Continue changing messages to remove password references or Continue configuring the LoginForm widget.

Editing other message bases on the Log In page

To edit other message bases on the Log In page

1 Open the *login_form.php* file in the */views/pages/utils* folder.

2 To edit the “Log In” heading, locate the following line of code and type the new heading between the `<h1>` tags.

```
<h1>#rn:msg:LOG_IN_UC_LBL#</h1>
```

3 To edit the “We work with many services you already use” message, locate the following line of code and type the new message between the `<h2>` tags.

```
<h2>#rn:msg:SERVICES_MSG#</h2>
```

4 To edit the “Log in or register using…” message, locate the following line of code and type the new message between the `<br>` tags.

```
<br/>#rn:msg:LOG_IN_OR_REGISTER_USING_ELLIPSIS_MSG#<br/>
```

5 To edit the “Log in with an existing account” message, locate the following line of code and type the new message between the `<h2>` tags.

```
<h2>#rn:msg:LOG_IN_WITH_AN_EXISTING_ACCOUNT_LBL#</h2><br/>
```

6 To change the “Not registered yet?” heading, locate the following line of code and replace it with the new message.

```
#rn:msg:NOT_REGISTERED_YET_MSG#
```

7 Save *login_form.php*.

Continue configuring the Log In page.

Removing the Sign Up link

To remove the Sign Up link from the Log In page

1 Open the *login_form.php* file in the */views/pages/utils* folder.

2 Delete the following lines of code.

```
#rn:msg:NOT_REGISTERED_YET_MSG#
<a href="/app/utils/create_account/redirect/
<?=urlencode(\RightNow\Utils\Url::getParameter('redirect'));?>#rn:ses
sion#">#rn:msg:SIGN_UP_LBL#</a>
```

3 Save *login_form.php*.

Continue configuring the Log In page.

Editing the Sign Up link label

To edit the label on the Sign Up link

1 Open the *login_form.php* file in the */views/pages/utils* folder.

2 Locate the following line of code.

```
#rn:msg:NOT_REGISTERED_YET_MSG#
<a href="/app/utils/create_account/redirect/
<?=urlencode(\RightNow\Utils\Url::getParameter('redirect'));?>#rn:ses
sion#">#rn:msg:SIGN_UP_LBL#</a>
```

3 Replace `#rn:msg:SIGN_UP_LBL#` with the new label you want to appear on the button.

4 Save *login_form.php*.

Continue configuring the Log In page.

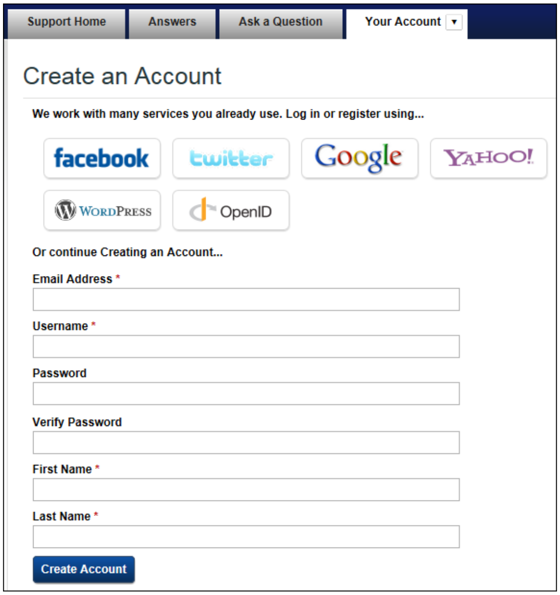
Create an Account page

Customers can open the Create an Account page by clicking the Sign Up link on the Log In page or in the upper right corner of any customer portal page. Just as the Log In page and the LoginDialog widget let your customers use an external service provider to log in to the customer portal, so does the Create an Account page. You can also add fields to this page (including a global **opt-in** selection), remove fields, and edit labels and message bases.

Configuration options on the Create an Account page include the following.

- Modifying the open login widgets
- Editing the heading
- Adding fields
- Removing fields
- Editing the password label to specify password length
- Preventing user name enumeration (automatic retrieval of user names for malicious purposes)

When you're finished configuring this page, you can select another page to configure.



Editing the heading

To edit the Create an Account heading

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:CREATE_AN_ACCOUNT_CMD#</h1>
```

3 Type the replacement heading for the page between the `<h1>` tags.

4 Save *create_account.php*.

Continue configuring the Create an Account page.

Adding fields

You can add fields to the Create an Account page, including a global **opt-in** selection, as well as additional contact and organization fields.

To add a global opt-in field on the Create an Account page

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 Locate the following lines of code.

```
<rn:widget path="input/CustomAllInput"
table="Contact"/>
<rn:widget path="input/FormSubmit"
label_button="#rn:msg:CREATE_ACCT_CMD#" on_success_url="/app/account/
overview"
error_location="rn_ErrorLocation"/>
```

3 Add a FormInput widget between the lines you located in step 2 to ask customers if they want to be on your mailing list. The following sample code adds the widget and also changes the label from the default Global Opt-In.

```
<rn:widget path="input/FormInput"
name="Contact.MarketingSettings.MarketingOptIn"
label_input="Can we add you to our mailing list?" />
```

4 Save *create_account.php*.

To add fields on the Create an Account page

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 To add a contact field, add a line of code that calls the FormInput widget. For example, you might want to add alternate email address fields and the customer's mailing address to the page. In this case, you would add the following code to the block of FormInput widgets for contact fields.

Note To find the names of all the contact fields you can use for the FormInput widget, click Framework > Business Objects on the Customer Portal Administration site. Refer to [Business objects](#).

```
<rn:widget path="input/FormInput" name="Contact.Emails.ALT1.Address"
label_input="Alternate Email 1" />
<rn:widget path="input/FormInput" name="Contact.Emails.ALT2.Address"
label_input="Alternate Email 2" />
```

```
<rn:widget path="input/FormInput" name="Contact.Address.Street" />
<rn:widget path="input/FormInput" name="Contact.Address.City" />
<rn:widget path="input/FormInput"
name="Contact.Address.StateOrProvince" label_input="State or
Province" />
<rn:widget path="input/FormInput" name="Contact.Address.PostalCode" /
>
```

Note If you want the Street field to allow the entry and display of multiple lines, add the *textarea* attribute to the FormInput widget so your code is as follows.

```
<rn:widget path="input/FormInput"
name="Contact.Address.Street" textarea="true" />
```

3 To add an organization login and password so your customers can be associated with an organization, add the following lines of code. (Customers cannot enter the organization's name, so they must know the login and password before they can be associated with an organization.)

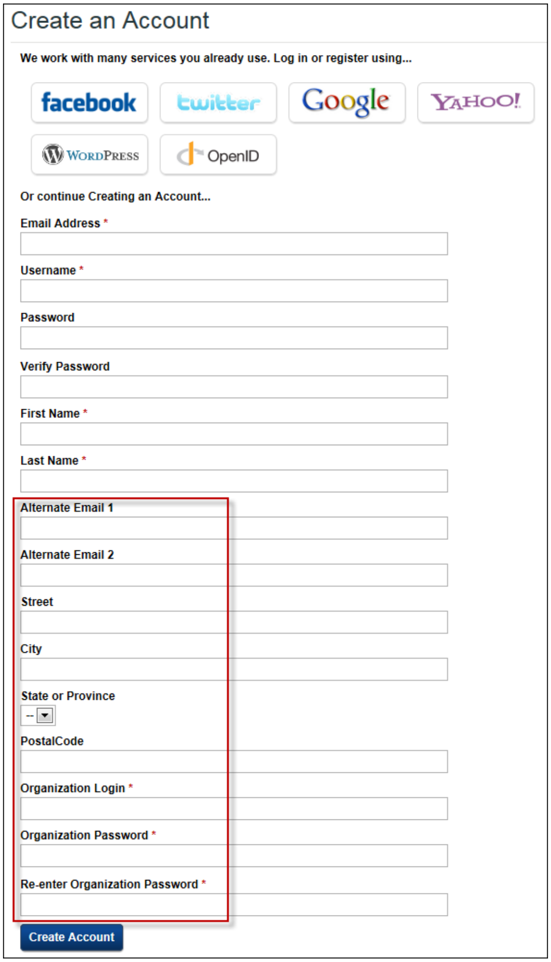
```
<rn:widget path="input/FormInput" name="Contact.Organization.Login"
label_input="Organization Login" />
<rn:widget path="input/FormInput"
name="Contact.Organization.NewPassword" label_input="Organization
Password" />
```

Note If organizations in your knowledge base have passwords and you want to let your customers create an organization association when they create an account, you must be sure to include the organization password on the page. If you do not, they will be prevented from making the association.

4 To make the organization login and password required fields, replace the code in step 3 with the following code.

```
<rn:widget path="input/FormInput" name="Contact.Organization.Login"
required="true" label_input="Organization Login" />
<rn:widget path="input/FormInput"
name="Contact.Organization.NewPassword" required="true"
label_input="Organization Password" />
```

5 Save *create_account.php*.



[Continue configuring the Create an Account page.]()

Removing fields

To remove fields on the Create an Account page

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 To remove the Email Address field, delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
validate_on_blur="true"
initial_focus="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```

3 To remove the Username field, delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Login"
required="true"
validate_on_blur="true"
label_input="#rn:msg:USERNAME_LBL#"/>
```

4 To remove the Password and Verify Password fields, delete the following lines of code.

```
<rn:condition config_check="EU_CUST_PASSWD_ENABLED == true">
    <rn:widget path="input/FormInput"
    name="Contact.NewPassword"
    require_validation="true"
    label_input="#rn:msg:PASSWD_LBL#"
    label_validation="#rn:msg:VERIFY_PASSWD_LBL#"/>
</rn:condition>
```

5 To remove the First Name and Last Name fields, delete the following lines of code.

```
<rn:condition config_check="intl_nameorder == 1">
    <rn:widget path="input/FormInput"
    name="Contact.Name.Last"
    label_input="#rn:msg:LAST_NAME_LBL#"
    required="true"/>
    <rn:widget path="input/FormInput"
    name="Contact.Name.First"
    label_input="#rn:msg:FIRST_NAME_LBL#"
    required="true"/>
<rn:condition_else/>
    <rn:widget path="input/FormInput"
    name="Contact.Name.First"
    label_input="#rn:msg:FIRST_NAME_LBL#"
    required="true"/>
    <rn:widget path="input/FormInput"
    name="Contact.Name.Last" label_input="#rn:msg:LAST_NAME_LBL#"
    required="true"/>
</rn:condition>
```

6 To remove all contact custom fields with end-user visibility, delete the following line of code.

```
<rn:widget path="input/CustomAllInput"
table="Contact"/>
```

7 Save *create_account.php*.

Continue configuring the Create an Account page.

Editing the password label to specify password length

If you set a minimum password length that customers must enter when they're creating an account or changing their password, passwords are automatically required. You may want to edit the label on the Create an Account and Change Your Password pages so customers know how long their password must be before they enter one.

To edit the password label on the Create an Account page

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.NewPassword"
require_validation="true"
label_input="#rn:msg:PASSWORD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"/>
```

3 Edit the *label_input* attribute of the FormInput widget to define password length information. Your code will resemble the following.

```
<rn:widget path="input/FormInput"
name="Contact.NewPassword"
require_validation="true"
label_input="Password (8 characters minimum)"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"/>
```

4 Save *create_account.php*.

Continue configuring the Create an Account page.

To edit the password label on the Change Your Password page

1 Open the *change_password.php* file in the */views/pages/account* folder.

2 Locate the following line of code.

```
<rn:widget path="input/PasswordInput"
name="Contact.NewPassword"
require_validation="true"
require_current_password="true"
```

```
label_input="#rn:msg:PASSWORD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

3 Edit the *label_input* attribute of the PasswordInput widget to define password length information. Your code will resemble the following.

```
<rn:widget path="input/PasswordInput"
name="Contact.NewPassword"
require_validation="true"
require_current_password="true"
label_input="Password (8 characters minimum)"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

Note Even if you leave the *required* attribute set to false, setting a minimum password length on the administration interface causes the configuration setting to override the attribute. Refer to Configuring password requirements.

4 Save *change_password.php*.

Preventing user name enumeration

User name enumeration is an automated attempt to retrieve user names in your database for malicious purposes. By default, the entry of an existing user name on the Create an Account page triggers a warning that the user name already exists, and the warning appears as soon as the focus shifts to another field. While this is useful to your customers because they don't have to complete the entire page before learning that they need to select another user name, you may decide that the security risk is greater than customer convenience. If that is the case, you can add barriers to prevent the automated harvesting of user names.

Two changes to the Create an Account page can accomplish this. The first is removing the *validate_on_blur* attribute, which prevents the message from appearing until the entire form is completed and submitted. The second is requiring a CAPTCHA validation on every submit.

To prevent user name enumeration

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 Locate the following lines of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
```

```
validate_on_blur="true"
initial_focus="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
<rn:widget path="input/FormInput"
name="Contact.Login" required="true"
validate_on_blur="true"
label_input="#rn:msg:USERNAME_LBL#"/>
```

3 Remove the *validate_on_blur* attribute for both widgets located in step 2 so the code now reads as follows.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true" initial_focus="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
<rn:widget path="input/FormInput"
name="Contact.Login"
required="true"
label_input="#rn:msg:USERNAME_LBL#"/>
```

4 Locate the following line of code.

```
<rn:widget path="input/FormSubmit"
label_button="#rn:msg:CREATE_ACCT_CMD#"
on_success_url="/app/account/overview"
error_location="rn_ErrorLocation"/>
```

5 Edit the FormSubmit widget code to add the *challenge_required* attribute. Your edited code now reads as follows.

```
<rn:widget path="input/FormSubmit"
label_button="#rn:msg:CREATE_ACCT_CMD#"
on_success_url="/app/account/overview"
error_location="rn_ErrorLocation"
challenge_required="true" />
```

Note To learn about CAPTCHAs, see Web form security.

6 Save *create_account.php*.

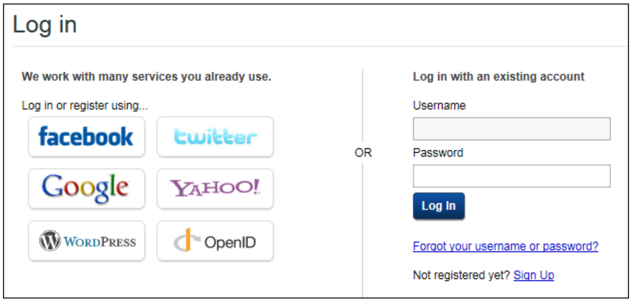
Continue configuring the Create an Account page.

Customer portal open login

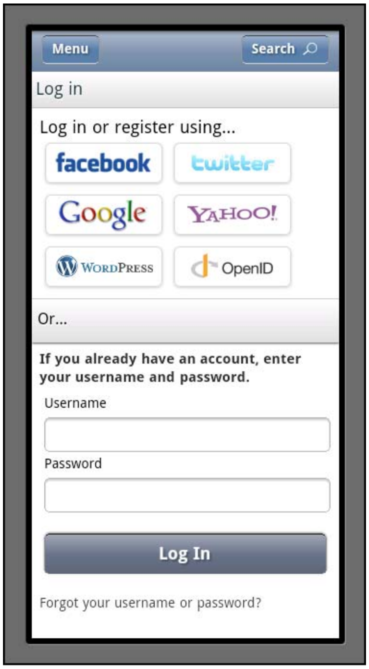
The open login feature lets your customers create an **account** in Oracle Service Cloud or log in to the customer portal by logging in through an external service provider where they already have an account, such as Facebook, Twitter, or Google. By using the external service to authenticate customers instead of requiring them to create a separate customer portal account, you offer your customers a faster, more convenient experience. Although Oracle Service Cloud creates **contact** records with information passed from the external service, that process occurs automatically and is invisible to customers.

The list of external services from which the customer portal accepts verified customer logins includes Facebook, Twitter, Google, Yahoo, WordPress, and most other OpenID sites. Customers who try to access a customer portal page that requires a password are presented with the Log In page, which offers them the option of logging in through one of the external services, in addition to the options of logging in to the customer portal with an existing account or signing up to create an account in Oracle Service Cloud. The OpenLogin widgets also appear on the Create an Account page.

OpenLogin widgets on the standard Log In page



OpenLogin widgets on the mobile login page



[Click here for an overview of open login.](#)

[Click here to configure the OpenLogin widgets.](#)

Overview of open login

The default Log In and Create an Account pages contain six OpenLogin widgets, each one associated with an external service provider, such as Facebook or Twitter. When customers click the Sign Up link, the Create an Account page opens. Instead of completing the contact information fields on the page to create their account, they can click a widget associated with an external account provider they already have. After being logged in to the external account, an **account** is created for them automatically in Oracle Service Cloud.

Customers on the Log In page can click one of the OpenLogin widgets to log in to their external provider, after which they will be automatically logged in to their Oracle Service Cloud account. If they do not yet have an account, one will be created for them automatically after they log in through the external provider.

Customers who click the Facebook, Twitter, Google, or Yahoo OpenLogin widgets see a message that tells them to log in to the external service and explains that they will then be redirected to your customer portal and logged in. When they click the button above the message, they are taken to the external site to log in (if they are not already logged in). The site asks for permission to send their email address and possibly their name, depending on the site, back to the customer portal. Customers who allow the transfer of information to Oracle Service Cloud are redirected to the customer portal and logged in automatically.

Important To allow customers to log in using Facebook, Twitter, and Google, you must define public IDs and private keys for the applications. Refer to Open login configuration settings.

Additionally, to use Facebook as an open login provider, you must migrate to OAuth 2.0, process a signed_request parameter, and obtain an SSL certificate. For the latest information about these requirements, refer to the Facebook Developer Roadmap Update.

If customers want to log in using their WordPress or OpenID account, they are asked to enter a user name or OpenID provider. Then, just as with the other open login sites, they are asked for permission to send their information to your support site. When they agree, they are logged in to the customer portal.

Note If you are opening your customer portal pages in iFrames, you should not use open login. Open login directs customers to a third-party site that then redirects them to the customer portal after verification. Because iFrames do not display a URL, customers cannot verify that the third-party login site is legitimate, and security issues are possible. Additionally, some open login providers do not allow their login page to be opened in an iFrame.

For a general discussion about iFrames and the Customer Portal, see Using iFrames.

How open login works

The Customer Portal uses the web industry protocols OAuth and OpenID to let customers log in from their existing accounts on external services. OAuth lets customers grant authorization for your customer portal to access their information from external sites where they have existing accounts. The Customer Portal supports OAuth 1.0 – 2.0.

OpenID lets customers log in to the site, which then confirms their identity to your customer portal, and also lets them specify what customer information can be shared.

Note Customer information includes, at a minimum, an email address, but may contain other information, such as the customer's full name. The specific information that is shared depends on which external service is the provider for the customer's account.

How contacts are created in the database

When the customer portal receives the customer's email address from the external provider, it creates a **contact** record in the Oracle database. (If the email address is not received, a contact cannot be created and customers see a message that asks them for their email address or lets them know an account was not created.) If the customer's name has been transferred from the site, that information is also added to the contact record. The Login field of the record on the **agent desktop** (which is the Username field on the customer portal) is populated with the customer's email address, and the password is null.

Important Customers whose contact record has been disabled on the agent desktop cannot log in through open login.

Customers can continue to log in through open login with a null password, but they cannot log in to the customer portal directly until they set a password using the standard customer portal protocol. Customers who log in through open login can create a password on the customer portal by clicking the Change Your Password link on the Account Settings page. They can then log in to the customer portal using their login and password, or they can continue to log in through open login.

Oracle Service Cloud keeps track of all open login accounts a customer uses to prevent duplicate contact records. When a customer's email address is provided from the external service and it matches an email address in the database, the application finds the existing contact and adds a new channel or OpenId for the customer. The database table *openid_accounts* keeps track of the different OpenID accounts customers use to log in by mapping OpenIDs to contact IDs.

Initial login

When customers log in to the customer portal using open login, the following events occur the first time they log in from the selected service provider.

1 The customer attempts to access a password-protected customer portal page and is directed to the Log In page. Or, the customer clicks the Sign Up link, opening the Create an Account page.

2 The customer selects one of the open login options.

3 If the customer is not logged in to the external service provider, the third-party login page opens to allow login, and the provider verifies the customer's identity.

4 The external service lets the customer know that the customer portal is requesting specific account information and asks the customer for permission to share that information.

5 When the customer grants permission for the external site to share information with the customer portal, the site gives the customer's information to Oracle Service Cloud.

6 A contact record for the customer is created in the database using the email address and, if available, the customer's name. The contact record uses the customer's email address as the login/username with a null password. The customer is logged in to the customer portal.

Subsequent logins

After customers have logged in to the customer portal using one of their accounts with an external service, the following events occur when they use open login again with the same account.

1 The customer tries to access the customer portal by logging in through an external site.

2 The external site verifies the customer and sends the customer's information to the customer portal. If the customer previously gave permission for more than one-time use, this step occurs automatically and the customer does not see the provider page, but is logged in to the customer portal and directed to the Support Home page.

3 The customer portal looks up the customer using the account's user ID (provided by Twitter and Facebook and stored as contact2channel_type.userid) or the OpenID URL (used by Google, Yahoo, and other OpenID providers, stored as openid_account.openid_url).

4 The customer portal then checks the customer's login, which should still be the email address, as it was when the contact record was created. If the login is blank for any reason (for example, a staff member deleted it), the login field is repopulated with the customer's email address.

5 The customer's email address, as received from the external site, is checked against the email address in the database. If the two addresses do not match, the contact record is updated with the email address from the external site. However, the customer's login, which is the original email address, is *not* updated.

6 If the customer does not have a first or last name in the database but that information is received from the external service, the first name and last name fields are updated in the database.

The process is slightly different when customers use an open login from a different external site than the one used to create the contact record in Oracle Service Cloud. If the open login account the customer is using on this visit does not match other open logins associated with the contact record, the account's OpenID URL is added to the contact record.

Note By default, customers who use external login to access your customer portal, whether through open login or pass-through authentication, cannot edit their account information on the Account Settings (*profile.php*) page. If you remove the external login condition on the FormSubmit button—which we recommend against doing—you must also add the *allow_external_login_updates* attribute before the Save Changes button is available to customers. See Allowing customer edits after PTA and open login.

Email address sharing

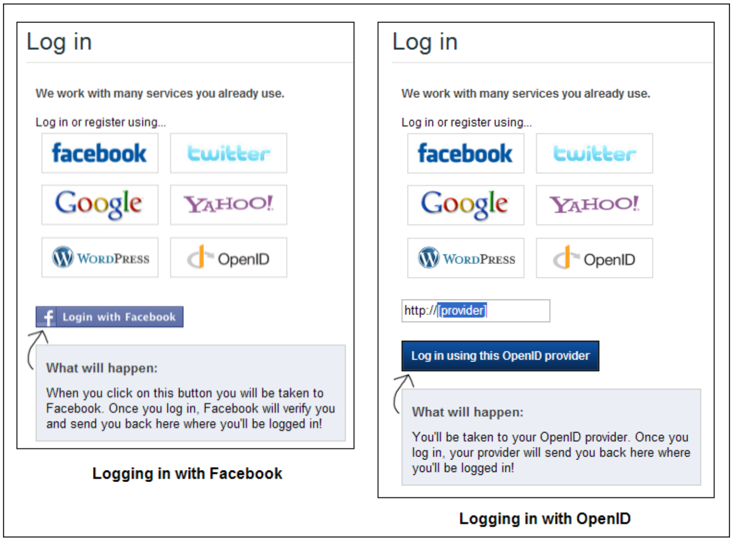
When email address sharing is enabled (refer to Allowing duplicate email addresses) and the external site returns an email address that already exists in the database, the first contact record with that email address is updated with the open login channel or URL. (Refer to the flowchart in Email address sharing to see how the associated contact is determined.)

Editing the OpenLogin widgets

Six OpenLogin widgets appear on the Log In page of the standard and mobile reference implementations, and also on the Create an Account pages of both page sets. There's a separate widget for every open login provider, so you can configure these pages to include only the open login providers you want.

Note The code for the default Log In page includes six OpenLogin widgets, but your page may not display all of these widgets if your site is not configured for Facebook and Twitter use. The Facebook logo appears only if FACEBOOK_OAUTH_APP_ID and FACEBOOK_OAUTH_APP_SECRET have been defined on the **administration interface**. The Twitter logo appears only if TWITTER_OAUTH_APP_ID and TWITTER_OAUTH_APP_SECRET have been defined. And the Google logo appears only if GOOGLE_OAUTH_APP_ID and GOOGLE_OAUTH_APP_SECRET have been defined. Refer to Open login configuration settings.

When customers click one of the open login options, a message explains what will happen. The information is slightly different depending on the external service the customer selects. The following figure shows Facebook and OpenID selections.



Logging in with Facebook

Logging in with OpenID

The following configuration options are available for open login.

- Remove all OpenLogin widgets from the Log In page.
- Remove all OpenLogin widgets from the Create an Account page.
- Remove selected OpenLogin widgets from the Log In or Create an Account page.
- Configure individual OpenLogin widgets. You can modify the following for each of the OpenLogin widgets on the Log In page and the Create an Account page.
  - ▷ Change widget labels.
  - ▷ Populate text for OpenID provider URLs.
  - ▷ Specify the page where customers are redirected after successful login to the external provider.

Removing all OpenLogin widgets from the Log In page

To remove all OpenLogin widgets from the Log In page

1 Open the *login_form.php* file in the */views/pages/utils* folder.

2 Delete the following lines of code.

```
<div class="rn_Column rn_LeftColumn rn_ThirdPartyLogin">
    <h2>#rn:msg:SERVICES_MSG#</h2>
    <br/>#rn:msg:LOG_IN_OR_REGISTER_USING_ELLIPSIS_MSG#<br/>
```

```
<rn:widget path="login/OpenLogin"/> <? /* Attributes Default to
Facebook */ ?>

<rn:widget path="login/OpenLogin"
display_in_dialog="false"
controller_endpoint="/ci/openlogin/oauth/authorize/twitter"
label_service_button="Twitter"
label_process_explanation="#rn:msg:CLICK_BTN_TWITTER_LOG_TWITTER_
MSG#"
label_login_button="#rn:msg:LOG_IN_USING_TWITTER_LBL#"/>

<rn:widget path="login/OpenLogin"
display_in_dialog="false"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VE
RIFY_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>

        IDER_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_THIS_OPENID_PROVIDER_LBL
        #"/>

    </div>
    <span class="rn_MiddleBuffer">#rn:msg:OR_CAPS_LBL#</span>
    <div class="rn_Column rn_RightColumn">
```

3 Save *login_form.php*.

Continue configuring the Log In page.

Removing all OpenLogin widgets from the Create an Account page

To remove all OpenLogin widgets from the Create an Account page

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 Delete the following lines of code.

```
<div class="rn_Padding">
    <p><strong>#rn:msg:SERVICES_MSG#
    #rn:msg:LOG_IN_OR_REGISTER_USING_ELLIPSIS_MSG#</strong></p>
    <div class="rn_ThirdPartyLogin">

        <rn:widget path="login/OpenLogin"/>

        <rn:widget path="login/OpenLogin"
        controller_endpoint="/ci/openlogin/oauth/authorize/twitter"
        label_service_button="Twitter"
        label_process_explanation="#rn:msg:CLICK_BTN_TWITTER_LOG_TWIT
        TER_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_TWITTER_LBL#"/>

        <rn:widget path="login/OpenLogin"
        controller_endpoint="/ci/openlogin/openid/authorize/google"
        label_service_button="Google"
        label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGL
        E_VERIFY_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>

        <rn:widget path="login/OpenLogin"
        controller_endpoint="/ci/openlogin/openid/authorize/yahoo"
        label_service_button="Yahoo"
```

```
        label_process_explanation="#rn:msg:CLICK_BTN_YAHOO_LOG_YAHOO_
        VERIFY_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_YAHOO_LBL#"/>

        <rn:widget path="login/OpenLogin"
        controller_endpoint="/ci/openlogin/openid/authorize"
        label_service_button="Wordpress"
        openid="true"
        preset_openid_url="https://[username].wordpress.com"
        openid_placeholder="[#rn:msg:YOUR_WORDPRESS_USERNAME_LBL#]"
        label_process_explanation="#rn:msg:YOULL_LOG_ACCT_WORDPRESS_T
        AB_ENTER_MSG#"
        label_login_button="#rn:msg:LOG_USING_YOUR_WORDPRESS_ACCOUNT_
        LBL#"/>

        <rn:widget path="login/OpenLogin"
        controller_endpoint="/ci/openlogin/openid/authorize"
        label_service_button="OpenID"
        openid="true"
        openid_placeholder="http://[provider]"
        label_process_explanation="#rn:msg:YOULL_OPENID_PROVIDER_LOG_
        PROVIDER_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_THIS_OPENID_PROVIDER
        _LBL#"/>

    </div>
    <p><strong>#rn:msg:CONTINUE_CREATING_ACCOUNT_ELLIPSIS_CMD#</
    strong></p>
```

3 Save *create_account.php*.

Continue configuring the Create an Account page.

Removing selected OpenLogin widgets from a page

To remove selected OpenLogin widgets from the Log In or Create an Account page

1 Open the *login_form.php* file in the */views/pages/utils* folder.

Or

Open the *create_account.php* file in the */views/pages/utils* folder.

2 Identify the widgets you want to remove. The code `<rn:widget path="login/OpenLogin"/>` is for the Facebook widget. All other widgets include the provider's name in the *controller_endpoint, label_service_button, label_process_explanation,* and *label_login_button* attributes. For example, here is the widget to log in with a Google account as it appears on the Log In page.

```
<rn:widget path="login/OpenLogin" display_in_dialog="false"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>
```

And here is the code for the Create an Account page. Notice the absence of the *display_in_dialog* attribute, which is enabled by default.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>
```

3 Delete the lines of code associated with open login providers you want to remove from the page.

4 Save the page.

Continue configuring OpenLogin widgets or Return to configuring the Log In page or Return to configuring the Create an Account page.

Changing labels on OpenLogin widgets

This procedure uses the Google OpenLogin widget as an example, but you can use the same method to edit labels on all OpenLogin widgets.

To change labels on OpenLogin widgets

1 Open the *login_form.php* file in the */views/pages/utils* folder.

Or

Open the *create_account.php* file in the */views/pages/utils* folder.

2 Locate the code for the widget you want to edit. This example from the Log In page uses the Google widget.

```
<rn:widget path="login/OpenLogin"
display_in_dialog="false"
```

```
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>
```

Note Remember that OpenLogin widgets on the Create an Account page do not contain the *display_in_dialog* attribute.

3 To change the label on the login button (in this example, "Log in using Google"), edit the *label_login_button* attribute. Your code will resemble the following.

```
<rn:widget path="login/OpenLogin"
display_in_dialog="false"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="Use Google to log in now"/>
```

4 To change the label that explains the process to customers (in this example, "When you click on this button you will be taken to Google. Once you log in, Google will verify you and send you back here where you'll be logged in!"), edit the *label_process_explanation* attribute.

```
<rn:widget path="login/OpenLogin"
display_in_dialog="false"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="Google will verify you and log you in
instantly."
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>
```

5 To change the "What will happen:" label in the explanation area, add the *label_process_header* attribute. Your code will resemble the following.

```
<rn:widget path="login/OpenLogin" display_in_dialog="false"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"
label_process_header="Why it is okay to do this" />
```

6 To edit the email labels that appear when the service provider authenticates the customer but does not provide the customer's email address, add any of the following widget attributes to the code: *label_email_address, label_email_prompt, label_email_prompt_cancel_button, label_email_prompt_submit_button,* and *label_email_prompt_title*. Your code might resemble the following.

```
<rn:widget path="login/OpenLogin" display_in_dialog="false"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"
label_email_prompt="We'll get you started just as soon as you enter
your email address." />
```

7 To change the text label that is hidden by the service provider's logo, edit the *label_service_button* attribute.

8 Save the page.

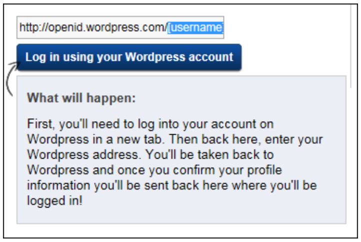
Continue configuring OpenLogin widgets or Return to configuring the Log In page or Return to configuring the Create an Account page.

Populating and pre-setting OpenID URLs

By default, the WordPress and OpenID widgets use the OpenID protocol and therefore have the *openid* attribute set to true.

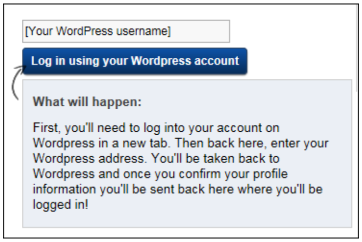
Using the *openid_placeholder* attribute of the OpenLogin widget, you can preset the URL that displays when an OpenID widget opens, where the URL contains a space for the user name. For example, for the WordPress OpenLogin widget, you would edit the widget code to remove the *preset_openid_url* attribute and include:

```
openid_placeholder="https://openid.wordpress.com/[username]"
```



However, you might want the increased security of hiding the URL so the customer sees only a user name field to complete. The *preset_openid_url* attribute defines the URL but does not expose it on the page. The reference implementation uses the following attributes to hide the URL and name the default placeholder "Your WordPress username." That widget code includes the following attributes:

```
preset_openid_url="https://openid.wordpress.com/[username]"
openid_placeholder="[#rn:msg:YOUR_WORDPRESS_USERNAME_LBL#]"
```



Continue configuring OpenLogin widgets or Return to configuring the Log In page or Return to configuring the Create an Account page.

Specifying the redirect page

After customers log in successfully to their open login provider, they are returned to the customer portal page they tried to access originally. The *redirect_url* attribute lets you send them to a different page instead.

To redirect customers after login

1 Open the *login_form.php* file in the */views/pages/utils* folder.

Or

Open the *create_account.php* file in the */views/pages/utils* folder.

2 Locate the code for the widget you want to edit. This example uses the Google widget on the Log In page.

```
<rn:widget path="login/OpenLogin" display_in_dialog="false"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
```

```
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"/>
```

Note Remember that OpenLogin widgets on the Create an Account page do not contain the *display_in_dialog* attribute.

3 Add the *redirect_url* attribute to the widget code setting the value to the page where you want customers to be redirected.

4 Save the page.

Continue configuring OpenLogin widgets or Return to configuring the Log In page or Return to configuring the Create an Account page.

53

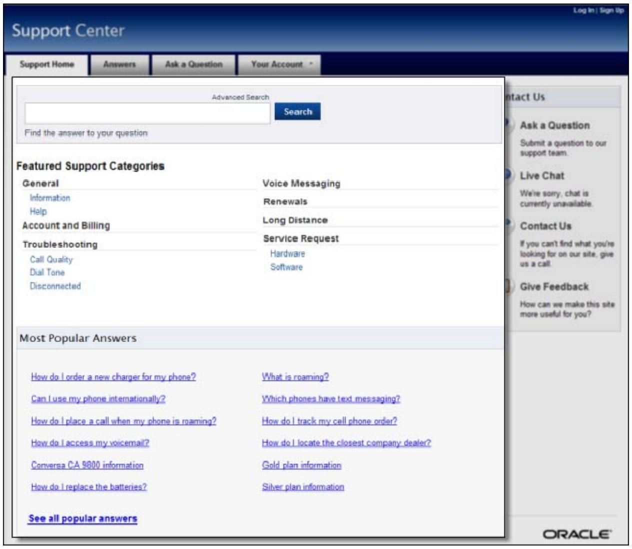
Support Home Page

The Support Home page is the entry point to your customer support portal. The default configuration for the Support Home page contains a search field where your customers can enter their search terms to search your **knowledge base** for **answers** that address their questions. It also contains a list of support **categories** they can drill down on for specific answers as well as the Most Popular Answers **report** that displays the list of answers most frequently viewed by your customers.

Note This page includes an off-screen <h1> tag that is made visible to screen readers using the rn_ScreenReaderOnly CSS class. This tag provides **accessible** navigation using shortcut keys for customers who use screen readers to access your customer portal pages. The content is not visible to sighted users unless styles are disabled.

For information about creating content that is hidden to all users except screen readers, refer to the WebAIM article [CSS in Action: Invisible Content Just for Screen Reader Users.]

Click to view



The other elements on the page—log in/sign up links, navigation tabs, Contact Us sidebar, and the Oracle logo, shown on the gray background of the figure—are part of the customer portal template.

You can configure the following areas on the Support Home page.

- The search field and search options
- The featured support categories
- The Most Popular Answers report

If you are finished editing this page and want to configure another page on your customer portal, select the page you want to edit.

- Answers Page
- Answer Details Page
- Ask a Question Page
- Your Account Pages
- Log In page
- Live Help page or Chat page

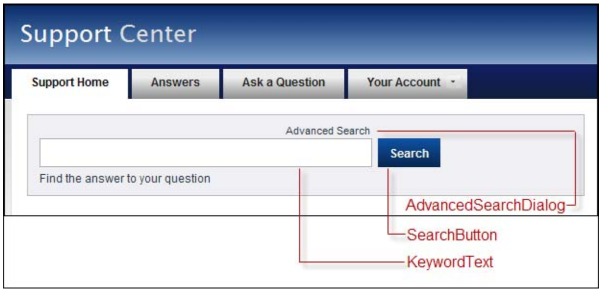
Configuring the search field

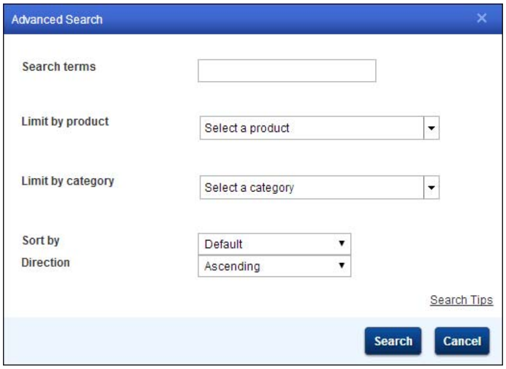
The search field on the Support Home page lets your customers search your **knowledge base** to find answers that match their search terms. Besides the search field and Search button, the search area also includes the Advanced Search dialog.

When customers enter search keywords on the Support Home page, the search parameters are remembered while the customer navigates among the search results pages. If the customer navigates away from the search results and then returns to the Answers page, previous search parameters are not maintained. If customers want to return to earlier search results, they must use the Back button on the browser.

If customers click the Advanced Search link, the options they select on that dialog—which include **products**, **categories**, and sorting options—are remembered as well. However, if they select advanced search options and then close the Advanced Search dialog or click the Cancel button, the search options revert to the values they had when the page was originally loaded.

Three widgets make up the search field on the Support Home page. These include AdvancedSearchDialog, KeywordText, and SearchButton. By modifying the attributes of these widgets, you can make several changes to the search field.





Do you want to let your customers search the knowledge base from the Support Home page?

- **Yes.** This is the default, so you can continue configuring other sections of the Support Home page.
- **Yes,** but I want to change labels or messages on the search field.
- **Yes,** but I want to change the search report that opens.
- **Yes,** but I want to edit the search filters display.
- **No.** I want to remove the search field from the Support Home page.

When you're finished with the search field, continue configuring the Support Home page.

Editing labels and message bases

The search field is comprised of the AdvancedSearchDialog, KeywordText, and SearchButton widgets. By modifying their attributes, you can change the following labels and messages.

- The Search button label
- The default search message
- The Advanced Search link label
- Labels on the Advanced Search window
- The Search Tips page

When you're finished with labels and messages, continue configuring the search field.

Editing the Search button label

To edit the Search button label

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="search/SearchButton"
report_page_url="/app/answers/list"/>
```

3 Edit the code to add the *label_button* attribute with the text you want to display on the button. Your new code will resemble the following.

```
<rn:widget path="search/SearchButton"
label_button="Find All Answers"
report_page_url="/app/answers/list" />
```

4 Save *home.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Editing the default search message

The default search message is "Find the answer to your question." You can change this message if you want.

To edit the default search message

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="search/KeywordText"
label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#"
initial_focus="true" />
```

3 Select the text between the quotation marks for the *label_text* attribute and type the text you want to display. Your new code will resemble:

```
<rn:widget path="search/KeywordText"
label_text="Search all answers."
initial_focus="true" />
```

4 Save *home.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Editing the Advanced Search link

To edit the label for the Advanced Search link

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="search/AdvancedSearchDialog"
report_page_url="/app/answers/list"/>
```

3 Add a *label_link* attribute to the AdvancedSearchDialog widget code. Your new code will resemble the following.

```
<rn:widget path="search/AdvancedSearchDialog"
report_page_url="/app/answers/list"
label_link="Advanced Searching Options"/>
```

4 Save *home.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Configuring labels on the Advanced Search dialog

The text of labels on the Advanced Search window can be modified by adding label parameters to the AdvancedSearchDialog widget code.

The code for the AdvancedSearchDialog widget is:

```
<rn:widget path="search/AdvancedSearchDialog" report_page_url="/app/
answers/list"/>
```

The *report_page_url* attribute is an attribute of the AdvancedSearchDialog, which you'll see when you go to the widget definition page at:

https://<your_site>/ci/tags/widgets/standard/search/AdvancedSearchDialog

However, you won't see the *show_confirm_button_in_dialog* attribute in the list of attributes for the AdvancedSearchDialog widget. The *show_confirm_button_in_dialog* attribute belongs to the ProductCategorySearchFilter widget, which is contained in the AdvancedSearchDialog widget. When a widget contains other widgets, you can use the attributes of the contained widgets in the widget definition.

To configure labels on the Advanced Search dialog

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="search/AdvancedSearchDialog"
```

```
report_page_url="/app/answers/list"/>
```

3 Add any or all of the following attributes of the AdvancedSearchDialog widget to make the following changes.

   a To change the Cancel button, add `label_cancel_button="New Cancel Button"` to the widget code.

   b To change the window title, add `label_dialog_title="New Window Title"` to the widget code.

   c To change the Search button, add `label_search_button="New Search Button"` to the widget code.

4 Save *home.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Editing the Search Tips page

The Search Tips link on the Advanced Search window points to the default Search Tips page. You can edit the default page or create a different search tips page and change the URL that the link points to.

To edit the Search Tips page

1 Open the *help_search.php* file in the */views/pages/utils* folder.

2 Make whatever changes you want to the file.

Note The text on this page can be modified by either replacing or editing the indicated message bases. Learn about editing message bases here.

3 Save *help_search.php*.

To point the Search Tips link to a different page

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="search/AdvancedSearchDialog"
report_page_url="/app/answers/list"/>
```

3 Add a *search_tips_url* attribute to the AdvancedSearchDialog widget code to point to a different search tips page. Your new code will resemble:

```
<rn:widget path="search/AdvancedSearchDialog"
```

```
report_page_url="/app/answers/list"
search_tips_url="/app/utils/help_search_2" />
```

4 Save *home.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Changing the search report

The default search report on the Support Home page is Answers–Complex Expressions Search Default (report ID 176). If you want to replace this report, you must be sure that the report you use contains the answers.special_settings filter. (Learn how to check for the filter here.)

Note You should add the SearchTypeList widget to any page containing a custom report that uses an integer filter. Without the widget, your customers can search only by answer ID. Adding the widget lets your customers select a different search type so they can enter text search terms.

To change the search report on the Support Home page

Important So that all of your customer portal search functions work the same way, you should also change the reports used on the Answers page. When these pages use different reports, unexpected results may occur.

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:container report_id="176">
```

3 Replace the `176` in the code shown in step 2 with the report ID of the answers report you want to open when the customer conducts a search. (Learn how to find a report's ID number.)

4 Save *home.php*.

Continue configuring the search field.

Checking for the answers.special_settings filter in an answers report

Answers reports that are used on the customer portal must contain the answers.special_settings filter. All standard answers reports for the customer portal include this filter, but you must be sure any custom answers reports you want to use also include it.

Tip One way to be sure the answers.special_settings filter is included in a custom answers report is to copy one of the standard answers reports and edit the copy to create your custom report.

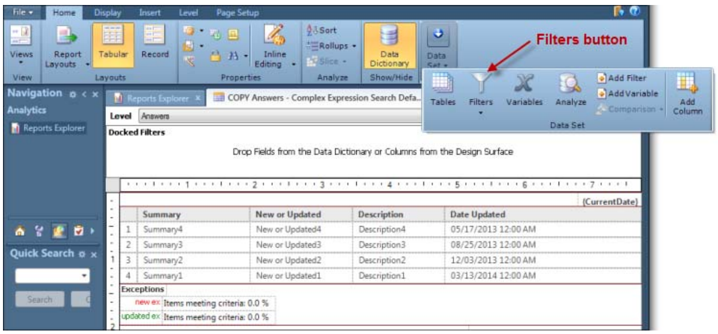
To check for the answers.special_settings filter in an answers report

1 Log in to Oracle Service Cloud.

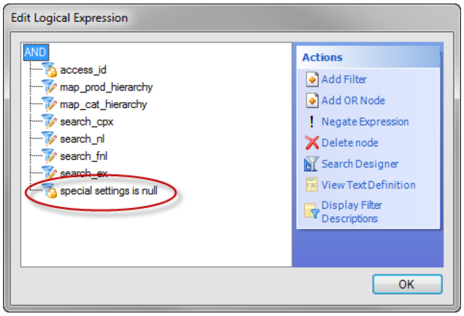
2 Click Analytics.

3 Double-click Reports Explorer.

4 Locate the custom answers report you want to use on the customer portal, right-click it, and select Edit. The report opens on the report design center. (Refer to [Opening the report design center](#) if you want to learn to design reports.)



5 Click the Filters button on the ribbon. (The Filters button is in the Data Set group, which may be collapsed and require expanding.) The Edit Logical Expression window opens.

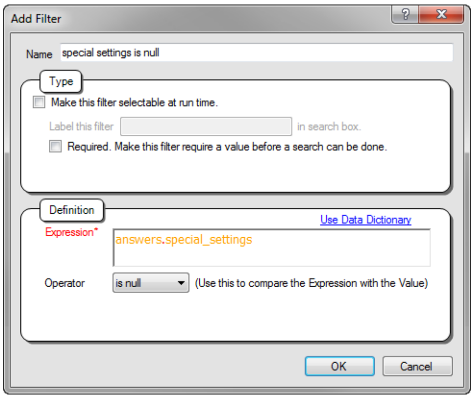


6 Locate “special settings is null” in the list of filters on the window.

7 If the special settings filter is not present in the list, add it.

a Click Add Filter in the Actions column. The Add Filter window opens.
b Type “special settings is null” in the Name field.
c Type “answers.special_settings” in the Expression field.
d Select “is null” in the Operator drop-down menu.

Note If the “is null” option is not available in the Operator menu, be sure the check box for “Make this filter selectable at run time.” is cleared. (The check box appears in the Type section just below the Name field.)



e Click OK to close the Add Filter window.

8 Click OK to close the Edit Logical Expression window.

9 Close the report.

Or

If you edited the report, click Save and Close.

Finding the ID number for a report

To find a report ID

1 Log in to Oracle Service Cloud.

2 Click Analytics.

3 Double-click Reports Explorer.

4 **Drill down** through the tree of reports until the report you want appears in the list on the right.

Tip Standard Customer Portal reports are located in the *Public Reports**Service**Views–Service**Customer Portal* folder.

5 If the list does not contain an ID column, click Choose Details on the explorer **ribbon**, select the check box for ID in the Hide or Display Details window, and click OK. The Report ID column now appears in the list of reports.

Click to view

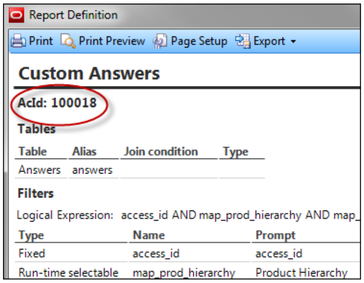
Or, you can open a report by right-clicking it and selecting Open. Then click Definition on the report ribbon and select View. The AcId value in the upper left corner is the report ID.

Click to view



Continue configuring the search field.

Removing the search field from the Support Home page

To remove the search field from the Support Home page

1 Open the *home.php* file in the */views/pages* folder.

2 Delete the following code from the page.

```
<div id="rn_SearchControls">
    <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
    <form onsubmit="return false;">
        <rn:container report_id="176">
        <div class="rn_SearchInput">
            <rn:widget path="search/AdvancedSearchDialog"
            report_page_url="/app/answers/list"/>
            <rn:widget path="search/KeywordText"
            label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#
            " initial_focus="true"/>
        </div>
        <rn:widget path="search/SearchButton" report_page_url="/app/
        answers/list" />
        </rn:container>
    </form>
</div>
```

3 Save *home.php*.

Continue configuring the Support Home page.

Configuring Featured Support Categories

The standard Support Home page contains a list of Featured Support Categories to a maximum of thirty top-level categories with two hierarchical levels.

Do you want to display the Featured Support Categories on the Support Home page?

- **Yes.** This is the default, so continue editing the Support Home page.
- **Yes,** but I'd like to edit the Featured Support Categories.
- **Yes,** and I'd like to add featured products to the page as well.
- **No.** Show me how to remove this section.

Continue configuring the Support Home page.

Editing Featured Support Categories

You can change the heading, the number of top-level **categories** that are displayed, and the number of category levels that are displayed. You can also add featured support **products** to the Support Home page.

To edit the Featured Support Categories section of the Support Home page

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="search/ProductCategoryList"
data_type="categories"
label_title="#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#"/>
```

3 Select the change you want to make.

- Change the heading
- Change the number of top-level categories displayed
- Change the number of displayed category levels
- Change categories to products

4 Save *home.php*.

Continue configuring Featured Support Categories or Continue configuring the Support Home page.

Changing the heading

To change the Featured Support Categories heading

Replace the **message base** for the *label_title* attribute with whatever text you want to add. (Learn about editing message bases here.) Your edited code might look like this.

```
<rn:widget path="search/ProductCategoryList"
data_type="categories"
label_title="Answers by Category" />
```

Changing the number of top-level categories

To change the number of top-level categories displayed

Add the *maximum_top_levels* attribute to the widget code and set the value equal to the number of categories you want to display. Your edited code might look like this.

```
<rn:widget path="search/ProductCategoryList"
data_type="categories"
label_title="#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#"
maximum_top_levels="10"/>
```

Changing the number of displayed category levels

To change the number of displayed category levels

The default value displays two sub-levels of categories. You can change this to display just one sub-level by adding the *levels* attribute to the widget code and setting it equal to 1. Your edited code looks like this.

```
<rn:widget path="search/ProductCategoryList"
data_type="categories"
label_title="#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#"
levels="1" />
```

Changing categories to products

To change categories to products

The default widget displays products, not categories, so all you have to do is edit the widget code to delete the other attributes that refer to categories. Your code will look like this.

```
<rn:widget path="search/ProductCategoryList" />
```

Continue editing Featured Support Categories.

Adding Featured Support Products

If you want to add products to the Support Home page, add the following line of code.

```
<rn:widget path="search/ProductCategoryList" />
```

To add products below categories

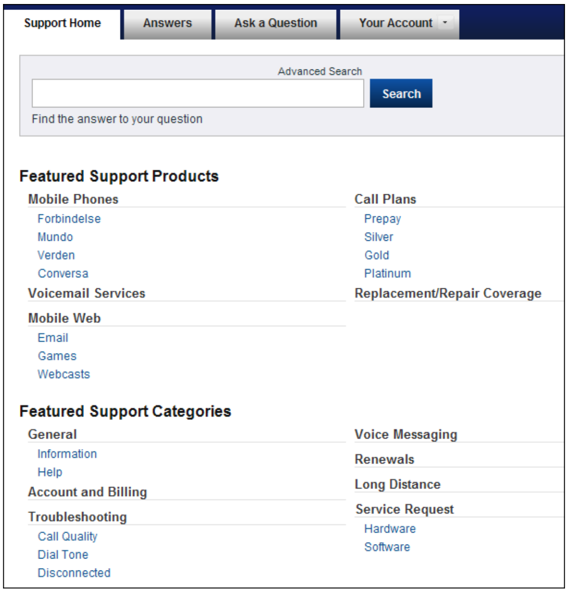
Your code should look like this:

```
<rn:widget path="search/ProductCategoryList"
data_type="categories"
label_title="#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#"/>
<rn:widget path="search/ProductCategoryList" />
```

To add products above categories

Your code should look like this:

```
<rn:widget path="search/ProductCategoryList" />
<rn:widget path="search/ProductCategoryList"
data_type="categories"
label_title="#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#"/>
```



Continue configuring Featured Support Categories or Continue configuring the Support Home page.

Removing Featured Support Categories

To remove Featured Support Categories from the Support Home page

1 Open the *home.php* file in the */views/pages* folder.

2 Delete the following line of code.

```
<rn:widget path="search/ProductCategoryList" data_type="categories"
label_title="#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#"/>
```

3 Save *home.php*.

Continue configuring the Support Home page.

Configuring the Most Popular Answers report

The standard Support Home page contains the Most Popular Answers report. Customers can click a link to open any of the frequently viewed answers displayed in the report.

Do you want to display the Most Popular Answers report on the Support Home page?

- **Yes.** This is the default, so continue configuring the Support Home page.
- **Yes,** but I want to make some changes. Show me how I can edit the report's appearance.
- **Yes,** but I want to open URL and file attachment answer types in a separate window.
- **No,** I don't want to display the Most Popular Answers report, but I'd like to display another report instead. Show me how to substitute a different report for the Most Popular Answers report.
- **No,** I don't want to display the Most Popular Answers report or any other report on the Support Home page. Show me how to remove the report.

When you're finished configuring the Most Popular Answers report, you can return to configuring the Support Home page.

Editing the Most Popular Answers report

You can edit the following elements of the Most Popular Answers Report.

- Change the report heading.
- Change the number of answers that are displayed.
- Change the "See all popular answers" link.

When you're finished editing the report's elements, you can configure other aspects of the Most Popular Answers report.

Editing the Most Popular Answers report heading

To edit the Most Popular Answers report heading

1 Open the *home.php* file in the */views/pages* folder.

2 If you want to customize the report heading, select all code between the <h2> and </h2> tags in the following line and type whatever title you want. (Learn about editing message bases here.)

```
<h2>#rn:msg:MOST_POPULAR_ANSWERS_LBL#</h2>
```

3 Save *home.php*.

Continue configuring the Most Popular Answers report.

Changing the number of displayed popular answers

To change the number of displayed answers

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the *per_page* attribute of the report widget in the following line of code and replace `12` with the number of answers you want to display.

```
<rn:widget path="reports/Multiline"
report_id="194"
per_page="12"/>
```

3 Save *home.php*.

Continue configuring the Most Popular Answers report.

Changing the See All Popular Answers link

To edit the See All Popular Answers link

1 Open the *home.php* file in the */views/pages* folder.

2 To edit the page that is displayed when the See All Popular Answers link is selected, select `/app/answers/list` in the following line and replace it by typing the path and page you want displayed.

```
<a class="rn_AnswersLink"
href="/app/answers/
list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
```

3 To edit the link, select the code beginning with `#rn:msg` and ending at # in the following line and replace it with the text you want to appear in the link. Your edited code will resemble the following.

```
<a class="rn_AnswersLink"
href="/app/answers/alt_list_2#rn:session#">Find other relevant
answers here</a>
```

4 Save *home.php*.

Continue configuring the Most Popular Answers report.

Opening answers in a separate window

Your **knowledge base** can contain up to three answer types: 1) HTML answers that are created using standard HTML and are viewed in the same browser window; 2) URL answers that consist of a link to an external URL; and 3) file attachment answers that link to information in another document.

When customers click an answer in the Most Popular Answers report, HTML-type answers open in the same browser. When customers are finished viewing the answer, they can click the browser's Back button to return to the report. The same is true of URL and file attachment type answers, although you may prefer to have these answers open in a separate window.

To open URL and file attachment answers in a separate window

1 Open the *home.php* file in the */views/pages* folder.

2 Replace this code:

```
<rn:widget path="reports/Multiline"
report_id="194"
per_page="12"/>
```

With this code:

```
<rn:widget path="reports/Multiline"
report_id="195"
```

```
per_page="12"/>
```

Note Report ID 195 is identical to report ID 194 except that it opens URL and file attachment answers in a separate window.

3 Save *home.php*.

Continue configuring the Most Popular Answers report or Continue editing the Support Home page.

Substituting a report

The default Most Popular Answers report on the Support Home page is the standard report Popular Answers, with report ID 194. If you want to replace this report, you must be sure that the report you use contains the answers.special_settings filter. (Learn how to check for the filter here.)

To replace the Most Popular Answers report on the Support Home page

1 Open the *home.php* file in the */views/page* folder.

2 In the following line of code, change the report ID number from `194` to the ID number of the report you want to substitute.

```
<rn:widget path="reports/Multiline"
report_id="194"
per_page="12"/>
```

3 Change the heading and label in the following (nonsequential) lines of code to correspond with the report you selected in step 2. You can use a **message base** or simply type the text you want. (Learn about editing message bases here.)

```
<h2>#rn:msg:MOST_POPULAR_ANSWERS_LBL#</h2>
<a class = "noIntercept"
href="/app/answers/
list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_LBL#</a>
```

4 Save *home.php*.

Continue configuring the Most Popular Answers report or Continue editing the Support Home page.

Removing the Most Popular Answers report

To remove the Most Popular Answers report from the Support Home page

1 Open the *home.php* file in the */views/pages* folder.

2 Delete the following section of code from the file.

```
<div class="rn_Module">
    <h2>#rn:msg:MOST_POPULAR_ANSWERS_LBL#</h2>
    <rn:widget path="reports/Multiline" report_id="194"
    per_page="12"/>
    <a class="rn_AnswersLink" href="/app/answers/
    list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
</div>
```

3 Save *home.php*.

Continue configuring the Support Home page.

54

Answers Page

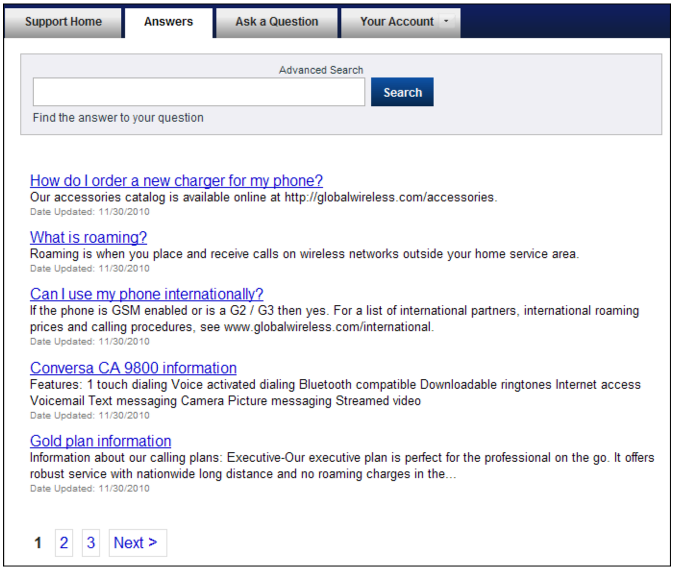
The Answers page lets your customers enter search terms and then provides a list of answers from your knowledge base that match the search terms that were entered.

Note If you want to keep the answers in your knowledge base from being available to the general public, you must require login on both the Answers and the answer details page. If both pages do not have the same login requirement, a warning will appear when you stage and promote your customer portal. The most secure way to do this is to require login on all pages of your customer portal.

Note This page includes off-screen <h1> and <h2> tags that are made visible to screen readers using the rn_ScreenReaderOnly CSS class. These tags provide **accessible** navigation using shortcut keys for customers who use screen readers to access your customer portal pages. The content is not visible to sighted users unless styles are disabled.

For information about creating content that is hidden to all users except screen readers, refer to the WebAIM article CSS in Action: Invisible Content Just for Screen Reader Users.

Click to view



You can configure the following elements on the Answers page.

- The search field and search options
- Web indexing results
- The answers report that is displayed
- Search feedback options

If you are finished editing this page and want to configure another page on your customer portal, select the page you want to edit.

- Support Home Page
- Answer Details Page
- Ask a Question Page
- Your Account Pages
- Log In page
- Live Help page or Chat page

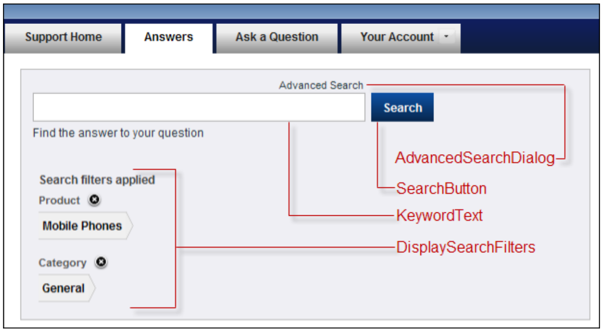
Configuring the search field

The search field on the Answers page is very similar to the one on the Support Home page. When customers enter search keywords on the Support Home page, the search parameters are remembered while customers navigate among the search results pages. If customers navigate away from the search results and then return to the Answers page, previous search parameters are not maintained. If customers want to return to earlier search results, they must use the Back button on the browser.

If customers click the Advanced Search link, the options they select on that dialog—search term, **product**, **category**, and sorting options—are also remembered. However, if customers select advanced search options and then close the Advanced Search dialog or click the Cancel button, the search options revert to the values they had when the page was originally loaded.

The search field on the Answers page is almost identical to the one that is used on the Support Home page. One difference is that Support Home page uses the *report_page_url* attribute for the AdvancedSearchDialog and SearchButton widgets to display the Answers page report. The Answers page does not need to use this attribute since the default is to stay on the same page. Another difference is that the Answers page adds the DisplaySearchFilters widget to indicate which product and category filters have been applied to the search. Customers can apply product and category filters to their search by selecting them on the Advanced Search dialog.

Four widgets make up the search field on the Answers page. These include AdvancedSearchDialog, KeywordText, SearchButton, and DisplaySearchFilters. By modifying the attributes of these widgets, you can make several changes to the search field.



Do you want to keep the default search field options on the Answers page?

- **Yes.** This is the default, so continue configuring the Answers page.
- **No,** I want to edit labels or messages on the search field.
- **No,** I want to change the search filters display.
- **No,** I want to change the product and category tree display on the AdvancedSearchDialog widget.
- **No,** I want to add Search By or Sort By options.

When you're finished configuring the search field, continue configuring the Answers page.

Editing labels and message bases

You can edit much of the text that appears on the widgets that comprise the search field on the Answers page, including the following.

- The Search button label
- The default search message
- The Advanced Search link label
- Labels on the Advanced Search dialog
- The Search Tips page

When you're finished with labels and messages, continue configuring the search field.

Editing the Search button label

To edit the Search button label

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="search/SearchButton" />
```

3 Edit the code to add the *label_button* attribute with the text you want to display on the button. Your new code will resemble:

```
<rn:widget path="search/SearchButton" label_button="Find All Answers"
/>
```

4 Save *list.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Editing the default search message

The default search message is “Find the answer to your question.” You can change this message if you want.

To edit the default search message

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="search/KeywordText"
label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#"
initial_focus="true" />
```

3 Select the text between the quotation marks for the *label_text* attribute and type the text you want to display. Your new code will resemble:

```
<rn:widget path="search/KeywordText"
label_text="Search all answers."
initial_focus="true" />
```

4 Save *list.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Editing the Advanced Search link

To edit the label for the Advanced Search link

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="search/AdvancedSearchDialog"/>
```

3 Add a *label_link* attribute to the AdvancedSearchDialog widget code. Your new code will resemble:

```
<rn:widget path="search/AdvancedSearchDialog"
label_link="Advanced Searching Options"/>
```

4 Save *list.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Configuring labels on the Advanced Search dialog

To configure labels on the Advanced Search dialog

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="search/AdvancedSearchDialog"/>
```

3 Add any or all of the following attributes of the AdvancedSearchDialog widget to make the following changes.

   a To change the window title, add `label_dialog_title="New Window Title"` to the widget code.

   b To change the Search button, add `label_search_button="New Search Button"` to the widget code.

   c To change the Cancel button, add `label_cancel_button="New Cancel Button"` to the widget code.

4 Save *list.php*.

Continue editing search field labels and messages or Continue configuring the search field.

Editing the Search Tips page

You can edit the default Search Tips page. Or you can create a different search tips page and change the URL to which the Search Tips link, found on the Advanced Search window, points.

To edit the Search Tips page

1 Open the *help_search.php* file in the */views/pages/utils* folder.

2 Make whatever changes you want to the file.

3 Save *help_search.php*.

To point the Search Tips link to a different page

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="search/AdvancedSearchDialog"/>
```

3 Add a *search_tips_url* attribute to the AdvancedSearchDialog widget code to point to a different search tips page. Your new code will resemble:

```
<rn:widget path="search/AdvancedSearchDialog" search_tips_url="/app/
utils/help_search_2" />
```

4 Save *list.php*.

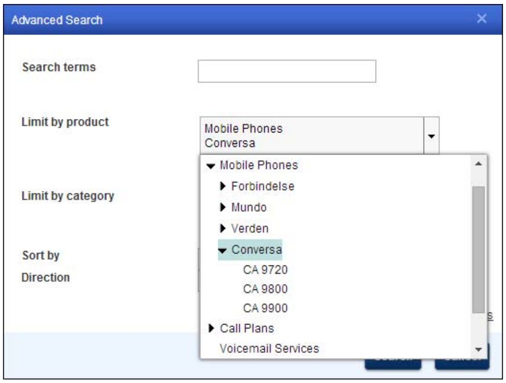
Continue editing search field labels and messages or Continue configuring the search field.

Editing the search filters display

Your customers can use the Advanced Search link to restrict their search to specific products and categories. You can also change the default display to replace the triangle bullets for expanding and collapsing the folders with +/– signs.

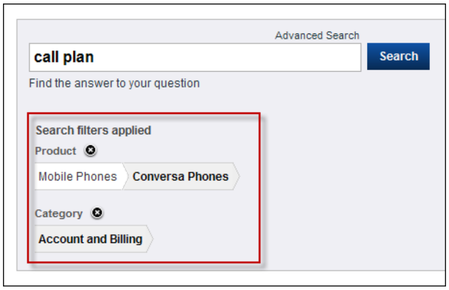
Note Although these procedures modify the search filters displayed on the Answers page, they can easily be edited for use on the Support Home page as well.

Click to view



When searches are restricted by products, categories, or both, the search filters are displayed on the Answers page. This display is controlled by the DisplaySearchFilters widget, which is included by default on the standard Answers page. You can also add custom filters used by the AdvancedSearchDialog widget when you display custom reports.

Click to view



Do you want to keep the DisplaySearchFilters widget on the Answers page?

- **Yes.** This is the default, so you can continue configuring the Answers page.
- **Yes,** but I'd like to make changes to the widget.
- **No,** I'd like to remove the widget.

Editing the DisplaySearchFilters widget

The DisplaySearchFilters widget lets you change labels for the heading, the Remove button, and the image used for the Remove button.

To edit the DisplaySearchFilters widget

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="search/DisplaySearchFilters"/>
```

3 To change the current heading, "Search filters applied," edit the widget code to add the *label_title* attribute with your new heading. Your code will resemble the following.

```
<rn:widget path="search/DisplaySearchFilters" label_title="Your New
Heading" />
```

4 To change the "Remove" tip when customers hover over the Remove button (the black circle with an X in it), edit the code to add the *label_filter_remove* attribute with the new text. Your code will resemble the following.

```
<rn:widget path="search/DisplaySearchFilters"
label_filter_remove="New Remove Label"/>
```

5 To change the Remove button image, edit the code to add the *remove_icon_path* attribute with the path and file name of the new image. (Images are located in the */cp/customer/assets/themes/standard/images* folder.) Your code will resemble the following.

```
<rn:widget path="search/DisplaySearchFilters" remove_icon_path="/cp/
customer/assets/themes/standard/images/new_remove_icon.png"/>
```

6 Save *list.php*.

Continue configuring the search field or Continue configuring the Answers page.

Removing the DisplaySearchFilters widget

To remove the DisplaySearchFilters widget

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Delete the following line of code.

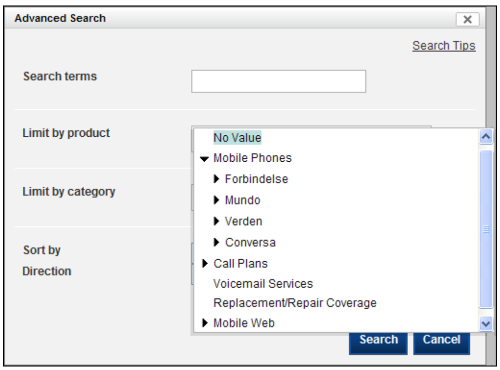
```
<rn:widget path="search/DisplaySearchFilters" />
```

3 Save *list.php*.

Continue configuring the search field or Continue configuring the Answers page.

Changing AdvancedSearchDialog product/category tree display

The AdvancedSearchDialog widget contains two instances of the ProductCategorySearchFilter widget that displays the products and categories with a hierarchical tree structure. By default, these widgets use triangle bullets for expanding and collapsing the folders, as shown here. After customers select the product or category, they must click the OK button to confirm their selection.



If you prefer to display +/– signs for expanding and collapsing the folders, you can edit the Answers page according to the following procedure.

To change the folder structure display

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

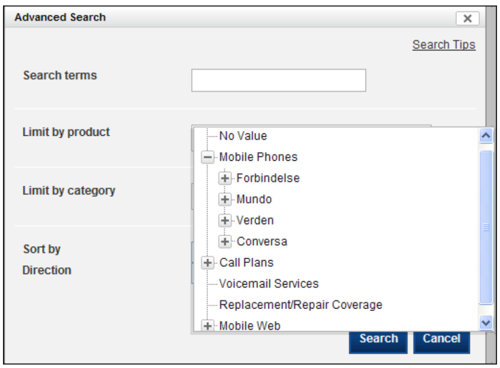
```
<rn:widget path="search/AdvancedSearchDialog"/>
```

3 Edit the widget to add the *treeview_css* attribute as shown in the following code.

Note The *treeview_css* attribute is not listed in the attributes for AdvancedSearchDialog because it is an attribute of the ProductCategorySearchFilter widget, which is contained in AdvancedSearchDialog. When a widget contains other widgets, the parent widget can use the attributes of the other widgets it contains.

```
<rn:widget path="search/AdvancedSearchDialog"
treeview_css="#rn:php:\RightNow\Utils\Url::getYUICodePath('gallery-
treeview/assets/treeview-skin.css')#" />
```

4 Save *list.php*.



Continue configuring the search field or Continue configuring the Answers page.

Adding Search By or Sort By options

You might want to add other searching or sorting options to the Answers page. You can offer your customers their choice of search type, and you can let them sort the search results by report column in ascending or descending order.

- Adding Search By options
- Configuring Sort By options

Adding Search By options

When you add the SearchTypeList widget to the Answers page, customers can select from the following search options.

- **Phrases** matches the phrase the customer enters.
- **Similar Phrases** matches answers containing synonyms and similarly spelled words as those the customer enters.
- **Exact Search** matches the exact sequence of the entered search terms.
- **Complex Expression** allows wildcard searching.

Note that all four methods of searching will find different word forms of the entered terms, such as singular, plural, and different verb tenses. Also, all search methods use the logical operators AND and OR.

To allow search type selection on the Answers page

1 Open the *list.php* file in the */views/pages/answers* folder.

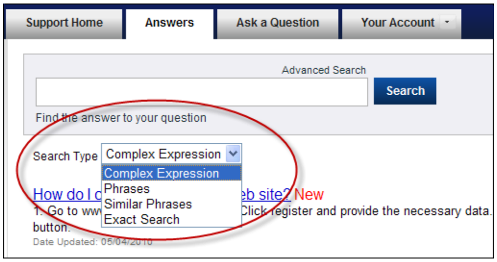
2 Locate the following line of code.

```
<h2 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_RESULTS_CMD#</h2>
```

3 Add the following line of code immediately below the code you located in step 2.

```
<rn:widget path="search/SearchTypeList" />
```

4 Save *list.php*.



Continue configuring the search field or Continue configuring the Answers page.

Configuring Sort By options

The ability to sort the search results appears automatically on the AdvancedSearchDialog widget. You can add it directly to the Answers page or you may want to remove it from the AdvancedSearchDialog widget.

To add sorting options to the Answers page

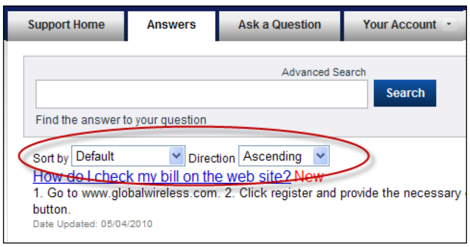
1. Open the *list.php* file in the */views/pages/answers* folder.
2. Locate the following line of code.

```
<h2 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_RESULTS_CMD#</h2>
```

3. Add the following line of code immediately below the code you located in step 2.

```
<rn:widget path="search/SortList" />
```

4. Save *list.php*.



To remove sorting options from AdvancedSearchDialog

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="search/AdvancedSearchDialog"/>
```

3 Edit the code to add the *display_sort_filter* attribute to the widget and set it to false, as shown in the following code.

```
<rn:widget path="search/AdvancedSearchDialog"
display_sort_filter="false" />
```

4 Save *list.php*.

Continue configuring the search field or Continue configuring the Answers page.

Displaying web indexing results

If you want your customers' search results to include documents as well as answers from your knowledge base, you can use the results of **web indexing**. You must enable web indexing first.

You'll need to create a new Answers page that uses one of the two web search reports that display web indexing results. The default web search report is report 10022. Report ID 10016 displays the same information with the exception of the size and score columns.

Product and category filters do not apply to web search reports, so you'll want to remove widgets that use these filters. Instead, you'll use the web search widgets that let your customers sort their web search results by the report columns (the WebSearchSort widget) and specify the matching criteria (the WebSearchType widget).

Here's what your web indexing Answers page might look like.

```
<rn:meta title="#rn:msg:FIND_ANS_HDG#" template="standard.php"
clickstream="answer_list"/>

<rn:widget path="knowledgebase/RssIcon"/>
<rn:container report_id="10022">
<div id="rn_PageTitle" class="rn_AnswerList">
    <div id="rn_SearchControls">
        <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
        <form onsubmit="return false;">
            <div class="rn_SearchInput">
                <rn:widget path="search/WebSearchSort"/>
```

```
                <rn:widget path="search/WebSearchType"/>
                <rn:widget path="search/KeywordText"
                label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_CMD#
                " initial_focus="true"/>
            </div>
            <rn:widget path="search/SearchButton"/>
        </form>
    </div>
</div>
<div id="rn_PageContent" class="rn_AnswerList">
    <div class="rn_Padding">
        <h2 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_RESULTS_CMD#</h2>
        <rn:widget path="reports/ResultInfo"/>
        <rn:widget path="reports/Multiline"/>
        <rn:widget path="reports/Paginator"/>
    </div>
</div>
</rn:container>
```

Continue configuring the Answers page.

Changing the report on the Answers page

By default, the Answers page uses the report called Answers–Complex Expression Search Default, which has report ID 176. But you have several options for changing and configuring the report that is displayed when customers enter search terms. Here are some options for changing the report on the Answers page. Click here for general information about configuring widgets for answers reports.

- Use a different report.
- Use a grid report instead of a multiline report.
- Change the number of answers that are displayed.
- Truncate the length of answers.
- Open URL and file attachment answers in a separate window.
- Change the length of time answers are considered new or updated.
- Edit search term highlighting.

Continue configuring the Answers page.

Changing the search report

The default search report on the Answers page is Answers–Complex Expressions Search Default (report ID 176). If you want to replace this report with another standard answers report or a custom answers report, you must be sure that the report you use contains the answers.special_settings filter. (Learn how to check for the filter here.)

Note You should add the SearchTypeList widget to any page containing a custom report that uses an integer filter. Without the widget, your customers can search only by answer ID. Adding the widget lets your customers select a different search type so they can enter text search terms.

To change the search report

Important So that all of your customer portal search functions work the same way, you should also change the report used on the Support Home page. When these pages use different reports, unexpected results may occur.

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:container report_id="176">
```

3 Replace `176` with the report ID of the answers report you want to open when the customer conducts a search. Customer Portal reports can be found in the Reports explorer by going to the \Public Reports\Service\Views – Service\Customer Portal folder. (Learn how to find a report's ID number.)

4 Save *list.php*.

Continue changing the report on the Answers page or Continue configuring the Answers page.

Finding the ID number for a report

To find a report ID

1 Log in to Oracle Service Cloud.

2 Click Analytics.

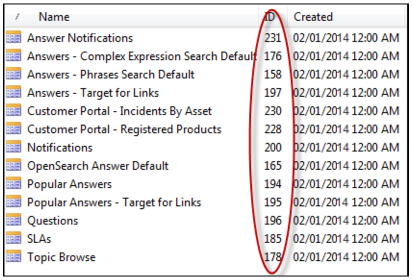
3 Double-click Reports Explorer.

4 **Drill down** through the tree of reports until the report you want appears in the list on the right.

Note Standard Customer Portal reports are located in the *\Public Reports\Service\Views–Service\Customer Portal* folder.

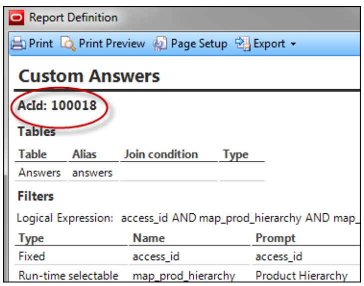
5 If the list does not contain an ID column, click Choose Details on the explorer **ribbon**, select the check box for ID in the Hide or Display Details window, and click OK. The Report ID column now appears in the list of reports.

Click to view



Or, you can open a report by right-clicking it and selecting Open. Then click Definition on the report ribbon and select View. The AcId value in the upper left corner is the report ID.

Click to view



[Continue changing the report on the Answers page] or [Continue configuring the Answers page.]

Using a grid report

By default, the Answers page displays search results in a multiline format, which puts the answer summary, answer text, and date updated on separate lines. If you like, you can substitute a grid report, which displays the information in tabular form.

Click to view

To use a grid report on the Answers page

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="reports/Multiline"/>
```

3 Replace the Multiline widget with the Grid widget by editing the line as follows.

```
<rn:widget path="reports/Grid" />
```

4 Save *list.php*.

Continue changing the report on the Answers page or Continue configuring the Answers page.

Changing the number of displayed answers

You may want to change the number of answers that are displayed on the report on the Answers page. By default, the report displays the number specified in a report, but you can edit the *per_page* attribute of the report to change that number.

To change the number of displayed answers

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code for the Multiline report widget.

```
<rn:widget path="reports/Multiline"/>
```

3 Change the number of displayed answers by adding the *per_page* attribute.

```
<rn:widget path="reports/Multiline" per_page="5" />
```

4 Add the *per_page* attribute to the ResultInfo widget so that it displays the same number of answers as the report does. Your code will resemble the following.

```
<rn:widget path="reports/ResultInfo" per_page="5"/>
```

5 Add the *per_page* attribute to the Paginator widget so that it displays the same number of answers as the report does. Your code will resemble the following.

```
<rn:widget path="reports/Paginator" per_page="5"/>
```

6 Save *list.php*.

Continue changing the report on the Answers page or Continue configuring the Answers page.

Truncating answer length

By default, answer summaries (the first line of an answer on the Answers page report) and the answer itself are truncated if they exceed 200 characters. You can change the length of truncated summaries and answers if you want to shorten these fields or if you want to display more information than the default.

To modify answer truncation

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code for the Multiline report widget.

```
<rn:widget path="reports/Multiline"/>
```

3 Change the truncation length by editing the widget code to add the *truncate_size* attribute.

```
<rn:widget path="reports/Multiline" truncate_size="50" />
```

4 Save *list.php*.

Continue changing the report on the Answers page or Continue configuring the Answers page.

Opening answers in a separate window

You may prefer to open **URL answers** and **file attachment answers** in a separate browser window to keep your customers on your site. You can accomplish that by first creating a custom report to open URL and file attachment type answers in a separate window. Then you must replace the standard report in the */views/pages/answers/list.php* file with the custom report you created.

To copy the standard Answers report

1 Log in to Oracle Service Cloud.

2 Click Analytics.

3 Double-click Reports Explorer.

4 Click Find in the Navigation group on the ribbon.

5 Select ID in the Find Using drop-down menu.

6 Select the Equal To radio button.

7 Type `176` in the field.

8 Click Find. The Answers–Complex Expression Search Default report displays in the right column.

9 Right-click the report and select Copy. The Copy Answers window opens.

10 Type a name for the custom report you are going to create in the Name field, for example, `Custom Answers`.

11 Click OK.

Next, you'll edit the report so it will open URL and file attachment answers in a separate window.

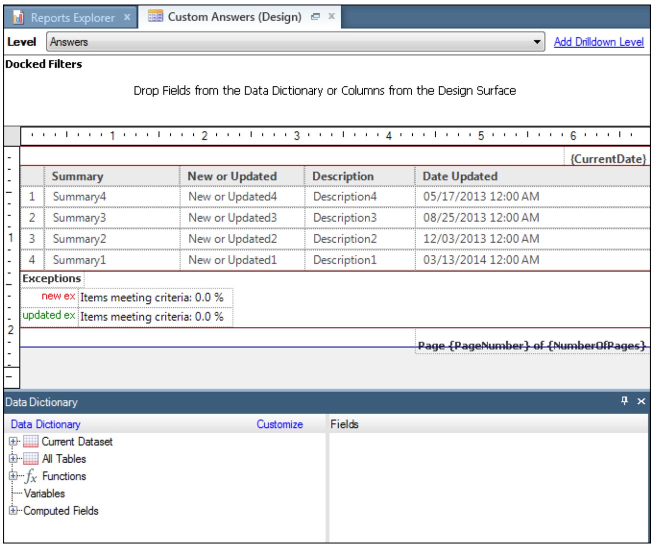
Editing a custom report

To edit a custom report

1 With the Reports explorer still open, locate the custom report you just created. (In the previous procedure, we called it Custom Answers.)

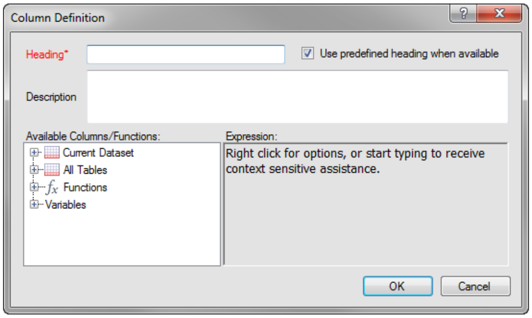
2 Right-click the report and select Edit. The report design center opens.

Click to view



3 Right-click the Summary column and select Insert New Column Before. The Column Definition window opens.

Click to view



4 Type `Link Target` in the Heading field.

5 Place the cursor in the Expression field to the right of the Available Columns/Functions. The field is activated.

6 Type the following in the Expressions field.

```
if((answers.type = 2 | answers.type = 3), '_blank')
```

7 Click OK to close the Column Definition window. The column now appears in the report definition before the Summary column and is selected.

Click to view

	Link Target	Summary	New or Update	Description	Date Updated
1	Link Target4	Summary4	New or Updated	Description4	05/17/2013 12:00 AM
2	Link Target3	Summary3	New or Updated	Description3	08/25/2013 12:00 AM
3	Link Target2	Summary2	New or Updated	Description2	12/03/2013 12:00 AM
4	Link Target1	Summary1	New or Updated	Description1	03/13/2014 12:00 AM

8 Right-click the Link Target column and select Hide Column.

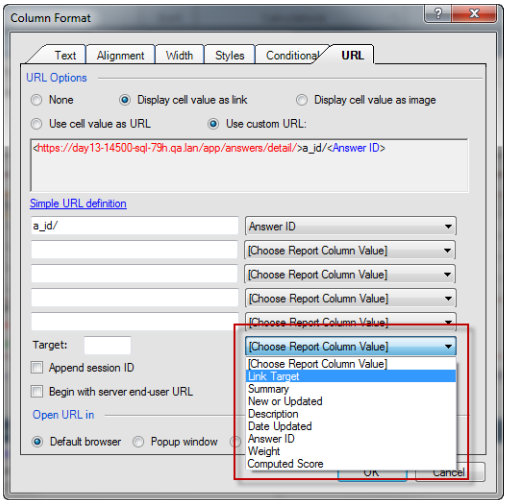
9 Right-click the Summary column and select Edit Format. The Column Format window opens with the Text tab on top.

10 Click the URL tab. URL options display on the tab.

11 Click the Advanced URL Definition link. The advanced URL options display.

12 Click the drop-down menu to the right of the Target field (the last drop-down menu labeled Choose Report Column Value on the right) and select Link Target.

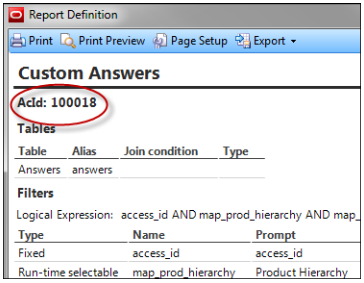
Click to view



13 Click OK to close the Column Format window.

14 Click the Home tab on the ribbon, click the Definition button in the Properties group, and select View to open the Report Definition window. Note the AcId number in the upper left corner. This is the report ID you will use to replace the standard report in the */views/pages/answers/list.php* file.

Click to view



15 Close the Report Definition window.

16 Save the report by clicking Save on the Quick Access toolbar.

Now you'll edit the file for the Answers page so it will use the custom report you've created.

Modifying the Answers page to open answers in a separate window

To modify the Answers page to open answers in a separate window

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:container report_id="176">
```

3 Replace `176` with the ID number for the custom report you created. (This is the ID you found in step 14 of Editing a custom report.)

4 Save *list.php*.

Continue changing the report on the Answers page or Continue configuring the Answers page.

Changing the number of days an answer displays New or Updated

By default, answers reports append New to answers that have been created within the last 30 days and Updated to answers that have been edited within the last 30 days. If you want to change the length of time that an answer is considered new or updated, you can create a custom report and edit the variables that define the new and updated time periods. Then you'll need to replace the standard report in the */views/pages/answers/list.php* file with the custom report you created.

To copy the standard Answers report

1 Log in to Oracle Service Cloud.

2 Click Analytics.

3 Double-click Reports Explorer.

4 Click Find in the Navigation group on the ribbon.

5 Select ID in the Find Using drop-down menu.

6 Select the Equal To radio button.

7 Type `176` in the field.

8 Click Find. The Answers–Complex Expression Search Default report displays in the right column.

9 Right-click the report and select Copy. The Copy Answers window opens.

10 Type a name for the custom report you are going to create in the Name field, for example, `Custom Answers New and Updated`.

11 Click OK.

Next, you'll edit the report to change the New and Updated variables.

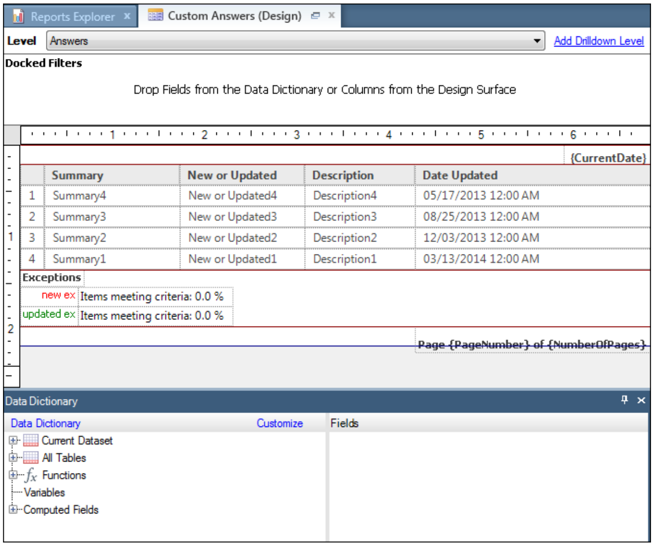
Editing a custom report to change New and Updated variables

To edit a custom report

1 With the Reports explorer still open, locate the custom report you just created. (In the previous procedure, we called it Custom Answers New and Updated.)

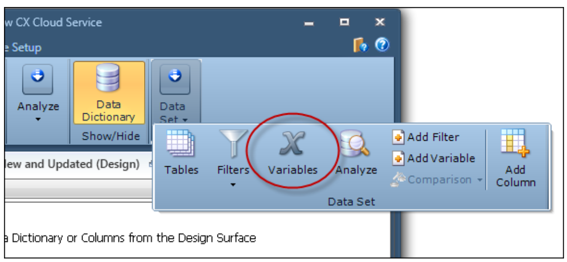
2 Right-click the report and select Edit. The report design center opens.

Click to view



3 Click the Variables button in the Data Set group on the ribbon. (If the group is collapsed, as shown in the figure, click the arrow and select Variables.) The Edit Variables window opens.

Click to view



4 To change the number of days an answer summary will be marked as New, double-click $new. The Edit Variable window opens.

a Double-click “30” in the Expression field and type the number of days you want to designate an answer as new.

b Click OK to close the window.

5 To change the number of days an answer summary will be marked as Updated, double-click $updated. The Edit Variable window opens.

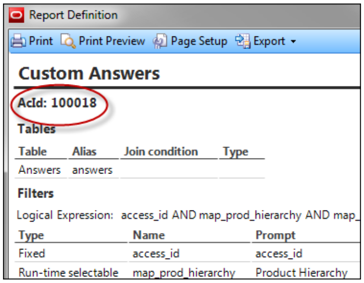
a Double-click “30” in the Expression field and type the number of days you want to designate an answer as updated.

b Click OK to close the window.

6 Click OK to close the Edit Variables window.

7 Click the Home tab on the ribbon, click the Definition button in the Properties group, and select View to open the Report Definition window. Note the AcId number in the upper left corner. This is the report ID you will use to replace the standard report in the */views/pages/answers/list.php* file.

Click to view



8 Close the Report Definition window.

9 Save the report by clicking Save on the Quick Access toolbar.

Now you’ll edit the file for the Answers page so it will use the custom report you’ve created.

Modifying the Answers page

To modify the Answers page with different New and Updated values

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:container report_id="176">
```

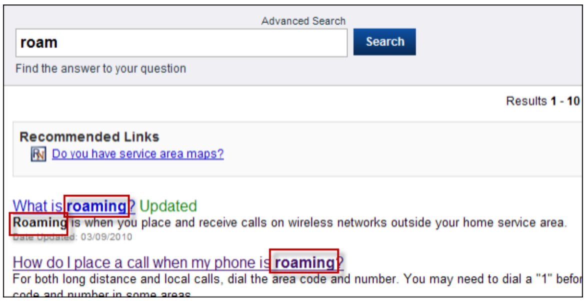
3 Replace `176` with the ID number for the custom report you created. (This is the ID you found in step 7 of this procedure.)

4 Save *list.php*.

Continue changing the report on the Answers page or Continue configuring the Answers page.

Editing search term highlighting

The words that customers type into the search field are stemmed and all versions of the stemmed words are highlighted in the search results. So if your customer enters “roam,” for example, “roam” and “roaming” are highlighted in the results on both the Answers page and the answer details page. (However, forms of the word that include punctuation are not highlighted.) The highlighting is done with bold text.



Do you want search terms to appear in bold text in the search results?

- **Yes.** This is the default, so continue configuring the Answers page.
- **No,** I’d like to change how search terms appear in the search results.
- **No,** I’d like to remove all highlighting from search terms.

Changing the appearance of search terms

If you want to change how search terms are highlighted in the results, you’ll need to edit the *site.css* file. The following procedure shows you how to do this. For the sake of this example, we’ll assume you want to change the search terms to italic font and highlight the background with yellow.

To change the appearance of search terms

1 Open the *site.css* file in the */cp/customer/assets/themes/standard* folder.

2 Locate the following code, which begins around line 701.

```
.rn_Highlight {
        font-style:normal;
        font-weight:bold;
        text-decoration:inherit;
}
```

3 Change the font style of the search terms to italic by editing the `font-style:normal;` line and replacing it with the following code.

```
font-style:italic;
```

4 Add yellow highlighting to the search terms by adding the following line of code after the font-style code.

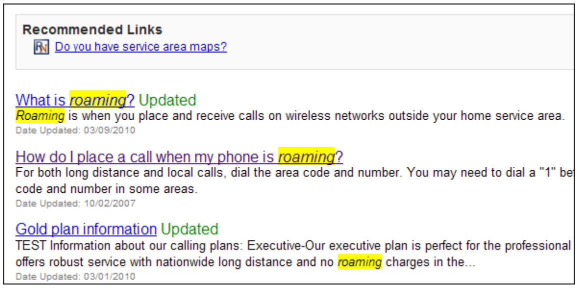
```
background-color:#FFFF00;
```

5 Delete the following line of code.

```
font-weight:bold;
```

6 Save *site.css*.

Continue changing the report on the Answers page or Continue configuring the Answers page.



Disabling search term highlighting

By default, search term highlighting is enabled, but you can disable it by editing the code for the report widget.

To disable search term highlighting

1. Open the *list.php* file in the */views/pages/answers* folder.
2. Locate the following line of code for the Multiline report widget.

```
<rn:widget path="reports/Multiline" />
```

3. Disable highlighting by editing the widget code to add the *highlight* attribute.

```
<rn:widget path="reports/Multiline" highlight="false" />
```

4. Save *list.php*.

Continue changing the report on the Answers page or Continue configuring the Answers page.

Configuring search feedback

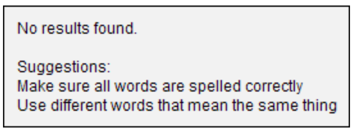
The default Answers page uses the ResultInfo widget to provide feedback to your customers when they conduct a search. This feedback includes the following options that you can modify or disable.

- Customize the message and suggestions when no results are returned.
- Display spelling suggestions if a search term appears to have been misspelled.
- Display suggested searches.

Continue configuring the Answers page.

Customizing messages when no results are returned

When the search terms your customers enter have no match in your knowledge base, the default Answers page displays a “No results found” message.



Instead of the default message, you might want to direct customers to the Ask a Question tab or refer them to your Search Tips page.

To customize messages when no search results are returned

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code for the ResultInfo widget.

```
<rn:widget path="reports/ResultInfo"/>
```

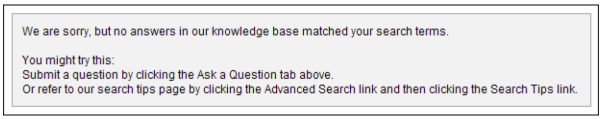
3 To change the “No results found” message, edit the widget code to add the *label_no_results* attribute.

```
<rn:widget path="reports/ResultInfo" label_no_results="We are sorry,
but no answers in our knowledge base matched your search terms." />
```

4 To change the “Suggestions” message as well, edit the widget code to add the *label_no_results_suggestions* attribute.

```
<rn:widget path="reports/ResultInfo" label_no_results="We are sorry,
but no answers in our knowledge base matched your search terms."
label_no_results_suggestions="You might try this:<ul><li>Submit a
question by clicking the Ask a Question tab above.</li><li>Or refer to
our search tips page by clicking the Advanced Search link and then
clicking the Search Tips link.</li></ul>" />
```

5 Save *list.php*.



Continue configuring search term feedback or Continue configuring the Answers page.

Displaying spelling suggestions

When customers enter a search term the application considers to be a misspelling, the default Answers page provides suggested replacements under a “Did You Mean?” heading.

Do you want to offer your customers suggested replacements for misspelled words?

- **Yes.** This is the default, and EU_SEARCH_TERM_FEEDBACK_ENABLE (RightNow User Interface > End-User Interface > General) must also be set to Yes, which is its default setting. Continue configuring search term feedback.
- **Yes,** but I’d like to change the label from “Did you mean?”
- **No.** Show me how to disable it.

Changing the "Did you mean?" label

To change the "Did you mean?" label

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code for the ResultInfo widget.

```
<rn:widget path="reports/ResultInfo"/>
```

3 Add the *label_spell* attribute to the widget. Your code will resemble the following.

```
<rn:widget path="reports/ResultInfo" label_spell="Try these terms
instead:" />
```

4 Save *list.php*.

Continue configuring search term feedback or Continue configuring the Answers page.

Disabling spelling suggestions

To disable spelling suggestions

1 Log in to Oracle Service Cloud.

2 Use the procedure described in To locate and edit configuration settings to locate EU_-SEARCH_TERM_FEEDBACK_ENABLE under RightNow User Interface > End-User Interface > General.

3 Click the drop-down menu in the Value field and select No.

4 Click the Save button on the ribbon.

Continue configuring search term feedback or Continue configuring the Answers page.

Displaying suggested searches

The suggested searches feature builds links between search words and phrases based on similar answer search results. It then displays suggested search terms on the Answers page to help customers search for answers by suggesting terms they may not have thought of or known the terminology for.

Do you want to offer your customers suggested searches?

- **Yes.** This is the default, and EU_SUGGESTED_SEARCHES_ENABLE (RightNow User Interface > End-User Interface > General) must also be set to Yes, which is its default setting. If you haven't changed it, you don't need to do anything. Continue configuring search term feedback.
- **Yes,** but I'd like to change the label.
- **No.** Show me how to disable it.

Changing the suggested searches label

To change the suggested searches label

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code for the ResultInfo widget.

```
<rn:widget path="reports/ResultInfo"/>
```

3 Add the *label_suggestion* attribute to the widget. Your code will resemble the following.

```
<rn:widget path="reports/ResultInfo" label_suggestion="You might try
these other searches too:" />
```

4 Save *list.php*.

Continue configuring search term feedback or Continue configuring the Answers page.

Disabling suggested searches

To disable suggested searches

1 Log in to Oracle Service Cloud.

2 Use the procedure described in To locate and edit configuration settings to locate EU_-SUGGESTED_SEARCHES_ENABLE under RightNow User Interface > End-User Interface > General.

3 Click the drop-down menu in the Value field and select No.

4 Click the Save button on the ribbon.

Continue configuring search term feedback or Continue configuring the Answers page.

55

Answer Details Page

When customers select an answer on an answers report, such as the Most Popular Answers report on the Support Home page or the Answers report on the Answers page, the answer details page opens.

Important Depending on how an answer was configured, it may or may not be visible to all customers on the answer details page. Many factors control answer visibility, including its **status**, **access level**, **language**, associated **products** and **categories**, **conditional sections**, and the customers' **SLAs**.

This is also true of answers that have been reached through a **guide** on your customer portal. For example, if an answer or section of an answer is available only to customers whose SLAs give them permission to view certain answer access levels, that answer will not be visible to customers without that SLA even if they click an answer in a guide. Refer to Controlling answer visibility.

If you want to keep the answers in your knowledge base from being available to the general public, you must require login on both the Answers and the answer details page. If both pages do not have the same login requirement, a warning will appear when you stage and promote your customer portal. The most secure way to do this is to require login on all pages of your customer portal.

The top of the answer details page displays the answer summary, question and answer text, and dates when the answer was published and updated. Additional information includes any files that are attached to the answer, an answer feedback section, sections for related and previously viewed answers, and links for sharing, printing, emailing, and subscribing to the answer. The page also contains the GuidedAssistant widget, which walks customers through a series of questions, called a guide, to help them locate information that may provide additional information to answer their questions.

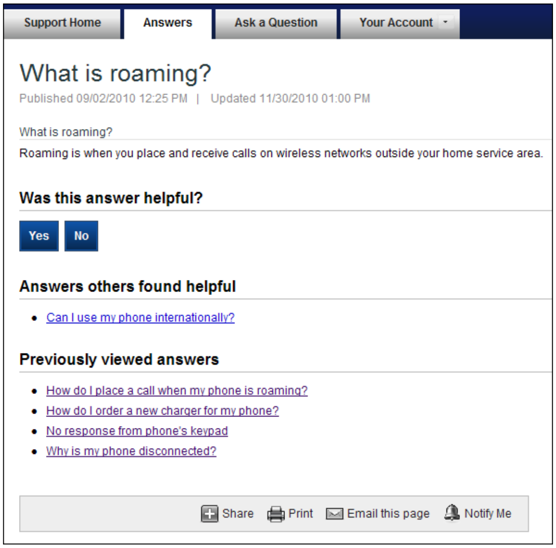
Note For search engine optimization, the source code for the answer details page includes a tag that contains the title of the answer. The title is all lowercase and the words are separated by hyphens. Punctuation in a title is escaped and the title uses a maximum of 80 characters. The link tag is automatically added to the <head> section of the answer and uses the following form.

```
<link rel="canonical" href="http://www.example.com/app/
answers/detail/a_id/<answerID>/~/<answer-title>" />
```

To view this tag, view the source code for an answer page in your web browser. Here is an example.

```
<link rel="canonical" href="http://www.example.com/app/
answers/detail/a_id/1575/~/how-do-i-place-a-call-when-my-
phone-is-roaming%3F"/>
```

Click to view



The customer portal lets you modify the answer details page in the following ways.

- Edit the Published/Updated information.
- Configure search term highlighting for the answer.
- Modify the file attachments display.
- Configure guided assistance.
- Edit the answer feedback section.
- Add the AnswerComments widget so customers can post comments to answers.
- Change the number of related answers or remove them.
- Change the number of previously viewed answers or remove them.
- Add answer details.

Editing Published/Updated information

By default, the answer details page lists the publication date of the answer and the date it was last updated. These dates appear right below the answer summary.

Do you want the published/updated dates to appear on the answer details page?

- **Yes.** This is the default, so continue configuring the answer details page.
- **Yes,** but I'd like to change the labels for these dates.
- **No,** I'd like to remove these dates from the page.

Editing date labels

To edit the date labels on the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
#rn:msg:PUBLISHED_LBL# <rn:field name="Answer.CreatedTime" />
  |   
#rn:msg:UPDATED_LBL# <rn:field name="Answer.UpdatedTime" />
```

3 Edit the code to reflect your label changes. Your code will resemble the following.

```
This answer was first published on <rn:field name="Answer.CreatedTime"
/>
  |   
This answer was last updated on <rn:field name="Answer.UpdatedTime" />
```

4 Save *detail.php*.

[Continue configuring the answer details page.]

Removing dates

To remove the dates on the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Delete the following code.

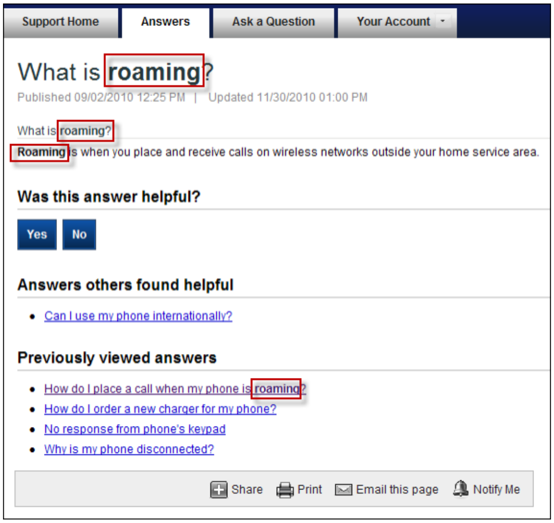
```
#rn:msg:PUBLISHED_LBL# <rn:field name="Answer.CreatedTime" />
  |   
#rn:msg:UPDATED_LBL# <rn:field name="Answer.UpdatedTime" />
```

3 Save *detail.php*.

[Continue configuring the answer details page.]

Configuring search term highlighting

The words that customers type in the search field are stemmed, and all versions of the stemmed words are highlighted in the search results. So if a customer enters “roam,” for example, “roam” and “roaming” will be highlighted in the results on both the Answers page and the answer details page. (However, forms of the word that include punctuation will not be highlighted.) By default, highlighting is done with bold text.



Do you want search terms to appear in bold text on the answer details page?

- **Yes.** This is the default, so continue configuring the answer details page.
- **No,** I'd like to change how search terms appear in the answer.
- **No,** I'd like to remove all highlighting from search terms in the answer.

Changing the appearance of search terms

If you want to change how search terms are highlighted in the results, you'll need to edit the *site.css* file. The following procedure shows you how to do this. For the sake of this example, we'll assume you want to change the search terms to italic font and highlight the background with yellow.

To change the appearance of search terms

1 Open the *site.css* file in the */cp/customer/assets/themes/standard* folder.

2 Locate the following code, which begins around line 706.

```
.rn_Highlight {
      font-style:normal;
      font-weight:bold;
      text-decoration:inherit;
}
```

3 Change the font style of the search terms to italic by deleting the `font-style:normal;` line and replacing it with the following code.

```
font-style:italic;
```

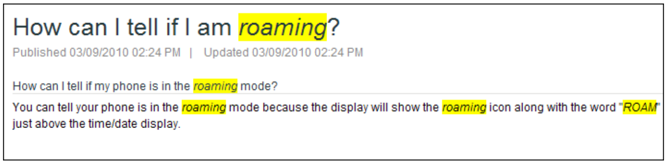
4 Add yellow highlighting to the search terms by adding the following line of code after the font-style code.

```
background-color:#FFFF00;
```

5 Delete the following line of code.

```
font-weight:bold;
```

6 Save *site.css*.



Continue configuring the answer details page.

Disabling search term highlighting

By default, search term highlighting is enabled on the answer details page, but you can disable it by editing the code for report widget.

To disable search term highlighting

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following lines of code. Note that these three lines are not sequential.

```
<h1 id="rn_Summary"><rn:field name="Answer.Summary" highlight="true"/
></h1>
<rn:field name="Answer.Question" highlight="true"/>
<rn:field name="Answer.Solution" highlight="true"/>
```

3 In each of the three lines of code, replace `highlight="true"` with `highlight="false"`.

4 Save *detail.php*.

Continue configuring the answer details page.

Modifying the file attachments display

By default, the answer details page lists any files attached to the answer and displays the file size as well.

Do you want to display file attachments on the answer details page?

- **Yes.** This is the default, so continue configuring the answer details page.
- **Yes,** and I want to display the list of file attachments sorted numerically and alphabetically.
- **Yes,** but I want to remove the file size information.
- **Yes**, but I want to remove file attachment thumbnail.
- **No,** I want to prevent the display of answer file attachments.

Sorting the file attachments

To sort the file attachment list numerically and alphabetically

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
label="#rn:msg:ATTACHMENTS_LBL#"/>
```

3 Edit the DataDisplay widget to add the *sort_by_filename* attribute. (This attribute is actually an attribute of the FileListDisplay widget, which is contained in the DataDisplay widget. Refer to Widget attributes to learn how attributes of a widget contained in another widget can be passed to the “parent” widget.)

```
<rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
label="#rn:msg:ATTACHMENTS_LBL#" sort_by_filename="true" />
```

4 Save *detail.php*.

Continue configuring the answer details page.

Removing file attachment size information

To remove the file attachment size information

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
label="#rn:msg:ATTACHMENTS_LBL#" />
```

3 Edit the DataDisplay widget to add the *display_file_size* attribute. (This attribute is actually an attribute of the FileListDisplay widget, which is contained in the DataDisplay widget. Refer to Widget attributes to learn how attributes of one widget contained in another widget can be passed to the parent widget.)

```
<rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
label="#rn:msg:ATTACHMENTS_LBL#" display_file_size="false" />
```

4 Save *detail.php*.

Continue configuring the answer details page.

Removing file attachment thumbnail

To remove file attachment thumbnail

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
label="#rn:msg:ATTACHMENTS_LBL#" />
```

3 Edit the DataDisplay widget to add the *display_file_size* attribute. (This attribute is actually an attribute of the FileListDisplay widget, which is contained in the DataDisplay widget. Refer to Widget attributes to learn how attributes of one widget contained in another widget can be passed to the parent widget.)

```
<rn:widget path="output/DataDisplay" name="Answer.FileAttachments"
label="#rn:msg:ATTACHMENTS_LBL#" display_thumbnail="false"/>
```

4 Save *detail.php*.

Continue configuring the answer details page.

Preventing the display of answer file attachments

To prevent displaying answer file attachments on the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Delete the following code.

```
<div id="rn_FileAttach">
    <rn:widget path="output/DataDisplay"
    name="Answer.FileAttachments" label="#rn:msg:ATTACHMENTS_LBL#" />
</div>
```

3 Save *detail.php*.

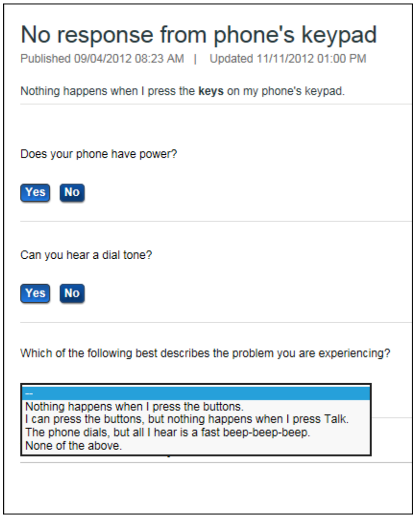
Continue configuring the answer details page.

Configuring the GuidedAssistant widget

The default answer details page includes the GuidedAssistant widget, which helps your customers locate solutions to their problems when they answer questions presented to them on the customer portal. These branching sets of questions are called **guides**, and they are created on the **administration interface** by your knowledge engineer. (Refer to Guided Assistance.)

Note Be sure to check your guides as they appear on the customer portal. Image type questions, in particular, benefit from additional configuration to display effectively. For instance, it's a good idea to leave additional white space to the left of the image and, if possible, include the caption as part of the image rather than separately. Additionally, images that are roughly 350 by 200 pixels display optimally. Don't forget to check your guides on your mobile customer portal as well.

The following figure shows an example of the default GuidedAssistant widget after a customer has answered the first few questions.



Note All text fields are automatically marked as required on the customer portal.

Guides can be associated with individual answers so that when your customers select an answer, the GuidedAssistant widget appears on the answer details page. (If the selected answer is not associated with a guide, the widget will not appear.) Or you can select one guide you want to always appear on the page regardless of which answer is opened. If you define a guide ID in the widget code, that guide will be displayed even if another guide is already associated with the selected answer. If the widget code does not specify a guide, the page displays the guide associated with the answer that is selected, if it has one.

In addition, guides can be configured to pass parameters to the Ask a Question page. If, for instance, your customer reaches the end of a guide and still doesn't have the answer to a question, you can ask for product and category information that will be passed in the URL to the Ask a Question page to populate those fields automatically. Refer to Passing parameters through Call URL nodes.

The GuidedAssistant widget appears by default on the answer details page when the displayed answer is associated with a guide. You can configure the widget to open the guide in a separate window or to display only one question at a time.

Note When a guide uses an inline web page as an answer to a question and the customer repeatedly changes responses to earlier questions, intensive JavaScript loading may cause errors in iFrames with Internet Explorer.

Do you want to display the GuidedAssistant widget on the answer details page?

- **Yes.** This is the default, so continue configuring the answer details page.
- **Yes,** but I want to open a general guide for every answer instead of the one associated with that answer.
- **Yes,** but I want to open guides in a separate window.
- **Yes,** but I want to open any called URLs in a separate window.
- **Yes,** but I want to display only one question at a time.
- **Yes,** but I want to edit the widget labels.
- **No,** I want to remove the GuidedAssistant widget from the answer details page.

Another configuration option for the GuidedAssistant widget is available when customer responses to the guide lead to another answer in your knowledge base. By default, the answer opens in a pop-up window, but you can configure the widget to open answers inline.

The procedures in this section describe configuring the GuidedAssistant widget on the answer details page, but the procedures are similar for any other customer portal page.

Opening the same guide on every answer

Even if the answers that customers select are associated with a guide, you can override that association and specify one guide to open on the answer details page regardless of the answer. To do that, you define the ID of the guide in the widget's code.

To open the same guide on every answer

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant" />
```

3 Edit the GuidedAssistant widget to add the *static_guide_id* attribute and specify the ID of the guide. (Click here if you need help finding a guide's ID.)

```
<rn:widget path="knowledgebase/GuidedAssistant" static_guide_id="21"
/>
```

4 Save *detail.php*.

Continue configuring the answer details page.

Finding the ID for a guide

To find a guide ID

1 Log in to Oracle Service Cloud.

2 Click the Configuration button.

3 Double-click Guided Assistance Explorer in the configuration list under Service. The list of guides is displayed on the right.

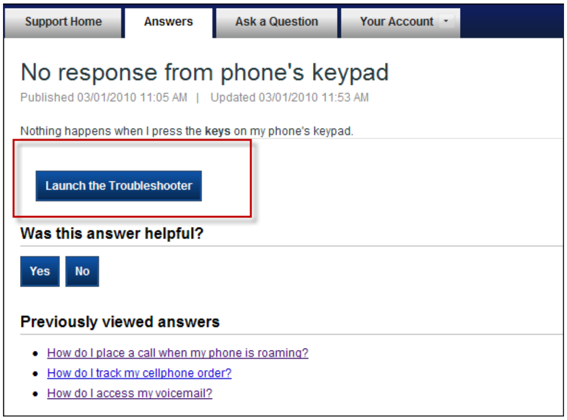
4 If the list does not contain an ID column, click Choose Details on the explorer **ribbon**, select the check box for ID in the Hide or Display Details window, and click OK. The ID column now appears in the list of guides.

Opening guides in a separate window

By default, guides open on the answer details page by displaying the first question of the guide, but you might want them to open in a separate pop-up window instead. First, you must create the page that opens in the window and place another GuidedAssistant widget on that page. Then you must configure the GuidedAssistant widget on the answer details page so it opens the new guide page. When you configure the GuidedAssistant widget to open on a separate page, the answer details page displays a Launch the Troubleshooter button instead of the first guide question.

Note You should not open guides in pop-up windows if the guides include Microsoft file attachments such as Word or Excel because the attachments will not open properly in Internet Explorer 7 or Internet Explorer 8. (For information about adding answers to guides, refer to Adding answers and text explanations to responses.)

Click to view



To create a guide page

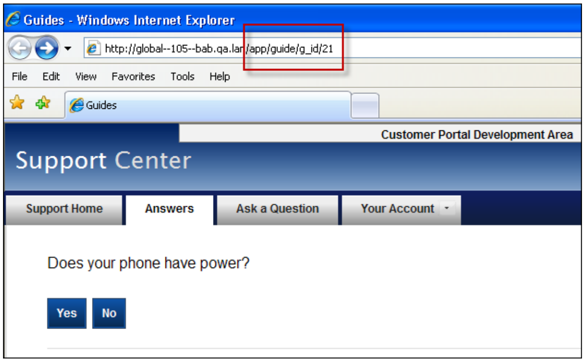
Create a PHP page that contains the GuidedAssistant widget and place it in a *development* folder. In this example, we'll call the page *guide.php* and place it in the */development/views/pages* folder.

The following code is an example of a page you might use.

```
<rn:meta title="Guides" template="standard.php" />
<div id="rn_PageContent">
    <div class="rn_AnswerDetail">
        <dl class="rn_Overview">
            <rn:widget path="knowledgebase/GuidedAssistant"/>
        </dl>
    </div>
</div>
```

The page uses the *standard.php* template and the URL passes the ID of the guide associated with the answer from which the guide was launched.

Click to view



To open guides in a separate window

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"/>
```

3 Edit the GuidedAssistant widget to add the *popup_window_url* attribute to specify the guide page you just created. Be sure to add */app/* to the beginning of the page path.

```
<rn:widget path="knowledgebase/GuidedAssistant" popup_window_url="/
app/guide" />
```

4 Save *detail.php*.

Continue configuring the answer details page.

Opening URLs in a separate window

When a question within a guide has a Call URL action, the URL defined in the guide opens by default in the same window. (Refer to Creating guides for information about the various actions that can occur when customers respond to a guide question.) Customers may find it unsettling to respond to a guide question and suddenly be directed to a different URL. To prevent that potential confusion, you may want the GuidedAssistant widget to open URLs in a separate window instead of the same window.

To open guide URLs in a separate window

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"/>
```

3 Edit the GuidedAssistant widget to add the *call_url_new_window* attribute.

```
<rn:widget path="knowledgebase/GuidedAssistant"
call_url_new_window="true" />
```

4 Save *detail.php*.

Continue configuring the answer details page.

Opening answers inline

When a guide leads customers to a solution that consists of directing them to another answer in your knowledge base, that answer opens in a separate window by default. The following procedure describes how to open answers inline instead of in a separate window.

To open answers inline

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"/>
```

3 Edit the GuidedAssistant widget to add the *target* attribute.

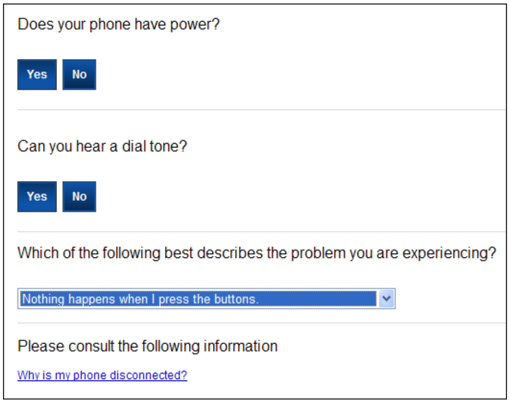
```
<rn:widget path="knowledgebase/GuidedAssistant" target="_self" />
```

4 Save *detail.php*.

Continue configuring the answer details page.

Displaying only the current question

When customers answer a question in a guide, the default GuidedAssistant widget displays the next question while continuing to display all the previous questions.



If you prefer, you can configure the widget to display only the current question. When you do so, a back button is automatically added to the page to let customers return to previous questions.

Note The following procedure edits the widget on the answer details page so that the guide questions are displayed on that page. If you have configured the GuidedAssistant widget on the answer details page to open the guide in a separate window, you'll want to edit the GuidedAssistant widget on your custom guide page, not the answer details page.

To display only the current question

1 Open the *detail.php* file in the */views/pages/answers* folder.

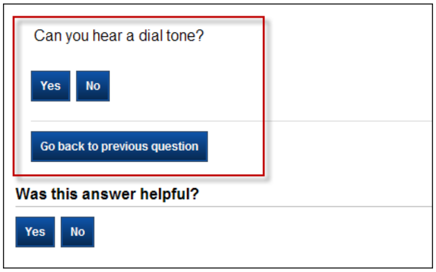
2 Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"/>
```

3 Edit the GuidedAssistant widget to add the *single_question_display* attribute.

```
<rn:widget path="knowledgebase/GuidedAssistant"
single_question_display="true" />
```

4 Save *detail.php*.



Continue configuring the answer details page.

Editing widget labels

To edit labels on the GuidedAssistant widget

1. Open the *detail.php* file in the */views/pages/answers* folder.
2. Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"/>
```

3. Use the following table to identify the default message and its corresponding widget attribute so you can edit the GuidedAssistant widget and change the label. For example, to edit the label on the button that opens the guide in a separate window, your code might resemble the following.

```
<rn:widget path="knowledgebase/GuidedAssistant" popup_window_url="/
app/guide" label_popup_launch_button="Open Help System" />
```

Table 381: GuidedAssistant Widget Labels

To edit this default label	Edit this attribute of GuidedAssistant
Please consult the following information	label_answer_result
Launch the Troubleshooter	label_popup_launch_button
Go back to previous question	label_question_back
Start over	label_start_over
OK	label_text_response_button
(Null)	label_text_result

4 Save *detail.php*.

Continue configuring the answer details page.

Removing the GuidedAssistant widget

To remove the GuidedAssistant widget

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Delete the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"/>
```

3 Save *detail.php*.

Continue configuring the answer details page.

Editing the answer feedback section

By default, the answer details page lets customers submit a Yes or No response to the “Was this answer helpful?” question. You can offer up to five options in response to this question. If the customer answers No and provides information in the Your Feedback field, the question is converted automatically into an incident in the knowledge base.

Do you want to offer the Yes and No options to provide answer feedback?

- **Yes.** This is the default, so continue configuring the answer details page.
- **Yes,** but I'd like to change the answer feedback page that opens.
- **No,** I'd like to offer a wider range of feedback options.
- **No,** I'd like to remove the answer feedback section.

Other options for editing the answer feedback section include:

- Changing the rating threshold that opens the feedback dialog for customers to provide additional feedback about an answer.
- Editing the feedback dialog, including the width of the dialog and its label.

Changing the answer feedback page

You might want to create a different answer feedback page where your customers will be redirected when they submit feedback that is below the threshold you specify. You must first create the page and then note its location. For this example, let's assume that your page name is *new_answer_feedback_page.php* and that you have stored it in *views/pages/answers* folder.

To change the answer feedback page

1. Open the *detail.php* file in the */views/pages/answers* folder.
2. Locate the following line of code.
```
<rn:widget path="feedback/AnswerFeedback"/>
```
3. Add the *feedback_page_url* attribute to the AnswerFeedback widget by editing the widget code as follows.
```
<rn:widget path="feedback/AnswerFeedback" feedback_page_url="/app/
answers/new_answer_feedback_page" />
```
4. Save *detail.php*.

Continue configuring the answer details page.

Offering multiple feedback options

If you want to offer your customers more than the default Yes and No options as a response to the answer feedback question, you can define up to five options. These options appear as stars by default, but you can also display a percentage rating.

To offer more than Yes and No feedback options

1. Open the *detail.php* file in the */views/pages/answers* folder.
2. Locate the following line of code.
```
<rn:widget path="feedback/AnswerFeedback"/>
```
3. Edit the code to add the *options_count* attribute to the widget. The modified code will resemble the following.
```
<rn:widget path="feedback/AnswerFeedback" options_count="5" />
```
4. If you want the options to appear in descending order rather than the default ascending order, add the *options_descending* attribute to the code, which will resemble the following.
```
<rn:widget path="feedback/AnswerFeedback" options_count="5"
```

```
options_descending="true" />
```

5 If you want to explain the rating scale, you can edit the *label_title* attribute as well. The following code is an example of what you might add.

```
<rn:widget path="feedback/AnswerFeedback" options_count="5"
label_title="Rate this answer for helpfulness by selecting between 1
(low) and 5 (high) stars" />
```

6 If you want to display a numerical percentage rating instead of the default stars that are used when more than two responses are offered, add the *use_rank_labels* attribute, shown in the following example.

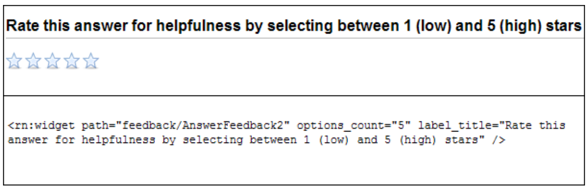
```
<rn:widget path="feedback/AnswerFeedback" options_count="5"
label_title="How useful is this answer?" use_rank_labels="true" />
```

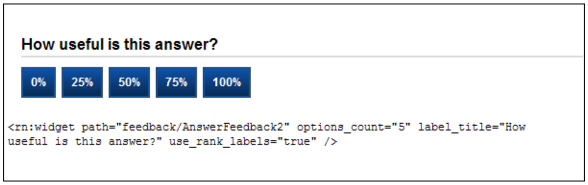
Note The rank labels have default values in the message base. RANK1_LBL is 0%, RANK2_LBL is 25%, RANK3_LBL is 50%, RANK4_LBL is 75%, and RANK5_LBL is 100%. As a result, if you define *options_count* to be 3 or 4 instead of 5, the scale will be incorrect. For example, selecting three options means the labels will be 0%, 25%, and 50%. To have your scale span the full 0-100% range with fewer than five options, you must edit the message bases.

For three options, set RANK1_LBL to 0%, RANK2_LBL to 50%, and RANK3_LBL to 100%. With four options, you'll set RANK1_LBL to 0%, RANK2_LBL to 33%, RANK3_LBL to 67%, and RANK4_LBL to 100%. To find these message bases, first open the Message Base editor. (Click the Configuration button and double-click Message Bases under Site Configuration.) In the Search window, type `rank*` in the Key field and locate the labels in the report. Refer to Editing message bases if you need more help.

You can also edit these message bases to label the options with non-numeric terms, for example, "No," "Partially," "Mostly," and "Yes."

7 Save *detail.php*.





Continue configuring the answer details page.

Removing answer feedback

To remove answer feedback from the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Delete the following line of code.

```
<rn:widget path="feedback/AnswerFeedback"/>
```

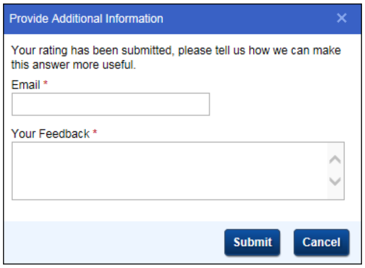
3 Save *detail.php*.

Continue configuring the answer details page.

Setting the rating threshold for opening the feedback dialog

By default, if a customer clicks Yes in response to the “Was this answer helpful?” question, the feedback rating is submitted without offering the customer a chance to provide more detailed feedback. In contrast, if the rating is No, the AnswerFeedback widget displays a Rating Submitted dialog and asks the customer to provide feedback on how the answer could be more useful. If the customer is logged in, the only field on the dialog is the Your Feedback field. If the customer is not logged in, the Email field is a required field on the dialog.

Click to view



Maybe you've offered multiple feedback options and therefore want to set the threshold higher than just the default value of 1. In that case, you would edit the *dialog_threshold* attribute of the AnswerFeedback widget. This attribute specifies the number of feedback options that ask the customer for additional information.

To change the rating threshold

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="feedback/AnswerFeedback" />
```

3 Edit the code to add the *dialog_threshold* attribute to the widget. If you never want to let customers provide feedback on the answer, set the threshold to 0. If you want to offer every customer the ability to provide feedback, regardless of the answer rating, set the threshold to the total number of feedback options (2 for the default Yes/No buttons, 5 for the default multiple feedback options). If you have implemented multiple feedback options, you can set the threshold you want. For example, for a five-option rating scale, you might want to solicit feedback from everyone who ranks the answer at a 3 or lower. Your modified code will resemble the following.

```
<rn:widget path="feedback/AnswerFeedback" dialog_threshold="3" />
```

4 Save *detail.php*.

Continue configuring the answer details page.

Editing the feedback dialog

You can configure the AnswerFeedback widget that opens when the customer submits feedback that an answer wasn't helpful. By default, the dialog width is 375 pixels and the label says, "Your rating has been submitted, please tell us how we can make this answer more useful."

To edit the feedback dialog

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="feedback/AnswerFeedback"/>
```

3 To change the width of the dialog from 375 pixels, edit the *dialog_width* attribute to the width you want.

4 To edit the label on the dialog, edit the *label_dialog_description* attribute. Your edited code may resemble the following.

```
<rn:widget path="feedback/AnswerFeedback" dialog_width="500px"
label_dialog_description="How could we have been more helpful?" />
```

5 Save *detail.php*.

Continue configuring the answer details page.

Related answers

Related answers are part of **SmartAssistant**, which evaluates the language of a customer's question and suggests possible answers. (You can use SmartAssistant to offer answers to your customers before they submit their questions on the Ask a Question page.) The default answer details page uses the RelatedAnswers widget to display a list of related answers to help your customers find the answers they need. These appear under the heading "Answers others found helpful."

Relationships among answers are generated when staff members manually relate answers on the **agent desktop** (refer to Managing answer relationships) or when customers use your site. Links are created when customers move from one answer to another within a visit to your customer portal. As these links are generated between answers in multiple customer visits over time, the related answers feature is better able to suggest answers based on what customers have viewed during the current visit.

By default, a maximum of five related answers are displayed on the answer details page. You can change that number by editing the *limit* attribute of the RelatedAnswers widget, or you can disable the display of related answers.

To change the number of related answers

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="knowledgebase/RelatedAnswers" />
```

3 Edit the code to add the *limit* attribute. (If you do not want a limit on the number of answers, set the attribute to 0.) Your edited code will resemble the following.

```
<rn:widget path="knowledgebase/RelatedAnswers" limit="3" />
```

4 Save *detail.php*.

To remove related answers from the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Delete the following line of code.

```
<rn:widget path="knowledgebase/RelatedAnswers" />
```

3 Save *detail.php*.

Continue configuring the answer details page.

Previously viewed answers

By default, up to five previously viewed answers are displayed on the answer details page. You can change that number by editing the *limit* attribute of the PreviousAnswers widget, or you can remove previously viewed answers from the page.

To change the number of previously viewed answers

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="knowledgebase/PreviousAnswers" />
```

3 Edit the code to add the *limit* attribute. (If you do not want a limit on the number of answers, set the attribute to 0.) Your edited code will resemble the following.

```
<rn:widget path="knowledgebase/PreviousAnswers" limit="3" />
```

4 Save *detail.php*.

To remove previously viewed answers from the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Delete the following line of code.

```
<rn:widget path="knowledgebase/PreviousAnswers" />
```

3 Save *detail.php*.

Continue configuring the answer details page.

Adding answer details

You might want to provide additional information about the answer being viewed on the answer details page. This procedure shows you how to add fields to the page.

To add fields on the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following line of code and add the details in the following steps below this line.

```
<rn:field name="Answer.Solution" highlight="true"/>
```

3 To add the answer's ID, add the following line of code.

```
<p>Answer ID <rn:field name="Answer.ID" /></p>
```

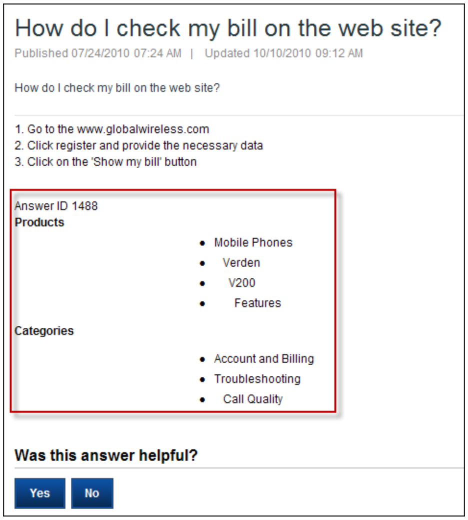
4 To add product information for the answer, add the following line of code.

```
<rn:widget path="output/DataDisplay" name="Answer.Products" />
```

5 To add category information for the answer, add the following line of code.

```
<rn:widget path="output/DataDisplay" name="Answer.Categories" />
```

6 Save *detail.php*.



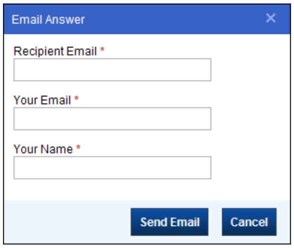
Continue configuring the answer details page.

Editing links

By default, the answer details page includes four links at the bottom of the page that customers can click to access answer features.

- **Share**—Click to share the answer on social networking sites. The default sites are Facebook, Twitter, Linked In, and Reddit.

- **Print**—Click to open a print dialog that lets you print the answer.
- **Email This Page**—Click to send a link to the answer by email. If the customer viewing the answer is not logged in, a form asks for the recipient's email address and the customer's email address and name. If the customer is logged in, only the recipient's email address is requested.



- **Notify Me**—Click to be notified by email when the answer is updated.

Note The Notify Me link appears only if the customer is logged in.

Do you want to keep all links on the answer details page?

- **Yes.** This is the default, so continue configuring the answer details page.
- **Yes,** but I want to edit the list of social networking sites on the Share link.
- **No.** I want to remove one or more links.

Editing social networking links

By default, the Share link lets you share answer content with the Facebook, Twitter, Linked In, and Reddit social networking sites. You can add, remove, or rearrange the options displayed by editing the SocialBookmarkLink widget.

Important To correctly display the icons associated with each social network when you edit the answer details page, you will also need to edit the CSS file for the SocialBookmarkLink widget.

To edit the list of social networking sites on the Share link

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="utils/SocialBookmarkLink" />
```

3 Edit the code as follows to individually list each site as a comma-separated values of the *sites* attribute.

```
<rn:widget path="utils/SocialBookmarkLink"
```

```
sites="Facebook > Post to Facebook > http://facebook.com/
sharer.php?u=|URL|,
Twitter > Tweet this > http://twitter.com/
home?status=|TITLE|+|URL|,
LinkedIn > Post to LinkedIn > http://www.linkedin.com/
shareArticle?mini=true&url=|URL|&title=|TITLE|&summary=|TITLE|&so
urce=|URL|,
Reddit > Post to Reddit > http://reddit.com/
submit?url=|URL|&title=|TITLE|" />
```

4 To remove one or more of the default links, delete the associated code from the *sites* attribute. To rearrange the links, select the code for the link you want to move and place it where you want it to appear. Each link includes the site name, site title, the URL, and page title. Assume, for example, that you want to remove the link for LinkedIn and rearrange the remaining links in the following order: Twitter, Reddit, and Facebook. You'll edit the code to look like the following.

```
<rn:widget path="utils/SocialBookmarkLink"
    sites="Twitter > Tweet this > http://twitter.com/
    home?status=|TITLE|+|URL|,
    Reddit > Post to Reddit > http://reddit.com/
    submit?url=|URL|&title=|TITLE|,
    Facebook > Post to Facebook > http://facebook.com/
    sharer.php?u=|URL|" />
```

5 Now, edit the CSS file for the SocialBookmarkLink widget. Click here.

6 To add links for other supported social media services, insert one or more of the following code lines as additional comma-separated values for the *sites* attribute.

```
Digg > Post to Digg > http://digg.com/
submit?url=|URL|&title=|TITLE|,
Delicious > Post to Delicious > http://del.icio.us/
post?url=|URL|&title=|TITLE|,
StumbleUpon > Post to StumbleUpon > http://stumbleupon.com/
submit?url=|URL|&title=|TITLE|,
Tumblr > Post to Tumblr > http://www.tumblr.com/
share?v=3&u=|URL|&t=|TITLE|,
```

For example, if adding links for Digg and StumbleUpon, your edited code will resemble the following.

```
<rn:widget path="utils/SocialBookmarkLink"
    sites="Facebook > Post to Facebook > http://facebook.com/
    sharer.php?u=|URL|,
    Twitter > Tweet this > http://twitter.com/
    home?status=|TITLE|+|URL|,
```

```
LinkedIn > Post to LinkedIn > http://www.linkedin.com/
shareArticle?mini=true&url=|URL|&title=|TITLE|&summary=|TITLE|&so
urce=|URL|,
Reddit > Post to Reddit > http://reddit.com/
submit?url=|URL|&title=|TITLE|,
Digg > Post to Digg > http://digg.com/
submit?url=|URL|&title=|TITLE|,
StumbleUpon > Post to StumbleUpon > http://stumbleupon.com/
submit?url=|URL|&title=|TITLE|," />
```

7 To add your own custom links, add code to the *sites* attribute using the following format for each link you want to add. If you have multiple links, separate them with commas.

```
site name > title to display for site > URL with page title
```

Important When you change the links displayed by the SocialBookmarkLink widget, you'll also need to edit the widget's CSS file to add images for the links. Click here for an example of editing the CSS file with the default images.

8 Save *detail.php*.

Editing the CSS file for the SocialBookmarkLink widget

The SocialBookmarkLink widget uses a sprite, which is a single image file comprised of all the icons that are displayed next to the social media links. (To view this sprite image, go to */cp/customer/assets/themes/standard/images/icons/socialBookmark.png*.) The CSS file for the widget (*SocialBookmarkLink.css)* calls the sprite and uses the *background-position* attribute to define the pixel position of each icon, including Facebook at -32px, Twitter at -80px, LinkedIn at -96px, and Reddit at -48px.

The *SocialBookmarkLink.css* file associates each icon with its corresponding social media link by referencing the link order defined by the widget. If you customize the link order in the widget, you must also edit the CSS file to indicate the link order and icon position for each link. For example, when four links are defined, Link1 is the far left link and Link4 is on the far right. If you edit the widget to make Twitter the far left link, you must update the CSS file to associate Link1 with the position of the Twitter icon, which is -80px.

The following procedure describes how to edit the CSS file to position the links according to the edits you made to the SocialBookmarkLink widget on the answer details page.

To edit the CSS file for the SocialBookmarkLink widget

1 Open the *SocialBookmarkLink.css* file in the */cp/customer/assets/themes/standard/widgetCss* folder.

2 Locate the following lines of code.

```
/* Facebook */
.rn_SocialBookmarkLink li.rn_Link1 {
    background-position:0 -32px;
}
/* Twitter */
.rn_SocialBookmarkLink li.rn_Link2 {
    background-position:0 -80px;
}
/* LinkedIn */
.rn_SocialBookmarkLink li.rn_Link3 {
    background-position:0 -96px;
}
/* Reddit */
.rn_SocialBookmarkLink li.rn_Link4 {
    background-position:0 -48px;
```

3 Edit the code as follows to position the icons in the order they are defined on the widget. For example, if the defined order is Twitter, Reddit, Facebook, and LinkedIn, your edited code will resemble the following.

```
/* Twitter */
.rn_SocialBookmarkLink li.rn_Link1 {
    background-position:0 -80px;
}
/* Reddit */
.rn_SocialBookmarkLink li.rn_Link2 {
    background-position:0 -48px;
}
/* LinkedIn */
.rn_SocialBookmarkLink li.rn_Link3 {
    background-position:0 -96px;
}
/* Facebook */
.rn_SocialBookmarkLink li.rn_Link4 {
    background-position:0 -32px;
}
```

4 If you have added a social media service to the Share link, enter custom code in the same format to define its link order and logo location. Your added code will resemble the following.

```
/* StumbleUpon */
.rn_SocialBookmarkLink li.rn_Link5 {
    background-position:0 -64px;
}
```

Note The *background-position* attributes for icons of other supported social media services—Delicious, Digg, and StumbleUpon—are listed at the bottom of the *SocialBookmarkLink.css* file.

5 If you have removed a social media service from the Share link, remove the code that defined its link order and logo location, and adjust the link orders defined for the remaining links accordingly.

6 Save *SocialBookmarkLink.css*.

Continue configuring the answer details page.

Removing links

To remove links on the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 To remove the Share link, delete the following line of code.

```
<rn:widget path="utils/SocialBookmarkLink" />
```

3 To remove the Print link, delete the following line of code.

```
<rn:widget path="utils/PrintPageLink" />
```

4 To remove the Email This Page link, delete the following line of code.

```
<rn:widget path="utils/EmailAnswerLink" />
```

5 To remove the Notify Me link, delete the following lines of code.

```
<rn:condition logged_in="true">
    <rn:widget path="notifications/AnswerNotificationIcon" />
</rn:condition>
```

6 If you removed the Notify Me link, remove the Notifications option on the Your Account tab drop-down menu.

Then remove the Notifications section of the Account Overview page.

7 Save *detail.php*.

Continue configuring the answer details page.

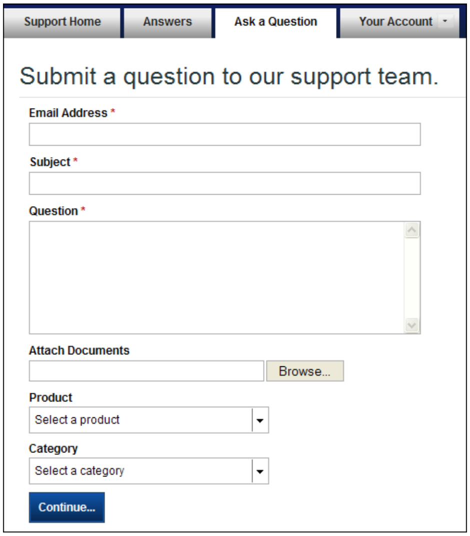
Turning off answer notifications

If you turn off the ability for customers to subscribe to be notified when an answer is updated, you should also turn off the Notifications option on the Your Account tab, remove the Notifications section of the Account Overview page, and remove the reference to notifications on the Log In page. Click here for the full procedure.

56

Ask a Question Page

The Ask a Question page lets your customers submit questions to your customer support group when they cannot find the information they are looking for on your customer portal. If the customer is not logged in, the Email Address field is displayed and is required before the question can be submitted. If the customer is logged in, the Email Address field does not appear on the page. When a customer submits a question, the customer portal automatically converts the question into an incident in the knowledge base, where it can then be solved.



Workflow configuration options

As an alternative to using the default workflow where accounts are automatically created for customers who do not already have one when they submit a question, you have the option of configuring other workflows for the Ask a Question page. [Review workflow options here](), or click one of the following workflows for a description and configuration procedure.

- The default email-only workflow automatically creates an account when customers who do not have an account submit a question.
- The email check workflow requires customers without an account to create one before asking a question.
- The login required workflow requires customers to log in before asking a question.
- The additional contact fields workflow requires customers to complete other contact fields you have placed on the page before they can submit a question.

Additional Ask a Question page configuration options

Besides setting up the workflow, the following configuration options are also available on the Ask a Question page.

- Require customers to view answers or conduct searches before the Ask a Question tab is visible.
- Require customers to have an SLA (service level agreement) before submitting a question.
- Remove the Subject field.
- Populate the Subject field.
- Specify the number of levels of products and categories customers must select.
- Automatically populate the products and categories.
- Display +/– symbols for expanding and collapsing product and category trees.
- Restrict or prevent file attachments on the Ask a Question page.
- Define the amount of time a customer has to complete the Ask a Question form before it expires.
- Configure the confirmation page that tells customers their question has been submitted.
- Send an email incident receipt when customers submit a question.
- Use the SmartAssistant feature.
  - ▷ Set up SmartAssistant on the administration interface.
  - ▷ Configure the SmartAssistant dialog that opens before customers complete submitting their question.
  - ▷ Use SmartAssistant with a Do Not Create Incident rule.
- Create Siebel service requests on the Customer Portal.

If you are finished editing this page and want to configure another page, select the page you want to edit.

- Answer Details Page
- Your Account Pages
- Log In page
- Live Help page or Chat page

Ask a Question page workflows

The standard Ask a Question workflow in the Customer Portal reference implementation was designed to address usability studies that suggest it offers the best customer experience. This workflow asks for only an email address, letting customers complete that field quickly and then submit their incident without requiring account creation or login. However, we recognize that your site may have different needs, so the Customer Portal supports each of the following workflows.

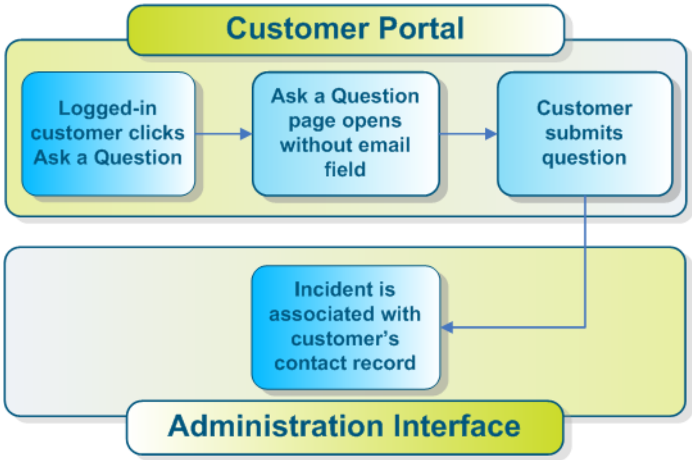
- **Email-only**—If your organization finds an email address to be adequate customer identification, this default workflow is ideal. It can also be useful when most of your customers update their incidents through email instead of logging in to your customer portal. Refer to Email-only default workflow.
- **Email check**—Use this workflow when you require customers to have an account before they can submit a question. The customer portal checks the email address, letting customers with an associated contact record submit the question while requiring those without contact records to create an account first. Refer to Email check.
- **Login required**—When you not only want customers to have an account, but you also want them logged in prior to asking questions, you can set up the Ask a Question page to require login. Refer to Requiring login.
- **Additional contact fields**—This workflow is similar to the email-only flow, but it requires customers to complete additional fields on the Ask a Question page before they can submit a question. Refer to Additional contact fields workflow.

Important If your organization needs a dynamic Ask a Question form, that is, you need to display or hide certain fields based on a customer's response to another field, you can create a custom widget and a customized Ask a Question page to accomplish your objectives. See Dynamic forms.

Logged-in customers

The differences among the workflows described in this section are apparent only when customers are not logged in. When customers are logged in, the Ask a Question process is the same for all workflows:

- Because the customer is logged in (and, therefore, the email address is known), the Ask a Question page opens without an Email Address field.
- The customer completes the fields and submits the question.
- Oracle Service Cloud converts the question into an incident, which is associated with the customer's contact record.



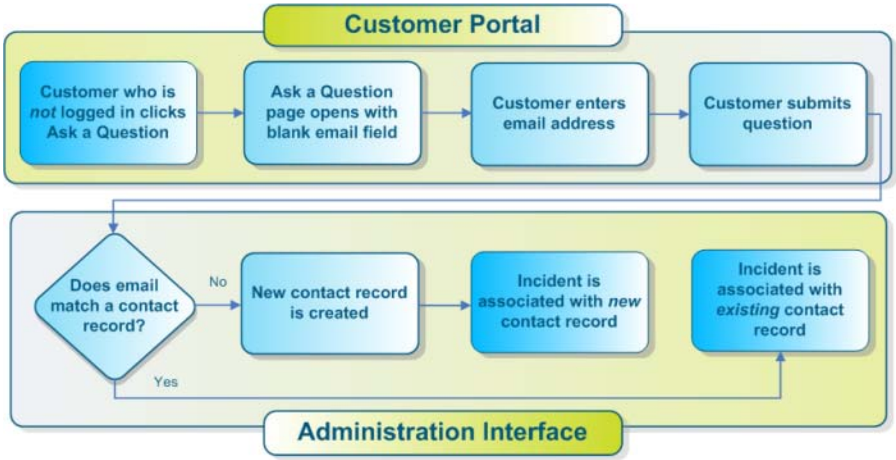
Email-only default workflow

The default Ask a Question page on the reference implementation has been designed to let your customers complete their question quickly without being required to log in. If customers are not logged in when they click the Ask a Question tab, they must enter their email address before submitting their question. If the email address is associated with a contact record in the knowledge base, the resulting incident is associated with the existing contact record. (All email correspondence related to the incident is directed to the email address the customer entered, even if it is not the customer's primary email address, when OE_SVC_SEND-MAIL_SINGLE_ADDRESS is enabled. See Modifying general customer portal settings.) If the email address does not match an existing contact record, a new record is created for the customer and the incident is associated with that record. The new contact record contains only the email address, so customers will be required to use account assistance if they want to log in to the customer portal in the future.

Note Customers are not logged in to the customer portal after submitting a question, whether their contact record already exists or is created through the question submission.

This workflow is useful when:

- Your organization accepts an email address as adequate customer information.
- Most customers update their incidents through email instead of logging in to the customer portal.



Usability studies show this workflow offers customers a good experience because it lets them quickly fill out their email address and then submit their incident without being interrupted to create an account first. It offers the following advantages and disadvantages.

Pros

- The workflow offers a positive customer experience.
  - ▷ Existing customers don't need to remember their user name and password.
  - ▷ New customers don't have to create an account before submitting a question.
- Incidents can be submitted quickly with a minimal number of steps.
- The easier process means less page abandonment by customers.

Cons

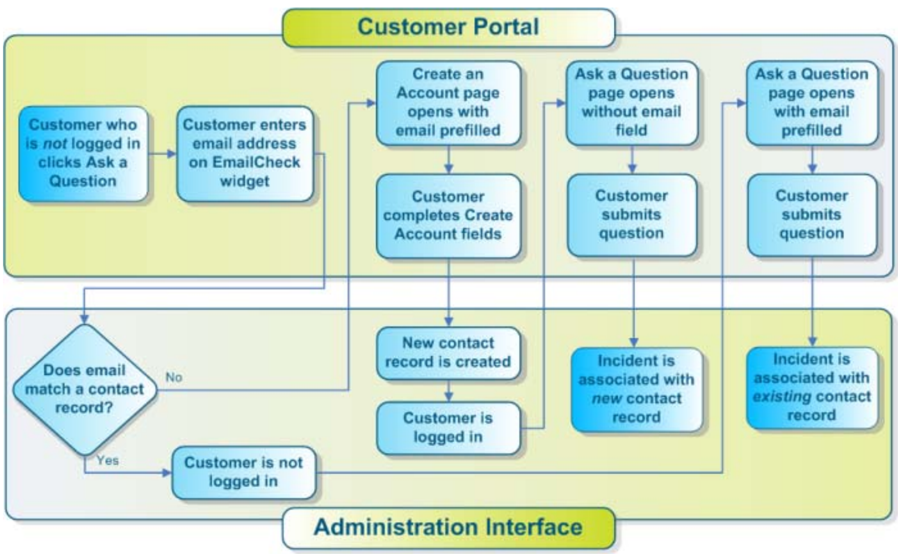
- Customers who create contact records in this workflow must use account assistance the first time they log in to the customer portal.
- At least some of the contact records in your knowledge base contain only an email address so the customer's name is unknown.

Because this is the behavior of the standard Ask a Question page, this workflow is implemented by default.

Email check

As described in Email-only default workflow, the standard Ask a Question page creates a contact record when a customer enters an email address that is not already in the knowledge base. Although this workflow has been tested for its usability and adopted in the reference implementation, your organization may require more customer information than just an email address. The best way to ensure getting this information is to require customers to create an account before they can ask a question.

The following workflow can be accomplished by editing the standard Ask a Question and Create an Account pages. ProgressBar widgets on the pages increase usability by showing customers where they are in the workflow.



This workflow is most useful when your organization requires valid data in every field of a contact record.

Pros

- Your organization's contact records include complete customer information.
- The ProgressBar widgets let customers see where they are in the workflow.
- Existing customers are minimally impacted by this workflow.

Cons

- New customers must create an account before asking a question, which may lead to form abandonment.
- The sequence of multiple steps may lead to abandonment.

To implement this workflow, you'll first need to modify the Ask a Question page to display the EmailCheck and ProgressBar widgets. Then you'll add the ProgressBar widget to the Create an Account page.

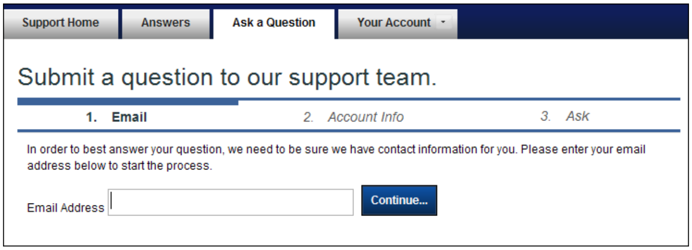
Editing the Ask a Question page for the email check workflow

First, you'll edit the default Ask a Question page to achieve the following objectives.

- Display the EmailCheck widget when customers are not logged in so they can enter their email address.
  - ▷ If the email address matches an existing contact record, return customers to the Ask a Question page, where the Email Address field is populated.
  - ▷ If the submitted email address does not match a contact record in the knowledge base, take customers to the Create an Account page. The Email Address field on this page is populated with the submitted information.
- Display the ProgressBar widget so customers who are in this workflow can determine which step of the process they're currently on.

Note Because the only step for logged-in customers is to complete the Ask a Question fields, the ProgressBar widget is enclosed in conditional tags so it won't appear to them. The ProgressBar widget includes a *current_step* attribute that gets set from the EmailCheck widget's *redirect_after_contact_creation* attribute.

Customers who click the Ask a Question navigation tab or sidebar link will see the following page when they are not logged in. The progress bar below the heading lets customers know they are on the Email step of the process.



Here is the code for the revised Ask a Question page. It includes the EmailCheck and ProgressBar widgets and the conditions for displaying them.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#" template="standard.php"
clickstream="incident_create"/>
<div id="rn_PageTitle" class="rn_AskQuestion">
    <h1>#rn:msg:SUBMIT_QUESTION_OUR_SUPPORT_TEAM_CMD#</h1>
    <rn:condition logged_in="false" url_parameter_check="step != null">
        <rn:condition url_parameter_check="step == null">
            <rn:widget path="utils/ProgressBar"/>
        <rn:condition_else/>
            <rn:widget path="utils/ProgressBar"
            current_step="#rn:url_param_value:step#"/>
        </rn:condition>
    </rn:condition>
</div>
<div id="rn_PageContent" class="rn_AskQuestion">
    <div class="rn_Padding">
        <!--Logged in or on final step of process-->
        <rn:condition logged_in="true" url_parameter_check="step == 3">
            <form id="rn_QuestionSubmit" method="post" action="/ci/
            ajaxRequest/sendForm">
                <div id="rn_ErrorLocation"></div>
                <rn:condition logged_in="false">
                <rn:widget path="input/FormInput"
                name="Contact.Emails.PRIMARY.Address" required="true"
                label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
                <rn:widget path="input/FormInput" name="Incident.Subject"
                required="true" initial_focus="true" />
                </rn:condition>
                <rn:condition logged_in="true">
                <rn:widget path="input/FormInput" name="Incident.Subject"
```

```
                    required="true" initial_focus="true"/>
                    </rn:condition>
                    <rn:widget path="input/FormInput" name="Incident.Threads"
                    required="true" label_input="#rn:msg:QUESTION_LBL#"/>
                    <rn:widget path="input/FileAttachmentUpload"/>
                    <rn:widget path="input/ProductCategoryInput"
                    name="Incident.Product" />
                        <rn:widget path="input/ProductCategoryInput"
                        name="Incident.Category"
                        label_input="#rn:msg:CATEGORY_LBL#"
                        label_nothing_selected="#rn:msg:SELECT_A_CATEGORY_LBL
                        #"/>
                    <rn:widget path="input/CustomAllInput" table="Incident"/>
                    <rn:widget path="input/FormSubmit"
                    label_button="#rn:msg:CONTINUE_ELLIPSIS_CMD#"
                    on_success_url="/app/ask_confirm"
                    error_location="rn_ErrorLocation" />
            <rn:condition answers_viewed="2" searches_done="1">
            <rn:condition_else/>
                <rn:widget path="input/SmartAssistantDialog"/>
            </rn:condition>
            </form>
            <rn:condition_else/>
                <!-- Not logged in or on one of initial steps-->
                <rn:condition url_parameter_check="step == null">
                    <p>In order to best answer your question, we need to have
                    contact information for you. Please enter your email
                    address below to start this process. </p>
                    <rn:widget path="input/EmailCheck" initial_focus="true"
                    redirect_existing_contact="/app/ask/step/3"
                    redirect_after_contact_creation="/app/ask/step/3"
                    redirect_new_contact="/app/utils/create_account/step/2" /
                    >
                </rn:condition>
            </rn:condition>
        </div>
    </div>
```

Next, go to Editing the Create an Account page.

Editing the Create an Account page

Next, you'll edit the Create an Account page. You want customers who access the page from the email check workflow to see the progress bar so they know how far along they are in the process of asking their question. However, it's not necessary or helpful to display it to customers who click the Sign Up link and access the page normally.

Although this procedure modifies the standard Create an Account page, you may want to create a separate page for this workflow if your standard page contains many fields. Because you've interrupted a customer who is trying to submit a question, we recommend that you display only the minimum number of fields your organization requires to create an account. Customers can then return quickly to the initial task.

The following procedure checks the step parameter you added to the EmailCheck widget on the Ask a Question page. If the step parameter in the URL is not null, the ProgressBar widget appears on the Create an Account page. The EmailCheck widget on the Ask a Question page uses the default value for the *redirect_after_contact_creation* attribute. (The default value is `/app/ask/step/3`.) Clicking Submit on the Create an Account page then redirects the customer to the Ask a Question page, where the progress bar shows step 3.

To edit the Create an Account page

1 Open the *create_account.php* file in the */views/pages/utils* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:CREATE_AN_ACCOUNT_CMD#</h1>
```

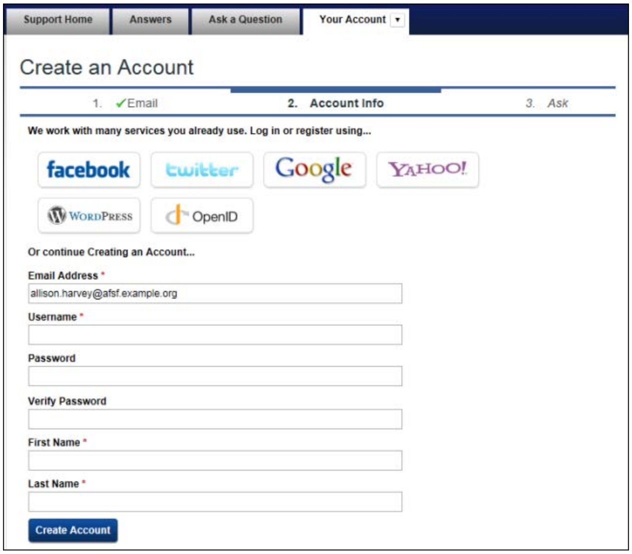
3 Add the following lines of code immediately below the line you located in step 2.

```
<rn:condition url_parameter_check="step != null">
    <rn:widget path="utils/ProgressBar"
    current_step="#rn:url_param_value:step#"/>
</rn:condition>
```

4 Save *create_account.php*.

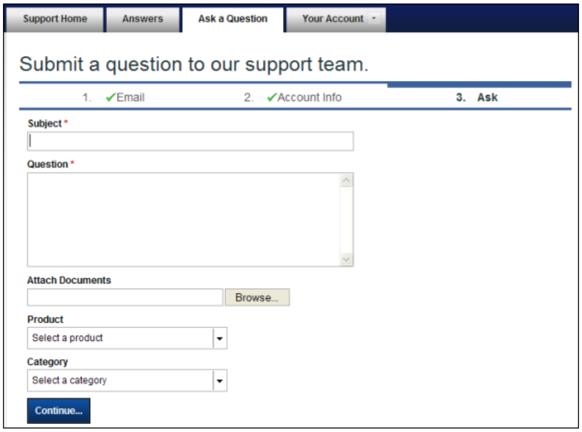
After customers enter their email address and click the Continue button on the EmailCheck widget, the Create an Account page opens. Notice that the Email Address field is populated and the progress bar indicates the Account Info step of the flow.

Click to view



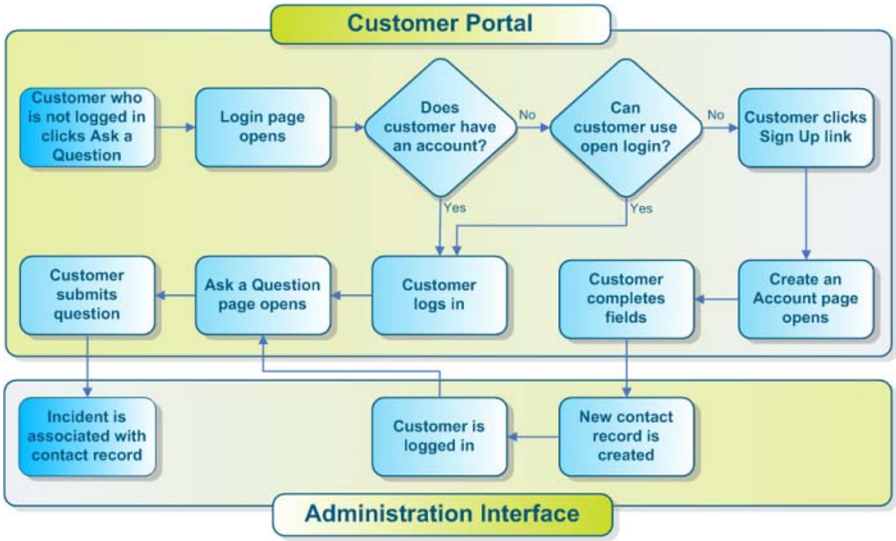
When customers complete the information on the Create an Account page and click Continue, they are logged in and redirected to the Ask a Question page.

Click to view



Requiring login

Another workflow approach is to simply require customers to log in before they can submit a question. (You'll recall that the email check workflow requires customers to have an account, but does not require them to log in prior to submitting questions.)



The open login feature enhances the ease of customer login by letting them log in through their Facebook, Twitter, Google, and other open login accounts. (Refer to Customer portal open login.) Requiring login for submitting questions can be a useful approach when you encourage open login or when your customer portal is used internally within your organization more than externally by customers. As with every Ask a Question workflow, it has advantages and disadvantages.

Pros

- The required login workflow is easy to implement.
- It is easy for customers to understand.
- You can collect whatever customer information you want.

Cons

- Requiring login can be a frustrating experience for customers.

By default, the *login_required* page meta tag attribute is false, so setting it to true requires you to add the attribute to the page code. After you've completed the following procedure, customers who click the Ask a Question tab when they're not logged in will be redirected to the Login page. After logging in or creating an account, the Ask a Question page opens.

Note The Ask a Question confirmation page should have the same value for the *login_required* page meta tag as the Ask a Question page. The following procedure adds the *login_required* attribute to both pages.

To require login on the Ask a Question page

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code at the top of the file.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="standard.php"
clickstream="incident_create"/>
```

3 Edit the code to add the *login_required* page meta tag.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="standard.php"
clickstream="incident_create" login_required="true" />
```

4 Save *ask.php*.

5 Open the *ask_confirm.php* file in the */views/pages* folder.

6 Locate the following line of code at the top of the file.

```
<rn:meta title="#rn:msg:QUESTION_SUBMITTED_LBL#"
template="standard.php"
clickstream="incident_confirm"/>
```

7 Edit the code to add the *login_required* page meta tag.

```
<rn:meta title="#rn:msg:QUESTION_SUBMITTED_LBL#"
template="standard.php"
clickstream="incident_confirm"
login_required="true" />
```

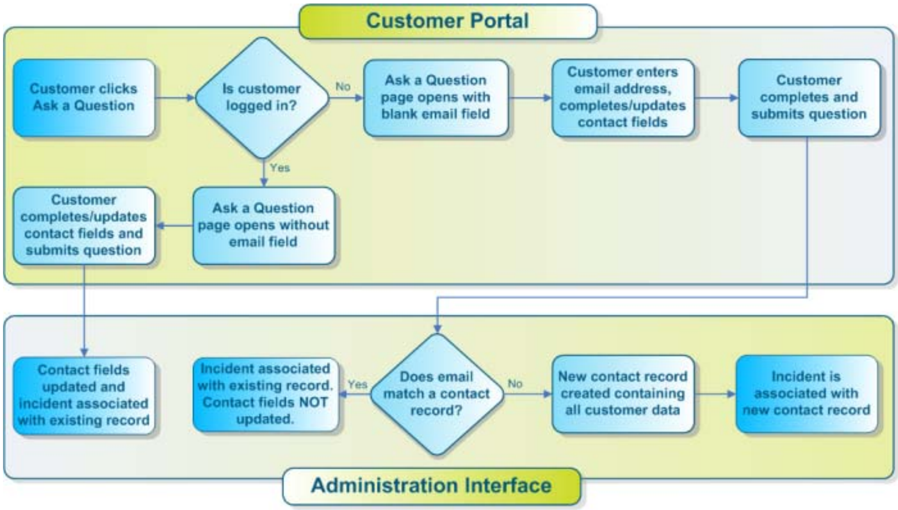
8 Save *ask_confirm.php*.

Additional contact fields workflow

You may find yourself wanting to collect more customer information than just an email address (the only information provided by the default email-only workflow) from a new customer who wants to ask a question on your site, but you don't want to redirect them to the Create an Account page (as you do with the email check workflow). One way you can accomplish this is by adding contact fields on the Ask a Question page and requiring (or simply allowing) your customers to answer them prior to submitting a question.

Before you develop this approach, however, you should understand how the application treats the data that is entered into these fields. There are three primary situations where contact information is handled differently.

- **A customer who does not have a contact record in your knowledge base asks a question.** At a minimum, the customer is required to enter an email address to submit the question. The customer must also enter information in any additional contact fields you require, and the data from the required fields is stored in the new contact record for that customer. If you have also added optional contact fields to the Ask a Question page, customer information in these fields becomes part of the contact record too.
- **An existing customer is logged in and submits a question.** The email address field does not appear on the Ask a Question page because page conditions in the code hide the field when the customer is logged in. Any additional contact fields on the page are populated with the customer's information if it is available in the contact record. If there are blank required fields on the page, the customer must complete them before submitting the question. Optional and required fields can also be edited to update the customer's contact record. (This assumes that you did not hide the additional fields for logged-in customers with the `<rn:condition logged_in="false">` tag. Obviously, if the fields are not visible to logged-in customers, they cannot edit them.)
- **An existing customer is not logged in and submits a question.** The email address field is visible because the customer is not logged in, and the customer must enter the address and other required contact fields on the page before the question is submitted. Although the additional contact fields appear on the page and the customer can add or edit them, **none of the changes made by the customer on the Ask a Question page to required or optional contact fields will be saved to the contact record if the customer enters an email address that is already in the knowledge base.** This prevents persons who know the customer's email address from being able to update the customer's information. Customers with contact records in the knowledge base must be logged in before they can edit their contact information.



It's a good idea to limit the number of additional contact fields on the Ask a Question page, and to think carefully about whether you want those fields to be visible to logged-in customers. Remember that existing customers can always update information in their contact record from the Account Settings (*profile.php*) page after they have logged in, so it's not necessary to offer that opportunity on the Ask a Question page as well.

This workflow can be most useful when you require a minimal number of additional contact fields in order to create a contact record.

Pros

- The additional contact fields workflow lets you collect more customer information than just the email address.
- It doesn't require existing customers to log in.
- It doesn't require new customers to go to the Create an Account page.

Cons

- Confusion can result when existing customers who are not logged in add new information or update fields on the page but their information is not updated in the contact record.

The following procedure shows you how to add first and last names and an alternate email address to the Ask a Question page and make the name fields required. We'll display these fields only to customers who are not logged in, remembering that any additions or changes made by customers who are not logged in but who already have an email address in the knowledge base will not be recorded.

Note Find the names of the contact fields you can use by clicking Framework > Business Objects on the Customer Portal Administration site.

To add contact fields to the Ask a Question page

1. Open the *ask.php* file in the */views/pages* folder.

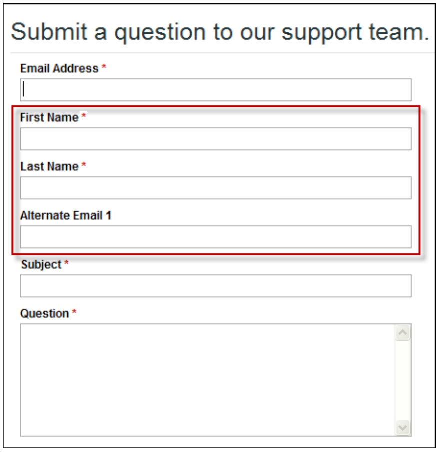
2. Locate the following lines of code between the `<rn:condition logged_in="false">` condition tags.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
initial_focus="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true" />
```

3. Add the following code between the two lines you located in step 2.

```
<rn:widget path="input/FormInput"
name="Contact.Name.First"
required="true" />
<rn:widget path="input/FormInput"
name="Contact.Name.Last"
required="true" />
<rn:widget path="input/FormInput"
name="Contact.Emails.ALT1.Address"
label_input="Alternate Email 1" />
```

4. Save *ask.php*.



Continue configuring the Ask a Question page.

Ask a Question page configuration options

The following configuration options are available on the Ask a Question page.

- Require customers to view answers or conduct searches before the Ask a Question tab is visible.
- Require customers to have an SLA (service level agreement) before submitting a question.
- Remove the Subject field.
- Populate the Subject field.
- Specify the number of levels of products and categories customers must select.
- Automatically populate the products and categories.
- Display +/– symbols for expanding and collapsing product and category trees.
- Restrict or prevent file attachments on the Ask a Question page.
- Define the amount of time a customer has to complete the Ask a Question form before it expires.
- Configure the confirmation page that tells customers their question was submitted.
- Send an email incident receipt when customers submit a question.
- Configure the SmartAssistant dialog that opens before customers complete submitting their question.

Removing the Subject field

When a customer asks a question, an **incident** is created in **Oracle RightNow Cloud Service**, and the Subject field of the incident is the same as the Subject field the customer completes on the Ask a Question page.

You have the option of removing the Subject field from the Ask a Question page. If you do so, the incident's Subject field is automatically populated with the first 80 characters of the customer's question.

To remove the Subject field from the Ask a Question page

1. Open the *ask.php* file in the */views/pages* folder.
2. Delete the following line of code from the file to remove the Subject field when the customer is not logged in.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true" />
```

3. Delete the following lines of code from the file to remove the Subject field when the customer is logged in.

```
<rn:condition logged_in="true">
    <rn:widget path="input/FormInput"
    name="Incident.Subject"
    required="true"
    initial_focus="true"/>
</rn:condition>
```

4. Save *ask.php*.

Continue configuring the Ask a Question page.

Setting the required levels of products and categories

The standard Ask a Question page does not require that customers select a minimum number of **product** or **category** levels related to their question. (If none of your products have end-user visibility specified (refer to Adding and editing products, categories, and dispositions for the step to define visibility), the product selection drop-down menu will not appear on the page. Similarly, the category menu will not appear if no categories have end-user visibility.)

We recommend that you do not require product and category selection, since doing so may result in customers abandoning the page.

Do you want to allow your customers to submit a question without specifying product or category levels?

- **Yes.** This is the default, so you can continue configuring the Ask a Question page.
- **No.** Show me how to require customers to select a certain number of product or category levels.

Requiring product and category levels

To require product and category levels on the Ask a Question page

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following lines of code in the file.

```
<rn:widget path="input/ProductCategoryInput" name="Incident.Product"
/>
<rn:widget path="input/ProductCategoryInput"
name="Incident.Category"  />
```

3 Add the *required_lvl* attribute to both ProductCategoryInput widgets to specify how many levels you want your customers to select. If you want to require two levels of products and one level of categories, your code will look like the following.

```
<rn:widget path="input/ProductCategoryInput"
name="Incident.Product"
required_lvl="2" />
<rn:widget path="input/ProductCategoryInput"
name="Incident.Category"
required_lvl="1" />
```

4 To specify how many levels will be displayed to the customer, add the *max_lvl* attribute to the ProductCategoryInput widgets. (If the value for *required_lvl* is greater than the value for *max_lvl*, the *max_lvl* value will be set equal to the *required_lvl* value.) Your code will resemble the following.

```
<rn:widget path="input/ProductCategoryInput"
name="Incident.Product"
required_lvl="2"
max_lvl="4" />
<rn:widget path="input/ProductCategoryInput"
name="Incident.Category"
required_lvl="1"
max_lvl="3" />
```

5 Save *ask.php*.

Continue configuring the Ask a Question page.

Populating products and categories

The default Ask a Question page contains fields for **products** and **categories**, which are empty until the customer makes a menu selection in the fields. If you want, you can open the Ask a Question page with the product or category already populated. In order to do that, you must know the product's ID number. The following procedures show you first how to determine a product's ID and then how to modify the Ask a Question page to populate the Product field when the page opens.

Note The procedure is the same to populate the Category field.

To identify a product's ID number

1 Log in to Oracle Service Cloud.

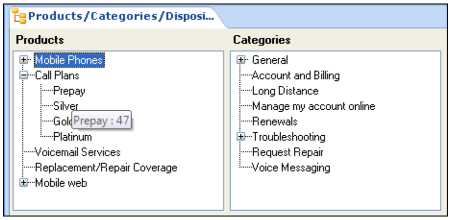
2 Click the Configuration button.

3 Double-click Products/Categories/Dispositions under Service.

4 Expand the product or category tree if necessary to view the product or category you want to add.

5 Hover over the product or category to display the ID number, and make a note of it.

6 If you are selecting a sub-product, you also need to know the ID numbers of its parent product or products. For example, in the following figure, the ID for the Prepay sub-product is 47, but you also need to know that its parent product Call Plans has an ID of 421. The full ID for Prepay is then 421,47.



Now edit the Ask a Question page to populate the Product field when the page opens.

Editing Ask a Question page to populate the Product field

To edit the Ask a Question page to populate the Product field

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/ProductCategoryInput"
name="Incident.Product" />
```

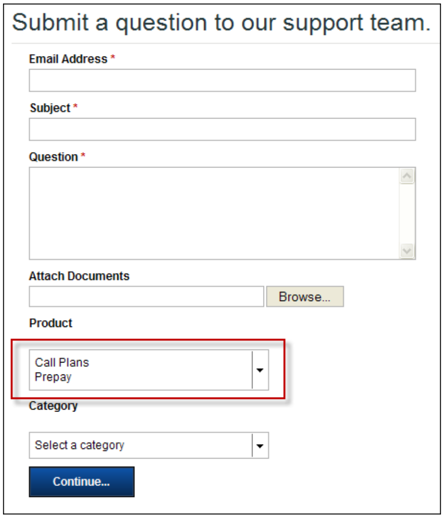
3 Add the *default_value* attribute to the ProductCategoryInput widget to specify the product you just identified the ID number for. Your code will resemble the following.

```
<rn:widget path="input/ProductCategoryInput"
name="Incident.Product"
default_value="421,47" />
```

4 Save *ask.php*.

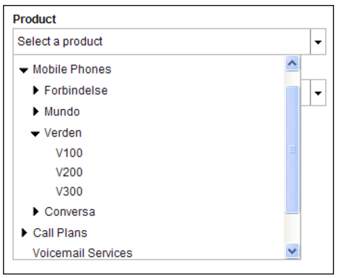
Although the *default_value* attribute takes precedence over any other method of populating the products and categories for the ProductCategoryInput widget, you can also populate the product and category fields by passing the ID numbers in the URL used to open the page. This lets you populate different products and categories when customers access the Ask a Question from different external pages. Refer to Populating fields with URLs from external pages. You can also use POST parameters, but the URL parameters will override the POST parameter if both are used.

Continue configuring the Ask a Question page.



Changing product and category tree symbols

By default, the ProductCategoryInput widget displays the hierarchical product and category trees with triangle bullets for expanding and collapsing the folders, as shown here.



If you prefer to display +/– signs for expanding and collapsing the folders, you can edit the Ask a Question page according to the following procedure.

To change the folder structure display

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following lines of code.

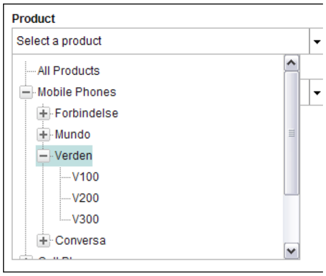
```
<rn:widget path="input/ProductCategoryInput" name="Incident.Product"
```

```
/>
<rn:widget path="input/ProductCategoryInput"
name="Incident.Category" />
```

3 Add the *treeview_css* attribute to the ProductCategoryInput widgets to change the display using the following code.

```
<rn:widget path="input/ProductCategoryInput" name="Incident.Product"
treeview_css="#rn:php:\RightNow\Utils\Url::getYUICodePath('gallery-
treeview/assets/treeview-skin.css')#" />
<rn:widget path="input/ProductCategoryInput" name="Incident.Category"
treeview_css="#rn:php:\RightNow\Utils\Url::getYUICodePath('gallery-
treeview/assets/treeview-skin.css')#" />
```

4 Save *ask.php*.



The ProductCategorySearchFilter widget, which is part of the AdvancedSearchDialog widget, also uses the *treeview_css* attribute. Refer to Changing AdvancedSearchDialog product/category tree display for the procedure to change the Answers page.

Continue configuring the Ask a Question page.

Controlling file attachments

The standard Ask a Question page lets your customers attach an unlimited number of files to the question they submit, but you can restrict the number or type of file attachments or prevent them from attaching files at all. When you restrict the number of attachments, the Browse button on the Ask a Question page is disabled after customers select the maximum number of attachments. You can also require customers to attach a minimum number of files before submitting their question.

Although you can control the number and type of file attachments that are uploaded, the size of file attachments is defined on the **administration interface** with the FATTACH_MAX_SIZE configuration setting. (The setting is located in RightNow User Interface > General >

File Attach. See To locate and edit configuration settings.) Regardless of the file attachment limits defined on the customer portal or administration interface, file upload will fail if the upload takes more than five minutes.

For a discussion about file attachment security and recommended practices, refer to File attachment security.

Refer to the following sections for additional information about security practices.

- Security-Related Configuration Settings
- Developing a Security Plan
- Recommendations for Security-Related Configuration Settings

Do you want to allow your customers an unlimited number of file attachments on the Ask a Question page?

- **Yes.** This is the default, so you can continue configuring the Ask a Question page.
- **Yes,** but I want to restrict the type of files that can be attached.
- **No,** I want to restrict the number of attachments.
- **No,** I want to remove the option of attaching files to a question.
- **No,** I want to require a minimum number of file attachments.

Restricting the type of file attachments

To restrict the type of file attachments

1. Open the *ask.php* file in the */views/pages* folder.

2. Locate the following line of code.

```
<rn:widget path="input/FileAttachmentUpload"/>
```

3. Add the *valid_file_extensions* attribute to the FileAttachmentUpload widget. Your code will resemble the following.

```
<rn:widget path="input/FileAttachmentUpload"
valid_file_extensions="doc,docx,xls,xlsx" />
```

4. To change the default label that displays if customers try to attach a file type that is not valid, add the *label_invalid_extension* attribute and define the label. (The default label in this example would be “Only the following file types are allowed: .doc, .docx, .xls, xlsx.”) Your code will resemble the following.

```
<rn:widget path="input/FileAttachmentUpload"
valid_file_extensions="doc,docx,xls,xlsx"
label_invalid_extension="You may attach only the following file
types:%s" />
```

5 Save *ask.php*.

Continue configuring the Ask a Question page.

Restricting the number of file attachments

When you restrict the number of allowable file attachments using the following procedure and customers have added the maximum number, they will see a message telling them that they have reached the limit. The Browse button is also disabled when the maximum number of files have been attached.

To restrict the number of file attachments

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FileAttachmentUpload"/>
```

3 Add the *max_attachments* attribute to the FileAttachmentUpload widget. Your code will resemble the following.

```
<rn:widget path="input/FileAttachmentUpload"
max_attachments="5" />
```

4 To change the default label that displays if customers exceed the allowable number of attachments, add the *label_max_attachment_limit* attribute and define the label. (The default label is "You have reached the limit of files that may be uploaded. To add another file, you must first remove one of the files above.") Your code will resemble the following.

```
<rn:widget path="input/FileAttachmentUpload"
max_attachments="5"
label_max_attachment_limit="You may upload only 5 files to your
question."/>
```

5 Save *ask.php*.

Continue configuring the Ask a Question page.

Removing file attachments

To remove the ability to attach files to a question

1 Open the *ask.php* file in the */views/pages* folder.

2 Delete the following line of code.

```
<rn:widget path="input/FileAttachmentUpload"/>
```

3 Save *ask.php*.

Continue configuring the Ask a Question page.

Requiring file attachments

When you set a value for the *min_required_attachments* attribute, the Attach Documents field displays an asterisk to show customers that file attachments are required.

To require a minimum number of file attachments

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FileAttachmentUpload"/>
```

3 Add the *min_required_attachments* attribute to the FileAttachmentUpload widget. Your code will resemble the following.

```
<rn:widget path="input/FileAttachmentUpload"
min_required_attachments="2" />
```

4 To change the default label that displays if customers do not attach the minimum number of attachments, add the *label_min_required* attribute and define the label. (The default label in this example would be "Attach Documents requires 2 file(s).") Your code will resemble the following.

```
<rn:widget path="input/FileAttachmentUpload"
min_required_attachments="2"
label_min_required="You must attach at least 2 files before submitting
your question."/>
```

5 Save *ask.php*.

Continue configuring the Ask a Question page.

Defining maximum form completion time

Your customers might begin filling out the Ask a Question page and then become distracted. By default, their partially completed information remains valid for 30 minutes, but you can change that value. Five minutes prior to the form's expiration (that is, 25 minutes in the default condition), customers are prompted with a warning that the form is about to expire. If they click OK in the warning message, they now have 30 minutes (or the value you set) to finish completing the form. This process will be repeated until the customer either submits the question or fails to respond to the warning message before the form expires.

To define form completion time

1 Use the procedure described in To locate and edit configuration settings to locate SUBMIT_TOKEN_EXP under RightNow User Interface > General > Security.

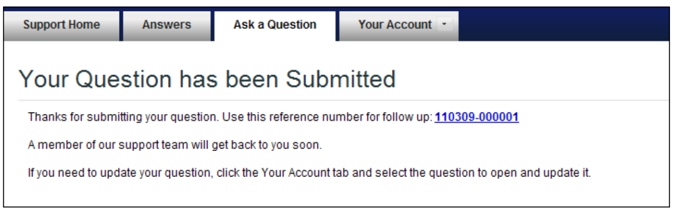
2 Click the Value field and type a value to indicate the number of minutes at which you want the form to expire.

3 Click the Save button on the ribbon.

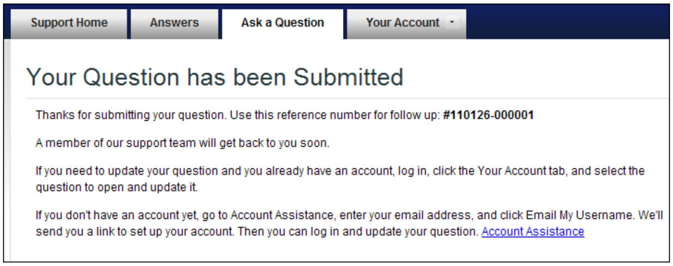
Continue configuring the Ask a Question page.

Configuring the confirmation page

By default, the Ask a Question page displays a confirmation page when a customer finishes submitting a question. The confirmation page looks like this when the customer is logged in, and the customer can click the link for the incident reference number to open the incident on the question details page.



If the customer is not logged in, the following message appears.



Do you want to display the default confirmation page when a customer submits a question?

- **Yes.** This is the default, so you can continue configuring the Ask a Question page.
- **No.** Show me how to change the confirmation page.

Editing the confirmation page

You can either edit the standard confirmation page that opens when a customer submits a question on the Ask a Question page, or you can display a different confirmation page.

To edit the standard confirmation page

1 Open the *ask_confirm.php* file in the */views/pages* folder.

2 To change the "Your Question has been Submitted" heading, locate the following line of code.

```
<h1>#rn:msg:QUESTION_SUBMITTED_HDG#</h1>
```

3 Edit the code with your revised heading. Your code will resemble the following.

```
<h1>Thank you for submitting your question.</h1>
```

4 To change any of the other **message bases** on the page, follow the example in steps 2 and 3 to locate and change the message base. (Learn about editing message bases here.)

5 Save *ask_confirm.php*.

To display a different confirmation page

Note You must edit the *ask.php* file to indicate the confirmation page.

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FormSubmit"
label_button="#rn:msg:CONTINUE_ELLIPSIS_CMD#"
on_success_url="/app/ask_confirm"
error_location="rn_ErrorLocation" />
```

3 Edit the code to replace `"/app/ask_confirm"` with the page of your choice.

4 Save *ask.php*.

Continue configuring the Ask a Question page.

Sending an incident receipt

You may want to send an email receipt to your customers when they submit a question on the Ask a Question page. By setting up an **incident rule**, you can ensure this process happens automatically. (If you need more detailed information about rules than is offered in the following procedure, refer to Business Rules Management.)

To create an incident rule for incident receipts

1 Click the Configuration button on the **navigation pane**.

2 Double-click Rules under Site Configuration. The Rules editor displays on the content pane.

3 If the Incident button is not selected on the ribbon, click it.

4 Click the Edit button on the ribbon.

5 If an initial state does not already exist for the incident rule base, create one.

- **a** Right-click States in the Rules tree and select New State.
- **b** Type a name, such as Initial State, in the State Name field.
- **c** Select the Initial State check box.
- **d** Click Save.

6 Right-click the initial state and select New Rule.

Note The incident receipt rule must be the first rule in the initial state.

7 Type a name for the incident rule in the Rule Name field.

8 Click Add IF Condition Based On. Select Incident from the menu, and then select Source from the incident conditions menu.

9 Click the arrow in the Select Operator field and select Equals.

10 Expand the End-User Pages heading in the incident source menu and select the check box for Ask a Question.

11 Click Add Action–Then. The actions menu opens.

12 Select Email and then select Send Receipt Email.

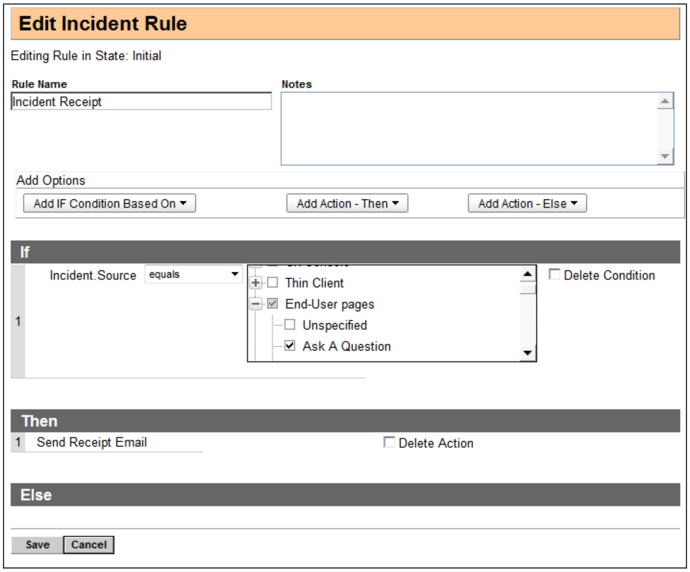
13 Click Save.

14 Expand the initial state again and determine the location of the incident receipt rule. If it is not at the top of the list, drag it to the top position.

15 Click Activate, click OK at the confirmation message, and OK again at the message that says the rule base compiled without errors.

16 If incidents are in the Null state or a state that has been removed, you should move them into an active state in the rule base. Click the drop-down arrow to select a state where the incidents should be moved and click Save. Refer to Objects in the Null state.

Continue configuring the Ask a Question page.

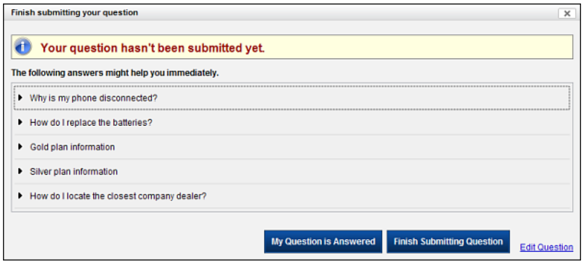


Using SmartAssistant on the Ask a Question page

When your customers can't find an answer to their question in your knowledge base, they can submit it on the Ask a Question page. Then, if you have an incident **business rule** defined to do so, the **SmartAssistant** suggested answers feature uses natural language processing to display a list of answers from your knowledge base that may contain the information your customers are seeking. The list of **suggested answers** is presented to customers before they finish submitting their questions.

Note Besides displaying a list of proposed answers to customer questions, SmartAssistant can also display standard text or a single, specific answer.

You'll first need to set up SmartAssistant on the administration interface. Then you'll configure the SmartAssistantDialog widget on the Ask a Question page.



You'll have special considerations if you're combining the SmartAssistant rule with a rule containing the Do Not Create Incident action. Click here to see the setup for that situation.

Setting up SmartAssistant on the administration interface

To set up SmartAssistant on the **administration interface**, you need to create an incident rule and then configure options for the feature, such as how many answers are displayed and how long the customer has to fill out the form before it expires.

Complete the following tasks to use SmartAssistant.

- Create an incident rule to display the SmartAssistant suggested answers to customers who submit a question on the Ask a Question page.
- Configure SmartAssistant options.

You can also specify the maximum amount of time a customer has to complete the Ask a Question page.

If you plan to use a rule with the Do Not Create Incident action, learn how to combine it with the SmartAssistant rule.

When you're finished configuring SmartAssistant on the administration interface, you can configure the SmartAssistantDialog widget on the Ask a Question page.

Creating an incident rule for SmartAssistant

If you need more detailed information about rules than is offered in the following procedure, refer to Business Rules Management.

To create an incident rule for SmartAssistant

1 Click the Configuration button on the **navigation pane**.

2 Double-click Rules under Site Configuration. The Rules editor displays on the content pane.

3 If the Incident button is not selected on the ribbon, click it.

4 Click the Edit button on the ribbon.

5 If an initial state does not already exist for the incident rule base, create one.

   a Right-click States in the Rules tree and select New State.
   b Type a name in the State Name field.
   c Select the Initial State check box.
   d Click Save.

6 Right-click the state you want to add the rule to and select New Rule.

7 Type a name for the incident rule in the Rule Name field.

8 Click Add IF Condition Based On. Select Incident from the menu, and then select Source from the incident conditions menu.

9 Click the arrow in the Select Operator field and select Equals.

10 Expand the End-User Pages heading in the incident source menu and select the check box for SmartAssistant on Ask a Question.

11 Click Add Action–Then. The actions menu opens.

12 Select Append Thread and then select Append SmartAssistant Response to Response Field. (You may need to widen the window to view and select the Append Thread options.)

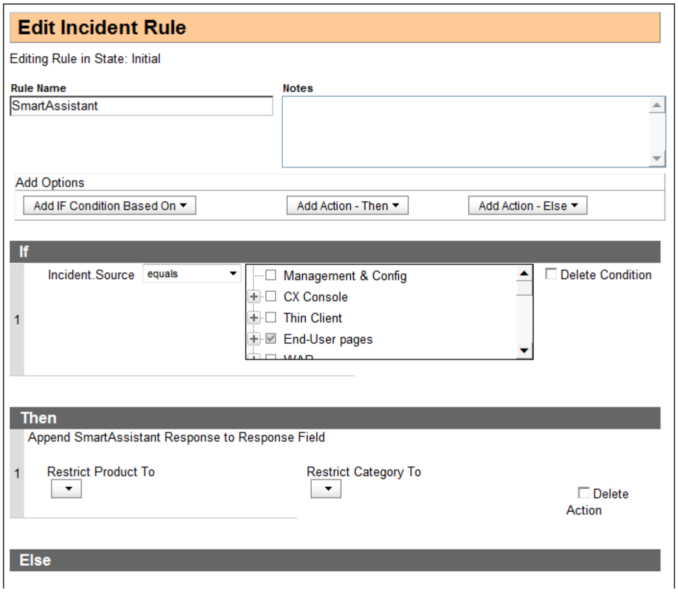
Note In addition to displaying a list of suggested answers, you can also append either standard text or the text of a specific answer. To display standard text, select Append Thread > Append Response Template to Response Field and select the standard text response from the drop-down menu. To display an answer, select Append Thread > Append Existing Solution (by Answer ID) to Response Field and type the ID of the answer you want to display.

13 Click Save.

14 Click Activate, click OK at the confirmation message, and OK again at the message that says the rule base compiled without errors.

15 If incidents are in the Null state or a state that has been removed, you should move them into an active state in the rule base. Click the drop-down arrow to select a state where the incidents should be moved and click Save. Refer to Objects in the Null state.

Now you can configure SmartAssistant options.



Configuring SmartAssistant options

If you want, you can change any of the following SmartAssistant options.

- Enable SmartAssistant optimization.
- Configure the number of days SmartAssistant optimization data remains valid.
- Define how many answers should include the full question and answer instead of just a link.
- Define the number of suggested answers displayed to the customer.
- Limit suggested answers by category or product.
- Modify the weights of answers for impacting SmartAssistant relevancy.

When you've finished configuring SmartAssistant on the **administration interface**, you can configure the SmartAssistantDialog widget for the Ask a Question page on the customer portal.

Enabling SmartAssistant optimization

By default, SmartAssistant optimization is disabled. You can enable optimization so that the parameters that control SmartAssistant accuracy are analyzed to determine their optimum values.

To enable SmartAssistant optimization

1. Use the procedure described in To locate and edit configuration settings to locate KF_SA_OPTIMIZATION_ENABLE under Common > Knowledge Base > Knowledge Foundation.

2. Click the Value field and select Yes from the drop-down menu.

3. Click the Save button on the ribbon.

Continue configuring SmartAssistant options or Configure the SmartAssistantDialog widget.

Configuring the number of days SmartAssistant optimization data is valid

SmartAssistant is optimized so that the parameters that control SmartAssistant accuracy are analyzed to determine their optimum values. By default, this data is not removed, but you can set it to expire after the number of days you specify.

To configure the number of days optimization data is valid

1 Use the procedure described in To locate and edit configuration settings to locate KF_SA_OPTIMIZATION_DATA_PURGE_DAYS under Common > Knowledge Base > Knowledge Foundation.

2 Click the Value field and type the number of days after which the optimization data is removed.

3 Click the Save button on the ribbon.

Continue configuring SmartAssistant options or Configure the SmartAssistantDialog widget.

Defining the number of answers to display as text solutions instead of links

By default, all suggested answers are displayed as links consisting of the question part of the answer, and none are expanded into the full question and answer. You can display some or all of the suggested answers as full solutions instead of links by editing a configuration setting.

To define the number of answers to display as solutions instead of links

1 Use the procedure described in To locate and edit configuration settings to locate SA_WF_SOLNS_EXPAND_CNT under RightNow User Interface > Support > SmartAssistant.

2 Click the Value field and type the number of expanded suggested answers you want to appear on the customer portal. To display all, type 5.

3 Click the Save button on the ribbon.

Continue configuring SmartAssistant options or Configure the SmartAssistantDialog widget.

Defining the number of suggested answers

By default, five answers are suggested to the customer.

To define how many answers are suggested

1 Use the procedure described in To locate and edit configuration settings to locate SA_NL_MAX_SUGGESTIONS under RightNow User Interface > Support > SmartAssistant.

2 Click the Value field and type the number of suggested answers you want to appear on the customer portal.

3 Click the Save button on the ribbon.

Continue configuring SmartAssistant options or Configure the SmartAssistantDialog widget.

Limiting suggested answers by category or product

To limit suggested answers by category or product

1 Use the procedure described in To locate and edit configuration settings to locate the following configuration settings under RightNow User Interface > Support > SmartAssistant.

2 To limit by categories, click the Value field for SA_SUGGEST_LIMIT_CAT_LVL and type a value to indicate how you want to restrict suggested answers by category sub-levels. Refer to the setting's description of the options.

3 To limit by products, click the Value field for SA_SUGGEST_LIMIT_PROD_LVL and type a value to indicate how you want to restrict suggested answers by products sub-levels. Refer to the setting's description of the options.

4 Click the Save button on the ribbon.

Continue configuring SmartAssistant options or Configure the SmartAssistantDialog widget.

Modifying SmartAssistant relevancy

Two configuration settings let you control how an incident's subject and body are treated to influence the way answers are returned in SmartAssistant. The value for SA_SUBJ_BODY_-WEIGHTS includes three values: one for the weight of the incident subject text, one for the weight of the incident body text, and one for the bonus that is added when both subject and body text are matched.

The SA_DISPATCH_RATIO value includes two values to define whether the answers are returned based on the hybrid mode used by SA_SUBJ_BODY_WEIGHTS or on the standard SmartAssistant mode. The default value "100 0" means that they will always be returned by the first mode, while "0 100" means they will always be returned by the standard mode.

Note The two values do not have to add up to 100. Instead they represent the odds that the first or second mode will be chosen. For example, a value of "50 20" means that for every 70 requests, the first mode will be chosen 50 times, and the standard mode will be chosen 20.

To modify SmartAssistant relevancy

1 Use the procedure described in To locate and edit configuration settings to locate the configuration settings under Common > Knowledge Base > Answer Search.

2 In the SA_SUBJ_BODY_WEIGHTS value field, type three values, separated by a single space, to indicate how you want to weight an incident's subject, body, and bonus value for the hybrid SmartAssistant mode. Refer to the setting's description for details.

3 In the SA_DISPATCH_RATIO value field, type two values, separated by a single space, to define the ratio for returning SmartAssistant answers using the mode from SA_SUBJ_BODY_WEIGHTS. Refer to the setting's description for details.

4 Click the Save button on the ribbon.

Note These configuration settings are also used to identify similar answers for the Smart Merge feature in **Service**. (To learn how this feature is used, refer to Merging similar answers.) If you notice that the behavior defined by these settings has changed, you might want to check to see if a knowledge base engineer changed them for use with Smart Merge.

Continue configuring SmartAssistant options or Configure the SmartAssistantDialog widget.

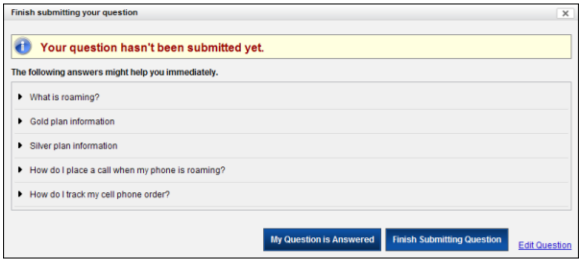
Configuring the SmartAssistantDialog widget

When your customers click the Continue button after filling out the fields on the Ask a Question page, the default response is to display the "Finish submitting your question" dialog, which is generated by the SmartAssistantDialog widget that appears in the *ask.php* file for the Ask a Question page. However, this dialog appears only if you have first configured an **incident rule** that appends **SmartAssistant** responses. (To create an incident rule and configure other SmartAssistant options, log in to the **administration interface** and click here.)

Customers can then open any of the suggested answers to see if it answers the question they are about to submit. If it does, they can click the My Question is Answered button on the dialog to close it and return to the Ask a Question page without submitting the question.

Note Anytime the SmartAssistant dialog appears and the customer clicks the My Question is Answered button, no additional SmartAssistant suggested answers appear, even if the question is modified and resubmitted.

Click to view



If you do not have a SmartAssistant incident rule set up on the administration interface, this dialog does not open. Instead, the Ask a Question confirmation page appears immediately after the customer clicks the Continue button.

By default, the SmartAssistantDialog does not open if the customer has either opened two answers or conducted one search. You can configure the condition to different values or remove the condition so the dialog always opens.

Note If you have a rule that has a Do Not Create Incident action, you will want to edit the Ask a Question page to remove the conditions that control the display of the SmartAssistantDialog. If you do not, the conditions that control the widget display will override the conditions that trigger the rule, and a warning message displays to tell customers there was a problem with their submission.

Do you want to display the SmartAssistantDialog widget when customers submit a question?

- **Yes,** and I have already configured a SmartAssistant incident rule and other SmartAssistant options. Continue configuring the Ask a Question page.
- **Yes,** but I first need to configure a SmartAssistant incident rule and other SmartAssistant options.
- **Yes,** but I want to change the number of answers viewed or searches conducted.
- **Yes,** and I want to always display the dialog, regardless of answers viewed or searches done.
- **Yes,** and I want to let customers open the suggested answers in a separate window instead of inline.

- **Yes,** but I want to change the button labels or their display order, or change the buttons to links.
- **Yes,** and I want to redirect customers when their question is answered.
- **Yes,** but I want to change the width of the dialog.
- **No,** I want to remove the SmartAssistantDialog widget.

Changing the widget display conditions

The default Ask a Question page uses a condition tag to determine whether the SmartAssistantDialog widget opens when the customer clicks the Continue button on the Ask a Question page, or whether the confirmation page appears immediately. The conditions on the default page are two answers viewed or one search conducted.

To change the answers viewed or searches done condition

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:condition answers_viewed="2"
searches_done="1">
```

3 Edit the code to either delete or change the value of the *answers_viewed* or *searches_done* attributes. If, for example, you want to change the number of answers viewed and remove the requirement to perform a search, your code will resemble the following.

```
<rn:condition answers_viewed="3">
```

4 Save *ask.php*.

Continue configuring the Ask a Question page.

Removing widget display conditions

If you remove the condition tags around the SmartAssistantDialog widget, it will always propose answers to your customers before they can finish submitting their question, regardless of the number of answers they've viewed or searches they've conducted. (You must still set up SmartAssistant incident rules and other SmartAssistant options before the widget appears on the Ask a Question page.)

To remove conditions for the SmartAssistant Dialog widget

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following lines of code.

```
<rn:condition answers_viewed="2"
searches_done="1">
<rn:condition_else/>
    <rn:widget path="input/SmartAssistantDialog"/>
</rn:condition>
```

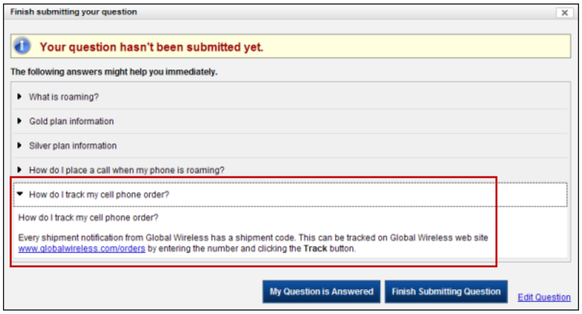
3 Delete the two lines of code beginning with <rn:condition and the </rn:condition> line. All that should remain is the code that calls the SmartAssistantDialog widget.

4 Save *ask.php*.

Continue configuring the Ask a Question page.

Opening answers in a separate window

When customers click a suggested answer on the default Ask a Question page, the answer opens inline, as shown in the following figure. (Any links in suggested answers open in a separate window.)



If you prefer to display the answer in a separate window instead, add the *display_answers_inline* attribute for the SmartAssistantDialog widget and set it to false.

To open answers in a separate window

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/SmartAssistantDialog"/>
```

3 Edit the code to add the *display_answers_inline* attribute. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
display_answers_inline="false" />
```

4 Save *ask.php*.

Changing the buttons

By default, the SmartAssistantDialog widget on the standard Ask a Question page contains a solved button (My Question is Answered), a submit button (Finish Submitting Question), and a cancel link (Edit Question). You can edit the labels for these items, change their display order on the dialog, or change the buttons to links.

To change the buttons on the SmartAssistantDialog widget

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/SmartAssistantDialog"/>
```

3 To change the labels on the buttons and link, add the *label_solved_button*, *label_submit_button*, and *label_cancel_button* attributes. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
label_solved_button="This answered my question"
label_submit_button="I still need an answer"
label_cancel_button="Return to my question" />
```

4 To change the buttons' display order, add the *button_ordering* attribute. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
button_ordering="label_submit_button, label_cancel_button,
label_solved_button" />
```

5 To change the buttons to links, add them as values to the *display_button_as_link* attribute. By default, this attribute includes only the cancel button. Items not included in this attribute display as buttons by default. For example, the following code will display the solved and submit buttons as links and the cancel link as a button.

```
<rn:widget path="input/SmartAssistantDialog"
display_button_as_link="label_solved_button, label_submit_button" />
```

6 Save *ask.php*.

Redirecting customers when their questions are answered

By default, customers who click the My Question is Answered button are redirected to the Support Home page. If you want to direct them to a different page, you can add the *solved_url* attribute to the SmartAssistantDialog widget.

To redirect customers when questions are answered

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/SmartAssistantDialog"/>
```

3 Edit the widget code to add the *solved_url* attribute. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
solved_url="/app/answers/list" />
```

4 Save *ask.php*.

Changing the dialog width

By default, the width of the SmartAssistantDialog widget on the Ask a Question page is 600 pixels. You can change the width by first deleting the widget's CSS width rule and then adding the *dialog_width* attribute. (If the widget CSS and the *dialog_width* attribute have differing values, the widget CSS takes precedence.)

To delete the CSS width rule

1 Open the *SmartAssistantDialog.css* file in the */customer/assets/themes/standard/widgetCss* folder.

2 Delete the following lines of code (beginning around line 86).

```
.rn_SmartAssistantDialogContainer {
    width: 600px;
}
```

3 Save *SmartAssistantDialog.css*.

To change the dialog width

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following line of code.

```
<rn:widget path="input/SmartAssistantDialog"/>
```

3 Add the *dialog_width* attribute. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
dialog_width="500px"/>
```

4 Save *ask.php*.

Removing the SmartAssistantDialog widget

If you remove the SmartAssistantDialog widget, answers will never be suggested to your customers after they click the Continue button. Instead, the Ask a Question confirmation page opens immediately.

To remove the SmartAssistant Dialog widget

1 Open the *ask.php* file in the */views/pages* folder.

2 Delete the following lines of code.

```
<rn:condition answers_viewed="2" searches_done="1">
<rn:condition_else/>
    <rn:widget path="input/SmartAssistantDialog"/>
</rn:condition>
```

3 Save *ask.php*.

Continue configuring the Ask a Question page.

Using the Do Not Create Incident action with SmartAssistant

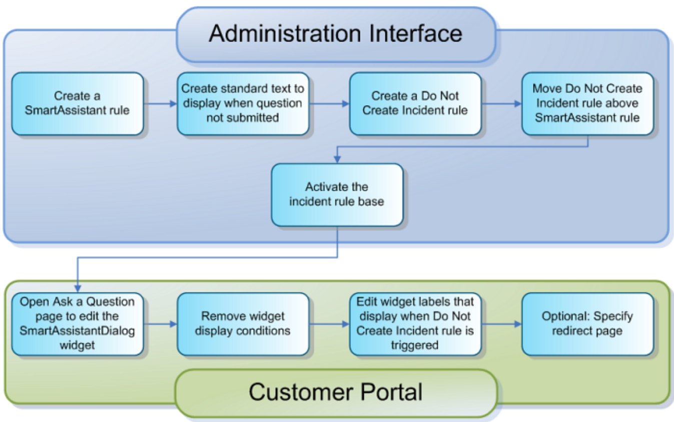
Incident business rules include an action called Do Not Create Incident. You might use this action if, for example, your organization has stopped supporting an older product. Instead of creating an incident for an unsupported product, you might want to direct customers to the

Answers page, where they can search the knowledge base for an answer to their question. In this case, the SmartAssistantDialog widget notifies them that their question hasn't been submitted and then directs them to the Answers page.

Another time you might want to combine a Do Not Create Incident rule with a SmartAssistant rule is when your organization requires additional information before a customer's question can be submitted. In this case, the rule base performs a basic form validation. It checks to see if the information is complete and, if it isn't, directs the customer back to the Ask a Question page without creating an incident from the partial question. You might use this when you have a field on the Ask a Question page that you need customers to answer only under certain conditions. For example, assume you have an Urgency field that is not required except when customers select the Troubleshooting category. When customers select Troubleshooting without selecting an Urgency option, you can automatically direct them back to the Ask a Question form to complete the field before submitting the question.

The following flow chart summarizes the steps you'll take when using a Do Not Create Incident rule with a SmartAssistant rule. The specific setup depends on which of the two preceding scenarios you want to define. Both are described in greater detail in the following sections.

Using a Do Not Create Incident rule with Smart Assistant



Preventing incident creation and redirecting customers to the Answers page

You'll use this scenario when you want to redirect customers without creating an incident from their question. When the question meets the conditions specified in the Do Not Create Incident rule and the customer clicks the Continue button, the SmartAssistantDialog widget appears. Instead of displaying the suggested answers and standard message bases, the widget displays the labels you have designed specifically for this situation.

For the sake of this example, let's assume that when customers submit an incident from the Ask a Question page that specifies the product Call Plans > Prepay, you want to tell them that the incident cannot be submitted because your organization no longer offers that product. Instead, you want to direct them to the Answers page, where they can search the knowledge base for the answer to their question. However, customers who select any other product will see the normal suggested answers presented by the SmartAssistantDialog widget.

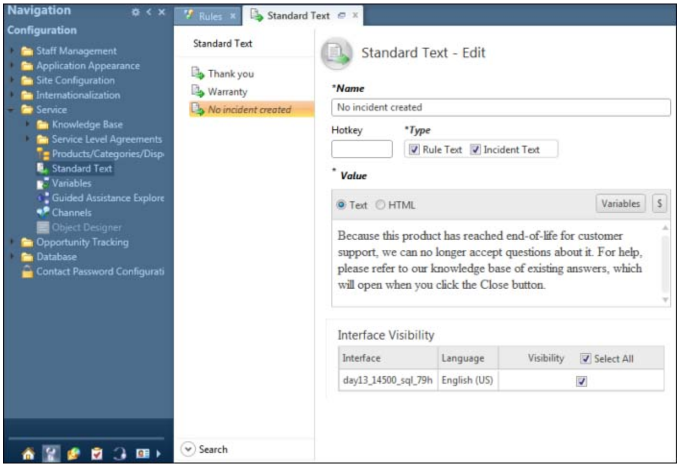
To prevent incident creation

1 Create the SmartAssistant rule. Refer to Setting up SmartAssistant on the administration interface.

2 Create the standard text message you want to display when the SmartAssistant window opens to tell customers their question has not been submitted. In this example, you might create standard text that says something like the following:

"Because this product has reached end-of-life for customer support, we can no longer accept questions about it. For help, please refer to our knowledge base of existing answers, which will open when you click the Close button."

Refer to Adding standard text.



3 Create the Do Not Create Incident rule. Follow the example in Creating an incident rule for SmartAssistant (or refer to Adding rules if you need more direction) to create the following rule.

IF Incident.Source equals End-User Pages > SmartAssistant on Ask a Question

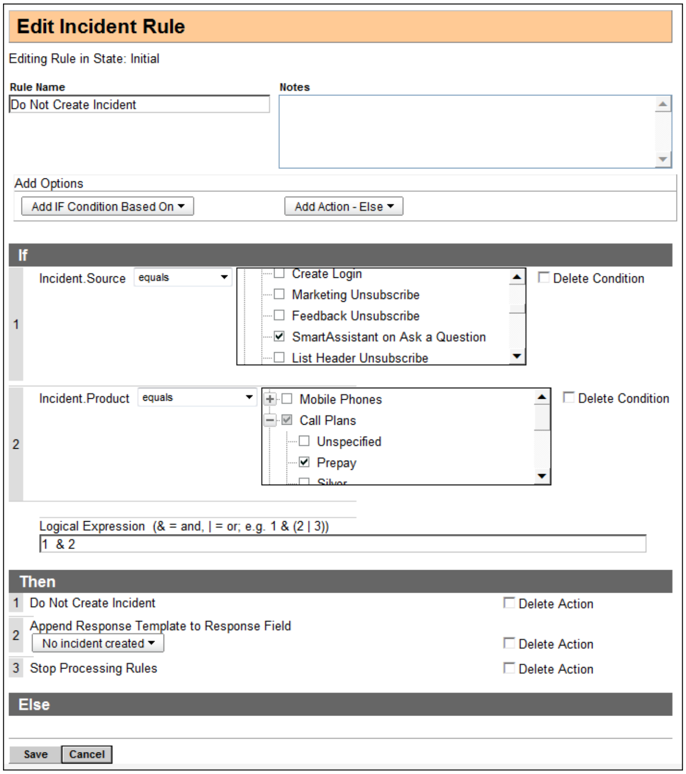
AND Incident.Product equals Call Plans > Prepay

THEN Do Not Create Incident

AND Append Response Template to Response Field (Select the standard text you created in step 2.)

AND Stop Processing Rules

Note A rule that contains the Do Not Create Incident action must include the Stop Processing Rules action as its final action.



4 On the Rules editor, drag the Do Not Create Incident rule so it appears above the SmartAssistant rule in the list of rules within the state. Refer to Modifying rule bases.

Note You'll want the rules engine to hit the Do Not Create Incident rule before it hits the SmartAssistant rule. Otherwise, customers will see suggested answers first, but will still have the option to submit their question, triggering an error message if Call Plans > Prepay is selected.

5 Activate the rule base. Refer to Compiling and activating rule bases.

6 Edit the Ask a Question page to make changes to the SmartAssistantDialog widget.

Editing the Ask a Question page for SmartAssistant redirects

To redirect customers

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following lines of code.

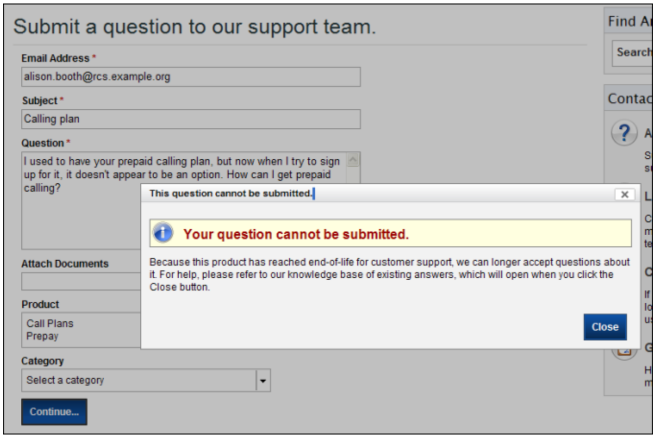
```
<rn:condition answers_viewed="2" searches_done="1">
<rn:condition_else/>
    <rn:widget path="input/SmartAssistantDialog"/>
</rn:condition>
```

3 In the code you located in step 2, delete the three lines with condition tags. If you don't remove the conditional text tags around the widget, the widget won't appear to customers who have viewed the necessary number of answers or performed searches, even if they select the Call Plans > Prepay product. All they will see is an error message telling them their question cannot be submitted.

4 Edit the SmartAssistantDialog widget code to add the *dnc_label_* attributes, which change the labels on the widget when the Do Not Create rule is encountered, and the *dnc_redirect_url*, which defines the page where the customer will be redirected. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
dnc_label_cancel_button="Close"
dnc_label_banner="Your question cannot be submitted."
dnc_label_dialog_title="This question cannot be submitted."
dnc_redirect_url="/app/answers/list" />
```

5 Save *ask.php*.



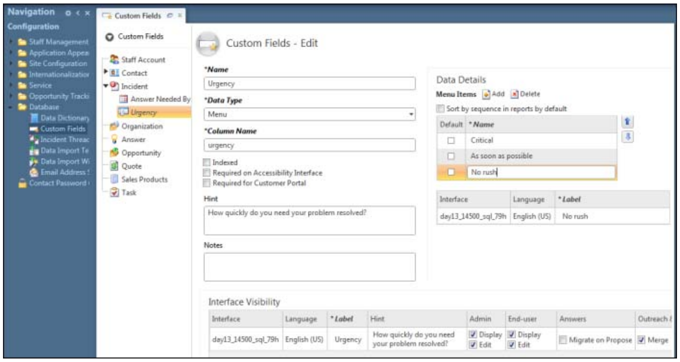
Preventing incident creation when additional information is required

The other time you might want to combine a Do Not Create Incident rule with a SmartAssistant rule is when you need a basic form validation tool. Assume, for example, that a customer selects a product on the Ask a Question page, but does not complete an optional custom field. If you want to make the custom field required only when a certain product is selected (but not when all other products are selected), you can create a rule that sends the customer back to the Ask a Question page to resubmit the form without creating an incident from the initial submission.

This example assumes you want customers to specify an urgency level whenever they select the Troubleshooting category.

To prevent incident creation

1 First create a custom field and name it Urgency. Refer to To add or edit a custom field.



2 Create the SmartAssistant rule. Refer to Setting up SmartAssistant on the administration interface.

3 Create the standard text message you want to display when the SmartAssistant window opens to tell customers their question has not been submitted. In this example, you might create standard text that says something like the following:

"When you select the Troubleshooting category, we need you to tell us how urgent your problem is. Please click the Complete Form button to return to the Ask a Question page and complete the Urgency field."

Refer to Adding standard text.

4 Create the Do Not Create Incident rule. Follow the example in Creating an incident rule for SmartAssistant (or refer to Adding rules if you need more direction) to create the following rule.

IF Incident.Source equals End-User Pages>SmartAssistant on Ask a Question

AND Incident.Category equals Troubleshooting

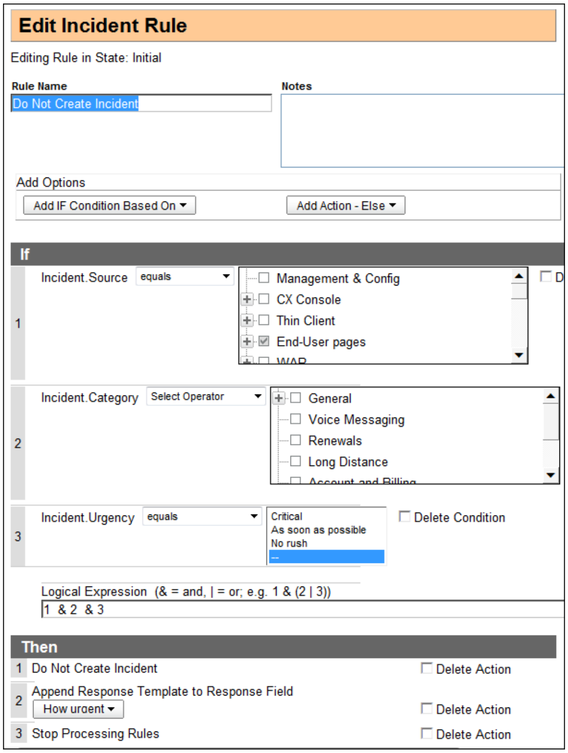
AND Incident.Urgency equals -- (that is, none of the options are selected)

THEN Do Not Create Incident

AND Append Response Template to Response Field (Select the standard text you created in step 3.)

AND Stop Processing Rules

Note A rule that contains the Do Not Create Incident action must include the Stop Processing Rules action as its final action.



5 On the Rules editor, drag the Do Not Create Incident rule so it appears above the SmartAssistant rule in the list of rules within the state. Refer to Modifying rule bases.

Note You'll want the rules engine to hit the Do Not Create Incident rule before it hits the SmartAssistant rule. Otherwise, customers will see suggested answers first, but will still have the option to submit their question, triggering an error message if Troubleshooting is selected when the Urgency field is null.

6 Activate the rule base. Refer to Compiling and activating rule bases.

7 Edit the Ask a Question page to make changes to the SmartAssistantDialog widget.

Editing the Ask a Question page to require additional information

To require additional information on the Ask a Question page

1 Open the *ask.php* file in the */views/pages* folder.

2 Locate the following lines of code.

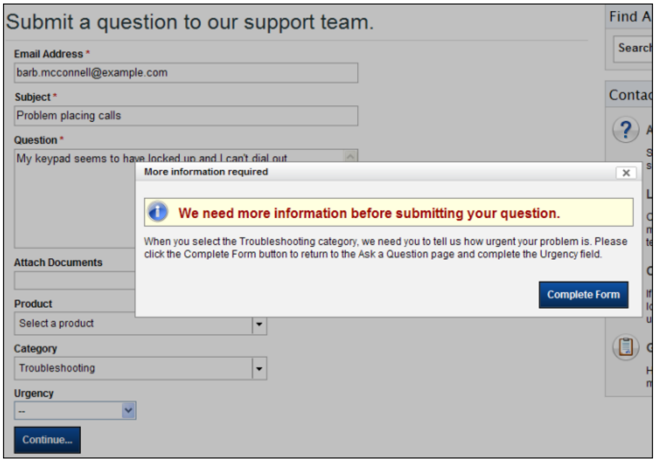
```
<rn:condition answers_viewed="2" searches_done="1">
<rn:condition_else/>
    <rn:widget path="input/SmartAssistantDialog"/>
</rn:condition>
```

3 In the code you located in step 2, delete the three lines with condition tags. If you don't remove the conditional text tags around the widget, the widget won't appear to customers who have viewed the necessary number of answers or performed searches, even if they select the Troubleshooting category. All they will see is an error message telling them their question cannot be submitted.

4 Edit the SmartAssistantDialog widget code to add the *dnc_label_* attributes, which change the labels on the widget when the Do Not Create rule is encountered. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
dnc_label_cancel_button="Complete Form"
dnc_label_banner="We need more information before submitting your
question."
dnc_label_dialog_title="More information required" />
```

5 Save *ask.php*.



Creating Siebel service requests on the Customer Portal

You can let your customers use your customer portal to create service requests in versions 8.1.1.7 and 8.1.1.11 of your Siebel CRM system. This allows you to deliver the superior web experience of the Customer Portal without having to implement the complete Oracle Service Cloud solution.

When customers submit their questions on the Customer Portal Ask a Question page, their questions are converted to Siebel service requests. (The time of service request creation is determined by the time zone configuration of the Siebel application, not by Oracle Service Cloud.) By default, the customer experience includes SmartAssistant-suggested answers for customer self-help before the question is submitted. The Oracle Service Cloud application creates a contact for customers who submit a question, but it does not create an incident in the knowledge base.

Important If customers log in to your customer portal through Facebook, the Siebel integration will not work. When they submit a question on the Ask a Question page, an incident is created in the Oracle Service Cloud knowledge base instead of a service request being created in the Siebel application.

Configuring the page set for Siebel integration

Your customers will not be able to view their service requests from the Customer Portal, so it's not necessary for them to log in. Logging in to the Customer Portal is feasible, but may provide a confusing experience. We recommend the following best practices for the most straightforward, intuitive customer experience.

Integrating Customer Portal with the Siebel CRM system

- Remove the ability to log in, create an account, or manage an account.
- Set limits on the maximum length of the Subject and Question fields.
- Remove the file attachment field from the Ask a Question page.
- Do not use any contact menu fields on the Ask a Question page. If necessary, create custom menu fields for incidents to mimic the contact menu fields you want.

Disabling login and account management functions

You'll need to edit the template to remove the Log In and Sign Up links, remove navigation to the Your Account pages, and delete the Your Account pages from your customer portal.

To disable login and account management functions

1 Open the *standard.php* file in the */views/templates* folder.

2 Delete the following lines of code to remove the Log In and Sign Up links.

```
<rn:condition_else />
    <rn:condition config_check="PTA_ENABLED == true">
        <a href="javascript:void(0);"
        id="rn_LoginLink">#rn:msg:LOG_IN_LBL#</a> | <a
        href="javascript:void(0);">#rn:msg:SIGN_UP_LBL#</a>
    <rn:condition_else />
        <a href="javascript:void(0);"
        id="rn_LoginLink">#rn:msg:LOG_IN_LBL#</a> | <a
        href="/app/utils/
        create_account#rn:session#">#rn:msg:SIGN_UP_LBL#</a>
        <rn:condition hide_on_pages="utils/create_account, utils/
        login_form, utils/account_assistance">
            <rn:widget path="login/LoginDialog"
            trigger_element="rn_LoginLink"/>
```

```
            </rn:condition>
            <rn:condition show_on_pages="utils/create_account, utils/
            login_form, utils/account_assistance">
                <rn:widget path="login/LoginDialog"
                trigger_element="rn_LoginLink"
                redirect_url="/app/account/overview"/>
            </rn:condition>
        </rn:condition>
```

3 Delete the following two lines of code to remove navigation to the Your Account pages.

```
<li><rn:widget path="navigation/NavigationTab"
label_tab="#rn:msg:YOUR_ACCOUNT_LBL#"
link="/app/account/overview"
pages="utils/account_assistance, account/overview, account/profile,
account/notif, account/change_password, account/questions/list,
account/questions/detail, account/notif/list, utils/login_form,
utils/create_account, utils/submit/password_changed, utils/submit/
profile_updated"

subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile,
#rn:msg:NOTIFICATIONS_LBL# > /app/account/notif/list"/></li>
```

4 Save *standard.php*.

5 Open the *ask.php* file in the */views/pages* folder so you can remove the logged in conditions.

6 Delete the following line of code from the file.

```
<rn:condition logged_in="false">
```

7 Delete the following lines of code.

```
</rn:condition>
<rn:condition logged_in="true">
    <rn:widget path="input/FormInput" name="Incident.Subject"
    required="true" initial_focus="true"
    label_input="#rn:msg:SUBJECT_LBL#"/>
</rn:condition>
```

8 Save *ask.php*.

9 Delete the *account* folder from */cp/customer/development/views/pages.*

10 Delete the *account_assistance.php, create_account.php, and login_form.php* files from the */cp/customer/development/views/pages/utils* folder.

Limiting Subject and Question field length

The Ask a Question page's Subject field, which allows a maximum length of 240 characters, maps to the Siebel Abstract field, which allows a maximum of only 100 characters. Characters may also be escaped before sending data to Siebel, adding even more characters to the string. (For example, the **<** character becomes **<** after being escaped.) A server-side check prevents the Subject field from sending more than 100 characters to the Siebel application and sends an error message to the customer if that number has been exceeded. To prevent customers from typing an unacceptably long value in the field only to receive an error message upon submitting, best practice recommends using the *maximum_length* attribute to limit the number of characters customers can enter to 80.

The same situation exists with Siebel's Description field, which is mapped from the Email Address and Question fields. The Question field on the customer portal can hold 4,000 characters, but the Siebel field holds only 2,000. The server-side check for this field restricts the number of characters that are sent to Siebel to 1,900, but customers will receive an error message until you limit the number of characters they can enter on the Customer Portal. Best practice in this case involves limiting the Question field to between 1,200 and 1,500 characters using the *maximum_length* attribute. You'll want to use the lower number if you have many fields on the Ask a Question page, while you can increase the value if you have few additional fields.

If the combination of the Email Address field, Question field, and any other completed fields exceeds 2,000 characters (the maximum length of the Siebel Description field), the contents will be truncated to 2,000 characters. As a result, part of the customer's submission may be missing from the service request, but the truncation process should ensure that the customer's email address and thread field are available, even if additional fields may be missing.

Important If your Siebel installation has inbox workflows enabled, the Description field length is limited to only 250 characters.

The following procedure shows you how to add the *maximum_length* attribute to the input widgets that render the Subject and Question fields.

Note If you have not already removed the logged in condition from the Ask a Question page, complete steps 5 through 8 of To disable login and account management functions before beginning this procedure.

To limit the length of the Subject and Question fields

1 Open the *ask.php* file in the */views/pages* folder.

2. Locate the following lines of code in the file.

```
<rn:widget path="input/FormInput" name="Incident.Subject"
required="true" label_input="#rn:msg:SUBJECT_LBL#"/>
<rn:widget path="input/FormInput" name="Incident.Threads"
required="true" label_input="#rn:msg:QUESTION_LBL#"/>
```

3. Edit the code so that it resembles the following.

```
<rn:widget path="input/FormInput" name="Incident.Subject"
required="true" label_input="#rn:msg:SUBJECT_LBL#"
maximum_length="80" />
<rn:widget path="input/FormInput" name="Incident.Threads"
required="true" label_input="#rn:msg:QUESTION_LBL#"
maximum_length="1200" />
</rn:condition>
```

4. Save *ask.php*.

Removing the file attachments option

The submission of file attachments with a service request is not supported so you should remove that option from the Ask a Question page.

To remove the file attachments option

1. Open the *ask.php* file in the */views/pages* folder.
2. Delete the following line of code.

```
<rn:widget path="input/FileAttachmentUpload"/>
```

3. Save *ask.php*.

Configuring Oracle Service Cloud for Siebel integration

In addition to configuring your customer portal pages for integration with the Siebel CRM system, you must configure the Oracle Service Cloud application to allow communication between the two applications. The settings are not sandboxed, that is, they apply to the development, staging, and production environments.

To define Siebel integration configuration settings

1. Use the procedure described in To locate and edit configuration settings to locate the list of settings under RightNow Common > Siebel Integration > General.

2 To edit any of the following settings, click the Value field and type a value in the field.

Table 382: Siebel Integration Configuration Settings

Setting	Description
SIEBEL_EAI_HOST	The host name of the Siebel server instance.
SIEBEL_EAI_LANGUAGE	The three-letter language code for the Siebel server instance.
SIEBEL_EAI_PASSWORD	The password for accessing the EAI inbound web services on the Siebel server instance.
SIEBEL_EAI_USERNAME	The user name for accessing the EAI inbound web services on the Siebel server instance.

3 Click the Save button on the ribbon.

Using hooks in Siebel integration

When a customer completes the Ask a Question page, the information is used to create an incident object. But the incident object is not saved in the Oracle Service Cloud knowledge base. Instead, a SOAP request is made to Siebel to create a service request. By default, the request populates only the Siebel Abstract field (from the Subject field of the Ask a Question page) and the Description field (from the Email Address and Question fields).

The following hooks are available to change existing fields, add fields, analyze and return error information, and prevent recommended actions.

pre_siebel_incident_submit

This hook lets you manipulate the data sent to Siebel, either by changing the existing Abstract and Description fields or by adding additional fields.

The hook data content includes:

- **siebelUrl**—URL of the Siebel service to create a Service Request (https://{SIEBEL_EAI_HOST}/eai_{SIEBEL_EAI_LANGUAGE}/start.swe?SWEExtSource=SecureWebService&SWEExtCmd=Execute&WSSOAP=1).
- **soapAction**—SOAPAction to put in the request (document/http://siebel.com/Service/FS/ServiceRequests:ServiceRequestInsert).
- **requestHeader**—XML data in the request before the <data:ServiceRequest> fields.
- **requestFooter**—XML data in the request after the <data:ServiceRequest> fields.

- **formData**—Same as the $formData sent to the create function in the Incident model.
- **incident**—Populated Connect Incident object.
- **siebelData**—Array of data to send to Siebel, with the keys referring to the name of each XML field to put it in (e.g. array('Abstract' => 'subject info', 'Description' => 'question thread')).

As an example, assume you have a Severity field on your Siebel application and you want all Customer Portal service requests to be set to severity level 1-Critical. Your hook function would resemble the following.

```
function preSiebelIncidentSubmit(&$hookData)
{
    // the Severity field in Siebel will now be set
    $hookData['siebelData']['Severity'] = '1-Critical';
}
```

post_siebel_incident_error

This hook lets you process errors that are found when a service request is submitted. It can either send the error information to a custom location or analyze the error information and return a custom error message back to the user.

The hook data content includes:

- **errors**—Array containing a generic error message that will be displayed to the user.
- **requestErrorNumber**—Result of curl_errno.
- **requestErrorMessage**—Result of curl_error.
- **responseInfo**—Result of curl_getinfo.
- **requestBody**—The <data:ServiceRequest> fields sent in the Siebel request.
- **incident**—Populated Connect Incident object.

You can provide a custom error message to customers in one of two ways. The first method returns a custom string:

```
function postSiebelIncidentError(&$hookData)
{
    return "Whoops! Please try again later.";
}
```

The second method is to reset the errors array:

```
function postSiebelIncidentError(&$hookData)
{
    $hookData['errors'][0] = "We're currently experiencing issues.
    Please try again later.";
```

```
}
```

pre_incident_create_save

This hook facilitates use of the framework with the Siebel integration. Although it is not recommended, you could use it to prevent saving an incident in the database.

The hook data content includes:

- **formData**—Same as the $formData sent to the create function in the Incident model.
- **incident**—Populated Connect Incident object.
- **shouldSave**—Boolean set to true.

The following hook function prevents the incident from being saved in the database.

```
function preIncidentCreateSave(&$hookData)
{
    $hookData['shouldSave'] = false;
}
```

You can also use this hook to display a custom error message to the customer using a custom string, although using the pre_incident_create hook is the recommended option.

```
function preIncidentCreateSave(&$hookData)
{
    return "Whoops! Please try again later.";
}
```

pre_register_smart_assistant_resolution

This hook facilitates use of the framework with the Siebel integration. Although it is not recommended, you could use it to prevent registering SmartAssistant resolutions with the Knowledge Foundation API.

The hook data content includes:

- **knowledgeApiSessionToken**—KFAPI session token.
- **smartAssistantToken**—SmartAssistant token.
- **resolution**—KFAPI SmartAssistantResolution object.
- **incident**—Populated Connect Incident object.
- **shouldSave**—Boolean set to true.

You can use this hook to prevent the SmartAssistant resolution from being sent to the Knowledge Foundation API.

```
function preRegisterSmartAssistantResolution(&$hookData)
{
```

```
        $hookData['shouldRegister'] = false;
    }
```

Contact records

When a customer submits a service request from the Customer Portal, Oracle Service Cloud creates a contact record in the Oracle knowledge base. If the customer already has a contact record in the knowledge base, the Customer Portal passes along the contact data that the customer has entered rather than submitting the knowledge base data.

To prevent complications when a customer already has a contact record in the knowledge base, the information that is sent to create the service record includes the customer’s raw input. Best practice recommends against adding contact menu fields because the data that is passed contains IDs rather than the field’s actual value (for example, “5” instead of “US”).

If customers with an existing contact record enter data that differs from the information in the knowledge base, the knowledge base is **not** updated with the new information.

Error handling

When an error occurs on your production customer portal, customers will see a generic error message. If you’re working in development mode, error information is appended to the generic message to provide you with better information for debugging the error.

57

Your Account Pages

The Your Account pages let your customers manage their account. Using these pages, they can view, open, and update questions they have submitted to your support team. They can update their contact information and change their account password. They can also view, renew, and delete any product/category or **answer notifications** they have subscribed to.

You can configure the following Your Account pages.

- Account Overview
- Support History
- Question details (accessed by opening a question on the Support History page)
- Account Settings
- Notifications

This section also describes the Change Your Password page.

If you are finished editing these pages and want to configure another page on your customer portal, select the page you want to edit.

- Support Home Page
- Answers Page
- Answer Details Page
- Ask a Question Page
- Log In page
- Live Help page or Chat page

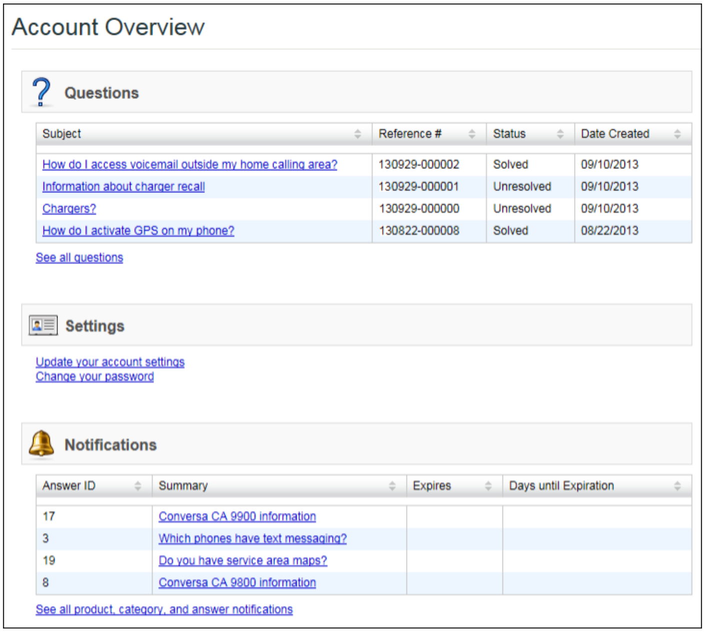
Editing the Account Overview page

When customers click the Your Account tab, the Account Overview page opens. On this page, your customers can view recent questions they've submitted and **notifications** they've requested, as well as change their account information and password. In addition, you can modify this page to display the **SLAs** applied to their account.

The configuration options for the Account Overview page include the following.

- Editing page headings, for example, the Questions or Settings heading, or other message bases on the page.
- Removing the Support History section if your organization doesn't use the Ask a Question tab to allow customers to submit questions.
- Removing the Notifications section and the ability for customers to subscribe to answers.
- Displaying the Service Contracts section if your organization uses SLAs and you want your customers to see them.
- Displaying recent logins and login attempts.

When you've finished editing the Account Overview page, continue configuring other Your Account pages.



Changing the headings on the Account Overview page

To change the Account Overview page headings

1 Open the *overview.php* file in the */views/pages/account* folder.

2 To change the Questions heading (which is also a link), locate the following line of code.

```
<h2><a class="rn_Questions"
href="/app/account/questions/
list#rn:session#">#rn:msg:QUESTIONS_HDG#</a></h2>
```

3 Edit the code with your revised heading. Your code will resemble the following.

```
<h2><a class="rn_Questions"
href="/app/account/questions/list#rn:session#">Incidents You Have
Submitted</a></h2>
```

4 To change any of the other **message bases** on the page, follow the example in steps 2 and 3 to locate and change the message base. (Learn about editing message bases here.)

5 Save *overview.php*.

Continue editing the Account Overview page or Continue configuring other Your Account pages.

Removing Support History from Account Overview

If your organization doesn't let customers submit questions through your support site, you can remove the Support History section of the Account Overview page (although you might decide to keep it for tracking incidents created through email or phone channels).

To remove Support History from the Account Overview page

1 Open the *overview.php* file in the */views/pages/account* folder.

2 Delete the following lines of code.

```
<h2><a class="rn_Questions" href="/app/account/questions/
list#rn:session#">#rn:msg:QUESTIONS_HDG#</a></h2>
<div class="rn_Questions">
    <rn:widget path="reports/Grid" report_id="196" per_page="4"
    label_caption="<span
    class='rn_ScreenReaderOnly'>#rn:msg:YOUR_RECENTLY_SUBMITTED_QUEST
    IONS_LBL#</span>"/>
    <a href="/app/account/questions/
    list#rn:session#">#rn:msg:SEE_ALL_QUESTIONS_LBL#</a>
</div>
```

3 Save *overview.php*.

Continue editing the Account Overview page or Continue configuring other Your Account pages.

Removing Notifications from your customer portal

If you don't want to let customers subscribe to answers, you'll need to remove the Notify Me link, which appears only when a customer is logged in, from the answer details page. Then you'll want to remove the Notifications option from the Your Account tab and the Notifications section from the Account Overview page. You don't have to remove the *list.php* file from the */views/pages/account/notif* folder, but you can if you're concerned that customers will accidentally access it. First we'll remove the Notify Me icon on the answer details page.

To remove the Notify Me icon from the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Delete the following lines of code.

```
<rn:condition logged_in="true">
    <rn:widget path="notifications/AnswerNotificationIcon" />
</rn:condition>
```

3 Save *detail.php*.

Next, we'll modify the template to remove the Notifications option from the Your Account tab.

Removing the Notifications option from the Your Account tab

To remove the Notifications option from the Your Account tab

1 Open the *standard.php* file in the */views/templates* folder.

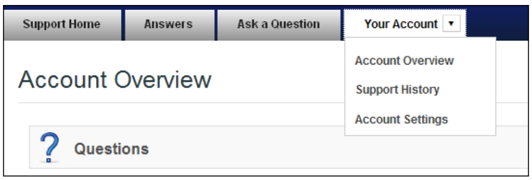
2 Locate the following line of code.

```
subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile,
#rn:msg:NOTIFICATIONS_LBL# > /app/account/notif/list"/></li>
```

3 Edit the line to delete the Notifications option as shown in the following code.

```
subpages="#rn:msg:ACCOUNT_OVERVIEW_LBL# > /app/account/overview,
#rn:msg:SUPPORT_HISTORY_LBL# > /app/account/questions/list,
#rn:msg:ACCOUNT_SETTINGS_LBL# > /app/account/profile"></li>
```

4 Save *standard.php*.



Now we'll remove the Notifications section from the Account Overview page.

Removing the Notifications section from the Account Overview page

To remove the Notifications section from the Account Overview page

1 Open the *overview.php* file in the */views/pages/account* folder.

2 Delete the following lines of code.

```
<h2><a class="rn_Notifs" href="/app/account/notif/
list#rn:session#">#rn:msg:NOTIFICATIONS_HDG#</a></h2>
<div class="rn_Notifs">
    <rn:widget path="reports/Grid" report_id="231" per_page="4"/>
    <a href="/app/account/notif/
    list#rn:session#">#rn:msg:PRODUCT_CATEGORY_ANS_NOTIFICATIONS_LBL#
    </a>
</div>
```

3 Save *overview.php*.

Displaying Service Contracts on Account Overview

If your organization uses **SLAs** and you want them to be visible to your customers, you can add the Service Contracts section to the Account Overview page.

To display Service Contracts on the Account Overview page

1 Open the *overview.php* file in the */views/pages/account* folder.

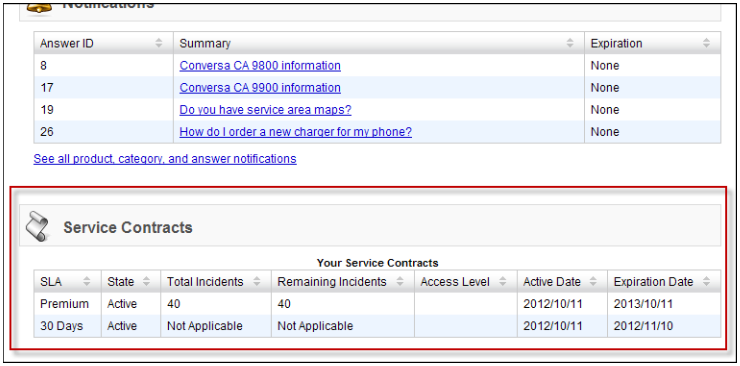
2 Locate the following lines of code at the end of the file.

```
    </div>
</div>
```

3 Add the following code just above the code you located in step 2.

```
<h2><strong class="rn_Contracts">#rn:msg:SERVICE_CONTRACTS_LBL#</
strong></h2>
<div class="rn_Contracts">
    <rn:widget path="reports/Grid" report_id="185"
    label_caption="#rn:msg:YOUR_SERVICE_CONTRACTS_LBL#"/>
</div>
```

4 Save *overview.php*.



Continue editing the Account Overview page or Continue configuring other Your Account pages.

Displaying recent logins

You can add two reports to the Account Overview page to display your customers' most recent logins as well as the number of failed login attempts since the most recent successful login.

- **Contact Login Statistics**—Displays the contact's name, the login date of the current session, the last successful login date, last successful login IP address, last unsuccessful login attempt date, and last unsuccessful login attempt IP address. By default, only login attempts from the last 60 days are available. You can drill down to find the number of unsuccessful login attempts since the previous successful login. Although the report is not visible in the Reports explorer, you can reference it with ID 10046.
- **Unsuccessful Login Attempts by Contact**—Displays the contact's name and the dates and IP addresses for the unsuccessful login attempts since the previous successful login. The report ID is 10047.

Note These reports are not part of the reference implementation but can be added to any customer portal page, not just the recommended Account Overview page. Or you can add them to a custom page and then create a link to that page from the Account Overview page or any other customer portal page.

To add login information to the Account Overview page

1 Open the *overview.php* file in the */views/pages/account* folder.

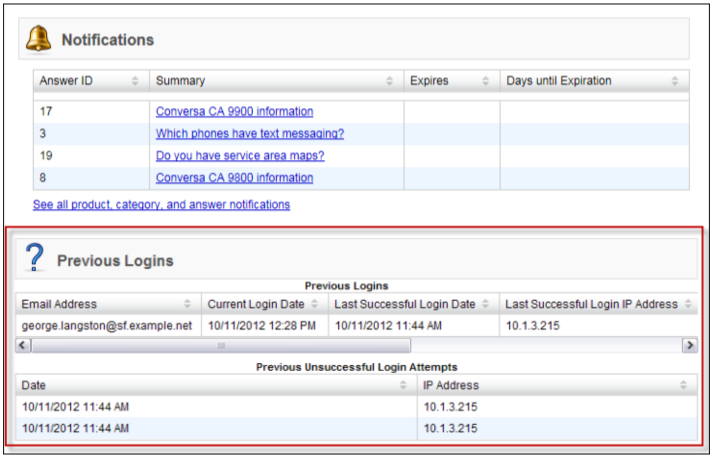
2 Locate the following lines of code at the end of the file.

```
        </div>
    </div>
```

3 Add the following code just above the code you located in step 2.

```
    <h2><strong>Previous Logins</strong></h2>
        <rn:widget path="reports/Grid" report_id="10046"
        label_caption="Previous Logins" date_format="date_time"/>
        <rn:widget path="reports/Grid" report_id="10047"
        label_caption="Previous Unsuccessful Login Attempts"
        date_format="date_time"/>
```

4 Save *overview.php*.



Editing the Your Account subpages

Besides the Account Overview page, the Your Account pages include the following.

- Support History page
- Question details page
- Account Settings page
- Notifications page

Editing the Support History page

The Support History section on the Account Overview page lists the most recent questions submitted by your customers. Customers can click the “See all questions” link on the Account Overview page to open the Support History page. Or they can select Support History from the drop-down menu on the Your Account tab.

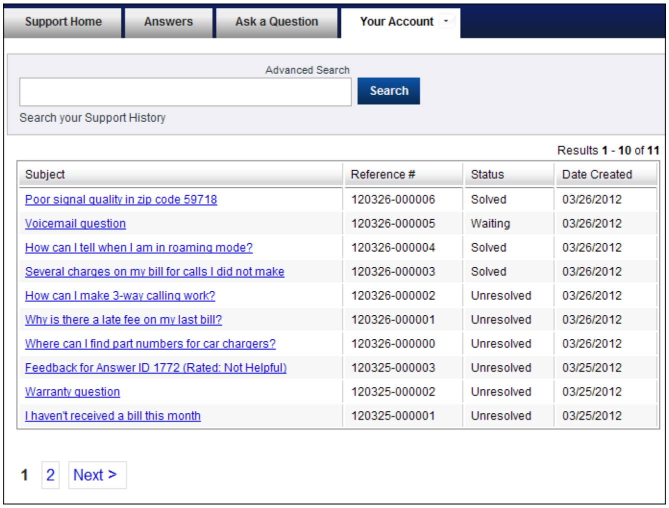
Note This page includes off-screen <h1> and <h2> tags that are made visible to screen readers using the rn_ScreenReaderOnly CSS class. These tags provide **accessible** navigation using shortcut keys for customers who use screen readers to access the customer portal pages. The content is not visible to sighted users unless styles are disabled.

For information about creating content that is hidden to all users except screen readers, refer to the WebAIM article CSS in Action: Invisible Content Just for Screen Reader Users.

Configuration options on the Support History page include the following.

- Editing the page heading
- Removing the search field from the Support History page
- Changing the report that displays the customer’s questions
- Displaying all incidents from an organization

When you’re finished editing the Support History page, you can configure the other Your Account pages.



Note If an incident has been created when a customer provided feedback that an answer was not helpful, the Subject field on the Support History page will resemble the following:

Feedback for Answer ID 1772 (Rated: Not Helpful)

Editing the Support History page heading

The heading of the Support History page is visible only to screen readers. However, you can change its value by editing the *label_caption* attribute of the report widget.

To change the Support History heading

1 Open the *list.php* file in the */views/pages/account/questions* folder.

2 Locate the following line of code.

```
<rn:widget path="reports/Grid"
label_caption="<span
class='rn_ScreenReaderOnly'>#rn:msg:SEARCH_YOUR_SUPPORT_HISTORY_CMD#<
/span>"/>
```

3 Edit the code to change the heading to the new heading. Your code will resemble the following.

```
<rn:widget path="reports/Grid"
label_caption="<span class='rn_ScreenReaderOnly'>Your Incidents</
span>"/>
```

4 Save *list.php*.

Continue editing the Support History page or Configure other Your Account subpages.

Removing the search field

To remove the search field from the Support History page

1 Open the *list.php* file in the */views/pages/account/questions* folder.

2 Delete the following lines of code.

```
<div id="rn_SearchControls">
    <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
    <form onsubmit="return false;">
            <div class="rn_SearchInput">
                <rn:widget path="search/AdvancedSearchDialog"/>
                <rn:widget path="search/KeywordText"
                label_text="#rn:msg:SEARCH_YOUR_SUPPORT_HISTORY_CMD#"
                initial_focus="true"/>
            </div>
            <rn:widget path="search/SearchButton"/>
    </form>
    <rn:widget path="search/DisplaySearchFilters"/>
</div>
```

3 Save *list.php*.

Continue editing the Support History page or Configure other Your Account subpages.

Changing the Support History report

By default, the Support History page uses the Questions report (ID 196).

To change the report on the Support History page

1 Open the *list.php* file in the */views/pages/account/questions* folder.

2 Locate the following line of code.

```
<rn:container report_id="196">
```

3 Replace `196` with the ID for the standard or custom report you want to use instead. (Learn how to find a report's ID number.)

4 Save *list.php*.

Continue editing the Support History page or Configure other Your Account subpages.

Displaying all incidents from the organization

When you add the OrgList2 widget to the Support History page, your customers can choose to view only their own **incidents**, incidents from everyone in their **organization**, or incidents from everyone in their organization and all of the organization's subsidiaries.

Note When you use the OrgList2 widget, set the value of the configuration setting MYQ_VIEW_ORG_INCIDENTS to 2.

To let customers display all incidents from the organization

1 Open the *list.php* file in the */views/pages/account/questions* folder.

2 Locate the following line of code.

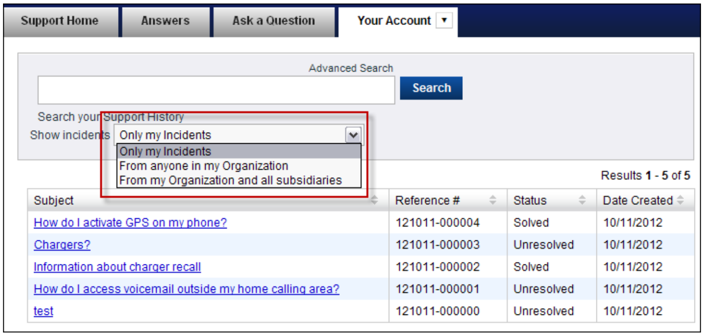
```
<div id="rn_PageContent" class="rn_QuestionList">
```

3 Type the following code just above the line you added in step 2.

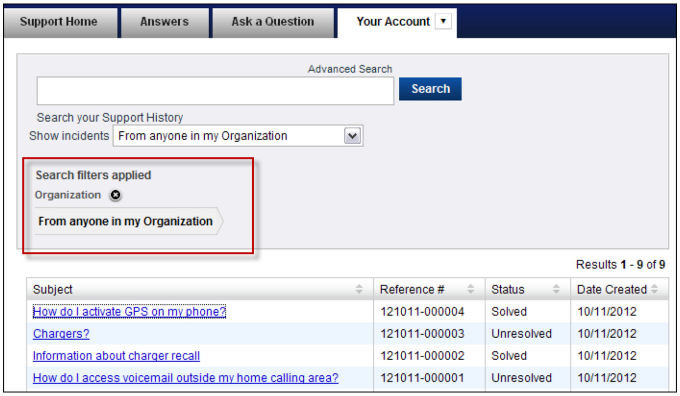
```
<rn:widget path="search/OrgList" search_on_select="true" />
```

Note When the *search_on_select* attribute is true, customers don't have to click the Search button after making their menu selection for displaying incidents because the report refreshes automatically.

4 Save *list.php*.



The report shows the selected filter and includes all incidents submitted from the customer's organization.



Notice that the report displays different incidents than the report containing only the individual's incidents.

Continue editing the Support History page or Configure other Your Account subpages.

Editing the question details page

Customer questions submitted through the customer portal generate **incidents** in your **knowledge base** that can be worked on the **agent desktop** by agents in your organization. When customers view the list of their questions on the Support History or Account Overview page, they can click an individual question to open the question details page for that question.

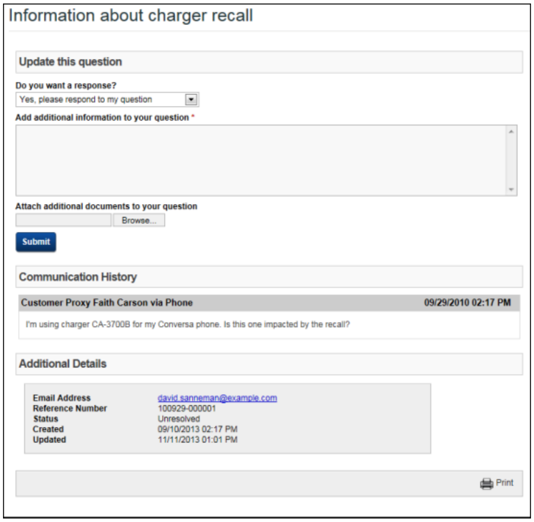
Whenever customers respond to the “Do you want a response?” question with “Yes, please respond to my question,” the Add Additional Information to Your Question field is automatically marked as a required field, and customers must enter something in the field before submitting their request.

Besides changing message bases, other configuration options on the question details page include the following.

- Change the details that are shown for the question/incident
- Prevent customers from solving incidents
- Prevent customers from updating closed incidents

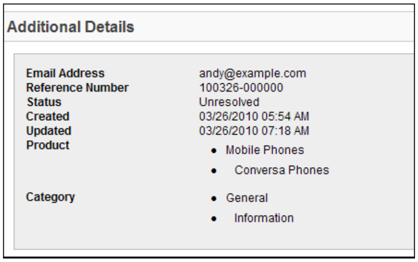
Note If incidents do not display as you expect them to, check to see if the agent associated with the incident changed font style, color, or highlighting when editing the incident on the agent desktop. Any font styles selected from the Rich Text Incident Thread control override CSS styling in customer portal code.

When you’re finished editing the question details page, you can configure the other Your Account pages.



Changing incident details

The Additional Details section on the question details page lists the customer's email address and information about the incident, including reference number, status, dates updated and created, and the associated product and category.



To add or remove incident details on the question details page

1 Open the *detail.php* file in the */views/pages/account/questions* folder.

2 Locate the following line of code.

```
<div id="rn_AdditionalInfo">
```

3 To add an incident detail, add a line of code that adds the DataDisplay widget to the block of DataDisplay code for incident fields. You can find the name of all the incident fields you can use by clicking Framework > Business Objects on the Customer Portal Administration site. (Refer to Business objects.) For example, you might want to add the time the incident was closed. In this case you would add the following code.

```
<rn:widget path="output/DataDisplay" name="Incident.ClosedTime"
label="Closed" />
```

4 To remove one of the incident fields, locate the line of code that displays the field and delete it.

5 Save *detail.php*.

Prevent customers from solving incidents or Prevent customers from updating closed incidents or Configure the other Your Account pages.

Preventing customers from solving an incident

When customers select “No, I don’t need this question answered now” from the Do You Want a Response? drop-down menu and then click Submit, the incident’s status is set to Solved automatically. You can remove the status field from the page, which prevents customers from solving incidents.

Note Removing this field prevents customers from intentionally solving an incident on the question details page. However, if customers update an incident by adding information to their question or attaching a file, the incident status is automatically set to Updated.

To prevent customers from solving incidents

1 Open the *detail.php* file in the */views/pages/account/questions* folder.

2 Delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Incident.StatusWithType.Status"
label_input="#rn:msg:DO_YOU_WANT_A_RESPONSE_MSG#"/>
```

3 Save *detail.php*.

Prevent customers from updating closed incidents or Configure the other Your Account pages.

Preventing customers from updating closed incidents

By default, the question details page uses a condition to prevent customers from updating incidents (the customers’ questions) that have been solved for more than one week (168 hours). You can change the amount of time until an incident can no longer be updated or you can prevent customers from ever updating a closed incident, regardless of how recently it’s been solved.

To prevent customers from updating solved incidents

1 Open the *detail.php* file in the */views/pages/account/questions* folder.

2 Locate the following line of code.

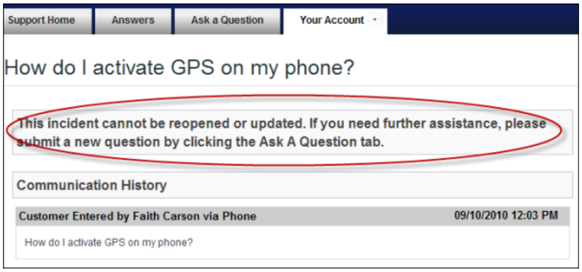
```
<rn:condition incident_reopen_deadline_hours="168">
```

3 Edit the code to change the value for the *incident_reopen_deadline_hours* attribute to 0.

```
<rn:condition incident_reopen_deadline_hours="0">
```

4 Save *detail.php*.

Configure the other Your Account pages.

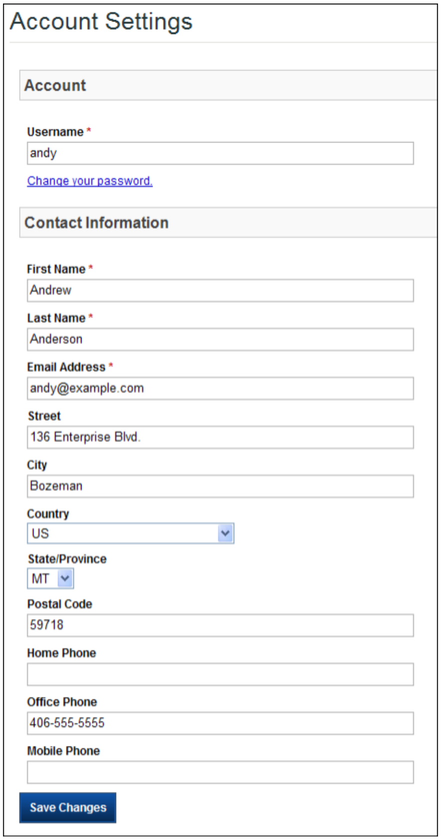


Editing the Account Settings page

The Account Settings page lets your customers update their account information. The fields on the default page include Username, First Name, Last Name, Email Address, Street, City, Country, State/Province, Postal Code, Home Phone, Office Phone, and Mobile Phone. Any **contact custom fields** that have been created on the **administration interface** and given End-user Read/Write Visibility will also appear on this page. (Refer to Setting custom field visibility.)

Besides changing the page title and other message bases on the Account Settings page, you can add or remove fields, allow multi-line address entry, and allow customers to edit fields when logging in with pass-through authentication.

When you're finished editing the Account Settings page, you can configure the other Your Account pages.



Changing the Account Settings page title

To edit the title on the Account Settings page

1 Open the *profile.php* file in the */views/pages/account* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:ACCOUNT_SETTINGS_LBL#</h1>
```

3 Edit the code you located to change the message base to your new heading. Your code will resemble the following.

```
<h1>New Title for the Account Settings Page</h1>
```

4 Save *profile.php*.

Add or remove contact fields or Configure the other Your Account pages.

Adding or removing contact fields

To add or remove contact fields on the Account Settings page

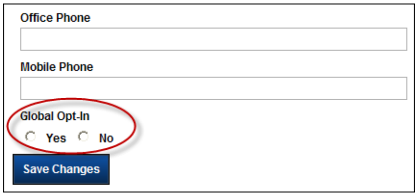
1 Open the *profile.php* file in the */views/pages/account* folder.

2 To add a field to the Account Settings page, insert a line of code that calls the FormInput widget in the location on the page where you want the field to appear. You can find the names of all the contact fields you can use by clicking Framework > Business Objects on the Customer Portal Administration site. For example, to add the alternate email address fields to the page, add the following lines of code.

```
<rn:widget path="input/FormInput" name="Contact.Emails.ALT1.Address"
label_input="Alternate Email 1" />
<rn:widget path="input/FormInput" name="Contact.Emails.ALT2.Address"
label_input="Alternate Email 2" />
```

3 To add a radio button selection that lets customers opt in to communications from your marketing department, add the following code wherever you want in the block of FormInput widgets on the page.

```
<rn:widget path="input/FormInput"
name="Contact.MarketingSettings.MarketingOptIn" label_input="Opt in
to marketing communications from us?"/>
```



4 To remove one of the contact fields, locate the line of code that displays the field and delete it. For example, to remove the phone fields, you would delete the following lines of code.

```
<rn:widget path="input/FormInput" name="Contact.Phones.HOME.Number"
label_input="#rn:msg:HOME_PHONE_LBL#">
<rn:widget path="input/FormInput" name="Contact.Phones.OFFICE.Number"
label_input="#rn:msg:OFFICE_PHONE_LBL#"/>
<rn:widget path="input/FormInput" name="Contact.Phones.MOBILE.Number"
```

```
label_input="#rn:msg:MOBILE_PHONE_LBL#"/>
```

Note The *profile.php* code contains conditional sections that display the physical address fields in a different sequence if the browser is using an Asian language. Physical address fields include Street, City, Country, State/Province, and Postal Code. If you want to remove any or all of these fields for all languages, be sure to remove them from both conditions.

5 Save *profile.php*.

Configure the other Your Account pages.

Allowing multiline address entry

To add or remove contact fields on the Account Settings page

1 Open the *profile.php* file in the */views/pages/account* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Address.Street"
label_input="#rn:msg:STREET_LBL#"/>
```

3 Add the *textarea* attribute to the FormInput widget so your code is as follows.

```
<rn:widget path="input/FormInput"
name="Contact.Address.Street"
label_input="#rn:msg:STREET_LBL#"
textarea="true" />
```

4 Save *profile.php*.

Configure the other Your Account pages.

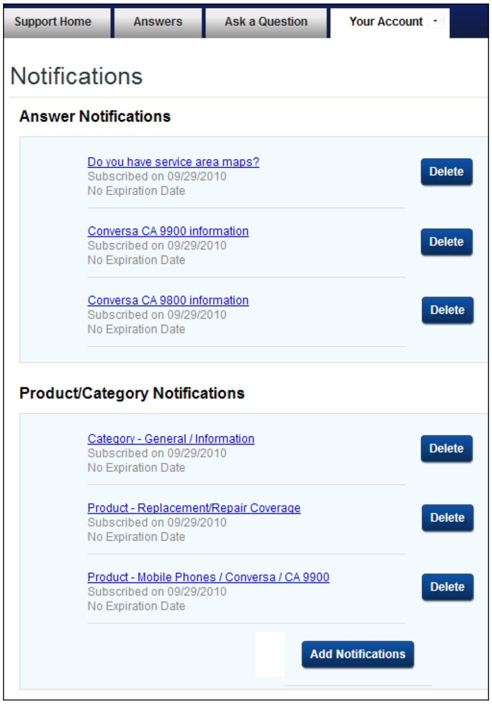
Editing the Notifications page

Your customers can access the Notifications page by selecting Notifications on the Your Account tab's drop-down menu, or they can open the page by selecting the "See all product, category, and answer notifications" link on the Account Overview page.

The Notifications page displays all answer notifications and product/category notifications the customer is subscribed to. It lists the date the customer subscribed to the notification and the date the notification expires. It also includes Delete and Renew buttons to let the customer manage all notifications from the page and an Add Notifications button so the customer can add other product/category notifications.

When your customer clicks an answer notification, the answer details page opens to display the answer. When a product/category notification is selected, the Answers page opens to display a list of all answers related to that product or category.

You can change the page title, change message bases, and remove either answer notifications or product/category notifications on the Notifications page.



Changing the Notifications page title

To edit the title on the Notifications page

1 Open the *list.php* file in the */views/pages/account/notif* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:NOTIFICATIONS_HDG#</h1>
```

3 Edit the code you located to change the message base to your new heading. Your code will resemble the following.

```
<h1>New Title for the Notifications Page</h1>
```

4 Save *list.php*.

Configure the other Your Account pages.

Removing notifications

To remove notifications from the Notifications page

1 Open the *list.php* file in the */views/pages/account/notif* folder.

2 To remove the Answer Notifications section, delete the following lines of code.

```
<h2>#rn:msg:ANSWER_LBL# #rn:msg:NOTIFICATIONS_HDG#</h2>
<rn:widget path="notifications/AnswerNotificationManager" />
```

3 To remove the Product/Category Notifications section, delete the following lines of code.

```
<h2>#rn:msg:PRODUCT_LBL#/#rn:msg:CATEGORY_LBL#
#rn:msg:NOTIFICATIONS_HDG#</h2>
<rn:widget path="notifications/ProdCatNotificationManager" />
```

4 Save *list.php*.

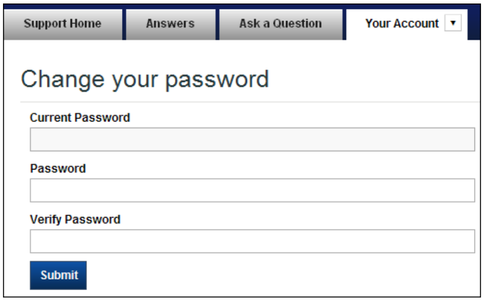
Change Your Password page

Customers can open the Change Your Password page by clicking the Change Your Password link under Settings on the Account Overview page or by clicking the Change Your Password link under Account on the Account Settings page.

Note Customers who have logged in through an open login account cannot change their password on this page. They will be required to log out and click the Forgot Your Username or Password? link.

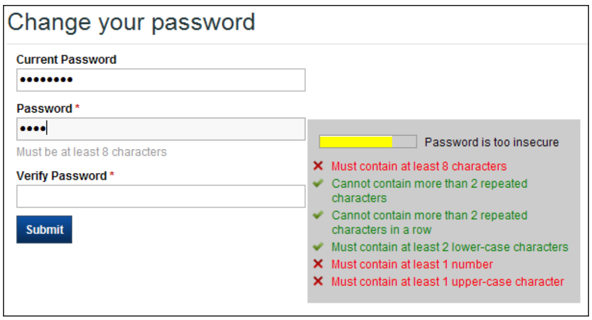
Configuration options on the Change Your Password page include the following.

- Configuring the password hardening features of the PasswordInput widget
- Editing message bases
- Editing the Password label to indicate the password minimum length requirement



Configuring the PasswordInput widget

The PasswordInput widget used on the Change Your Password page contains a password hardening feature that lets you define the strength of customer passwords on the **administration interface** (refer to [Configuring password requirements](#)). When customers change their password, the password formatting requirements appear on the page. As customers begin typing their password, the requirements that are met are marked with a green check mark. Incomplete requirements are marked with a red X.



To configure the PasswordInput widget

1 Open the *change_password.php* file in the */views/pages/account* folder.

2 Locate the following line of code.

```
<rn:widget path="input/PasswordInput"
name="Contact.NewPassword"
require_validation="true"
require_current_password="true"
```

```
label_input="#rn:msg:PASSWORD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

3 To enable the customer's web browser to auto-complete the password values, add the *disable_password_autocomplete* attribute and set it to false.

```
<rn:widget path="input/PasswordInput"
name="Contact.NewPassword"
require_validation="true"
require_current_password="true"
disable_password_autocomplete="false"
label_input="#rn:msg:PASSWORD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

4 To remove the Current Password field from the form so that customers must enter only the new password value, delete the *require_current_password* attribute.

5 To remove the validation requirement that causes the Verify Password field to appear, delete the *require_validation* attribute.

6 Save *change_password.php*.

Continue editing the Change Your Password page or Select another page to configure.

Editing message bases on the Change Your Password page

To edit message bases on the Change Your Password page

1 Open the *change_password.php* file in the */views/pages/account* folder.

2 To edit the heading, locate the following line of code and type the new heading between the `<h1>` tags.

```
<h1>#rn:msg:CHANGE_YOUR_PASSWORD_CMD#</h1>
```

3 Locate the following line of code.

```
<rn:widget path="input/PasswordInput" name="Contact.NewPassword"
require_validation="true" require_current_password="true"
label_input="#rn:msg:PASSWD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

4 To edit labels for any of the password fields, add or edit the following attributes.

a. To edit the Current Password label, add the *label_current_password* attribute and set its value to the label you want.
b. To edit the Password label, edit the value for the *label_input* attribute.
c. To edit the Verify Password label, edit the value for the *label_validation* attribute.
d. To edit the label displayed when the required password field is left blank, add the *label_required* attribute and set its value to the label you want.

5. To edit labels for any of the password hardening validation messages, add the following attributes.
   a. To edit the message stating that one or more characters are required in the password, add the *label_min_length_char* and *label_min_length_chars* attributes and set their values to the labels you want.
   b. To edit the message stating that one or more lowercase characters are required, add values for the *label_lowercase_char* and *label_lowercase_chars* attributes.
   c. To edit the message stating that a character cannot occur in the password more than the specified number of times, add values for the *label_occurring_char* and *label_occurring_chars* attribute.
   d. To edit the message stating that a character cannot be repeated consecutively more than the specified number of times, add values for the *label_repetition_char* and *label_repetition_chars* attributes.
   e. To edit the message stating that one or more uppercase characters are required, add values for the *label_uppercase_char* and *label_uppercase_chars* attributes.
   f. To edit the message stating that one or more special characters are required, add values for the *label_special_char* and *label_special_chars* attributes.
   g. To edit the message stating that one or more special characters and/or numbers are required, add values for the *label_special_digit_char* and *label_special_digit_chars* attributes.

Note Although the default label is “Must contain at least [x] numbers,” the requirement is met if customers enter the required number of numbers or special characters, or a combination of the two. If you want to be more specific, you can change the label to “Must contain any combination of at least [x] numbers and special characters.”

6. Save *change_password.php*.

If you have finished editing the Change Your Password page, you can select another page to configure.

58

Chatting on the Customer Portal

Occasionally, your customers may not find the information they are looking for on your support site or need an answer more quickly than a typical email response. When **Oracle RightNow Chat Cloud Service** (Chat) is enabled on your site, your customers can click a link to request a real-time chat session with an agent to resolve their needs quickly.

When a customer clicks the Live Chat link on the sidebar of any standard Customer Portal page, the Live Help page opens and displays a small chat request form. Once the request is submitted, the Chat page opens indicating the customer's position in the queue. Once an agent accepts the chat request, the Chat page provides a place for the customer to post messages to the agent, and displays a transcript of the chat session.

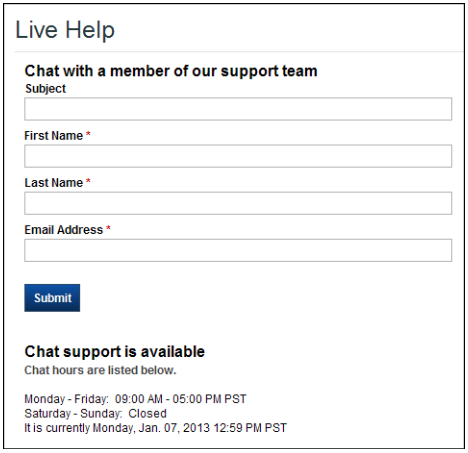
In addition to accepting requests through the sidebar link, you can add a Chat navigation tab to the template or place a chat link on any customer portal page or on an external page. Also, rather than waiting for customers to submit a request, you can proactively offer them a chat invitation based on criteria you define, such as after they perform three searches or spend a certain amount of time on a page.

Live Help page

The Live Help page is where your customers submit a request for a **chat session**. After the request has been submitted, the Chat page opens and the customer can begin chatting with an available agent. The Live Help page is opened when customers click the Live Chat link on the sidebar or the Chat navigation tab, if it has been added to the template.

The default Live Help page displays the customer's first and last names and email address if the customer is logged in. If the customer is not yet logged in, the fields are blank waiting for customer input. If you have **incident custom fields** with chat visibility, those fields are displayed on the default Live Help page as well, with required custom fields noted by a red asterisk. The page also contains a Submit Request button, a chat status message, and the chat hours listing.

[Learn how to configure the Live Help page.](#)



If you are finished editing this page and want to configure another page on your customer portal, select the page you want to edit.

- Support Home Page

- Chat page

Configuring the Live Help page

The following configuration options are available for the Live Help page.

- Change the message bases
- Change the chat hours
- Remove fields on the Live Help page
- Require an SLA for chats

When you're finished configuring the Live Help page, you can configure the Chat page.

Changing the message bases

You can change the following message bases on the Live Help page. (Learn more about editing message bases here.)

- Live Help heading
- Chat with a Support Assistant subheading
- Chat support available message

Continue configuring the Live Help page.

Changing the Live Help heading

To change the Live Help heading

1 Open the *chat_launch.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:LIVE_HELP_HDG#</h1>
```

3 Type the new heading between the `<h1>` and `</h1>` tags.

4 Save *chat_launch.php*.

Continue editing the Live Help message bases or Continue configuring the Live Help page.

Changing the Chat subheading

To change the Chat subheading

1 Open the *chat_launch.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<span
class="rn_ChatLaunchFormHeader">#rn:msg:CHAT_MEMBER_OUR_SUPPORT_TEAM_
LBL#</span>
```

3 Type a replacement heading to replace the message base. Your code will resemble the following.

```
<span class="rn_ChatLaunchFormHeader">Talk to someone on our support
team right now!</span>
```

4 Save *chat_launch.php*.

Continue editing the Live Help message bases or Continue configuring the Live Help page.

Changing the Chat Support available message

To change the Chat Support available message

1 Open the *chat_launch.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatStatus"/>
```

3 Add the *label_chat_available* attribute to the code. Your changes will resemble the following example.

```
<rn:widget path="chat/ChatStatus"
label_chat_available="Agents are currently available." />
```

4 Save *chat_launch.php*.

Continue editing the Live Help message bases or Continue configuring the Live Help page.

Changing the chat hours

The Live Help page lists the chat hours as they have been defined on the **administration interface**. If you change the chat hours on the administration interface, they will change on your customer portal.

To change chat hours

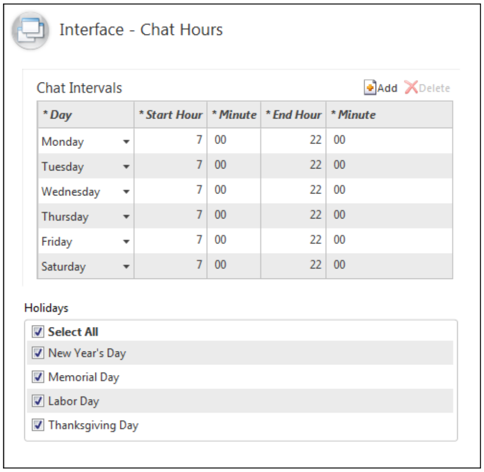
1 Log in to Oracle Service Cloud.

2 Click the Configuration button on the navigation pane.

3 Double-click Interfaces under Site Configuration. The Interfaces tree displays on the content pane.

4 Click the interface you want to edit chat hours for. The Interfaces editor displays on the content pane.

5 Click the Chat Hours button on the ribbon. The Chat Hours page opens.



6 To add a day, click the Add button and select a day from the drop-down menu.

7 To edit the start hour and minute or the end hour and minute for any day, click in the field and type the new value.

8 When you are finished making your changes, click the Save and Close button to save the chat hours and close the editor. Your changes now appear on the Live Help page.

If you need more information, refer to Setting chat hours.

Continue configuring the Live Help page.

Removing fields from the Live Help page

To remove fields from the Live Help page

1 Open the *chat_launch.php* file in the */views/pages/chat* folder.

2 Locate the following lines of code.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
label_input="#rn:msg:SUBJECT_LBL#"/>
<rn:condition config_check="COMMON:intl_nameorder == 1">
    <rn:widget path="input/FormInput"
    name="Contact.Name.Last"
    label_input="#rn:msg:LAST_NAME_LBL#"
    required="true"/>
```

```
        <rn:widget path="input/FormInput"
        name="Contact.Name.First"
        label_input="#rn:msg:FIRST_NAME_LBL#" required="true"/>
    <rn:condition_else/>
        <rn:widget path="input/FormInput"
        name="Contact.Name.First"
        label_input="#rn:msg:FIRST_NAME_LBL#"
        required="true"/>
        <rn:widget path="input/FormInput"
        name="Contact.Name.Last"
        label_input="#rn:msg:LAST_NAME_LBL#"
        required="true"/>
    </rn:condition>
    <rn:widget path="input/FormInput"
    name="Contact.Emails.PRIMARY.Address"
    required="true" label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
    <!-- optional fields -->
    <rn:widget path="input/CustomAllInput"
    table="Incident"
    chat_visible_only="true"
    always_show_mask="false" />
```

3 To remove the Subject field, delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
label_input="#rn:msg:SUBJECT_LBL#"/>
```

4 To remove the Last Name field and display only the first name, delete the following line of code from both condition cases.

```
    <rn:widget path="input/FormInput"
    name="Contact.Name.Last"
    label_input="#rn:msg:LAST_NAME_LBL#" required="true"/>
```

5 To remove the Email Address field, delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```

6 To remove incident custom fields, delete the following lines of code.

```
<!-- optional fields -->
<rn:widget path="input/CustomAllInput"
table="Incident"
chat_visible_only="true" always_show_mask="false" />
```

7 Save *chat_launch.php*.

Continue configuring the Live Help page.

Requiring an SLA for chats

You can hide the chat link on the sidebar or make the Live Help page content conditional on the customer having an **SLA.** Or, you can simply add a meta tag to the page to prevent customers without a chat SLA from requesting a chat. Customers who do not have an SLA will see a Permission Denied message.

To set an SLA condition before displaying the chat link

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:condition config_check="MOD_CHAT_ENABLED == true">
    <rn:widget path="chat/ConditionalChatLink"
    min_sessions_avail="1"/>
</rn:condition>
```

3 Add the following line of code immediately before the code you located in step 2.

```
<rn:condition sla="chat" />
```

4 Add the following code immediately after the code you located in step 2.

```
</rn:condition>
```

5 Save *standard.php*.

To set an SLA condition before displaying page content

1 Open the *chat_launch.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<!-- optional fields -->
<div id="rn_PageContent"
class="rn_Live">
```

3 Add the following line of code immediately before the code you located in step 2.

```
<rn:condition sla="chat" />
```

4 Add the following code after the last line in the *chat_launch.php* file.

```
<rn:condition_else />
<div id="rn_PageContent"
```

```
class="rn_AnswerDetail">
    <div class="rn_Padding">
        <h2>#rn:msg:PERMISSION_DENIED_LBL#</h2>
        <p>#rn:msg:CHAT_SLA_REQUIRED_LBL#</p>
    </div>
</div>
</rn:condition>
```

5 Save *chat_launch.php*.

To set a page meta tag to require an SLA

1 Open the *chat_launch.php* file in the */views/pages/chat* folder.

2 Add the *sla_required_type* page meta tag to the first line of the file, which should now read:

```
<rn:meta title="#rn:msg:LIVE_CHAT_LBL#"
template="standard.php"
clickstream="chat_request"
sla_required_type="chat" />
```

3 Save *chat_launch.php*.

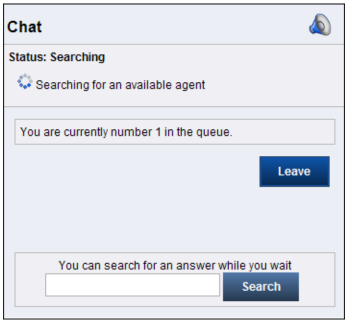
Note If you require a chat SLA on the Live Help page, you should also require one on the Chat page. Edit the *chat_landing.php* file in the same manner by adding `sla_required_type="chat"` to the line that begins with `<rn:meta`. The edited code will look like the following.

```
<rn:meta clickstream="chat_landing"
javascript_module="standard"
include_chat="true"
sla_required_type="chat" />
```

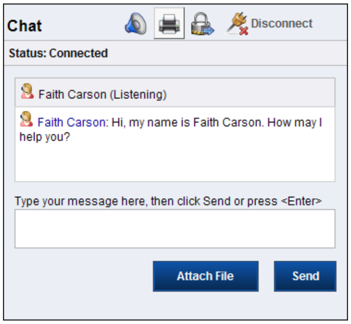
Continue configuring the Live Help page or, if finished, you can move on to configuring the Chat page.

Chat page

The Chat page opens after customers submit a chat request. While **Chat** looks for an available agent, the customer sees the screen shown here. You can tell from the look of the page that it doesn't use the standard template for the reference implementation.



After an agent accepts the chat request, the Chat page displays the agent's opening comments.



Important By default, the *chat_landing.php* file for the Chat page contains the *include_chat* page meta tag, which is set to true. If you create additional pages that contain a chat application, you must include this meta tag and set it true in the page file. When the *include_chat* tag is set to true, the page includes all the required JavaScript files for Chat.

Although the default Chat page includes multiple widgets, only the following three widgets are actually necessary to create a usable Chat page.

- ChatServerConnect
- ChatTranscript
- ChatPostMessage

Configure the required Chat page widgets or View other widgets on the Chat page.

When you're finished editing the Chat pages and want to configure another page on your customer portal, select the page you want to edit.

- Support Home Page
- Answers Page
- Answer Details Page
- Ask a Question Page
- Your Account Pages
- Log In page

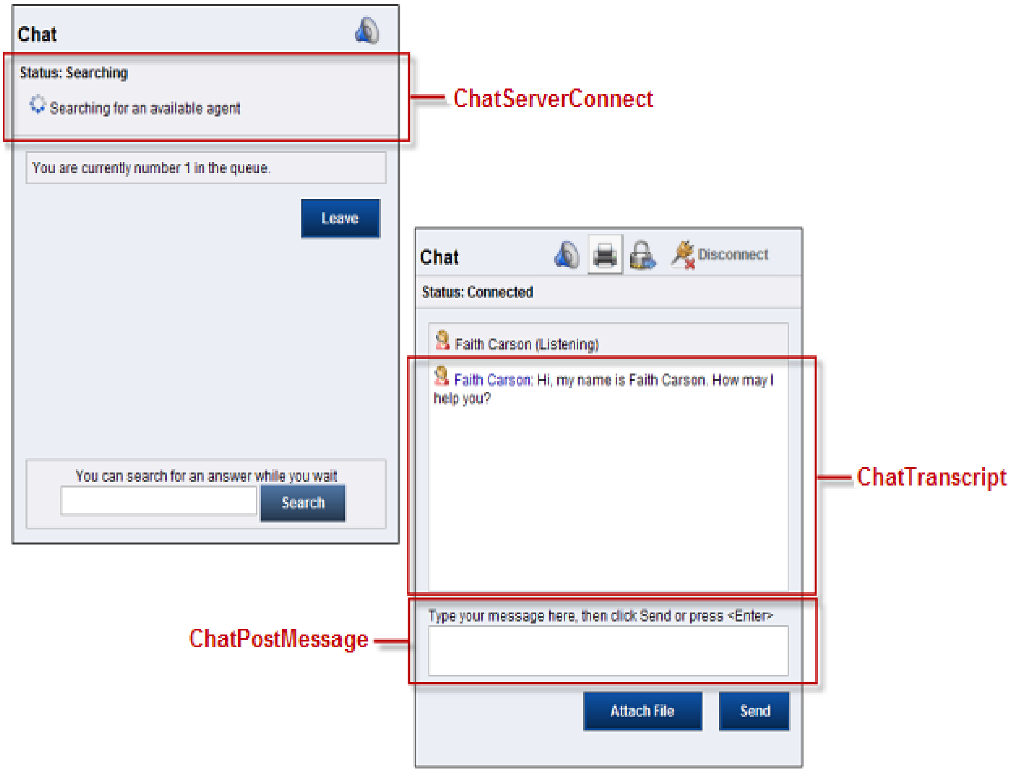
Configuring the primary chat widgets

The Chat page requires, at a minimum, the following three widgets, which you can configure.

- ChatServerConnect widget
- ChatTranscript widget
- ChatPostMessage widget

Although only three widgets are required for a working Chat page, additional chat widgets provide more functionality on the Chat page.

When you are finished configuring these widgets, continue configuring other Chat options.



Configuring the ChatServerConnect widget

The ChatServerConnect widget is used to communicate with the customer who has just requested a chat session. Besides changing the loading icon and specifying a page to be loaded in the chat window when the chat session ends, you can modify the messages that appear when connecting, when the connection succeeds or fails, and when the session is terminated.

To configure the ChatServerConnect widget

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatServerConnect"/>
```

3 To change the loading icon, add the *loading_icon_path* attribute to the widget. Your code will resemble the following.

```
<rn:widget path="chat/ChatServerConnect"
loading_icon_path="images/indicator_2.gif" />
```

4 To edit any of the following default labels (shown in quotation marks), add the associated attribute (shown in italics) and define it with your new label. (Learn about editing message bases here.)

label_connecting—"Please wait while we establish a connection to the Chat Server."

label_connection_fail—"There was a problem connecting to the Chat Server."

label_connection_success—"A connection to the Chat Server has been established successfully."

label_prevent_anonymous_chat—"One or more required contact fields are missing. Please review all fields and re-submit the chat request." This attribute applies only when you prevent anonymous chat requests by requiring one or more of the email, first name, and last name fields (the *email_required, first_name_required,* or *last_name_required* attributes).

label_terminate_session—"This action will terminate your current session. Do you want to continue?"

Your code may resemble the following.

```
<rn:widget path="chat/ChatServerConnect"
label_connecting="We are connecting to the chat server now." />
```

5 Save *chat_landing.php*.

Continue configuring other chat widgets.

Configuring the ChatTranscript widget

The ChatTranscript widget lets you replace the default icons and labels that appear on the transcript window.

- Disable new message notifications
- Replace ChatTranscript widget icons
- Replace ChatTranscript widget labels

Continue configuring other chat widgets.

Disabling new message notifications

By default, customers are notified about new messages from the chat agent if the chat transcript window does not have focus when the message is received. The title bar of the window displays the number of unread messages. If you want to disable the notification, use the following procedure.

To disable new message notifications

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatTranscript"/>
```

3 Add the *unread_messages_titlebar_enabled* attribute to the widget and set it to false. Your code will resemble the following.

```
<rn:widget path="chat/ChatTranscript"
unread_messages_titlebar_enabled="false" />
```

4 Save *chat_landing.php*.

Edit other attributes of the ChatTranscript widget or Continue configuring other chat widgets.

Replacing ChatTranscript widget icons

You can replace the following default icons, which are specified as attributes of the ChatTranscript widget, by defining the path and file name for the replacement icon. In the *chat_landing.php* file, the code for the ChatTranscript widget is the following.

```
<rn:widget path="chat/ChatTranscript"/>
```

To replace the default Agent Message icon, add the *agent_message_icon_path* attribute to the widget. Your code will resemble the following.

```
<rn:widget path="chat/ChatTranscript"
agent_message_icon_path="images/chat_agent_new.png" />
```

All default icons are in the */cp/customer/assets/themes/standard/images* folder, but you can reference the path in the widget attribute simply by typing `images/[filename]`.

- Agent Message Icon—*agent_message_icon_path* attribute
- Alert Icon—*alert_icon_path* attribute
- End-user Message Icon—*enduser_message_icon_path* attribute
- Off the Record Icon—*off_the_record_icon_path* attribute

Edit other attributes of the ChatTranscript widget or Continue configuring other chat widgets.

Editing ChatTranscript widget labels

You can replace the following default labels, which are specified as attributes of the ChatTranscript widget, by defining the new label. For specific information about where each label is used, refer to the label attribute descriptions in the widget documentation at http://<your_site>/ci/admin/docs/widgets/standard/chat/ChatTranscript.

- Agent Requesting to Control Desktop
- Agent Requesting to View Desktop
- Allow (agent to **co-browse**)
- Click (label used in co-browse invitation)
- Deny (co-browse invitation)
- End User Name Default Prefix
- File Attachment Error
- File Attachment Received
- File Attachment Started (uploading)
- Has Disconnected
- Has Joined Chat
- Has Left Chat
- Have Disconnected
- Initializing Screen Sharing Session
- Java Certificate Rejected
- Java Not Detected
- Off the Record
- Or
- Screen Sharing Session Declined
- Screen Sharing Session Ended
- Screen Sharing Session Error
- Screen Sharing Session Started
- You

Edit other attributes of the ChatTranscript widget or Continue configuring other chat widgets.

Configuring the ChatPostMessage widget

The configuration options for the ChatPostMessage widget include the following.

- Edit the label that provides the instructions for sending a post.
- Set all customer messages to post off the record.
- Notify customers that a new agent message is available.

Continue configuring other chat widgets.

Editing the instructions for sending a post

To edit the instructions label

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatPostMessage"/>
```

3 Add the *label_send_instructions* attribute to the ChatPostMessage widget to change the message that is displayed to the customer. Your code will resemble the following.

```
<rn:widget path="chat/ChatPostMessage"
label_send_instructions="Your new instructions for sending a message."
/>
```

4 Save *chat_landing.php*.

Set all customer messages to post off the record or Continue configuring other chat widgets.

Notifying customers of incoming messages

If your customers have several windows open on their desktop when they are chatting with one of your agents, they may not be aware that the agent has replied to their most recent message. You can set the *focus_on_incoming_messages* attribute of the ChatPostMessage widget to bring the chat window to the top or flash the task bar button to notify customers that a new response is available.

Note This attribute functions only for customers using Internet Explorer.

To notify customers of incoming messages

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatPostMessage"/>
```

3 Add the *focus_on_incoming_messages* attribute to the ChatPostMessage widget. Your code will resemble the following.

```
<rn:widget path="chat/ChatPostMessage"
focus_on_incoming_messages="true" />
```

4 Save *chat_landing.php*.

Additional chat widgets

Although only three widgets are required for a working Chat page, additional chat widgets provide more functionality on the Chat page.

Click to view

The ChatSoundButton widget provides an audio tone that lets your customers know when a chat agent is first connected and whenever the agent posts a message. Customers can mute the sound by clicking the widget.

You can add icons to the following buttons or change an icon that is already associated with the button. You can also change the labels for all buttons, dialog titles, and tooltips. Refer to Editing message bases.

- ChatAttachFileButton
- ChatCancelButton
- ChatDisconnectButton
- ChatOffTheRecordButton
- ChatPrintButton
- ChatRequestEmailResponseButton
- ChatSendButton

Configuring chat options

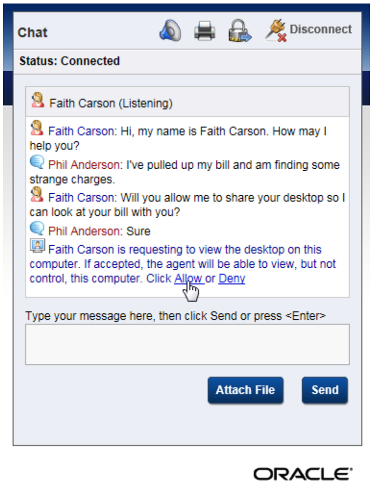
Additional chat configuration options include the following.

- Configure co-browsing by chat agents.
- Change the size of the Chat page.
- Change the size of the window that opens when customers search for an answer while waiting to chat.
- Allow or prevent chatting off the record.
- Remove the search field on the Chat page.
- Remove Virtual Assistant widgets.

When you're finished configuring chat options, you can select another page to configure.

Configuring chat co-browsing

The ChatCobrowsePremium widget can be added to the Chat page to let customers share their desktop with agents who are chatting with them. When an agent initiates screen sharing, the customer is asked to accept or deny the screen sharing request.



After the customer allows the screen sharing session, the agent can view the customer portal pages or, in Advanced Mode, the customer's entire desktop. (To learn more, see Co-browsing with customers.)

Note The Co-Browse Premium feature must be enabled before the widget displays. Contact your Oracle account manager to enable Co-Browse Premium.

The chat sessions **workspace** must be customized to add the Co-Browse tab so the agent can use the feature. Refer to Configuring co-browse on chat workspaces.

To add the ChatCobrowsePremium widget to the Chat page

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Locate the following lines of code.

```
<div id="rn_InChatButtonContainer">
    <rn:widget path="chat/ChatAttachFileButton"/>
    <rn:widget path="chat/ChatSendButton"/>
```

3 Add the following lines of code immediately after the last line you located in step 2.

```
    <rn:widget path="chat/ChatCobrowsePremium" />
```

4 Save *chat_landing.php*.

Continue configuring chat options.

Changing the Chat page size

The size of the Chat page is determined by the ChatLaunchButton widget used on the Live Help page. That means you'll have to edit the Live Help page to change the Chat page size.

To change the Chat window size

1 Open the *chat_launch.php* file in the */views/pages/chat* folder.

2 Locate the following lines of code.

```
<rn:widget path="chat/ChatLaunchButton"
    error_location="rn_ErrorLocation"
    add_params_to_url="q_id,pac,request_source,p,c,survey_send_id,sur
    vey_send_delay,survey_comp_id,survey_term_id,chat_data,survey_ter
    m_auth,survey_comp_auth"/>
```

3 Add the *launch_height* and *launch_width* attributes to the ChatLaunchButton widget to define the size of the Chat page that opens. The value you enter is in pixels, and the default height is 495 and the default width is 380. Your edited code will resemble the following.

```
<rn:widget path="chat/ChatLaunchButton"
    error_location="rn_ErrorLocation"
    launch_height="800"
    launch_width="700"
    add_params_to_url="q_id,pac,request_source,p,c,survey_send_id,sur
    vey_send_delay,survey_comp_id,survey_term_id,chat_data,survey_ter
    m_auth,survey_comp_auth"/>
```

4 Save *chat_launch.php*.

Continue configuring chat options.

Changing the answer window size

The ChatQueueSearch widget lets customers search for an **answer** while waiting for an agent. By default, a separate window opens when the Search button is clicked. You can control the size of that window by specifying its size as a percentage of the total screen height and width.

Note The *popup_window* attribute must be set to true for the changes to the answer window size to be meaningful.

To change the answer window size

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatQueueSearch"
popup_window="true"/>
```

3 Add the *popup_window_height_percent* and *popup_window_width_percent* attributes to the ChatQueueSearch widget to define the size of the answer window that opens. (These attributes actually belong to the SearchButton widget, which is contained in the ChatQueueSearch widget.) The value you enter is a percentage, and the default height is 42 percent and the default width is 30 percent. Your edited code will resemble the following.

```
<rn:widget path="chat/ChatQueueSearch"
popup_window="true"
popup_window_height_percent="50"
popup_window_width_percent="40" />
```

4 Save *chat_landing.php*.

Continue configuring chat options.

Chatting off the record

The default Chat page contains a button that customers can click to send an off-the-record message during the chat session. The button appears at the top of the page between the Print and Disconnect buttons. Any information the customer types in the Off the Record Message dialog that opens when the button is clicked will not appear on the Messages tab of the incident that is created from the chat session. Instead, the incident will show "Message Removed."

Do you want your customers to be able to submit posts using the off-the-record option?

- **Yes.** This is the default, so continue configuring chat options.
- **Yes,** and I want customer posts to always be off the record.
- **No,** I want to remove the Off the Record button and dialog.

Setting all chat posts off the record

To set all chat posts off the record

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatPostMessage"/>
```

3 Edit the widget to add the *all_posts_off_the_record* attribute, as shown in the following code.

```
<rn:widget path="chat/ChatPostMessage"
all_posts_off_the_record="true" />
```

4 Save *chat_landing.php*.

Continue configuring chat options.

Removing the off-the-record chat option

To remove the off-the-record chat option

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Delete the following two lines of code. (These lines are not sequential in the file.)

```
<rn:widget path="chat/ChatOffTheRecordDialog"/>
<rn:widget path="chat/ChatOffTheRecordButton"/>
```

3 Save *chat_landing.php*.

Continue configuring chat options.

Removing the search field

The default Chat page lets customers search your knowledge base for answers while they are waiting for an agent. If you want to remove this search field, you can delete the ChatQueue-Search widget.

To remove the search field on the Chat page when customers are waiting for an agent

1 Open the *chat_landing.php* file in the */views/pages/chat* folder.

2 Delete the following lines of code.

```
<div id="rn_ChatQueueSearchContainer">
    <rn:widget path="chat/ChatQueueSearch"/>
</div>
```

3 Save *chat_landing.php*.

Continue configuring chat options.

Removing virtual assistant widgets

The Customer Portal reference implementation includes four virtual assistant widgets on the default Chat page: VirtualAssistantAvatar, VirtualAssistantBanner, VirtualAssistantFeedback, and VirtualAssistantSimilarMatches. If your customer portal is not integrated with Oracle RightNow Virtual Assistant Cloud Service, you will want to remove these widgets to prevent widget errors from appearing in the header on your development site.

To remove Virtual Assistant widgets

1. Open the *chat_landing.php* file in the */views/pages/chat* folder.

2. Delete the following lines of code.

```
<div id="rn_VirtualAssistantContainer">
    <rn:widget path="chat/VirtualAssistantAvatar"/>
    <rn:widget path="chat/VirtualAssistantBanner"/>
</div>
```

3. Also delete the following lines of code.

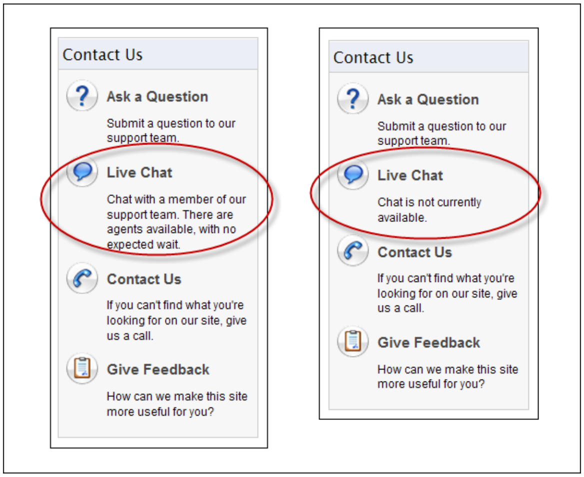
```
<rn:widget path="chat/VirtualAssistantSimilarMatches"/>
<rn:widget path="chat/VirtualAssistantFeedback"/>
```

4. Save *chat_landing.php*.

Continue configuring chat options.

Creating a chat link on a customer portal page

The reference implementation for the standard page set includes a Live Chat link on the sidebar. When Chat is enabled, the link appears by default and lets customers know whether chat sessions are currently available, if agents are available, and what the expected wait time is. The Live Help page opens when the link is clicked and chats are available. By default, the widget that creates the chat link checks for agent availability every five seconds for the first ten minutes, then every minute thereafter.



In addition to or instead of displaying the chat link on the sidebar, you might want to add the link to another customer portal page or add the link to a page that is external to the customer portal. For example, you might want to remove it from the template and add it only to the Answers page.

Adding a chat link to the Answers page

You can add a chat link to any customer portal page by inserting the ConditionalChatLink widget, but for the purpose of this procedure, we'll add it to the Answers page.

To add a chat link to the Answers page

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following line of code.

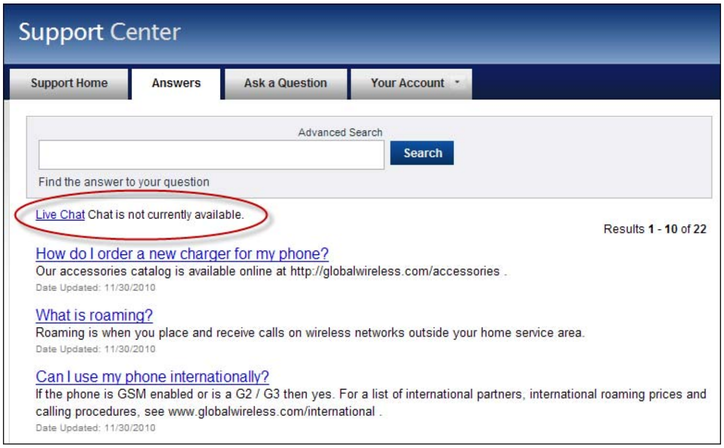
```
<h2 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_RESULTS_CMD#</h2>
```

3 Add the following directly below the code you located in step 2.

```
<rn:widget path="chat/ConditionalChatLink" />
```

4 Save *list.php*.

5 Now you can configure the ConditionalChatLink widget.



Configuring the ConditionalChatLink widget

The following configuration options are available for the ConditionalChatLink widget.

Detecting incident ID automatically

When you add the ConditionalChatLink widget to a page or edit it on the sidebar, you can pass an incident ID through the URL for the agent. To do so, add the *auto_detect_incident* attribute to the widget. Your code will resemble the following.

```
<rn:widget path="chat/ConditionalChatLink"
auto_detect_incident="true" />
```

Opening a different chat launch page

If you want to change the launch page that opens when customers click the chat link, edit the *chat_login_page* attribute to identify the new page. Your code will resemble the following.

```
<rn:widget path="chat/ConditionalChatLink"
chat_login_page="/app/chat/chat_launch_alternate1" />
```

Hiding link when agents are unavailable

You can define the ConditionalChatLink widget to appear on your customer portal only when agents are available by setting the *hide_on_unavailable* attribute to true. Your code will resemble the following.

```
<rn:widget path="chat/ConditionalChatLink"
hide_on_unavailable="true" />
```

Ignoring chat session pre-routing information

The ConditionalChatLink widget considers available information when determining agent availability levels, and pre-routes each request to a queue and agent accordingly. As a result, any information the customer enters after being pre-routed is ignored by default and will not affect the routing of the chat request.

If you want such data to be considered when routing, you can set the *ignore_preroute* attribute to true. This will enable routing rules to check the values of customer fields and re-route the request accordingly. Your code will resemble the following.

```
<rn:widget path="chat/ConditionalChatLink"
ignore_preroute="true" />
```

Important The agent availability detection and pre-routing functions occur before routing rules are applied. As a result, when the *ignore_preroute* attribute is enabled, customers may be routed to a different queue than the one originally determined by agent availability, even a queue for which no agent is immediately available. This can conflict with the indication of availability expressed by the widget itself, leading to customer confusion. For this reason, the *ignore_preroute* attribute should be enabled only when necessary for achieving a specific business goal.

Initiating link by event

If you do not want the ConditionalChatLink widget to check chat availability until it is triggered by a specific event, set the *initiate_by_event* attribute to true. The widget will display the default message ("Chat directly with a member of our support team") or any other value you define for the *label_default* attribute.

Configuring additional attributes

Other modifications to the standard ConditionalChatLink widget let you:

- Open the chat launch page in a new window (*open_in_new_window*), specify the size of that window (*chat_login_page_height, chat_login_page_width*), and add scrollbars to that window (*enable_scrollbars*).
- Disable the availability check so the link is always displayed (*enable_availability_check*).
- Disable polling, which continually checks for chat availability (*enable_polling*).
- Set a minimum number of available sessions to activate the widget (*min_sessions_avail*).
- Define the maximum wait time (*wait_threshold*).
- Edit labels (*label_available_immediately_template, label_available_with_wait_template, label_default, label_unavailable_busy_template,* and *label_unavailable_hours*).

Creating a chat link on an external page

Just as you can add a chat link to a customer portal page, you can also add one to an external page using the **syndicated** ConditionalChatLink widget. Its function is similar to the standard ConditionalChatLink widget that informs customers about the availability of chat sessions.

- Add the syndicated ConditionalChatLink widget.
- Configure the syndicated ConditionalChatLink widget.

Adding the syndicated ConditionalChatLink widget

The widget information page lets you configure the syndicated ConditionalChatLink widget by creating widget code based on the attributes you define. You'll simply copy the generated code to the external page where you want the chat link to appear.

To add the syndicated ConditionalChatLink widget to a web page

1 Type `https://<your_site>/ci/tags/syndicated_widgets/standard/ConditionalChatLink` to open the page for the syndicated ConditionalChatLink widget. The page displays a preview of the widget and the code you will add to your page.

Note Your profile must have WebDAV permission enabled, and you must log in with your Oracle Service Cloud user name and password.

2 Scroll down to the Configure Widget section and begin modifying widget attributes for your organization's needs. The attribute is on the left, the value is in the center, and a description of the attribute is on the right. For specific information about the attributes, refer to Configuring the syndicated ConditionalChatLink widget.

3 To preview your changes, click the Apply button at the bottom of the Configure Widget section. Continue to configure the widget until you are satisfied with the result.

Note You can also modify the widget's appearance by editing its CSS file, which is */cp/customer/assets/css/syndicated_widgets/standard/ConditionalChatLink.css*. If you modify the CSS file, you must reload the page to see your changes.

4 Open the source code for the web page you want to add the widget to.

5 To ensure the page renders correctly in Internet Explorer 7, add the following code to the top of the page before your first HTML tag.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http:/
/www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
```

6 On the right side of the page, click the top Select Text button to select the code in the first yellow box and press **Ctrl+c** to copy the code.

7 Paste the code into your page file just before the closing </body> tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.

8 Click the second Select Text button and copy the code that defines the widget.

9 Paste the copied code just below the code you pasted in step 7.

10 Click the third Select Text button, copy the code, and paste it in the page code where you want the widget to appear.

11 Save your web page.

Click here for information about configuring the syndicated ConditionalChatLink widget.

Configuring the syndicated ConditionalChatLink widget

The following options exist for configuring the syndicated ConditionalChatLink widget.

Opening a different page when the link is selected

The Live Help page (*/app/chat/chat_launch*) opens by default when customers click the syndicated ConditionalChatLink widget. To direct customers to a different page, type the page name in the field for the *chat_login_page* attribute. Be sure to begin the path with `/app/`.

Specifying product and category IDs

You can configure the syndicated ConditionalChatLink widget by specifying the product or category, which helps route the chat session to the most appropriate queue. You can select only one product or category in the attribute's field, so if the product or category you want is a sub-level, you'll need to enter the ID for the sub-product or sub-category instead of the ID for the parent level. To determine the ID for a product or category, refer to Finding product ID numbers.

To add a product, type the product ID number in the field for the attribute called *p*. To add a category, type its ID number in the field for the *c* attribute.

Specifying custom fields

Type one or more key-value pairs in the field for the *custom_fields* attribute. The key is the custom field ID and the value is the value of the custom field.

Note If you add or remove custom fields on the **administration interface**, the changes do not appear on the page containing the syndicated widget until the duration specified in CACHED_CONTENT_EXPIRE_TIME passes. You must then refresh the page and, if Internet Explorer is the browser, you may also need to close and reopen the browser.

Ignoring chat session pre-routing

Customers are pre-routed to a chat queue based on agent availability. As a result, any information they enter after being pre-routed is ignored. If you want customer data to be considered when routing to a chat session, select the Enabled check box for the *ignore_preroute* attribute. (It is possible that customers may then be routed to a different queue than the one originally determined by agent availability.)

Additional attributes for the syndicated ConditionalChatLink widget

Other modifications to the syndicated ConditionalChatLink widget let you:

- Open the chat launch page in a new window (*open_in_new_window*) and specify the size of that window (*chat_login_page_height, chat_login_page_width*).
- Disable the availability check so the link is always displayed (*enable_availability_check*).
- Disable polling, which continually checks for chat availability (*enable_polling*).
- Set a minimum number of available sessions to activate the widget (*min_sessions_avail*).
- Define the maximum wait time (*wait_threshold*).
- Edit labels (*label_available_immediately_template, label_available_with_wait_template, label_default, label_unavailable_busy_template,* and *label_unavailable_hours*).
- Define IDs for the widget container (*container_element_id*), the widget instance (*instance_id*), and the HTML elements that display the widget and chat link (*info_element_id, link_element_id*).

Offering customers a chat session

Rather than waiting for your customers to request a **chat session**, you may want to offer them one when it appears they are not finding the information they are looking for. You can proactively offer a chat session from your customer portal pages as well as from any external page on your website.

- Offering a chat on customer portal pages
- Offering a chat on external pages
- Reports for the ProactiveChat widget

The following summary of events occurs when a customer accepts a chat offer through either the ProactiveChat widget in the */cp/core/widgets/standard/chat* folder or the **syndicated** ProactiveChat widget accessed by clicking Widgets > Syndicated Widgets on the Customer Portal Administration page.

- Before the chat is offered to the customer, the chat session routing rules determine what **queue** the chat request will be directed to based on **products**, **categories**, **custom fields**, and other **rule conditions**.
- When the customer accepts the chat request, the chat page that opens contains by default any incident custom fields that have chat visibility. If you have edited the page to add the ability to select products or categories, they will also appear.
- If the customer changes any of the information on the chat page, that information is passed to the agent on the chat session workspace. However, the rules engine does **not** run again. As a result, the customer may change a field that would have triggered the chat being assigned to a different queue, but because rules are not run on the updated chat page, the original queue assignment does not change.

We recommend that you do not add any fields to the chat page that would result in a queue reassignment if the customer edits that field since reassignment does not occur with either the standard or syndicated widget. If you want to display a different page to customers who enter a chat session through a proactive chat offer than you display to customers who submit a chat request by clicking the chat login, you can create a custom chat login page. After you create the custom page, change the *chat_login_page* attribute for the widget to specify the custom page.

Chat sessions are not offered in the following situations.

- If the customer's browser does not accept cookies, no chat is offered during the customer session.
- If the widget looks for a chat queue ten times without finding one, no chat is offered on that page.

- If a chat is offered (whether or not it is accepted), a cookie is set and no more chat offers are made during the current customer session.
- If a chat is offered and the customer refuses, a cookie is set and no more chat offers are made for 30 days.

Reports for the ProactiveChat widget

The following standard reports are available for the ProactiveChat widget. They can be found in the Reports explorer under Public Reports > Service > Chat Reports > Proactive Chat.

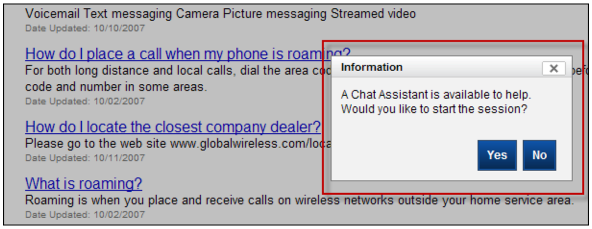
- **Proactive Chat Offer Statistics**—Shows the number of site visits, proactive chat invitations, and accepted, declined, refused, and ignored chat invitations.
- **Proactive Chat Summary Statistics**—Shows the number of chat requests resulting from a proactive chat invitation and the number of chat sessions that were deflected, abandoned, and accepted (with and without agent interaction).

Offering a chat on customer portal pages

You can put the ProactiveChat widget on any page, but for the purpose of this procedure, we'll add it to the Answers page. Chat must be enabled and agents must be available before a chat will be offered to a customer. Additionally, the customer's browser must be configured to accept cookies.

Important The default code for the ProactiveChat widget will not trigger a chat offer until you add an attribute that defines the trigger for the offer. Therefore, you must add at least one of the following attributes to the code: *seconds, searches,* or *profile_* attributes. If you do not specify one of these, the widget will not offer a chat session.

Alternatively, you can define an event that will trigger a chat offer by creating a custom widget based on the ProactiveChat widget. Refer to Triggering a chat offer by an event.



To add the ProactiveChat widget to the Answers page

1 Open the *list.php* file in the */views/pages/answers* folder.

2 Locate the following code.

```
<rn:widget path="reports/Paginator" />
```

3 Add the following code immediately after the code you found in step 2.

```
<rn:widget path="chat/ProactiveChat" />
```

4 To trigger the chat offer based on the customer's inactive time on the page, add the *seconds* attribute to the code, which will resemble the following.

```
<rn:widget path="chat/ProactiveChat"
seconds="60" />
```

5 To trigger the chat offer based on the number of searches the customer conducted, add the *searches* attribute to the code.

```
<rn:widget path="chat/ProactiveChat"
searches="3" />
```

6 To trigger the chat offer based on the customer's profile information, including organization, SLAs, and default product and category, refer to Triggering chat offers on profile attributes.

7 To trigger the chat offer based on an event, refer to Triggering a chat offer by an event.

8 Save *list.php*.

Define the attributes of the ProactiveChat widget, including the events that trigger a chat request.

Configuring the ProactiveChat widget attributes

The default code for the ProactiveChat widget will not trigger a chat offer because the default values for the *seconds, searches,* and *profile_* attributes are 0. You must define at least one of these attributes before the chat offer will be triggered.

When one of these attributes has been met, an AJAX request is made to the server, which then sends back the number of available agents and the minimum wait time. If a product or category can be determined through search terms or answers or incidents viewed, the queue ID for that product or category is also returned. This information is then matched against any additional widget attributes.

You can configure any of the following ProactiveChat widget attributes.

- Chat triggers
  - ▷ Number of seconds on page
  - ▷ Number of searches conducted
  - ▷ Profile attributes (*profile_item, profile_operator,* and *profile_value*)
- Display and function
  - ▷ The wording of the chat invitation
  - ▷ The chat login page that opens when customers accept
  - ▷ Whether the chat login page opens in a new window or the same one
- Chat availability
  - ▷ The minimum number of available agents
  - ▷ Maximum wait time in queue

Important If you add multiple attributes that control a chat offer (for example, *seconds, min_agents_avail,* and *wait_threshold*), all of them must be met before a chat will be offered to customers.

Triggering chat offers based on time

The default setting of 0 for the *seconds* attribute does not mean chats are offered immediately (after 0 seconds). Instead, it means chats will never be offered based on the amount of time customers spend on a page.

However, you might decide that the amount of time spent on a page is a valid trigger for offering a chat. If you want to offer customers a chat session if, for example, they've been on a page for 60 seconds without any activity, you can set the *seconds* attribute to trigger a chat at that time.

To trigger chat offers based on page time

Add the *seconds* attribute to the code so it resembles the following.

```
<rn:widget path="chat/ProactiveChat"
seconds="60" />
```

Continue configuring attributes for the ProactiveChat widget.

Triggering chat offers on number of searches

The default setting of 0 for the *searches* attribute means that chats will never be offered based on the number of searches conducted by customers. You might decide to use number of searches as a trigger for offering a chat. If customers have conducted several searches without finding what they're looking for, an invitation to chat might be useful.

To trigger chat offers based on number of searches

Add the *searches* attribute to the code so it resembles the following.

```
<rn:widget path="chat/ProactiveChat"
searches="3" />
```

Continue configuring attributes for the ProactiveChat widget.

Triggering chat offers on profile attributes

The default null values for the *profile_* attributes mean that chats will never be offered based on customer profile information, but you might decide to set those values because you want to offer chats based on customer profile information.

When you configure the ProactiveChat widget to offer a chat based on customer profile information, you must define all three profile attributes for the widget: the profile item, the operator, and the value. In other words, once you select the profile item you want to evaluate before the widget offers a chat, you must then select the value and operator as well. For example, if you want to offer a chat based on a customer's organization, you must also specify what that organization is.

Let's assume you want to offer a chat to all customers from ABC International, which has an organization ID of 81945. (Learn how to identify an organization's ID number.) In that case, the widget code would resemble the following.

```
<rn:widget path="chat/ProactiveChat"
profile_item="org_id"
profile_operator="equals"
profile_value="81945" />
```

The following list includes all the profile items you can use as conditions for offering chats to customers.

- **slac**—The number of chat incidents the customer's SLA allows.
- **slai**—The number of self-service incidents the customer's SLA allows.
- **web_access**—The customer's SLA allows self-service.
- **org_id**—The ID of the organization associated with the customer.
- **o_lvlN**—The ID of the organization's sublevel, if the organization has subsidiaries, where N is the organization level.

Any of the following operators are valid for defining profile items.

- Equals
- Less than or equals
- Greater than or equals
- Not equal
- Less than
- Greater than

One useful case for the profile attributes is verifying that a customer has an SLA that allows chat incidents before offering them a chat session.

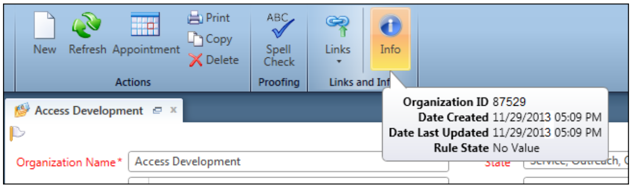
Identifying an organization ID

To identify an organization ID

1 Log in to Oracle Service Cloud.

2 Open the organization record.

3 Click the Info button on the ribbon to display information about the organization, including its ID, the dates when it was created and last updated, and the rule state the organization is in, if applicable.



Triggering chat offers based on customer SLAs

If your organization requires **SLAs** in order for customers to chat with agents, you'll want to verify that the customer has an SLA with available chat incidents before a **chat session** is offered. The profile attributes of the ProactiveChat widget can do that for you.

An SLA defines the total number of **incidents** a customer can submit, as well as specific numbers of chat, staff member, email, and web self-service incidents.

To check for chat SLAs prior to offering a chat

Add the *profile_item, profile_operator,* and *profile_value* attributes to the code for the ProactiveChat widget. You will want to set the *slac* item to be greater than zero to be sure the customer has remaining chat incidents available on their SLA. You will probably also still want to include the *seconds* or *searches* attributes so the chat invitation is not immediately offered when the customer lands on the page with the widget. Your edited code will resemble the following.

```
<rn:widget path="chat/ProactiveChat"
seconds="30"
profile_item="slac"
profile_operator="greater than"
profile_value="0" />
```

Continue configuring attributes for the ProactiveChat widget.

Editing the chat invitation

By default, the chat invitation says "A Chat Assistant is available to help. Would you like to start the session?" That message can be edited by editing an attribute of the ProactiveChat widget.

To edit the chat invitation

Add the *label_chat_question* attribute to the code so that it resembles the following.

```
<rn:widget path="chat/ProactiveChat"
seconds="30"
label_chat_question="Staff members are available now. Would you like
to chat with someone?" />
```

Note Remember that you must define the *seconds, searches,* or *profile_* attributes in order to trigger the chat invitation.

Continue configuring attributes for the ProactiveChat widget.

Changing the chat login page

When customers click Yes to accept the chat offered by the ProactiveChat widget, the Live Help page (*/chat/chat_launch*) opens by default. You might want to direct customers to a different page instead.

To change the chat login page

Add the *chat_login_page* attribute to the widget code so it resembles the following. Note that the path to the page must begin with */app/*.

```
<rn:widget path="chat/ProactiveChat"
seconds="30"
chat_login_page="/app/chat/alternate_chat_launch_page" />
```

Note Remember that you must define the *seconds, searches,* or *profile_* attributes in order to trigger the chat invitation.

Continue configuring attributes for the ProactiveChat widget.

Defining how the chat login page opens

By default, the chat login page opens in a new window that lets you configure its height and width. You can also set the chat login page to open in the same window.

To change the size of the chat login window

Add the *chat_login_page_height* and *chat_login_page_width* attributes to the widget code, defining the new values for height and width. Your code will resemble the following.

```
<rn:widget path="chat/ProactiveChat"
seconds="30"
chat_login_page_height="500"
chat_login_page_width="600" />
```

Note Remember that you must define the *seconds, searches,* or *profile_* attributes in order to trigger the chat invitation.

To open the chat login page in the same window

Add the *open_in_new_window* attribute and set it to false so your code resembles the following.

```
<rn:widget path="chat/ProactiveChat"
```

```
seconds="30"
open_in_new_window="false" />
```

Note Remember that you must define the *seconds, searches,* or *profile_* attributes in order to trigger the chat invitation.

Continue configuring attributes for the ProactiveChat widget.

Defining the minimum number of agents

If the *seconds, searches,* or *profile_* attributes of the chat widget have been met, an AJAX request is made to the server, which sends back the number of available agents. If you have defined the minimum number of agents required before a chat session is offered, that value is compared to the number returned from the chat server. If the number of available agents is greater than or equal to the number you defined in the *min_agents_avail* attribute, the chat is offered to the customer.

To define the minimum number of agents

Add the *min_agents_avail* attribute to the widget code so it resembles the following.

```
<rn:widget path="chat/ProactiveChat"
seconds="30"
min_agents_avail="2" />
```

Note Remember that you must define the *seconds, searches,* or *profile_* attributes in order to trigger the chat invitation.

Continue configuring attributes for the ProactiveChat widget.

Defining the maximum wait time

If the *seconds, searches,* or *profile_* attributes of the chat widget have been met, an AJAX request is made to the server, which sends back the wait time for a chat session. If you have defined the maximum time the customer will have to wait in a queue, that value will be compared to the number returned from the chat server. If the wait time is less than the value you defined for the *wait_threshold* attribute, the chat is offered to the customer.

Tip We recommend that you set *min_agents_avail* to 0 when you set the maximum wait time.

To define the maximum wait time

Add the *wait_threshold* attribute to the widget code so it resembles the following. Note that the wait time value is measured in seconds.

```
<rn:widget path="chat/ProactiveChat"
seconds="30"
wait_threshold="60" />
```

Note Remember that you must define the *seconds, searches,* or *profile_* attributes in order to trigger the chat invitation.

Continue configuring attributes for the ProactiveChat widget.

Triggering a chat offer by an event

If you want to trigger chat offers only when a specific event occurs, you must first create an event called *evt_customProactiveInitialization* using custom code. Then set the *initiate_by_event* attribute of the ProactiveChat widget to true. This tells the widget's logic file to listen for the event before triggering a chat offer.

Note For specific information about defining *evt_customProactiveInitialization* for use with the *initiate_by_event* attribute, refer to the documentation for the ProactiveChat widget at http://<your_site>/ci/admin/docs/widgets/standard/chat/ProactiveChat.

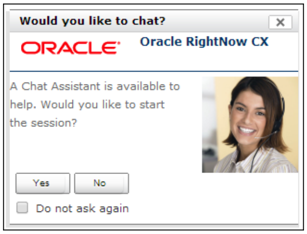
Offering a chat on external pages

The syndicated ProactiveChat widget functions much like the ProactiveChat widget that you place on your customer portal pages. However, you can place the syndicated widget on external sites that are not hosted by Oracle instead of having widget placement restricted to customer portal pages.

The syndicated ProactiveChat widget opens a chat invitation to your customers after they spend a specified amount of time on the page where you placed the widget. You can define additional conditions that must also be met before a chat is offered, including the number of available agents and wait time. If you want to write your own custom rules, you can even trigger a chat offer based on conditions such as the dollar value or type of products in your customer's shopping cart.

The widget lets you configure images, labels, and messages for the chat invitation window. You can define a product and category to route the chat session into an appropriate chat queue and specify whether customers can ignore the invitation or must respond to it.

- Adding the syndicated ProactiveChat widget
- Configuring the syndicated ProactiveChat widget
- Custom rules for the syndicated ProactiveChat widget



Adding the syndicated ProactiveChat widget

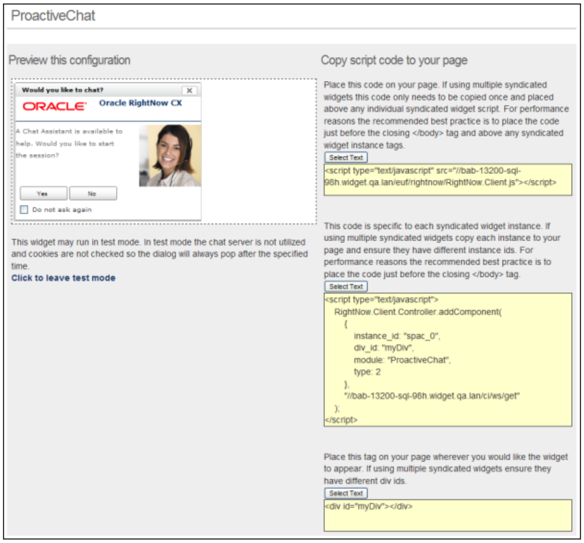
The widget information page gives you everything you need to add the **syndicated** ProactiveChat widget to any page on your website. As you modify the attributes of the widget, the page displays a preview of the widget and modifies the widget code to reflect the changes you make. When you're done, all you have to do is select and copy the code to your page to place the syndicated widget on it.

To add the syndicated ProactiveChat widget to a web page

1 Type `https://<your_site>/ci/tags/syndicated_widgets/standard/ProactiveChat` to open the page for the syndicated ProactiveChat widget. The page displays a preview of the widget and the code you will add to your page.

Note Your profile must have WebDAV permission enabled, and you must log in with your user name and password.

Click to view



2 Scroll down to the Configure Widget section and begin modifying the widget attributes as you choose. The attribute is on the left, the value is in the center, and a description of the attribute is on the right. For specific information about the attributes, refer to [Configuring the syndicated ProactiveChat widget](#).

Click to view

Configure Widget

The CSS file for this widget may be edited. It is located at:
euf/assets/css/syndicated_widgets/standard/ProactiveChat.css

avatar_image	/euf/assets/images/avatar_photo.jpg	Avatar image URL. Specifying an empty string will disable the avatar
c		The ID of the category to use. Only a single category may be used with chat. Example: 1
chat_login_page	/app/chat/chat_launch	Page to display to log in to chat. This should start with "/app". Example: /app/chat/chat_launch
chat_login_page_height	686	The height of the window to display. If open_in_new_window is set to false, setting this value has no effect.
chat_login_page_width	700	The width of the window to display. If open_in_new_window is set to false, setting this value has no effect.
div_id	myDiv	The div element on your page where you want the code to appear
instance_id	spac_0	Widget instance_id must be unique for each widget on a page
label_accept_button	Yes	Label for the accept button
label_avatar_image	Helpful person waiting to chat with you	Alt text for the avatar image
label_dialog_header	RightNow Technologies	Label for the dialog header
label_logo_image		Alt text for the corporate logo image
label_question	A Chat Assistant is available to help. Would you like to start the se	Text to display to users when asking them if they would like to chat
label_refuse_checkbox	Do not ask again	Label for the chat refusal checkbox
label_reject_button	No	Label for the reject button
label_title	Would you like to chat?	Label for the dialog title bar
logo_image	/euf/assets/images/rn_logo.png	Corporate logo image URL. Specifying an empty string will disable the logo
min_agents_avail	1	Minimum number of agents (or agent sessions if using min_agents_avail_type "sessions") available
min_agents_avail_type	agents	Determines whether to use the number of agents available, or the number of agent chat sessions available.
modal	☐ Enabled	Enables dialog to be modal
open_in_new_window	☑ Enabled	If set to true, the page defined by chat_login_page will be displayed in a new window. If false, the current window will navigate to that page.
p		The ID of the product to use. Only a single category may be used with chat. Example: 1
seconds	0	Seconds until the chat invite pops up. If it is set to 0, the chat invite will not pop up unless it is called explicitly using the API.
wait_threshold	40	Maximum queue time in seconds. It is recommended that you set min_agents_avail to 0 when utilizing this attribute.

Apply

3 To preview your changes, click the Apply button at the bottom of the Configure Widget section. Continue to configure the widget until you are satisfied with the result.

Note You can also modify the widget's appearance by editing its CSS file, which is */cp/customer/assets/css/syndicated_widgets/standard/ProactiveChat.css*. If you modify the CSS file, you must reload the page to see your changes.

4 Open the web page you want to add the widget to.

5 To ensure the page renders correctly in Internet Explorer 7, add the following code to the top of the page before your first HTML tag.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http:/
/www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
```

6 On the right side of the page, click the top Select Text button to select the code in the first yellow box and press **Ctrl+c** to copy the code.

7 Paste the code into your page file just before the closing </body> tag. Even if you plan to use multiple syndicated widgets on the page, you need to paste this code only once.

8 Click the second Select Text button and copy the code that defines the widget.

9 Paste the copied code just below the code you copied in step 7.

10 Add the following line to the page code wherever you want the widget to appear.

```
<div_id="myDiv"></div>
```

Note You can also copy this line from the page by pressing the third Select Text button, copying the code, and pasting it where you want the widget to appear.

11 Save your web page.

Click here for specific information about configuring the syndicated ProactiveChat widget.

Configuring the syndicated ProactiveChat widget

The default code for the syndicated ProactiveChat widget will not trigger a chat offer because the default values for the *seconds* attribute is 0. You must set this attribute before a chat offer will be triggered. (Or you can create custom rules that will trigger a chat offer.)

When the time the customer spends on the page exceeds the value you set for the *seconds* attribute, an AJAX request is made to the server, which then sends back the number of available agents and the minimum wait time. This information is then matched against any additional widget attributes.

You can configure any of the following syndicated ProactiveChat widget attributes.

- Number of seconds the customer is on the page before a chat offer is extended
- The minimum number of available agents
- The maximum wait time in the queue
- Product and category IDs
- The chat login page that opens when customers accept
- Whether the chat login page opens in a new window or the same one
- Avatar and logo images
- Labels
  - ▷ Accept and reject buttons and refusal check box
  - ▷ Alternate text for the avatar and logo images (for screen reader use)
  - ▷ Dialog header and title bar
  - ▷ The wording of the chat invitation
- Div element
- Instance ID
- Whether the dialog is modal (A modal dialog requires the customer to take some action before the dialog closes and the customer can return to the previous screen.)

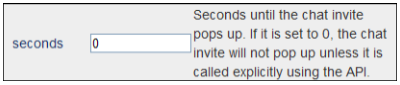
Important If you add multiple attributes that trigger a chat offer (for example, *seconds, min_agents_avail,* and *wait_threshold*), all of them must be met before a chat will be offered to customers.

Triggering chat offers based on time

The default setting of 0 for the *seconds* attribute results in no chat invitation being offered unless it is explicitly called using the API. Use this value to trigger a chat at the number of seconds you specify. For example, if you want to offer customers a chat session when they've been on a page for 60 seconds without any activity, you can set the *seconds* attribute to trigger a chat at that time.

To trigger chat offers based on page time

Type a value in the field for the *seconds* attribute.



Defining the minimum number of agents

If the *seconds* attribute of the chat widget has been met, an AJAX request is made to the server, which sends back the number of available agents. If you have defined the minimum number of agents required to offer a chat session, that value will be compared to the number returned from the chat server. If the number of available agents is greater than or equal to the number you defined in the *min_agents_avail* attribute, the chat is offered to the customer.

To define the minimum number of agents

Type a value in the field for the *min_agents_avail* attribute.

Defining the maximum wait time

If the *seconds* attribute of the chat widget has been met, an AJAX request is made to the server, which sends back the wait time for a chat session. If you have defined the maximum time the customer will have to wait in a queue, that value will be compared to the number returned from the chat server. If the wait time is less than the value you defined for the *wait_threshold* attribute, the chat is offered to the customer.

To define the maximum wait time

Type a value in the field for the *wait_threshold* attribute.

Continue configuring attributes for the syndicated ProactiveChat widget.

Defining product and category IDs

You can specify the product or category you want to use for the syndicated ProactiveChat widget, which helps route the chat session to the most appropriate queue. You can select only one product or category in the attribute's field, so if the product or category you want is a sub-level, you'll need to enter the ID for the sub-product or sub-category instead of the ID for the parent level. To determine the ID for a product or category, refer to Finding product ID numbers.

To define products for the syndicated ProactiveChat widget

Note This procedure describes how to specify a product for the syndicated ProactiveChat widget. The procedure to specify a category is identical, but the attribute name is **c** for category instead of **p** for product.

1 With the syndicated ProactiveChat widget page open, scroll to the Configure Widget section of the page and find the attribute called **p.**

2 Type the product ID in the field. Refer to Finding product ID numbers if you do not know the product ID number.

Finding product ID numbers

The ID numbers for products and categories are defined on the administration interface, so you'll need to log in to find these values.

To find a product ID number

1 Log in to Oracle Service Cloud.

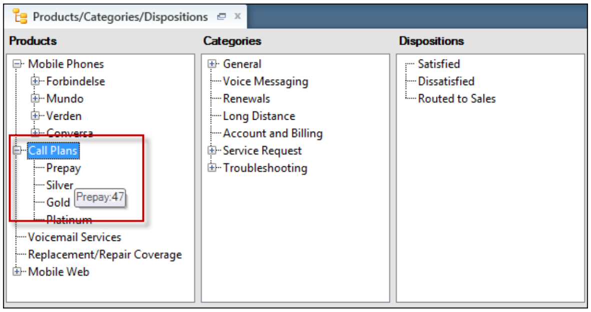
2 Click the Configuration button on the navigation pane.

3 Double-click Products/Categories/Dispositions under Service. The Products/Categories/Dispositions editor displays on the content pane.

4 Expand the products tree if necessary to display the product you want to select.

Note Remember that you want to get the ID number for the lowest level product you want to use for the widget, so don't use the ID number for any of the product's parent levels.

5 Hover over the product name to display its ID, as shown here, where the ID number for the Prepay call plan is 47.



Continue configuring attributes for the syndicated ProactiveChat widget.

Changing the chat login page

When customers click Yes to accept the chat offered by the syndicated ProactiveChat widget, the Live Help page (*/chat/chat_landing*) opens by default. You might want to direct customers to a different page instead.

To change the chat login page

Type a value in the field for the *chat_login_page* attribute. Note that the path to the page must begin with */app/*.

Note Remember that you must define the *seconds* attribute in order to trigger the chat invitation.

Defining how the chat login page opens

By default, the chat login page opens in a new window that lets you configure its height and width. You can also set the chat login page to open in the same window.

To change the size of the chat login window

Type the new height of the window, in pixels, in the field for the *chat_login_page_height* attribute, and type the width in the *chat_login_page_width* field.

To open the chat login page in the same window

Clear the Enabled check box in the *open_in_new_window* attribute.

Continue configuring attributes for the syndicated ProactiveChat widget.

Replacing images

The images for the chat assistant avatar and the logo are located in the */cp/customer/assets/images/* folder. The default avatar file is *avatar_photo.jpg*, and the default logo file is *rn_logo.png*. You will probably want to change these, or you may decide not to use any images on the syndicated ProactiveChat widget.

Note It's a good idea to store the images you want to use in the same */cp/customer/assets/images/* folder where the default images are stored.

To replace default images

1 To replace the avatar image, type the path in the field for the *avatar_image* attribute. Leave the field blank if you do not want to display an avatar.

2 To replace the logo image, type the path in the field for the *logo_image* attribute. Leave the field blank if you do not want to display a logo.

Continue configuring attributes for the syndicated ProactiveChat widget.

Editing labels

You might want to change the wording of messages on the chat invitation. You can do so by editing the *label* attributes of the syndicated ProactiveChat widget. (Don't forget that you also need to define the *seconds* attribute to trigger the chat invitation.)

You can edit the following labels for the syndicated ProactiveChat widget.

- Accept and reject buttons and refusal check box
- Alt text for the avatar and logo images (for screen reader use)
- Dialog header and title bar
- The wording of the chat invitation

Editing button and check box labels

The default labels for accepting or rejecting the chat invitation are Yes and No. The default message to refuse all future chat invitations is "Do not ask again."

To edit button and check box labels

1 To edit the Yes button, type the new label in the field for the *label_accept_button* attribute.

2 To edit the No button, type the new label in the field for the *label_reject_button* attribute.

3 To edit the label for the chat refusal check box, type the new label in the field for the *label_refuse_checkbox* attribute.

Editing alt text for images

Alt text labels do not appear on the syndicated ProactiveChat widget but are defined so they can be read by screen readers to meet accessibility guidelines for the widget. The default alt text for the logo is null so you can add text that applies to your organization's logo.

To edit alt text for images

1 To edit the alt text for the avatar image, type the new label in the field for the *label_avatar_image* attribute.

2 To add alt text for the corporate logo image, type text in the field for the *label_logo_image* attribute.

Editing the dialog header and title bar

The default header label is blank, so you'll want to add your organization's name or another message. The default title bar is "Would you like to chat?"

To edit the dialog header and title bar

1 To edit the header label, type the new label in the field for the *label_dialog_header* attribute.

2 To edit the title bar, type the new label in the field for the *label_title* attribute.

Edit other labels or Continue configuring the syndicated ProactiveChat widget.

Editing the chat invitation

By default, the chat invitation says "A Chat Assistant is available to help. Would you like to start the session?"

To edit the chat invitation

Type a new chat invitation message in the field for the *label_question* attribute.

Edit other labels or Continue configuring the syndicated ProactiveChat widget.

Editing the div element

The default div element that defines where you want the syndicated ProactiveChat widget to appear on the page is myDiv. If you change the *div_id* attribute, the code you add to the page also changes.

To edit the div element

Type a new name for the div element in the field for the *div_id* attribute. The new code for the div element will resemble the following.

```
<div id="newDiv"></div>
```

Editing the instance ID

If you have more than one syndicated ProactiveChat widget on a page, you must have unique ID values for each of them. The default value is spac_0.

To edit the instance ID

Replace the "0" in "spac_0" in the *instance_id* attribute with another value for each widget you add to the page. Each instance of the widget must have a unique value.

Changing the dialog to be modal

By default, the syndicated ProactiveChat widget is not modal. That is, the widget does not require action from the customer in order to close the dialog and resume activity on the page.

To change the dialog to modal

Select the Enabled check box for the *modal* attribute.

[Continue configuring the syndicated ProactiveChat widget](#).

Custom rules for the syndicated ProactiveChat widget

Using only the attributes of the syndicated ProactiveChat widget, you can define the time a customer must spend on a page before a chat invitation is offered. But you may want to define custom rules that specify other conditions for triggering a chat offer. For example, you may want to offer a chat to customers who have a certain dollar value or a specific type of product in their shopping cart.

The syndicated ProactiveChat widget includes two JavaScript API functions.

- The chatAvailability() function, for checking agent availability
- The offerChat() function, for offering a chat invitation

You can call these functions from your web pages on a specific instance of the ProactiveChat widget. This can be done either through an event or with a direct method call. The custom code to trigger a chat offer must appear on the same page where you place the syndicated ProactiveChat widget.

Exposing the syndicated ProactiveChat widget API

To expose the API functions of the syndicated ProactiveChat widget, you must set the seconds attribute in the widget instance to 0. When this attribute is set to 0, agent availability is not checked and chat invitations are not offered unless direct API calls are made.

To expose the API functions

Add code like the following to your web page for each widget instance for which you want to call the functions.

```
<script type="text/javascript">
    RightNow.Client.Controller.addComponent(
        {
            modal: true,
            instance_id: "spac_0",
            div_id: "myDiv",
            seconds: 0,
            module: "ProactiveChat",
            type: 2
        },
        "http://[your_site]/ci/wsf/get"
    );
</script>
```

For more information about adding a widget instance, see Adding the syndicated ProactiveChat widget.

Now that you have exposed the API functions, you can use them for the following options.

- Requesting agent availability using the chatAvailability() function
- Offering a chat session using the offerChat() function
- Requesting chat availability using an event
- Offering a chat using an event

Note For code samples and to see how other developers are using the syndicated ProactiveChat widget, refer to the Customer Portal developer forum.

Requesting agent availability using the chatAvailability() function

The chatAvailability() function of the syndicated ProactiveChat widget requests agent availability. You can use the function to check:

- The queue id that is currently assigned to the chat instance.
- The number of agents available.
- The current wait time.

The chatAvailability() function accepts an argument that is the name of the callback method that is executed if the function is successful. If the function call is successful, the agent availability data is passed to the callback method.

To use the chatAvailability function

1 Expose the widget API.

2 On the web page containing the widget, add code like the following to define a function that calls chatAvailability() and to define a callback method.

```
function chatAvail(){
    spac_0.chatAvailability(chatDataAvail);

};

function chatDataAvail(result){
    alert("q_id "+result.queueId);
    alert("agent_avail "+result.availableAgentSessions);
    alert("wait_time "+result.expectedWaitSeconds);
};
```

3 On the web page, make sure that your code calls the function that makes the call to chatAvailability(), which in the example is the chatAvail() function.

In this example, the chatAvail() function calls the chatAvailability() function on the spac_0 instance of the syndicated ProactiveChat widget. The callback method, chatDataAvail, displays alerts for the queue ID, agent availability, and wait time data of the result argument.

Offering a chat session using the offerChat() function

The offerChat() function of the syndicated ProactiveChat widget allows you to offer a chat to a user. You generally use the function together with code that determines the criteria for offering the chat, and which then checks the availability of agents through the chatAvailability() function. The offerChat() function offers a chat session if its Boolean argument is true.

To use the offerChat() function

1 Expose the widget API.

2 On the web page containing the widget, add code like the following to define a function that calls chatAvailability() and to define a callback method that calls the offerChat() function.

```
function chatAvail(){
    spac_0.chatAvailability(chatDataAvail);

};

function chatDataAvail(result){
    if(result.availableAgentSessions > 0) {
        alert("offering a chat now");
        spac_0.offerChat(check);
    }
};
```

3 On the web page, make sure that your code calls the function that makes the call to chatAvailability(), which in the example is the chatAvail() function.

In this example, the chatAvail() function calls the chatAvailability() function on the spac_0 instance of the syndicated ProactiveChat widget. The callback method, chatDataAvail, examines the result argument to verify that more than one agent is available and, if so, calls the offerChat() function to offer a chat to the user.

Requesting chat availability using an event

On the web page containing the syndicated ProactiveChat widget, you can request chat availability through an event. The code must first subscribe to the evt_chatAvailabilityResponse event and then fire an evt_chatAvailabilityRequest event.

To request chat availability using an event

1 Add the following code to the web page containing the syndicated ProactiveChat widget.

```
function chatAvailEvent(){

    RightNow.Client.Event.evt_chatAvailabilityResponse.unsubscribe(on
    DataReady);
    RightNow.Client.Event.evt_chatAvailabilityResponse.subscribe(onDa
    taReady);
    RightNow.Client.Event.evt_chatAvailabilityRequest.fire();
```

```
};
```

2 On the web page, add code to call the function that requests chat availability, which in the example is chatAvailEvent().

Offering a chat using an event

On the web page containing the syndicated ProactiveChat widget, you can offer a chat session by firing an evt_chatOfferRequest event.

To request chat availability using an event

1 Add the following code to the web page containing the syndicated ProactiveChat widget.

```
function offerChatEvent(){
    RightNow.Client.Event.evt_chatOfferRequest.fire({data:
    {checkAvailability: true}, id: "spac_0"});

};
```

2 On the web page, add code to call the function that offers the chat, which in this example is offerChatEvent().

The checkAvailability parameter of the evt_chatOfferRequest event determines whether the request first checks for agent availability.

- If the argument is set to true, the evt_chatAvailabilityResponse event is first fired, which is used to determine whether agents are available.
- If the argument is set to false, a chat is offered immediately.

Continue configuring the syndicated ProactiveChat widget.

59

Communities on the Customer Portal

Oracle RightNow Social Experience communities allow you to add a customized, dynamic social media channel to your support site. A community gives your customers a place to meet and discuss your organization's products and services, share experiences and troubleshooting techniques, and generally promote a positive customer culture driven by your own brand. When a community is enabled and configured, customers can view community posts on your customer portal, conduct searches of community posts, and comment on answers in your knowledge base. By adding community access and features to your customer portal, you can provide customer-generated solutions and social opportunities directly from your support site.

The **reference implementation** of the Customer Portal includes a tab for the community and a sidebar link for submitting a question to the community. Once enabled, you can add other community features using the Community integration widgets.

Important To enable a community, you will need additional information and assistance from your Oracle account manager.

To enable a community on your customer portal

1 Use the procedure described in To locate and edit configuration settings to locate the following configuration settings under RightNow Common > RightNow Social > General.

2 To specify the base URL of the community site, click COMMUNITY_BASE_URL, type the URL in the Value field, and click Update.

Important This configuration setting should never point to a customer portal page because requests for data will create an invalid loop.

Furthermore, if the community is enabled and the COMMUNITY_BASE_URL value is null, logging out of the customer portal displays an error message to the customer.

3 To specify the URL for the community home page, click COMMUNITY_HOME_URL, type the URL in the Value field, and click Update.

4 To specify the private key for the community search API, click COMMUNITY_PRIVATE_KEY, type the value, and click Update.

5 To specify the public key for the community search API, click COMMUNITY_PUBLIC_KEY, type the value, and click Update.

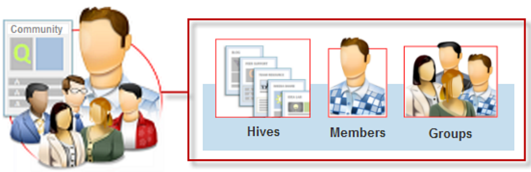
6 Click Save.

Now that your community has been enabled, you can add other features to let your customers view community posts on the customer portal, conduct searches of community posts, and comment on answers in your knowledge base.

Add and configure community integration widgets.

Community integration widgets

When adding **community** features to the customer portal, it is helpful to understand a few basic concepts about communities. A community is a social site designed to help your customers meet and share information, such as troubleshooting ideas or product recommendations. As such, communities are defined primarily by their users and content.



The community interface is comprised of one or more hives—highly adaptable resource entities that can take a variety of forms, such as blogs, forums, message boards, or media shares. Each hive usually accepts different types of **posts** and **comments**, which form the core content that the hive presents.

Members are the users who populate the community. Their roles often vary based on **user types**—they may be general members, moderators, administrators, or builders of the community. Members can be included in one or more **groups** based on roles or interests they have in common with other members. Also, because the community is included in pass-through authentication, members who log in to your customer portal are automatically logged in to the community as well.

Important Member access to community content and functions is governed by a combination of settings, such as community privacy levels, hive permissions and privacy levels, and user types, as well as permissions extended through association with a group. As a result, when a member is logged in to the customer portal, community widgets will display only content that is available to that member in the community. When a member is not logged in, the widgets will display only content that is publicly available. Refer to Configuring community access.

Also, community content is cached frequently for requests submitted by users who are not logged in. As a result, live changes to some data may not be reflected in community widgets for up to five minutes unless you are logged in to the community.

Community content can be accessed from the customer portal through a variety of features. For example, your customers can view and search posts made in the community in addition to viewing and searching answers in your knowledge base. They can also post and respond to comments on individual answers. The following widgets can be used to add these and other community features to your customer portal pages.

- CommunityPosts—Displays the five most recent posts on the community. You can configure the number and order of displayed posts, and how much information each post includes.
- CommunitySearchResults—Displays community posts associated with the search terms customers enter. This allows customers to search content from both the knowledge base and community at once, and view both result sets on the same page.
- AnswerComments—Displays a comments feature on the answer details page to let customers view, add, and manage answer comments for each answer.
- CommunityPostDisplay—Displays a community post and its comments and allows logged-in customers to rate and comment on the post.
- CommunityPostSubmit—Displays a post form that allows customers submit a question or discussion item to the community.
- CommunityUserDisplay—Displays a customer's name and picture.

Adding the CommunityPosts widget to the template

By including a sampling of recent community posts on your customer portal, you can position the community as another helpful support resource. Giving your customers a glimpse of available content encourages them to explore and participate.

This example assumes you want to add the CommunityPosts widget to the sidebar so it appears on all pages that use the **reference implementation** template.

To add the CommunityPosts widget to the sidebar

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following code.

```
            <div class="rn_Feedback">
                <rn:widget path="feedback/SiteFeedback" />
                <span>#rn:msg:SITE_USEFUL_MSG#</span>
            </div>
        </div>
    </div>
```

3 Add the following code immediately after the code you found in step 2.

```
    <div class="rn_Module">
        <h2>Latest Community Posts</h2>
        <rn:widget path="social/CommunityPosts" />
    </div>
```

4 Save *standard.php*.

Next, configure the attributes of the CommunityPosts widget or Return to the community integration widgets overview.

Configuring the CommunityPosts widget

You can configure widget attributes to alter how customer posts are displayed on the customer portal. The following properties can be edited in the CommunityPosts widget code:

- The display of post information, including:
  - ▷ Author
  - ▷ Number of comments
  - ▷ Snippets of content
  - ▷ Updated date
- Labels on the widget
- The number of results to be displayed
- Removing the link to all posts
- The number of characters for truncating post content
- Sorting order for the posts
  - ▷ Alphabetical
  - ▷ Highest rating
  - ▷ Most views
  - ▷ Most comments
  - ▷ Most recent

Return to the community integration widgets overview.

Defining what post information is displayed

By default, the CommunityPosts widget displays a snippet of the content (the length of which is defined by the *truncate_size* attribute), the author, and the updated date for each post. You can remove any of this information. You can also add the number of comments the post has received, which is not displayed by default.

To define what post information is displayed

1 To remove content snippets from posts, add `show_post_content="false"` to the widget code, which now reads as follows.

```
<rn:widget path="social/CommunityPosts"
show_post_content="false" />
```

2 To remove authors' names from posts, add `show_author_name="false"` to the widget code.

3 To remove the updated dates from posts, add `show_updated_date="false"` to the widget code.

4 To add the number of comments to posts, add `show_comment_count="true"` to the widget code.

Continue configuring the CommunityPosts widget or Return to the community integration widgets overview.

Editing labels

The default CommunityPosts widget uses the labels Author, Updated, and Comments to identify the information it displays. It also uses See All Posts as the label for the link to go to the community. You can edit any or all of these labels.

To edit labels on the CommunityPosts widget

1 To edit the Author label, add `label_author="Your new author label: %s"` to the widget code, which now reads as follows. (Substitute whatever text you want for "Your new author label.")

```
<rn:widget path="social/CommunityPosts"
label_author="Your new author label: %s" />
```

2 To edit the Updated label, add `label_updated="Your new updated label: %s"` to the widget code.

3 To edit the Comments label, add `label_comment="Your new comment label: %s"` to the widget code.

Note The *show_comment_count* attribute must be set to true in order for this label to display. The complete widget code will resemble the following.

```
<rn:widget path="social/CommunityPosts"
show_comment_count="true"
label_comment="Your new comment label: %s" />
```

4 To edit the See All Posts link label, add `label_all_results="Your new See All Posts label"` to the widget code.

Continue configuring the CommunityPosts widget or Return to the community integration widgets overview.

Defining the number of posts

The default CommunityPosts widget displays five posts from the community, but you can edit that value using the *limit* attribute.

To change the number of displayed posts

Add `limit="10"` to the widget code, replacing `"10"` with the value you want. The code now resembles the following.

```
<rn:widget path="social/CommunityPosts"
limit="10" />
```

Continue configuring the CommunityPosts widget or Return to the community integration widgets overview.

Removing the link to all posts

By default, the See All Posts link appears at the bottom of the list of posts. When customers click the link, they are taken to the community site. You can remove the link if you want.

To remove the See All Posts link

Add `show_all_results_link="false"` to the widget code so it reads as follows.

```
<rn:widget path="social/CommunityPosts"
show_all_results_link="false" />
```

Continue configuring the CommunityPosts widget or Return to the community integration widgets overview.

Truncating posts

By default, the CommunityPosts widget displays the first 60 characters of the content for a post and then displays an ellipsis to indicate additional content. Because partial words are not displayed, the actual number of displayed characters may not total exactly 60. You can edit the *truncate_size* attribute to vary the number of displayed characters between 1 and 200.

To change the number of characters used to display content

Add `truncate_size="100"` to the widget code, replacing `"100"` with the value you want. The code now resembles the following.

```
<rn:widget path="social/CommunityPosts"
truncate_size="100" />
```

Continue configuring the CommunityPosts widget or Return to the community integration widgets overview.

Sorting posts

By default, the community posts are sorted with the most recent one first in the list, but the *sort_order* attribute lets you change sorting options.

To change sorting order

1 To sort posts alphabetically by post title, add `sort_order="alphabetical"` to the widget code, which now reads as follows.

```
<rn:widget path="social/CommunityPosts"
sort_order="alphabetical" />
```

2 To sort posts by the highest rating, add `sort_order="highestRating"` to the widget code.

3 To sort posts by the number of views, add `sort_order="mostViews"` to the widget code.

4 To sort posts by the number of comments, add `sort_order="mostComments"` to the widget code.

Continue configuring the CommunityPosts widget or Return to the community integration widgets overview.

Adding the CommunitySearchResults widget to the Answers page

When you add the CommunitySearchResults widget to your Answers page, customers who enter a search term can view not only the answers related to their search term but also any community posts that include the term.

To add the CommunitySearchResults widget to the Answers page

1. Open the *list.php* file in the */views/pages/answers* folder.

2. Locate the following code.

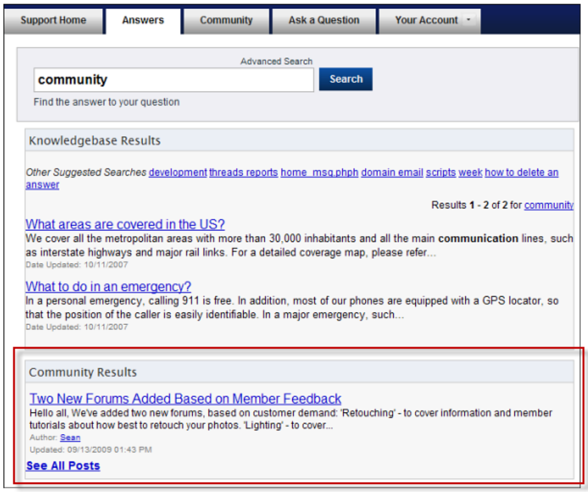
```
<div class="rn_Padding">
    <h2 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_RESULTS_CMD#</h2>
    <rn:widget path="reports/ResultInfo"
    add_params_to_url="p,c"/>
    <rn:widget path="knowledgebase/TopicWords"/>
    <rn:widget path="reports/Multiline" />
    <rn:widget path="reports/Paginator" />
</div>
```

3. Add the following code immediately after the code you located in step 2.

```
<div class_"rn_Module">
    <h3>Community Results</h3>
    <rn:widget path="social/CommunitySearchResults" />
</div>
```

4. Save *list.php*.

Next, configure the attributes of the CommunitySearchResults widget or Return to the community integration widgets overview.



Configuring the CommunitySearchResults widget

You can configure widget attributes to alter how community search results appear on your customer portal. The following properties can be edited in the CommunitySearchResults widget code.

- The display of post information, including:
  - ▷ Author
  - ▷ Number of comments
  - ▷ Snippets of content
  - ▷ Updated date
- Labels on the widget
- Search term highlighting
- The number of results to be displayed
- Removing the link to all posts
- The number of characters for truncating post content

Return to the community integration widgets overview.

Defining what post information is displayed

By default, the CommunitySearchResults widget displays a snippet of the content (the length of which is defined by the *truncate_size* attribute), the author, and the updated date for each post. You can remove any of this information, and you can add the number of comments the post has received, which is not displayed by default.

To define what post information is displayed

1 To remove content snippets from posts, add `show_post_content="false"` to the widget code, which now reads as follows.

```
<rn:widget path="social/CommunitySearchResults"
show_post_content="false" />
```

2 To remove authors' names from posts, add `show_author_name="false"` to the widget code.

3 To remove the updated dates from posts, add `show_updated_date="false"` to the widget code.

4 To add the number of comments to posts, add `show_comment_count="true"` to the widget code.

Continue configuring the CommunitySearchResults widget or Return to the community integration widgets overview.

Editing labels

The default CommunitySearchResults widget uses the labels Author, Updated, and Comments to identify the information it displays. It also uses See All Posts as the label for the link to go to the community. You can edit any or all of these labels.

To edit labels on the CommunitySearchResults widget

1 To edit the Author label, add `label_author="Your new author label: %s"` to the widget code, which now reads as follows. (Substitute whatever text you want for "Your new author label.")

```
<rn:widget path="social/CommunitySearchResults"
label_author="Your new author label: %s" />
```

2 To edit the Updated label, add `label_updated="Your new updated label: %s"` to the widget code.

3 To edit the Comments label, add `label_comment="Your new comment label: %s"` to the widget code.

Note The *show_comment_count* attribute must be set to true in order for this label to display. The complete widget code will resemble the following.

```
<rn:widget path="social/CommunitySearchResults"
show_comment_count="true" label_comment="Your new comment
label: %s" />
```

4 To edit the See All Posts link label, add `label_all_results="Your new See All Posts label"` to the widget code.

Continue configuring the CommunitySearchResults widget or Return to the community integration widgets overview.

Highlighting search terms

By default, customer-entered search terms are highlighted with bold text in the list of matching community posts, but you can disable this feature.

To disable search term highlighting

Add `highlight="false"` to the widget code to change it as follows.

```
<rn:widget path="social/CommunitySearchResults"
highlight="false" />
```

Continue configuring the CommunitySearchResults widget or Return to the community integration widgets overview.

Defining the number of posts

The default CommunitySearchResults widget displays five posts from the community, but you can edit that value using the *limit* attribute.

To change the number of displayed posts

Add `limit="10"` to the widget code, replacing `"10"` with the number of posts you want to display. The code now resembles the following.

```
<rn:widget path="social/CommunitySearchResults"
limit="10" />
```

Continue configuring the CommunitySearchResults widget or Return to the community integration widgets overview.

Removing the link to all posts

By default, the See All Posts link appears at the bottom of the list of posts. When customers click the link, they are taken to the community site. You can disable the link if you want.

To disable the See All Posts link

Add `show_all_results_link="false"` to the widget code so it reads as follows.

```
<rn:widget path="social/CommunitySearchResults"
show_all_results_link="false" />
```

Continue configuring the CommunitySearchResults widget or Return to the community integration widgets overview.

Truncating posts

By default, the CommunitySearchResults widget displays the first 200 characters of the content for a post and then displays an ellipsis to indicate additional content. Because partial words are not displayed, the actual number of displayed characters may not total exactly 200. You can edit the *truncate_size* attribute to vary the number of displayed characters between 1 and 200.

To change the number of characters used to display content

Add `truncate_size="100"` to the widget code, replacing `"100"` with the value you want. The code now resembles the following.

```
<rn:widget path="social/CommunitySearchResults"
truncate_size="100" />
```

Continue configuring the CommunitySearchResults widget or Return to the community integration widgets overview.

Adding the AnswerComments widget to the answer details page

When you add the AnswerComments widget to the answer details page, your customers can post comments to individual answers, as well as reply to comments posted by other customers. You can place the widget anywhere on the page. In this example, we'll add it to the bottom of the page below the links for sharing, printing, emailing, and subscribing to the answer.

To add the AnswerComments widget to the answer details page

1 Open the *detail.php* file in the */views/pages/answers* folder.

2 Locate the following lines of code.

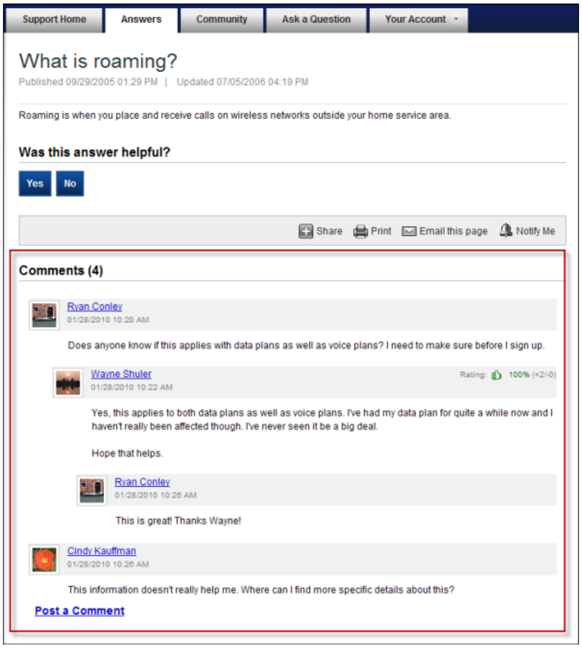
```
<div id="rn_DetailTools">
    <rn:widget path="utils/SocialBookmarkLink" />
    <rn:widget path="utils/PrintPageLink" />
    <rn:widget path="utils/EmailAnswerLink" />
    <rn:condition logged_in="true">
        <rn:widget path="notifications/AnswerNotificationIcon" />
    </rn:condition>
</div>
```

3 Add the following code immediately below the code you located in step 2.

```
<rn:widget path="social/AnswerComments" />
```

4 Save *detail.php*.

Next, configure the attributes of the AnswerComments widget or Return to the community integration widgets overview.



Configuring the AnswerComments widget

You can configure the AnswerComments widget to let your customers comment on individual answers in your knowledge base. Answer comments are often insightful and can be used to refine and expand knowledge base content and adjust to the needs of your customers.

The following characteristics can be edited in the widget code.

- Control the number of comment levels
- Change the thumbs up/thumbs down icons
- Change labels on the widget

Controlling the number of comment levels

By default, five comment levels are allowed on the AnswerComments widget. When comments have reached a depth of five levels, no additional comments can be submitted. You can change this value, but you may need to change the width of the widget to accommodate higher values.

To change the number of comment levels

Define the *max_comment_depth* attribute so the widget code resembles the following.

```
<rn:widget path="social/AnswerComments"
max_comment_depth="3" />
```

Continue configuring the AnswerComments widget or Return to the community integration widgets overview.

Replacing icons

You can replace the default thumbs up and thumbs down icons, which are specified as attributes of the AnswerComments widget, by defining the path and file name for the replacement icon. All default icons are in the */cp/customer/assets/themes/standard/images* folder, but you can reference the path in the widget attribute simply by typing `images/[filename]`.

To replace the thumbs up icon

Define the *thumbs_up_icon* attribute so your code resembles the following.

```
<rn:widget path="social/AnswerComments"
thumbs_up_icon="images/new/thumbUp.png" />
```

To replace the thumbs down icon

Define the *thumbs_down_icon* attribute so your code resembles the following.

```
<rn:widget path="social/AnswerComments"
thumbs_down_icon="images/new/thumbDown.png" />
```

Changing labels

You can change any of the following labels by editing its corresponding attribute. For example, to replace the default title, your code will resemble the following.

```
<rn:widget path="social/AnswerComments"
label_title="New Comments Label (%d)" />
```

- Cancel button—*label_cancel_submit*
- Create account link—*label_create_account*
- Delete link—*label_delete*
- Delete confirmation message—*label_delete_confirm*
- Title on delete confirmation message—*label_delete_confirm_title*
- Label for deleted comment—*label_deleted*
- Edit link—*label_edit*
- Edited label—*label_edited*
- Flag link—*label_flag*
- Flagged comment label—*label_flagged*
- Text for new comment—*label_new_comment*
- Text when there are no comments—*label_no_comments*
- Label for notification check box—*label_notify*
- Rate it link—*label_rate*
- Accessibility labels for rating links—*label_rate_up*, *label_rate_down*
- Label for customer's rating—*label_rated*
- Rating label—*label_rating*
- Reply link—*label_reply*
- Submit button—*label_submit*
- Suspended label—*label_suspended*
- Title—*label_title*

Continue configuring the AnswerComments widget or Return to the community integration widgets overview.

Adding the CommunityPostDisplay widget

The CommunityPostDisplay widget displays a community **post** on your customer portal. You can specify which post you want to display by setting the *post_hash* attribute to the post's **hash** value. You can use other attributes to alter the post's appearance. By default, any comments for the post appear in chronological order, and logged-in customers can rate posts and comments and submit comments of their own.

Important The CommunityPostDisplay widget assumes that the post's title is contained in the **post type's** first field and the body text is in its second field. To display the post properly, be sure that the post type conforms to this field order. Refer to Posts.

This example assumes you want to add the CommunityPostDisplay widget to display a public post on the Support Home page. If a non-public post is defined instead, customers must log in before they can see it.

To add the CommunityPostDisplay widget to the Support Home page

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following code.

```
<div class="rn_Module">
    <h2>#rn:msg:MOST_POPULAR_ANSWERS_LBL#</h2>
    <rn:widget path="reports/Multiline"
    report_id="194"
    per_page="12"/>
    <a class="rn_AnswersLink"
    href="/app/answers/
    list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
</div>
```

3 Add the following code immediately after the code you found in step 2, entering the hash of the post you want to display so that your code resembles the following.

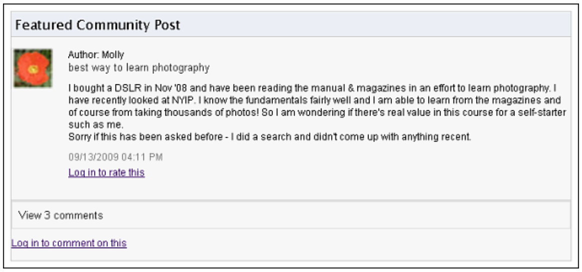
```
<div class="rn_Module">
    <h2>Featured Community Post</h2>
    <rn:widget path="social/CommunityPostDisplay"
    post_hash="bbe47d0d5e" />
```

```
</div>
```

Note A post's hash is found in the URL of its page. For example, if a post is located at `http://<your_site>.com/posts/bbe47d0d5e`, the post hash is `bbe47d0d5e`.

4 Save *home.php*.

Next, configure the attributes of the CommunityPosts widget or Return to the community integration widgets overview.



Configuring the CommunityPostDisplay widget

You can configure the CommunityPostDisplay widget's attributes to alter how the post appears on your customer portal. The following properties can be edited in the widget code.

- The display of post information, including:
  - ▷ Author name and profile photo
  - ▷ Post rating option
  - ▷ Post creation date
  - ▷ Post comments
  - ▷ Number of post comments
- Labels on the widget

Return to the community integration widgets overview.

Defining the post information displayed

By default, the CommunityPostDisplay widget includes the author's name and profile picture, a rating submission option, the date that the post was created, and the Log In To Comment On This link. You can remove any of this information.

To remove post information

1 To remove the author's name and profile picture, add `show_author="false"` to the widget code so it reads as follows.

```
<rn:widget path="social/CommunityPostDisplay"
post_hash="bbe47d0d5e"
show_author="false" />
```

2 To remove the option for submitting a post rating, add `post_ratings="false"` to the widget code.

```
<rn:widget path="social/CommunityPostDisplay"
post_hash="bbe47d0d5e"
post_ratings="false" />
```

3 To remove the post's creation date, add `show_posted_date="false"` to the widget code.

```
<rn:widget path="social/CommunityPostDisplay"
post_hash="bbe47d0d5e"
show_posted_date="false" />
```

4 To remove the Log In To Comment On This link, add `post_comments="false"` to the widget code.

```
<rn:widget path="social/CommunityPostDisplay"
post_hash="bbe47d0d5e"
post_comments="false" />
```

Continue configuring the CommunityPostDisplay widget or Return to the community integration widgets overview.

Changing labels

You can change any of the following labels by editing its corresponding attribute. For example, to modify the login link text, your code would resemble the following.

```
<rn:widget path="social/CommunityPostDisplay"
label_login_link_comment="Sign in to comment" />
```

- Author name—*label_author* (Defaults to `'Author: %s'`.)
- Post creation date—*label_posted_date* (Defaults to `'%s'`.)
- Log in to rate link—*label_login_link_rate*
- Log in to comment link—*label_login_link_comment*
- Comment placeholder text—*label_comment_placeholder*

Continue configuring the CommunityPostDisplay widget or Return to the community integration widgets overview.

Adding the CommunityPostSubmit widget

The CommunityPostSubmit widget displays a form that allows customers to submit a community **post** from your customer portal. You direct form submissions to a specific **hive** and **post type** by setting the *resource_hash* and *post_type_id* attributes. You can also configure other attributes to alter the post's appearance.

Important The CommunityPostSubmit widget supports only the title and body fields. To ensure that posts are created properly, be sure that the post type includes these fields. Refer to Posts.

This example assumes you want to add the CommunityPostSubmit widget to the Support Home page.

To add the CommunityPostSubmit widget to the Support Home page

1 Open the *home.php* file in the */views/pages* folder.

2 Locate the following code.

```
<div class="rn_Module">
    <h2>#rn:msg:MOST_POPULAR_ANSWERS_LBL#</h2>
    <rn:widget path="reports/Multiline"
    report_id="194"
    per_page="12"/>
    <a class="rn_AnswersLink"
    href="/app/answers/
    list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
</div>
```

3 Add the following code immediately after the code you found in step 2, entering the hash of the post you want to display so that your code resembles the following.

```
<div class="rn_Module">
    <h2>Submit a Community Post</h2>
    <rn:widget path="social/CommunityPostSubmit"
    resource_hash="a93f4c7f51" post_type_id="5" />
```

```
</div>
```

Note The hive resource hash ID is found in the URL of its hive summary page. For example, if a hive is located at `http://<your_site>.com/hives/a93f4c7f51/summary`, the hive's resource hash is `a93f4c7f51`.

The post type ID can be found in the URL of the post type's configuration page, located at Admin > Posts > (post name). For example, if a post type's configuration page URL is `http://<your_site>.com/settings/posttypes/5`, the post type ID is 5. Refer to Posts.

4 Save *home.php*.

Next, configure the attributes of the CommunityPostSubmit widget or Return to the community integration widgets overview.

Configuring the CommunityPostSubmit widget

You can configure the CommunityPostSubmit widget's attributes to alter how the community post submit form appears on your customer portal. The following properties can be edited in the widget code.

- The enabling of post form functions, including:
  - Field hints
  - Title field focus
  - Confirmation dialog
  - Submission landing page
  - Append parameters
  - Submission progress image
- Labels on the widget

Return to the community integration widgets overview.

Enabling post form functions

By default, the CommunityPostSubmit widget displays only the title and body fields. You can add widget attributes to always show field hints, auto-focus the title field, prompt for confirmation, redirect to a custom, parameterized URL upon submission, and display a submission progress graphic.

To enable post form functions

1 To always display hints for form fields (not just when a field has focus), add `always_show_hint="true"` to the widget code so it reads as follows.

```
<rn:widget path="social/CommunityPostSubmit"
resource_hash="a93f4c7f51" post_type_id="5"
always_show_hint="true" />
```

2 To set browser focus to the title field, add `initial_focus="true"` to the widget code.

```
<rn:widget path="social/CommunityPostSubmit"
resource_hash="a93f4c7f51"
post_type_id="5"
initial_focus="true" />
```

3 To prompt members for confirmation when they click the Submit button, add `label_confirm_dialog="true"` to the widget code.

```
<rn:widget path="social/CommunityPostSubmit"
resource_hash="a93f4c7f51"
post_type_id="5"
label_confirm_dialog="true" />
```

4 To redirect members to another page upon submitting the post form, add the `on_success` attribute with the page URL so that your code resembles the following.

```
<rn:widget path="social/CommunityPostSubmit"
resource_hash="a93f4c7f51"
post_type_id="5"
on_success="http://yoursite.com" />
```

5 To append parameters to the redirecting URL, list them in comma-separated format using the `add_params_to_url` attribute so that your code resembles the following.

```
<rn:widget path="social/CommunityPostSubmit"
resource_hash="a93f4c7f51"
post_type_id="5"
on_success="http://yoursite.com"
add_params_to_url="param_1=7,param_2=45,param_3=123" />
```

6 To display an image while the post submission in is progress, add the `icon_loading_path` attribute to the widget code so it resembles the following.

```
<rn:widget path="social/CommunityPostSubmit"
resource_hash="a93f4c7f51"
post_type_id="5"
icon_loading_path="http://yoursite.com/images/image.jpg" />
```

Continue configuring the CommunityPostSubmit widget or Return to the community integration widgets overview.

Changing labels

You can change any of the following labels by editing its corresponding attribute. For example, to modify the body hint text, your code would resemble the following.

```
<rn:widget path="social/CommunityPostSubmit"
label_body_hint="When submitting a technical issue to the community,
please include your system specifications." />
```

- Field required—*label_required* (Defaults to `'%s is required'`.)
- Submit button—*label_submit_button*
- Title field label—*label_title_field*
- Title hint—*label_title_hint*
- Body field label—*label_body_field* (Defaults to `'Your Post'`.)
- Body hint—*label_body_hint*

Return to the community integration widgets overview.

60

Mobile Customer Portal

The Oracle RightNow Customer Portal Cloud Service (Customer Portal) not only provides a superior customer experience on full-featured browsers, but it also includes a reference implementation designed specifically for mobile devices. In addition to its streamlined interface and optimized performance, the mobile customer portal includes the ability to direct customers to a predefined page set based on the type of device they use to access your support site.

Using the default mobile **reference implementation**, customers can view popular answers and featured support categories. They can conduct searches, view lists of answers and individual answers, and provide feedback on an answer. They can also submit questions, update their account information, chat with an agent, and be guided through a series of questions to reach a solution.

The mobile reference implementation has been tested on devices using the following operating systems.

- Android 1.5+
- iPhone 3.1+

Although not officially supported, other devices that support full-featured browsers (those supporting JavaScript, style sheets, and cookies) are expected to be able to use the mobile reference implementation without customization.

Note All figures showing mobile customer portal pages were captured using an Android mobile device emulator.

Overview of working with the mobile customer portal

The mobile customer portal pages are automatically included in the Customer Portal reference implementation. This section describes the steps you must take so you can view the mobile pages in development mode and so your customers with mobile devices can view them on your production site.

Step 1—Enable page set mappings. This step is critical for viewing the mobile customer portal. Refer to Enabling page set mappings.

Step 2—Decide where you want to view the development pages. Your options include viewing them on your regular desktop workstation, mobile devices, and mobile device emulators. Refer to Working with the mobile development pages.

Step 3—Edit the mobile reference implementation to incorporate all the changes you eventually want to include on your production site. Begin by editing the template at Mobile template configuration, and then continue editing individual mobile pages and widgets as described within this section.

Step 4—Define the user agent mapping so customers who use desktop browsers can view your standard pages and those using mobile devices can view your mobile pages. Refer to Defining user agent mapping.

Step 5—Stage and promote the customer portal so the mobile development pages you have been working on are promoted to your production site. Refer to Staging and Promoting the Customer Portal.

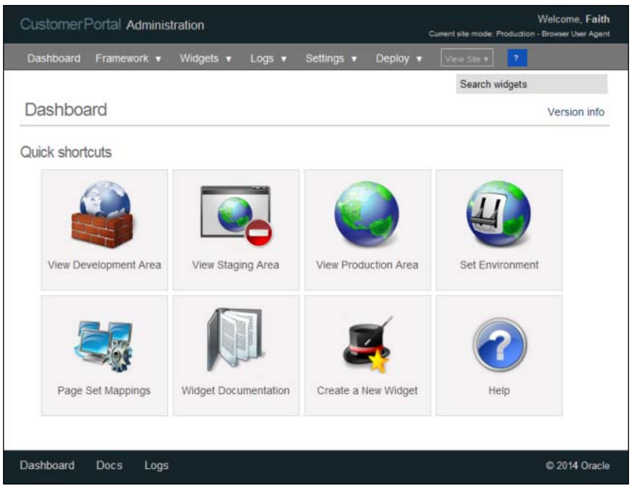
Enabling page set mappings

Before you can view the mobile customer portal page set in the development area, you must enable at least one of the default page set mappings. It does not matter which browser you use to enable page set mappings, whether it's your desktop system or a mobile device. After you enable one or more page set mappings on any system and then set the development area for the specific browser or device, you can view the default mobile page set in the development area.

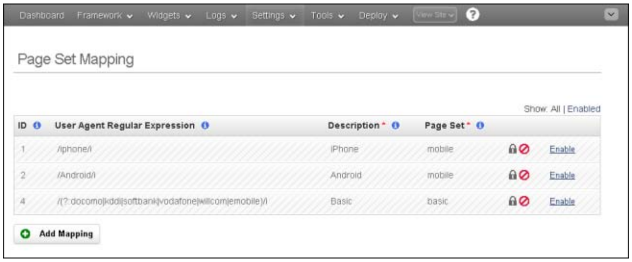
Important Although the mobile page set is visible in the development area after you have enabled page set mappings, the mobile pages will not be visible on your production site until you have **staged** and **promoted** the customer portal.

To enable page set mappings

1 In a web browser, type `https://<your_site>/ci/admin`. After you log in, the Customer Portal Dashboard displays.



2 Click the Page Set Mappings shortcut on the dashboard. The Page Set Mapping page displays.



3 Click Enable in the right column for one or more of the three mobile devices (iPhone, Android, and Palm). The link changes to Disable.

4 To add your own page set mappings, click here.

5 To make these pages available on your production site, log in to Oracle Service Cloud and stage and promote the customer portal.

Working with the mobile development pages

When you begin working on your **development pages**, you'll want to test and review your changes before you **stage** and **promote** them into **production**. You can—and should—review the pages on the actual mobile devices you expect your customers to use to access your support site before you promote the changes. However, you might prefer to do preliminary testing on your desktop browser or a mobile device emulator.

The following emulators are available for testing your development pages.

- iPhone Simulator application on PCs or the native simulator application on your Mac
- Android emulator

Although you need to enable the page set mappings just once on any browser or device you choose, you must set the development area for each browser or device you test on. For example, assume you want to test your mobile pages on your iPhone and also on an Android emulator. You must select the development area separately for each device. And if you want to also view your mobile pages on your workstation without an emulator, you must set the development area for your browser too.

You can view the mobile development pages in any of the following ways.

- On a mobile device
- On a mobile device emulator

- On your workstation using one or more browsers

Note You may find it easier to verify pages on your desktop browser instead of a mobile device emulator because emulators typically have slower performance. (Google Chrome provides the most representative mobile page set when viewed in a web browser.) Still, before you stage and promote your development pages, you should always preview your pages on the actual kinds of mobile devices you expect your customers to use.

Viewing development pages on a mobile device or emulator

Prerequisite

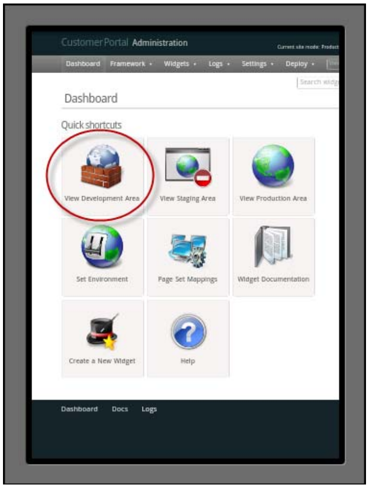
You must complete the procedure in Enabling page set mappings before you set the development area.

To view the development pages on a mobile device or emulator

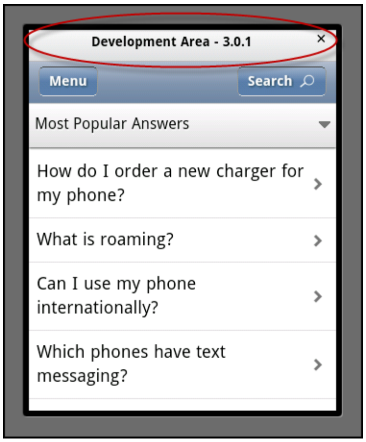
Note For the best mobile customer portal experience, devices should be configured to load images on web pages. If images are turned off, display issues may occur.

1 Enter the following URL on your mobile device or emulator to access the Customer Portal Administration site.

```
https://<your_site>/ci/admin
```



2 On the Quick Shortcuts Dashboard, click View Development Area. The home page opens, and the Development Area header appears at the top of the page so you know you are viewing development pages.



Refer to [Development header] for an explanation of the options available on the header.

Viewing mobile development pages on a desktop workstation

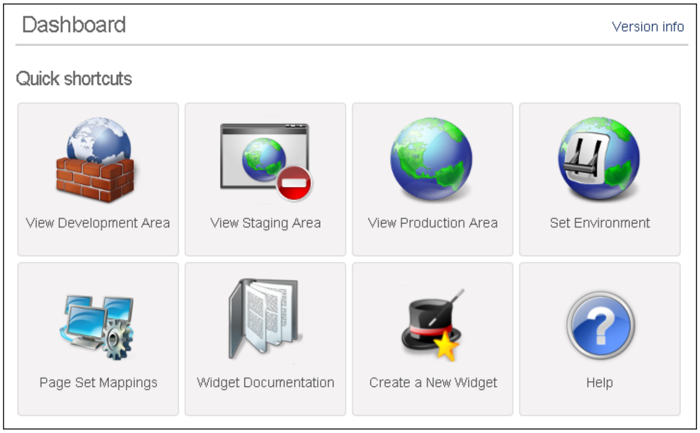
Prerequisite

You must complete the procedure in Enabling page set mappings before you set the development area.

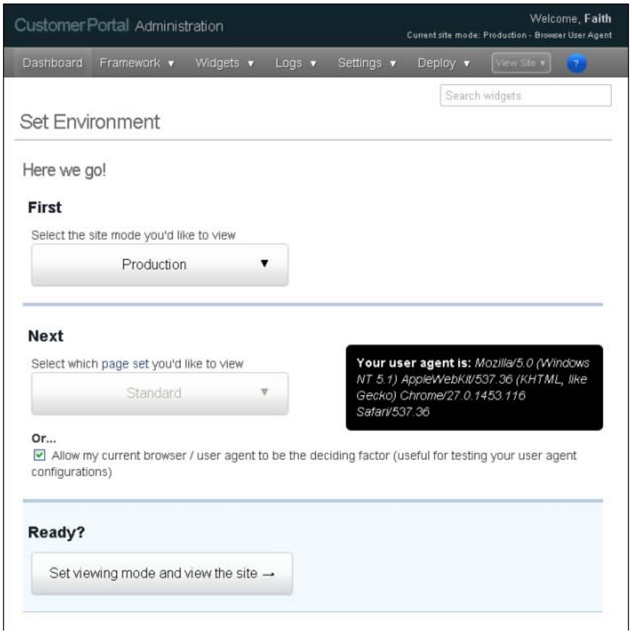
To view mobile development pages on a desktop workstation

1 Enter the following URL on your workstation browser to access the Customer Portal Administration site.

```
https://<your_site>/ci/admin
```



2 On the Quick Shortcuts Dashboard, click Set Environment.



3 In the Production drop-down menu, select Development.

Note If you want to view your current production site, you can select Production. However, if you haven't staged and promoted the customer portal after enabling the page set mappings, the mobile pages will not be displayed on your production site.

4 Clear the check box that says "Allow my current browser/user agent to be the deciding factor."

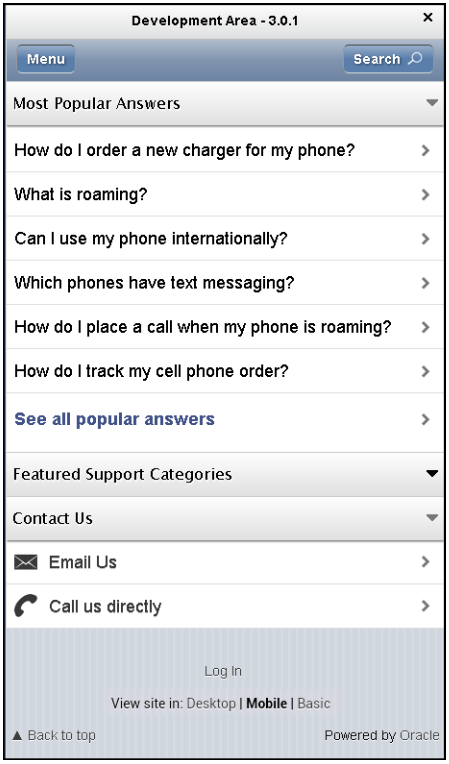
5 In the drop-down menu just above the check box, select Mobile.

Note If the Mobile option doesn't appear in the menu, at least one default page set mapping must first be enabled.

6 Click Set Viewing Mode and View the Site. The Development Area header appears at the top of the page so you know you are viewing development pages. (Refer to Development header for an explanation of the options available on the header.)

The following figure shows the mobile page set displayed on a desktop workstation using Google Chrome, which mimics more closely than other web browsers how the pages appear on a mobile device. If you also want to view your mobile pages using additional web browsers (Mozilla Firefox, for example), you'll need to repeat this procedure for those browsers as well.

Note For a good representation of the mobile page set, use any browser except Internet Explorer.



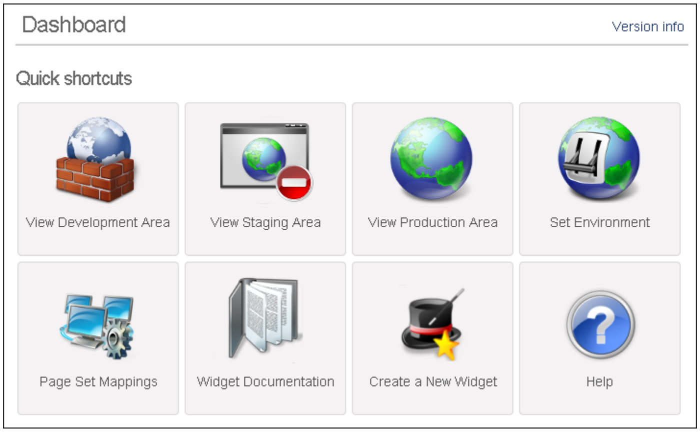
Defining user agent mapping

You want your customers to be automatically directed to the correct interface based on the browser they are using. That is, if they are using a desktop or laptop computer, you want them to access your standard customer portal, but if they are using a mobile device, you want them to be directed to your mobile customer portal interface. User agent mapping lets you control how that occurs. It also lets you define unique page sets for various mobile devices if you want.

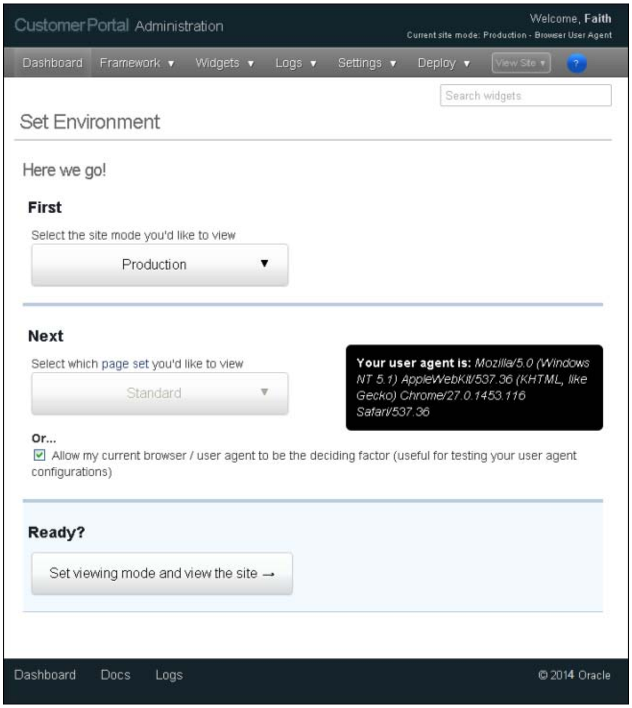
To define user agent mapping

1 Enter the following URL on your workstation browser to access the Customer Portal Administration site.

```
https://<your_site>/ci/admin
```



2 On the Quick Shortcuts Dashboard, click Set Environment.



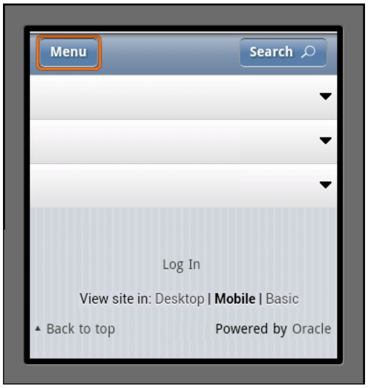
3 Select the check box that says "Allow my current browser/user agent to be the deciding factor," which means that the page set is determined by the browser or user agent accessing the pages. The user agent of your browser is shown on the page.

Note With this check box selected, you will see the standard page set if you are using a desktop browser and the mobile page set if you are using a mobile device or emulator.

Mobile template configuration

The mobile reference implementation for the Customer Portal includes its own template and a set of pages specific to the mobile customer portal. The template and pages are optimized for mobile devices, and many of the widgets are specially designed for the mobile application.

The file for the mobile reference implementation template is *mobile.php*, located in the customer portal file structure under */cp/customer/development/views/templates*. The template includes a Menu button, a Search button, and a page set selector that lets customers display the standard page set on their mobile device if they choose. It also includes a Log In/Logout link, an option that takes customers to the top of the page, and another link for the Oracle Service Cloud website.



Select one of the following template features to learn about its configuration options.

- Configuring security
- Menu button
- Search button
- Log In/Logout link
- Page set selector

When you finish configuring the mobile template, you can configure the individual pages that make up the mobile interface. These pages are located in the */cp/customer/development/views/pages/mobile* folder. The following main pages are included.

- Home page
- Login page
- Answers list page
- Answer details page
- Guided assistance page
- Ask a question page
- Chat pages

- Create account page
- Support history page
- Question details page
- Account settings page
- Change password page

Configuring security

Clickjacking is an attack on browser security that can mislead your customers into clicking a concealed link. To prevent clickjacking, you cannot let your site be put into an iFrame on another site. If you do not use iFrames, make the following edits to the template file.

Note If you intentionally run your customer portal inside an iFrame, do not use the following procedure.

To configure the template for security

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following first lines of code.

```
<rn:meta javascript_module="mobile"/>
<!DOCTYPE html>
<html lang="#rn:language_code#">
    <head>
```

3 Immediately after the `<head>` tag you located in step 2, add the following code.

```
<script>
if (top!= self) top.location.href = self.document.location;
if (parent!= self) top.location.href = location.href;
if (top.frames.length!=0) top.location=self.document.location;
if (window!= window.top) top.location.href = location.href;
</script>
```

4 Save *mobile.php*.

5 Open the *hooks.php* file in the */customer/development/config* folder.

6 Add the following code to the pre_page_render hook to prevent clickjacking in modern browsers. Refer to Adding hooks.

```
header("X-Frame-Options:deny");
```

7 Save *books.php*.

Menu button

The Menu button, which appears on the mobile template and therefore on all mobile pages, toggles between displaying and hiding an overlay of the following navigation options.

- Home
- Contact Us
- Your Account

Review the code for the Menu button.

Code for the Menu button

The MobileNavigationMenu widget is a toggle button. When it is used to generate the Menu button, the code defines the submenu (rn_MenuList) that is opened and closed when the button is clicked. You can see from the following code that the rn_MenuList submenu has the class rn_Hidden, meaning that options are hidden until the button is clicked. The default *label* attribute of MobileNavigationMenu is "Menu," so the widget code doesn't need to specify a button label.

```
<span class="rn_FloatLeft">
    <rn:widget path="navigation/MobileNavigationMenu"
    submenu="rn_MenuList"/>
</span>
<ul id="rn_MenuList"
class="rn_Hidden">
    <li>
        <a href="/app/
```

```
    #rn:config:CP_HOME_URL##rn:session#">#rn:msg:HOME_LBL#</a>
</li>
<li>
    <a href="javascript:void(0);"
    class="rn_ParentMenu">#rn:msg:CONTACT_US_LBL#</a>
    <ul class="rn_Submenu rn_Hidden">
        <rn:condition config_check="MOD_CHAT_ENABLED == true">
            <li><a href="/app/chat/
            chat_launch#rn:session#">#rn:msg:CHAT_LBL#</a></li>
        </rn:condition>
        <li><a href="/app/
        ask#rn:session#">#rn:msg:EMAIL_US_LBL#</a></li>
        <li><a
        href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#<
        /a></li>
        <rn:condition config_check="COMMUNITY_ENABLED == true">
            <li><a
            href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_
            LBL#</a></li>
        </rn:condition>
    </ul>
</li>
<li>
    <a href="javascript:void(0);"
    class="rn_ParentMenu">#rn:msg:YOUR_ACCOUNT_LBL#</a>
    <ul class="rn_Submenu rn_Hidden">
        <rn:condition logged_in="false">
            <rn:condition config_check="PTA_ENABLED == true">
                <li><a
                href="javascript:void(0);">#rn:msg:SIGN_UP_LBL#</
                a></li>
                <li><a
                href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</
                a></li>
            <rn:condition_else>
                <li><a href="/app/utils/
                create_account#rn:session#">#rn:msg:SIGN_UP_LBL#<
                /a></li>
                <li><a href="/app/
                #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG
                _IN_LBL#</a></li>
            </rn:condition>
```

```
                    <li><a href="/app/
                    #rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">#rn:ms
                    g:ACCOUNT_ASSISTANCE_LBL#</a></li>
                </rn:condition>
                <li><a href="/app/account/questions/list
                #rn:session#">#rn:msg:VIEW_YOUR_SUPPORT_HISTORY_CMD#</
                a></li>
                <li><a href="/app/account/profile
                #rn:session#">#rn:msg:CHANGE_YOUR_ACCOUNT_SETTINGS_CMD#</
                a></li>
            </ul>
        </li>
    </ul>
```

Home section

The rn_MenuList element is a list of the three options: Home, Contact Us, and Your Account. The Home option consists of the following simple code to return customers to the mobile home page.

```
        <li>
            <a href="/app/
            #rn:config:CP_HOME_URL##rn:session#">#rn:msg:HOME_LBL#</a>
        </li>
```

Contact Us section

Code for the Contact Us section is more complex since it displays several contact options. The following code defines the Contact Us section.

```
        <li>
            <a href="javascript:void(0);"
            class="rn_ParentMenu">#rn:msg:CONTACT_US_LBL#</a>
            <ul class="rn_Submenu rn_Hidden">
                <rn:condition config_check="MOD_CHAT_ENABLED == true">
                    <li><a href="/app/chat/
                    chat_launch#rn:session#">#rn:msg:CHAT_LBL#</a></li>
                </rn:condition>
                <li><a href="/app/
                ask#rn:session#">#rn:msg:EMAIL_US_LBL#</a></li>
                <li><a
                href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#<
                /a></li>
                <rn:condition config_check="COMMUNITY_ENABLED == true">
                    <li><a
                    href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_
```

```
                LBL#</a></li>
            </rn:condition>
        </ul>
    </li>
```

Clicking Contact Us invokes a submenu with Chat, Email Us, Call Us Directly, and Ask the Community options. Notice that the JavaScript links for the last two options are blank by default. You'll need to define the Call Us Directly link and the Ask the Community link.

Your Account section

The Your Account section is defined by the following code. Notice that the first three options on the Your Account submenu—Sign Up, Log In, and Account Assistance—are displayed conditionally only when customers are not logged in. When customers are logged in, the Your Account menu has just two options: View Your Support History and Change Your Account Settings.

```
    <li>
        <a href="javascript:void(0);"
        class="rn_ParentMenu">#rn:msg:YOUR_ACCOUNT_LBL#</a>
        <ul class="rn_Submenu rn_Hidden">
            <rn:condition logged_in="false">
                <rn:condition config_check="PTA_ENABLED == true">
                    <li><a
                    href="javascript:void(0);">#rn:msg:SIGN_UP_LBL#</
                    a></li>
                    <li><a
                    href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</
                    a></li>
                <rn:condition_else>
                    <li><a href="/app/utils/
                    create_account#rn:session#">#rn:msg:SIGN_UP_LBL#<
                    /a></li>
                    <li><a href="/app/
                    #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG
                    _IN_LBL#</a></li>
                </rn:condition>
                <li><a href="/app/
                #rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">#rn:ms
                g:ACCOUNT_ASSISTANCE_LBL#</a></li>
            </rn:condition>
            <li><a href="/app/account/questions/list
            #rn:session#">#rn:msg:VIEW_YOUR_SUPPORT_HISTORY_CMD#</
            a></li>
```

```
            <li><a href="/app/account/profile
            #rn:session#">#rn:msg:CHANGE_YOUR_ACCOUNT_SETTINGS_CMD#</
            a></li>
        </ul>
    </li>
```

Removing and adding Menu button navigation options

You can remove or add navigation options for the Menu button.

To remove navigation options from the Menu button

1 Open the *mobile.php* file in the */views/templates* folder.

2 To remove Home, delete the following lines of code.

```
<li>
    <a href="/app/
    #rn:config:CP_HOME_URL##rn:session#">#rn:msg:HOME_LBL#</a>
</li>
```

3 To remove Contact Us, delete the following lines of code.

```
<li>
    <a href="javascript:void(0);"
    class="rn_ParentMenu">#rn:msg:CONTACT_US_LBL#</a>
    <ul class="rn_Submenu rn_Hidden">
        <rn:condition config_check="MOD_CHAT_ENABLED == true">
            <li><a href="/app/chat/
            chat_launch#rn:session#">#rn:msg:CHAT_LBL#</a></li>
        </rn:condition>
        <li><a href="/app/ask#rn:session#">#rn:msg:EMAIL_US_LBL#</
        a></li>
        <li><a
        href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</
        a></li>
        <rn:condition config_check="COMMUNITY_ENABLED == true">
            <li><a
            href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#
            </a></li>
        </rn:condition>
    </ul>
</li>
```

4 To remove Your Account, Delete the following lines of code.

```
<li>
    <a href="javascript:void(0);"
    class="rn_ParentMenu">#rn:msg:YOUR_ACCOUNT_LBL#</a>
    <ul class="rn_Submenu rn_Hidden">
        <rn:condition logged_in="false">
            <rn:condition config_check="PTA_ENABLED == true">
                <li><a
                href="javascript:void(0);">#rn:msg:SIGN_UP_LBL#</
                a></li>
                <li><a
                href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</
                a></li>
            <rn:condition_else>
                <li><a href="/app/utils/
                create_account#rn:session#">#rn:msg:SIGN_UP_LBL#<
                /a></li>
                <li><a href="/app/
                #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG
                _IN_LBL#</a></li>
            </rn:condition>
            <li><a href="/app/
            #rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">#rn:ms
            g:ACCOUNT_ASSISTANCE_LBL#</a></li>
        </rn:condition>
        <li><a href="/app/account/questions/list
        #rn:session#">#rn:msg:VIEW_YOUR_SUPPORT_HISTORY_CMD#</
        a></li>
        <li><a href="/app/account/profile
        #rn:session#">#rn:msg:CHANGE_YOUR_ACCOUNT_SETTINGS_CMD#</
        a></li>
    </ul>
</li>
```

5 Save *mobile.php*.

Adding options to the Menu button

You can add other options to the Menu button that will take your customers to pages in your customer portal or to external URLs. The following example removes the default options and creates a custom menu that opens when the Menu button is clicked.

To add options to the Menu button

1 Open the *mobile.php* file in the */views/templates* folder.

2 Delete the default code for the Home option, the Contact Us option, and the Your Account option.

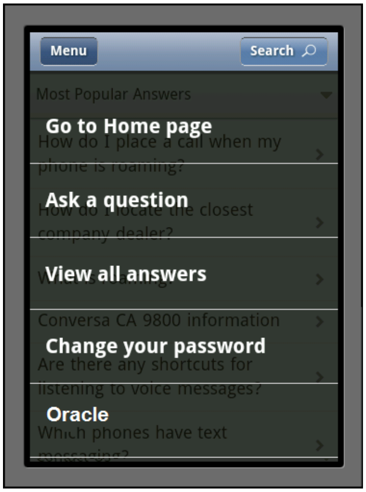
3 Locate the following line of code.

```
<ul id="rn_MenuList" class="rn_Hidden">
```

4 Add the following code below the line you located in step 3.

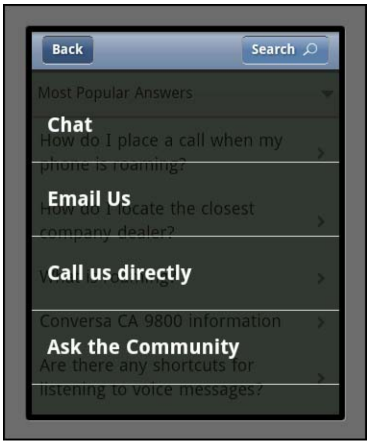
```
<li>
    <a href="/app/#rn:config:CP_HOME_URL##rn:session#">Go to Home
    page</a>
</li>
<li>
    <a href="/app/ask#rn:session#">Ask a question</a>
</li>
<li>
    <a href="/app/answers/list#rn:session#">View all answers</a>
</li>
<li>
    <a href="/app/account/change_password#rn:session#">Change your
    password</a>
</li>
<li>
    <a href="http://www.oracle.com">Oracle</a>
</li>
```

5 Save *mobile.php*.



Contact Us section

Clicking the Menu button and then clicking Contact Us opens the following menu.



- **Chat**—Clicking Chat submits a request to chat with an agent. Refer to Chatting on the mobile customer portal.
- **Email Us**—Clicking Email Us opens the page to ask a question. Refer to Asking a question on the mobile customer portal.

- **Call Us Directly**—This link opens a web page containing your organization's contact information. By default, the URL is void, so you'll need to specify the URL you want to link to. Refer to Adding a URL for the Call Us Directly option.
- **Ask the Community**—This link takes customers to your organization's **community** forum page. By default, the URL is void, so you'll need to specify the URL for the community forum page where they can submit their questions. Refer to Defining a URL for the Ask the Community option.

Note The Ask the Community link is enclosed in a condition that checks to see if Oracle RightNow Social Experience (Social Experience) is enabled on your site. If it is not, the link does not appear. For information about this condition tag, refer to Config Setting Check condition.

Clicking the Back button on the upper left returns customers to the menu they originally accessed by clicking the Menu button (Home, Contact Us, and Your Account).

Configuration options for the Contact Us menu include removing default items and adding other options to the menu.

Removing default options from the Contact Us menu

To remove default options from the Contact Us menu

1 Open the *mobile.php* file in the */views/templates* folder.

2 To remove the Chat option, delete the following lines of code.

```
<rn:condition config_check="MOD_CHAT_ENABLED == true">
    <li><a href="/app/chat/
    chat_launch#rn:session#">#rn:msg:CHAT_LBL#</a></li>
</rn:condition>
```

3 To remove the Email Us option, delete the following line of code.

```
<li><a href="/app/ask#rn:session#">#rn:msg:EMAIL_US_LBL#</a></li>
```

4 To remove the Call Us Directly option, delete the following line of code.

```
<li><a href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</a></
li>
```

5 To remove the Ask the Community option, delete the following line of code.

```
<rn:condition config_check="COMMUNITY_ENABLED == true">
    <li><a
    href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#</a></
```

```
    li>
</rn:condition>
```

6 Save *mobile.php*.

Adding options to the Contact Us menu

To add an option to the Contact Us menu

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
<a href="javascript:void(0);"
class="rn_ParentMenu">#rn:msg:CONTACT_US_LBL#</a>
<ul class="rn_Submenu rn_Hidden">
    <rn:condition config_check="MOD_CHAT_ENABLED == true">
        <li><a href="/app/chat/
        chat_launch#rn:session#">#rn:msg:CHAT_LBL#</a></li>
    </rn:condition>
    <li><a href="/app/ask#rn:session#">#rn:msg:EMAIL_US_LBL#</a></li>
    <li><a href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</
    a></li>
    <rn:condition config_check="COMMUNITY_ENABLED == true">
        <li><a
        href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#</
        a></li>
    </rn:condition>
</ul>
```

3 Add code that resembles the following example in the location where you want it to appear in the list of options. Here we'll add a link for driving directions after the Call Us Directly option.

```
    <li><a href="http://www.mapquest.com/
    maps?city=Bozeman&state=MT&address=136+Enterprise+Blvd&zipcode=59
    718-5945&country=US&latitude=45.655298&longitude=-
    111.06968&geocode=ADDRESS">Get driving directions</a></li>
```

4 Save *mobile.php*.

Adding a URL for the Call Us Directly option

By default, the URL for the Call Us Directly option is void so you won't unknowingly link to a site you don't want to link to. To activate the option, you'll want to specify a URL that takes customers to a web page containing your organization's contact information.

If you prefer to display your phone number in the menu, you can change the message base to add the phone number.

To define a URL for the Call Us Directly option

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<li><a href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</a></
li>
```

3 Replace `javascript:void(0);` with the URL for your contact page. Your edited code will resemble the following.

```
<li><a href="http://www.oracle.com/company-
contact.php">#rn:msg:CALL_US_DIRECTLY_LBL#</a></li>
```

4 Save *mobile.php*.

Adding a phone number

To add a phone number to the Contact Us options

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<li><a href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</a></
li>
```

3 Edit the code to replace the Call Us Directly message base with your phone number. Your edited code will resemble the following.

```
<li><a href="javascript:void(0);">Call us at (406) 555-1212</a></li>
```

4 Save *mobile.php*.

Defining a URL for the Ask the Community option

By default, the URL for the Ask the Community option is void so you won't unknowingly link to a site you don't want to link to. To activate the option, you'll need to specify a URL that takes customers to the community forum page where they can submit their questions.

Note The Ask the Community option is enclosed in a condition that checks to see if **Social Experience** is enabled on your site. If it is not, the option does not appear. For information about this condition tag, refer to Config Setting Check condition.

To define a URL for the Ask the Community option

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following code.

```
<li><a
href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#</a></
li>
```

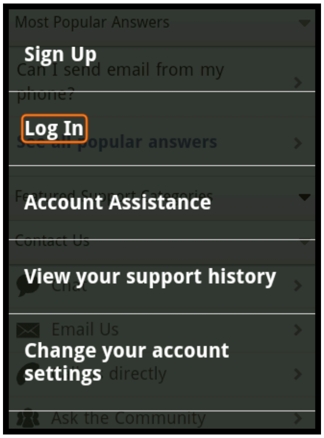
3 Replace `javascript:void(0);` with the URL for your community forum page that lets customers submit questions, being sure to append the community token (`#rn:community_token#`)to the end. Your edited code will resemble the following.

```
<li><a href="http://community.example.com/resources/b1248fb2a1/
summary#rn:community_token#">
#rn:msg:ASK_THE_COMMUNITY_LBL#</a></li>
```

4 Save *mobile.php*.

Your Account options

When customers who are not logged in click the Menu button and then click Your Account, the following options are displayed. Customers who are logged in see only the View Your Support History and Change Your Account Settings options.



- **Sign Up**—Customers who click Sign Up are taken to a page where they can enter their account information. Refer to Create account page.
- **Log In**—Clicking Log In takes customers to the login page. Configure the page here.
- **Account Assistance**—Customers can click Account Assistance to request their user name or reset their password.
- **View Your Support History**—When customers click View Your Support History, a list of incidents they have submitted displays. Customers can drill down for details about a specific incident. Refer to Configuring the support history page.
- **Change Your Account Settings**—Clicking Change Your Account Settings takes customers to the account settings page, where they can update the information in their contact record. Configure the page here.

Configuration options for the Your Account menu include removing default items and adding other options to the menu.

Removing default options from the Your Account menu

To remove default options from the Your Account menu

1 Open the *mobile.php* file in the */views/templates* folder.

2 To remove the Sign Up and Log In options, delete the following lines of code.

```
<rn:condition config_check="PTA_ENABLED == true">
    <li><a href="javascript:void(0);">#rn:msg:SIGN_UP_LBL#</a></li>
    <li><a href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</a></li>
<rn:condition_else>
    <li><a href="/app/utils/
    create_account#rn:session#">#rn:msg:SIGN_UP_LBL#</a></li>
    <li><a href="/app/
    #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG_IN_LBL#</a></
    li>
</rn:condition>
```

3 To remove the Account Assistance option, delete the following line of code.

```
<li><a href="/app/
#rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">#rn:msg:ACCOUNT_ASSIST
ANCE_LBL#</a></li>
```

4 To remove the View Your Support History option, delete the following line of code.

```
<li><a href="/app/account/questions/
list#rn:session#">#rn:msg:VIEW_YOUR_SUPPORT_HISTORY_CMD#</a></li>
```

5 To remove the Change Your Account Settings option, delete the following line of code.

```
<li><a href="/app/account/
profile#rn:session#">#rn:msg:CHANGE_YOUR_ACCOUNT_SETTINGS_CMD#</a></
li>
```

6 Save *mobile.php*.

Adding options to the Your Account menu

To add an option to the Your Account menu

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
    <li>
        <a href="javascript:void(0);"
        class="rn_ParentMenu">#rn:msg:YOUR_ACCOUNT_LBL#</a>
```

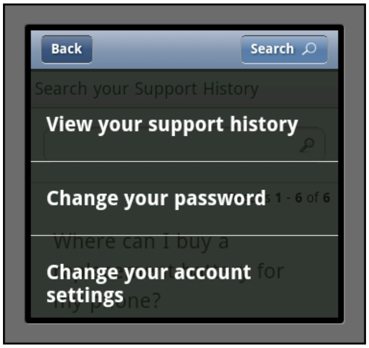
```
        <ul class="rn_Submenu rn_Hidden">
            <rn:condition logged_in="false">
                <rn:condition config_check="PTA_ENABLED == true">
                    <li><a
                    href="javascript:void(0);">#rn:msg:SIGN_UP_LBL#</
                    a></li>
                    <li><a
                    href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</
                    a></li>
                <rn:condition_else>
                    <li><a href="/app/utils/
                    create_account#rn:session#">#rn:msg:SIGN_UP_LBL#<
                    /a></li>
                    <li><a href="/app/
                    #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG
                    _IN_LBL#</a></li>
                </rn:condition>
                <li><a href="/app/
                #rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">#rn:ms
                g:ACCOUNT_ASSISTANCE_LBL#</a></li>
            </rn:condition>
            <li><a href="/app/account/questions/list
            #rn:session#">#rn:msg:VIEW_YOUR_SUPPORT_HISTORY_CMD#</
            a></li>
            <li><a href="/app/account/profile
            #rn:session#">#rn:msg:CHANGE_YOUR_ACCOUNT_SETTINGS_CMD#</
            a></li>
        </ul>
    </li>
```

3 Add code that resembles the following example in the location where you want it to appear in the list of options. Because our example is adding a change password option, we'll put it between the options available to logged-in customers: View Your Support History and Change Your Account Settings.

```
<li><a href="/app/account/change_password#rn:session#">Change
your password</a></li>
```

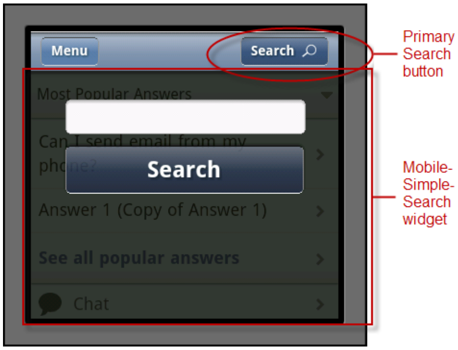
Note Depending on the option you're adding, you'll want to pay attention to whether you're placing the new option between the `logged_in="false"` condition tags. If you want the option to be available to everyone, place it anywhere in the block of code. If you want the option to be available when customers are logged in, place it after the closing condition tag (`</rn:condition>`).

4 Save *mobile.php*.



Template search feature

The search feature on the mobile reference implementation template consists of two widgets. The MobileNavigationMenu widget generates the Search button that toggles between displaying and hiding the MobileSimpleSearch widget. The MobileSimpleSearch widget includes a search field and Search button. To distinguish between the two Search buttons, we'll call the one from the MobileNavigationMenu widget the primary Search button.



[Review the code that makes up the search feature on the template.]

You can change the following search configuration options on the mobile template.

- [The label on the primary Search button]
- [The icon on the primary Search button]

- The icon in the search field that clears the field
- An initial hint that populates the search field
- The label for the Search button on the MobileSimpleSearch widget
- The page that opens when the Search button is clicked
- An icon to replace the Search button

Return to template configuration options.

Code for the template search feature

The MobileNavigationMenu widget is a toggle button. Because the button can be used for different purposes, the template specifies the label and image to define its use as a search button. (The Menu button to the left of the Search button is also generated using the MobileNavigationMenu widget.) The *submenu* attribute defines the div ID of the element to be displayed when the button is clicked. This div ID is rn_SearchForm, which contains the MobileSimpleSearch widget. Because the class for the rn_SearchForm div is rn_Hidden, the MobileSimpleSearch widget remains hidden until the MobileNavigationMenu widget calls it when the Search button is clicked. This is the code for the template's search feature.

```
<span class="rn_FloatRight rn_Search" role="search">
    <rn:widget path="navigation/MobileNavigationMenu"
    label_button="#rn:msg:SEARCH_LBL#<img src='images/search.png'
    alt='#rn:msg:SEARCH_LBL#'/>" submenu="rn_SearchForm"/>
</span>
<div id="rn_SearchForm" class="rn_Hidden">
    <rn:widget path="search/MobileSimpleSearch" report_page_url="/
    app/answers/list"/>
</div>
```

Changing the primary Search button label

To change the primary Search button label

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:widget path="navigation/MobileNavigationMenu"
label_button="#rn:msg:SEARCH_LBL#<img src='images/search.png'
alt='#rn:msg:SEARCH_LBL#'/>" submenu="rn_SearchForm"/>
```

3 Edit the code to change the *label_button* attribute so that your code resembles the following.

```
<rn:widget path="navigation/MobileNavigationMenu"
```

```
label_button="Find Answers<img src='images/search.png'
alt='#rn:msg:SEARCH_LBL#'/>" submenu="rn_SearchForm"/>
```

4 Save *mobile.php*.

Replacing the icon on the primary Search button

To change the icon for the primary Search button

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:widget path="navigation/MobileNavigationMenu"
label_button="#rn:msg:SEARCH_LBL#<img src='images/search.png'
alt='#rn:msg:SEARCH_LBL#'/>" submenu="rn_SearchForm"/>
```

3 Edit the code to change the image path, as shown in the following example code.

```
<rn:widget path="navigation/MobileNavigationMenu"
label_button="#rn:msg:SEARCH_LBL#<img src='images/search_new.png'
alt='#rn:msg:SEARCH_LBL#'/>" submenu="rn_SearchForm"/>
```

4 Save *mobile.php*.

Replacing the icon that clears the search field

When a customer begins entering text in the search field, a circled X appears on the right side of the field. Clicking the X completely clears the search field so the customer can enter a new search term without having to delete each previously entered character.

To change the icon for clearing the search field

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"/>
```

3 Edit the code to add the *clear_text_icon_path* attribute for defining the new icon, as shown in the following example code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"
clear_text_icon_path="images/new_x.png" />
```

4 Save *mobile.php*.

Adding a hint to the search field

By default, the search field is blank when you first open it, but you can add a hint to the field. The hint is cleared when focus enters the field.

Note The search field automatically has focus when the primary Search button is clicked, so the hint is not visible unless the field loses focus (that is, unless the customer clicks somewhere else on the page).

To add a hint to the search field

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"/>
```

3 Edit the code to add the *label_hint* attribute, as shown in the following example code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"
label_hint="Enter search term here" />
```

4 Save *mobile.php*.

Changing the Search button label

If you added the *search_icon_path* attribute to the MobileSimpleSearch widget (go here to learn how) to replace the label with an icon, changing the label as described in this procedure changes the alternate text for the button. By default, the label is “Search.”

Note Alternative (alt) text is provided for accessibility purposes so that screen readers, used by low-vision customers, know how to describe the button.

To change the Search button label

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"/>
```

3 Edit the code to add the *label_search* attribute, as shown in the following example code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"
label_search="Find answers now" />
```

4 Save *mobile.php*.

Opening a different page when the Search button is clicked

When customers click the Search button, the answers list page opens by default, but you can change that. For example, you might have created an alternate page that you want to display instead. This example procedure assumes you've created a *list_2.php* file in the *answers* folder.

To open a different page when the Search button is clicked

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"/>
```

3 Edit the code to edit the *report_page_url* attribute as shown in this example. (The page name must begin with */app/*. Alternately, you can specify a fully qualified URL that accepts the search parameters that are passed in the URL.)

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list_2"/>
```

4 Save *mobile.php*.

Replacing the Search button with an icon

To replace the Search button with an icon

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileSimpleSearch"
```

```
report_page_url="/app/answers/list"/>
```

3 Edit the code to add the *search_icon_path* attribute, as shown in the following example code.

```
<rn:widget path="search/MobileSimpleSearch"
report_page_url="/app/answers/list"
search_icon_path="images/search.png" />
```

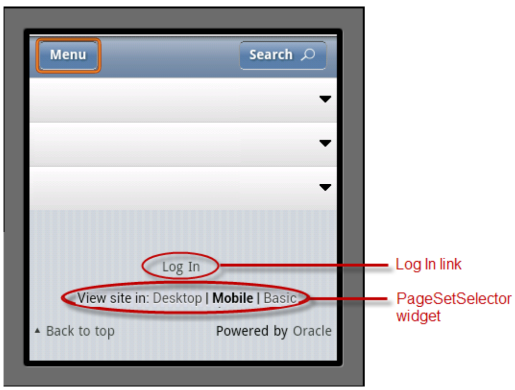
Note If the image for the *search_icon_path* attribute is in the */cp/customer/assets/themes/mobile/images* folder, you need to specify only `images/<file_name>`. If you reference a file in another folder, specify the entire path, for example:

```
search_icon_path="/cp/customer/assets/new images/
new_search.png"
```

4 Save *mobile.php*.

Additional mobile template features

Besides the Search and Menu buttons, the template for the mobile customer portal includes a Log In/Logout link, the PageSetSelector widget, and navigation options to take customers to the top of the page or to the Oracle website.

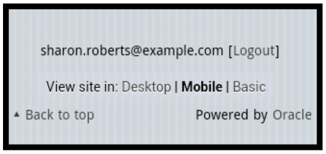


[Learn about configuring log in here.](#)

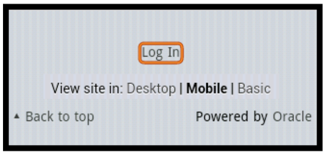
[Learn about the PageSetSelector widget here.](#)

Configuring the template Log In link

By default, the template for the mobile customer portal includes Log In/Logout links. When customers are logged in, the email address is displayed next to the Logout link.



Customer logged in



Customer not logged in

You can configure the following options for the Log In/Logout links.

- [Removing the links](#)
- [Editing the link labels](#)
- [Adding a welcome message](#)
- [Adding the customer's name](#)
- [Removing the email address](#)

[Click here to learn how to configure the login page that opens when the Log In link is clicked.](#)

Removing Log In/Logout links

To remove the Log In/Logout links

1 Open the *mobile.php* file in the */views/templates* folder.

2 Delete the following lines of code.

```
<div>
    <rn:condition logged_in="true">
        <rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
        path="login/LogoutLink"/>
    <rn:condition_else />
```

```
            <rn:condition config_check="PTA_ENABLED == true">
                <a href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</a>
            <rn:condition_else/>
                <a href="/app/
                #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG_IN_LBL#
                </a>
            </rn:condition>
        </rn:condition>
        <br/><br/>
    </div>
```

3 Save *mobile.php*.

Editing link labels

To edit the Log In and Logout labels

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
        <rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
        path="login/LogoutLink"/>
    <rn:condition_else />
        <rn:condition config_check="PTA_ENABLED == true">
            <a href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</a>
        <rn:condition_else/>
            <a href="/app/
            #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG_IN_LBL#</a>
        </rn:condition>
```

3 Edit the code with new link names. You'll add the *label* attribute to the LogoutLink widget and edit the login message base so your code resembles the following.

```
        <rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
        path="login/LogoutLink" label="Sign Out Now" />
    <rn:condition_else />
            <rn:condition config_check="PTA_ENABLED == true">
            <a href="javascript:void(0);">Sign In Now</a>
        <rn:condition_else/>
            <a href="/app/#rn:config:CP_LOGIN_URL##rn:session#">Sign In
            Now</a>
        </rn:condition>
```

4 Save *mobile.php*.

Adding a welcome message

The first example adds a generic welcome message that does not distinguish between logged-in and logged-out customers. The second example uses the same generic welcome message for customers who are not logged in, but adds a personalized welcome for logged-in customers.

To add a generic welcome message

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
<div>
    <rn:condition logged_in="true">
        <rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
        path="login/LogoutLink"/>
    <rn:condition_else />
        <rn:condition config_check="PTA_ENABLED == true">
            <a href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</a>
        <rn:condition_else/>
            <a href="/app/
            #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG_IN_LBL#
            </a>
        </rn:condition>
    </rn:condition>
    <br/><br/>
</div>
```

3 Add your welcome message between the `<div>` and `<rn:condition logged_in="true">` lines. Your code will resemble the following.

```
Welcome to Global Wireless
<br/><br/>
```

4 Save *mobile.php*.

To add a conditional personalized welcome message

Notice the placement of code with respect to the condition tags, where the generic message appears to customers who are not logged in and the personalized message appears to logged-in customers.

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following lines of code.

```
<div>
    <rn:condition logged_in="true">
        <rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
        path="login/LogoutLink"/>
    <rn:condition_else />
        <rn:condition config_check="PTA_ENABLED == true">
            <a href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</a>
        <rn:condition_else/>
            <a href="/app/
            #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG_IN_LBL#
            </a>
        </rn:condition>
    </rn:condition>
    <br/><br/>
</div>
```

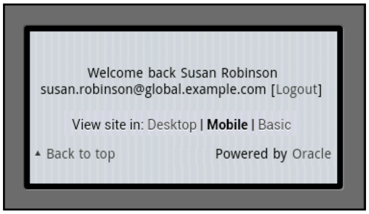
3 Edit the code to resemble the following.

```
<div>
    <rn:condition logged_in="true">
        Welcome back <rn:field name="Contact.LookupName"/>
        <rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
        path="login/LogoutLink"/>
```

```
        <rn:condition_else />
        Welcome to Global Wireless
        <br/><br/>
            <rn:condition config_check="PTA_ENABLED == true">
                <a href="javascript:void(0);">#rn:msg:LOG_IN_LBL#</a>
            <rn:condition_else/>
                <a href="/app/
                #rn:config:CP_LOGIN_URL##rn:session#">#rn:msg:LOG_IN_LBL#
                </a>
            </rn:condition>
        </rn:condition>
        <br/><br/>
    </div>
```

4 Save *mobile.php*.

Customers who are not logged in will see the same message as in the first procedure. Logged-in customers will see a message resembling the following figure.



If you display customers' names, you might want to [remove their email addresses from the Log In link](#).

Adding the customer name

You can [display the customer's name as part of a personalized welcome message](#), or you might want to add just the name without a message. You might also want to display the organization associated with the customer.

To add customer name and organization

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following lines of code.

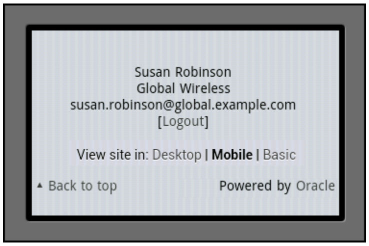
```
<rn:condition logged_in="true">
<rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
```

```
path="login/LogoutLink"/>
```

3 Edit the code to add name and organization fields. This example puts each field and the Logout link on a separate line. Your code might resemble the following.

```
<rn:condition logged_in="true">
<rn:field name="Contact.LookupName"/>
<br/>
<rn:field name="Contact.OrganizationName"/>
<br/>
<rn:field name="Contact.Emails.PRIMARY.Address"/>
<br/>
<rn:widget path="login/LogoutLink"/>
```

4 Save *mobile.php*.



Removing the email address from the mobile template

If you don’t want the email address to be associated with the Log In/Logout link, you can remove it from the template.

To remove the email address

1 Open the *mobile.php* file in the */views/templates* folder.

2 Locate the following line of code.

```
<rn:field name="Contact.Emails.PRIMARY.Address"/><rn:widget
path="login/LogoutLink"/>
```

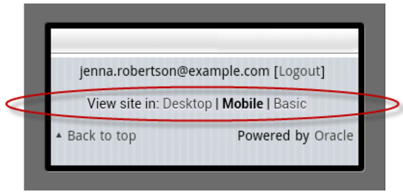
3 Edit the line to remove the `Contact.Emails.PRIMARY.Address` field.

```
<rn:widget path="login/LogoutLink"/>
```

4 Save *mobile.php*.

PageSetSelector

If you select the “Allow my current browser/user agent to be the deciding factor” check box on the Set Environment page of the Customer Portal Administration site, the page set is determined by the user agent accessing the pages. As a result, the mobile page set opens when mobile devices access the customer portal. The PageSetSelector widget lets customers select the option of viewing the standard reference implementation or the basic page set on their mobile device instead of viewing the mobile page set. (Cookies must be enabled on the customer’s browser to allow this option. If cookies are disabled and the Desktop or Basic option is selected, the mobile page simply refreshes.)



Login page

Clicking the Log In link on the template opens the login page, where customers can log in, request their user name or password, create a new account, or log in through an existing external account, such as Facebook, Twitter, and Google. (Refer to Customer portal open login.) Customers can also access this page by clicking Menu > Your Account > Log In.

Note The Facebook logo appears only if FACEBOOK_OAUTH_APP_ID and FACEBOOK_OAUTH_APP_SECRET have been defined on the **administration interface**. The Twitter logo appears only if TWITTER_OAUTH_APP_ID and TWITTER_OAUTH_APP_SECRET have been defined. And the Google logo appears only if GOOGLE_OAUTH_APP_ID and GOOGLE_OAUTH_APP_SECRET have been defined. Refer to Open login configuration settings.

The configuration options for the login page include the following.

- Working with OpenLogin widgets
- Editing labels on the page
- Removing the Password field
- Removing the Create a New Account link
- Editing the Create a New Account link

Working with OpenLogin widgets

You might decide to remove some or all of the OpenLogin widgets, change their labels, add URL text, or define a redirect page after customers log in. Select a link for one or more of the following procedures.

- Removing all OpenLogin widgets
- Removing selected OpenLogin widgets
- Changing labels on OpenLogin widgets
- Populating and pre-setting OpenID URLs
- Specifying the redirect page for customers after they log in to their external provider

Removing all OpenLogin widgets

To remove all OpenLogin widgets from the login page

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Delete the following lines of code.

```
<div id="rn_ThirdPartyLogin"
class="rn_Padding">

    <h1>#rn:msg:LOG_REGISTER_SERVICES_CONTINUE_MSG#</h1>

    <rn:widget path="login/OpenLogin"/> <? /* Attributes Default to
    Facebook */ ?>

    <rn:widget path="login/OpenLogin"
    controller_endpoint="/ci/openlogin/oauth/authorize/twitter"
    label_service_button="Twitter"
    label_process_explanation="#rn:msg:CLICK_BTN_TWITTER_LOG_TWITTER_
    MSG#"
    label_login_button="#rn:msg:LOG_IN_USING_TWITTER_LBL#" />

    <rn:widget path="login/OpenLogin"
    controller_endpoint="/ci/openlogin/openid/authorize/google"
    label_service_button="Google"
    label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VE
    RIFY_MSG#"
    label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#" />

    <rn:widget path="login/OpenLogin"
    controller_endpoint="/ci/openlogin/openid/authorize/yahoo"
```

```
        label_service_button="Yahoo"
        label_process_explanation="#rn:msg:CLICK_BTN_YAHOO_LOG_YAHOO_VERI
        FY_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_YAHOO_LBL#" />

        <rn:widget path="login/OpenLogin"
        controller_endpoint="/ci/openlogin/openid/authorize"
        label_service_button="Wordpress"
        openid="true"
        preset_openid_url="http://[username].wordpress.com"
        openid_placeholder="[#rn:msg:YOUR_WORDPRESS_USERNAME_LBL#]"
        label_process_explanation="#rn:msg:YOULL_LOG_ACCT_WORDPRESS_WINDO
        W_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_WORDPRESS_LBL#" />

        <rn:widget path="login/OpenLogin"
        controller_endpoint="/ci/openlogin/openid/authorize"
        label_service_button="OpenID"
        openid="true"
        openid_placeholder="http://[provider]"
        label_process_explanation="#rn:msg:YOULL_OPENID_PROVIDER_LOG_PROV
        IDER_MSG#"
        label_login_button="#rn:msg:LOG_IN_USING_OPENID_LBL#" />

    </div>
```

3 Save *login_form.php*.

Continue configuring the mobile login page.

Removing selected OpenLogin widgets

To remove selected OpenLogin widgets from the login page

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Identify the widgets you want to remove. The code `<rn:widget path="login/OpenLogin" />` is for the Facebook widget. All other widgets include the provider's name in the *controller_endpoint, label_service_button, label_process_explanation,* and *label_login_button* attributes. For example, here is the widget to log in with a Google account.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
```

```
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#" />
```

3 Delete the lines of code associated with open login providers you want to remove from the login page.

4 Save *login_form.php*.

Continue configuring the mobile login page.

Changing labels on OpenLogin widgets

This procedure uses the Google OpenLogin widget as an example, but you can use similar methods to edit labels on all of the OpenLogin widgets.

To change labels on OpenLogin widgets

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Locate the code for the widget you want to edit. This example uses the Google widget.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#" />
```

3 To edit the email labels that appear when the service provider authenticates the customer but does not provide the customer's email address, add any of the following widget attributes to the code: *label_email_address, label_email_prompt, label_email_prompt_cancel_button, label_email_prompt_submit_button,* and *label_email_prompt_title*. Your code might resemble the following.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"
label_email_prompt="We'll get you started just as soon as you enter
your email address." />
```

4 To change the label on the login button (in this example, "Log in using Google"), edit the *label_login_button* attribute. Your code will resemble the following.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
```

```
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="Use Google to log in now" />
```

5 To change the label that explains the process to customers (in this example, "When you click on this button you will be taken to Google. Once you log in, Google will verify you and send you back here where you'll be logged in!"), edit the *label_process_explanation* attribute.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="Google will verify you and log you in
instantly."
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#" />
```

6 To change the "What will happen:" label in the explanation area, add the *label_process_header* attribute. Your code will resemble the following.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#"
label_process_header="Why it is okay to do this" />
```

7 To change the text label that is hidden by the service provider's logo, edit the *label_service_button* attribute.

8 Save *login_form.php*.

Continue configuring the mobile login page.

Populating and pre-setting OpenID URLs

By default, the WordPress and OpenID widgets use the OpenID protocol and therefore have the *openid* attribute set to true.

Using the *openid_placeholder* attribute of the OpenLogin widget, you can preset the URL that displays when an OpenID widget opens, where the URL contains a space for the user name. For example, for the WordPress OpenLogin widget, you would edit the widget code to remove the *preset_openid_url* attribute and include:

```
openid_placeholder="http://openid.wordpress.com/[username]"
```

However, you might want the increased security of hiding the URL so the customer sees only a user name field to complete. The *preset_openid_url* attribute defines the URL but does not expose it on the page. The reference implementation uses the following attributes to hide the URL and name the default placeholder "Your WordPress username." That widget code includes the following attributes:

```
preset_openid_url="http://openid.wordpress.com/[username]"
openid_placeholder="[#rn:msg:YOUR_WORDPRESS_USERNAME_LBL#]"
```

Continue configuring the mobile login page.

Specifying the redirect page

By default, customers will be redirected to the page they were on when they used open login after they have successfully logged in. You can send them to a different page by defining the *redirect_url* attribute.

To redirect customers after login

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Locate the code for the widget you want to edit. This example uses the Google widget.

```
<rn:widget path="login/OpenLogin"
controller_endpoint="/ci/openlogin/openid/authorize/google"
label_service_button="Google"
label_process_explanation="#rn:msg:CLICK_BTN_GOOGLE_LOG_GOOGLE_VERIFY
_MSG#"
label_login_button="#rn:msg:LOG_IN_USING_GOOGLE_LBL#" />
```

3 Add the *redirect_url* attribute to the widget code setting the value to the page where you want customers to be redirected.

4 Save *login_form.php*.

Continue configuring the mobile login page.

Editing labels on the login page

To edit labels on the login page

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/questions/list"/>
```

3 To change the Username label, add the *label_username* attribute to the LoginForm widget and set the value equal to the replacement label you want to use.

4 To change the Password label, add the *label_password* attribute to the LoginForm widget and set the value equal to the replacement label you want to use.

5 To change the Log In button's label, add the *label_login_button* attribute to the LoginForm widget and set the value equal to the replacement label you want to use. Your edited code may resemble the following.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/questions/list"
label_username="Your name"
label_password="Your password"
label_login_button="Log In Now" />
```

6 Save *login_form.php*.

Continue configuring the mobile login page.

Removing the Password field

If your organization doesn't require its customers to have passwords, you can remove the Password field from the login page. If you want to remove it from the create account page as well, you can simply set the value of EU_CUST_PASSWD_ENABLED to No. (Keep in mind that changing this configuration setting also affects your standard page set.) If you want to remove the password only from the login page, leave the configuration setting at its default value of Yes and remove the field from the page using the following procedure. The value of the LoginForm widget's *disable_password* attribute overrides the value of the configuration setting.

Note If you remove the Password field, any customers who already have passwords will still be able to log in with only their user name.

To remove the Password field from the login page

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/questions/list"/>
```

3 Add the *disable_password* attribute to the LoginForm widget and set its value to true, as shown in the following code.

```
<rn:widget path="login/LoginForm"
redirect_url="/app/account/questions/list"
disable_password="true" />
```

4 Save *login_form.php*.

5 Next, you'll want to change message bases that refer to passwords.

Changing message bases after removing the Password field

After you've removed the Password field from the login page, you'll probably want to edit the following pages and widget to remove references to passwords.

- Edit the link on the login page
- Remove the link on the account settings page

Editing the password link on the login page

To edit the password link on the login page

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<a href="/app/
#rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">#rn:msg:FORGOT_YOUR_US
ERNAME_OR_PASSWORD_MSG#</a>
```

3 Edit the message base to remove the reference to the password. Your code might resemble the following.

```
<a href="/app/#rn:config:CP_ACCOUNT_ASSIST_URL##rn:session#">Forgot
your username?</a>
```

4 Save *login_form.php*.

Continue changing messages to remove password references.

Removing the password link on the account settings page

To remove the password link on the account settings page

1 Open the *profile.php* file in the */views/pages/mobile/account* folder.

2 Delete the following line of code.

```
<rn:condition external_login_used="false">
    <rn:condition config_check="EU_CUST_PASSWD_ENABLED == true">
        <a href="/app/
        #rn:config:CP_CHANGE_PASSWORD_URL##rn:session#">#rn:msg:CHG_Y
        OUR_PASSWORD_CMD#</a><br/><br/>
    </rn:condition>
</rn:condition>
```

3 Save *profile.php*.

Removing the Create a New Account link

You may not want to let your customers create an account from the mobile customer portal. If that's the case, you can remove the "Not registered yet?" message and the Create a New Account link from the login page.

To remove the Create a New Account link

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Delete the following lines of code.

```
<div>
    <h3>#rn:msg:NOT_REGISTERED_YET_MSG#</h3>
    <br/><a href='/app/utils/create_account/redirect/
    <?=urlencode(\RightNow\Utils\Url::getParameter('redirect'));?>#rn
    :session#'>#rn:msg:CREATE_NEW_ACCT_CMD#</a><br/><br/>
</div>
```

3 Save *login_form.php*.

Continue configuring the mobile login page.

Editing the Create a New Account link

To edit the Create a New Account link

1 Open the *login_form.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<br/><a href='/app/utils/create_account/redirect/
<?=urlencode(\RightNow\Utils\Url::getParameter('redirect'));?>#rn:ses
sion#'>#rn:msg:CREATE_NEW_ACCT_CMD#</a><br/><br/>
```

3 Edit the code to change the link's label. Your code will resemble the following.

```
<br/><a href='/app/utils/create_account/redirect/
<?=urlencode(\RightNow\Utils\Url::getParameter('redirect'));?>#rn:ses
sion#'>Sign Up Now</a><br/><br/>
```

4 Save *login_form.php*.

[Continue configuring the mobile login page.](#)

Create account page

When customers who are not logged in click Menu > Your Account > Sign Up, a page opens to let them submit information for creating an account. This page also opens when customers click the Create a New Account button on the login page. You can add fields to this page, including a global **opt-in** selection, as well as remove fields and edit labels and message bases.

Configuration options on the mobile create account page include the following.

- Editing the page heading
- Adding fields

- Removing fields
- Editing the password label to specify password length

Editing the page heading

To edit the Create an Account heading

1 Open the *create_account.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:CREATE_AN_ACCOUNT_CMD#</h1>
```

3 Type the replacement heading for the page between the `<h1>` tags.

4 Save *create_account.php*.

Adding fields

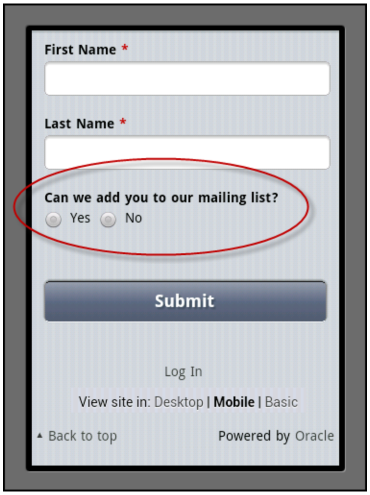
You can add fields to the create account page, including a global **opt-in** selection and additional contact and organization fields.

To add a global opt-in field

1 Open the *create_account.php* file in the */views/pages/mobile/utils* folder.

2 In the block of FormInput widgets, add code that uses another FormInput widget to ask customers if they want to be on your mailing list. Add the code wherever you want it to appear in the list of input fields. The following sample code adds the widget below the Last Name field. The sample code also changes the label.

```
<rn:widget path="input/FormInput"
name="Contact.MarketingSettings.MarketingOptIn"
label_input="Can we add you to our mailing list?" />
```



3 Save *create_account.php*.

To add a contact field

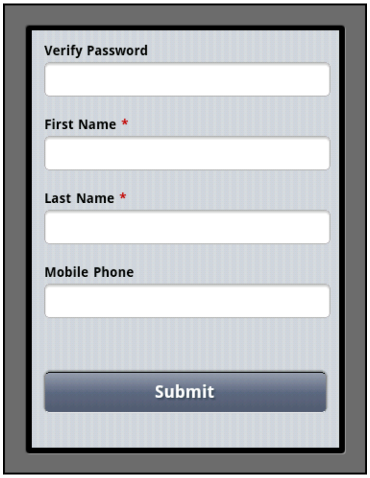
1 Open the *create_account.php* file in the */views/pages/mobile/utils* folder.

2 Add a line of code that calls the FormInput widget. For example, you might want to add a phone number field to the page. In this case, you would add the following code to the block of FormInput widgets for contact fields.

```
<rn:widget path="input/FormInput"
name="Contact.Phones.MOBILE.Number" />
```

Note To find the names of all the contact fields you can use for the FormInput widget, click the Framework tab and select Business objects on the Customer Portal Administration site.

3 Save *create_account.php*.



Removing fields

To remove fields on the create account page

1 Open the *create_account.php* file in the */views/pages/mobile/utils* folder.

2 To remove the Email Address field, delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
validate_on_blur="true"
initial_focus="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"  />
```

3 To remove the Login field, delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Login"
required="true"
validate_on_blur="true"/>
```

4 To remove the Password and Verify Password fields, delete the following lines of code.

```
<rn:condition config_check="EU_CUST_PASSWD_ENABLED == true">
    <rn:widget path="input/FormInput"
    name="Contact.NewPassword"
```

```
    require_validation="true"
    label_input="#rn:msg:PASSWD_LBL#"
    label_validation="#rn:msg:VERIFY_PASSWD_LBL#"/>
</rn:condition>
```

5 To remove the First Name and Last Name fields, delete the following lines of code.

```
<rn:condition config_check="intl_nameorder == 1">
    <rn:widget path="input/FormInput"
    name="Contact.Name.Last"
    label_input="#rn:msg:LAST_NAME_LBL#"
    required="true"/>
    <rn:widget path="input/FormInput"
    name="Contact.Name.First"
    label_input="#rn:msg:FIRST_NAME_LBL#"
    required="true"/>
<rn:condition_else/>
    <rn:widget path="input/FormInput"
    name="Contact.Name.First"
    label_input="#rn:msg:FIRST_NAME_LBL#"
    required="true"/>
    <rn:widget path="input/FormInput"
    name="Contact.Name.Last"
    label_input="#rn:msg:LAST_NAME_LBL#"
    required="true"/>
</rn:condition>
```

6 To remove all contact custom fields with end-user visibility, delete the following line of code.

```
<rn:widget path="input/CustomAllInput"
table="Contact" />
```

7 Save *create_account.php*.

Editing the password label to specify password length

If you set a minimum password length that customers must enter when they're creating an account or changing their password, passwords are automatically required. You may want to edit the label on the mobile create account and change password pages so customers know how long their password must be before they enter one.

To edit the password label on the mobile create account page

1 Open the *create_account.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.NewPassword"
require_validation="true"
label_input="#rn:msg:PASSWD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"/>
```

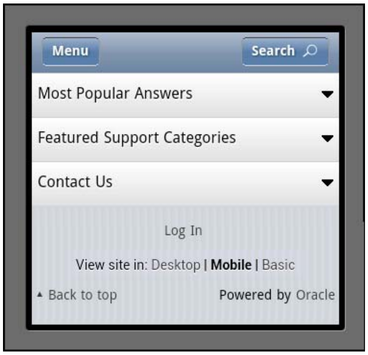
3 Edit the *label_input* attribute of the FormInput widget to define password length information. Your code will resemble the following.

```
<rn:widget path="input/FormInput"
name="Contact.NewPassword"
require_validation="true"
label_input="Password (8 characters minimum)"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"/>
```

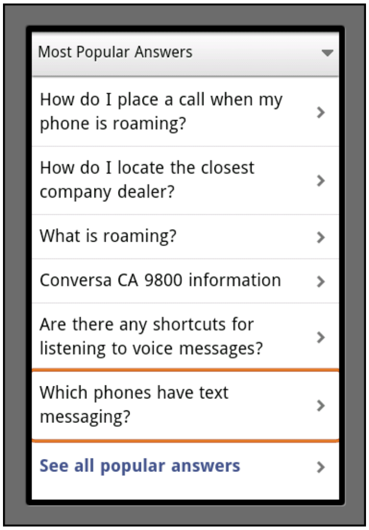
4 Save *create_account.php*.

Home page

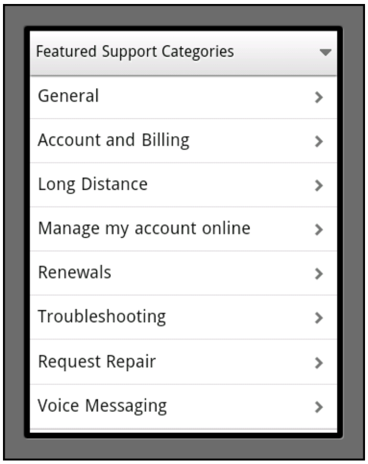
The default home page, */pages/mobile/home.php*, includes the top six most popular answers, the top-level support categories, and options for contacting your support team. This page uses three instances of the Accordion widget, which lets customers expand and collapse the Most Popular Answers, Featured Support Categories, and Contact Us headings. By default, the widgets for the Most Popular Answers and Contact Us headings are expanded, while the Featured Support Categories heading is collapsed. (The following figure shows all headings collapsed.) The home page uses the template for the mobile reference implementation, which means that it displays the Menu and Search buttons as well as a page set selector and links for Log In/Logout, Back to Top, and Powered by Oracle.



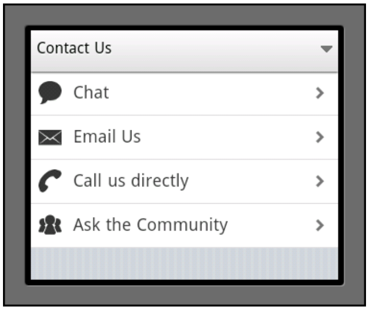
Most Popular Answers expanded



Featured Support Categories expanded



Contact Us expanded



The following configuration options are available for the mobile home page.

- Edit the Most Popular Answers section
- Edit the Featured Support Categories section
- Edit the Contact Us section
- Remove one or all of these sections

Removing home page widgets

You can remove the Most Popular Answers, Featured Support Categories, or Contact Us section from the home page.

To remove home page widgets

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 To remove Most Popular Answers, delete the following lines of code.

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_AccordTrigger"/>
    <h2 id="rn_AccordTrigger"
    class="rn_Expanded">#rn:msg:MOST_POPULAR_ANSWERS_LBL#<span
    class="rn_Expand"></span></h2>
    <div class="rn_Report">
        <rn:widget path="reports/MobileMultiline"
        report_id="194"
        per_page="6"/>
```

```
            <a class="rn_AnswersLink"
            href="/app/answers/
            list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
        </div>
    </div>
```

3 To remove Featured Support Categories, delete the following lines of code.

```
    <div class="rn_Module">
        <rn:widget path="navigation/Accordion"
        toggle="rn_ListTrigger"/>
        <h2 id="rn_ListTrigger"
        class="rn_Collapsed">#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#<spa
        n
        class="rn_Expand"></span></h2>
        <div class="rn_Hidden">
            <rn:widget path="search/MobileProductCategoryList"
            data_type="categories" levels="1"
            label_title=""/>
        </div>
    </div>
```

4 To remove Contact Us, delete the following lines of code.

```
    <div class="rn_Module">
        <rn:widget path="navigation/Accordion"
        toggle="rn_ContactTrigger"/>
        <h2 id="rn_ContactTrigger"
        class="rn_Expanded">#rn:msg:CONTACT_US_LBL#<span
        class="rn_Expand"></span></h2>
        <ul class="rn_ContactChannels">
            <rn:condition config_check="MOD_CHAT_ENABLED == true">
                <li>
                    <a class="rn_ChatChannel"
                    href="/app/chat/chat_launch">#rn:msg:CHAT_LBL#</a>
                </li>
            </rn:condition>
            <li>
                <a class="rn_AskChannel"
                href="/app/ask">#rn:msg:EMAIL_US_LBL#</a>
            </li>
            <li>
                <a class="rn_VoiceChannel"
                href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#<
                /a>
```

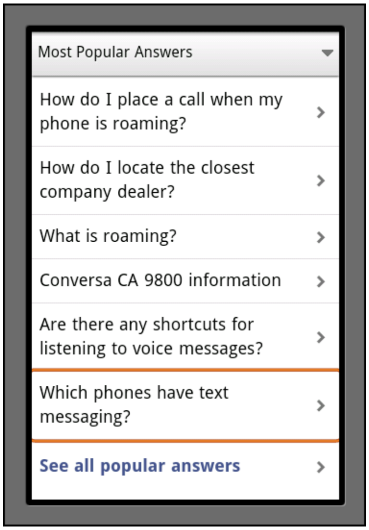
```
            </li>
            <rn:condition config_check="COMMUNITY_ENABLED == true">
                <li>
                    <a class="rn_CommunityChannel"
                    href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_
                    LBL#</a>
                </li>
            </rn:condition>
        </ul>
    </div>
```

5 Save *home.php*.

Most Popular Answers

The Most Popular Answers section of the mobile home page is generated using the Mobile-Multiline widget. You can edit the following attributes of this section.

- Whether the widget is expanded or collapsed
- The label for the section
- The number of answers displayed
- The report that is displayed
- The “See all popular answers” link at the bottom of the list



Collapsing the widget

By default, the Accordion widget for the Most Popular Answers section is expanded on the mobile home page. The following procedure results in the page opening with the widget collapsed.

To collapse the widget

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code.

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_AccordTrigger"/>
    <h2 id="rn_AccordTrigger"
    class="rn_Expanded">#rn:msg:MOST_POPULAR_ANSWERS_LBL#<span
    class="rn_Expand"></span></h2>
    <div class="rn_Report">
        <rn:widget path="reports/MobileMultiline"
        report_id="194"
        per_page="6"/>
        <a class="rn_AnswersLink"
        href="/app/answers/
        list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
```

```
    </div>
</div>
```

3 Edit the code as follows. (This code edit changes the CSS class to the one specified by the *collapsed_css_class* attribute and hides the MobileMultiline widget and “See all popular answers” link.)

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_AccordTrigger"/>
    <h2 id="rn_AccordTrigger"
    class="rn_Collapsed">#rn:msg:MOST_POPULAR_ANSWERS_LBL#<span
    class="rn_Expand"></span></h2>
    <div class="rn_Hidden">
        <rn:widget path="reports/MobileMultiline"
        report_id="194"
        per_page="6"/>
        <a class="rn_AnswersLink"
        href="/app/answers/
        list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
    </div>
</div>
```

4 Save *home.php*.

Editing the Most Popular Answers label

To edit the Most Popular Answers label

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<h2 id="rn_AccordTrigger"
class="rn_Expanded">#rn:msg:MOST_POPULAR_ANSWERS_LBL#<span
class="rn_Expand"></span></h2>
```

3 Edit the code to replace the message base with your new title as shown in the following example.

```
<h2 id="rn_AccordTrigger"
class="rn_Expanded">See what other people are viewing<span
class="rn_Expand"></span></h2>
```

4 Save *home.php*.

Changing the number of displayed answers

To change the number of displayed answers

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<rn:widget path="reports/MobileMultiline" report_id="194"
per_page="6"/>
```

3 Edit the code to change the *per_page* attribute of the report widget to the number of answers you want to display, as shown in the following example.

```
<rn:widget path="reports/MobileMultiline" report_id="194"
per_page="3"/>
```

4 Save *home.php*.

Changing the displayed report

The default answers report on the mobile home page is report 194, Popular Answers. If you want to replace this report, you must be sure that the report you use contains the answers.special_settings filter. (Learn how to check for the filter here.)

To change the report

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<rn:widget path="reports/MobileMultiline" report_id="194"
per_page="6"/>
```

3 Edit the *report_id* attribute of the widget to identify the report you want to display on the home page. (Learn how to find a report's ID number here.) Your edited code will resemble the following.

```
<rn:widget path="reports/MobileMultiline" report_id="100015"
per_page="6"/>
```

4 Save *home.php*.

Editing the See All Popular Answers link

To edit the See All Popular Answers link

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<a class="rn_AnswersLink"
href="/app/answers/
list#rn:session#">#rn:msg:SEE_ALL_POPULAR_ANSWERS_UC_LBL#</a>
```

3 Edit the code to replace the message base as shown in the following example.

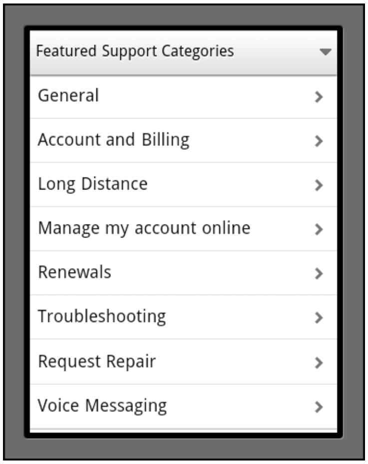
```
<a class="rn_AnswersLink"
href="/app/answers/list#rn:session#">View additional answers</a>
```

4 Save *home.php*.

Featured Support Categories

The Featured Support Categories section of the mobile home page is generated using the MobileProductCategoryList widget. You can edit the following attributes of this section.

- Whether the widget is expanded or collapsed
- Whether products or categories are displayed
- The label for the section
- The number of category levels to display
- The maximum number of top-level categories to display
- The specific categories to display
- The report that is displayed



Expanding the widget

By default, the Accordion widget for the Featured Support Categories section is collapsed on the mobile home page.

To expand the widget

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code.

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_ListTrigger"/>
    <h2 id="rn_ListTrigger"
    class="rn_Collapsed">#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#<spa
    n
    class="rn_Expand"></span></h2>
    <div class="rn_Hidden">
        <rn:widget path="search/MobileProductCategoryList"
        data_type="categories"
        levels="1"
        label_title=""/>
    </div>
</div>
```

3 Edit the code as follows.

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_ListTrigger"/>
    <h2 id="rn_ListTrigger"
    class="rn_Expanded">#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#<span

    class="rn_Expand"></span></h2>
    <div>
        <rn:widget path="search/MobileProductCategoryList"
        data_type="categories"
        levels="1"
        label_title=""/>
    </div>
</div>
```

4 Save *home.php*.

Displaying products instead of categories

If you decide to display **products** instead of **categories**, you don't need to set the *data_type* attribute because its default is product. However, you will want to change the title of this section so it doesn't say Featured Support Categories when you are displaying products.

To display products instead of categories

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code.

```
<h2 id="rn_ListTrigger"
class="rn_Collapsed">#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#<span
class="rn_Expand"></span></h2>
<div class="rn_Hidden">
    <rn:widget path="search/MobileProductCategoryList"
    data_type="categories"
    levels="1"
    label_title=""/>
```

3 Edit the code as follows, changing the message base for products and removing the *data_type* attribute.

```
<h2 id="rn_ListTrigger"
class="rn_Collapsed">#rn:msg:FEATURED_SUPPORT_PRODUCTS_LBL#<span
class="rn_Expand"></span></h2>
<div class="rn_Hidden">
    <rn:widget path="search/MobileProductCategoryList"
    levels="1"
    label_title=""/>
```

4 Save *home.php*.

Editing the Featured Support Categories label

To edit the Featured Support Categories label

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<h2 id="rn_ListTrigger"
class="rn_Collapsed">#rn:msg:FEATURED_SUPPORT_CATEGORIES_LBL#<span
class="rn_Expand"></span></h2>
```

3 Edit the code to replace the message base with your new title as shown in the following example code.

```
<h2 id="rn_ListTrigger"
class="rn_Collapsed">View Answers by Category<span
class="rn_Expand"></span></h2>
```

4 Save *home.php*.

Editing the number of category levels

By default, only the top-level categories are displayed on the mobile home page, but you can add a second level.

To display two levels of categories

1 Open the *home.php* file in the */views/pages/mobile* folder.

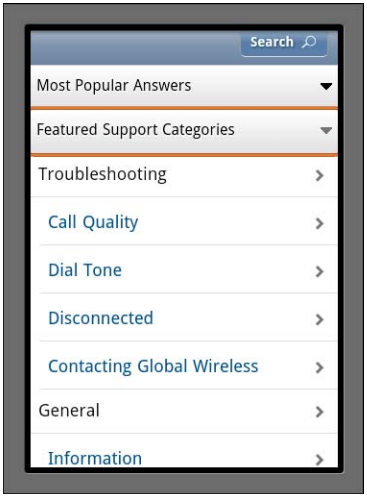
2 Locate the following line of code.

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1"
label_title=""/>
```

3 Edit the code to remove the *levels* attribute as shown in the following example code. (Although the home page uses a single category level, the default level for the widget is 2 so you don't need to edit the attribute. You can just delete it.)

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
label_title=""/>
```

4 Save *home.php*.



Editing the number of top-level categories

To edit the number of top-level categories

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1"
label_title=""/>
```

3 Edit the code to add the *maximum_top_levels* attribute to define the number of categories you want to display. Your code will resemble the following.

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1"
label_title=""
maximum_top_levels="5"/>
```

4 Save *home.php*.

Displaying specific categories

To display specific categories

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1"
label_title=""/>
```

3 Edit the code to add the *only_display* attribute to define the specific top-level categories you want to display. List each category by its ID number and separate them with commas. Go here if you need help to determine an ID number. (The procedure shows you how to find a product ID number, but the procedure is the same for categories.) Your edited code will resemble the following.

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1"
label_title=""
only_display="64,98,61" />
```

4 Save *home.php*.

Displaying a different report page

By default, clicking a category on the mobile home page opens the answers list page. If you create a different page and want to display that page instead, you can edit the *report_page_url* attribute, which must begin with */app/*. You can also display a page by using a fully qualified URL in the attribute definition. The following procedure assumes you've created a *list_2.php* file you want to use and saved it in the *answers* folder.

To display a different report page

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1"
label_title=""/>
```

3 Edit the code to add the *report_page_url* attribute. Your edited code will resemble the following.

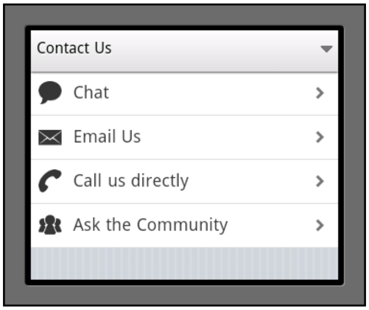
```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1"
label_title=""
report_page_url="/app/answers/list_2" />
```

4 Save *home.php*.

Contact Us

You can edit the following attributes of the Contact Us section on the home page.

- Whether the widget is expanded or collapsed
- The label for the section
- Which default links are displayed
- The Call Us Directly link
- The Ask the Community link



Collapsing the widget

By default, the Accordion widget for the Contact Us section is expanded on the mobile home page.

To collapse the widget

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code.

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_ContactTrigger"/>
    <h2 id="rn_ContactTrigger"
    class="rn_Expanded">#rn:msg:CONTACT_US_LBL#<span
    class="rn_Expand"></span></h2>
    <ul class="rn_ContactChannels">
        <rn:condition config_check="MOD_CHAT_ENABLED == true">
            <li>
                <a class="rn_ChatChannel"
                href="/app/chat/chat_launch">#rn:msg:CHAT_LBL#</a>
            </li>
        </rn:condition>
        <li>
            <a class="rn_AskChannel"
            href="/app/ask">#rn:msg:EMAIL_US_LBL#</a>
        </li>
        <li>
            <a class="rn_VoiceChannel"
            href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#<
            /a>
        </li>
        <rn:condition config_check="COMMUNITY_ENABLED == true">
            <li>
                <a class="rn_CommunityChannel"
                href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_
                LBL#</a>
            </li>
        </rn:condition>
    </ul>
</div>
```

3 Edit the code as follows.

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_ContactTrigger"/>
    <h2 id="rn_ContactTrigger"
    class="rn_Collapsed">#rn:msg:CONTACT_US_LBL#<span
    class="rn_Expand"></span></h2>
    <div class="rn_Hidden">
    <ul class="rn_ContactChannels">
        <rn:condition config_check="MOD_CHAT_ENABLED == true">
```

```
            <li>
                <a class="rn_ChatChannel"
                href="/app/chat/chat_launch">#rn:msg:CHAT_LBL#</a>
            </li>
        </rn:condition>
        <li>
            <a class="rn_AskChannel"
            href="/app/ask">#rn:msg:EMAIL_US_LBL#</a>
        </li>
        <li>
            <a class="rn_VoiceChannel"
            href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#<
            /a>
        </li>
        <rn:condition config_check="COMMUNITY_ENABLED == true">
            <li>
                <a class="rn_CommunityChannel"
                href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_
                LBL#</a>
            </li>
        </rn:condition>
    </ul>
    </div>
</div>
```

4 Save *home.php*.

Editing the Contact Us label

To edit the Contact Us label

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<h2 id="rn_ContactTrigger"
class="rn_Expanded">#rn:msg:CONTACT_US_LBL#<span
class="rn_Expand"></span></h2>
```

3 Edit the code to replace the message base with your new title as shown in the following example code.

```
<h2 id="rn_ContactTrigger"
class="rn_Expanded">Select a Contact Channel<span
class="rn_Expand"></span></h2>
```

4 Save *home.php*.

Removing links

To remove Contact Us links

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 To remove the Chat option, delete the following lines of code.

```
<rn:condition config_check="MOD_CHAT_ENABLED == true">
    <li>
        <a class="rn_ChatChannel" href="/app/chat/
        chat_launch">#rn:msg:CHAT_LBL#</a>
    </li>
</rn:condition>
```

3 To remove the Email Us option, delete the following lines of code.

```
<li>
    <a class="rn_AskChannel"
    href="/app/ask">#rn:msg:EMAIL_US_LBL#</a>
</li>
```

4 To remove the Call Us Directly option, delete the following lines of code.

```
<li>
    <a class="rn_VoiceChannel"
    href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</a>
</li>
```

5 To remove the Ask the Community option, delete the following lines of code.

```
<rn:condition config_check="COMMUNITY_ENABLED == true">
    <li>
        <a class="rn_CommunityChannel"
        href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#</a>
    </li>
</rn:condition>
```

6 Save *home.php*.

Adding a URL for Call Us Directly

By default, the URL for the Call Us Directly option is void so you won't unknowingly link to a site you don't want to link to. To activate the option, you'll want to specify a URL that takes customers to a web page containing your organization's contact information.

If you prefer to display your phone number in the menu, you can change the message base to add the phone number.

To define a URL for the Call Us Directly option

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<a class="rn_VoiceChannel"
href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</a>
```

3 Replace `javascript:void(0);` with the URL for your contact page. Your edited code will resemble the following.

```
<a class="rn_VoiceChannel"
href="http://www.oracle.com/company-
contact.php">#rn:msg:CALL_US_DIRECTLY_LBL#</a>
```

4 Save *home.php*.

Adding a phone number

To add a phone number to the Contact Us options

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code.

```
<a class="rn_VoiceChannel"
href="javascript:void(0);">#rn:msg:CALL_US_DIRECTLY_LBL#</a>
```

3 Edit the code to replace the Call Us Directly message base with your phone number. Your edited code will resemble the following.

```
<a class="rn_VoiceChannel"
href="javascript:void(0);">Call us at (406) 555-1212</a>
```

4 Save *home.php*.

Adding a URL for Ask the Community

By default, the URL for the **Ask the Community** option is void so you won't unknowingly link to a site you don't want to link to. To activate the option, you'll need to specify a URL that takes customers to the community forum page where they can submit their questions.

To define a URL for the Ask the Community option

1 Open the *home.php* file in the */views/pages/mobile* folder.

2 Locate the following code.

```
<a class="rn_CommunityChannel"
href="javascript:void(0);">#rn:msg:ASK_THE_COMMUNITY_LBL#</a>
```

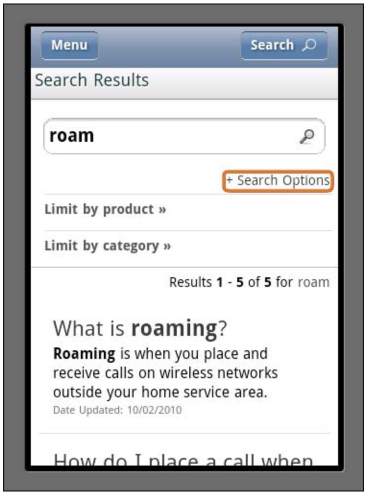
3 Replace `javascript:void(0);` with the URL for your community forum page that lets customers submit questions, being sure to append the community token `(#rn:community_token#)`to the end. Your edited code will resemble the following.

```
<a class="rn_CommunityChannel"
href="http:/
/community.example.com/resources/b1248fb2a1
/summary#rn:community_token#">#rn:msg:ASK_THE_COMMUNITY_LBL#</a>
```

4 Save *home.php*.

Answers list page

The answers list page, */pages/mobile/answers/list.php*, includes widgets for a search field, search button, product and category search filters, and a **multiline** report that has been optimized for mobile devices. Keyword highlighting is used on the page to highlight search terms.



Configuration options that you can change on the answers list page include the following.

- The answers report that is displayed
- The Search Results heading
- The display of product and category filters
- Whether search terms are highlighted
- Whether the number of results is displayed
- Whether pagination controls are displayed

Changing the displayed report

The default search report on the answers list page is Answers–Complex Expressions Search Default (report ID 176). If you want to replace this report with another standard answers report or a custom answers report, you must be sure that the report you use contains the answers.special_settings filter. (Learn how to check for the filter here.)

To change the report

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following line of code.

```
<rn:container report_id="176">
```

3 Replace `176` with the ID number of the report you want to replace the default report with. (Learn how to find a report's ID number here. For information about containers, refer to Applying common attributes to multiple widgets.)

4 Save *list.php*.

Editing the Search Results heading

To edit the Search Results heading

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:SEARCH_RESULTS_CMD#</h1>
```

3 Replace the message base with your new heading so your code resembles the following.

```
<h1>New Search Results Heading</h1>
```

4 Save *list.php*.

Displaying product and category filters

By default, the product and category filters are displayed on the answers list page using the MobileProductCategorySearchFilter widget. The + Search Options control on the page lets the customer toggle between hiding and displaying the filters. You can remove this ability to toggle, and you can also remove one or both of the filters. The following list lets you link to these and other configuration options for the search filters.

- Remove the option to toggle between displaying and hiding the filters
- Hide filters by default
- Display only products or only categories
- Edit labels on the filters

Removing the option to toggle filters

The default answers list page on the mobile reference implementation lets your customers toggle the product and category filters on and off by clicking + Search Options. If you want to remove that ability, you'll need to decide whether you want the filters to be displayed or removed.

To display product and category filters

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following lines of code.

```
<rn:widget path="navigation/Accordion"
toggle="rn_Advanced"/>
<div class="rn_Padding">
    <a class="rn_AlignRight"
    href="javascript:void(0);"
    id="rn_Advanced">#rn:msg:PLUS_SEARCH_OPTIONS_LBL#</a>
    <div>
        <rn:widget path="search/MobileProductCategorySearchFilter"
        filter_type="products" />
        <rn:widget path="search/MobileProductCategorySearchFilter"
        filter_type="categories" />
    </div>
</div>
```

3 Delete the first four lines you located in step 2 and the last two lines. The remaining code defines the two widgets.

```
<rn:widget path="search/MobileProductCategorySearchFilter"
filter_type="products" />
```

```
        <rn:widget path="search/MobileProductCategorySearchFilter"
        filter_type="categories" />
```

4 Save *list.php*.

To remove product and category filters

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 Delete the following lines of code.

```
<rn:widget path="navigation/Accordion"
toggle="rn_Advanced"/>
<div class="rn_Padding">
    <a class="rn_AlignRight"
    href="javascript:void(0);"
    id="rn_Advanced">#rn:msg:PLUS_SEARCH_OPTIONS_LBL#</a>
    <div>
        <rn:widget path="search/MobileProductCategorySearchFilter"
        filter_type="products" />
        <rn:widget path="search/MobileProductCategorySearchFilter"
        filter_type="categories" />
    </div>
</div>
```

3 Save *list.php*.

Hiding filters when page opens

By default, the answers list page opens with the product and category filters displayed. Customers can hide the filters by clicking + Search Options. If you want the page to open with the filters hidden instead, use the following procedure. Modifying the answers list page according to this procedure still lets customers display the filters by using the + Search Options toggle. If you want to remove the filters entirely, click here.

To hide filters when the answers list page opens

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following lines of code.

```
<rn:widget path="navigation/Accordion"
toggle="rn_Advanced"/>
<div class="rn_Padding">
    <a class="rn_AlignRight"
    href="javascript:void(0);"
```

```
        id="rn_Advanced">#rn:msg:PLUS_SEARCH_OPTIONS_LBL#</a>
        <div>
            <rn:widget path="search/MobileProductCategorySearchFilter"
            filter_type="products" />
            <rn:widget path="search/MobileProductCategorySearchFilter"
            filter_type="categories" />
        </div>
    </div>
```

3 In the section of code you located in step 2, replace the line containing `<div>` with the following line.

```
<div class="rn_Hidden">
```

4 Save *list.php*.

Displaying only one filter

To display only one filter

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 To display only the product filter, delete the following line of code.

```
<rn:widget path="search/MobileProductCategorySearchFilter"
filter_type="categories" />
```

3 To display only the category filter, delete the following line of code.

```
<rn:widget path="search/MobileProductCategorySearchFilter"
filter_type="products" />
```

4 Save *list.php*.

Editing filter labels

To change filter labels

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following lines of code.

```
    <rn:widget path="search/MobileProductCategorySearchFilter"
    filter_type="products" />
    <rn:widget path="search/MobileProductCategorySearchFilter"
    filter_type="categories" />
```

3 To edit the default label for the product filter, add the *label_input* attribute to the widget. Your edited code will resemble the following.

```
<rn:widget path="search/MobileProductCategorySearchFilter"
filter_type="products"
label_input="New Product Filter Label"/>
```

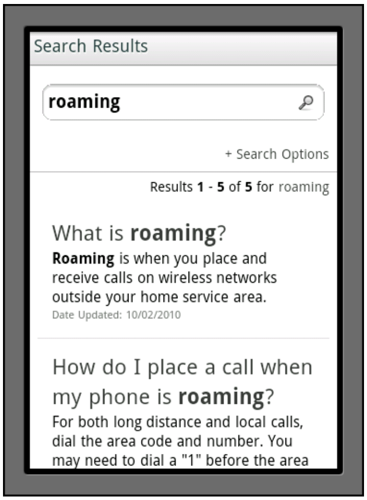
4 To edit the default label for the category filter, add the *label_input* attribute to the widget. Your edited code will resemble the following.

```
<rn:widget path="search/MobileProductCategorySearchFilter"
filter_type="categories"
label_input="New Category Filter Label"/>
```

5 Save *list.php*.

Disabling search term highlighting

By default, the search terms your customers enter are highlighted with bold text in the list of answers that match their search.



To disable search term highlighting

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="reports/MobileMultiline" />
```

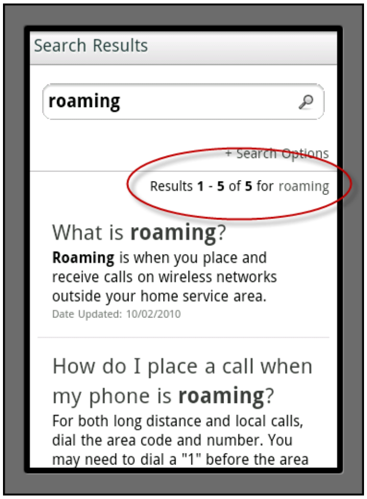
3 Edit the code to turn off search term highlighting by adding the *highlight* attribute.

```
<rn:widget path="reports/MobileMultiline"
highlight="false"/>
```

4 Save *list.php*.

Removing the number of results

By default, the mobile answers list page shows the number of results returned from a customer's search. This procedure shows you how to remove the number of results.



To remove the number of results

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

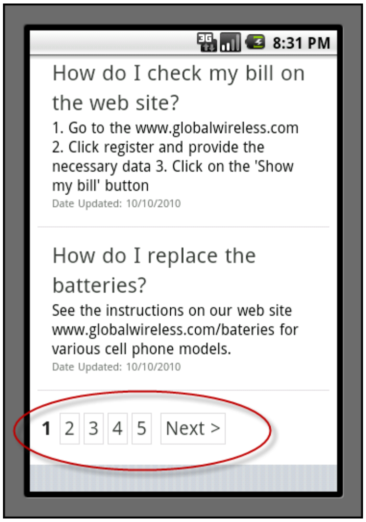
2 Delete the following line of code.

```
<rn:widget path="reports/ResultInfo" />
```

3 Save *list.php*.

Removing the pagination control

By default, the mobile answers list page displays a pagination control that lets your customers go to the next or previous page if the number of displayed answers is greater than ten. The following procedure shows you how to remove the control.



To remove the pagination control

1 Open the *list.php* file in the */views/pages/mobile/answers* folder.

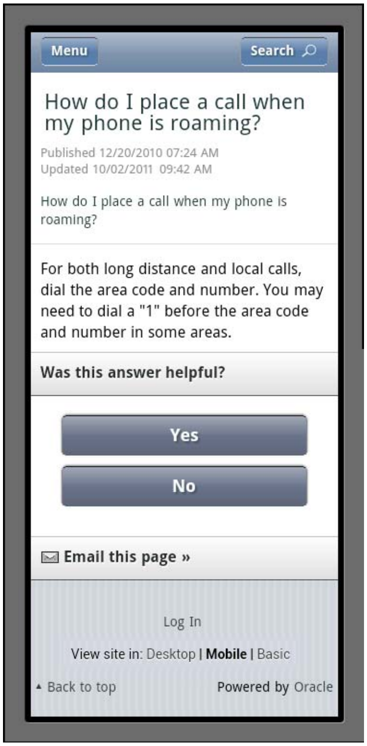
2 Delete the following line of code.

```
<rn:widget path="reports/Paginator" />
```

3 Save *list.php*.

Answer details page

The answer details page, */pages/mobile/answers/detail.php*, displays the details of an answer and allows customers to provide answer feedback. Keyword highlighting is used on the page to highlight search terms. Also, customers have the option of emailing the answer.



The following configuration options are available for the answer details page on the mobile reference implementation.

- Providing guided assistance to customers
- Disabling search term highlighting
- Changing the Published and Updated labels
- Turning off published on and updated on dates
- Disabling file attachments
- Removing related answers
- Disabling answer feedback

- Disabling the ability to email the page

Providing guided assistance to customers

Guided assistance lets your customers find the most appropriate answers to their questions by leading them through a series of branching questions. When answers are created on the **administration interface** for your organization's **knowledge base**, they can be associated with a specific guide. Then, whenever that answer is opened, customers are asked questions that lead them to the correct answer for their particular situation. It's also possible to specify a single guide that opens every time any answer is viewed.

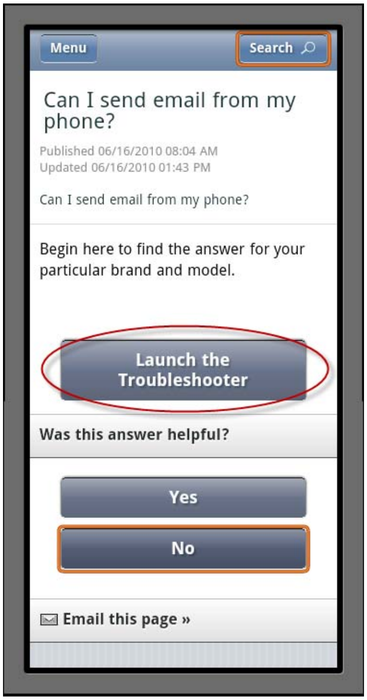
Creating a guide is done on the administration interface, and you can view an overview of guided assistance here. There are recommended best practices for using guided assistance on the mobile customer portal.

Guidelines for guided assistance on the mobile customer portal

Certain practices produce guides that are optimized for use on mobile devices, while others produce a less-than-optimal result. For example, image questions can display poorly if the images aren't scaled for mobile displays. Best practices include the following.

- The best question types for mobile guides are Button, Yes/No, Text, and Menu.
- Although the default configuration opens guides in a separate window, a better customer experience will result if you change the answer details page so it displays single answers inline on the page. Refer to Opening the guide inline.
- Because mobile devices may not be able to open certain file types, avoid using guides that include answers containing file attachments.
- Avoid long menu options to prevent wrapping display problems on a mobile device.
- Avoid the use of wide elements, such as tables, images, and inline web pages, within a question's content to help prevent a confusing display, particularly since horizontal scrolling is not available on many mobile devices.
- Save answer responses for the last node in a guide to prevent the answer from taking control of the screen, thereby preventing the customer's return to the guide.
- Avoid list questions to prevent problems that can occur when customers' previous responses do not display, as sometimes happens on mobile devices.
- Restrict the use of images as much as possible for the best display with the fewest number of alignment issues on the mobile display. Optimal image size is approximately 300 pixels. However, the *mobile/site.css* file will automatically resize images within answer content.
- Displaying a single question at a time generally results in a better customer experience than appending each new question to the previous ones.

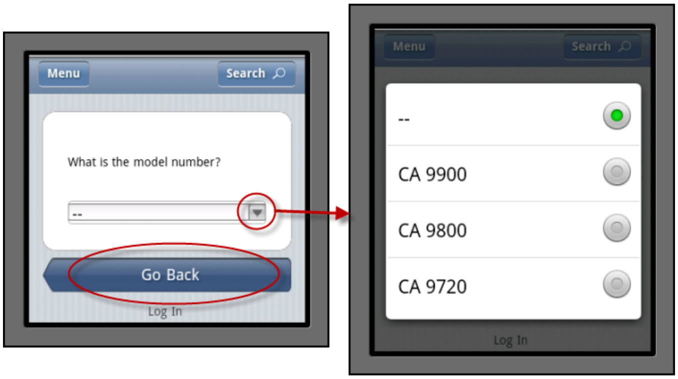
The default answer details page for the mobile customer portal includes the GuidedAssistant widget. A Launch the Troubleshooter button appears on the answer details page when an answer that is associated with a guide is opened.



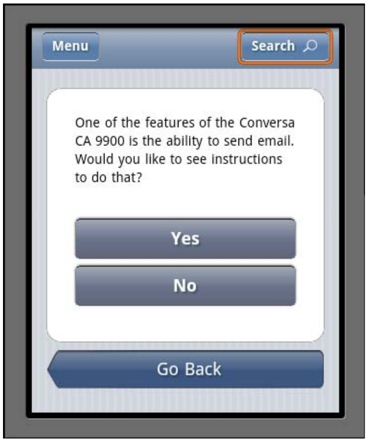
When customers click the Launch the Troubleshooter button, the first question appears. Depending on the type of question, customers may select a menu or list option, a button, radio button, or image, or type text in a field. The following figure shows a menu option.

After customers respond to the first question, they can return to the previous screen and change their answer by clicking the Go Back button. Questions are presented one at a time on the mobile customer portal.

Note Note that clicking the mobile device's Back button may take customers back to the answer where the guide was launched, it may return them to the device's home page, or it may exhibit some other behavior. Different mobile devices and operating systems implement the Back button differently.



Customers continue to answer questions that lead them to a solution in the form of a text explanation, an answer from your knowledge base, a URL, or an external event. They may also be led to another guide that asks additional questions until a solution is presented.



Configuring guided assistance

The following configuration options are available for the GuidedAssistant widget.

- Whether the guide opens in a separate window or inline
- Whether only one question is displayed at a time
- Whether the same guide opens with every answer
- Labels
  - ▷ Label when the response is an answer from the knowledge base
  - ▷ Launch button label
  - ▷ Back button label
  - ▷ Start over button
  - ▷ Label on the response button that appears with text explanations
  - ▷ Label when the response is a text explanation

Opening the guide inline

By default, clicking the Launch the Troubleshooter button opens the guide in a separate window that displays the guided assistance page (*/views/pages/mobile/utils/guided_assistant.php*). Although this is the default configuration, using pop-up windows may cause browsing and backward navigation problems. For this reason, we suggest that you configure the customer portal so guides open inline on the answer details page. When you do this, you must modify the GuidedAssistant widget on the answer details page since you are no longer directing customers to the *guided_assistant* page. When you open the guide inline, it's also a good idea to display a single question at a time, which is the default behavior of the GuidedAssistant widget.

To open the guide inline on the answer details page

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"
popup_window_url="/app/utils/guided_assistant"
label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#" />
```

3 Edit the GuidedAssistant widget to remove the *popup_window_url* attribute and add the *single_question_display* attribute. Your edited code is the following.

```
<rn:widget path="knowledgebase/GuidedAssistant"
single_question_display="true"
label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#"/>
```

4 Save *detail.php*.

Displaying multiple questions inline

When the guide opens on the guided assistance page, the GuidedAssistant widget displays one question at a time, with each new question displaying a button that lets customers return to the previous question. (However, the default behavior of the GuidedAssistant widget is to display multiple questions on a page, so the code for the mobile guided assistant page sets the widget's *single_question_display* attribute to true.) This generally results in a better customer experience than generating a long page of questions. If you'd prefer to display the full series of questions, you can edit the widget to do so.

Note The list of questions is generated one at a time since each subsequent question depends on the customer's previous answer. As a result, even when you choose to display multiple questions, only the first question is displayed when the guide initially launches.

To display multiple questions

1 Open the *guided_assistant.php* file in the */views/pages/mobile/utils* folder.

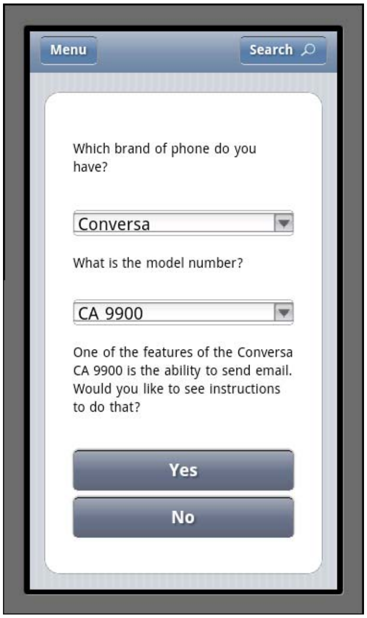
2 Locate the following line of code.

```
<rn:widget path="knowledgebase/GuidedAssistant"
single_question_display="true"
label_question_back="#rn:msg:GO_BACK_CMD#" />
```

3 Delete the *single_question_display* attribute from the code so the edited line is as follows. (The default value for the attribute is false, so you don't need to include it in the code if you want the default.)

```
<rn:widget path="knowledgebase/GuidedAssistant"
label_question_back="#rn:msg:GO_BACK_CMD#" />
```

4 Save *guided_assistant.php*.



Displaying the same guide for every answer

Even if the answers that customers select are associated with a **guide**, you can override that association and specify one guide to open on the answer details page regardless of the answer. To do that, you define the ID of the guide in the widget's code.

Note Most procedures in this section make changes to the guided assistance page. Because you want the guide to open regardless of the answer being displayed, this change must be made to the answer details page.

To open the same guide on every answer

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following code.

```
<rn:widget path="knowledgebase/GuidedAssistant"
popup_window_url="/app/utils/guided_assistant"
label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#" />
```

3 Edit the GuidedAssistant widget to add the *static_guide_id* attribute and specify the ID of the guide. (Click here if you need help finding a guide's ID.)

```
<rn:widget path="knowledgebase/GuidedAssistant"
popup_window_url="/app/utils/guided_assistant"
label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#"
static_guide_id="21" />
```

4 Save *detail.php*.

GuidedAssistant labels

You'll edit labels for the GuidedAssistant widget on the guided assistant page (*/mobile/utils/guided_assistant.php*) if you're using the default mobile page set that opens guides on a new page. If you're opening guides on the answer details page (*/mobile/answers/detail.php*), you'll edit the widget on that page. The only exception is the Launch the Troubleshooter button, which must be edited on the answer details page.

To edit the GuidedAssistant button label

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following line of code.

```
<rn:widget path="knowledgebase/GuidedAssistant"
popup_window_url="/app/utils/guided_assistant"
label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#" />
```

3 Add the *label_popup_launch_button* attribute. Your code will resemble the following.

```
<rn:widget path="knowledgebase/GuidedAssistant"
popup_window_url="/app/utils/guided_assistant"
label_text_result="#rn:msg:PLEASE_READ_THIS_RESPONSE_MSG#"
label_popup_launch_button="Start Here" />
```

4 Save *detail.php*.

To edit other labels on the GuidedAssistant widget

1 Open the *guided_assistant.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="knowledgebase/GuidedAssistant"
single_question_display="true"
label_question_back="#rn:msg:GO_BACK_CMD#" />
```

3 To change the Go Back label that returns customers to the previous question in the guide, edit the *label_question_back* attribute. Your code will resemble the following.

```
<rn:widget path="knowledgebase/GuidedAssistant"
single_question_display="true"
label_question_back="Previous Question" />
```

4 To change any of the other labels on the GuidedAssistant widget, add the associated label attribute to the widget code and define its value with the text you want.

a To edit the message displayed when the customer reaches a solution that is an answer from the knowledge base (default is "Please consult the following information"), add the *label_answer_result* attribute. Your code will resemble the following.

```
<rn:widget path="knowledgebase/GuidedAssistant"
single_question_display="true"
label_question_back="#rn:msg:GO_BACK_CMD#"
label_answer_result="This information should answer your
question."/>
```

b To edit the Start Over label when the customer reaches the end of the guide, add the *label_start_over* attribute to the widget code.

c To edit the OK button that customers click to enter a text response, add the *label_text_response_button* attribute to the widget code.

d To edit the message displayed when the customer reaches a text explanation, add the *label_text_result* attribute. Your widget code will resemble the following.

```
<rn:widget path="knowledgebase/GuidedAssistant"
single_question_display="true"
label_question_back="#rn:msg:GO_BACK_CMD#"
label_text_result="The following information answers your
question." />
```

5 Save *guided_assistant.php*.

Disabling search term highlighting

By default, the search terms your customers enter are highlighted on the answer details page.

To disable search term highlighting

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following three lines of code. Note that these lines are not sequential.

```
<h1 id="rn_Summary"><rn:field name="Answer.Summary" highlight="true"/
></h1>
<rn:field name="Answer.Question" highlight="true"/>
<rn:field name="Answer.Solution" highlight="true"/>
```

3 Remove `highlight="true"` from each line.

4 Save *detail.php*.

Changing the Published and Updated labels

To change the Published and Updated labels

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following lines of code.

```
#rn:msg:PUBLISHED_LBL# <rn:field name="Answer.CreatedTime" />
<br/>
#rn:msg:UPDATED_LBL# <rn:field name="Answer.UpdatedTime" />
```

3 To edit the Published label, edit the first line of the code you located in step 2 so it resembles the following.

```
This answer was orginally published on <rn:field
name="Answer.CreatedTime" />
```

4 To edit the Updated label, edit the last line of the code you located in step 2 so it resembles the following.

```
This answer was last updated on <rn:field name="Answer.UpdatedTime" />
```

5 Save *detail.php*.

Removing the Published and Updated dates

To remove the Published and Updated dates

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Delete the following lines of code.

```
#rn:msg:PUBLISHED_LBL# <rn:field name="Answer.CreatedTime" />
<br/>
#rn:msg:UPDATED_LBL# <rn:field name="Answer.UpdatedTime" />
```

3 Save *detail.php*.

Disabling the file attachments display

If files are attached to the answer displayed on the answer details page, the attachments will be displayed as part of the answer unless you disable their display with this procedure.

To disable the file attachments display

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

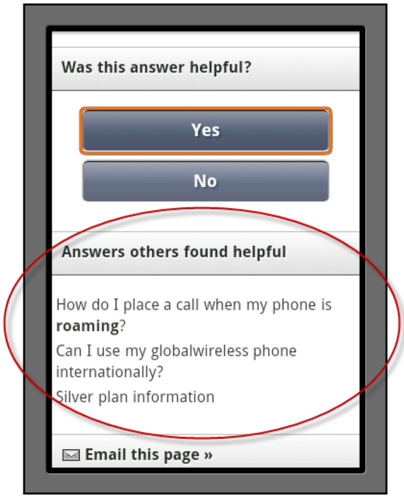
2 Delete the following lines of code.

```
<div id="rn_FileAttach">
    <rn:widget path="output/DataDisplay"
    name="Answer.FileAttachments"
    label="#rn:msg:ATTACHMENTS_LBL#"/>
</div>
```

3 Save *detail.php*.

Removing related answers

By default, related answers appear on the answer details page if the answer being displayed is related to any other answers in your knowledge base. The section is labeled Answers Others Found Helpful. View information about related answers here.



To remove related answers

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

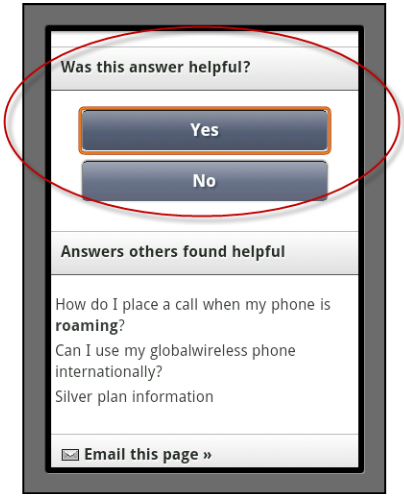
2 Delete the following line of code.

```
<rn:widget path="knowledgebase/RelatedAnswers" />
```

3 Save *detail.php*.

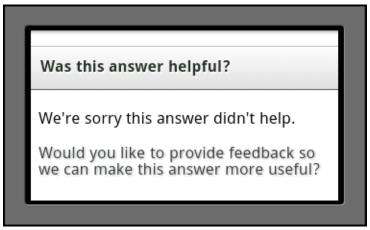
Disabling answer feedback

The default answer details page uses the MobileAnswerFeedback widget to let customers provide feedback on the answer they are viewing.



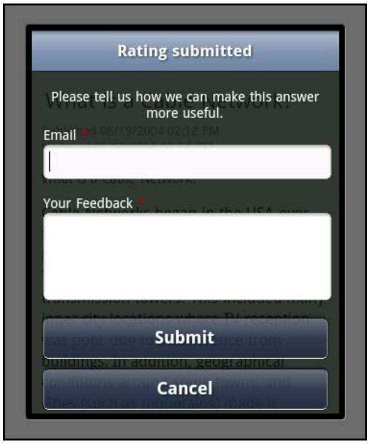
If customers answer Yes, their feedback is recorded and a thank-you message acknowledges the feedback. If they answer No, they have an opportunity to provide additional feedback.

Click to view



If customers select the link, another window opens where feedback can be entered. If customers are not logged in, the Email field is displayed and is required. If customers are logged in, only the Your Feedback field is displayed.

Click to view



You can edit all the labels on the MobileAnswerFeedback widget. The following table lists the widget attribute and its associated label.

Table 383: Label Attributes for the MobileAnswerFeedback Widget

Attribute	Default Label
label_cancel_button	Cancel
label_comment_box	Your Feedback
label_dialog_prompt	Please tell us how we can make this answer more useful.
label_dialog_title	Rating submitted
label_dissatisfied	We're sorry this answer didn't help.
label_email_address	Email
label_feedback_submit_success	Thanks for your feedback.
label_no_button	No
label_provide_feedback	Would you like to provide feedback so we can make this answer more useful?
label_satisfied	Thanks for your feedback.

Table 383: Label Attributes for the MobileAnswerFeedback Widget (Continued)

Attribute	Default Label
label_send_button	Submit
label_title	Was this answer helpful?
label_yes_button	Yes

If you don't want to offer your customers the chance to offer answer feedback on the mobile implementation, you can disable the feature.

To disable answer feedback

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Delete the following line of code.

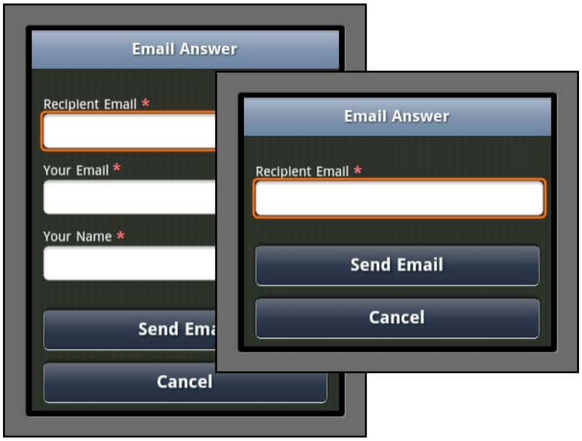
```
<rn:widget path="feedback/MobileAnswerFeedback" />
```

3 Save *detail.php*.

Disabling the ability to email the page

The default answer details page lets customers email the displayed answer.

When customers are not logged in, the widget displays fields for the customer's email address and name. Logged-in customers need to enter only the recipient's email address, as shown in the overlay on the right.



If you want to remove the ability for customers to email an answer, you can delete the EmailAnswerLink widget from the answer details page.

To remove EmailAnswerLink

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Delete the following line of code.

```
<rn:widget path="utils/EmailAnswerLink" />
```

3 Save *detail.php*.

Adding answer details

You might want to provide additional information about the answer being viewed on the answer details page. This procedure shows you how to add fields to the page.

To add fields on the answer details page

1 Open the *detail.php* file in the */views/pages/mobile/answers* folder.

2 Locate the following line of code and add the details in the following steps below this line.

```
<rn:field name="Answer.Solution"
highlight="true"/>
```

3 To add the answer's ID, add the following line of code.

```
<p>Answer ID <rn:field
```

```
name="Answer.ID" /></p>
```

4 To add product information for the answer, add the following line of code.

```
<rn:widget path="output/DataDisplay"
name="Answer.Products" />
```

5 To add category information for the answer, add the following line of code.

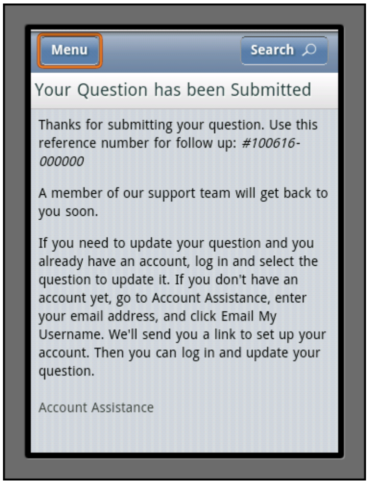
```
<rn:widget path="output/DataDisplay"
name="Answer.Categories" />
```

6 Save *detail.php*.

Asking a question on the mobile customer portal

Customers can submit a question to your support team using their mobile device by clicking the Email Us button under Contact Us on the mobile home page. Alternately, they can click Menu > Contact Us > Email Us to open the page for submitting their question. The default page lets customers enter their email address (if they are not logged in), submit their question, select **product** and **category**, and complete any **incident custom fields** your organization has added.

After customers have submitted their question, they receive a confirmation message that includes an incident reference number for the question. If the customer is logged in, the incident's reference number is a clickable link that re-opens the question when the customer clicks it.



Workflow configuration options

If customers do not already have an account when they submit a question, the default workflow automatically creates one for them. Other workflow configurations are also supported. Review workflow options here, or click one of the following workflows for a description and configuration procedure.

- The default email-only workflow automatically creates an account when customers who do not have an account submit a question.
- The email check workflow requires customers without an account to create one before asking a question.
- The login required workflow requires customers to log in before asking a question.
- The additional contact fields workflow requires customers to complete other contact fields you have placed on the page before they can submit a question.

Additional configuration options for the ask a question page

Besides setting up the workflow, the following options are available for configuring the page on the mobile interface where customers ask questions.

- Configure the SmartAssistantDialog widget
- Require customers to have an SLA before submitting their questions
- Remove the Subject field

- Specify the required number of levels for products or categories
- Automatically populate products or categories
- Let customers attach images to their questions

Ask a question page workflows

The workflows on the mobile customer portal pages are the same as those for the standard customer portal. For a complete discussion of each workflow on the standard reference implementation, including flowcharts and comparisons of advantages and disadvantages, click here. The following sections provide a summary of this information for the mobile customer portal.

The default workflow asks for only an email address, letting customers complete that field quickly and then submit their incident without requiring account creation or login. However, we recognize that your site may have different needs, so the mobile customer portal supports each of the following workflows.

- **Email-only**—If your organization determines that an email address is adequate customer identification, this default workflow is ideal. It can also be useful when most of your customers update their incidents through email instead of logging in to the customer portal. Refer to Email-only default workflow.
- **Email check**—Use this workflow when you require customers to have an account before they can submit a question. The customer portal checks the email address, letting customers with an associated contact record submit the question while requiring those without contact records to create an account first. Refer to Email check.
- **Login required**—When you want customers to not only have an account, but also to be logged in prior to asking questions, you can set up the ask a question page to require login. Refer to Requiring login.
- **Additional contact fields**—This workflow is similar to the email-only flow, but it requires customers to complete additional fields on the ask a question page before they can submit a question. Refer to Additional contact fields workflow.

Logged-in customers

The differences among the workflows are apparent only when customers are not logged in. When customers are logged in, the ask a question process is the same for all workflows.

- The ask a question page opens without an Email Address field because the customer is logged in (and, therefore, the email address is known).
- The customer completes the fields and submits the question.

- Oracle Service Cloud converts the question into an incident, which is associated with the customer's contact record.

Email-only default workflow

If customers are not logged in when they select Email Us (from either the Contact Us section on the home page or by clicking the Menu button and selecting Contact Us > Email Us), they must enter their email address before submitting their question. If the email address matches an existing contact record, the resulting incident is associated with that contact record. If the email address does not match an existing contact record, a new record is created for the customer and the incident is associated with that record. The new contact record contains only the email address, so customers will be required to use account assistance if they want to log in to the customer portal in the future. This workflow is implemented by default.

For more specific information about this workflow, click here.

Email check

Although the default workflow has been tested for its usability and adopted in the reference implementation, your organization may require more customer information than just an email address. The best way to ensure getting this information is to require customers to create an account before they can ask a question.

For more specific information about this workflow, click here.

To implement this workflow, you'll first need to modify the ask a question page to display the EmailCheck and ProgressBar widgets. Then you'll edit the create account page to add the ProgressBar widget.

Editing the ask a question page for the email check workflow

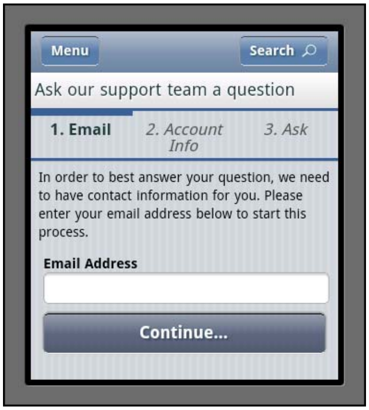
First, you'll edit the default ask a question page to achieve the following objectives.

- Display the EmailCheck widget when customers are not logged in so they can enter their email address.
  - ▷ If the email address matches an existing contact record, return customers to the ask a question page, where the Email Address field is populated.
  - ▷ If the submitted email address does not match a contact record in the knowledge base, take customers to the create account page. The Email Address field on this page is populated with the submitted information.

- Display the ProgressBar widget so customers who are in this workflow can determine which step of the process they're currently on.

Note Because the only step for logged-in customers is to complete the ask a question fields, the ProgressBar widget is enclosed in conditional tags so it won't appear to them. The ProgressBar widget includes a *current_step* attribute that gets set from the EmailCheck widget's *redirect_after_contact_creation* attribute.

Here's what customers who are not logged in will see when they click Menu > Contact Us > Email Us. The progress bar below the heading indicates to customers that they are on the email entry step of the process.



Here is the code for the revised ask a question page (*/views/pages/mobile/ask.php*). It includes the EmailCheck and ProgressBar widgets and the conditions for displaying them.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="mobile.php"
clickstream="incident_create"/>
<section id="rn_PageTitle"
class="rn_AskQuestion">
    <h1>#rn:msg:ASK_OUR_SUPPORT_TEAM_A_QUESTION_LBL#</h1>
    <rn:condition logged_in="false" url_parameter_check="step != null">
        <rn:condition url_parameter_check="step == null">
            <rn:widget path="utils/ProgressBar"/>
        <rn:condition_else/>
            <rn:widget path="utils/ProgressBar"
            current_step="#rn:url_param_value:step#"/>
```

```
        </rn:condition>
    </rn:condition>
</section>
<section id="rn_PageContent"
class="rn_AskQuestion">
    <div class="rn_Padding">
        <!--Logged in or on final step of process-->
        <rn:condition logged_in="true"
        url_parameter_check="step == 3">
            <form id="rn_QuestionSubmit"
            onsubmit="return false;">
                <div id="rn_ErrorLocation"></div>
                <fieldset>
                <rn:condition logged_in="false">
                <rn:widget path="input/FormInput"
                name="Contact.Emails.PRIMARY.Address"
                required="true" />
                <rn:widget path="input/FormInput"
                name="Incident.Subject" required="true" />
                <rn:condition_else/>
                <rn:widget path="input/FormInput"
                required="true"
                name="Incident.Subject" />

            label_prompt="#rn:msg:FLLOWING_ANS_HELP_IMMEDIATELY_MSG#"
            accesskeys_enabled="false"
            label_solved_button="#rn:msg:MY_QUESTION_IS_ANSWERED_MSG#"
            label_cancel_button="#rn:msg:EDIT_QUESTION_CMD#" />
        </rn:condition>
                <rn:widget path="input/FormInput"
                name="Incident.Threads"
                required="true"
                label_input="#rn:msg:ADD_ADDITIONAL_DETAILS_CMD#"/>
                <rn:widget path="input/FileAttachmentUpload"/>
                <rn:widget path="input/MobileProductCategoryInput" />
                <rn:widget path="input/MobileProductCategoryInput"
                data_type="Category"/>
                <rn:widget path="input/CustomAllInput"
```

```
                table="Incident"
                always_show_mask="true"/>
                <br/><br/><br/>
                <rn:widget path="input/FormSubmit"
                label_button="#rn:msg:CONTINUE_ELLIPSIS_CMD#"
                on_success_url="/app/ask_confirm"
                error_location="rn_ErrorLocation" />
                </fieldset>
            </form>
        <rn:condition_else/>
            <!-- Not logged in or on one of initial steps-->
            <rn:condition url_parameter_check="step == null">
                <p>In order to best answer your question, we need to have
                contact information for you. Please enter your email
                address below to start this process. </p>
                <rn:widget path="input/EmailCheck"
                initial_focus="true"
                redirect_existing_contact="/app/ask/step/3"
                redirect_after_contact_creation="/app/ask/step/3"
                redirect_new_contact="/app/utils/create_account/step/2" /
                >
            </rn:condition>
        </rn:condition>
    </div>
</section>
```

Next, go to Editing the create account page.

Editing the create account page

Next, you'll edit the create account page. You want customers who access the page from the email check workflow to see the progress bar so they know how far along they are in the process of asking their question. However, it's not necessary or helpful to display it to customers who access the page normally.

Although this procedure modifies the default create account page, you may want to create a separate page for this workflow if your default page contains many fields. Because you've interrupted a customer who is trying to submit a question, we recommend that you display only the minimum number of fields your organization requires to create an account. Customers can then return quickly to the initial task.

The following procedure checks the step parameter you added to the EmailCheck widget on the ask a question page. If the step parameter in the URL is not null, the ProgressBar widget appears on the create account page. The EmailCheck widget on the ask a question page uses the default value for the *redirect_after_contact_creation* attribute. (The default value is `/app/ask/step3`.) Clicking Submit on the create account page then redirects the customer to the ask a question page, where the progress bar shows step 3.

To edit the create account page

1 Open the *create_account.php* file in the */views/pages/mobile/utils* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:CREATE_AN_ACCOUNT_CMD#</h1>
```

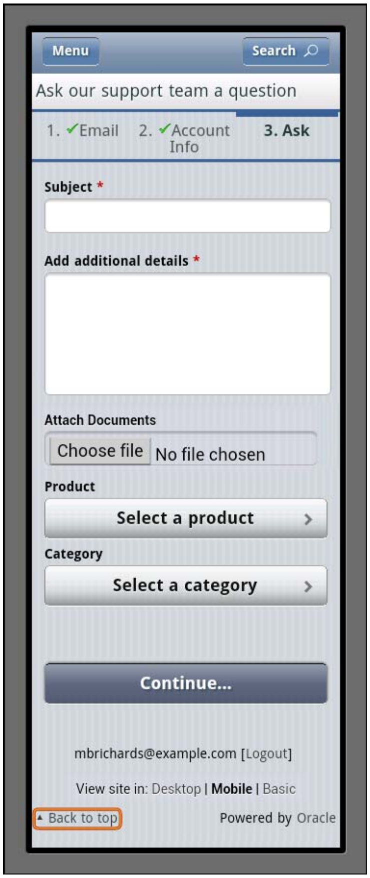
3 Add the following lines of code immediately below the line you located in step 2.

```
<rn:condition url_parameter_check="step != null">
    <rn:widget path="utils/ProgressBar"
    current_step="#rn:url_param_value:step#"/>
</rn:condition>
```

4 Save *create_account.php*.

After customers enter their email address and click the Continue button on the EmailCheck widget, the create account page opens. Notice that the Email Address field is populated and the progress bar indicates the Account Info step of the flow.

When customers complete the information on the create account page and click Continue, they are logged in and redirected to the ask a question page.



Requiring login

Another workflow approach is to simply require customers to log in before they can submit a question. (The email check workflow requires customers to have an account, but does not require them to log in prior to submitting questions.) The open login feature enhances the ease of customer login by letting them log in through their Facebook, Twitter, Google, or other open login accounts. (Refer to Customer portal open login.)

For more specific information about this workflow, refer to Requiring login.

By default, the *login_required* page meta tag attribute is false, so setting it to true requires you to add the attribute to the page code. After you've completed the following procedure, customers who click Email Us when they're not logged in will be redirected to the Login page. After logging in or creating an account, the ask a question page opens.

Note The ask a question confirmation page should have the same value for the *login_required* page meta tag as the ask a question page. The following procedure adds the *login_required* attribute to both pages.

To require login on the ask a question page

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code at the top of the file.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="mobile.php"
clickstream="incident_create"/>
```

3 Edit the code to add the *login_required* page meta tag.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="mobile.php"
clickstream="incident_create"
login_required="true" />
```

4 Save *ask.php*.

5 Open the *ask_confirm.php* file in the */views/pages/mobile* folder.

6 Locate the following line of code at the top of the file.

```
<rn:meta title="#rn:msg:QUESTION_SUBMITTED_LBL#"
template="mobile.php"
clickstream="incident_confirm"/>
```

7 Edit the code to add the *login_required* page meta tag.

```
<rn:meta title="#rn:msg:QUESTION_SUBMITTED_LBL#"
template="mobile.php"
clickstream="incident_confirm"
login_required="true" />
```

8 Save *ask_confirm.php*.

Additional contact fields workflow

You may find yourself wanting to collect more customer information than just an email address (the only information provided by the default email-only workflow) from a new customer who wants to ask a question on your site, but you don't want to require that they complete the create account page (as you do with the email check workflow). One way you can accomplish this is by adding contact fields on the ask a question and requiring (or simply allowing) your customers to answer them prior to submitting a question.

For more specific information about this workflow, refer to Additional contact fields workflow.

Oracle Service Cloud treats the data that is entered into fields on the mobile ask a question page the same way it does for fields on the standard ask a question page. You might want to review the different scenarios before adding fields to your mobile ask a question page.

The following procedure shows you how to add first and last names and make them required. We'll display these fields only to customers who are not logged in, remembering that any additions or changes made by customers who are not logged in but who already have an email address in the knowledge base will not be recorded.

Note Find the names of the contact fields you can use by clicking Framework > Business Objects on the Customer Portal Administration site.

To add contact fields to the ask a question page

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code between the `<rn:condition logged_in="false">` condition tags.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true" />
```

3 Add the following code between the two widgets you located in step 2.

```
<rn:widget path="input/FormInput"
name="Contact.Name.First"
required="true" />
<rn:widget path="input/FormInput"
```

```
name="Contact.Name.Last"
required="true" />
```

4 Save *ask.php*.

Other configuration options for the ask a question page

Besides setting up the workflow, the following options are available for configuring the page on the mobile interface where customers ask questions.

- Configure the SmartAssistantDialog widget
- Require customers to have an SLA before submitting their questions
- Remove the Subject field
- Specify the required number of levels for products or categories
- Automatically populate products or categories

Configuring the SmartAssistantDialog widget

When your customers click the Continue button after asking a question, the default mobile ask a question page displays a Finish Submitting Question page, generated by the SmartAssistantDialog widget. However, this dialog appears only if you have first configured an **incident rule** that appends **SmartAssistant** responses. (To create an incident rule for this purpose, log in to the **administration interface** and click here.)

Customers can click any of the suggested answers to open it and see if it offers a solution to the question they want to submit. If it does, they can click the My Question is Answered button to abandon their question and be redirected to the home page.

If you do not have a SmartAssistant incident rule set up on the administration interface, this dialog won't appear. Instead, the confirmation page is displayed immediately after the customer clicks the Continue button.

By default, the SmartAssistantDialog does not open if the customer has either opened two answers or conducted one search. You can configure the condition to a different number of answers or searches or you can remove the condition so the dialog always opens.

After you've configured a SmartAssistant incident rule, the following configuration options are available for the SmartAssistantDialog widget.

- Change the number of answers to be viewed or searches to be conducted

- Display the dialog always, regardless of answers viewed or searches done
- Edit the buttons
- Redirect customers when their questions is answered
- Remove the SmartAssistantDialog

Changing the widget display conditions

The default mobile ask a question page uses a condition tag to determine whether the SmartAssistantDialog widget appears when the customer clicks the Continue button or whether the confirmation page is displayed immediately. By default, SmartAssistant suggested answers are displayed after customers submit a question unless they have viewed two answers or conducted a search before asking the question.

To change the answers viewed or searches done condition

1. Open the *ask.php* file in the */views/pages/mobile* folder.
2. Locate the following line of code.

   ```
   <rn:condition answers_viewed="2" searches_done="1">
   ```

3. Edit the code to either delete or change the value of the *answers_viewed* or *searches_done* attributes. This example code assumes you want to change the number of answers viewed and remove the requirement to perform a search.

   ```
   <rn:condition answers_viewed="3">
   ```

4. Save *ask.php*.

Removing widget display conditions

If you remove the condition tags around the SmartAssistantDialog widget, it will always propose answers to your customers before they can finish submitting their question, regardless of the number of answers they've viewed or searches they've conducted. (You still need to have set up a SmartAssistant incident rule in order for the widget to appear.)

To remove conditions for the SmartAssistantDialog widget

1. Open the *ask.php* file in the */views/pages/mobile* folder.
2. Locate the following lines of code.

   ```
   <rn:condition answers_viewed="2" searches_done="1">
   <rn:condition_else/>
       <rn:widget path="input/SmartAssistantDialog"
       accesskeys_enabled="false" display_button_as_link=""/>
   ```

```
</rn:condition>
```

3 Delete the two lines of code beginning with `<rn:condition` and the `</rn:condition>` line. All that should remain is the code that calls the SmartAssistantDialog widget.

4 Save *ask.php*.

Editing buttons

The SmartAssistantDialog widget on the mobile ask a question page contains three buttons: My Question is Answered, Finish Submitting Question, and Edit Question. You can edit the labels for the buttons, change their display order on the dialog, or change the buttons to links.

To change the buttons on the SmartAssistantDialog widget

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code.

```
<rn:widget path="input/SmartAssistantDialog"
accesskeys_enabled="false" display_button_as_link=""/>
```

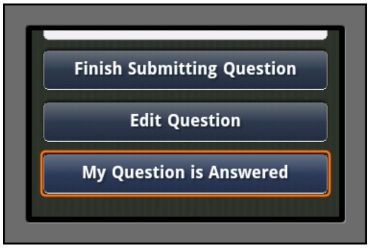
3 To change the labels on the buttons, add the *label_solved_button*, *label_cancel_button*, and *label_submit_button* attributes. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
accesskeys_enabled="false" display_button_as_link=""
label_solved_button="This answered my question"
label_cancel_button="Return to my question"
label_submit_button="I still need an answer"/>
```

4 To change the buttons' display order, add the *button_ordering* attribute. (By default, the display order for buttons is *label_solved_button, label_submit_button, label_cancel_button*.) Your code will resemble the following.

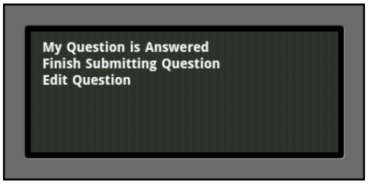
```
<rn:widget path="input/SmartAssistantDialog"
accesskeys_enabled="false"
```

```
display_button_as_link=""
button_ordering="label_submit_button, label_cancel_button,
label_solved_button" />
```



5 To change the buttons to links, edit the *display_button_as_link* attribute. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
accesskeys_enabled="false"
display_button_as_link="label_solved_button, label_submit_button,
label_cancel_button" />
```



6 Save *ask.php*.

Redirecting customers when their questions are answered

By default, customers who click the My Question is Answered button are redirected to the home page. If you want to direct them to a different page, you can add the *solved_url* attribute to the SmartAssistantDialog widget.

To redirect customers when questions are answered

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code.

```
<rn:widget path="input/SmartAssistantDialog"
accesskeys_enabled="false"
display_button_as_link="" />
```

3 Edit the widget code to add the *solved_url* attribute. Your code will resemble the following.

```
<rn:widget path="input/SmartAssistantDialog"
accesskeys_enabled="false"
display_button_as_link=""
solved_url="/app/answers/list"/>
```

4 Save *ask.php*.

Removing the SmartAssistantDialog

If you remove the SmartAssistantDialog widget, answers will never be suggested to your customers after they click the Continue button. Instead, the confirmation page will always open.

To remove the SmartAssistantDialog widget

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Delete the following lines of code.

```
<rn:condition answers_viewed="2"
searches_done="1">
<rn:condition_else/>
    <rn:widget path="input/SmartAssistantDialog"
    accesskeys_enabled="false"
    display_button_as_link="" />
</rn:condition>
```

3 Save *ask.php*.

Requiring SLAs

You might want to let only customers with **SLAs** (service level agreements) submit a question through your mobile ask a question page. When customers who are not logged in click Email Us on the home page or Menu > Contact Us > Email Us, they are redirected to the login page, so their SLA can be confirmed. Customers who are logged in but do not have the required SLA type will see a Permission Denied message.

To require an SLA on the ask a question page

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Locate the following line of code at the top of the file.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="mobile.php"
```

```
clickstream="incident_create"/>
```

3 Edit the code to add the *login_required* page meta tag, *sla_required_type meta tag,* and *sla_failed_page* meta tag. Your code will resemble the following.

```
<rn:meta title="#rn:msg:ASK_QUESTION_HDG#"
template="mobile.php"
clickstream="incident_create"
login_required="true"
sla_required_type="incident"
sla_failed_page="/app/error/error_id/2" />
```

4 Save *ask.php*.

Removing the Subject field

When a customer asks a question, an **incident** is created in **Oracle RightNow Cloud Service**, and the Subject field of the incident is the same as the Subject field the customer completes on the ask a question page.

You can remove the Subject field from the mobile ask a question page. Then, when an incident is created, the first 80 characters of the customer's question are automatically used as the incident's Subject field. If you do this, you might also want to change the "Add additional details" label since it could be misleading without the Subject field.

To remove the Subject field from the ask a question page

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Delete the following line of code from the file to remove the Subject field when the customer is not logged in.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
required="true" />
```

3 Delete the following lines of code from the file to remove the Subject field when the customer is logged in.

```
<rn:condition logged_in="true">
    <rn:widget path="input/FormInput"
    name="Incident.Subject"
    required="true"/>
</rn:condition>
```

4 To change the "Add additional details" label, first locate the following line of code.

```
<rn:widget path="input/FormInput"
name="Incident.Threads"
required="true"
label_input="#rn:msg:ADD_ADDITIONAL_DETAILS_CMD#"/>
```

a Edit the message base. Your code might resemble the following.

```
<rn:widget path="input/FormInput"
name="Incident.Threads"
required="true"
label_input="Enter your question here"/>
```

5 Save *ask.php*.

Requiring selection of products and categories

The mobile ask a question page does not require that customers select a minimum number of **product** or **category** levels related to their question, but you can edit the page to require them to select one or more levels of products or categories. (If none of your products have end-user visibility specified (refer to Adding and editing products, categories, and dispositions for the step to define visibility), the product selection drop-down menu will not appear. Similarly, the category menu will not appear if no categories have end-user visibility.)

Preventing form abandonment

Best practice recommends against requiring product and category selection to prevent form abandonment by your customers.

To require product and category levels

1 Open the *ask.php* file in the */views/pages/mobile* folder.

2 Locate the following lines of code in the file.

```
<rn:widget path="input/MobileProductCategoryInput" />
<rn:widget path="input/MobileProductCategoryInput"
data_type="Category" />
```

3 Add the *required_lvl* attribute to both MobileProductCategoryInput widgets to specify how many levels you want your customers to select. If you want to require two levels of products and one level of categories, your code will look like the following.

```
<rn:widget path="input/MobileProductCategoryInput"
required_lvl="2" />
<rn:widget path="input/MobileProductCategoryInput"
data_type="Category"
```

```
required_lvl="1" />
```

4 To specify how many levels will be displayed to the customer, add the *max_lvl* attribute to the MobileProductCategoryInput widgets. (If the value for *required_lvl* is greater than the value for *max_lvl*, the *max_lvl* value will be set equal to the *required_lvl* value.) Your code will resemble the following.

```
<rn:widget path="input/MobileProductCategoryInput"
required_lvl="2"
max_lvl="4" />
<rn:widget path="input/MobileProductCategoryInput"
data_type="Category"
required_lvl="1"
max_lvl="3" />
```

5 Save *ask.php*.

Populating products and categories automatically

The mobile ask a question page contains fields for **products** and **categories**, which are empty until the customer makes a menu selection in the fields. If you want, you can set the page to open with the product or category already populated. In order to do that, you must know the product's ID number. The following procedures show you first how to determine a product's ID and then how to make the changes to populate the Product field when the page opens.

To identify a product's ID number

1 Log in to Oracle Service Cloud.

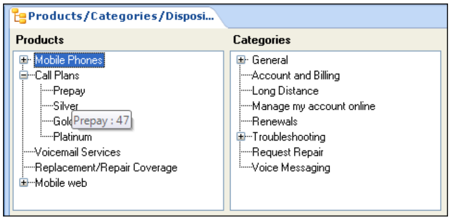
2 Click the Configuration button.

3 Double-click Products/Categories/Dispositions under Service.

4 Expand the product or category tree if necessary to view the product or category you want to add.

5 Hover over the product or category to display the ID number, and make a note of it.

6 If you are selecting a sub-product, you also need to know the ID numbers of its parent product or products. For example, in the following figure, the ID for the Prepay subproduct is 47, but you also need to know that its parent product Call Plans has an ID of 421. The full ID for Prepay is then 421,47.



Now edit the ask a question page to populate the Product field.

Populating the Product field

Note The procedure for populating the Category field is the same.

To populate the Product field

1 Open the *ask.php* file in the */views/pages/mobile* folder.

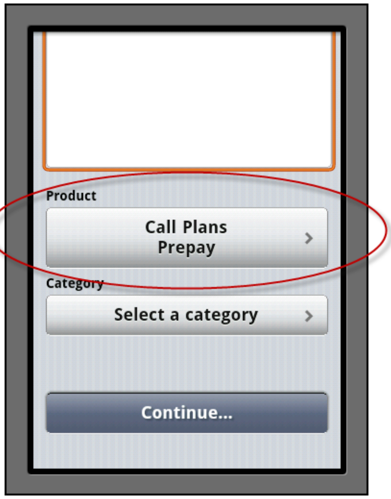
2 Locate the following line of code.

```
<rn:widget path="input/MobileProductCategoryInput" />
```

3 Add the *default_value* attribute to the MobileProductCategoryInput widget to specify the product you just identified the ID number for. Your code will resemble the following.

```
<rn:widget path="input/MobileProductCategoryInput"
default_value="421,47" />
```

4 Save *ask.php*.



Attaching files to questions

Your customers may want to attach image files to their questions, which they can do from their mobile device. For example, they can take a photo of a defective product and send it with their question. Thumbnails appear next to the image name when files have been attached.

Note It's possible that the image orientation might be different from the original sent by a customer, but staff members working the incident on the Service Console can reorient the image, save it to their desktop, then attach the correct orientation to the incident.

Chatting on the mobile customer portal

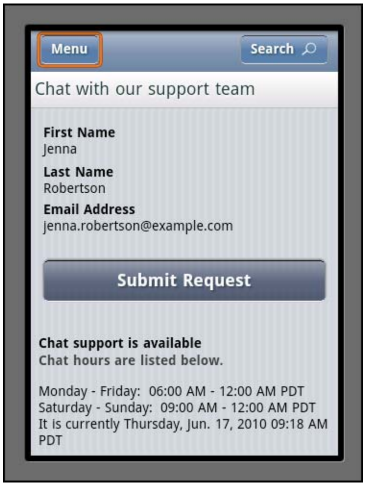
Using their mobile devices, customers can request a **chat session** with a member of your support team by clicking the Chat button under Contact Us on the mobile home page. Or they can click Menu > Contact Us > Chat to open a chat request.

- Requesting a chat
- Chatting on the mobile customer portal

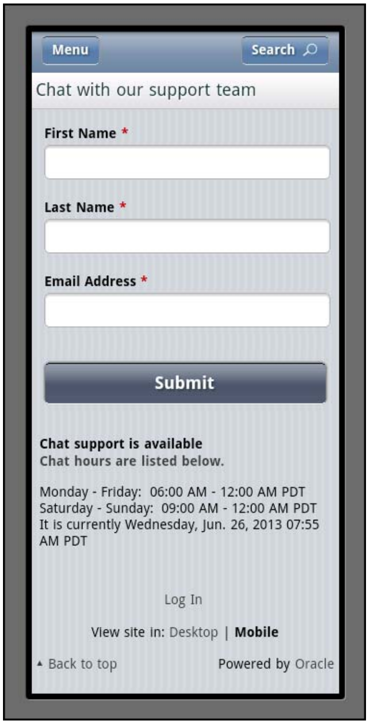
Requesting a chat

When customers click the Chat button on the mobile customer portal, the chat launch page opens. If the customer is logged in, the page displays first and last names and email address. If the customer is not logged in, fields for entering that information appear instead.

Chat request page when customer is logged in



Chat request page when customer is not logged in



When a chat request has been submitted and customers are waiting to be connected, they see a page that asks them to wait. As soon as a connection is established, customers are notified of their position in the queue.

Chat request queue notification

You can configure the following options on the chat launch page.

- Change message bases
- Change the chat hours
- Add a field where customers can enter their question
- Remove fields
- Require an SLA

Changing the message bases

You can change the default “Chat with our support team” and “Chat support is available” message bases on the mobile chat launch page.

To change the Chat with our Support Team heading

1 Open the *chat_launch.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:CHAT_WITH_OUR_SUPPORT_TEAM_LBL#</h1>
```

3 Type the new heading between the `<h1>` and `</h1>` tags.

4 Save *chat_launch.php*.

To change the Chat Support available message

1 Open the *chat_launch.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatStatus"/>
```

3 Add the *label_chat_available* attribute to the code. Your changes will resemble the following example.

```
<rn:widget path="chat/ChatStatus"
label_chat_available="Agents are currently available." />
```

4 Save *chat_launch.php*.

Adding a field for the customer question

You might want to add a field on the chat launch page for customers to enter their question. This gives the chat agent a better glimpse into the customer's needs when accepting the chat session request.

To add a question field on the chat launch page

1 Open the *chat_launch.php* file in the */views/pages/mobile/chat* folder.

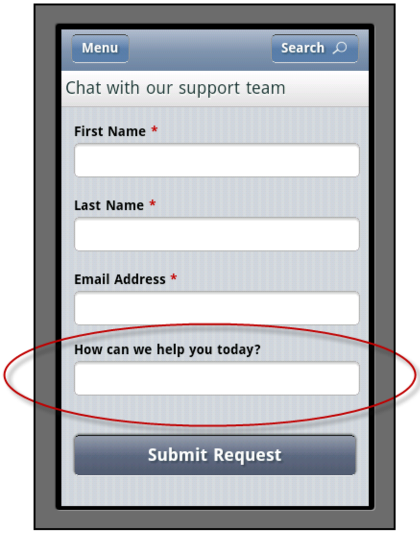
2 Locate the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```

3 Add the following code immediately below the code you located in step 2.

```
<rn:widget path="input/FormInput"
name="Incident.Subject"
label_input="How can we help you today?"/>
```

4 Save *chat_launch.php*.



Removing fields

To remove fields from the chat launch page

1 Open the *chat_launch.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following lines of code.

```
<fieldset>
    <rn:condition config_check="COMMON:intl_nameorder == 1">
        <rn:widget path="input/FormInput"
        name="Contact.Name.Last"
        label_input="#rn:msg:LAST_NAME_LBL#"
        required="true"/>
        <rn:widget path="input/FormInput"
        name="Contact.Name.First"
        label_input="#rn:msg:FIRST_NAME_LBL#"
        required="true"/>
    <rn:condition_else/>
        <rn:widget path="input/FormInput"
        name="Contact.Name.First"
        label_input="#rn:msg:FIRST_NAME_LBL#"
        required="true"/>
        <rn:widget path="input/FormInput"
        name="Contact.Name.Last"
```

```
        label_input="#rn:msg:LAST_NAME_LBL#"
        required="true"/>
    </rn:condition>
    <rn:widget path="input/FormInput"
    name="Contact.Emails.PRIMARY.Address"
    required="true"
    label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
</fieldset>
```

3 To remove the Last Name field and display only the first name, delete the following line of code from both condition cases.

```
<rn:widget path="input/FormInput"
name="Contact.Name.Last"
label_input="#rn:msg:LAST_NAME_LBL#"
required="true"/>
```

4 To remove the Address field, delete the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#"/>
```

5 Save *chat_launch.php*.

Requiring an SLA

You can make the chat launch page content conditional on the customer having an **SLA** or you can simply add a meta tag to the page to prevent customers without a chat SLA from requesting a chat. Customers who do not have an SLA will see a Permission Denied message on the page, and customers who are not logged in will be directed to the login page so their SLAs can be checked.

To set an SLA condition for displaying page content

1 Open the *chat_launch.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following line of code.

```
<section id="rn_PageContent"
class="rn_LiveHelp">
```

3 Add the following line of code immediately before the code you located in step 2.

```
<rn:condition sla="chat" />
```

4 Add the following code after the last line in the *chat_launch.php* file.

```
<rn:condition_else />
<div id="rn_PageContent"
class="rn_AnswerDetail">
    <div class="rn_Padding">
        <h2>#rn:msg:PERMISSION_DENIED_LBL#</h2>
        <p>#rn:msg:CHAT_SLA_REQUIRED_LBL#</p>
    </div>
</div>
</rn:condition>
```

5 Save *chat_launch.php*.

To set a page meta tag to require an SLA

1 Open the *chat_launch.php* file in the */views/pages/mobile/chat* folder.

2 Add the *sla_required_type* page meta tag to the first line of the file, which should now read:

```
<rn:meta title="#rn:msg:LIVE_CHAT_LBL#"
template="mobile.php"
clickstream="chat_request"
sla_required_type="chat" />
```

3 Save *chat_launch.php*.

Note If you require a chat SLA on the chat launch page, you should also require one on the chat page. Edit the *chat_landing.php* file in the same manner by adding `sla_required_type="chat"` to the first line in the file.

Chatting on the mobile customer portal

After an agent accepts a chat request, the customer and agent can begin chatting. The chat landing page displays the agent's opening comments and a transcript of the ongoing chat between the customer and agent.

Important By default, the *chat_landing.php* file for the mobile chat page contains the *include_chat* page meta tag, which is set to true. If you create additional pages that contain a chat application, you must include this meta tag and set it true in the page file. When the *include_chat* tag is set to true, the page includes all the required JavaScript files for **Oracle RightNow Chat Cloud Service**.

The following configuration options are available on the chat landing page.

- Configuring the primary chat widgets (Although the default chat landing page includes multiple widgets, only the following three widgets are actually necessary to create a usable chat page.)
  - ▷ ChatServerConnect widget
  - ▷ ChatTranscript widget
  - ▷ ChatPostMessage widget
- Additional chat widgets
- Allow customers the option to chat off the record
- Set customer posts to always be off the record

Configuring the primary chat widgets

The chat page requires, at a minimum, the following three widgets, which you can configure.

- ChatServerConnect widget
- ChatTranscript widget
- ChatPostMessage widget

Configuring ChatServerConnect widget

The ChatServerConnect widget is used to communicate with customers who have just requested a **chat session**. Besides changing the loading icon and specifying a page to be loaded in the chat window when the chat session ends, you can modify the messages that appear when connecting, when the connection succeeds or fails, and when the session is terminated.

To configure the ChatServerConnect widget

1 Open the *chat_landing.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatServerConnect"/>
```

3 To change the loading icon, add the *loading_icon_path* attribute to the widget. Your code will resemble the following.

```
<rn:widget path="chat/ChatServerConnect"
loading_icon_path="images/indicator_2.gif" />
```

4 To edit any of the following default labels (shown in quotation marks), add the associated attribute (shown in italics) and define it with your new label. ([Learn about editing message bases here.]())

label_connecting—"Please wait while we establish a connection to the Chat Server."

label_connection_fail—"There was a problem connecting to the Chat Server."

label_connection_success—"A connection to the Chat Server has been established successfully."

label_terminate_session—"This action will terminate your current session. Do you want to continue?"

Your code may resemble the following.

```
<rn:widget path="chat/ChatServerConnect"
label_connecting="We are connecting to the chat server now." />
```

5 Save *chat_landing.php*.

Configuring the ChatTranscript widget

The ChatTranscript widget lets you replace the default icons and labels that appear on the transcript window.

Note Hyperlinks are disabled in the chat transcript to prevent customers from following a link and then being unable to return to the chat session.

Replacing ChatTranscript widget icons

You can replace any of the default icons, which are specified as attributes of the ChatTranscript widget, by defining the path and file name for the replacement icon. In the *chat_landing.php* file, the code for the ChatTranscript widget is the following.

```
<rn:widget path="chat/ChatTranscript"
mobile_mode="true"/>
```

Note Setting the *mobile_mode* attribute to true disables the Close button, so customers must use the Menu button to navigate away from the chat window.

All default icons are in the */cp/customer/assets/themes/mobile/images* folder, but you can reference the path in the widget attribute simply by typing `images/[filename]`.

Table 384: ChatTranscript Widget Default Icons

Icon	Attribute	Default Value
Agent Message Icon	*agent_message_icon_path*	*images/chatAgent.png.*
Alert Icon	*alert_icon_path*	*images/chatAlert.png*
End-user Message Icon	*enduser_message_icon_path*	*images/chatEndUserMessage.png*
Off the Record Icon	*off_the_record_icon_path*	*images/chatOffTheRecord.png*

To replace the default Agent Message icon, for example, your code will resemble the following.

```
<rn:widget path="chat/ChatTranscript"
agent_message_icon_path="images/chatAgentNew.png" />
```

Editing ChatTranscript widget labels

You can replace any of the default labels, which are specified as attributes of the ChatTranscript widget, by defining the new label. Go to https://<your_site>/ci/tags/widgets/standard/chat/ChatTranscript for specific information about where each label is used. You can learn about editing message bases here.

Configuring the ChatPostMessage instructions

By default, the ChatPostMessage label on the mobile chat page says, "Type your message and send."

To edit the ChatPostMessage label

1 Open the *chat_landing.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatPostMessage"
label_send_instructions="#rn:msg:TYPE_YOUR_MESSAGE_AND_SEND_LBL#"
mobile_mode="true"/>
```

Note Setting the *mobile_mode* attribute to true blurs the input panel to allow more of the transcript to be viewed on the mobile device.

3 Edit the *label_send_instructions* attribute to change the default message base. Your code will resemble the following.

```
<rn:widget path="chat/ChatPostMessage"
label_send_instructions="Your new instructions for sending a message"
mobile_mode="true"/>
```

4 Save *chat_landing.php*.

Adding the option to chat off-the-record

You can add a button to the mobile chat page that lets customers send an off-the-record message during the chat session. Any information the customer types in the Off the Record Message dialog that opens when the button is clicked does not appear on the Messages tab of the incident that is created from the chat session. Instead, the incident displays “Message Removed.” Text that is submitted off-the-record is displayed with a different color and icon in the chat transcript window.

To add the option to chat off-the-record

1 Open the *chat_landing.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatEngagementStatus"/>
```

Note You can place the button wherever you want. In this example, we’re placing it below the status line.

3 Add the following lines of code immediately below the line you located in step 2.

```
<rn:widget path="chat/ChatOffTheRecordDialog"/>
<rn:widget path="chat/ChatOffTheRecordButton"
off_the_record_icon_path=""
label_off_the_record="#rn:msg:SEND_AN_OFF_THE_RECORD_MESSAGE_CMD#"/>
```

4 Save *chat_landing/php*.

Setting all chat posts off-the-record

To set all chat posts off-the-record

1 Open the *chat_landing.php* file in the */views/pages/mobile/chat* folder.

2 Locate the following line of code.

```
<rn:widget path="chat/ChatPostMessage"
label_send_instructions="#rn:msg:TYPE_YOUR_MESSAGE_AND_SEND_LBL#"
mobile_mode="true"/>
```

3 Edit the widget to add the *all_posts_off_the_record* attribute, as shown in the following code.

```
<rn:widget path="chat/ChatPostMessage"
label_send_instructions="#rn:msg:TYPE_YOUR_MESSAGE_AND_SEND_LBL#"
mobile_mode="true"
all_posts_off_the_record="true" />
```

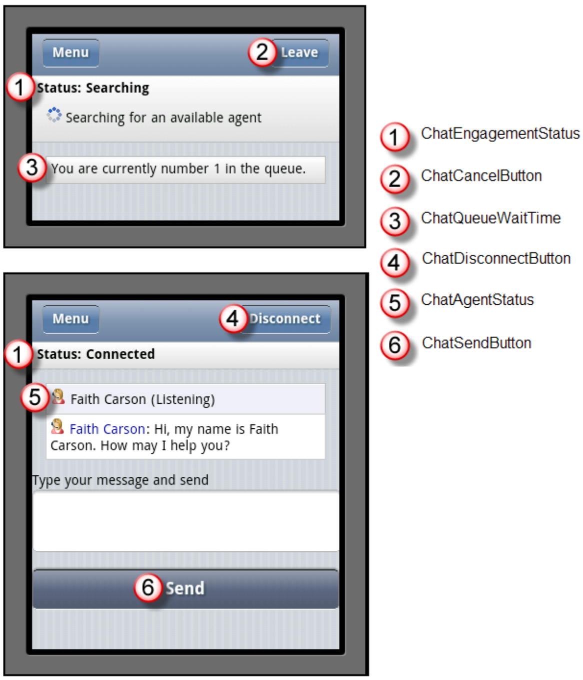
4 Save *chat_landing.php*.

Configuring the other chat widgets

Although only three widgets are required for a working chat page, the additional chat widgets shown in this figure provide increased functionality.

Note The following chat widgets are not available on the mobile customer portal.

- ChatAttachFileButton
- ChatPrintButton
- ChatQueueSearch
- ChatSoundButton



Customer account pages

Customers can manage their accounts on their mobile devices by viewing and updating the questions they've submitted to your support team. They can also update their account information and change their password.

You can configure the following customer account pages.

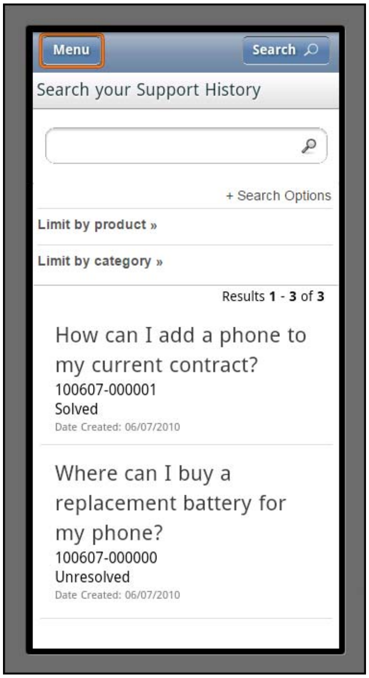
- Support history page
- Question details page
- Account settings page
- Change password page

Configuring the support history page

Customers can view the incidents they have submitted when they click Menu > Your Account > View Your Support History. The page displays a list of the **incidents** associated with the customer, including each incident's status and the date it was created. Your customers can filter the search results by product and category.

You can configure the following options on the support history page.

- Edit the page title
- Remove the search field
- Remove product and category filters
- Change the report that displays customer questions



Editing the page title

The default heading for the mobile support history page is Search Your Support History.

To edit the support history heading

1 Open the *list.php* file in the */views/pages/mobile/account/questions* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:SEARCH_YOUR_SUPPORT_HISTORY_CMD#</h1>
```

3 Edit the code to replace the message base with the new page heading between the <h1> tags. Your edited code will resemble the following.

```
<h1>Search your recent questions here</h1>
```

4 Save *list.php*.

Removing the search field

If you remove the search field from the support history page, you'll probably also want to change the page heading so it doesn't refer to searching.

To remove the search field from the support history page

1 Open the *list.php* file in the */views/pages/mobile/account/questions* folder.

2 Remove the following lines of code.

```
<form onsubmit="return false;">
    <rn:widget path="search/KeywordText" label_text=""
    initial_focus="true"/>
    <rn:widget path="search/SearchButton"
    icon_path="images/icons/search.png"/>
</form>
```

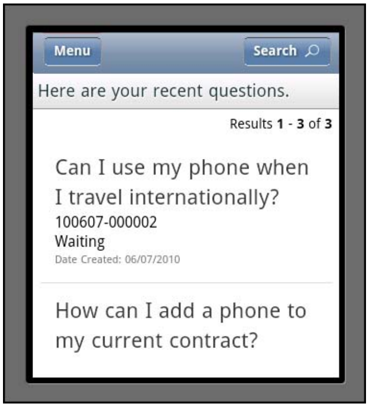
3 Locate the following line of code used for the page heading.

```
<h1>#rn:msg:SEARCH_YOUR_SUPPORT_HISTORY_CMD#</h1>
```

4 Edit the code you located in step 3 to replace the default message base that refers to the search feature you just removed. Type the new page heading between the `<h1>` tags. Your edited code will resemble the following.

```
<h1>Here are your recent questions.</h1>
```

5 Save *list.php*.



Removing product and category filters

By default, the support history pages lets customers filter their incidents by product and category.

To remove product and category filters

1 Open the *list.php* file in the */views/pages/mobile/account/questions* folder.

2 Delete the following lines of code.

```
<rn:widget path="navigation/Accordion" toggle="rn_Advanced"/>
<div class="rn_Padding">
    <a class="rn_AlignRight" href="javascript:void(0);"
    id="rn_Advanced">#rn:msg:PLUS_SEARCH_OPTIONS_LBL#</a>
    <div>
        <rn:widget path="search/MobileProductCategorySearchFilter"
        filter_type="products"/>
        <rn:widget path="search/MobileProductCategorySearchFilter"
        filter_type="categories"/>
    </div>
</div>
```

3 Save *list.php*.

Changing the report

By default, the support history page uses the Questions report (ID 196).

To change the report used by the support history page

1 Open the *list.php* file in the */views/pages/mobile/account/questions* folder.

2 Locate the following line of code.

```
<rn:container report_id="196">
```

3 Replace `196` with the standard or custom report you want to use instead. (Learn how to find a report’s ID number.)

4 Save *list.php*.

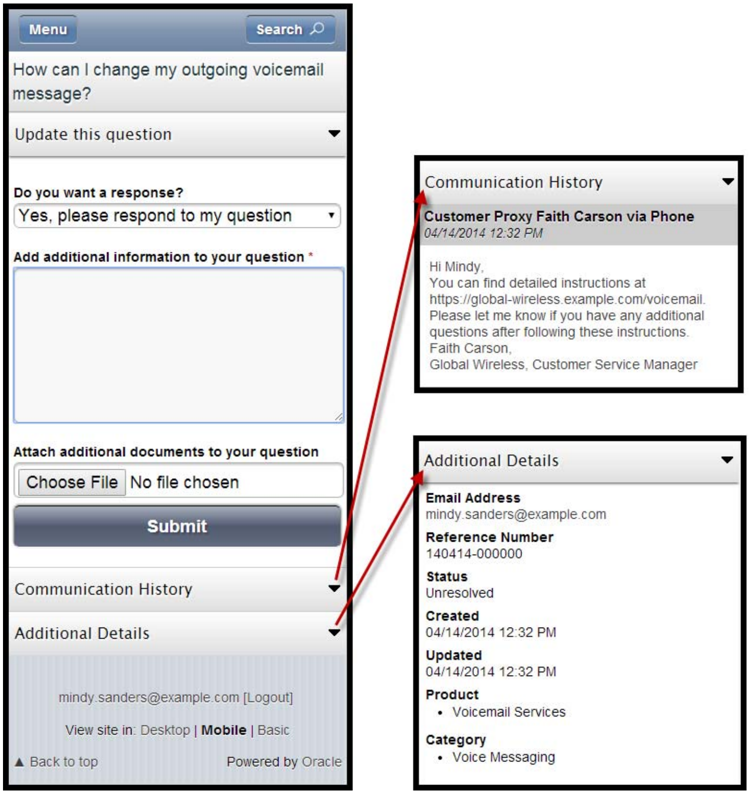
Configuring the question details page

When customers submit questions, **incidents** are created in the Oracle Service Cloud knowledge base. They can view the list of their questions on the support history page of the mobile customer portal. Selecting an individual question on the support history then opens the details page for that question, where customers can update their question by adding more information and requesting or declining a response from your support team. They can also view additional incident details, including the communication history, their email address, the incident's reference number and status, and the dates it was created and last updated.

Whenever customers respond to the "Do you want a response?" question with "Yes, please respond to my question," the Add Additional Information to Your Question field is automatically marked as a required field, and customers must enter something in the field before submitting their request.

Besides changing message bases on the question details page, other configuration options on the page include the following.

- Collapsing the Update This Question section when the page opens
- Expanding Communication History or Additional Details when the page opens
- Editing labels on the page
- Changing which details are displayed in the Additional Details section
- Preventing customers from updating solved incidents



Collapsing the Update This Question section

By default, the Update This Question section is expanded when the mobile question details page opens. Follow this procedure if you want the Accordion widget to be collapsed when the page opens.

To collapse the Update This Question section

1 Open the *detail.php* file in the */views/pages/mobile/account/questions* folder.

2 Locate the following lines of code.

```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_QuestionUpdate"/>
    <h2 id="rn_QuestionUpdate">#rn:msg:UPDATE_THIS_QUESTION_CMD#<span
```

```
        class="rn_Expand"></span></h2>
        <form id="rn_UpdateQuestion"
        onsubmit="return false;">
            <div id="rn_ErrorLocation"></div>
            <rn:widget path="input/FormInput"
            name="Incident.StatusWithType.Status"
            label_input="#rn:msg:DO_YOU_WANT_A_RESPONSE_MSG#"/>
            <rn:widget path="input/FormInput"
            name="Incident.Threads"
            label_input="#rn:msg:ADD_ADDTL_INFORMATION_QUESTION_CMD#"
            initial_focus="true"
            required="true" />
            <rn:widget path="input/FileAttachmentUpload"
            label_input="#rn:msg:ATTACH_ADDTL_DOCUMENTS_QUESTION_LBL#"/>
            <rn:widget path="input/FormSubmit"
            label_button="#rn:msg:SUBMIT_CMD#"
            on_success_url="/app/account/questions/list"
            error_location="rn_ErrorLocation"/>
        </form>
    </div>
```

3 Edit the code as follows.

```
    <div class="rn_Module">
        <rn:widget path="navigation/Accordion"
        toggle="rn_QuestionUpdate"/>
        <h2
        id="rn_QuestionUpdate"><class="rn_Collapsed">#rn:msg:UPDATE_THIS_
        QUESTION_CMD#<span class="rn_Expand"></span></h2>
        <div class="rn_Hidden rn_QuestionThreadContent">
            <form id="rn_UpdateQuestion"
            onsubmit="return false;">
                <div id="rn_ErrorLocation"></div>
                <rn:widget path="input/FormInput"
                name="Incident.StatusWithType.Status"
                label_input="#rn:msg:DO_YOU_WANT_A_RESPONSE_MSG#"/>
                <rn:widget path="input/FormInput"
                name="Incident.Threads"
                label_input="#rn:msg:ADD_ADDTL_INFORMATION_QUESTION_CMD#"

                initial_focus="true"
                required="true" />
                <rn:widget path="input/FileAttachmentUpload"
                label_input="#rn:msg:ATTACH_ADDTL_DOCUMENTS_QUESTION_LBL#
                "/>
```

```
                <rn:widget path="input/FormSubmit"
                label_button="#rn:msg:SUBMIT_CMD#"
                on_success_url="/app/account/questions/list"
                error_location="rn_ErrorLocation"/>
            </form>
        </div>
    </div>
```

4 Save *detail.php*.

Expanding Communication History or Additional Details

To expand Communication History when the page opens

1 Open the *detail.php* file in the */views/pages/mobile/account/questions* folder.

2 Locate the following lines of code.

```
<h2 id="rn_QuestionThread">#rn:msg:COMMUNICATION_HISTORY_LBL#<span
class="rn_Expand"></span></h2>
<div class="rn_Hidden rn_QuestionThreadContent">
```

3 Edit the code as follows.

```
<h2 id="rn_QuestionThread"
class="rn_Expanded">#rn:msg:COMMUNICATION_HISTORY_LBL#<span
class="rn_Expand"></span></h2>
<div>
```

4 Save *detail.php*.

To expand Additional Details when the page opens

1 Open the *detail.php* file in the */views/pages/mobile/account/questions* folder.

2 Locate the following lines of code.

```
<h2 id="rn_QuestionDetails">#rn:msg:ADDITIONAL_DETAILS_LBL#<span
class="rn_Expand"></span></h2>
<div class="rn_Hidden rn_Padding">
```

3 Edit the code as follows.

```
<h2 id="rn_QuestionDetails"
class="rn_Expanded">#rn:msg:ADDITIONAL_DETAILS_LBL#<span
class="rn_Expand"></span></h2>
<div class="rn_Padding">
```

4 Save *detail.php*.

Editing labels on the page

You can edit any of the message bases on the question details page. This procedure provides an example, but the process is the same for other labels and messages. Review information about changing message bases here.

To edit labels on the question details page

1 Open the *detail.php* file in the */views/pages/mobile/account/questions* folder.

2 To edit the Update This Question label, locate the following line of code.

```
<h2 id="rn_QuestionUpdate">#rn:msg:UPDATE_THIS_QUESTION_CMD#<span
class="rn_Expand"></span></h2>
```

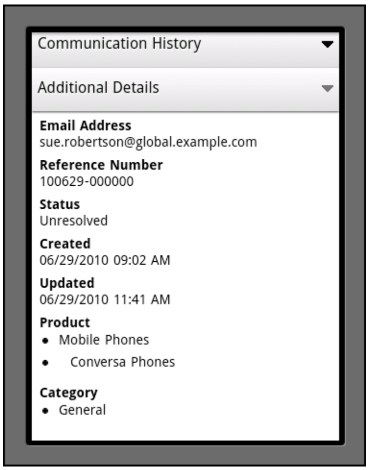
3 Edit the message base so your code resembles the following.

```
<h2 id="rn_QuestionUpdate">Provide updated information<span
class="rn_Expand"></span></h2>
```

4 Save *detail.php*.

Changing displayed details

The Additional Details section on the question details page lists the customer's email address and information about the incident, including reference number, status, dates created and updated, and the associated product and category.



To add or remove incident details on the question details page

1 Open the *detail.php* file in the */views/pages/mobile/account/questions* folder.

2 Locate the following lines of code and notice the block of DataDisplay widgets below them. Each line defines one of the details displayed on the page.

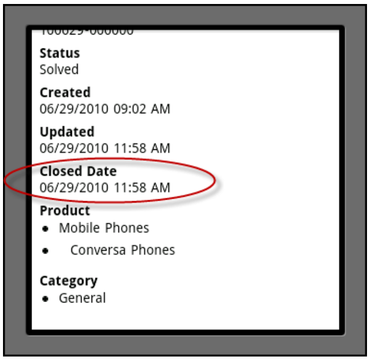
```
<div class="rn_Module">
    <rn:widget path="navigation/Accordion"
    toggle="rn_QuestionDetails"/>
    <h2 id="rn_QuestionDetails">#rn:msg:ADDITIONAL_DETAILS_LBL#<span
    class="rn_Expand"></span></h2>
    <div class="rn_Hidden rn_Padding">
```

3 To add an incident detail, add a line of code that adds the DataDisplay widget to the block of DataDisplay code for incident fields. You can find the names of all the incident fields you can add to the page by clicking the Framework tab and selecting Business objects on the Customer Portal Administration site.

```
<rn:widget path="output/DataDisplay"
name="Incident.ClosedTime"
label="#rn:msg:CLOSED_LBL#" left_justify="true"/>
```

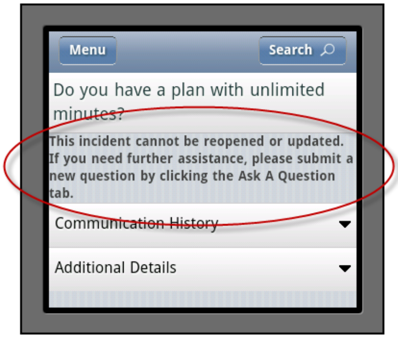
4 To remove one of the incident fields, locate the line of code that displays the field and delete it.

5 Save *detail.php*.



Preventing update of solved incidents

By default, the question details page uses a condition to prevent customers from updating **incidents** (customers' questions) that have been solved for more than one week (168 hours). You can change the amount of time until an incident can no longer be updated or you can prevent customers from ever updating a closed incident, regardless of how recently it's been solved.



Notice that the default message refers to the Ask a Question tab, which applies to the standard reference implementation but not the mobile page set. When you prevent customers from updating closed incidents, you should probably change that message base as well.

To prevent customers from updating solved incidents

1 Open the *detail.php* file in the */views/pages/mobile/account/questions* folder.

2 Locate the following line of code.

```
<rn:condition incident_reopen_deadline_hours="168">
```

3 Edit the code to change the value for the *incident_reopen_deadline_hours* attribute to 0.

```
<rn:condition incident_reopen_deadline_hours="0">
```

4 Now change the message base by first locating the following line of code.

```
<h4>#rn:msg:INC_REOPENED_UPD_FURTHER_ASST_PLS_MSG#</h4>
```

5 Edit the code to change the message that is displayed when the incident cannot be updated.

```
<h4>This incident can no longer be opened or updated. For help, submit
a new question to our support team.</h4>
```

6 Save *detail.php*.

Configuring the account settings page

When customers click Menu > Your Account > Change Your Account Settings, the page displays information entered when they first created their account or most recently updated it. By default, this page displays fields for user name, first and last names, email address, street address, and phone numbers. Customers can also change their password from this page.

Configuration options for this page include the following.

- Changing the page title
- Changing other message bases on the page
- Adding and removing fields

Editing the page title

To edit the account settings page title

1 Open the *profile.php* file in the */views/pages/mobile/account* folder.

2 Locate the following line of code.

```
<h1>#rn:msg:ACCOUNT_SETTINGS_LBL#</h1>
```

3 Edit the code with your new heading to resemble the following.

```
<h1>Your Current Profile Settings</h1>
```

4 Save *profile.php*.

Editing message bases and labels

You can edit any of the message bases and labels on the account settings page. This procedure provides an example, but the process is the same for other labels and messages. [Review information about changing message bases here.]()

To edit message bases and labels on the account settings page

1 Open the *profile.php* file in the */views/pages/mobile/account* folder.

2 To change the "Change your password" message, locate the following line of code.

```
<a href="/app/account/
change_password#rn:session#">#rn:msg:CHG_YOUR_PASSWORD_CMD#</a><br/
><br/>
```

a Edit the code with your new message to resemble the following.

```
<a href="/app/account/change_password#rn:session#">Click here to
change your password.</a><br/><br/>
```

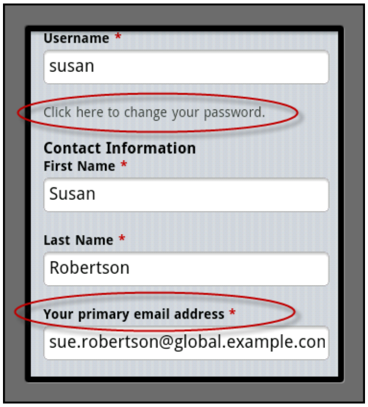
3 To change the label for the Email Address field, locate the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
validate_on_blur="true"
label_input="#rn:msg:EMAIL_ADDR_LBL#" />
```

a Edit the code with your new message to resemble the following.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.PRIMARY.Address"
required="true"
validate_on_blur="true"
label_input="Your primary email address" />
```

4 Save *profile.php.*



Adding and removing fields

To add or remove contact fields on the account settings page

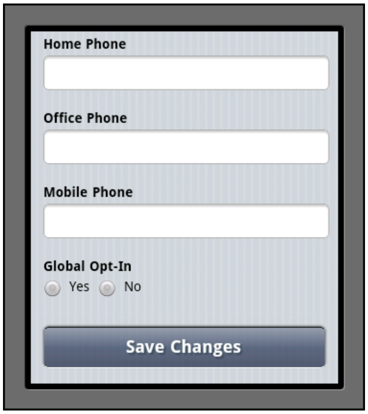
1 Open the *profile.php* file in the */views/pages/mobile/account* folder.

2 To add a field to the account settings page, insert a line of code that calls the FormInput widget in the location on the page where you want the field to appear. You can find the names of all the contact fields you can use by clicking the Framework tab and selecting Business objects on the Customer Portal Administration site. For example, to add the alternate email address fields to the page, add the following lines of code.

```
<rn:widget path="input/FormInput"
name="Contact.Emails.ALT1.Address" />
<rn:widget path="input/FormInput"
name="Contact.Emails.ALT2.Address" />
```

3 To add a radio button selection that lets customers opt in to communications from your marketing department, add the following code wherever you want in the block of FormInput widgets on the page.

```
<rn:widget path="input/FormInput"
name="Contact.MarketingSettings.MarketingOptIn" />
```



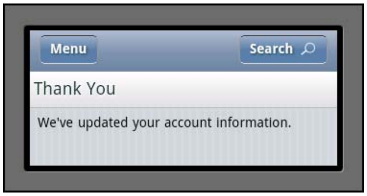
4 To remove one of the contact fields, locate the line of code that displays the field and delete it. For example, to remove the physical address fields, you would delete the following lines of code.

```
<rn:condition language_in="ja-JP,ko-KR,zh-CN,zh-HK,zh-TW">
    <rn:widget path="input/FormInput"
    name="Contact.Address.PostalCode" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Country" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.StateOrProvince" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.City" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Street" />
<rn:condition_else />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Street" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.City" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.Country" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.StateOrProvince" />
    <rn:widget path="input/FormInput"
    name="Contact.Address.PostalCode" />
</rn:condition>
```

5 Save *profile.php*.

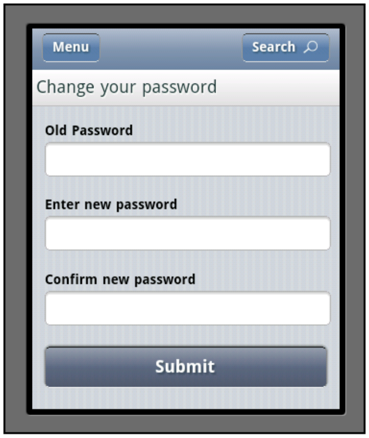
Confirmation of updated account settings

After customers edit their profile information and click Submit, they receive the following confirmation message.



Configuring the change password page

When customers click the Change Your Password link on the account settings page, the following page opens. After they submit their current and new password, a confirmation page opens.



Configuration options for this page include the following.

- Editing message bases
- Editing the Password label to indicate the password minimum length requirement

Editing message bases on the change password page

To edit message bases on the change password page

1 Open the *change_password.php* file in the */views/pages/mobile/account* folder.

2 To edit the heading, locate the following line of code and type the new heading between the <h1> tags.

```
<h1>#rn:msg:CHANGE_YOUR_PASSWORD_CMD#</h1>
```

3 To edit labels for any of the password fields, locate the following line of code.

```
<rn:widget path="input/PasswordInput"
name="Contact.NewPassword"
require_validation="true"
require_current_password="true"
label_input="#rn:msg:PASSWD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

a To edit the Current Password label, add the *label_current_password* attribute and set its value to the label you want.

b To edit the Password label, edit the value for the *label_input* attribute.

c To edit the Verify Password label, edit the value for the *label_validation* attribute.

4 Save *change_password.php*.

Editing the password label to specify password length

If you set a minimum password length that customers must enter when they're creating an account or changing their password, passwords are automatically required. You may want to edit the label so customers know how long their password must be before they enter one.

To edit the password label on the change password page

1 Open the *change_password.php* file in the */views/pages/mobile/account* folder.

2 Locate the following line of code.

```
<rn:widget path="input/FormInput"
name="Contact.NewPassword"
require_validation="true"
label_input="#rn:msg:PASSWD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

3 Edit the *label_input* attribute of the FormInput widget to define password length information. Your code will resemble the following.

```
<rn:widget path="input/FormInput"
name="Contact.NewPassword"
require_validation="true"
label_input="Password (8 characters minimum)"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#"
initial_focus="true"/>
```

4 Save *change_password.php*.

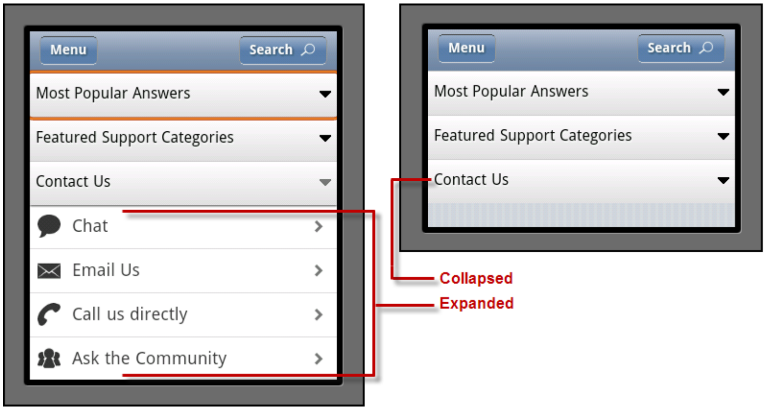
Mobile widgets

The mobile reference implementation uses the following widgets. All but the Accordion widget are intended for use only on the mobile pages.

- Accordion—Allows expandable/collapsible sections, which are especially useful with the limited screen size of mobile devices.
- MobileAnswerFeedback—Provides the response mechanism for customers to give feedback on the answer details page.
- MobileMultiline—Displays an answers report on the answers list page in a format optimized for mobile devices.
- MobileNavigationMenu—Displays a button that toggles between displaying and hiding content on a page, such as the Menu and Search buttons on the template.
- MobileProductCategoryInput—Displays products and categories for selection on the ask a question page.
- MobileProductCategoryList—Displays a list of products and categories. The home page uses this widget to display Featured Support Categories.
- MobileProductCategorySearchFilter—Lets customers filter an answers report to display only answers related to the selected product or category.
- MobileSimpleSearch—Displays a search field and Search button that let customers enter search terms on their mobile device.
- PageSetSelector—Allows customers to select the option of viewing the standard and basic page set on their mobile device.

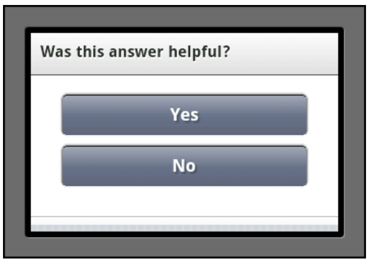
Accordion widget

The accordion widget is an expandable/collapsible container. Customers can click it to toggle between expanding and collapsing the elements contained in it. The default home page of the mobile reference implementation contains three of these widgets: Most Popular Answers, Featured Support Categories, and Contact Us.

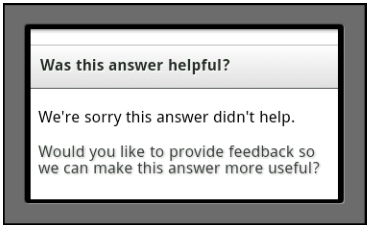


MobileAnswerFeedback

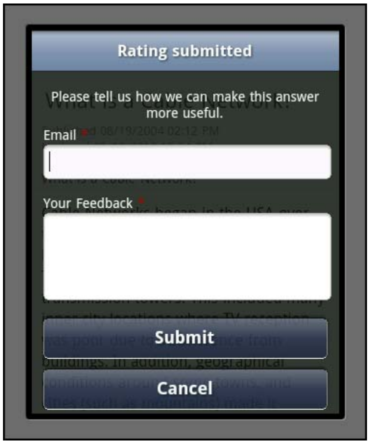
The MobileAnswerFeedback widget on the answer details page lets customers provide feedback on the answer they are viewing.



Positive feedback is recorded and a thank-you message acknowledges the feedback. If the answer is No, customers are offered the chance to provide additional feedback.

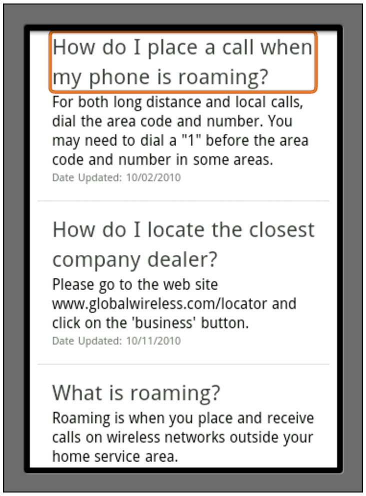


Selecting the link opens another window where feedback can be entered.



MobileMultiline widget

The MobileMultiline widget displays an answers report on the answers list page using a format that is optimized for mobile devices.

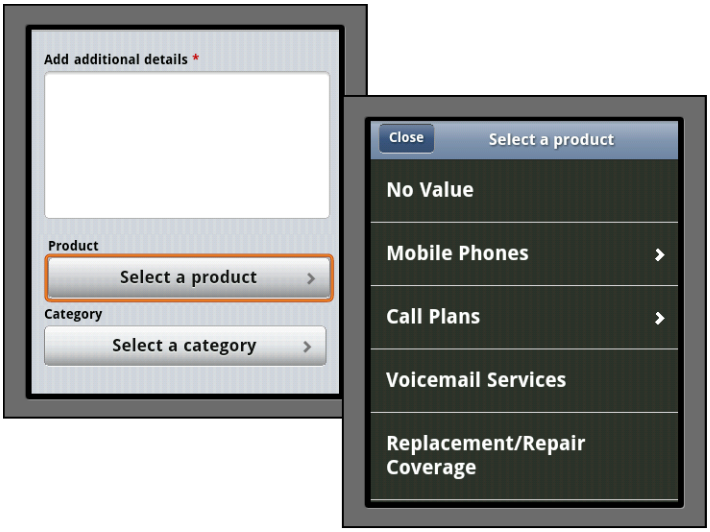


MobileNavigationMenu widget

The MobileNavigationMenu widget is a button that toggles between opening and closing content. The Menu and Search buttons on the template are both MobileNavigationMenu widgets. The MobileNavigationMenu widget code requires a label for the button, an ID of the div element that is displayed when the button is clicked (the *submenu* attribute), and the CSS class used by the button. When the button is first clicked, the defined element opens. When it is clicked again, the element closes.

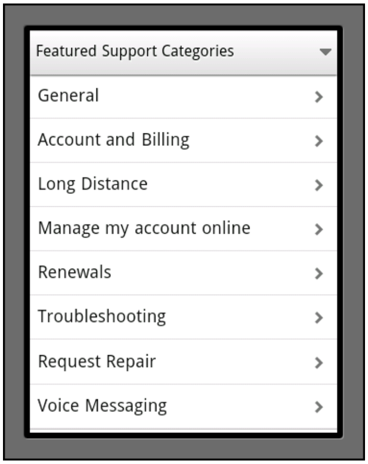
MobileProductCategoryInput

The MobileProductCategoryInput widget displays a drop-down menu for selecting products and categories on question and contact forms. By default, it appears on the ask a question page. When adding the MobileProductCategoryInput widget to a page, you must define the *table* attribute.



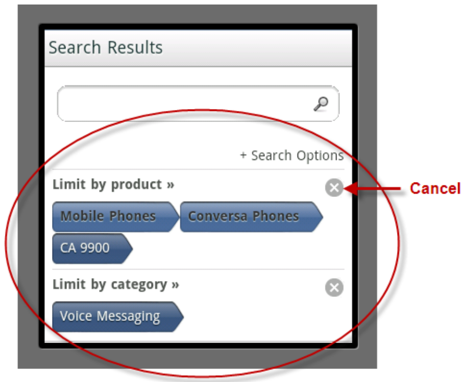
MobileProductCategoryList widget

The MobileProductCategoryList widget is used to display the Featured Support Categories on the home page. You can specify one or two levels of products or categories in the widget code. When customers click a product or category, all answers that are associated with that category are opened on the answers list page.



MobileProductCategorySearchFilter widget

The MobileProductCategorySearchFilter widget displays product and category filters on the answers list page so customers can restrict the displayed answers by the selected product and category. The answers list page displays both product and category filters, but you can include just one on the page or remove both of them. (Configure the search filter display on the answers list page.) Clicking a cancel button clears the filter choice.

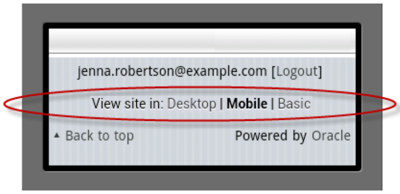


MobileSimpleSearch widget

The MobileSimpleSearch widget opens when the primary Search button on the template is clicked. When customers enter text in the search field, the field displays an X button to quickly clear the entered text. To optimize the mobile experience and prevent an unmanageable number of search results, searching will not occur if search terms have not been entered in the field when the Search button is clicked. When customers clear product or category search filters, they must click Search again because the search does not refresh automatically.

PageSetSelector

The PageSetSelector widget lets customers select the option of viewing the standard and basic reference implementation on their mobile device instead of viewing the mobile page set. Cookies must be enabled to allow this option. If cookies are disabled on the customer's browser and the Desktop option is selected, the mobile page refreshes instead of switching to the reference implementation. If customers view your site in Desktop mode, they won't have a way to return to the Mobile mode while their cookie is active unless you have modified your standard reference implementation to let them select the Mobile mode.



Other customer portal widgets

The Accordion widget and the nine mobile widgets are the only widgets designed specifically for the mobile reference implementation. In addition to these widgets, the following standard widgets are also supported in the mobile reference implementation. Many have modified presentation CSS in the */cp/customer/assets/themes/mobile/widgetCss* folder. As a result, their display on a mobile device is different from their display in the standard Customer Portal reference implementation.

- All widgets in the *chat* folder, **except** ChatAttachFileButton, ChatCoBrowseButton, ChatPrintButton, ChatQueueSearch, and ChatSoundButton
- All widgets in the *input* folder, **except** FileAttachmentUpload and ProductCategoryInput (The MobileProductCategoryInput is used on the mobile reference implementation to select products and categories.)
- *knowledgebase* folder
  - ▷ GuidedAssistant
  - ▷ PreviousAnswers
  - ▷ RelatedAnswers
- *login* folder
  - ▷ EmailCredentials
  - ▷ LoginForm

    - LogoutLink
    - ResetPassword
- All widgets in the *output* folder
- *reports* folder
    - Paginator
    - ResultInfo
- *search* folder
    - CombinedSearchResults
    - KeywordText
    - SearchButton
- *utils* folder
    - EmailAnswerLink

Important It's possible that additional customer portal widgets beyond these may function on your mobile pages, but the listed ones are the only supported widgets for the mobile page set. You must customize the presentation CSS of any non-supported widgets you add to your mobile pages because the default CSS is not compatible with an acceptable display on a mobile device.

Developer information

The mobile reference implementation offers a JavaScript Module meta tag that enhances performance of the customer portal on mobile devices. Another difference between the mobile and standard reference implementations is the styling of the development header and the information it contains. In order to automatically display the mobile page set to customers with mobile devices, the customer portal provides user agent mapping so you can define the page sets your customers see based on the browser they are using.

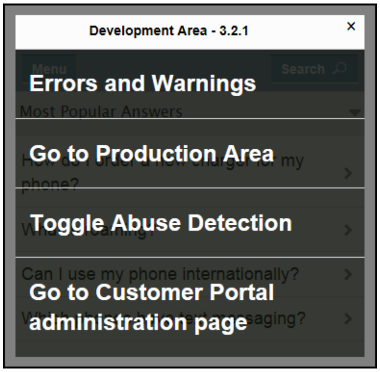
JavaScript Module meta tag

To support the higher latency on mobile browsers, a new page meta tag called *javascript_module* has been added. If this tag is omitted, the same framework JavaScript as used in the standard reference implementation is loaded. Selecting the *mobile* option for this tag loads core components, but omits large and unnecessary modules. No deprecated code will be loaded, and the *autoload.js* file will not be loaded either.

Development header

The mobile reference implementation uses an abbreviated version of the development header that lets you view errors, warnings, and notifications and contains links for the production pages and the Customer Portal Administration site. Clicking the Development Area header toggles between expanding and collapsing the header.

Click to view



Clicking Errors and Warnings lets you view any problems on the page. Clicking Go to Production Area displays the page in production mode. Clicking Toggle Abuse Detection puts your development site in an abuse simulation mode so you can test what happens under abuse conditions. And clicking Go to Customer Portal Administration Page opens the */ci/admin* page of your site.

61

Basic Page Set for the Customer Portal

The majority of customers who access your customer portal are most likely using either mobile devices or standard browsers on desktops and laptops. But you may have others using older devices and browsers with limited or no JavaScript capabilities. These include certain older versions of the Japanese Keitai phones and Symbian OS devices, which are still very much in use internationally. They also include embedded browsers such as those found in some gaming systems, "smart" home appliances, and GPS devices.

The Customer Portal's basic page set significantly expands the number of customers who can access your customer portal because it supports this wide variety of lower-capability devices and browsers. The page set detects the browser's level of JavaScript capability in order to present the best experience to the customer. Devices that display the basic page set must meet the following minimum requirements.

- **HTML doctype**—The device must be capable of rendering XHTML Basic 1.1, which is the current recommendation from W3C (World Wide Web Consortium) for mobile devices. The XHTML Basic 1.1 doctype is included in the reference implementation for the basic page set. If you use any other doctype, you must modify the template, pages, and possibly your widgets.
- **CSS**—The basic page set has been designed to deliver the pages in XHTML markup if the device or browser supports limited or no CSS. Some minimal styling has been added and will be rendered on devices that support CSS. The reference implementation supports CSS 2.1, but you can remove the CSS styling completely if necessary.
- **Cookies and authentication**—The basic page set requires cookies for customer and staff member login authentication. Session tracking works on all devices regardless of their ability to support cookies, but customer login authentication works only when cookies are supported and enabled. Administrative login requires authentication as well.

The following differences exist between the basic page set and the standard and mobile pages.

- Multiple reports will work on a basic page only if no search filtering widgets are included on the page.
- Clickstream reporting is based on customers performing a search.

- The following features are not supported in the basic page set.
  - ▷ **Guided assistance**
  - ▷ **Chat**
  - ▷ Community integration
  - ▷ Open login
  - ▷ CAPTCHAs on form submission
  - ▷ **Web indexing** of external documents
  - ▷ **Topic browsing**
  - ▷ **Search priority words**
  - ▷ Filtering incidents by organization

Detection of JavaScript capability

The CapabilityDetector widget is included on the standard, mobile, and basic templates. The widget detects the customer's browser capabilities, but it is not visible to customers because it is not rendered on the template. Here's how the widget works.

- When customers who are using a browser that has no or limited JavaScript capabilities try to access a standard or mobile page, a link is displayed advising them to switch to a different format. When they click the link, the basic page set opens. If you prefer to direct them to the basic page set automatically, you can set a widget attribute to do so. Refer to the procedure for automatically redirecting customers to the basic page set below.

  If the basic page set is not enabled, the message will tell them that their current browser will not display the pages well.
- When customers access the basic page set with a browser that supports modern JavaScript, you can set a widget attribute (disabled by default) to display a message that encourages them to use a different page set for a better experience. Refer to the procedure below for recommending the standard page set instead of the basic pages.

To automatically redirect customers to the basic page set

1 Open the *standard.php* file in the */views/templates* folder.

2 Locate the following line (around line number 22).

```
<rn:widget path="utils/CapabilityDetector" />
```

3 Edit the widget code as follows:

```
<rn:widget path="utils/CapabilityDetector"
automatically_redirect_on_failure="true" />
```

4 Save *standard.php*.

To recommend the standard page set instead of the basic pages

1 Open the *basic.php* file in the */views/templates* folder.

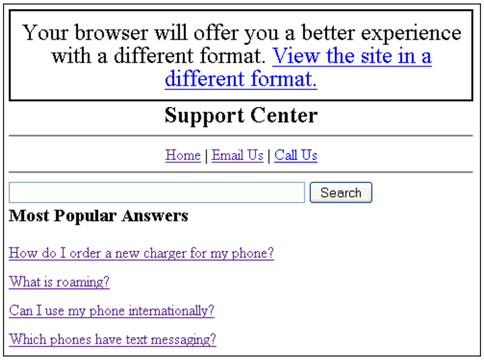
2 Locate the following line (around line number 62).

```
<rn:widget path="utils/CapabilityDetector" />
```

3 Edit the widget code to add the *display_tests_pass* attribute so that your code is:

```
<rn:widget path="utils/CapabilityDetector"
display_tests_pass="true" />
```

4 Save *basic.php*.



When customers click the link, they are directed to the standard page set, which results in a better web experience.

Form validation

Because the basic page set does not use JavaScript to preprocess data in form submissions, a separate set of form input widgets are used with these pages. The <rn:form> tag provides server-side validation of input fields and also supports a function that processes the data.

When customers submit information on the basic page set, they are notified if the information they enter is determined to be invalid, for example, if an email address is not in the usual email format. Error messages occur in the following circumstances.

- When the field is required and no information is entered.
- When the value for an integer field does not fall within the minimum and maximum allowable values.
- When the length of a string value does not fall within the minimum and maximum allowable values.
- When email and URL field types do not use a recognizable format.
- When fields with a mask do not conform to the mask definition.

Note If customers submit a form that returns a form validation error, they can no longer change the product or category except to select a sub-level of the selected product or category.

Features of form validation on the basic page set include the following.

- **Preservation of entered data**—When customers enter invalid data in a field and receive an error message, the other information they entered on that page is retained so they don't have to re-enter it.
- **Password verification**—If customers create an account and submit a password that does not meet the requirements defined on the Service Console, the page refreshes to indicate the missing password requirements.
- **Answer feedback**—Email address and feedback content are validated prior to submission.
- **Login credential validation**—When login information is incorrect, an error message is displayed to the customer.
- **State and province selection**—When the country is selected, a list of states or provinces associated with that country is displayed. Refer to Defining the State/Province field.

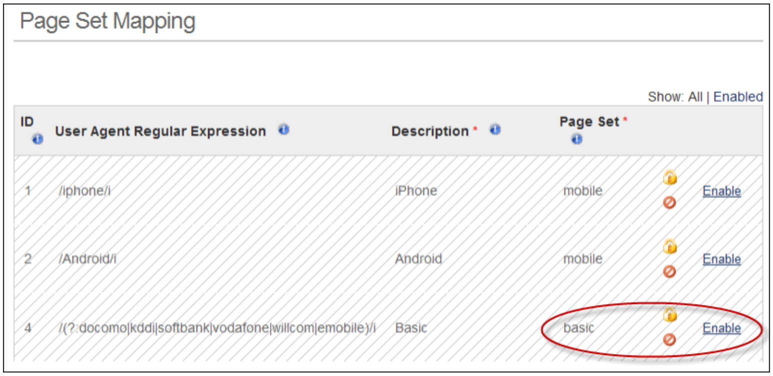
Enabling the basic page set

You must enable the basic **page set mapping** if you want customers who use the target devices and browsers to see the basic pages. This action is performed on the Customer Portal Administration site.

To enable the basic page set

1 In a web browser, type `https://<your_site>/ci/admin`. After you log in, the Customer Portal Dashboard displays.

2 Click the Page Set Mappings shortcut on the dashboard.



3 Click Enable in the right column for the basic page set. The link changes to Disable and the basic page set is enabled.

4 To add your organization's name to the basic page set, follow these steps.

  a Open the *basic.php* file in the */views/templates* folder.

  b Locate the `<body>` line (approximately line 60), and add the following code immediately below it.

```
<h1>My Company Name</h1>
```

  c Save *basic.php*.

Basic template configuration

You can customize the basic page set just as you can customize the standard and mobile page sets. The template (*/cp/customer/development/views/templates/basic.php*) includes the customizable header, called Support Center in the **reference implementation**, the Home, Email Us, and Call Us links, the BasicLogoutLink widget, and the PageSetSelector widget. Additionally, the template for the basic page set uses a special JavaScript Module type `None` that tells the Customer Portal framework not to load any framework or widget JavaScript.

Configuring security

Clickjacking is an attack on browser security that can mislead your customers into clicking a concealed link. To prevent clickjacking, you cannot let your site be put into an iFrame on another site. If you do not use iFrames, make the following edits to the template file.

Note If you intentionally run your customer portal inside an iFrame, do not use the following procedure.

To configure the template for security

1. Open the *basic.php* file in the */views/templates* folder.

2. Locate the following first lines of code.

```
<rn:meta javascript_module="none"/>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML Basic 1.1//EN" "http://
www.w3.org/TR/xhtml-basic/xhtml-basic11.dtd">
<html lang="#rn:language_code#">
    <head>
```

3. Immediately after the `<head>` tag you located in step 2, add the following code.

```
<script>
if (top!= self) top.location.href = self.document.location;
if (parent!= self) top.location.href = location.href;
if (top.frames.length!=0) top.location=self.document.location;
if (window!= window.top) top.location.href = location.href;
</script>
```

4. Save *basic.php*.

5. Open the *hooks.php* file in the */customer/development/config* folder.

6. Add the following code to the pre_page_render hook to prevent clickjacking in modern browsers. Refer to Adding hooks.

```
header("X-Frame-Options:deny");
```

7. Save *hooks.php*.

Support for Shift-JIS

Shift-JIS, a non-UTF-8 encoding character set used for the Japanese language, has been implemented for the basic page set. If you do not set up the page set for Shift-JIS, your basic page set uses the standard UTF-8 character encoding.

You can create a page set specifically for Shift-JIS, or you can configure the basic page set so it uses Shift-JIS. In either case, you must define which page sets should use Shift-JIS and note them in the new configuration setting CP_SHIFT_JIS_PAGE_SETS.

To define the CP_SHIFT_JIS_PAGE_SETS configuration setting

1. Log in to Oracle Service Cloud.
2. Click the Configuration button on the navigation pane.
3. Double-click Configuration Settings under Site Configuration. The Search window opens.
4. Type CP_SHIFT_JIS_PAGE_SETS in the Key field and click Search. A single-line report for the configuration setting opens.
5. Click the Value column so you can enter a value.
6. To use the Shift-JIS character set with the basic page set, type `basic` in the Value column.
7. To use the Shift-JIS character set with a page set you have created, type the page set name in the Value column.
8. To add more than one page set, separate the values with a comma.
9. Click the Save button on the ribbon.

To use Shift-JIS with the basic page set

1. Open the *basic.php* file in the */views/templates* folder.
2. Confirm that the *javascript_module* value in the first line of code is “none.”
   ```
   <rn:meta javascript_module="none"/>
   ```
3. Locate the following line of code.
   ```
   <meta http-equiv="content-type" content="text/html; charset=UTF-8"/>
   ```
4. Edit the code you located to change *charset* from UTF-8 to Shift-JIS.
   ```
   <meta hettp-equiv="content-type"
   ```

```
content="text/html;
charset=SHIFT_JIS"/>
```

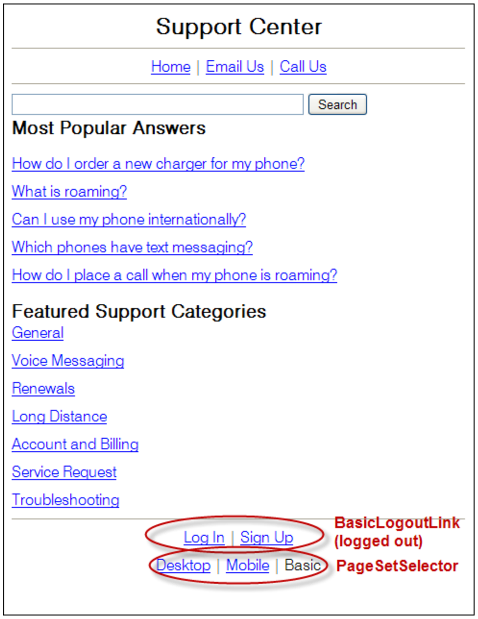
5 Save *basic.php*.

6 Stage and promote your customer portal.

When customers access any of the pages that use the basic template, the character encoding now uses Shift-JIS.

CapabilityDetector widget

Besides the BasicLogoutLink and PageSetSelector widgets, the basic template also includes the CapabilityDetector widget described in Detection of JavaScript capability. The PageSetSelector widget lets customers select the desktop or mobile page set from the basic page. If the customer is not logged in, the BasicLogoutLink widget displays Log In and Sign Up links.

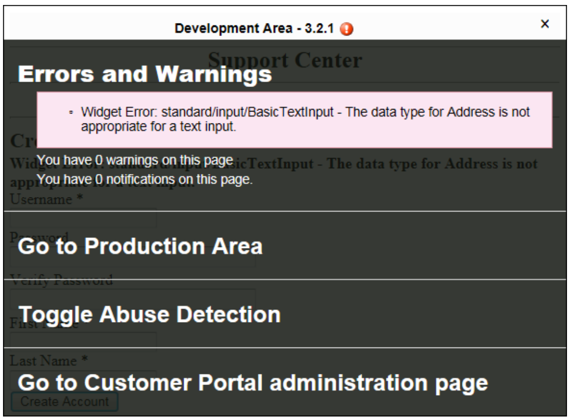


If the customer is logged in, the customer's name is displayed along with Logout and Your Account links.

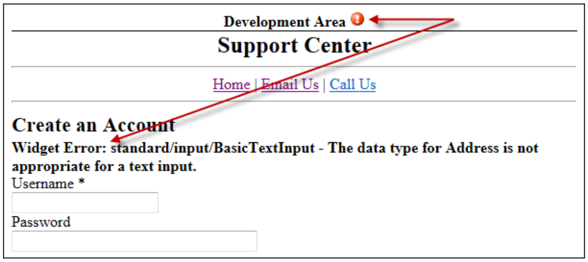
Development header

Just as you do in the standard and mobile page sets, you work with your pages in the development mode until you are ready to stage and promote them. This prevents your customers from seeing the changes you are making until you make them public. You can verify that you're working in development mode because the development header appears at the top of your page.

If your code contains errors, you'll see an exclamation point symbol in the header and the error is described at the top of the page. If JavaScript is enabled, you can click on the symbol to display the errors.



If the browser doesn't support JavaScript, the development area header is simplified and the exclamation point is inactive. The error is noted near the affected widget.



Besides Errors and Warnings, the following options also appear when you click the Development Area header on the basic page set.

- **Go to Production Area**—Click to open the equivalent page on the production site.
- **Toggle Abuse Detection**—Click to put your development site in an abuse simulation mode so you can test what happens under abuse conditions. The header indicates that your development site is now in abuse mode.

Important The CAPTCHAs that appear on the standard and mobile pages require JavaScript to display. Because the basic page set does not support JavaScript, your customers will see a generic error message if an abuse situation is detected.

- **Go to Customer Portal administration page**—Click to open the Customer Portal Administration site.

Basic pages

The following pages are described in this document.

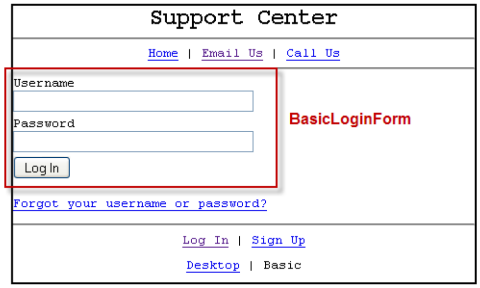
- Login page
- Create an Account page
- Account Assistance page
- Home page
- Search results page
- Answer details page
- Answer feedback page
- Email Us page
- Account Overview page

- Account Settings page
- Questions list page
- Question details page
- Change Password page

The BasicFormStatusDisplay widget is included on the pages that let customers enter and submit information in a form. This widget is not visible on the page but is used to display status and error messages based on form inputs.

Login page

The login page contains a simple form for entering the user name and password to log in to your customer portal. When customers log in, they are redirected to the page they were on before they logged in (unless you redirect them to a different page). The BasicLoginForm widget appears on this page. Customers can also click the Forgot Your Username or Password? link to be directed to the Account Assistance page where they can request their user name or reset their password. You can change the labels for user name, password, and the Log In button.



To edit labels on the Login page

1 Open the *login_form.php* file in the */views/pages/basic/utils* folder.

2 Locate the following line of code.

```
<rn:widget path="login/BasicLoginForm"/>
```

3 To change the Username label, add the *label_username* attribute to the BasicLoginForm widget. Your code will resemble the following.

```
<rn:widget path="login/BasicLoginForm"
label_username="New Username"/>
```

4 To change the Password label, add the *label_password* attribute to the BasicLoginForm widget. Your code will resemble the following.

```
<rn:widget path="login/BasicLoginForm"
label_password="New Password"/>
```

5 To change the Log In label on the button, add the *label_login_button* attribute to the BasicLoginForm widget. Your code will resemble the following.

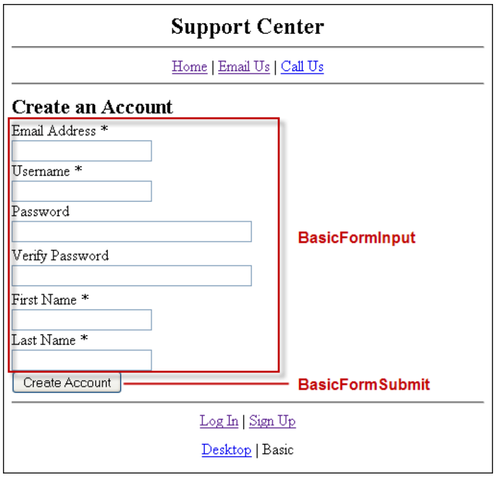
```
<rn:widget path="login/BasicLoginForm"
label_login_button="New Log In" />
```

6 Save *login_form.php*.

Create an Account page

When customers who are not logged in click the Sign Up link at the bottom of a page, the Create an Account page opens. This page contains the following widgets.

- **BasicFormStatusDisplay**—Appears only if status and error messages are displayed.
- **BasicFormInput**—Lets customers enter their email address, user name, password, and first and last names.
- **CustomDisplayAll**—Displays input fields for any contact custom fields with end-user visibility.
- **BasicFormSubmit**—Displays the Create Account button.



To edit the Create an Account page

1 Open the *create_account.php* file in the */views/pages/basic/utils* folder.

2 To edit the Create an Account page heading, locate the following code.

```
<h1>#rn:msg:CREATE_AN_ACCOUNT_CMD#</h1>
```

Replace the text between the `<h1>` markers. Your code will resemble the following.

```
<h1>Your New Create an Account Heading</h1>
```

3 To change the label for any of the input fields (Email Address, Username, Password, First Name, and Last Name), edit the *label_input* attribute for the corresponding BasicFormInput widget. For example, to edit the Username label, your edited code will resemble:

```
<rn:widget path="input/BasicFormInput"
name="Contact.Login"
required="true"
label_input="Login Name"/>
```

4 To add a field to the page, decide where you want to locate the field on the page, identify its database name (refer to Input and output widgets), and add the necessary code. For example, to add a phone number field after the customer’s last name, you would add a line such as the following immediately below the BasicFormInput for Contact.Name.Last. Notice that there are two last name widgets in the page code, one in conditional tags for international conventions. You will probably want to add the phone number field after each of them.

```
<rn:widget path="input/BasicFormInput"
name="Contact.Phones.MOBILE.Number"
label_input="Mobile Phone Number"/>
```

5 To remove a field, delete its associated line of code. For example, if your customers use their email address as their login, you could remove the following line of code.

```
<rn:widget path="input/BasicFormInput"
name="Contact.Login"
required="true"
label_input="Login Name"/>
```

6 Save *create_account.php*.

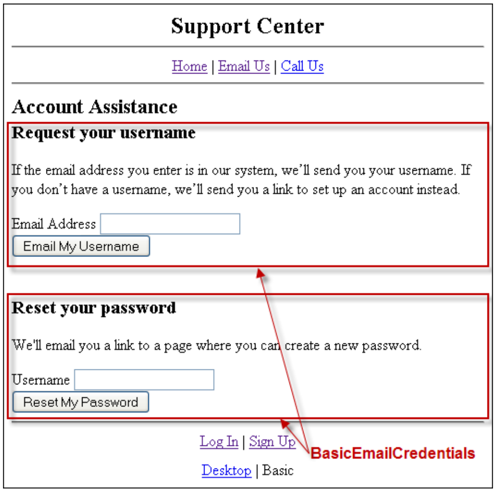
Account Assistance page

When customers click the Forgot Your Username or Password? link on the login page, they are directed to the Account Assistance page where they can request their user name or reset their password. The page contains the following widgets.

- **BasicFormStatusDisplay**—Appears only if status and error messages are displayed.
- **BasicEmailCredentials**—Lets customers retrieve their user name or reset their password.

When customers enter their email address and click the Email My Username button, their user name is sent to that address if it exists in the knowledge base. If no record of the customer's email address exists in the knowledge base, they will be sent a link to set up an account instead.

If customers know their user name but not their password, they can enter the user name and click Reset My Password. An email containing a link to reset the password will be sent to the email address associated with the user name that was entered.

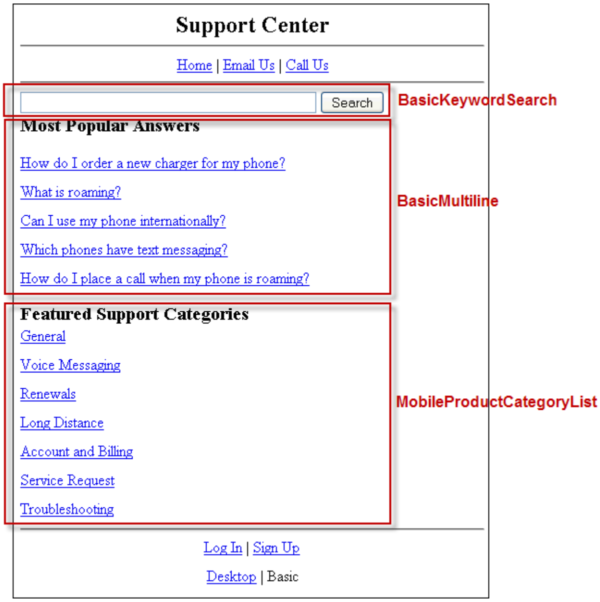


Home page

The home page contains a search field, a list of the five most popular answers, and featured support categories. Widgets on this page include the following.

- **BasicKeywordSearch**—Lets customers enter search terms to find the information they need.
- **BasicMultiline**—Displays the top five frequently viewed answers.
- **MobileProductCategoryList**—Displays a list of categories that can be used as search filters.

Your customers have several options for finding information from the home page. They can enter a search term in the field on the home page and click the Search button to open the search results page, which displays all the answers that match their search term. They can select an answer directly from the Most Popular Answers report, which opens the answer details page for that answer. Or they can browse answers related to one of the listed categories by clicking a category and viewing all answers related to that category.



To edit the home page

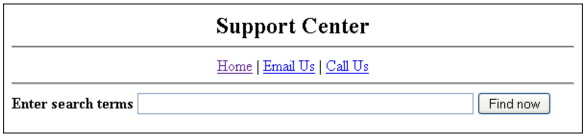
1 Open the *home.php* file in the */views/pages/basic/* folder.

2 To edit the search field, locate the following code.

```
<rn:widget path="search/BasicKeywordSearch"
label_text=""
report_page_url="/app/answers/list"/>
```

You can add a label to the search field and change the label of the Search button. Your code will resemble the following.

```
<rn:widget path="search/BasicKeywordSearch"
label_text="Enter search terms"
label_button="Find now"
report_page_url="/app/answers/list"/>
```

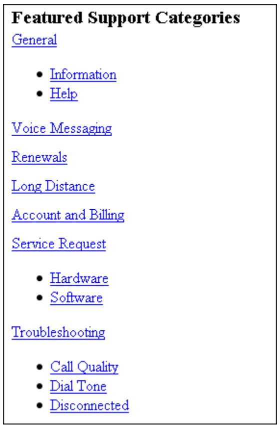


3 To change the number of answers displayed under Most Popular Answers from the default of five, locate the following line of code and edit the *per_page* attribute to the value you want.

```
<<rn:widget path="reports/BasicMultiline"
report_id="194"
per_page="5"/>
```

4 To display a second level of Featured Support Categories for those categories that have sub-levels, locate the following line of code and delete `levels="1"`. (Because 2 is the default value for the *levels* attribute, the widget defaults to that value when no level is defined.)

```
<rn:widget path="search/MobileProductCategoryList"
data_type="categories"
levels="1" label_title=""/>
```



5 To display products instead of categories, locate the following line of code and delete `data_type="categories"`. (Because products are the default value for the *data_type* attribute, the widget defaults to that value when no data type is defined.)

```
<rn:widget path="search/MobileProductCategoryList"
levels="1"
label_title=""/>
```

Now edit the title of the list by changing the `<h2>` line immediately above the code for the MobileProductCategoryList widget to the following.

```
<h2>#rn:msg:FEATURED_SUPPORT_PRODUCTS_LBL#</h2>
```

6 Save *home.php*.

Search results page

The search results page includes a search field and the ability to limit the returned answers by **product** or **category**. Customers reach this page by entering a search term on the home page or by selecting one of the listed categories (or products), also on the home page. The widgets on the search results page include the following.

- **BasicProductCategorySearchFilter**—Lets customers filter search results by product and category. The page contains two instances of this widget, one for products and one for categories.
- **BasicKeywordSearch**—Lets customers enter search terms to find the information they need.
- **BasicDisplaySearchFilters**—Displays the product and category filters selected by the customer.
- **BasicResultInfo**—Displays the number of search results.
- **BasicMultiline**—Displays the report containing all answers returned from the search.
- **BasicPaginator**—Lets customers move to a different page of search results when more than one page is required to display all returned answers.

To edit the search results page

1 Open the *list.php* file in the */views/pages/basic/answers* folder.

2 To edit the search field, locate the following code.

```
<rn:widget path="search/BasicKeywordSearch" label_text=""/>
```

You can add a label to the search field and change the label of the Search button as was shown on the home page in To edit the home page. Your code will resemble the following.

```
<rn:widget path="search/BasicKeywordSearch"
label_text="Enter search terms"
label_button="Find now"/>
```

3 To remove the link that lets your customers filter answers by product, delete the following line of code.

```
<a href="/app/answers/list/selectFilter/product/#rn:url_param:c#/
#rn:url_param:kw##rn:session#">#rn:msg:LIMIT_BY_PRODUCT_LBL#</a><br/>
```

4 To remove the link that lets your customers filter answers by category, delete the following line of code.

```
<a href="/app/answers/list/selectFilter/category/#rn:url_param:p#/
#rn:url_param:kw##rn:session#">#rn:msg:LIMIT_BY_CATEGORY_LBL#</a>
```

5 To change the labels on the selected product and category filters from All Products and All Categories, add the *label_all_products* and *label_all_categories* attributes to the widget, setting their values to the labels you want. Your code will resemble the following.

```
<rn:widget path="search/BasicDisplaySearchFilters"
label_all_products="Selected Product Filter"
label_all_categories="Selected Category Filter"/>
```

6 To remove the display of the selected product and category filters, delete the following line of code.

```
<rn:widget path="search/BasicDisplaySearchFilters" />
```

Note Deleting this code deletes the display of both product and category filters.

7 To change the number of displayed answers on the search results page from the default value of ten answers per page, locate the code for the BasicMultiline widget and add the *per_page* attribute, setting its value to the number of answers you want to display. You also need to add the same attribute and value to the BasicResultInfo widget. Your code will resemble the following.

```
<rn:widget path="reports/BasicResultInfo"
per_page="5"/>
<rn:widget path="reports/BasicMultiline"
per_page="5"/>
```

8 To display more or fewer characters of an answer than the default value of 100, add the *truncate_size* attribute to the BasicMultiline widget and set its value to the number of characters you want to display. Your code will resemble the following.

```
<rn:widget path="reports/BasicMultiline"
truncate_size="50" />
```

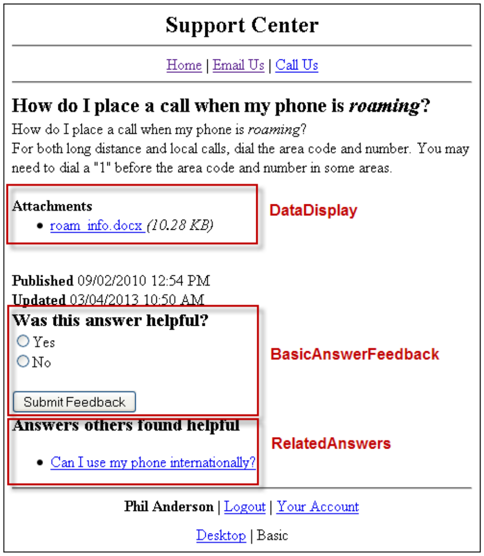
9 Save *list.php*.

Answer details page

When a customer selects an answer from the Most Popular Answers report on the home page or from the list of answers on the search results page, the answer details page opens. This page displays the answer content, any **file attachments** the answer might contain, the dates the answer was first published and last updated, an answer feedback section, and a list of additional answers that other customers found helpful after viewing the displayed answer.

The widgets on the answer details page include the following.

- **BasicFormStatusDisplay**—Appears only if status and error messages are displayed.
- **DataDisplay**—Displays any file attachments associated with the answer.
- **BasicAnswerFeedback**—Lets customers submit feedback on the answer.
- **RelatedAnswers**—Lists answers other customers found helpful.



To edit the answer details page

1 Open the *details.php* file in the */views/pages/basic/answers* folder.

2 To edit the date labels, locate the following lines of code.

```
<b>#rn:msg:PUBLISHED_LBL#</b> <rn:field name="Answer.CreatedTime"/>
<br />
<b>#rn:msg:UPDATED_LBL#</b> <rn:field name="Answer.UpdatedTime" />
```

```
<br />
```

Change the labels to the names you choose. Your code will resemble:

```
<b>First published on</b> <rn:field name="Answer.CreatedTime"/>
<br />
<b>Last edited on</b> <rn:field name="Answer.UpdatedTime" />
<br />
```

3 To remove the date labels, delete the code you located in step 2.

4 To edit the file attachments display, locate the following line of code.

```
<rn:widget path="output/DataDisplay"
name="Answer.FileAttachments"
left_justify="true"
label="#rn:msg:ATTACHMENTS_LBL#"/>
```

a To remove the file attachments display, delete the line of code you located. Also delete the preceding `<div>` and following `</div><br />` tags.

b To change the Attachments label, change the *label* attribute to `label="New Attachment Name."`

c To sort the file attachment list alphabetically, add the *sort_by_filename* attribute to the DataDisplay widget. Your code will look like:

```
<rn:widget path="output/DataDisplay"
name="Answer.FileAttachments"
left_justify="true"
label="#rn:msg:ATTACHMENTS_LBL#"
sort_by_filename="true"/>
```

d To remove the file size information, add the *display_file_size* attribute and set it to false. Your code will look like:

```
<rn:widget path="output/DataDisplay"
name="Answer.FileAttachments"
left_justify="true"
label="#rn:msg:ATTACHMENTS_LBL#"
display_file_size="false"/>
```

5 To edit the answer feedback section of the page, locate the following line of code.

```
<rn:widget path="feedback/BasicAnswerFeedback"
on_success_url="/app/answers/submit_feedback"/>
```

a To change the “Was this answer helpful?” question, add the *label_title* attribute to the BasicAnswerFeedback widget and set it to the value you want. Your code will look like this example.

```
<rn:widget path="feedback/BasicAnswerFeedback"
on_success_url="/app/answers/submit_feedback"
label_title="Let us know if this answered your question." />
```

b To add multiple feedback options beyond Yes and No, add the *options_count* attribute to the widget code, similar to the following.

```
<rn:widget path="feedback/BasicAnswerFeedback"
on_success_url="/app/answers/submit_feedback"
options_count="5"/>
```

c To edit the label on the Submit Feedback button, add the *label_submit_button* attribute to the widget so that your code resembles the following.

```
<rn:widget path="feedback/BasicAnswerFeedback"
on_success_url="/app/answers/submit_feedback"
label_submit_button="New Submit Button" />
```

d To remove answer feedback, delete the code you located in step 5.

6 To remove related answers (the answers that have been manually associated to the open answer by a staff member or automatically associated through other customer searches), delete the following line of code.

```
<rn:widget path="knowledgebase/RelatedAnswers" />
```

7 To change the maximum number of displayed answers from the default value of five, add the *limit* attribute. Your code will resemble the following.

```
<rn:widget path="knowledgebase/RelatedAnswers"
limit="3" />
```

8 Save *details.php*.

Answer feedback page

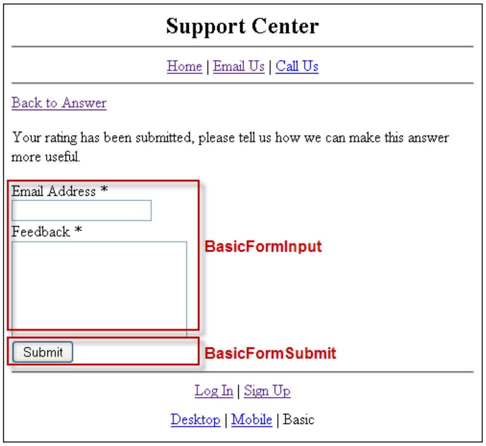
Customers can submit their feedback regarding an answer on the answer details page. The BasicAnswerFeedback widget asks if the answer was helpful. If the customer responds Yes and clicks the Submit Feedback button, a message appears at the top of the page to confirm that the feedback was submitted successfully.

If the customer replies No and clicks the Submit Feedback, the feedback is submitted and the answer feedback page opens. Customers are asked for an email address (unless they are already logged in) and for feedback that would make the answer more useful. Clicking the Submit button then results in the successful feedback confirmation message.

The widgets on the answer feedback page include the following.

- **BasicFormStatusDisplay**—Appears only if status and error messages are displayed.
- **BasicFormInput**—Lets customers enter their feedback and, if they are not logged in, their email address.
- **BasicFormSubmit**—Displays the Submit button.

Configuring the BasicAnswerFeedback widget was covered in step 5 of To edit the answer details page.

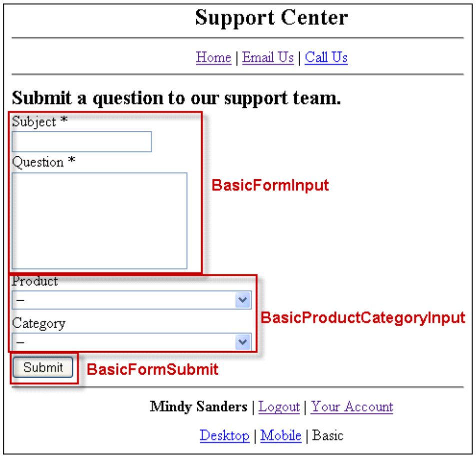


Email Us page

When your customers click the Email Us link, the page to submit a question opens. Logged-in customers enter the subject and text of their question, while customers who are not logged in also complete their email address.

All customers have the option to select a top-level **product** and **category** related to their question. You can also define a workflow that walks customers through the process of selecting specific sub-products and sub-categories before submitting a question. This can be helpful when your organization has large numbers of products and categories and you want to be sure their question gets directed to the appropriate support staff. Refer to Selecting multiple levels of products and categories.

Additionally, you can use **SmartAssistant** to suggest answers to your customers before they finish submitting their question. Customers who find answers to their question before submitting an incident have the satisfaction of an immediate solution. You have the benefit of assigning more complex questions to your agents because common questions are handled without agent intervention. Refer to Configuring SmartAssistant.



The following widgets appear on the page for submitting a question.

- **BasicFormStatusDisplay**—Appears only if status and error messages are displayed.
- **BasicFormInput**—Lets customers enter their email address, subject, and question.
- **BasicProductCategoryInput**—Lets customers select the associated product and category on the ask a question page.
- **BasicCustomAllInput**—Displays input fields for incident custom fields with end-user visibility.
- **BasicFormSubmit**—Displays the Submit button.

To edit the submit a question page

1 Open the *ask.php* file in the */views/pages/basic/* folder.

2 To delete the Subject field when customers are not logged in, delete the following line of code. (When you delete the Subject field on the customer portal page, the first 80 characters of the question field are used to populate the Subject field on the Service Console.)

```
<rn:widget path="input/BasicFormInput"
name="Incident.Subject"
required="true"
label_input="#rn:msg:SUBJECT_LBL#"/>
```

3 To delete the Subject field when customers are logged in, delete the following lines of code.

```
<rn:condition logged_in="true">
```

```
    <rn:widget path="input/BasicFormInput"
    name="Incident.Subject"
    required="true"
    label_input="#rn:msg:SUBJECT_LBL#"/>
</rn:condition>
```

4 To require the selection of a product or category, add the *required* attribute to the corresponding widget.

   a To require product selection, change the code to the following.

   ```
   <rn:widget path="input/BasicProductCategoryInput"
   name="Incident.Product" required="true"/>
   ```

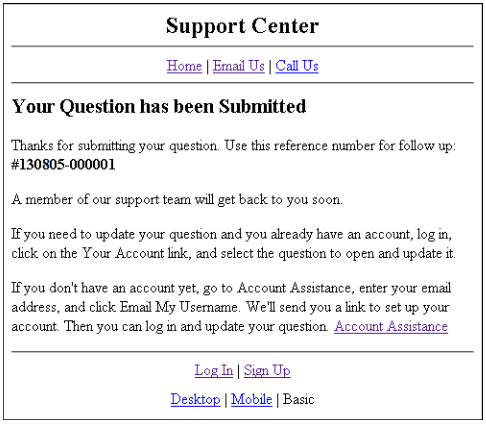
   b To require category selection, change the code to the following.

   ```
   <rn:widget path="input/BasicProductCategoryInput"
   name="Incident.Category" required="true"/>
   ```

5 Save *ask.php*.

Confirmation page

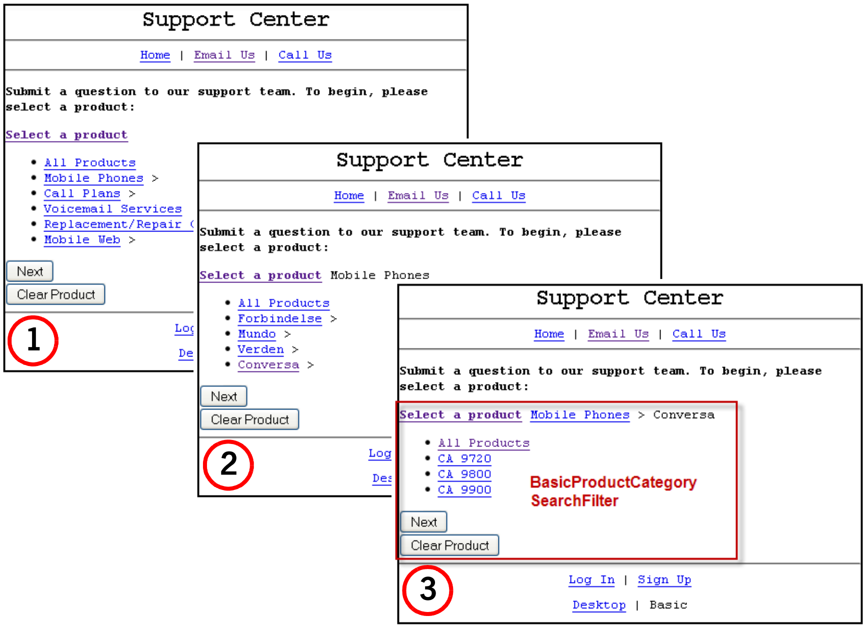
After customers submit their question, a confirmation page (*/views/pages/basic/ask_confirm.php*) opens to notify them of the incident reference number that was created by their question.



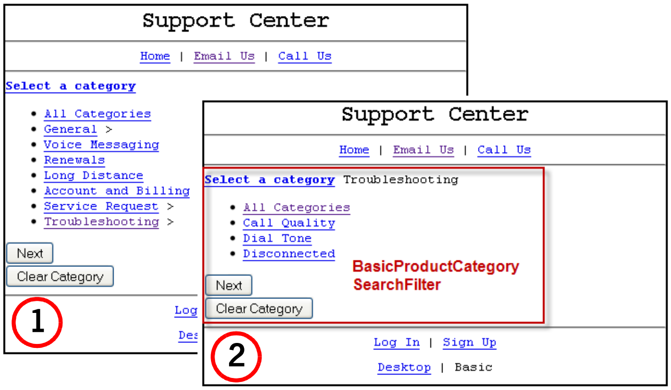
Selecting multiple levels of products and categories

While the reference implementation of the basic page set lets your customers select a top-level product and category when they submit their question, you may prefer to lead them through a sequence of product and category sub-levels to ensure that questions are sent to the appropriate support staff. A workflow based on product/category hierarchy also enforces **product-category linking** if your site supports that feature. (Refer to Product linking to learn about that feature.)

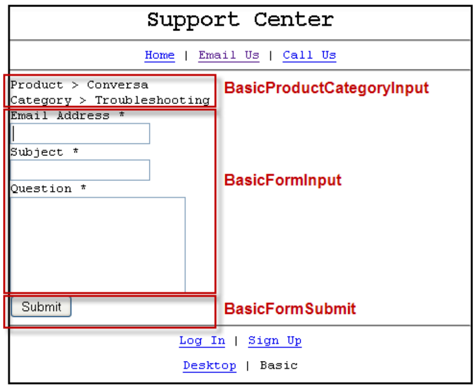
Here's what the workflow looks like: The first page that opens when the Email Us link is clicked asks customers to select a product. If the product has sub-products, they can select a sub-product and one of its sub-products as well. This workflow helps your support staff respond to customer questions more quickly and efficiently when they know the product and category before responding.



When there are no more sub-products or when customers click Next, they are asked to select a category and, if they choose, sub-categories.



When customers click Next on the category selection page, the question page opens to display the customer's product and category selections, the Subject and Question fields, and any custom incident fields in use on your site. If customers are not logged in, the Email Address field also appears.



The following procedure describes how to implement this workflow.

To create a workflow with multiple levels of product and category selections

1 Open the *ask.php* file in the */views/pages/basic/* folder.

2 Delete the following line of code.

```
<h1>#rn:msg:SUBMIT_QUESTION_OUR_SUPPORT_TEAM_CMD#</h1>
```

3 Add the following lines of code in place of the code you deleted in step 2.

```
<rn:condition url_parameter_check="prodSelected == null">
    <p><b>#rn:msg:SUBMIT_QUEST_SUPPORT_TEAM_BEG_PLS_MSG#</b></p>

    <rn:widget path="search/BasicProductCategorySearchFilter"
        report_page_url="/app/ask/prodSelected/1"
        clear_filters_page_url="/app/ask"
        label_search_button="#rn:msg:NEXT_LBL#"/>

<rn:condition_else/>

    <rn:condition url_parameter_check="catSelected == null">
        <rn:widget path="search/BasicProductCategorySearchFilter"
            report_page_url="/app/ask/prodSelected/1/catSelected/1"
            clear_filters_page_url="/app/ask"
            filter_type="categories"
            label_search_button="#rn:msg:NEXT_LBL#"
            label_clear_filters_button="#rn:msg:CLEAR_CATEGORY_CMD#"/
            >

    <rn:condition_else/>
```

4 Locate the following line of code.

```
<rn:form post_handler="postRequest/sendForm">
```

5 Add the following lines of code below the code you located in step 4.

```
    <rn:widget path="input/BasicProductCategoryInput"
    name="Incident.Product" read_only="true"
    label_input="#rn:msg:PRODUCT_LBL# &gt; "/>
    <rn:widget path="input/BasicProductCategoryInput"
    name="Incident.Category" read_only="true"
    label_input="#rn:msg:CATEGORY_LBL# &gt; "/>
```

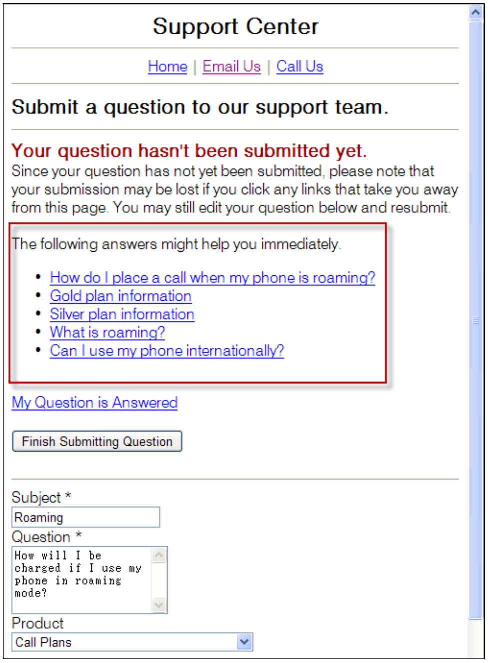
6 Add the following code as the last two lines of the file.

```
    </rn:condition>
</rn:condition>
```

7 Save *ask.php*.

Configuring SmartAssistant

By default, the BasicSmartAssistant widget is included on the Email Us page. SmartAssistant-suggested answers appear on the page containing the question form completed by the customer. If you already have SmartAssistant configured on the Service Console, it is also available on the basic page set. If you need to set up SmartAssistant, refer to Using SmartAssistant on the Ask a Question page. The following figure shows the BasicSmartAssistant widget.



The default Email Us page uses a condition tag to determine whether the answers are displayed when the customer clicks the Submit button, or whether the confirmation page appears immediately. The conditions on the default page are two answers viewed or one search conducted, which means that customers who have viewed at least two answers or conducted one search prior to submitting their question will not see SmartAssistant-suggested answers. You can change the conditions that allow display of the BasicSmartAssistant widget.

If you remove the condition tags around the widget, it will always propose answers to your customers before they can finish submitting their question, regardless of the number of answers they've viewed or searches they've conducted.

Note After the SmartAssistant response is displayed, customers can no longer change the product or category on their question.

To change the answers viewed or searches done condition

1 Open the *ask.php* file in the */views/pages/basic* folder.

2 Locate the following line of code.

```
<rn:condition answers_viewed="2" searches_done="1">
```

3 Edit the code to either delete or change the value of the *answers_viewed* or *searches_done* attributes. If, for example, you want to change the number of answers viewed and remove the requirement to perform a search, your code will resemble the following.

```
<rn:condition answers_viewed="3">
```

4 Save *ask.php*.

To remove conditions for the BasicSmartAssistant widget

1 Open the *ask.php* file in the */views/pages/basic* folder.

2 Locate the following lines of code.

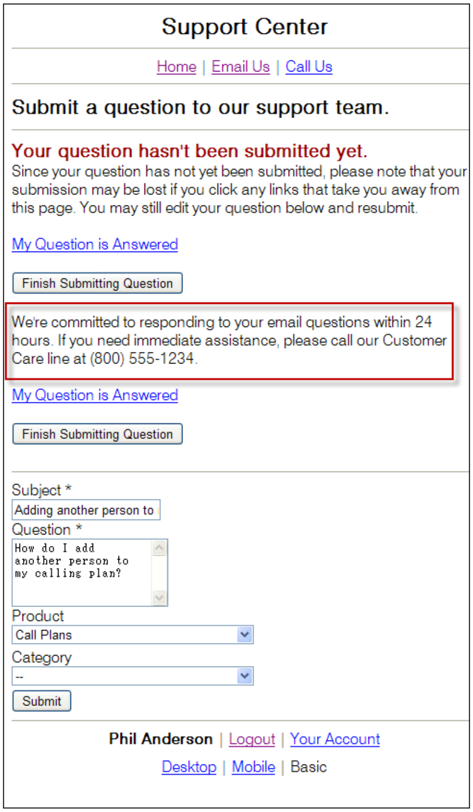
```
<rn:condition answers_viewed="2" searches_done="1">
<rn:condition_else/>
    <rn:widget path="input/BasicSmartAssistant"/>
</rn:condition>
```

3 Delete the two lines of code beginning with `<rn:condition` and the `</rn:condition>` line. All that should remain is the code that calls the SmartAssistantDialog widget.

4 Save *ask.php*.

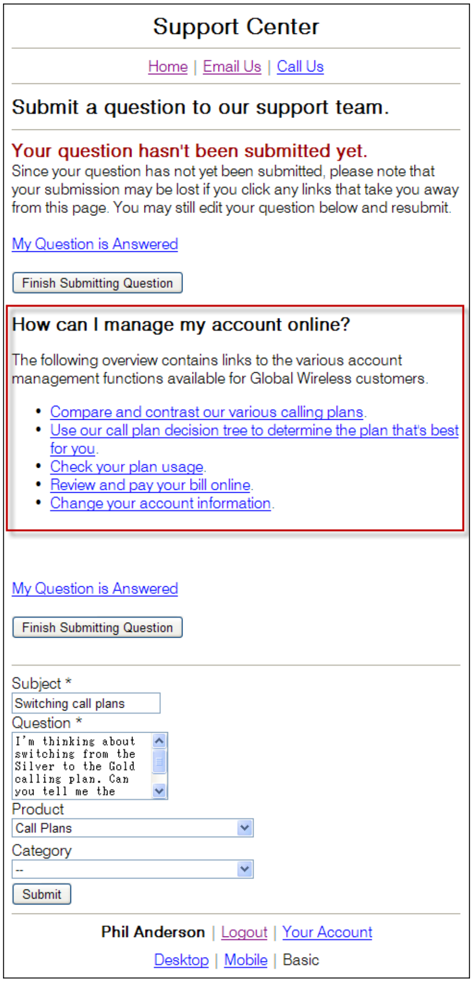
Appending standard text

You can also use a SmartAssistant rule to display a **standard text** message to your customers, either by itself or in conjunction with SmartAssistant-suggested answers, by setting the rule action to Append Thread > Append Response Template to Response Field. (Refer to Actions for incident rules.) The following figure shows an example of a standard text message display.



Appending an answer from the knowledge base

You may decide to create a rule that opens a specific answer from your knowledge base whenever the customer's product or category selection matches the rule condition. For example, you could display an answer with links to various account management features whenever customers select the Call Plans, Long Distance, or Account and Billing products or categories. To append an answer, set the rule action to Append Thread > Append Existing Solution (by Answer ID) to Response Field. (Refer to Actions for incident rules.) The results resemble the following figure.



Account Overview page

When customers are logged in, they can click the Your Account link in the page footer to open the Account Overview page. There they will see a list of their most recently submitted questions, including the subject, reference number, resolution, and date created. The page also displays links to all questions submitted by the customer, the page for updating account settings, and the change password page. The Account Overview page includes the BasicMultiline widget, which displays a list of up to four of the customer's most recently submitted questions.

To edit the Account Overview page

1 Open the *overview.php* file in the */views/pages/basic/account* folder.

2 To change the Account Overview heading, locate the `<h1>` heading line and replace the message base with your new heading. Your code will resemble the following.

```
<h1>Your New Heading</h1>
```

3 To change the Questions heading or Settings heading, locate the `<h2>` tags and replace the message bases with your new headings.

4 To change the maximum number of answers listed on the page from the default of four, locate the following code for the BasicMultiline widget and change the *per_page* attribute to the value you want.

```
<rn:widget path="reports/BasicMultiline"
report_id="196"
per_page="4"/>
```

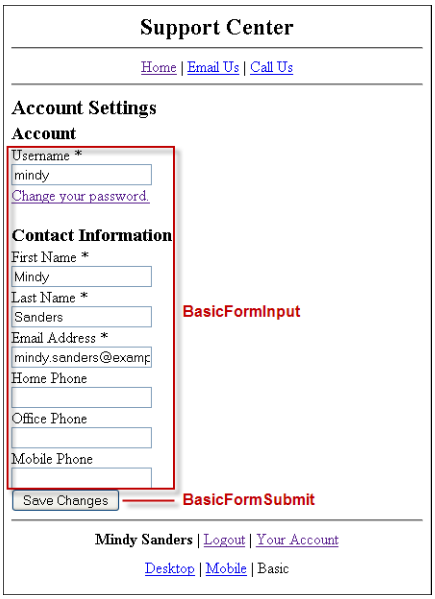
5 Save *overview.php*.

Account Settings page

Customers can update their account on the Account Settings page, accessed by clicking Your Account at the bottom of any page to open the Account Overview page and then clicking Update Your Account Settings.

The following widgets appear on the Account Settings page.

- **BasicFormStatusDisplay**—Appears only if status and error messages are displayed.
- **BasicFormInput**—Lets customers enter their user name, first name, last name, email address, street, city, state or province, postal code, country, and home, office, and mobile phone number fields. For information about the state/province field, refer to Defining the State/Province field.
- **BasicCustomAllInput**—Lets customers enter any contact custom fields with end-user visibility.
- **BasicFormSubmit**—Displays the Submit button.



To edit the Account Settings page

1 Open *profile.php* in the */views/pages/basic/account* folder.

2 To edit the Account Settings page title, locate the following code, remove the message base, and enter the new heading between the `<h1>` tags.

```
<h1>#rn:msg:ACCOUNT_SETTINGS_LBL#</h1>
```

3 To add input fields so customers can enter their address, add the following code wherever you want the fields to appear on the Account Settings page.

```
<rn:widget path="input/BasicFormInput"
name="Contact.Address.Street"
label_input="#rn:msg:STREET_LBL#"/>
<rn:widget path="input/BasicFormInput"
name="Contact.Address.City"
label_input="#rn:msg:CITY_LBL#"/>
<rn:widget path="input/BasicFormInput"
name="Contact.Address.Country"
label_input="#rn:msg:COUNTRY_LBL#"/>
<rn:widget path="input/BasicFormInput"
name="Contact.Address.StateOrProvince"
label_input="#rn:msg:STATE_PROV_LBL#"/>
<rn:widget path="input/BasicFormInput"
name="Contact.Address.PostalCode"
label_input="#rn:msg:POSTAL_CODE_LBL#" />
```

Note By default, the State/Province field does not appear until after the Country field has been submitted. Refer to Defining the State/Province field.

4 Save *profile.php*.

Defining the State/Province field

If you decide to add address fields on the Account Settings field as described in step 3 of To edit the Account Settings page, you'll need to understand the relationship between the State/Province field and the Country field. Additionally, phone number masks may be affected by the selected country.

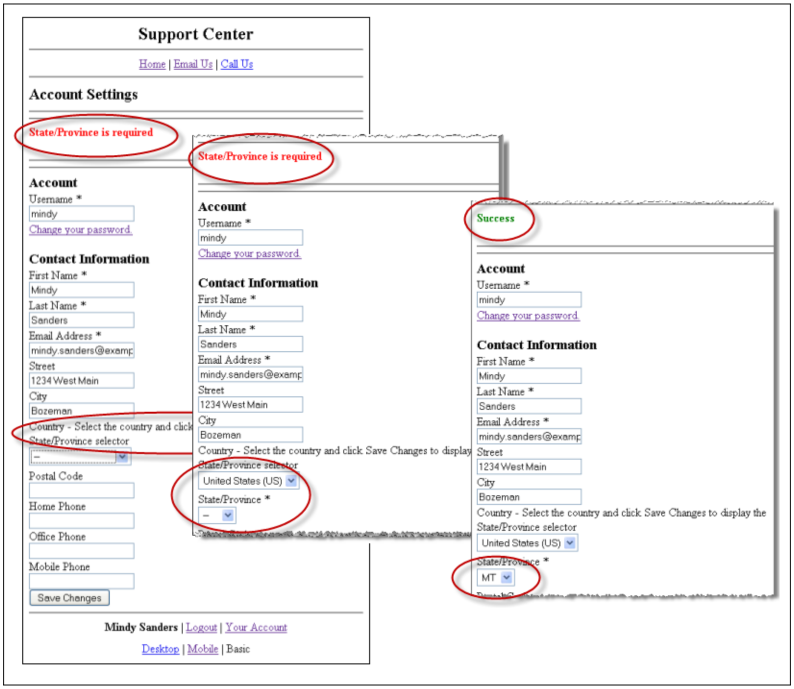
Note The same relationships exist on the Create an Account page.

By default, the State/Province drop-down menu is not displayed until a country is selected from the Country drop-down menu and the customer submits the change. At that point, the State/Province drop-down is available, but it's possible that customers will not notice it after submitting the rest of their address information. In that case, you could end up with a contact record in your knowledge base that includes all address information except the state or province.

To prevent this situation, you might add the *required* attribute to the BasicFormInput widget for the State/Province field so that customers must make a selection before the account settings are changed. However, the State/Province option is not available until they select the country information and click Submit. It's a good idea to add a hint on the page so that your code resembles the following.

```
<rn:widget path="input/BasicFormInput"
name="Contact.Address.Country"
label_input="#rn:msg:COUNTRY_LBL#"
hint="Select the country and click Save Changes to display the State/
Province selector."/>
<rn:widget path="input/BasicFormInput"
name="Contact.Address.StateOrProvince"
label_input="#rn:msg:STATE_PROV_LBL#"
required="true" />
```

The following figure illustrates the sequence when a customer enters street address information after editing the code. First, the customer completes the address information for the fields that appear on the page, but the State/Province selector is not yet available. When the customer clicks Save Changes, the page refreshes, the State/Province field appears, and a warning at the top of the page indicates that it's a required field. When the customer selects a state and clicks Save Change, the page refreshes and a Success message appears at the top of the page.



Using masks to format phone numbers

If you are using masks to ensure correct phone number formatting, you'll need to follow a similar procedure to make the country required. When the customer saves the changes, the mask requirement then applies to the page, and the customer will be required to use the mask formatting to enter the phone number. (Refer to Input masks.)

Questions list page

When customers click the See All Questions link on the Account Overview page, the questions list page opens. The page displays all questions submitted by the customer, including the subject, incident reference number, resolution, and date it was created. The page also offers a Search field and the ability to filter questions by product and category. The following widgets are used on the questions list page.

- **BasicProductCategorySearchFilter**—Lets customers filter their questions by product and category. The page contains two instances of this widget, one for products and one for categories.

- **BasicKeywordSearch**—Lets customers enter search terms to find the questions they are looking for.
- **BasicDisplaySearchFilters**—Displays any product and category filters selected by customers to filter their questions.
- **BasicResultInfo**—Displays the number of questions that match the search term and filters.
- **BasicMultiline**—Displays the list of questions in multiline report format.
- **BasicPaginator**—Lets customers move to a different page of questions when more than one page is required to display all returned results.

To edit the questions list page

1 Open the *list.php* file in the */views/pages/basic/account/questions* folder.

2 To remove the search field from the page, delete the following lines of code.

```
<h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
<rn:widget path="search/BasicKeywordSearch" label_text=""/>
```

3 To remove search filters that restrict the list of incidents to a specific product and category, delete the following lines of code.

```
<div>
    <a href="/app/account/questions/list/selectFilter/product/
    #rn:url_param:c#/
    #rn:url_param:kw##rn:session#">#rn:msg:LIMIT_BY_PRODUCT_LBL#</
    a><br/>
    <a href="/app/account/questions/list/selectFilter/category/
    #rn:url_param:p#/
    #rn:url_param:kw##rn:session#">#rn:msg:LIMIT_BY_CATEGORY_LBL#</a>
</div>
<rn:widget path="search/BasicDisplaySearchFilters" />
```

4 To display more or fewer incidents, locate the code for the BasicMultiline widget and add the *per_page* attribute, setting its value to the maximum number of incidents to be displayed.

```
 <rn:widget path="reports/BasicMultiline"
per_page="3"/>
```

5 Save *list.php*.

Question details page

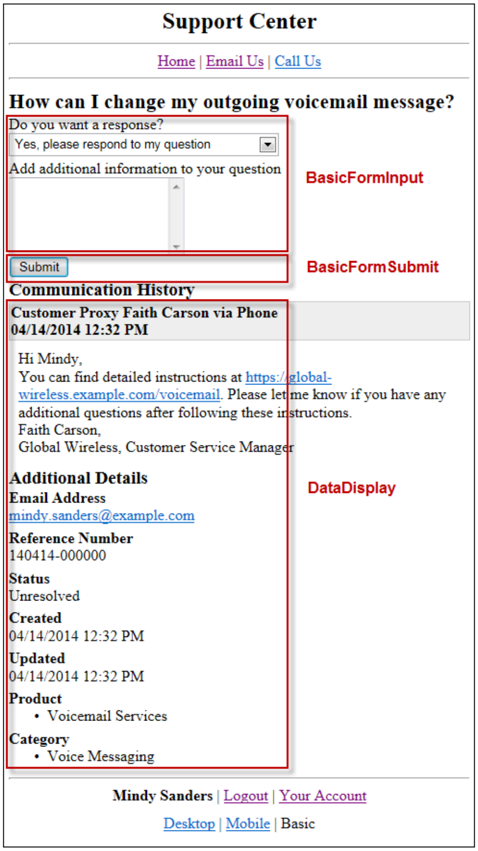
When customers click one of the questions they've submitted on either the questions list or the Account Overview page, the question details page opens. This page lets customers update their question, view the incident thread related to the question, and displays additional details about the incident that was created by the question.

Whenever customers respond to the "Do you want a response?" question with "Yes, please respond to my question," they must complete the Add Additional Information to Your Question field before submitting their request to prevent an error message from being displayed.

The following widgets are included on the question details page.

- **BasicFormStatusDisplay**—Appears only if status and error messages are displayed.

- **BasicFormInput**—Lets customers enter information in the question thread and request a response.
- **BasicFormSubmit**—Displays the Submit button.
- **DataDisplay**—Displays the previous incident thread information, the customer's email address, and information about the incident, including the reference number, status, dates it was created and last updated, its product and category, and any file attachments.
- **CustomAllDisplay**—Displays any incident custom fields with end-user visibility.



To edit the question details page

1 Open the *detail.php* file in the */views/pages/basic/account/questions* folder.

2 To change the details that are displayed on the page, locate the block of code for the DataDisplay widgets.

a To remove an incident field, locate the line of code that displays the field and delete it.

b To add an incident detail, add a line of code for the DataDisplay widget to the block of DataDisplay widgets already on the page. Refer to Business objects to find the names of available incident fields. For example, to add the closed time to an incident, add the following code.

```
<rn:widget path="output/DataDisplay"
name="Incident.ClosedTime"
label="Closed" />
```

3 To prevent customers from solving incidents, delete the following line of code.

```
<rn:widget path="input/BasicFormInput"
name="Incident.StatusWithType.Status"
label_input="#rn:msg:DO_YOU_WANT_A_RESPONSE_MSG#"/>
```

4 To prevent customers from updating closed incidents, locate the following line of code and change `"168"` to `"0"`.

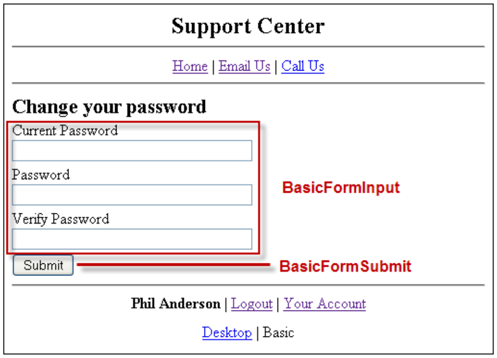
```
<rn:condition incident_reopen_deadline_hours="168">
```

5 Save *detail.php*.

Change Password page

The Change Password page opens when customers click Change Your Password on the Account Overview or Account Settings page. The widgets on this page include the following.

- **BasicFormInput**—Displays the Current Password, Password, and Verify Password fields.
- **BasicFormSubmit**—Displays the Submit button.



To edit the Change Your Password page

1 Open the *change_password.php* file in the */views/pages/basic/account* folder.

2 Locate the following line of code.

```
<rn:widget path="input/BasicFormInput"
name="Contact.NewPassword"
require_validation="true"
require_current_password="true"
label_input="#rn:msg:PASSWORD_LBL#"
label_validation="#rn:msg:VERIFY_PASSWD_LBL#" />
```

3 To enable auto-completion of the password, add `disable_password_autocomplete ="false"` to the code you located in step 2.

4 To remove the Current Password field so that customers need to enter only their new password, delete `require_current_password="true"` from the code you located in step 2.

5 To edit the heading, locate the following line of code and type the new heading between the <h1> tags.

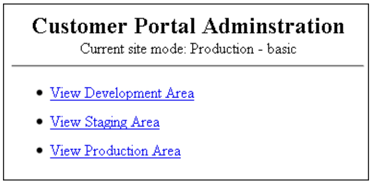
```
<h1>#rn:msg:CHANGE_YOUR_PASSWORD_CMD#</h1>
```

6 Save *change_password.php*.

Administration page

You can use the Customer Portal Administration site with the basic page set. The page lets you set the environment cookie to development, staging, or production.

Note If a staging area has not been created yet, the View Staging Area option does not appear.



Basic widgets

Because the basic page set prevents framework or widget JavaScript from being loaded on the page, the widgets used in the basic implementation also prevent JavaScript from being loaded. The basic template, *basic.php*, includes the meta tag `javascript_module="none"` instead of `javascript_module="standard"` or `javascript_module="mobile."` Most of the basic widgets have a standard widget counterpart from which they are extended.

Basic input widgets

All of the following basic input widgets are extended from standard widgets. Because the basic page set does not have JavaScript to preprocess data in form submissions as the standard page set does, the unique basic input widgets are necessary. Forms are submitted using the standard form submission features of HTML. The `<rn:form>` tag provides server-side validation of input fields and includes the capability to call a function to process the submitted data.

- BasicCustomAllInput
- BasicDateInput
- BasicFormInput
- BasicFormSubmit
- BasicPasswordInput

- BasicProductCategoryInput
- BasicSelectionInput
- BasicTextInput

The BasicFormStatusDisplay widget is used by the basic page set to display status and error messages as necessary when the input data is validated.

The following standard input widgets have no basic counterpart because the functionality produced by these widgets is not available on the basic pages.

- ChannelAllInput
- ContactNameInput
- EmailCheck
- FileAttachmentUpload
- SmartAssistantDialog

Basic login widgets

The following login widgets are included for the basic page set. Each of them has a standard widget counterpart.

- BasicEmailCredentials
- BasicLoginForm
- BasicLogoutLink
- BasicResetPassword

The LoginDialog widget does not have a basic counterpart.

Basic report widgets

The following report widgets are included for the basic page set. Each of them has a standard widget counterpart.

- BasicMultiline
- BasicPaginator
- BasicResultInfo

The Grid report widget does not have a basic counterpart.

Basic search widgets

The following widgets are included for the basic page set. Each of them has a standard widget counterpart.

- BasicDisplaySearchFilters
- BasicKeyword Search
- BasicProductCategorySearchFilter

Basic feedback widget

The BasicAnswerFeedback widget is used to collect customer feedback on individual answers.

CapabilityDetector widget

The CapabilityDetector widget is used on all page sets: standard, mobile, and basic. Refer to Detection of JavaScript capability.

62

Customer Portal Administration

Creating pages and widgets is a significant part of your work on the Oracle RightNow Customer Portal Cloud Service (Customer Portal), but you'll also have administrative tasks, such as setting the environment, viewing logs, and defining **page set mapping**. You can perform all of these tasks on the Customer Portal Administration site, where you can also view reference information about widgets, **business objects**, and widget and page tags.

Opening the Customer Portal Administration page

If you have CP Promote and CP Stage permissions enabled in your **profile**, you can open the Customer Portal Administration site using any of the following methods. If you have only CP Edit permission enabled in your profile, you can open the administration site using either of the first two procedures, but not the third. (Refer to [Assigning permissions](#) if you need help setting permissions.)

Note If your user name contains multi-byte characters, you will not be able to log in to the administration site.

To open the Customer Portal Administration site from a URL

Type `https://<your_site>/ci/admin.` You will be asked for your Oracle Service Cloud user name and password.

To open the Customer Portal Administration site from the file menu

1 Log in to Oracle Service Cloud.

2 Click **File** and select Links.

3 Click Site Administration under Customer Portal. You will be asked for your Oracle Service Cloud user name and password.

4 Type your user name and password and click OK. The Customer Portal Administration site opens in a browser window.

To open the Customer Portal Administration site from the configuration list

1 Log in to Oracle Service Cloud.

2 Click the Configuration button on the **navigation pane**.

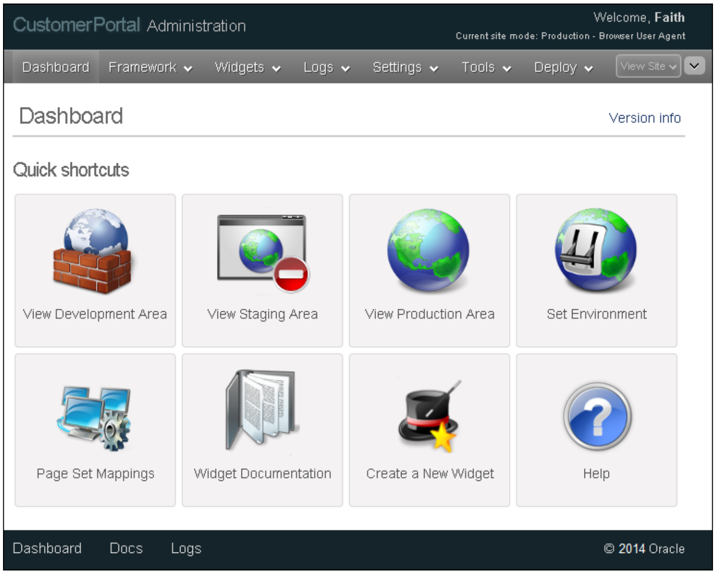
3 Double-click Customer Portal under Site Configuration. The Interfaces tree displays on the content pane.

4 Select the interface in the Interfaces tree.

5 Click Administration Interface on the ribbon. You will be asked for your Oracle Service Cloud user name and password.

6 Type your user name and password and click OK. The Customer Portal Administration site opens in a browser window.

Click to view



The Customer Portal Administration home page contains the following tabs across the top of the page.

- **Dashboard**—Clicking the Dashboard tab returns you to the home page of the Customer Portal Administration site. Click here.
- **Framework**—The Framework drop-down menu includes Framework Versions, Page Tags, Page Meta Tags, and Business Objects. If you have migrated to Customer Portal Framework Version 3.2 from Framework Version 2, the menu also includes the Old Framework Migration option. Clicking the tab opens a page with the same options. Click here.
- **Widgets**—The Widgets tab has a drop-down menu that lets you make the same selections that are on the page that opens when you click the tab: Browse Widgets, Widget Versions, Create a New Widget, Widget Info, and Syndicated Widgets. Click here.
- **Logs**—When you click the Logs drop-down menu or the tab to open the Logs Overview page, you can select WebDAV logs that show all transactions made to site files, debug logs that display problems that occur on the development pages when calling functions, or deployment logs that show a history of deploy operations. Click here.

- **Settings**—Clicking the Settings tab opens a drop-down menu that lets you go to the Page Set Mapping page where you can define specific page sets for different user agents (click here). You can also go to the Set Environment page (click here), preview the splash and error pages (click here), or go to Sandboxed Configurations, which displays the values of selected configuration settings for the development, staging, and production areas (click here).
- **Tools**—Clicking the Tools tab opens the Connect Object Explorer that helps you understand the Connect for PHP API or the Code Assistant that helps you migrate custom code.
- **Deploy**—Clicking the Deploy tab lets you stage, promote, and roll back your customer portal. Refer to Staging, Promoting, and Rolling back.

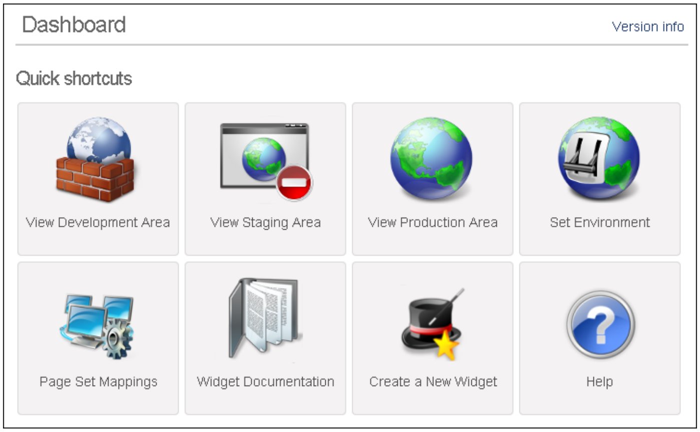
The tab bar on the Customer Portal Administration site also contains a View Site button and a Help button. You might want also want to view the About page.

Dashboard

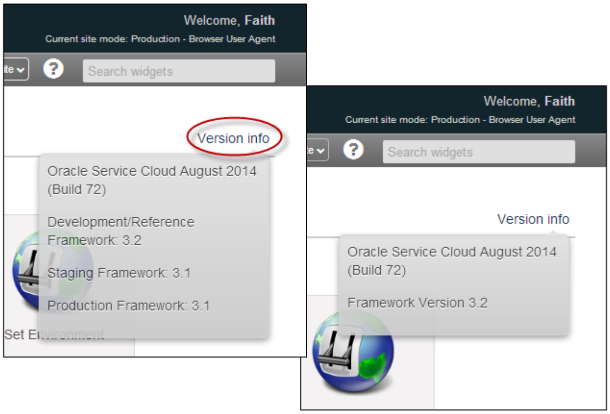
You can access the Customer Portal dashboard from any page of the administration site by clicking the Dashboard tab. The dashboard contains the following shortcuts.

- **View Development Area**—Click this shortcut to view your customer portal pages in development mode so you can evaluate your changes to files as you make them without needing to stage and promote the pages into production. Go here to set the site mode to development. To learn about the *development* folder file structure, click here.
- **View Staging Area**—Click this shortcut to preview your development pages after you have staged them but before you have promoted them to production. To learn about the staging process, click here.
- **View Production Area**—By default, the production area is displayed unless you select the development or staging area. When you are working on a development page, you may want to verify how the page looks and functions on your current production site. In that case, you can click View Production Area. Go here to set the site mode to production. To learn about the *production* folder, click here.
- **Set Environment**—The Set Environment shortcut lets you select the site mode (production, staging, development, or reference implementation) and the page set (standard, mobile, custom page set, or to be determined by the browser or user agent displaying the pages). Refer to Configuring the environment.
- **Page Set Mappings**—With page set mappings, you can define what page set should be displayed when accessed by specific browsers or user agents. This lets you optimize page sets for unique user agents. Refer to Configuring page set mapping.

- **Widget Documentation**—Click the Widget Documentation shortcut to open the Widgets page, which contains links to standard and custom widgets. Refer to Managing widgets.
- **Create a New Widget**—Click this shortcut to open the widget builder, where you can create a custom widget by extending an existing widget or building a new one from scratch. Refer to Widget builder.
- **Help**—Click the Help shortcut to open a page of links to additional resources. Refer to Help button.



In the upper right corner, the dashboard also contains a Version Info link. When you click the link, a window opens to show you what framework version is being used by the development, staging, production, and reference implementation areas. If all areas are using the same framework, the version is listed just once, as shown in the image on the lower right.



Configuring the environment

When you are working on your customer portal, you'll want to preview your pages without making them visible to your customers. Since the same URL (for example, http://<your_site>/app/answers/list) is used to point to pages on both the production and development areas, it is especially important that you display the development pages when you are trying to evaluate your changes. You can set your pages to development mode on the Customer Portal Administration site dashboard.

Important When you work on your development pages, your production site remains untouched until you first stage the development pages and then promote them to production. However, changes you make on the development area have the potential to affect your production data because the development site is connected to the production database. If this is a concern, you can request a **cloned** site by submitting an incident on our support site.

Even though the changes you make to files in the *development* folder affect only the development pages, it's possible to unintentionally make changes that also affect your production site. These include:

- **Editing files (except themes) in the *assets* folder**—The files in the *assets* folder (CSS files and images, as well as other files used on your customer portal) are shared by the development and production sites. If you edit a file used on your production pages, your edits may be visible to customers even before you stage and promote.

Tip You can reduce this risk by creating separate development and production subfolders in the *assets* folder. When making changes to pages and widgets, point to the assets in the development subfolder. When you are ready to stage and promote, you can copy the files to the production subfolder and change the references in your pages and widgets to that folder.

Themes, however, are handled differently and are used only by the development files. When you stage the development pages, the theme files are copied to a time-stamped folder in the staging directory and called by the staged pages from that folder. This lets you keep the themes you develop in an isolated sandbox until you promote the staged pages into production, when these files are copied into the *production* folder. For information about working with themes, click here.

- **Editing message bases, configuration settings, custom reports, and other configuration items**—You risk changing the look or functionality of your production customer portal if you edit message bases, configuration settings, custom reports, or other configuration items (such as products, categories, and custom fields) used by your production pages.

Learn how to set the environment here.

Setting the environment

The Set Environment page of the administration site lets you view different areas of your customer portal. When you select the Development site mode option, you can view the pages on your development site before you've staged and promoted those files into production. Besides Development, the other site mode menu options include:

- **Production**—Displays what your customers see.
- **Staging**—Displays the development pages after you've staged them, but before you have promoted them to production.
- **Reference Implementation**—Displays the Customer Portal pages before you have customized them.

By default, the site mode is set to Production.

Note To simulate an abuse scenario for testing purposes, select the Trigger Abuse Detection check box. The abuse mode applies only to your development pages. For more information, see Simulating abuse situations.

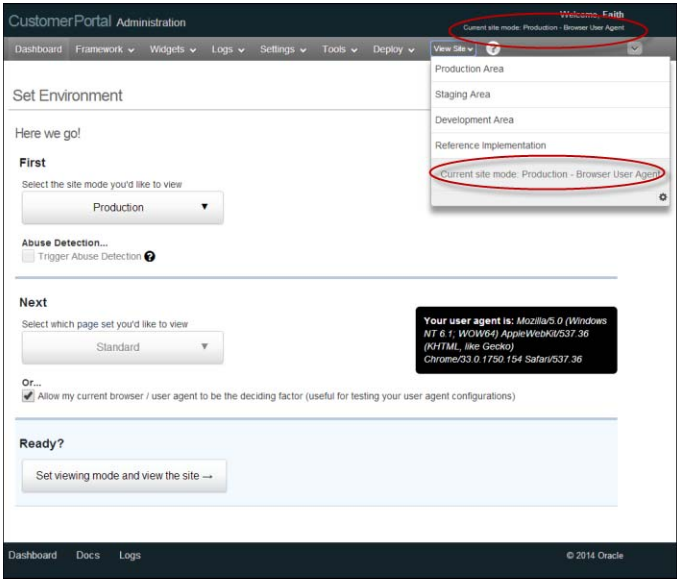
After you've selected the site mode you want to view, you can select the page set you want to display. The page set drop-down menu for selecting the standard, mobile, or basic pages is active only when the check box below the menu is cleared. By default, the check box is selected, which means that the page set is determined by the browser or user agent accessing the pages. As a result, the standard pages are displayed when customers access the customer portal from a desktop browser, the mobile pages are displayed when they access from a mobile device, and the basic pages are displayed when customers have a device with limited JavaScript capability. When this check box is selected, the user agent of your browser is shown on the page.

The default options on the menu include Standard, Mobile, and Basic. (The mobile and basic pages must be enabled before they appear in the menu. Click here to learn how to enable the mobile and basic pages.) Any other page sets you have added on the Page Set Mapping page also appear in the menu. (Refer to User agent mapping to learn how to add page sets.) Selecting Standard displays your standard (non-mobile and non-basic) pages. Selecting Mobile displays the pages associated with your mobile implementation, so you can view your mobile pages on your workstation without a mobile device. Similarly, selecting Basic displays the basic page set on your workstation.

Note To correctly display the mobile and basic page sets, use any browser except Internet Explorer.

- Set the site mode.
- Set the page set.

The current selections are identified at the top of the Set Environment page and on the View Site drop-down menu.



Setting the site mode

By default, the site mode is set to Production. If you want to view your development pages, the staging area, or the reference implementation instead, you must set the site mode for each user agent you access the site from. If, for example, you want to view your changes to the development pages in multiple browsers on your desktop, you must set the site mode to Development for each browser. Similarly, you must set the Development site mode on your mobile device or emulator to view your development pages instead of the default production pages.

You can set the site mode using several methods, as described in the following procedure.

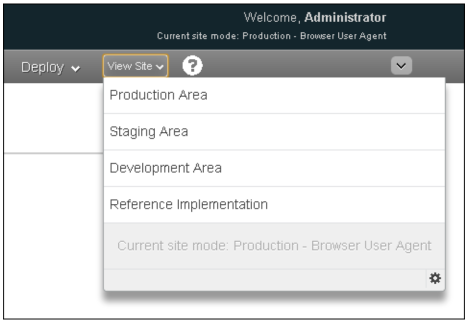
To set the site mode

1 Type `https://<your_site>/ci/admin.` The dashboard opens.

2 To set the development area mode, click the View Development Area shortcut on the dashboard. The Support Home page opens in development mode, indicated by the Customer Portal Development Area header at the top. (Refer to [Development header](#).)

Or

Click the View Site drop-down menu on the top right of the page and select Development Area.



Or

Click the Set Environment shortcut on the dashboard and select Development in the site mode drop-down menu. Then click Set Viewing Mode and View the Site.

a To simulate an abuse scenario on your development pages for testing purposes, select the Trigger Abuse Detection check box. For information, see Simulating abuse situations.

3 To set the staging area mode, click the View Staging Area shortcut on the dashboard. The Support Home page opens in staging mode.

Or

Click the View Site drop-down menu on the top right of the page and select Staging Area.

Or

Click the Set Environment shortcut on the dashboard and select Staging in the site mode drop-down menu. Then click Set Viewing Mode and View the Site.

4 To set the production area mode, click the View Production Area shortcut on the dashboard. The Support Home page opens in production mode.

Or

Click the View Site drop-down menu on the top right of the page and select Production Area.

Or

Click the Set Environment shortcut on the dashboard and select Production in the site mode drop-down menu. Then click Set Viewing Mode and View the Site.

5 To set the reference implementation site mode, click the View Site drop-down menu on the top right of the page and select Reference Implementation. The Support Home page opens in the reference implementation mode.

Or

Click the Set Environment shortcut on the dashboard and select Reference in the site mode drop-down menu. Then click Set Viewing Mode and View the Site.

Setting the page set

To set the page set

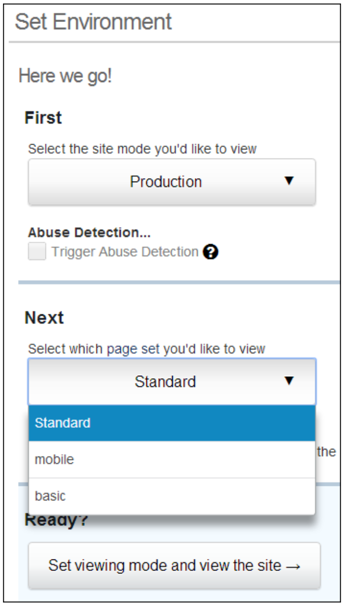
1 Type `https://<your_site>/ci/admin.` The dashboard opens.

2 Click the Set Environment shortcut.

3 Make a page set selection.

a To display the appropriate page set based on the user agent that is accessing the customer portal, select the check box (below the page set drop-down menu) that says “Allow my current browser/user agent to be the deciding factor.”

b To display the standard (non-mobile) page set, clear the check box and select Standard on the page set drop-down menu.



c To display the mobile pages, clear the check box and select Mobile. (The mobile pages must be enabled before the selection appears in the menu. [Click here to enable the mobile pages.](#))

d To display the basic page set, clear the check box and select Basic. (The basic page set must be enabled before the selection appears in the menu. Click here to enable the basic pages.)

e To display a custom page set, clear the check box and select the page set name in the menu. (To add a page set that will appear in this menu, refer to Adding page set mappings.)

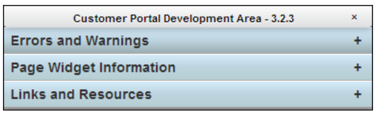
4 Click Set Viewing Mode and View the Site. The browser opens the Support Home page displaying the page set you selected.

Development header

When you view the development area, you'll see a Customer Portal Development Area header, including version number, on the page. The header provides useful information about errors and warnings, widget information, and additional links and resources.

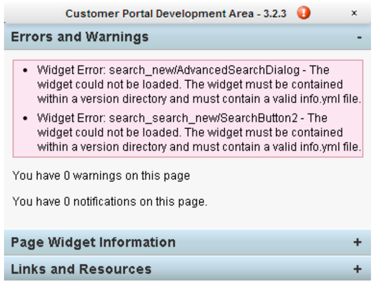
To close the header, click X. (If you want to display the header again, refresh the page.) To expand the header and display the following options, click the header. You can then expand and collapse each heading by clicking the associated plus (+) sign.

- Errors and warnings
- Page widget information
- Links and resources



Errors and warnings

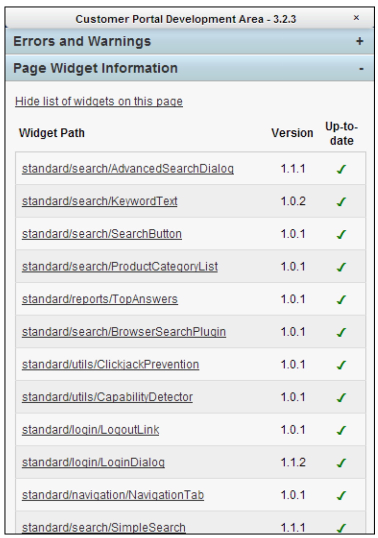
When you click the + sign on the Errors and Warnings heading of the development header, it expands to display the number of errors, warnings, and notifications for the page. If errors or warnings occur on the page, the development header displays an exclamation point that you can click to view the error or warning.



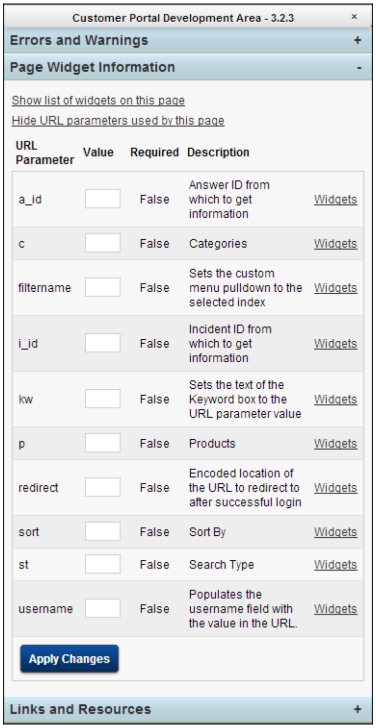
Page widget information

When you expand the Page Widget Information section of the development header, two links are displayed: one to show the list of widgets on the page and one to show URL parameters used by the page.

Clicking the first link displays a list of all widgets on the page, their version, and whether they are up-to-date. If the widget is compatible with the framework, a green check mark appears in the Up to Date column. If it is out-of-date, a red X appears in the column. Click any of the listed widgets to open the widget definition in a new window. When the list of widgets appears, the link changes to “Hide list of widgets on this page.”



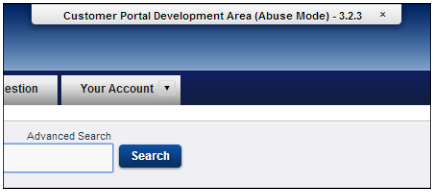
Clicking the second link displays the URL parameters used by the page, whether the parameter is required, and a description. You can click the Widgets link in the parameter's row to see a list of widgets that use the URL parameter. You can also change a parameter's value and click Apply Changes to preview the page with the value you changed.



Links and resources

The following links are available on the Links and Resources section of the development header.

- **Go to Production Area**—Click to open the equivalent page on the production site.
- **Go to Customer Portal administration page**—Click to open the Customer Portal Administration site.
- **Go to Reference Implementation**—Click to open the equivalent page on the reference implementation.
- **Toggle Abuse Detection**—Click to put your development site in an abuse simulation mode so you can test what happens under abuse conditions. The header indicates that your development site is now in abuse mode. See Simulating abuse situations.



- **Direct URL to this page in development mode**—Copy the URL in the field and paste it into a browser, email, or other document to provide a link to a development version of the page.
- **Go to Oracle Service Cloud Developer Community**—Click to open the Oracle Service Cloud Developer Community page where you can discuss the Customer Portal with other designers, developers, and **administrators**.

Configuring page set mapping

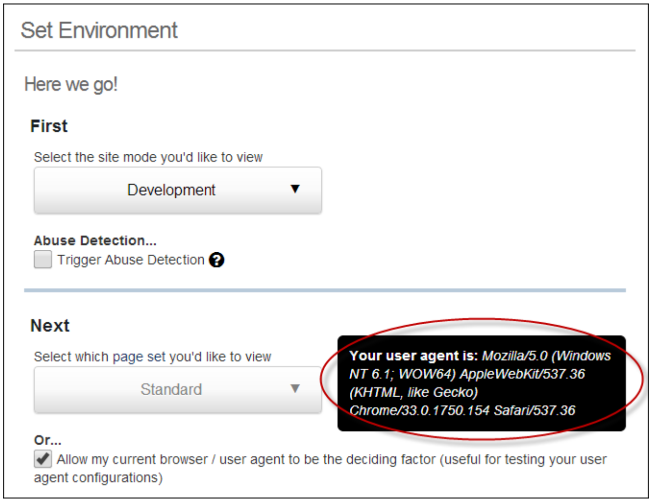
The Customer Portal Administration site lets you define page sets for user agent mapping. When you let the browser or user agent determine which page set is displayed (click here to see how), you can let your customers be automatically directed to the correct interface based on the browser they are using. If they're using a desktop or laptop computer, for example, you can direct them to your standard customer portal pages. But if they're using a mobile device, you probably want them to be directed to your mobile customer portal interface. And customers using devices that don't support JavaScript can still view your site with the basic page set. Page set mapping also lets you define unique page sets for various user agents.

Note Page set mappings affect only the development area until you stage and promote the customer portal. To make page set mappings active on your production site, you must stage and promote after saving your changes.

User agent mapping

When you click the Set Environment shortcut on the dashboard, the [Set Environment page] of the Customer Portal Administration site displays your user agent if the page set check box (Allow my current browser/user agent…) is selected.

Click to view



With the check box selected, the customer portal identifies customers' user agents so it can direct them to the appropriate page set. The default page sets are your standard customer portal pages and the mobile page set.

Important Oracle Service Cloud includes two default mappings to the mobile page set and one for the basic page set. These mappings are initially disabled, so you must enable at least one of the mobile page sets and the basic page set and then stage and promote your customer portal site before they are available to your customers. Until you do so, your customers will see your standard customer portal pages even when they are using a mobile or basic device. Additionally, these page sets will not appear in the page set menu on the Set Environment page.

Enable the default page set mappings or add page set mappings.

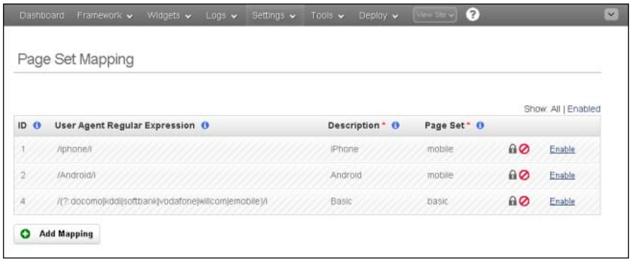
Enabling default page set mappings

You must enable the default page set mappings if you want your customers who use mobile and basic devices to be able to see those page sets. The default mappings cannot be edited.

To enable default page set mappings

1 In a web browser, type `https://<your_site>/ci/admin.` After you log in, the Customer Portal Dashboard displays.

2 Click the Page Set Mappings shortcut on the dashboard. The Page Set Mapping page displays.



3 To enable one of the mobile page sets, click Enable in the right column for one or more of the mobile devices (iPhone and Android). The link changes to Disable.

4 To enable the basic page set, click Enable in the right column for the basic page set. The link changes to Disable.

5 To add your own page set mappings, click here.

6 To make these pages available on your production site, log in to Oracle Service Cloud and stage and promote the customer portal.

Adding page set mappings

If you want to provide customer portal pages that display differently on different browsers, you can create unique pages sets and then map them to specific user agents. For example, you might want to create one mobile page set for viewing on iPhones and another for viewing on Androids. This lets you customize your pages for different mobile devices so your customers can have optimal experiences regardless of the device they use to access your support site.

To add page set mappings

1 In a web browser, type `https://<your_site>/ci/admin`.

2 Click the Page Set Mappings shortcut on the dashboard.

3 Click Add Mapping. A new row is added to the table.

4 Type a valid Perl-Compatible regular expression in the User Agent Regular Expression field or leave the field blank.

5 Type a description that can be used for reporting purposes in the Description field. This field is required.

6 Type a path in the Page Set field. The path identifies the page set in your customer portal file structure where customers will be directed. This field is required.

Note If you create a mapping to a page set folder that does not exist, you will not be allowed to save the mapping. If the folder is deleted after the mapping is created, customers who try to access it through a browser will see an error message about too many redirects. (The exact message is browser dependent.) The error occurs because failure to find the nonexistent folder results in a redirect to an error page in the same folder, which also cannot be found. The result is a recursive loop.

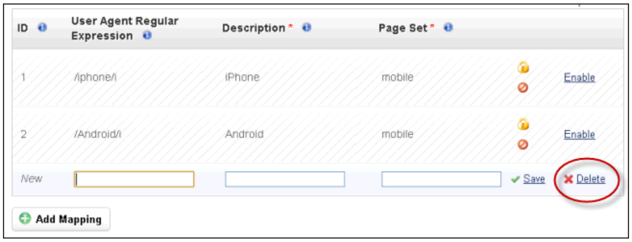
7 Click Save in the row you just added. An ID for the page set is assigned automatically.

8 Repeat steps 3 through 7 for each additional mapping you want to define.

9 To make the changes to your production site, stage and promote the customer portal.

Deleting and disabling mappings

You cannot delete the default mappings for the iPhone, Android, and basic page sets, but you can delete any page set mapping you have added if you have not yet saved it. To delete a mapping, click Delete in the row containing the mapping.



If you have staged and promoted the mappings you have added, you can no longer delete them, even by rolling back the site, but you can disable them by clicking Disable. You can also disable the default mappings. You must stage and promote the customer portal after you disable a mapping so the change will take effect on your production site.

Framework tab

When you type `https://<your_site>/ci/admin/docs/framework` into your browser or click the Framework tab from any page of the Customer Portal Administration site, the Framework page opens. The following options are available on the page and also from the drop-down menu that displays when you hover over the Framework tab.

- **Framework Versions**—Click this link to see the frameworks that are available and to set the framework version you want to use for your development pages. Refer to Framework versions.
- **Page Tags**—Click this link for a list of tags that control specific sections of the page or that hide or display content conditionally. Refer to Page tags.
- **Page Meta Tags**—Click this link to see the attributes that can be defined for each page. These include, among others, whether login or an SLA is required to view the page, the template used by the page, and the page title. Refer to Page meta tags.
- **Business Objects**—Click this link to display field information for adding answer, incident, and contact fields to input and output widgets and the Field page tag. The page displays the format to use for display and input widgets as well as the data type for each field. Refer to Business objects.

- **Old Framework Migration**—If you have migrated to Framework Version 3.2 from Framework Version 2, you can revert your development pages to the older framework. Your staging and production environments are not affected, and you can change back to Framework Version 3.2 later if you change your mind.

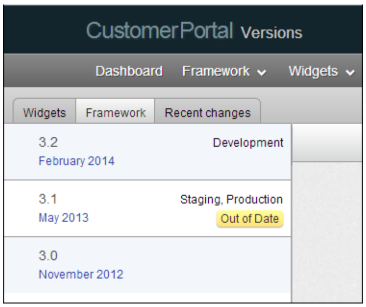
Note The Old Framework Migration option does not appear if your Customer Portal installation is new with Framework Version 3.2.

Framework versions

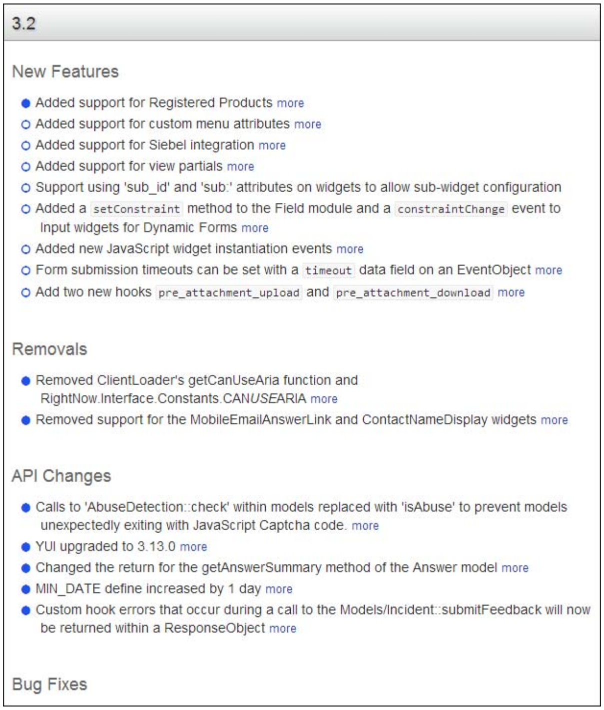
When you click the Framework tab and select Framework Versions, you'll see a list of the available Customer Portal frameworks in the left column. Because nano version changes indicate full backward compatibility, they are applied automatically. As a result, the page displays only minor and major versions.

For instance, Framework Version 3.1 was released in May 2013 as version 3.1.1, while the August 2013 version is 3.1.2. The nano level increment indicates full backward compatibility with Framework Version 3.1. If your customer portal uses version 3.1, your site will be migrated automatically to 3.1.2 when you upgrade to the August 2013 release. If your customer portal uses Framework Version 3.0, you can choose to keep using it upon upgrade until you decide to migrate to a later version to take advantage of increased functionality.

The list of frameworks in the left column shows the version being used by each of the three environments. In the figure below, for example, the development area is using version 3.2, but the staging and production areas use version 3.1 and have not yet been migrated to the newer version.



When you click a framework, the changes that are included in that version are defined.



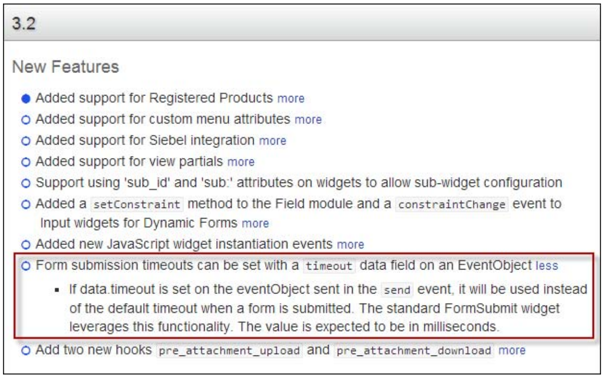
You can mouse over the bullet for each change to learn which of the following types of change it is.

- Likely to impact custom code (major version change)
- May impact custom code (minor version change)
- No impact to custom code (nano version change)

Additionally, the changes are divided into the following areas.

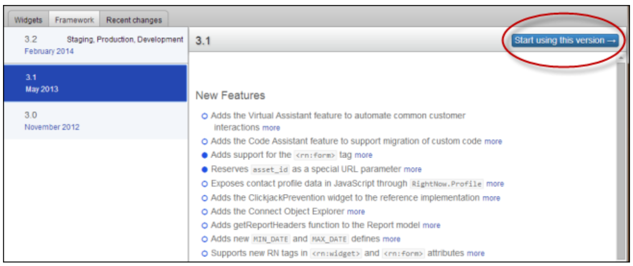
- New features
- Removal of functionality
- API changes
- Bug fixes

Click **more** at the end of each line for additional information about the change and what you might need to do to incorporate the change.

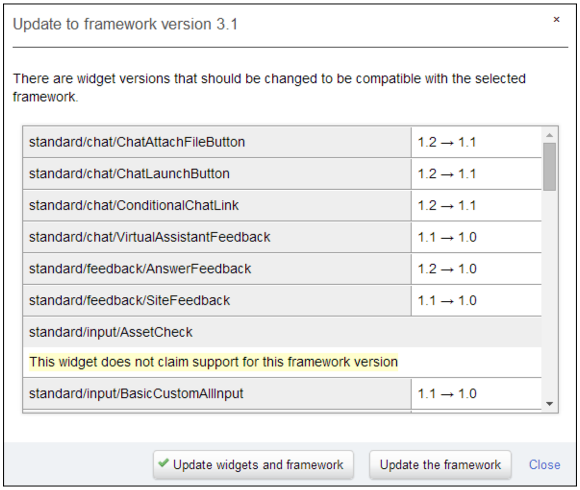


Reverting to an earlier framework

You can revert to an earlier framework version by selecting that version and clicking the Start Using This Version button. Whenever you revert to an earlier framework, you will likely encounter errors resulting from newer widgets being incompatible with the older framework, which will require additional work on your part to correct the pages that use the new widgets. We do not recommend you revert your customer portal, but we recognize there are times when you may need to do so.



When you click the button, you'll see a list of widgets that are not compatible with the framework version you select.

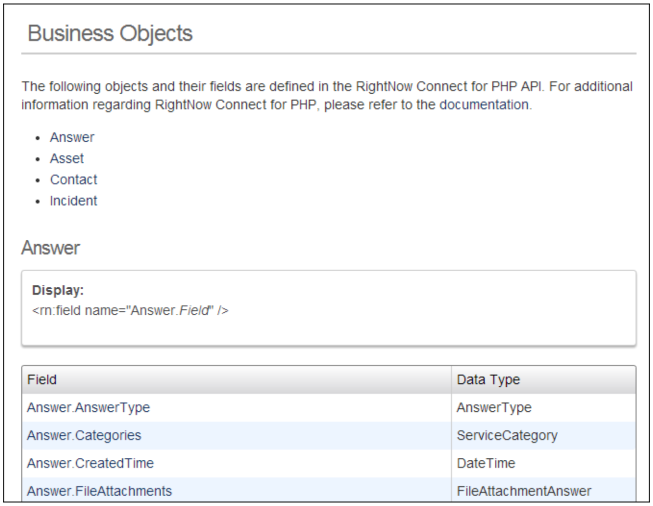


You have the option of updating both the framework and widgets or only the framework. If you click Update the Framework, the success message instructs you to manually update the outdated widgets to a version that is compatible with the framework. If you do not, errors will appear on your development pages, and you will experience errors when you try to stage and promote your site.

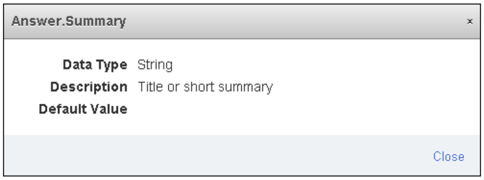
If you select Update Widgets and Framework, all of the widgets that require a version change to be compatible with the older framework are modified. Your site may still contain compatibility errors so be sure to check your development pages carefully before staging and promoting to prevent errors during the deploy process.

Business objects

When you are adding a field to the attributes of a Field page tag or the FormInput or DataDisplay widgets, you might not know its Connect PHP API field name. Click the Framework tab and select Business Objects to look up field and table names so you can include them in the widget code. The link displays fields in the *Answer, Asset, Contact,* and *Incident* tables. The page also provides examples to use for display and input.



If you want to see the description of an object, hover over its name. To view complete information about the object, click it to open a window that displays data type, description, and default value for answer business objects, as well as additional information for contact and incident objects. Click Close to close the window.



The following sections show you how to use business objects to add fields to different pages.

- Input and output widgets
- Outputting database fields (answer details page)
- To add contact fields to the Ask a Question page (Ask a Question page)
- Changing incident details (question details)
- Adding or removing contact fields (Account Settings page)
- Adding fields (Create an Account page)
- Displaying assets

Widgets tab

When you type https://<your_site>/ci/admin/docs/widgets into your browser or click the Widgets tab from any page of the Customer Portal Administration site, the Widgets page opens. The following options are available on the page and also from the drop-down menu that displays when you hover over the Widgets tab.

- **Browse Widgets**—Click this link to display links to the lists of standard and custom widgets, organized by folders. Refer to Navigating folders and searching for widgets.
- **Widget Versions**—When you click Widget Versions, you can select a widget to open detailed information for that widget, including a preview image, documentation, where the widget is used, and any version changes. You can also deactivate the widget on this page. Refer to Widget version management.
- **Create a New Widget**—Clicking this link opens the widget builder that lets you create a new widget, either from scratch or by extending an existing standard or custom widget. Refer to Widget builder.
- **Widget Info**—Specifies the details that should be included in a widget's *info.yml* file. Refer to YAML file.
- **Syndicated Widgets**—Click this link to display and configure the syndicated widgets, ConditionalChatLink, KnowledgeSyndication, PollingSyndication, ProactiveChat, and ProactiveSurveyLink. These widgets can access the Oracle knowledge base even though they are placed on web pages external to the customer portal. Refer to Syndicated widgets.

Error and splash page previews

When your customer portal is undergoing maintenance, you may want to display a page that lets your customers know that your site is currently unavailable. (Refer to To manually turn on the splash page.) You can view this splash page from the Customer Portal Administration site.

To view the splash page

1. In a web browser, type https://<your_site>/ci/admin.
2. Click the Settings tab drop-down menu and select Preview Error Pages.
3. Click */cp/customer/error/splash.html* to view your splash page.

You can also preview the error pages that are displayed. Click any of the following pages to view the displayed error page.

- */cp/customer/error/error404.html*
- */cp/customer/error/error413.html*
- */cp/customer/error/error500.html*

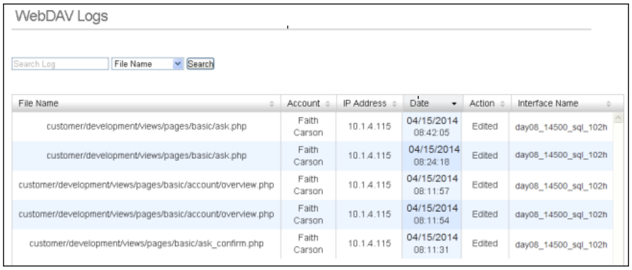
Logs tab

The Logs section of the Customer Portal Administration site lets you view logs for WebDAV, debugging, and **deployment**. The WebDav log shows a transaction history of all changes to files, including file name, staff account, IP address, date, action, and interface name for each change. The debug log shows log files that are generated during development using the log-Message ( ) function, and they contain the time, calling location, and message. The deployment log lists each log by its file name, date and time the log file was created, the type of action, and the staff member who performed the action. Click the log to see a history of the actions performed during the operation.

- Viewing WebDAV logs
- Viewing deployment logs

Viewing WebDAV logs

To view changes that have been made to the customer portal files, you can view WebDAV logs from the Customer Portal Administration page or from a URL. The log displays a list of file names, the staff account that took the action, the IP address from which the action was taken, the date and time, what action was taken, and the interface. By default, the log is sorted by date with the most recent action listed first, but you can sort the log by any of these columns. You can also search the log by each of the columns, for example, by account or page name.



To open WebDAV Logs

If you are logged in to the Customer Portal Administration site, click the Logs tab and select WebDAV Logs on the Logs Overview page.

Or

In a web browser, type https://<your_site>/ci/admin/logs/webdav.

Go to Viewing deployment logs or return to Logs tab.

Sandboxed configurations

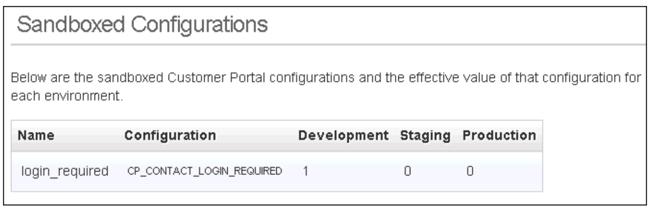
When a configuration setting can have a different value on your development site than on the staging and production sites (that is, you must stage and promote for the configuration setting to affect staging and production), the Sandboxed Configurations options lets you see how the value is set for each site. In Framework Version 3.2, CP_CONTACT_LOGIN_REQUIRED is the setting that can be different in the different areas.

When you change this kind of setting on the **administration interface**, the changes affect only the development and reference implementation pages of the customer portal, not the staging and production pages. When you stage the development pages, the changed configuration setting value is active in the staging environment. And when the staged pages are promoted, the change affects the production pages used by your customers.

To view sandboxed configuration settings

1 In a web browser, type https://<your_site>/ci/admin.

2 Click the Settings tab drop-down menu and select Sandboxed Configurations. The values for each setting in the development, staging, and production environments are listed.



Sandboxed Configurations

Below are the sandboxed Customer Portal configurations and the effective value of that configuration for each environment.

Name	Configuration	Development	Staging	Production
login_required	CP_CONTACT_LOGIN_REQUIRED	1	0	0

Connect Object Explorer

Customer Portal Framework Version 3.2 is based on the Connect for PHP API, a powerful tool for building custom functionality. The Connect Object Explorer uses a ROQL (RightNow Object Query Language) query interface to help you become familiar with Connect more quickly. You will learn more efficiently because you can explore Connect and the data it exposes from the Customer Portal Administration site instead of logging in to the administration interface in Oracle Service Cloud.

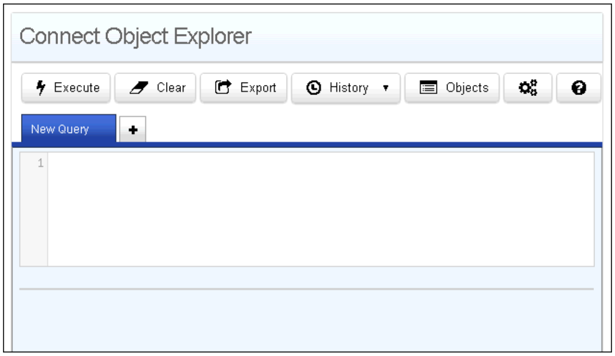
In addition to the ROQL query interface, the Connect Object Explorer also provides an object and field explorer to view Connect objects and metadata.

When you interact with the Connect Object Explorer, you gain detailed information about all Connect objects, which improves your efficiency and makes it easier to adopt Framework Version 3.2.

To use the Connect Object Explorer

1. Log in to your Customer Portal Administration site by typing `https://[your_site]/ci/admin`. You'll be prompted for your Oracle Service Cloud user name and password.

2. On the Tools tab drop-down menu, select Connect Object Explorer. The page opens.

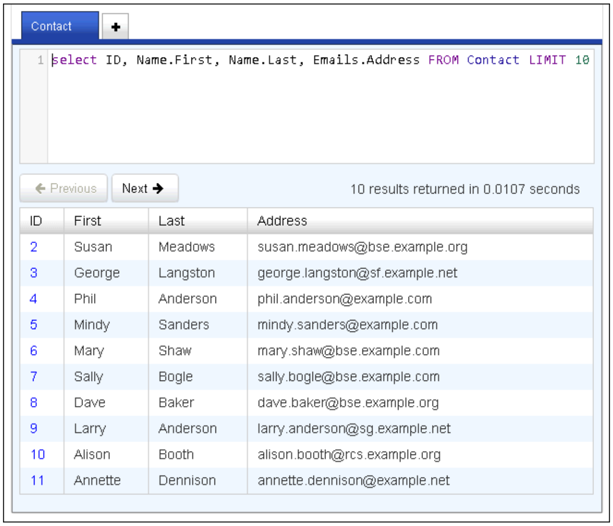


3. Enter a ROQL query in the New Query field. Your query might look like the following.

```
select ID, Name.First, Name.Last, Emails.Address FROM Contact LIMIT 10
```

Note The syntax for ROQL keywords and primary Connect objects is highlighted in the editor. Refer to Sample ROQL queries for examples of valid queries.

4 Click the Execute button on the far left of the toolbar to display the list of results.



5 To sort the results on any column, click the column heading to sort in ascending order. To sort in descending order, click the column heading again.

6 To see additional results, click the Previous or Next buttons on the left above the results.

7 To examine the metadata of a record, click its ID (or click the value in the first column if the first column is not ID). All of the properties of the object (except nested properties) are defined in a new window. When you are finished, click x in the upper right corner of the window or the Close link at the bottom right.

Meta data for **Contact** - ID 2

« Contact

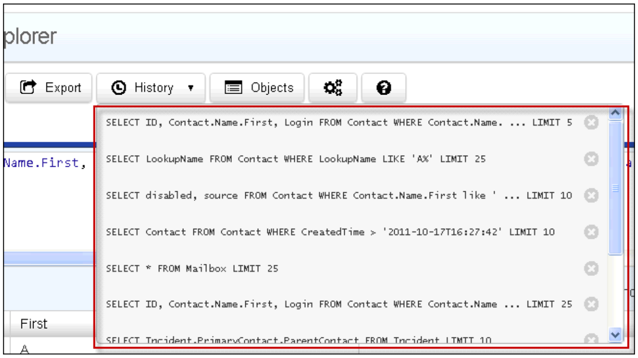
Field Name	Value	Field Type
type_name	RightNow\Connect\v1_2\Contact	
COM_type	Contact	
is_menu	false	
is_primary	true	
can_create	true	
can_get	true	
can_update	true	
can_destroy	true	
label	Contact	
description	Customers or end users of a site	
ID	2	long
LookupName	Susan Meadows	string
CreatedTime	1377117018	long
UpdatedTime	1377118929	long
Address		*Address*
- City		string
- Country		*Country*
- PostalCode		string
- StateOrProvince		*NamedIDLabel*
- Street		string
Banner		*Banner*

8 To conduct another query, click the + sign to add a new tab, and repeat steps 3 through 7.

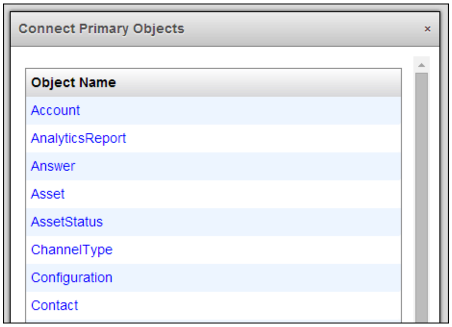
9 To export the data in a comma-separated values (CSV) file, click Export. An Excel spreadsheet file is generated.

10 To clear the query (and any results if the query was executed), click Clear.

11 To view the history of prior queries, click History.



12 To display a list of all Connect primary objects, click Objects.



a To view metadata for an object, click it to display a table of field names, values, and field types.

Meta data for Answer

« Answer

Field Name	Value	Field Type
type_name	RightNow\Connect\v1_2\Answer	
COM_type	Answer	
is_menu	false	
is_primary	true	
can_create	true	
can_get	true	
can_update	true	
can_destroy	true	
label	Answer	
description	Customer questions and answers maintained in the Knowledge Base

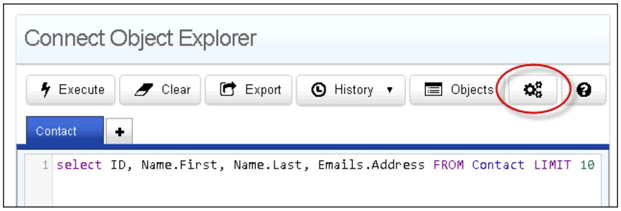
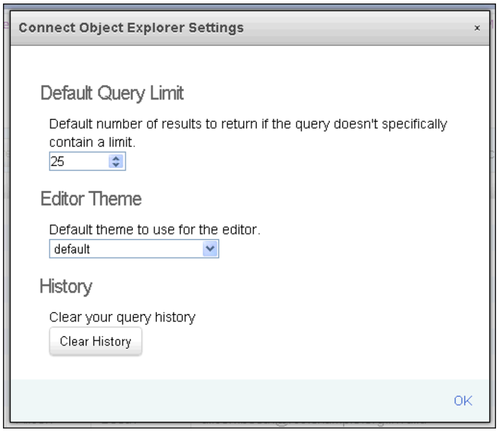
CreatedTime		long
UpdatedTime		long
AccessLevels		*AccessLevelArray*
AdminLastAccessTime		long
AnswerType		*AnswerType*
AssignedSibling		*Answer*

13 To adjust settings for the Connect Object Explorer, click the Settings button.



The Connect Object Explorer Settings window opens.



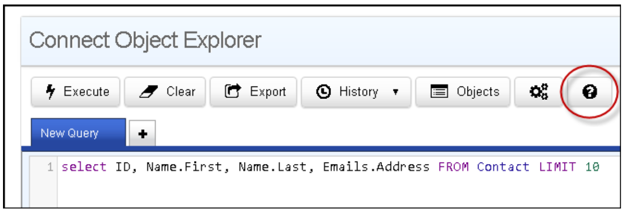
a To change the default number of results from 25, type a new number in the Default Query Limit field.

b To change the syntax highlighting theme used by the query editor, click the Editor Theme drop-down menu and select a new theme from the available options.

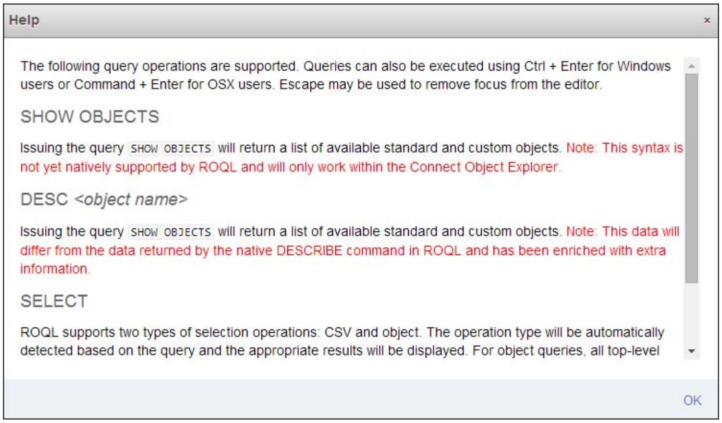
c To clear the query history, click Clear History.

d Click OK to save your changes and close the window.

14 To view the supported query options, click the Help button.



The Help window opens.



Sample ROQL queries

The following list contains sample queries to help you understand how to formulate your queries on the Connect Object Explorer. Standard object name mappings are used to automatically correct issues of character case and singular/plural form inconsistency until you become more familiar with Connect naming. For example, in the following list, all of the first four queries automatically appear as `DESC Incident` in the editor when they are executed.

Note The `desc`, `describe`, and `show` queries are not natively supported by ROQL and work only within the Connect Object Explorer.

The editor uses syntax highlighting of ROQL keywords and primary Connect objects, and you can change the theme by clicking the Settings button and making a selection on the Editor Theme drop-down menu.

- `desc Incident`
- `describe Incident`
- `describe incident`
- `desc incidents`
- `show objects`
- `Show Objects`
- `Show Tables`

- `SHOW TABLES`
- `SHOW OBJECTS`
- `SELECT * FROM Mailbox`
- `SELECT ID, LookupName FROM Account LIMIT 10`
- `SELECT Contact FROM Contact LIMIT 10`
- `SELECT Incident.PrimaryContact.ParentContact FROM Incident LIMIT 10`
- `SELECT Contact FROM Contact C WHERE C.Name.First like 'C%' LIMIT 10`
- `SELECT Contact FROM Contact WHERE CreatedTime > '2011-10-17T16:27:42' LIMIT 10`
- `SELECT disabled, source FROM Contact WHERE Contact.Name.First like 'C%' AND Contact.Address.City='Bozeman' LIMIT 10`
- `SELECT LookupName FROM Contact WHERE LookupName LIKE 'A%';`
- `SELECT ID, Contact.Name.First, Login FROM Contact WHERE Contact.Name.First IS NOT NULL ORDER BY Contact.Name.First ASC LIMIT 5`
- `SELECT ID, Contact.Name.First, Login FROM Contact WHERE Contact.Name.First IS NOT NULL`

Use the DESC or DESCRIBE statement to obtain field and relationship information about standard and custom objects defined in the Connect Common Object Model (CCOM). You must specify the object's name in the query, for example, `DESC Account`.

The SHOW OBJECTS statement lists both standard and custom objects defined in CCOM. The SHOW TABLES statement is an alias for SHOW OBJECTS.

The SELECT statement retrieves either rows or objects from one or more standard or custom objects defined in CCOM. The explorer automatically detects the query type and returns either CSV data or an object with fields you can explore.

Code Assistant tool

Migrating your customer portal to Framework Version 3 offers significant benefits and features. However, the process of migrating your customized code can be challenging, especially if you have extensive customizations. The Code Assistant simplifies the migration process between framework versions and provides specific guidance for updating your custom code. The tool offers the following help.

- Assistance for migrating Framework Version 2 widgets to Framework Version 3
- Help for converting from YUI 2 to YUI 3

- Removal of Intent Guide pages

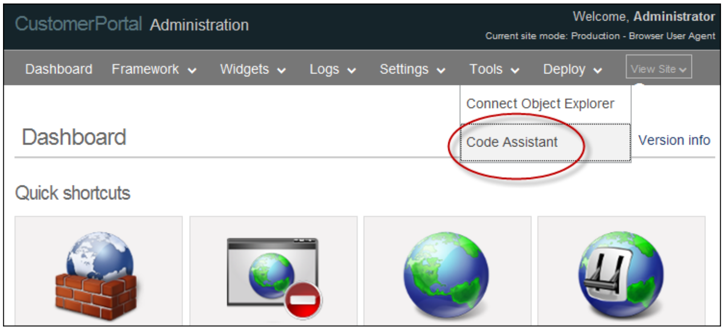
The widget migration wizard walks you through the custom code migration process, and the code suggestion feature offers suggestions for improving or migrating custom code that includes YUI 2. As a result, your framework migrations will be simpler and faster, and you'll be able to take advantage of the newest Customer Portal features sooner.

Important You must enable Framework Version 3 before using the Code Assistant.

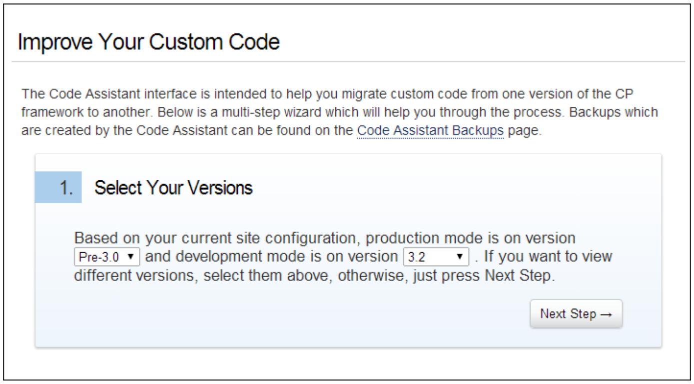
To use Code Assistant

1 Log in to your Customer Portal Administration site by typing `https://[your_site]/ci/admin`. You'll be prompted for your Oracle Service Cloud user name and password.

2 On the Tools tab drop-down menu, select Code Assistant.



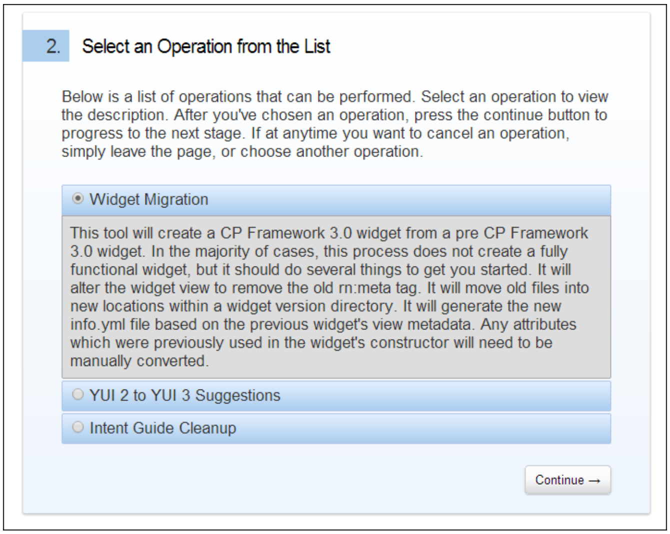
The page opens to display the Code Assistant, including information about your current production and development framework versions. Because you are migrating from one framework version to another, your development area will be using a more recent framework than your production area.



3 To migrate to a different framework version than 3.2 (if, for example, you want to use Framework Version 3.0 instead), select the version you want from the development mode drop-down menus.

Note We recommend you use the selected options to prevent potential coding errors.

4 Click Next Step to select a migration option.



5 The Widget Migration option is selected by default. To use the Code Assistant to help you migrate your widgets, click Continue and follow the steps described in To migrate your custom widgets to Framework Version 3 below.

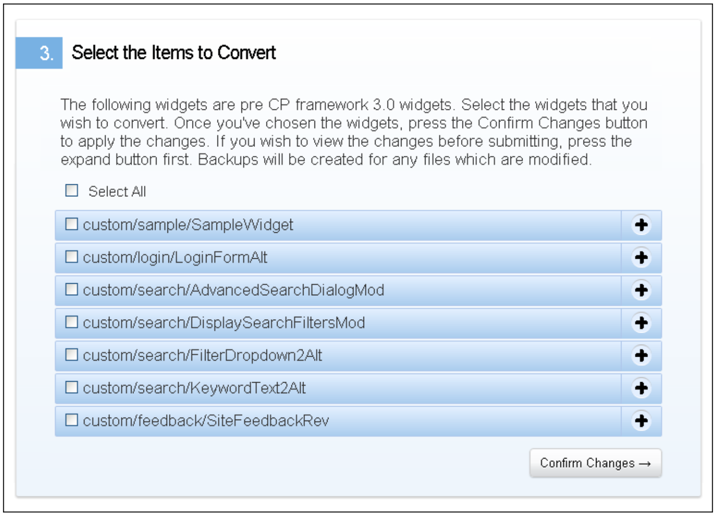
6 To update your custom code to YUI 3, see To update your YUI 2 code to YUI 3 below.

7 To remove Intent Guide pages (because Intent Guide is not supported in Framework Version 3.2), see To remove Intent Guide pages below.

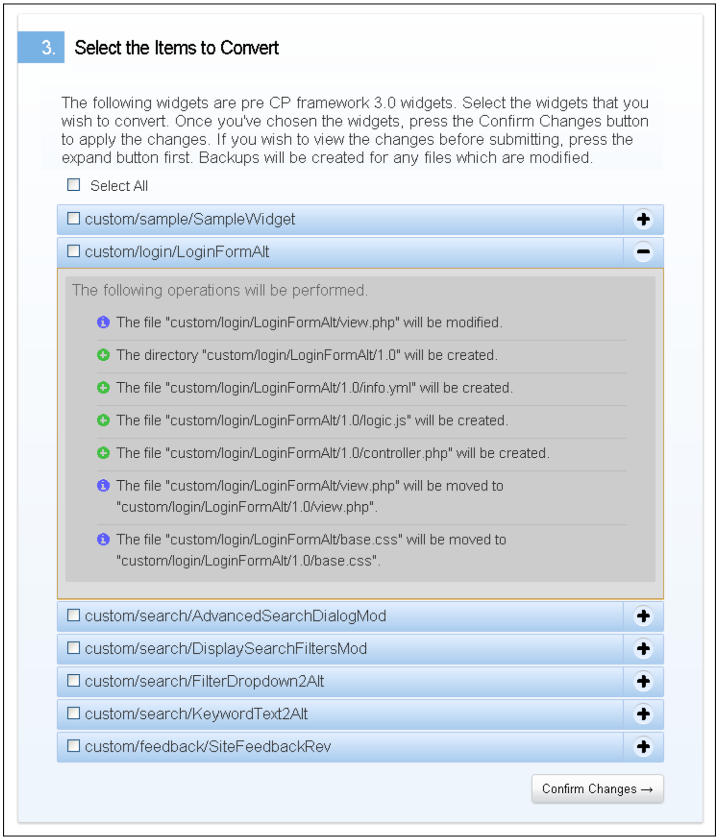
To migrate your custom widgets to Framework Version 3

Note Just as the widget builder creates a file structure and an information (YAML) file for your custom widgets, so does the Code Assistant. And just as you must edit the skeleton files that the widget builder generates, you must also edit the files generated by the Code Assistant in order to add the widget's attributes and make any other necessary changes.

1 If Widget Migration is not already selected on the Code Assistant page, select it and click Continue. A list of the custom widgets from your Framework Version 2 customer portal is displayed.



2 To review the changes the Code Assistant will make to an individual widget, click the + sign on the right side of the widget row. The row expands to identify the files that will be created, modified, and deleted.

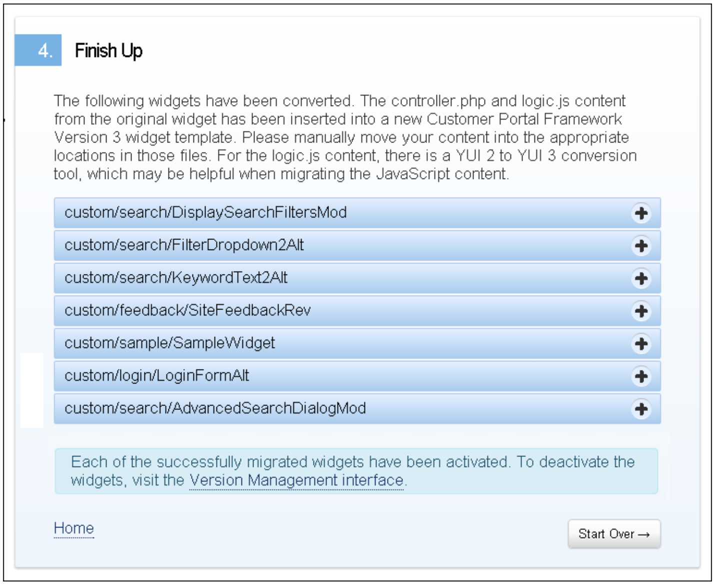


3 To select individual widgets for conversion, select the check box next to the widgets you want to migrate.

Or

To have Code Assistant migrate every listed widget, select the Select All check box at the top of the list.

4 Click Confirm Changes, and then click OK on the confirmation message.



5 To return to the Code Assistant starting page (where you select your production and development mode versions), click Start Over.

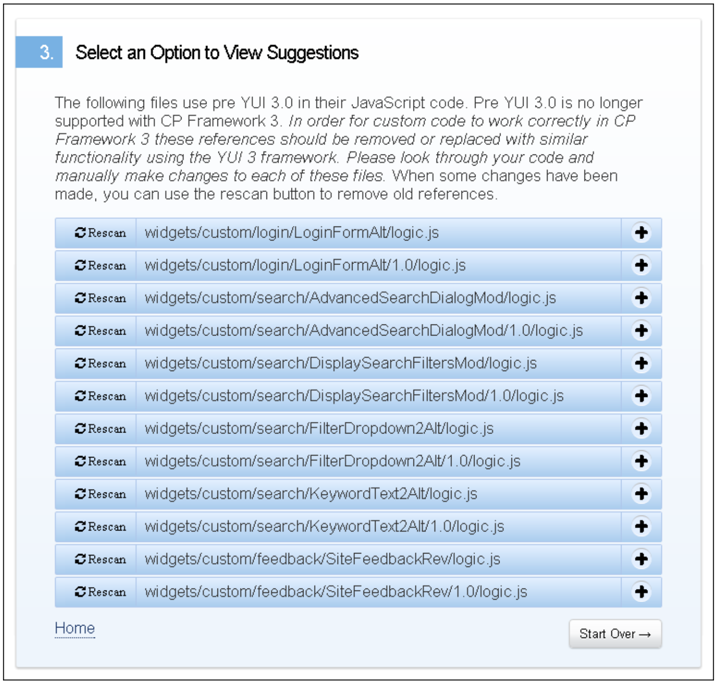
6 To return to the dashboard, click the Home link.

7 If a widget was successfully migrated, it will be activated automatically and you will be notified. If a widget could not be activated because additional code changes are required, the message will notify you about that.

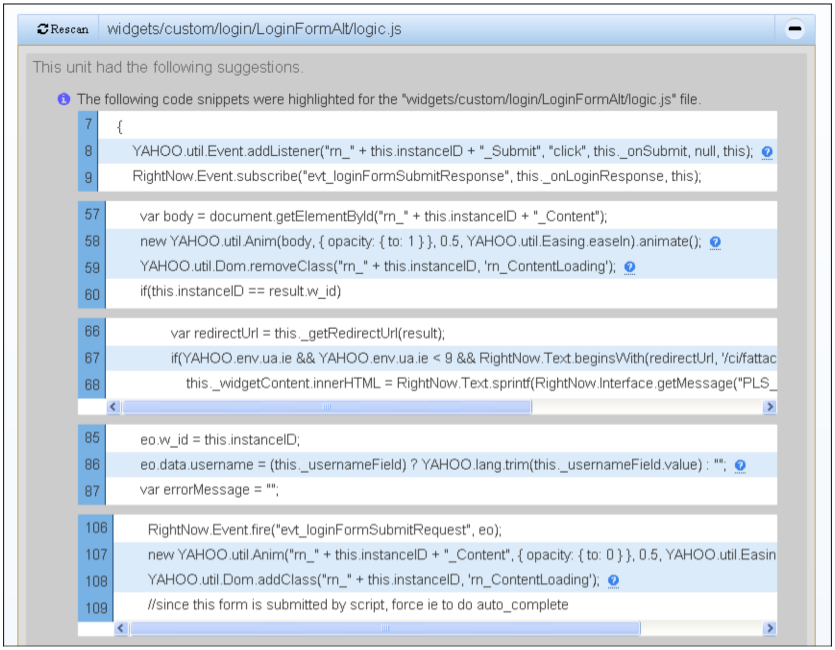
8 Edit the migrated widget files to include their Framework Version 2 features.

To update your YUI 2 code to YUI 3

1 On the Code Assistant page, select YUI 2 to YUI 3 Suggestions from the options and click Continue. The screen displays the list of files using YUI 2 that were migrated from your Framework Version 2 customer portal.



2 Click the + sign to the right of a file name to display the suggestions for editing the file's code to work with the YUI 3 framework.



3 Open the file that needs to be updated and follow the instructions from the Code Assistant for editing the file. The lines that need to be edited are noted. For each suggestion, hover over the question mark at the far right to see a summary of the change, for example, "YAHOO.util.Event's functionality was replaced with 'Y.Event'." Clicking the question mark takes you to the YUI library for the element, where you can find additional information.

4 Repeat steps 2 and 3 for each file that needs editing.

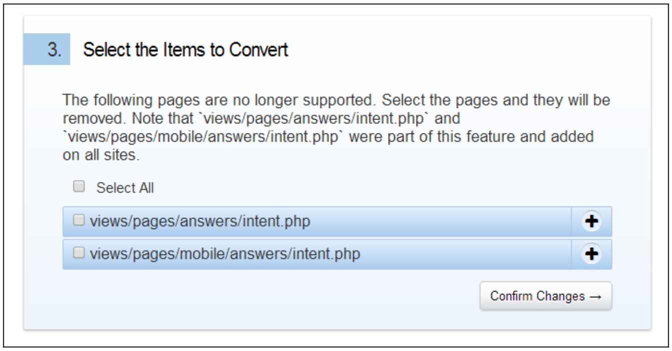
5 To review your work, click the Rescan button. Only the suggestions you have not yet incorporated will appear.

6 To return to the Code Assistant starting page (where you select your production and development mode versions), click Start Over.

7 To return to the dashboard, click the Home link.

To remove Intent Guide pages

1 On the Code Assistant page, select Intent Guide Cleanup from the options and click Continue. A list displays the Intent Guide pages, which are no longer supported.

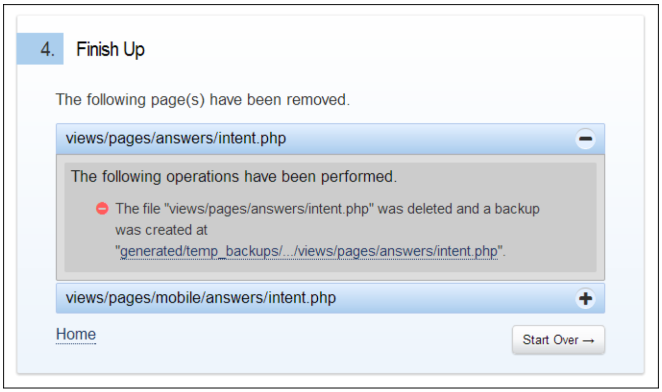


2 To select an individual page for deletion, select the check box next to the page.

3 To have Code Assistant delete both pages, select the Select All check box at the top of the list.

4 Click Confirm Changes, and then click OK on the confirmation message.

5 To see where a backup of a deleted page is located, click the + sign for the page.



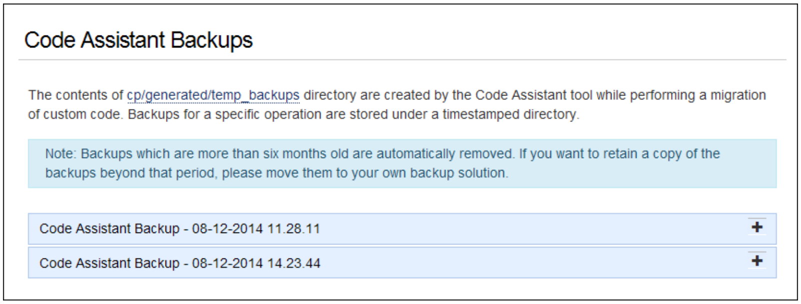
6 To return to the Code Assistant starting page (where you select your production and development mode versions), click Start Over.

7 To return to the dashboard, click the Home link.

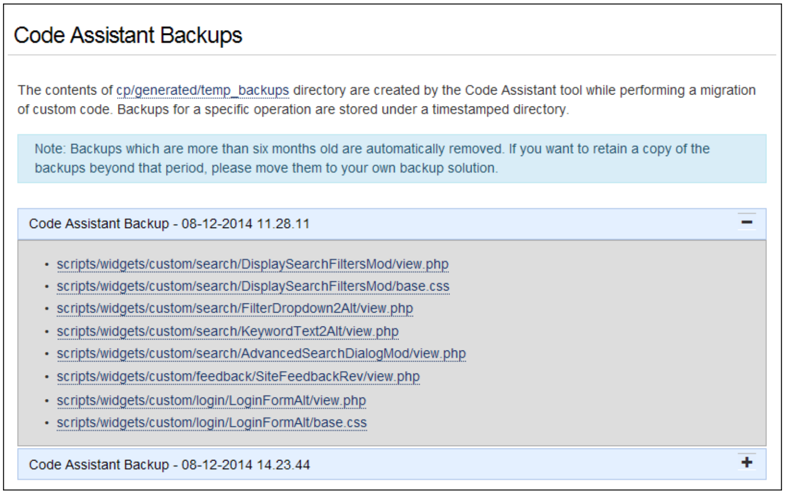
Backup directory

Whenever you let the Code Assistant modify your customer portal files, it creates backup files and stores them for up to six months. Each set of backup files is timestamped for ease of identification.

You can access the backup files through WebDAV at */cp/generated/temp_backups*. Or you can view them on the Customer Portal Administration site. Click Tools and select Code Assistant. The introductory paragraph contains a link to the Code Assistant Backups page. Clicking the link opens a page that resembles the following.



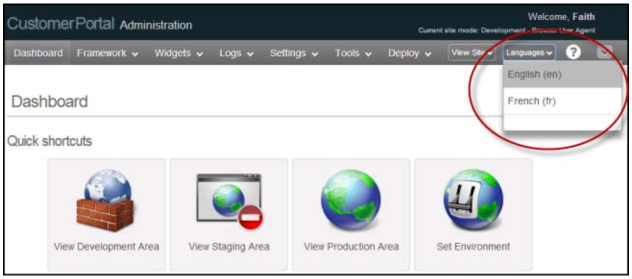
Clicking the + sign for a backup opens a list of all files in the backup directory, and clicking an individual file displays the code for that file.



Language selection

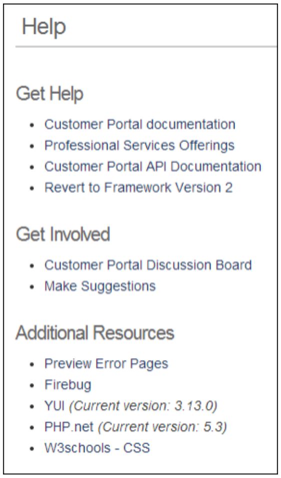
By default, the language on the Customer Portal Administration site is the same as the language for the interface. But that may not be useful to you if you are not fluent in every language your customer portal supports. Because you probably still want to display the administration site in your native language, the Language tab lets you select a language that persists across all administration pages for all interfaces.

The Language tab appears on the Customer Portal Administration site when your customer portal has more than one interface and at least two unique languages. The tab has a drop-down menu of the installed languages, which is dynamically generated by querying the SiteInterface object. When you select a language from the menu, a cookie is set and the language on the administration site uses the selected language regardless of the language of the interface.



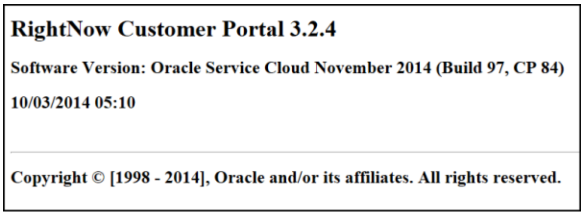
Help button

When you click the Help shortcut on the dashboard or the blue button on the right side of the tab bar, a screen containing links to various Customer Portal resources opens. The list includes links to all documentation, information about Oracle Service Cloud Professional Services, Customer Portal API documentation, the Customer Portal forum, a suggestions forum, the error page previews, and additional developer resources, including a link to revert to Framework Version 2 if your site was migrated from that version.



Viewing the About page

To view the version number and other information about the customer portal, go to http://<your_site>/ci/about.



Restoring the reference implementation

There may be times when you want to restore your development pages to the standard page set. For example, if you've modified your development pages for one interface but now want to create an entirely different interface (for another product or language, for instance), you might prefer to start from the **reference implementation**, especially if your first set of development pages is highly customized.

To restore development pages to the reference implementation

1 Open the */cp/core/framework* folder in WebDAV.

2 Copy the *views* subfolder and paste it to your desktop.

3 Copy the *views* folder from your desktop and paste it into the */cp/customer/development* folder, selecting Yes to All when you are asked to confirm the folder replacement.

4 If you have modified other files in different subfolders under */cp/customer/development*, copy and paste their */cp/core* equivalent to the appropriate *development* subfolder.

5 If you have modified CSS or image files in the *assets* folder, you may want to replace them with the equivalent files from the */cp/core/assets/default* folder.

63

Staging and Promoting the Customer Portal

Now that your customer portal pages are just the way you want them and you've checked your development site one final time, it's time to stage and then promote these pages into production so your customers can begin using them.

One benefit of the staging area is the ability to selectively stage and promote pages, widgets, versions, and page set mappings without being required to implement all changes from the entire development site. When you stage your customer portal, your selections are copied to a staging area and compiled and optimized for performance. The staging environment looks exactly like your production environment will look when you promote the staged files. As a result, you have one more chance to check your site before making it available to your customers.

When your staging environment looks the way you want, you can promote your changes. This process copies the pages from the staging area to the production area, making them publicly visible. Your current production pages are backed up in case you need to restore them. If you change your mind after promoting your staged pages to the production site, you can revert to the most recent set of production pages with a click of a button.

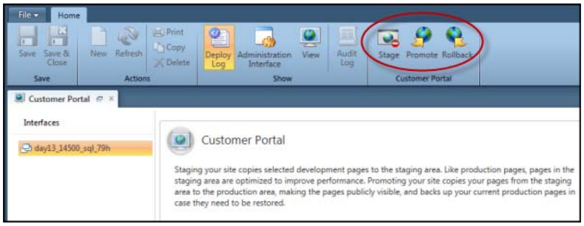
Staging

After you have edited the customer portal pages in the development area, you can stage them to see how your changes will appear on the production site. Because the staging area replicates the production site but keeps the pages from being visible to customers, you can continue to modify the development pages and then stage them without exposing the changes to your customers until you are satisfied with the results.

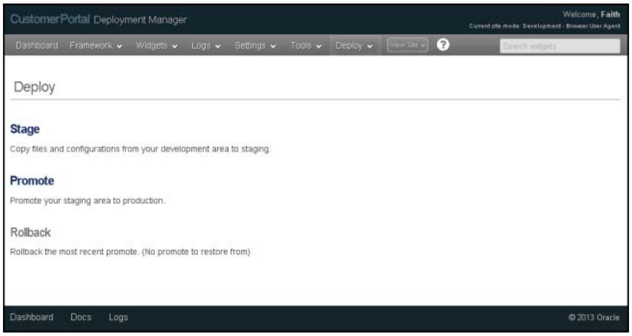
Note Before you can stage development pages, the **profile** assigned to you must have the CP Stage permission enabled. You or your **administrator** can enable this permission if necessary.

When you begin the staging process, the window displays all files that are different between the development area and the current staging area. You can select some or all of the edited files for staging. The pages in the *development* folder are then copied to a staging area and optimized for performance. This process checks for errors, reduces file size, and minimizes the number of disk access and HTTP requests required to load the pages.

After staging the files and reviewing them, you can promote the staged pages to the production area, where they are visible to your customers. You can stage, promote, and roll back your customer portal pages from the **administration interface**.



You can also stage, promote, and roll back from the **Customer Portal Administration site**.



Staging the customer portal pages

To stage your customer portal pages

1 Log in to Oracle Service Cloud.

Note Alternately, you can use the Customer Portal Administration site instead of the administration interface by typing https://<your_site>/ci/deploy/index (or http://<your_site>/ci/deploy/index if your site does not have SSL enabled). Resume this procedure at step 5.

2 Click the Configuration button on the **navigation pane**.

3 Double-click Customer Portal under Site Configuration.

4 Select the interface you want to stage from the Interfaces column.

5 On the administration interface, click the Stage button on the ribbon of the Customer Portal editor.

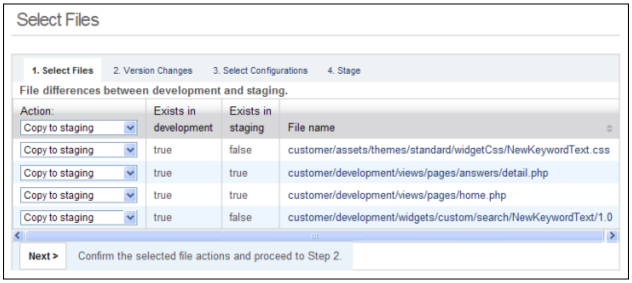
Or

On the Customer Portal Administration site, click Stage on the Deploy page.

The first window displays a list of files that have been changed in the development area since the last time files were staged. By default, all new and edited files are selected to be copied to the staging area, and any files you have removed from the development pages have the Remove From Staging action.

Note Although this procedure follows the steps presented on the buttons on the Select Files window, you can click **4 Stage** and immediately stage all file differences.

Important If you have created a new widget for your customer portal, you must be sure that Copy to Staging is selected for the widget on this first step of the staging process. Additionally, you must also select Yes to push all framework and widget version changes on the second page of the staging process, Version Changes. If you do not include pushing the version changes, your new widget will not be available on your staging site.



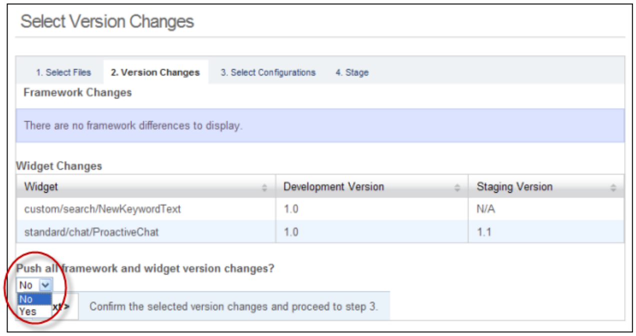
6 To prevent a file from being copied to the staging environment, click the Action drop-down menu in the row associated with the file and select No Action. This lets you maintain any changes you have made to the development page without having those changes appear in the staging environment (or the production pages when you promote the site).

7 To remove one or more files from the staging environment, click the Action drop-down menu in the row associated with the file and select Remove From Staging. The selected file will be removed from the staged pages and therefore will not be available to be copied to your production site.

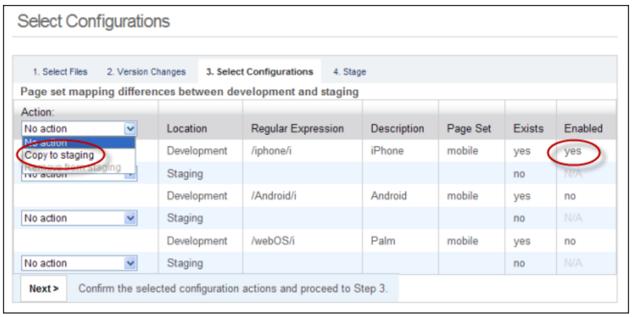
8 Click Next to continue. (Alternately, you can click **2 Version Changes** at the top of the page.) The window displays any version changes to the framework or widgets.

9 To push all framework and widget version changes, including the addition of new widgets, select Yes from the drop-down menu in the lower left corner of the page.

Important If you do not include pushing the version changes, any new widgets will not be available on your staging site.



10 Click Next to continue. (Alternately, you can click **3 Select Configurations** at the top of the page.) The window displays all user agent page set mappings for the interface and notes whether they are enabled or disabled. It also shows the differences in the page sets between the development and staging areas. By default, No Action is selected for the listed page sets, but if you have disabled a page set, the action will be Remove From Staging.

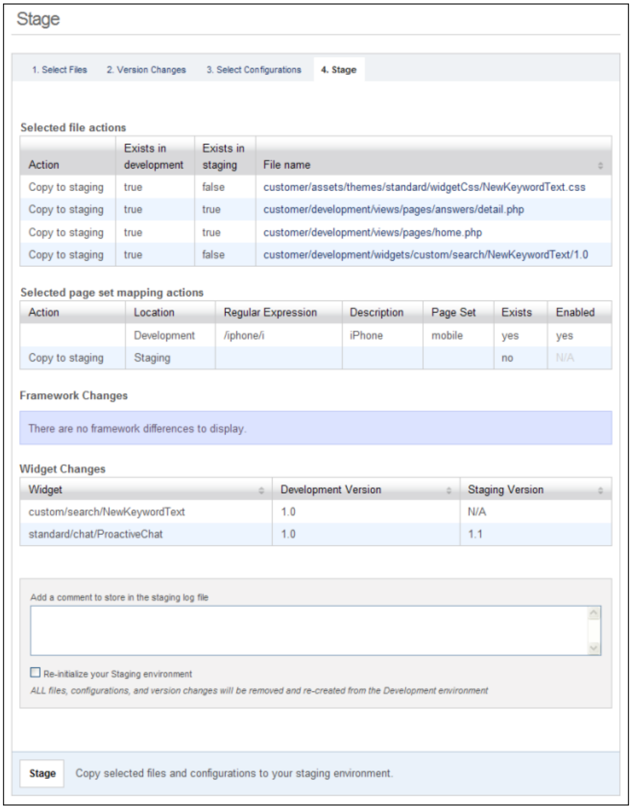


11 To copy a page set that you've enabled to the staging area, click the drop-down menu in the Actions column and select Copy To Staging.

Note If a page set has not been enabled, you will not be able to select Copy To Staging for that page set.

12 To remove a development page set from the staging area, click the drop-down menu in the Actions column and select Remove From Staging.

13 Click Next. (Alternately, you can click **4 Stage** at the top of the page.) The window summarizes your selections from the earlier pages of the staging process.



14 To store a comment in the staging log file, type a note in the field. You can enter up to 4,000 characters.

15 To re-initialize the staging environment, select the check box just above the Stage button.

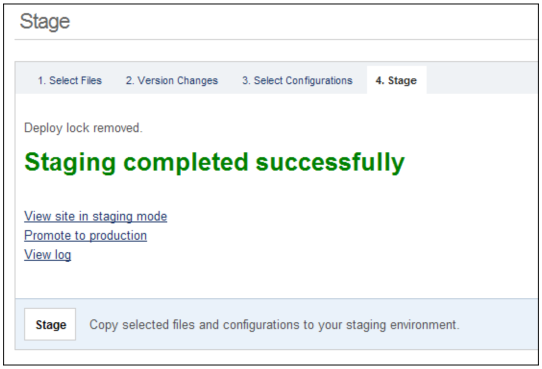
Important If you select this check box, you will lose any file and page set selections you have made during the staging process. Re-initializing means that all files in the staging area will be deleted and replaced with the complete set of development files. Additionally, all page set mappings, configuration settings, and version changes in the staging area will be deleted and replaced with their corresponding files or settings from the development area.

16 Click the Stage button. A message asks you to confirm that you want to copy the selected items to the staging area.

Note You will see a message if a deploy lock is in place. Clicking No cancels the staging operation and Yes will override the existing lock and continue with the staging operation. Use caution when clicking Yes because you may compromise another staff member's file promote if you start overwriting files in the staging area.

17 Click Stage to continue. When the process is complete, a window lets you know staging was successful. It also displays a link to view the log. If you staged the files from the Customer Portal Administration site, the window also contains links to the staging area, where you can view the pages, and a link to the Promote page.

Note If any widgets have been deleted (click here for information about deleting widgets), the message notifies you that the deleted widget has been deactivated in the staging environment. Also, if any of the widget versions are incompatible with the framework, a staging error occurs and identifies the incompatible widget.



Promoting

After you are satisfied with your staging area, you can promote the pages and files to production.

Note Before you can promote the staging area, the **profile** assigned to you must have the CP Promote permission enabled. You or your **administrator** can enable this permission if necessary.

Splash page for maintenance mode

The Customer Portal reference implementation includes a *splash.html* file in the */cp/customer/error* folder. The splash page is displayed to let your customers know that your site is undergoing maintenance.

To view the splash page

1 In a web browser, type `https://<your_site>/ci/admin`.

2 Click the Settings tab drop-down menu and select Preview Error Pages.

3 Click */cp/customer/error/splash.html* to view your splash page.

By default, your newly promoted production site is visible to customers immediately upon completion of the promote process. You might want a little more time to complete any manual tasks that may be required before making your changes public on the production site. If so, you can manually turn on the splash page.

Note Your development and staging pages, WebDAV access to your customer portal files, and the Customer Portal Administration site are unaffected by this configuration setting.

To manually turn on the splash page

1 Log in to Oracle Service Cloud.

2 Use the procedure described in [To locate and edit configuration settings]() to locate CP_-MAINTENANCE_MODE_ENABLED under RightNow User Interface > Customer Portal > General.

3 Click the drop-down menu in the Value field and select Yes.

4 Click the Save button on the ribbon. Visitors to your production site will continue to see the splash page until you reset CP_MAINTENANCE_MODE_ENABLED to No.

Promoting the customer portal pages

To promote your customer portal pages

1 Log in to Oracle Service Cloud.

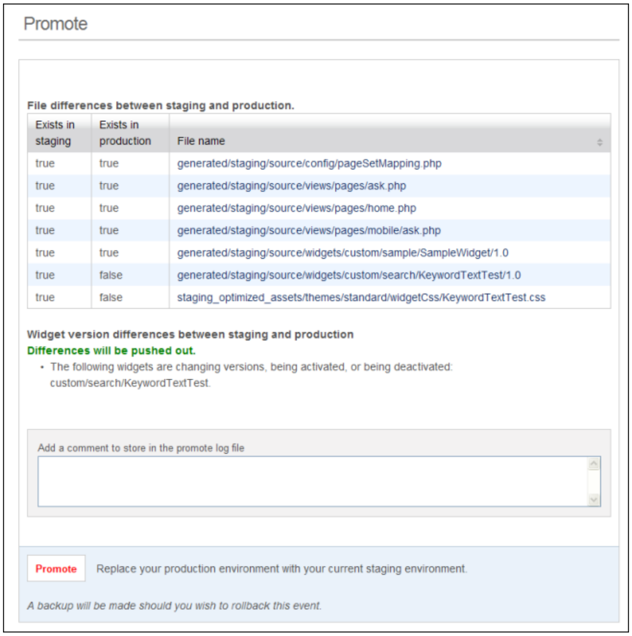
Note Alternately, you can use the **Customer Portal Administration site** instead of the **administration interface** by typing `https://<your_site>/ci/deploy/promote`. Resume this procedure at step 6.

2 Click the Configuration button on the navigation pane.

3 Double-click Customer Portal under Site Configuration.

4 Select the interface you want to promote from the Interfaces column.

5 Click the Promote button on the ribbon. The window shows you the list of edited files and configurations and notes whether the file or configuration exists in the staging and production areas.

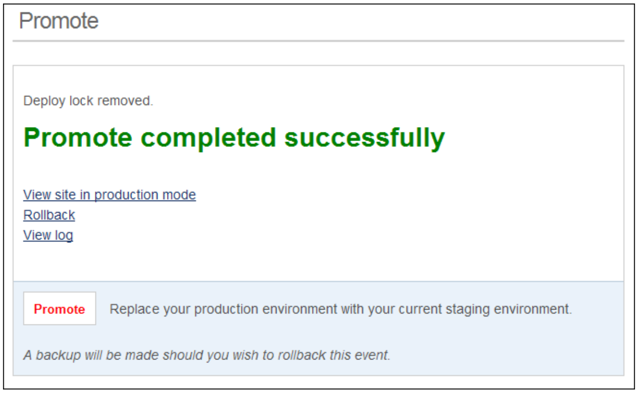


6 To store a comment in the log file, type a note in the field. You can enter up to 4,000 characters.

7 Click the Promote button at the bottom of the page. A message asks you to confirm that you want to replace your current production area with the files from the staging area.

Note You will see a message if a deploy lock is in place. Clicking No cancels the promote operation and Yes will override the existing lock and continue with the promote. Use caution when clicking Yes because you may overwrite another staff member's work.

8 Click Promote to continue. When the process is complete, a window lets you know the promote process was successful. It also displays a link to view the log. If you promoted the files from the Customer Portal Administration site, the window also contains a link to the production area, where you can view the promoted pages, and a link to the Rollback page.



Rolling back

If you promoted your staging area into production and then later realized you did not want to do that, you can use the Rollback feature to revert to the prior production pages. Your profile must contain the CP Promote permission before you can perform the rollback process. Rollback is disabled if the site has not yet been promoted, such as after an upgrade, or if the site has already been rolled back.

To roll back the most recent promote process

1 Log in to Oracle Service Cloud.

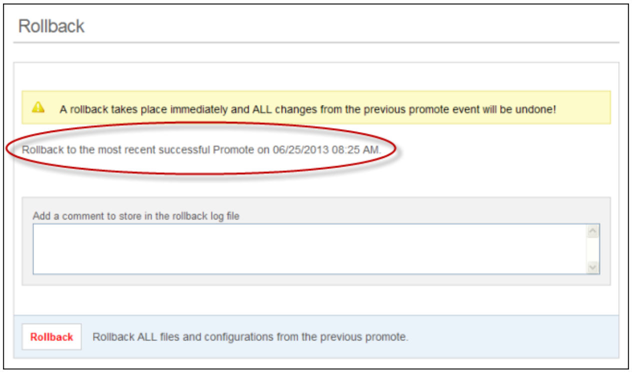
Note Alternately, you can use the **Customer Portal Administration site** instead of the **administration interface** by typing `https://<your_site>/ci/deploy/rollback`. Resume this procedure at step 6.

2 Click the Configuration button on the navigation pane.

3 Double-click Customer Portal under Site Configuration.

4 Select the interface you want to roll back from the Interfaces column.

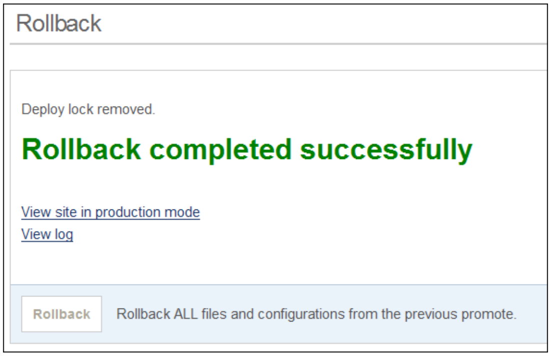
5 Click the Rollback button on the ribbon. The window lists the promote operation that will be rolled back. This will always be the most recent promote.



6 To store a comment in the log file, type a note in the field. You can enter up to 4,000 characters.

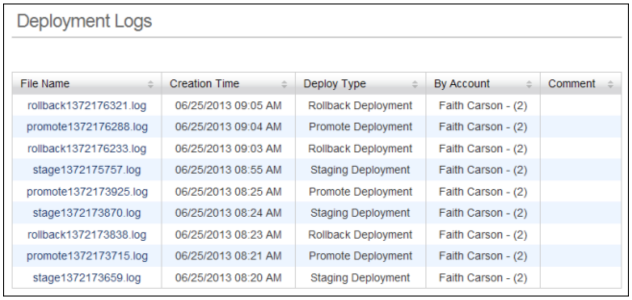
7 Click the Rollback button at the bottom of the window. A message asks you to confirm that you want to roll back the most recent promote operation.

8 Click Rollback to continue. When the process is complete, a window lets you know the rollback process was successful. It also displays a link to view the log. If you rolled back the files from the Customer Portal Administration site, the window also contains a link to the production area.



Viewing deployment logs

The Customer Portal editor on the **administration interface** includes a list of deployment logs sorted in descending order by date. It also lists the type of deployment and the staff member who initiated the deployment. Deploy types include Stage, Promote, and Rollback. Other deploy types include Service Packs and Upgrades. You can also view deployment logs from the **Customer Portal Administration site**.



Deployment Logs

File Name	Creation Time	Deploy Type	By Account	Comment
rollback1372176321.log	06/25/2013 09:05 AM	Rollback Deployment	Faith Carson - (2)
