Security Practices

Core Features

The following sections are intended for administrators and staff members. They contain information and procedures for configuring and using the core features that are common to Oracle Service Cloud products and features.

May 2015 Release Notes

Today's consumers are empowered like no other time in history. Although they've always expected to be listened to, supported, and valued, never before have consumers had the tools at their disposal to ensure those expectations become reality. Oracle Service Cloud, the customer experience suite, delivers comprehensive customer experience applications that drive revenue, increase efficiency, and build loyalty.

For a listing of the hardware and software requirements for all Oracle products, log in to our support site and access Answer ID 31. For information about upgrading from earlier versions, click the link for your specific upgrade path on the Upgrade Guides page.

Major new features

Single sign-on support for external identity providers

You can now use external identity providers (IdP) to log in to Oracle Service Cloud and other service provider (SP) applications such as Oracle Sales Cloud and Oracle Policy Automation Cloud Service. The IdP can be Oracle Identity Management, a third-party product, or an application developed internally. This lets agents log in once to be authenticated across several SP applications. Single logout is also supported, so when agents log out of any SP application, they are also automatically logged out of the IdP and any other SPs they were logged in to.

Note Deployments involving Oracle Service Cloud and Oracle Sales Cloud use Oracle Identity Management since it is bundled with the Sales Cloud application.

When using an external IdP, the IdP's login page is embedded in the Oracle Service Cloud Login window, letting staff members log in without having to directly access a separate login page. After successfully logging in to the IdP, the IdP generates an encrypted SAML token and passes it to Oracle Service Cloud. This method increases security since user IDs and passwords are not sent between the applications.

After being authenticated in Oracle Service Cloud, it then provides authentication services to other SPs, alleviating the need to integrate them and the external IdP.

Connect REST API

In the May 2015 release of Oracle Service Cloud, the new Connect REST API allows customers and partners to integrate with the Oracle Service Cloud platform using representational state transfer (REST) web services. Connect REST API is a public API that leverages the Connect Common Object Model version 1.3. It follows the Oracle REST standard and supports CRUD operations. To use the Connect REST API, contact your Oracle account manager.

Connect Common Object Model version 1.3

The May 2015 release of Oracle Service Cloud introduces version 1.3 of the Connect Common Object Model (CCOM). You can take advantage of this new CCOM version using Connect Web Services for SOAP (Connect Web Services), Connect PHP API, ROQL, and Connect REST API. CCOM version 1.3 provides synchronized metadata among Connect PHP API, ROQL, and Connect Web Services, and provides operation-specific metadata in Connect Web Services.

Also in CCOM version 1.3, ROQL blacklisting behavior has been changed so that candidate blacklist queries are allowed to run by default and are subject to further analysis. Fifteen new operations and properties have also been added to CCOM.

Service collaboration

An enhancement to service collaboration now lets agents get assistance from external users such as subject matter experts (SME) who are not agent desktop users. For example, non-agent users, such as engineers, product experts, and analysts, can be brought together to answer complex questions or contribute to solving an incident.

After you have Collaboration configured on your site and enabled, the External User check box displays on the Other tab of the Profiles editor. Selecting this check box designates that the profile contains only external users. These users can collaborate in conversations with agents, but are not charged to your organization as named users for licensing compliance purposes. External users can log in to the collaboration service directly via a web browser or supported mobile device, but cannot use the Service Console.

Additional new features and other changes

Oracle Service Cloud

- **New content on the Login window**—In the May 2015 release, you will see new content on the banner area of the Login window. The Oracle web page that displays promotes releases, webinars, and events, and lets you click links to perform actions such as signing up for a newsletter or joining a community. The banner area can also be customized to include your organization's own unique content and branding.
- **Oracle Policy Automation for mobile devices**—Customers can deploy their own policy models to the Oracle Policy Automation (OPA) mobile application, available for iOS and Android devices. Once rules and screens are modeled in Oracle Policy Modeling and downloaded by the mobile application, you can perform full, offline interviews using the mobile device application.

Service

Incident thread masking—Additional checks have been added to the 13- and 14-digit masking logic so that it closely matches 13-digit (Visa) and 14-digit (Diners Club) credit card number patterns and reduces the possibilities of false matches.

Customer Portal

Important Be sure to review the changelog for Framework Version 3.2 on the Customer Portal Administration site at https://<your_site>/ci/admin/versions/manage/#tab=1&framework=3.2 to see framework changes beyond those listed here.

Widget changes

- **Nano changes**—The utils/CobrowsePremium widget has had a nano change in this version of the Customer Portal. A nano change is fully backward compatible and is applied automatically to your widget files with no impact to your customer portal. To review the changes, go to the widget documentation page on the Customer Portal Administration site and read the changelog entry for the most recent version.

- **Minor changes**—The following widgets have had a minor change in this version of the Customer Portal. You can update your widgets to the latest version if you choose, but the change is not automatically applied. To review the changes, go to the widget documentation page on the Customer Portal Administration site and read the changelog entries for the most recent version.
  - ▷ input/BasicProductCategoryInput
  - ▷ knowledgebase/GuidedAssistant
  - ▷ notifications/ProdCatNotificationManager
  - ▷ output/FileListDisplay
- **Major changes**—The following widgets have had a major change in this version of the Customer Portal. These changes are not backward compatible. To review the changes to decide if you want to incorporate one of the new widgets, go to the widget documentation page on the Customer Portal Administration site and read the changelog entries for the most recent version.
  - ▷ input/ProductCategoryInput
  - ▷ input/SmartAssistantDialog
  - ▷ search/ProductCategorySearchFilter

Social Experience

- **New Social Monitor cloud results report column**—A new hidden column, Appended Incidents, has been added to the Social Monitor by Search, Conversations by Channel, and Private Messages by Channel Account cloud results reports. When this column is displayed, use Click to View to drill down to a report listing all incidents that cloud result have been manually or automatically appended to, and then click an incident to open it.
- **New Social Monitor configuration setting**— The SOCIAL_MONITOR_CONVERSATION_TRACKING_DEADLINE configuration setting specifies the number of days the system will track a conversation after an agent responds to a Social Monitor incident. Once the time period is exceeded, the incident will be removed from the conversation tracking, and any subsequent posts in the conversation will not be auto-appended as threads in the incident.

Release notes for previous versions

Click any of the following links to access release notes for a previous version.

1

Deploying Oracle Service Cloud

The Oracle Service Cloud Smart Client is deployed on your staff workstations to provide access to Oracle Service Cloud. Oracle Service Cloud uses Microsoft's Click-Once industry standard technology for deployment of the client application to staff workstations. This provides the following benefits:

- New versions of Oracle Service Cloud can be downloaded without redeploying the client.
- Service packs are applied automatically.
- Workstation administrative permissions are not required for staff members.
- Deployment requires little to no involvement from your IS staff.

Note If you are deploying Oracle Service Cloud in a Citrix environment, contact customer support to discuss your deployment needs by sending email to installer@mailca.custhelp.com.

Click-Once deployment

When you deploy the smart client, all necessary components and files are automatically downloaded to your workstation (refer to Application deployment process). After this is complete, your staff can immediately log in and begin configuring and customizing your application. To access the same site in the future, you can launch the client by selecting Start menu > All Programs > RightNow > RightNow (<your_site>).

The client application is site-based, meaning that a separate client must be deployed for each site you access. However, a single client application can be used to access all interfaces on a single site. Interfaces are added to the client in the same way the client is deployed. Simply access the interface's Launch page and click the Install Oracle Service Cloud button (as described in the following procedure), and the deployment tool will add the interface to the Interface drop-down menu on the client's Login window.

Important Before deploying the client application, be sure to review the system requirements (Answer ID 31) and the environmental configuration information (Answer ID 2364) on our support site.

If you are performing a large-scale deployment of Oracle Service Cloud, refer to Deploying Oracle Service Cloud to multiple staff members.

To download the Oracle Service Cloud client and log in

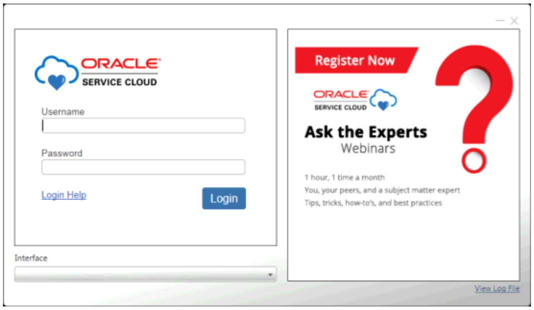
Important Cookies must be enabled on your workstation in order to work in the application.

1 Open your web browser and type the following URL.

```
http://<your_site>.custhelp.com/cgi-bin/<your_interface>.cfg/php/
admin/launch.php
```

2 Click Install Oracle Service Cloud. A security message warns you that the application should not be installed unless you know that it is from a trusted source.

3 Click Install. Once Oracle Service Cloud downloads to your workstation, the Login window opens.



Note To view all deployment files and processes, click View Log File. Refer to Application structure.

You can configure several login options for your application, including login help and Login window customizations. Other login options can help you control and track login behavior.

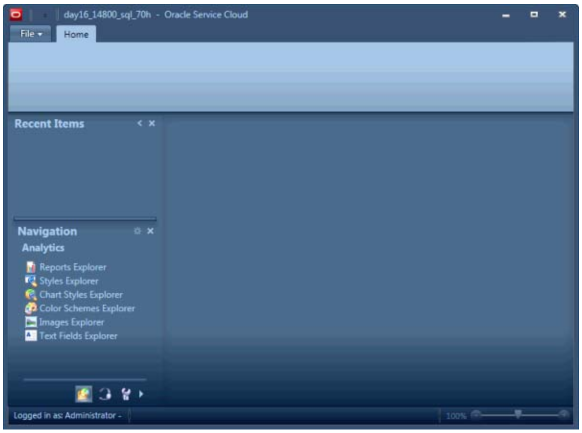
4 Type `administrator` in the Username field. You must enter this user name the first time.

5 Type the password assigned when your site was created. After logging in the first time, you must change your password.

User names and passwords are case sensitive. Keep this in mind as you add staff accounts.

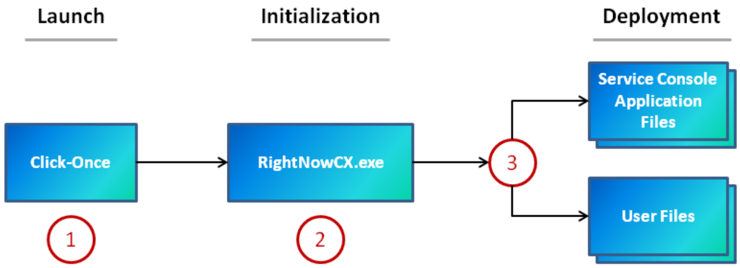
Tip The Interface field displays the name of the interface from which you launched the installer. This drop-down menu will also contain the names of any additional interfaces you install for this site, beginning with the first interface installed.

6 Click Login. The Service Console opens after the system updates and loads all necessary support files.



Application deployment process

When you deploy Oracle Service Cloud, the following process occurs.



1 Click-Once downloads the Oracle Service Cloud application, verifies that its deployment files are current (updating them if necessary), and launches the application.

2 The application prompts you to log in and verifies the credentials you enter.

3 The application deploys the appropriate version application and user files and initializes the smart client. You are now logged in to Oracle Service Cloud.

After Oracle Service Cloud is deployed to your workstation, you can access it in the future by selecting Start menu > All Programs > RightNow > RightNow (<your_site>).

Important Each time you start the application, the Click-Once function will make sure Oracle Service Cloud is current, downloading new files and libraries as needed to keep your deployment up-to-date with each release. For this reason, there is no need to uninstall and reinstall the application following an upgrade.

When logging in after an upgrade, Oracle Service Cloud streamlines the deployment by removing from the workstation any application files (such as program binaries) for versions previously run for the same site. However, user settings and cache files are retained to ensure a smooth transition and consistent experience for staff members.

The deployment process can be customized to ease the load on network bandwidth and disk space during large-scale deployments, operations, and updates of Oracle Service Cloud. For custom deployment options, refer to Deploying Oracle Service Cloud to multiple staff members.

Service pack deployment

Oracle issues service packs to enhance the product release cycle of Oracle Service Cloud. Six iterations are delivered on a regular schedule following the general availability of each major quarterly release. Oracle's automated service pack deployment process provides a simplified change management methodology, promptly delivering code and performance improvements without the need to perform a full upgrade. Service pack updates are deployed using a background process that requires no involvement from your IS team, minimizes impact on your network bandwidth, and is seamless to customers and staff members. For more about service pack deployment, refer to Answer ID 2525 on our support site.

Auto Upgrade Program

The Auto Upgrade Program is for organizations that want the latest version of Oracle Service Cloud by upgrading to each new quarterly release. By upgrading automatically, you get access to the latest features of Oracle Service Cloud while streamlining the upgrade process.

Sites that use standard product functionality and configuration options qualify for the Auto Upgrade Program. Sites that use customizations can qualify for the Auto Upgrade Program if the custom capability is built within the Connect APIs. To see if your site qualifies, contact your Oracle technical migration manager or account manager for a review of your implementation.

After your site is enrolled in the Auto Upgrade Program, an upgrade will be initiated for the site each quarter. An upgrade site and cutover date will be automatically generated, with notifications to your organization sent through an incident generated on our support site. The upgrade site will be available for you to test before cutover. You can change the upgrade cutover date if necessary. Any questions or problems during testing can be reported to customer support, which will be available to assist you during each upgrade cycle.

Starting with the May 2014 release, new sites are automatically enrolled in the Auto Upgrade Program. For more information, refer to Answer ID 6409 on our support site.

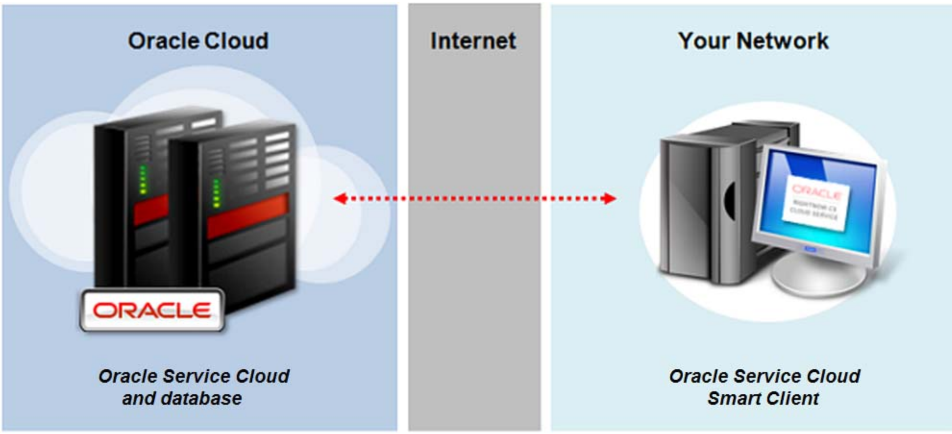
Application structure

Becoming familiar with the application's file structure can be helpful when considering custom deployment options or troubleshooting problems. The following overview describes the smart client directory structure and provides brief definitions of the major files and directories.

When Oracle Service Cloud is fully deployed to a workstation, the Click-Once deployment tool creates the following directories and files in the *%USERPROFILE%\AppData\Local\Apps\2.0* directory.

- <Alphanumeric string>—Contains client executables, cached libraries, and manifest files.
- *Data*—Contains user-specific settings and cache files.

In addition, a set of application resources is downloaded to the Windows user profile of each staff member. By default, these are placed in the *%APPDATA%\RightNow_Technologies\ <your_site>\<version>* directory.



These resources fall into the following three categories.

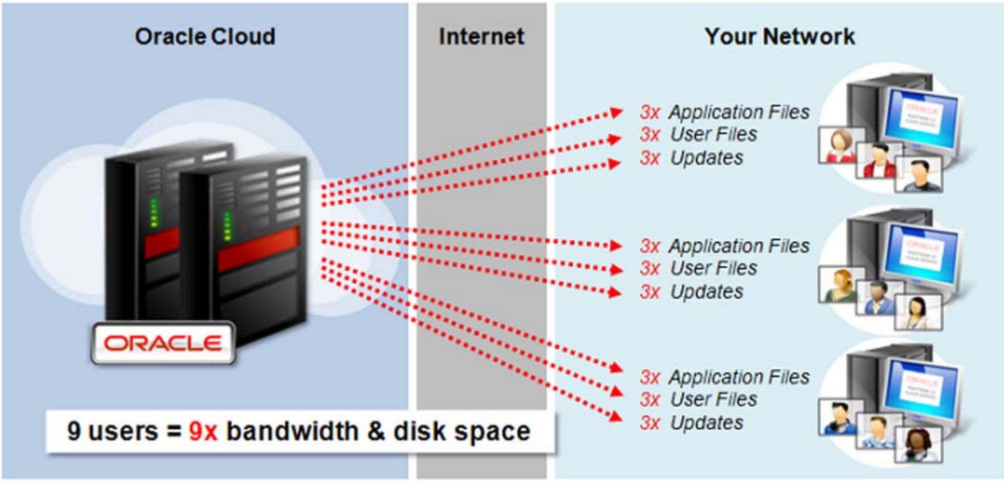
- **Application files**—The binary (.dll) and client files that comprise the extracted application. Upon deployment, these files are downloaded to the *<your_site>\<version>* directory and two subdirectories, *AddInPipeline* (containing add-in libraries) and *RN_COM* (containing the Redemption library used for Outlook integration).
- **User files**—The user-specific files written and used by the application, including user settings, downloaded file attachments, cache files, message base strings, and any add-ins to which the staff member has access. The user files are placed in the *<your_site>\ <version>\Users* subdirectory.
- **Updates directory**—Each time Oracle Service Cloud starts, it checks Oracle's cloud servers to see if there are new versions of the application files available, such as those provided by a service pack release. When an update is found, it is automatically downloaded to the *<your_site>\<version>\Updates* subdirectory as a zip file. The updated files are then extracted and moved to the application files location. The zip file and directory are removed following the update.

Note For custom deployment options, refer to Deploying Oracle Service Cloud to multiple staff members.

All deployment files and processes are logged in a time-stamped file called <yyyy.MM.dd.HHmm.ssffff>.log.txt, found in the <*your_site*>*logs* directory. The log for the current session can also be accessed by clicking View Log File on the Login window. Log files are saved for seven days following deployment and are then automatically deleted to conserve disk space.

Deploying Oracle Service Cloud to multiple staff members

When deploying Oracle Service Cloud to a large team, it is important to consider the impact of the deployment process on your network resources. When each staff member initially logs in to the application, client files and libraries that support the application's activity are downloaded to the workstation (refer to Application structure). Depending on the number of staff members and workstations, these individual downloads can consume significant bandwidth and disk space.



To reduce the impact of deployments and software updates on your resources, the application provides three custom deployment options. These settings allow for great flexibility and efficiency of scale when deploying Oracle Service Cloud to large numbers of workstations. All three options can be used together to dramatically lower the use of the local hard drive on agent workstations.

Important A few basic distribution items such as lock, logging, and settings files will always be written to the Windows profile directory. This occurs before agent login and therefore cannot be redirected to a custom location through configuration of the application. If you want to prevent any client files from being written to the workstation hard drive, you must implement Windows redirected profiles.

To greatly reduce the resources required to complete a large-scale deployment, we recommend the following process.

Step 1—Log in to Oracle Service Cloud and define one or more custom deployment options, based on resource availability.

- Sharing application files
- Storing user files on a network drive
- Sharing update files

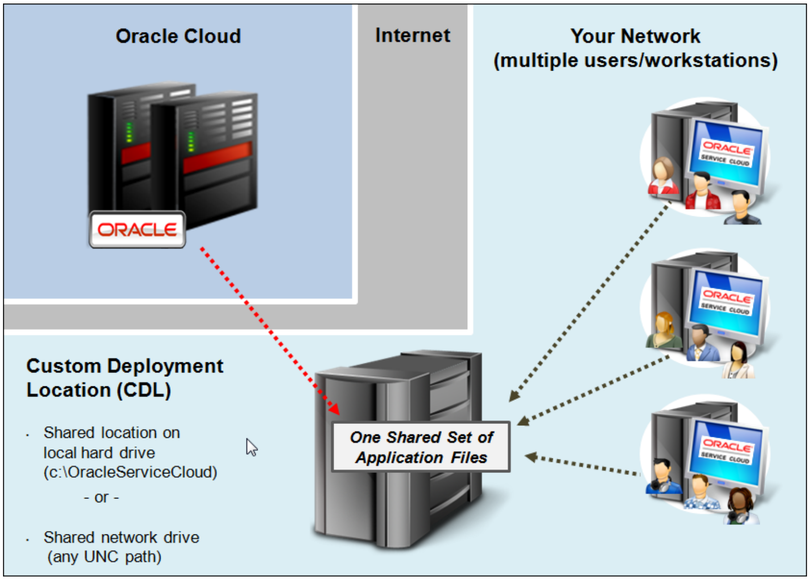
Step 2—Using the Click-Once deployment tool, deploy the application to one workstation. Refer to Click-Once deployment. This will download the deployment files to the custom locations you have defined.

Step 3—Complete the deployment by instructing all staff members to log in. The deployment process on each workstation will access the files from the custom locations, resulting in a much smaller resource impact than using the standard deployment procedure.

Sharing application files

When multiple staff share a single workstation, a full set of application files is placed in the Windows user profile of each staff member. These application files are identical for all staff members, as they do not include personal settings. To save disk space and avoid unnecessary redundancies, you can define a custom deployment location (CDL) to serve a single set of application files to multiple staff members. This location can be a directory on the workstation itself, or any path in universal naming convention (UNC) format.

When this option is enabled, the full set of application files is downloaded only once from the Oracle servers to the location you define, conserving bandwidth. This set of files can then be shared from the custom location by multiple staff members, conserving disk space. Even greater savings can be achieved when you store this set of files on a network drive, allowing it to be shared by staff members across multiple workstations.



You can define a CDL for your entire site, for specific profiles, or both. If both are defined, the location defined in the profile will override the location defined for the site for all staff members who share that profile.

To define a custom deployment location for a site

Set the CUSTOM_DEPLOYMENT_LOCATION configuration setting to the location you want. Refer to the online documentation.

Note If your site contains multiple interfaces, this setting must be consistent for all interfaces.

To define a custom deployment location for a profile

1 Log in to Oracle Service Cloud on an administrator's workstation.

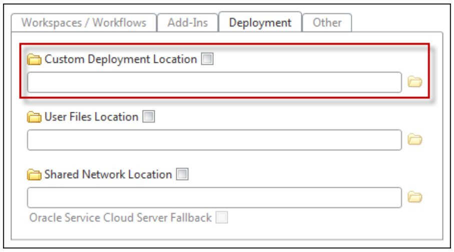
2 Click the Configuration button on the navigation pane.

3 Double-click Profiles under Staff Management. The report opens on the content pane, listing the profiles created for your site.

4 Double-click a profile to edit it. The Profiles editor opens.

5 Click the Deployment tab to display custom deployment settings.

6 Select the Custom Deployment Location check box.



7 Click the Browse button to the right of the field. The Browse for Folder window opens.

Tip As an alternative to browsing for a location, you can click the text field and type the path you want. This setting supports any UNC path or local directory name, such as C:\OracleServiceCloud.

8 Select a location for the custom deployment directory that is outside of the profile directory.

Or

Click the Make New Folder button to create a folder.

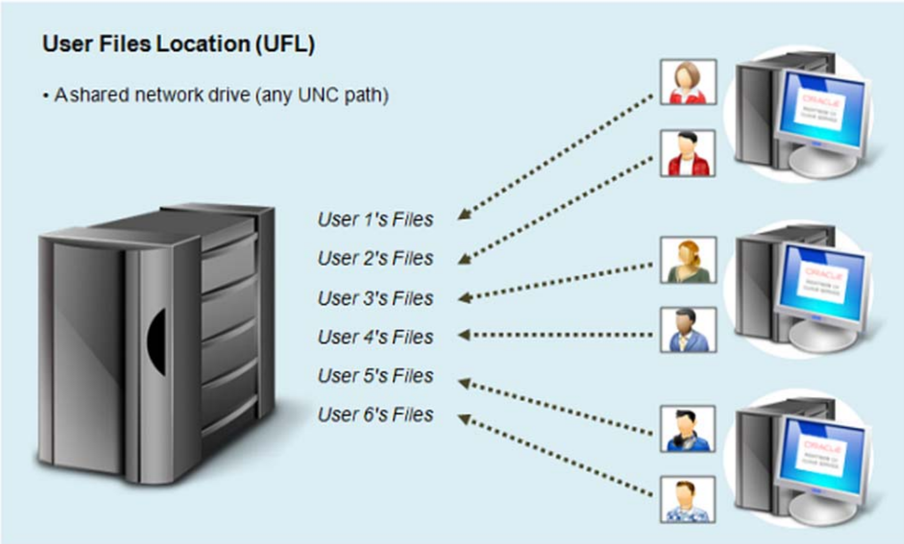
Important Staff members associated with the profile must have permission to create the directory you define (if it does not yet exist) as well as the ability to write and execute files in that directory. If a staff member does not have these permissions, the deployment tool will cease deployment of the files and prompt the staff member to contact an administrator to resolve the problem.

9 Click the OK button to close the window.

10 Click the Save and Close button to save your changes.

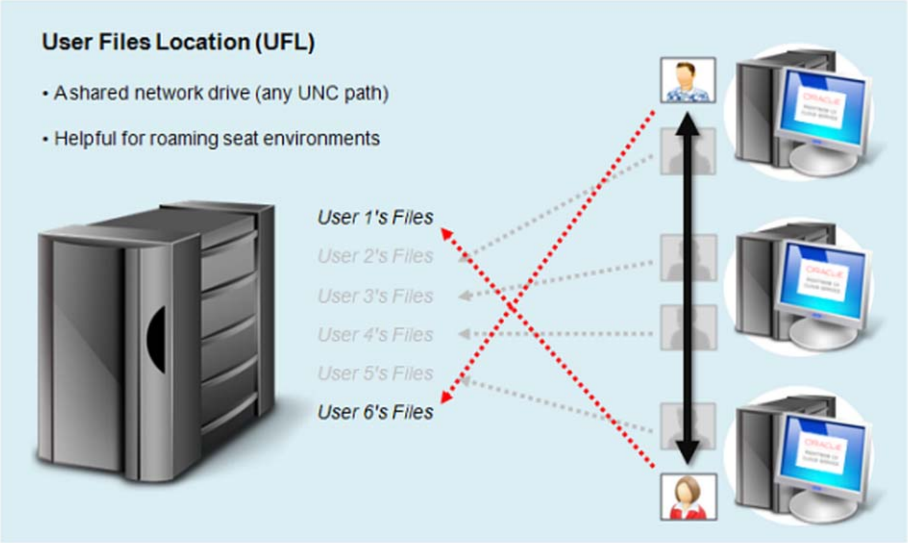
Storing user files on a network drive

When deploying to multiple staff members and workstations, you can define a custom user files location (UFL) for storing private user files that are used to run the Service Console. By default, these files are stored within each staff member's Windows profile. With this option, you can redirect them to a network drive.



Caution When specifying a shared network location for user files, make sure the location you define has adequate resources to serve these files efficiently to all of your staff members. Because these files support user processes in the application, they must be served efficiently in order to avoid system latency.

This option is also useful if your staff members roam among different workstations. When a UFL is defined, each staff member will access a single set of user files regardless of what workstation is used.



You can define a UFL for your entire site, for specific profiles, or both. If both are defined, the location defined in the profile will override the location defined for the site for all staff members who share that profile.

To define a user files location for a site

Set the USER_FILES_LOCATION configuration setting to the location you want. Refer to the online documentation.

Note If your site contains multiple interfaces, this setting must be consistent for all interfaces.

To define a user files location for a profile

1 Log in to Oracle Service Cloud on an administrator's workstation.

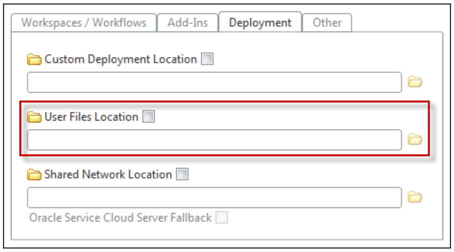
2 Click the Configuration button on the navigation pane.

3 Double-click Profiles under Staff Management. The report opens on the content pane, listing the profiles created for your site.

4 Double-click a profile to edit it. The Profiles editor opens.

5 Click the Deployment tab to display custom deployment settings.

6 Select the User Files Location check box.



7 Click the Browse button to the right of the field. The Browse for Folder window opens.

Tip As an alternative to browsing for a location, you can click the text field and type the path you want. This setting supports any UNC path.

8 Select a location for the user files directory, generally somewhere inside the staff member's profile directory.

Or

Click the Make New Folder button to create a folder.

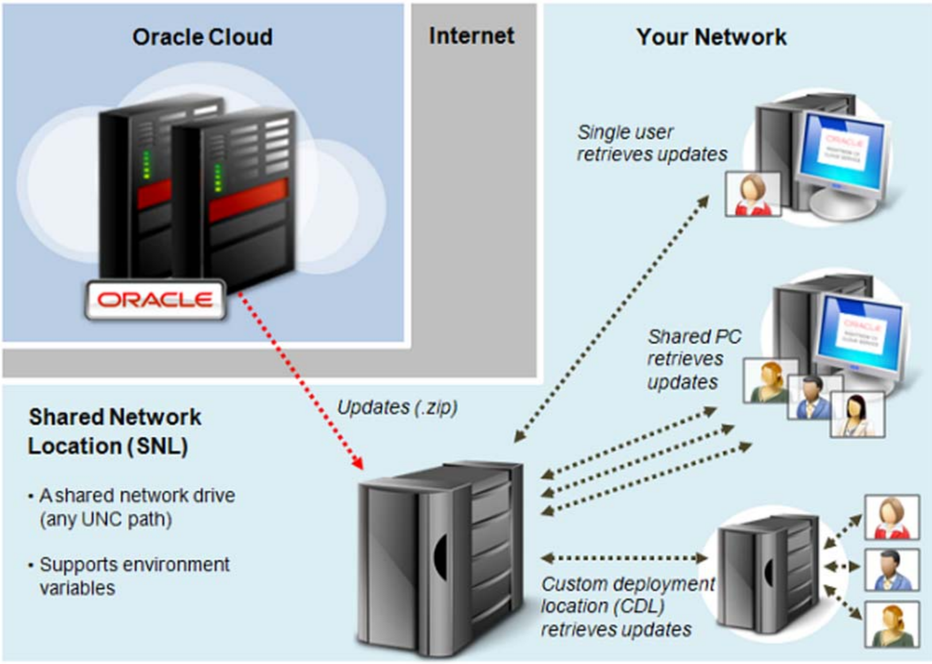
Important Staff members associated with the profile must have permission to create the directory you define (if it does not yet exist) as well as the ability to write and execute files in that directory. If a staff member does not have these permissions, the deployment tool will cease deployment of the files and prompt the staff member to contact an administrator to resolve the problem.

9 Click the OK button to close the window.

10 Click the Save and Close button to save your changes.

Sharing update files

To reduce the bandwidth and disk space required for application updates, you can define a shared network location (SNL) for storing and applying updates. This option can greatly reduce the impact of updating multiple workstations by locally mirroring the update content from the Oracle host servers. The first client to detect an available update will download the zip file to the location you define and extract the contents to its application files location. The zip file is then retained so it can be extracted by the remaining clients upon subsequent logins.



Note By default, updates are automatically downloaded to the *Updates* subdirectory of the application files location. For this reason, if a custom deployment location (CDL) has been specified (refer to Sharing application files), update files will already be shared from that location's *Updates* subdirectory just as they would be if the same location were defined in this setting.

However, you can still use this setting to define a different location to store updates if you prefer to do so. For example, if the CDL you have defined is on the workstation hard drive, you can still reduce resource impact by downloading updates to a shared network location.

You can also specify the protocol used to perform the updates, and enable the Oracle servers as a fallback resource should the location you define become unavailable, such as during server maintenance.

You can define an SNL for your entire site, for specific profiles, or both. If both are defined, the location defined in the profile will override the location defined for the site for all staff members who share that profile.

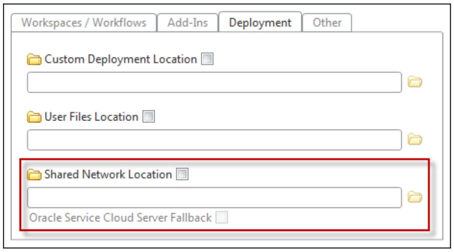
To define a shared update files location for a site

1. Set the SHARED_NETWORK_LOCATION configuration setting to the location you want. Refer to the online documentation.
2. To enable the Oracle servers as a fallback resource should the location you define become unavailable, set the RNT_SERVER_FALLBACK configuration setting to Yes.

Note If your site contains multiple interfaces, these settings must be consistent for all interfaces.

To define a shared update files location for a profile

1. Log in to Oracle Service Cloud on an administrator's workstation.
2. Click the Configuration button on the navigation pane.
3. Double-click Profiles under Staff Management. The report opens on the content pane, listing the profiles created for your site.
4. Double-click a profile to edit it. The Profiles editor opens.
5. Click the Deployment tab to display custom deployment settings.
6. Select the Shared Network Location check box.



7 Click the Browse button to the right of the field. The Browse for Folder window opens.

Tip As an alternative to browsing for a location, you can click the text field and type the path you want. This setting supports any UNC path.

8 Select a shared directory on the network.

Or

Click the Make New Folder button to create a folder.

Important Staff members associated with the profile must have permission to create the directory you define (if it does not yet exist) as well as the ability to write and execute files in that directory. If a staff member does not have these permissions, the deployment tool will cease deployment of the files and prompt the staff member to contact an administrator to resolve the problem.

9 Click the OK button to close the window.

10 To obtain update files from the Oracle servers as a fallback in the event the network location is inaccessible, select the Oracle Service Cloud Server Fallback check box.

11 Click the Save and Close button to save your changes.

2

Getting Started for Administrators

Today's consumers are empowered like no other time in history. Although they've always expected to be listened to, supported, and valued, never before have consumers had the tools at their disposal to ensure those expectations become reality. Oracle Service Cloud, the customer experience suite, delivers comprehensive customer experience applications that drive revenue, increase efficiency, and build loyalty.

Downloading Oracle Service Cloud

Once you download Oracle Service Cloud, all of the necessary components are automatically installed so you can begin configuring and customizing your application immediately. However, before you get started, you will want to review the system requirements in Answer ID 31 and the environmental configuration information in Answer ID 2364 on our support site.

To download the Oracle Service Cloud client and log in

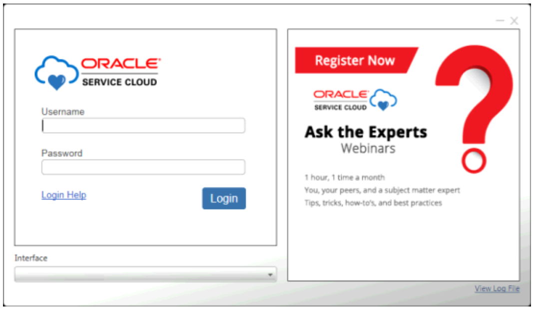
Important Cookies must be enabled on your workstation in order to work in the application.

1 Open your web browser and type the following URL.

```
http://<your_site>.custhelp.com/cgi-bin/<your_interface>.cfg/php/
admin/launch.php
```

2 Click Install Oracle Service Cloud. A security message warns you that the application should not be installed unless you know that it is from a trusted source.

3 Click Install. Once Oracle Service Cloud downloads to your workstation, the Login window opens.



Note To view all deployment files and processes, click View Log File. Refer to Application structure.

You can configure several login options for your application, including login help and Login window customizations. Other login options can help you control and track login behavior.

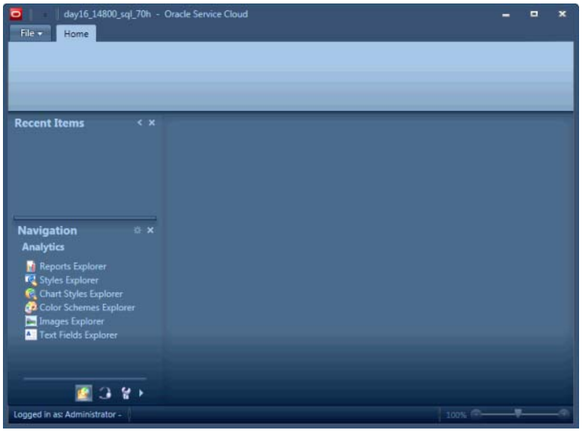
4 Type `administrator` in the Username field. You must enter this user name the first time.

5 Type the password assigned when your site was created. After logging in the first time, you must change your password.

User names and passwords are case sensitive. Keep this in mind as you add staff accounts.

Tip The Interface field displays the name of the interface from which you launched the installer. This drop-down menu will also contain the names of any additional interfaces you install for this site, beginning with the first interface installed.

6 Click Login. The Service Console opens after the system updates and loads all necessary support files.



Initial setup

The administrator login you used to download Oracle Service Cloud is a special account, meaning it is not a defined **staff account** and has no **profile** or **navigation set** associated with it. Consequently, your access to functionality is limited to the Analytics **explorers**, the administrator's **notifications**, and a default **configuration list**. This list contains essential items for initially configuring your application so your staff can begin working.

Before you get started, it's important to understand how navigation sets, profiles, and staff accounts work together as you initially configure your application.

Navigation sets, profiles, and staff accounts

No staff members can work in your application without a navigation set. Navigation sets control the navigation lists and buttons that staff members see on the console's navigation pane. You can create unique navigation sets for staff members who have any combination of responsibilities, such as working with incidents, maintaining answers in your knowledge base, and creating mailings and surveys.

Staff members must also be associated with a profile to give them permission to add and edit **reports**, **records**, and other items. You can create as many profiles as you need based on the areas that staff members will work in and the functionality they need to access. When you create profiles, you must assign a default navigation set to each profile.

It's important to consider the security of your site when granting staff members permissions. Refer to Using role access to define permissions for information about protecting your site when assigning staff member profile permissions. To learn how you can develop a security plan that fits the needs of your organization, see Developing a Security Plan.

The final element all staff members need is a staff account, which contains the login information they'll need to access the application.

Configure the initial setup for your staff in this order.

1. Create navigation sets consisting of navigation buttons and their associated navigation lists.
2. Create profiles and assign a navigation set to each profile.
3. Create a staff account for each staff member and assign a profile to each staff account.

Since you need access to all functionality, the first navigation set and profile you'll create is your own (see Creating a navigation set for the administrator). Then, add a staff account for yourself and begin using your new login information.

Tip If you intend to use custom **workspaces** instead of the default standard workspaces, you might want to create your custom workspaces before creating profiles, since you assign the workspaces staff members use in their profiles. However, if you decide to create your profiles and staff accounts first, you can always update profiles later with the custom workspaces. Refer to Creating custom workspaces.

- ❖ Creating navigation sets
- ❖ Customizing profiles
- ❖ Managing staff accounts
- ❖ Creating custom workspaces

Determining the functionality your organization needs

In order to configure your application with all the functionality your organization needs, it makes sense to identify those needs before creating your own navigation set. And while you can update any navigation set after you create it, we recommend doing it beforehand to save time and work.

Answers to the following questions can help determine what additional functionality beyond the defaults you want to use. If you answer Yes to any question, contact your Oracle account manager to enable the product or component.

1 Do you plan to use **Oracle RightNow Outreach Cloud Service** (Outreach) to communicate with your customers through mailings and campaigns and **Oracle RightNow Feedback Cloud Service** (Feedback) to survey your customers and prospects? If Yes, enable Outreach and Feedback. Refer to Creating mailings, Creating campaigns, and Creating surveys.

2 Do you want your sales staff to be able to manage and track all opportunity and related organization and contact information, and track quote interactions sent to customers and prospects? If Yes, enable **Oracle RightNow Opportunity Tracking Cloud Service** (Opportunity Tracking). Refer to Working with opportunities and Preparing quotes.

3 Do you want to take advantage of the power of social networking by providing your own social channels where your customers can interact with one another and your staff? If Yes, enable a **community** in **Oracle RightNow Social Experience** (Social Experience). Refer to Communities.

4 Do you want your staff to be able to monitor conversations taking place on the social web regarding your organization and its products and services? If Yes, enable **Oracle Right-Now Social Monitor Cloud Service** (Social Monitor). Refer to Social Monitoring.

Important Those products that are not enabled by default, Outreach and Opportunity Tracking, must be enabled in order for certain items to appear in the default list of configuration items for the administrator special account. For instance, if you want **tracked link categories** and the **external suppression list** to appear in your list of configuration items, contact your Oracle account manager to enable Outreach before you start this procedure. Likewise, if you want the **product catalog**, **price schedules**, **strategies**, **quote templates**, **territories**, and **sales periods** in your list of configuration items, Opportunity Tracking must be enabled. If you create navigation sets before Outreach and Opportunity Tracking are enabled, you will have to manually add those items to the list of configuration items for the Configuration button once the products are enabled.

Additionally, Feedback is not enabled by default, and while there are no configuration items associated with Feedback, it must be enabled in order to access the Surveys and Questions explorers and create **questions** and **surveys**.

Creating a navigation set for the administrator

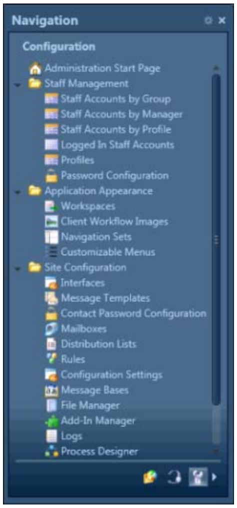
Your navigation set must contain all the navigation buttons you want to access. For instance, if you want to add and edit incidents, add the Incidents button to your navigation set and select the reports you want associated with this button. Your navigation set will also include the Configuration button, which will contain the configuration items you'll need to configure and customize your application.

To create a navigation set for the administrator

Tip We focus on adding items to the Configuration button in this procedure, but the same steps apply when adding reports and other items to any navigation button you want in your navigation set. See Creating navigation sets.

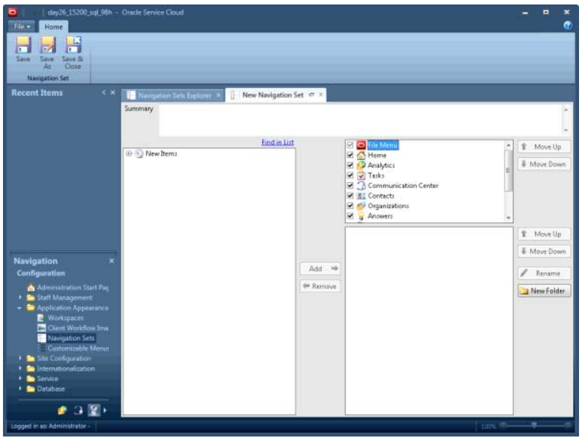
1 Log in to your application using the **special administrator account**.

2 Click the Configuration button on the navigation pane. The default list of configuration items displays.



3 Double-click Navigation Sets under Application Appearance. The Navigation Sets explorer opens.

4 Click New. The Navigation Sets editor opens.



Notice that File Menu displays first in the list on the right. While this is not a navigation button, it is part of every navigation set, and you can configure it with the items you want to be able to create from the **file menu** (accessed by clicking File next to the Home tab on the ribbon).

Keep in mind, however, that you must also have the corresponding permission in your profile for every item or record type you add to this menu. See To configure the file menu.

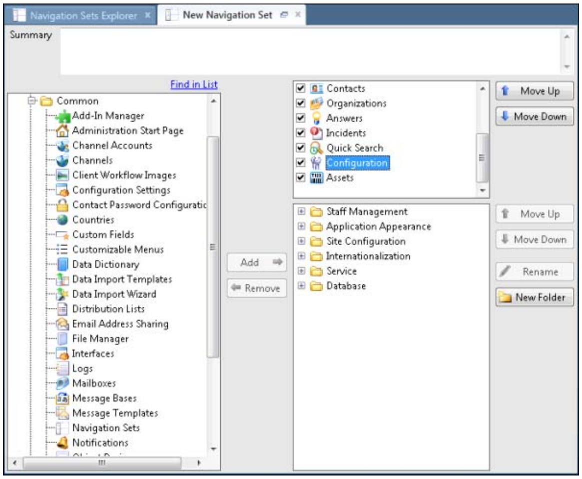
5 On the top right of the **content pane**, scroll down and select Configuration in the list of buttons. The lower portion displays the folders containing default configuration items associated with the Configuration button for the administrator special account.

a Expand each folder to view its items.

Tip File Menu will always appear first in the list, but since it isn't a button that appears on the navigation pane, you can move the Configuration button under the File Menu and it will appear first on the navigation pane. Just click the button in the top portion and then click Move Up to position it where you want it in the list.

6 On the left side of the content pane, click the plus sign next to Components to expand the list of configuration items.

a Expand the Common and Service subfolders. Items appear in alphabetical order.



Notice that Outreach and Opportunity Tracking folders don't appear in the default list. In order for them to appear, they need to be enabled before you create your navigation set. Contact your Oracle account manager.

The following table describes the default folders and items associated with the Configuration button.

Table 1: Default Configuration Items in a New Navigation Set

Folder/Configuration Item	**Description**
Staff Management	This folder contains options to configure your application for profiles, staff accounts, and password requirements.
Staff Accounts by Group	This report lists your organization's staff accounts by group. Refer to Adding and editing staff accounts. **Note:** When you access any report in this folder, you can double-click a staff account (or profile in the Profiles report) to open it or select one and click Open. You can also click New to add a staff account or profile, depending on the active report.
Staff Accounts by Manager	This report lists staff accounts by manager.
Staff Accounts by Profile	This report lists staff accounts by profile.
Logged In Staff Accounts	This report lists the staff members who are currently logged in. You can use this report to manage your **desktop user sessions**. Refer to Manually logging out active sessions.
Profiles	This report lists all profiles in your application. From this report you can add profiles that define the permissions staff members need to configure areas in your application and work with reports, records, and components. Refer to Customizing profiles.
Password Configuration	Define requirements for password expiration, number of invalid logins allowed, and password length for staff accounts. Refer to Configuring staff member passwords. **Important:** If you intend to require staff members to have a password to log in to the application, you must configure your organization's password requirements before adding staff accounts.

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	Description
Application Appearance	This folder contains options to customize the information that is displayed to staff members, determine what navigation buttons and navigation lists staff members can access, create images for workspaces, and customize your application with tools to ensure that your knowledge base contains accurate and consistent data.
Workspaces	Create custom workspaces to define the way fields, tabs, buttons, and reports display on the content pane when working with records (answers, assets, contacts, incidents, opportunities, organizations, and tasks) and when working in **Oracle RightNow Chat Cloud Service** (Chat). You can also create custom workspaces for the Quote, Quote Product, and Service Opportunity windows. See Creating custom workspaces.
Client Workflow Images	Create images to use in workspaces and in questions for **guided assistance**. Refer to Images explorer.
Navigation Sets	Create navigation sets containing the navigation buttons and associated navigation lists staff members can access. Refer to Creating navigation sets.
Customizable Menus	Create menu items to keep your knowledge base organized and up-to-date. Refer to Customizable Menus. **Note:** By default, the Customizable Menus tree contains a System Menus folder, consisting of default menu items, and a Custom Menus folder, which will contain the menu-only custom objects you create. If you disable the **custom objects** feature before creating your navigation set, the tree will not contain any folders and only the default menu items will be listed in the tree. See Creating menu-only custom objects.
System Menus	Customize any of the following default menu items in this folder. **Note:** When Opportunity Tracking and Chat are enabled, this list will also contain the following items. • **Opportunity Tracking**—Competitors, Contact Roles, Industry Types, Lead Rejection Types, Opportunity Statuses, and Win/Loss Reasons • **Chat**—Chat Agent Statuses and Chat Queues

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	Description
Answer Access Levels	Add custom answer access levels to control what information is visible to staff members and customers on each interface. The two default answer access levels are Help and Everyone. See Adding and editing answer access levels.
Answer Statuses	Add custom answer statuses to control which public answers are visible to customers and staff members. The four default answer statuses are Private, Proposed, Public, and Review. See Adding and editing answer statuses.
Asset Statuses	Add custom asset statuses to more accurately represent the status of **assets** (products and services) registered and tracked in your application. The default asset statuses are Active, Retired, and Unregistered. See Configuring asset statuses.
Billable Tasks	Add billable tasks so you can record the time agents spend working on incidents. The default billable task is Miscellaneous. See Adding and editing billable tasks.
Channel Types	Configure your application so you can store your contacts' Twitter, YouTube, and Facebook user names in their contact record. When user names are available, incidents created from these channels are associated with the appropriate contact, giving agents a more complete understanding of all incidents submitted by each contact. See Storing social media user names.
Contact Types	Add contact types to organize the contacts in your knowledge base into classifications, such as a contact's position or function with respect to your organization. See Adding and editing contact types.
Incident Queues	Add incident queues to automatically route incoming incidents when used with business rules. Adding incident queues lets you also control which incidents agents work on, the order incidents are worked on, and how many incidents agents can have in their **inbox** at one time. See Adding and editing incident queues.
Incident Severities	Add incident severity levels to record the importance or urgency of individual incidents. See Adding and editing incident severities.

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	**Description**
Incident Statuses	Add custom incident statuses to show a more complete representation of the state of incidents in your knowledge base. The four default incident statuses are Solved, Unresolved, Updated, and Waiting. See Adding and editing incident statuses.
Organization Address Types	Add organization address types to store multiple addresses for the organizations in your knowledge base. The default address types are Billing and Shipping. See Adding and editing organization address types.
Custom Menus	While this folder is initially empty, it will contain any menu-only custom objects you define for your application. Using menu-only custom objects, you can store options for populating menu fields in other custom objects. You can then use the same menu lists to populate menu fields in multiple custom objects. See Creating menu-only custom objects.
Site Configuration	This folder contains options to configure and customize all elements of your interfaces.
Interfaces	Change the display name of the interface (see Changing the interface display name) and identify the answers report that displays on your **customer portal** (see Changing the report on the Answers page). **Note:** When Chat is enabled, the ribbon on the Interfaces editor contains a Chat Hours button for setting the hours your agents are available to chat with customers. See Setting chat hours.
Message Templates	Customize your **Oracle RightNow Cloud Service** (Service) email, including messages used in administrator notifications and emails and in contact emails. You can also standardize the look and feel of all your outgoing email to present a unified image to your customers. See Working with the Message Templates editor.
Contact Password Configuration	Set requirements, such as minimum password length and the maximum number of character repetitions and occurrences allowed, to strengthen customer passwords when accessing your customer portal. See Configuring password requirements.

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	**Description**
Mailboxes	Add Service and Outreach mailboxes (when Outreach is enabled) and customize mailbox settings. You can configure both outgoing and incoming email options. See Adding and editing mailboxes. **Important:** If Oracle has added an **Oracle-managed Service mailbox** for your application, you can edit some of the settings associated with this mailbox, while other settings are read-only. See To edit an Oracle-managed Service mailbox.
Distribution Lists	Add mailing lists consisting of non-staff members' email addresses. See Managing distribution lists. Distribution lists can also be used to schedule and send reports. See Scheduling reports.
Rules	Configure your application with business rules to automate workflow and handle routine tasks. See Creating rule bases.
Configuration Settings	Customize **configuration settings** for each interface. See Customizing configuration settings. **Note:** When you change a configuration setting, you must log out and log back in for the change to take effect.
Message Bases	Customize the headings, labels, and text on the **administration interface** and your customer portal. See Customizing message bases.
File Manager	Modify Chat images, custom scripts, wordlist files, dictionary files, and certificate directories. See Managing files.
Add-In Manager	Upload add-ins and allow access to individual add-ins for each profile and interface. See Installing add-ins.
Logs	View the error log, info log, security log, and the external search log. You can also access the rule log from this option. See Viewing log files.
Process Designer	Create custom processes (**object event handlers**) that run when events occur on **objects** in Oracle Service Cloud. See Accessing the process designer.

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	Description
Internationalization	This folder contains an option to configure your application with the countries in which you do business.
Countries	Add countries and provinces to maintain accurate address information for the organizations and contacts in your knowledge base. See Adding and editing countries and provinces.
Service	This folder contains configuration options specific to Service.
Knowledge Base	Configure options so search results are more effective for customers when searching for answers and to broaden the scope of search capabilities for both customers and staff.
Incident Stopwords	View or change the list of stopwords for incidents that will be excluded from indexing and searching. See Configuring incident stopwords.
External Search Configuration	Configure the Web Indexer to index and search documents that are not part of your knowledge base (for example, web pages and entire websites). See Configuring the Web Indexer.
Search Priority Words	Create words that are associated with a public answer or a web document that will always display when the word is included in the search text. Refer to Configuring search priority words.
Answer Stopwords	View or change the list of **stopwords** for answers that will be excluded from indexing and searching. See Configuring answer stopwords.
Topic Browse	Test the cluster groups for the Browse search method or schedule clustering for the next run of the **Agedatabase** utility. See Adding a Browse page.
Service Level Agreements	Track the effectiveness of your customer service and control the service and support you provide to your customers.
Response Requirements	Define the time (in minutes) that agents have to initially respond to incidents and the time (in minutes) allowed to solve incidents. By defining response requirements, you can monitor how agents are meeting your organization's service goals. See Defining response requirements.

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	Description
Service Level Agreements	Create SLAs (service level agreements) to assign to the contacts and organizations in your knowledge base. You choose the duration of each SLA, the number of incidents that can be submitted through the SLA, and the response requirements based on the support you want to offer customers. See Creating SLAs.
Holidays	Add all the holidays your organization observes, per interface. Response requirements, including any custom response requirements you have created, are suspended during holidays. See Adding and editing holidays.
Products/Categories/Dispositions	• Add service products and categories to group the answers and incidents in your knowledge base. You can add products and categories to each interface you have configured as well as add additional levels of products (sub-products) and categories (sub-categories). • Add dispositions to record how incidents were resolved (what was done for the status to change to Solved). You can add up to six levels of dispositions and require that agents select a disposition before an incident's status can change to Solved. • Link products to categories and products to dispositions so that only the categories and dispositions that have been linked to a product appear when the product is selected on the administration interface or your customer portal. Refer to Adding and editing products, categories, and dispositions and Product linking.
Standard Text	Define text and responses for agents to insert when responding to incidents or engaged in chat sessions, or to add as a business rule action. When you define standard text, you designate where it will be available to staff: Incident Text and Rule Text. See Adding standard text. **Note:** When Chat is enabled, Chat Text and Chat URL options are also available.

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	Description
Variables	Define shortcuts instead of entering long strings of text. Variables can be inserted in the Question and Answer fields of answers or inline when responding to customers during a chat. When customers view the answer or receive a response from an agent during a chat, the variable is replaced with the value you define. See Adding variables.
Channels	Customize all the channels customers use to communicate with your organization, including the standard channels through which incidents are created (Service Email, Outreach Email, Phone, Fax, Post, Service Web, Outreach Web, Chat, and Email) as well as the social channels (**Community**, Twitter, YouTube, RSS, and Facebook). You can also create custom channels for Community, RSS, and Facebook. The remaining standard and social channels can be edited, including updating their name and disabling them. See Social channels overview. **Note:** **Social Monitor** must be enabled in order to monitor the social channels.
Channel Accounts	Configure your application so staff members can respond to contacts through communities, Facebook, or Twitter. Without a channel account, your staff can respond only through email. See Granting agent access to channel accounts. **Note:** Social Monitor must be enabled in order to create a channel account for communities.
Database	This folder contains options to add and update items in your database to ensure the information is complete and up-to-date.
Data Dictionary	View a list of all the tables in the Oracle database and all columns in each table. Refer to Viewing the data dictionary.
Custom Fields	Gather additional information about answers, contacts, incidents, opportunities, organizations, quotes, sales products, staff accounts, and tasks. See Adding and editing custom fields.

Table 1: Default Configuration Items in a New Navigation Set (Continued)

Folder/Configuration Item	Description
Object Designer	Create **custom objects** in order to integrate your organization's data with Oracle Service Cloud. You can manage and report on the data in the same way you manage and report on incidents, answers, contacts, tasks, and other **standard objects**. See Creating custom objects. **Note:** If you disable the custom objects feature before creating your navigation set, the Object Designer will not display in the default list.
Incident Thread Type Correction	Convert an incident response thread into a note thread. Note threads are never seen by customers in their incident responses. Refer to Converting response threads.
Data Import Templates	Add data import templates to map columns in a CSV file to columns in your database. You can then skip the column mapping process when uploading records from a CSV file with the same column ordering. See Data import templates.
Data Import Wizard	Upload multiple records using the Data Import Wizard. See Importing data.
Email Address Sharing	Enable email address sharing so a group of related contacts (such as a family or a team) can maintain individual contact records while sharing one email address. See Email address sharing.

7 Select the configuration item from the left column and click Add. You can also drag the item to the lower portion of the right column and place it where you want it in the list or double-click the item.

- **a** To add more than one item at the same time, press **Ctrl** while selecting each item and click Add.
- **b** To search for a specific item to add, click Find in List above Available Items. This feature also locates items in folders that aren't expanded.

8 To set an item as the default for the configuration list, right-click it and select Set As Default.

Note The item you set as the default will automatically open on the content pane when the configuration list displays when you log in.

9 To remove an item from the configuration list, select it and click Remove.

10 To group your items into more categories than currently exist in the configuration list, click New Folder.

  a Type the name of the folder.
  b Drag items to the folder.

11 To rename a folder, including one of the default folders, right-click it and select Rename. Then type a new name.

12 To move an item in the list, select it and click Move Up or Move Down, or drag it where you want it in the list.

13 To create a navigation list for each type of record and item that you want to be available in your navigation set (such as answers, incidents, contacts, and organizations), repeat steps 5 through 8.

Tip The check box next to each button is selected by default. To remove a button from your navigation set, just clear its check box.

14 To add items to the file menu so you can use this shortcut to add records and items to the knowledge base, scroll up to the top of your list and select File Menu. See To configure the file menu.

15 Click Save and Close. The Save As window opens.

  a Type a name for the navigation set in the Navigation Set Name field and click OK.

Next, create a profile with full administration permissions and associate your navigation set with this profile. Then add your staff account assigned to the full access profile. Thereafter, use your staff account information (name entered in the Username field and password, if you define one) to log in. Refer to Customizing profiles and Managing staff accounts.

Tip There's another way to customize your configuration list or any navigation list after you create your navigation set. With the Customize Navigation Sets permission in your profile, you can add items to a list directly from the navigation pane (by clicking the Gear button at the top right of the Configuration list). When you add items this way, you are changing only your lists, not the original navigation set. See Customizing navigation and configuration lists. To examine the implications of customizing your navigation set from the navigation pane, refer to Customizing navigation sets.

- Creating navigation sets
- Customizing profiles
- Managing staff accounts
- Changing navigation pane settings

Optional configuration items

Although Oracle Service Cloud contains a default configuration list for the special administrator account, there are more items you can add to your configuration list depending on what functionality you want. However, the majority of the items won't be available for you to add until the associated product or component is enabled. Contact your Oracle account manager to enable products and components listed in this section.

The following table describes the items that display under Components once their associated product or component is enabled. The alphabetical list is organized in folders: Analytics, Audiences, Common, Content Library, Feedback, Opportunity Tracking, Outreach, and Service items. Unless specifically noted, all items appear in the default configuration list if you enable the product or component before creating a navigation set. Otherwise, you must manually add the item to your configuration list.

Table 2: Additional Configuration Items Under Components

Folder/Item	Description
Analytics	The Analytics folder contains all Analytics explorers and the Report Management item. **Note:** The Analytics explorers are available to you with your special administrator account from the Analytics button on the navigation pane. In addition, the Analytics navigation button is part of new navigation sets, and you can add any Analytics explorers to this button for your own navigation set or any of the other navigation sets you create. Refer to Creating navigation sets.
Explorers	Analytics explorers include Chart Styles, Color Schemes, Images, Reports, Styles, and Text Fields.

Table 2: Additional Configuration Items Under Components (Continued)

Folder/Item	Description
Report Management	Manage reports more easily and gain insight into where and how reports are being used in your application. Using the Report Management item, you can identify certain types of reports to help make system and report maintenance easier. Refer to Management Reports. **Note:** This item does not have to be enabled, but you must manually add it to your navigation set. You can add it to the Analytics button, the Configuration button, or any other navigation button.
Audiences	The following configuration items appear under Audiences after you enable Outreach and Feedback.
Contact Lists Explorer	Add the Contact Lists explorer to a navigation list in order to access and create static lists of contacts for use in mailings and surveys. You must manually add this explorer to one of your navigation lists or the configuration list. See Adding contact lists.
External Suppression List	Add a list of email addresses that will be excluded from mailings. See Creating and editing the external suppression list. **Note:** The External Suppression List displays under the Outreach folder in the default configuration list if you enable Outreach before creating your navigation set.
Segments Explorer	Add the Segments explorer to a navigation list in order to access and create dynamic lists of contacts for use in mailings and surveys. You must manually add this explorer to one of your navigation lists or the configuration list. See Creating segments.
Common	Common items apply to all products: Feedback, Opportunity Tracking, Outreach, and Service.
Currencies/Exchange Rates	Add currencies for all the countries in which you do business and add exchange rates for each currency so your sales representatives have up-to-date rates when sending quotes to customers. See Adding and editing currencies. **Note:** This item appears under Internationalization in the default configuration list if you enable Opportunity Tracking before creating your navigation set.

Table 2: Additional Configuration Items Under Components (Continued)

Folder/Item	Description
Customer Portal	Access the Customer Portal Administration site to perform administrative tasks, including staging and deploying your customer portal pages. **Note:** You must enable MOD_CP_DEVELOPMENT_ENABLED at Common > Oracle Products > Modules in order to make changes to your development site. If you do not enable this setting, you cannot make changes to your customer portal, and your customers will see the default **reference implementation** with no customization. Refer to Customer Portal Administration.
Engagement Engine Rules	Create rules to give your organization greater control over where, when, and how proactive and reactive chats are provided to your customers. Refer to Configuring engagement engine rules. **Note:** Once this component is enabled, you must manually add it to your list of items for the Configuration button.
Language Skills	Add language skills to your application so you can route incoming chats to the agent with the most appropriate skill set. Refer to Configuring advanced routing. **Note:** Chat and **Smart Interaction Hub** must be enabled before you can add this item to your configuration list. Contact your Oracle account manager.
Product Skills	Add product skills to your application so you can route incoming chats to the agent with the most appropriate skill set. Refer to Configuring advanced routing. **Note:** Chat and Smart Interaction Hub must be enabled before you can add this item to your configuration list. Contact your Oracle account manager.
SA Auto Tuner	Fine-tune SmartAssistant to provide more relevant results to your customers and help reduce the incidents submitted to your support site. In addition to improving incident deflection rates, information produced by the autotuning feature can be useful for refining the knowledge base and providing guidance to agents. Refer to Adding SmartAssistant suggested answers. **Note:** You must enable KF_SA_OPTIMIZATION_ENABLE and manually add this component to your list of items for the Configuration button.

Table 2: Additional Configuration Items Under Components (Continued)

Folder/Item	Description
Scripts Explorer	Create scripts for workspaces that can contain fields and controls and branching logic to guide agents to different pages based on actions they take on a script page. See Creating and editing scripts. **Note:** This item appears under Application Appearance if you enable agent scripting before creating your navigation set.
Service Update Notifications	View changes that have been made in this version that may affect your organization if you are upgrading from an earlier version. You can view compatibility exceptions and deprecations and make changes **inline** to help you track how service updates affect your site. Refer to Service update notifications. **Note:** This component does not have to be enabled, but you must manually add it to your list of items for the Configuration button.
Single Sign-On Configurations	Administer **single sign-on** (SSO) integrations with external applications that reside outside Oracle Service Cloud. Single sign-on integrations let you use Oracle Service Cloud as an identity provider to store and authenticate customer credentials. After configuring an SSO service provider and application, staff members can then access the external application without being asked for their login credentials. Refer to Setting up single sign-on using an external identity provider. **Note:** This component does not have to be enabled, but you must manually add it to your list of items for the Configuration button.
Virtual Assistant Editor	Route incoming chats to a simulated agent that uses knowledge base data to respond to customer questions. Virtual assistant chats can ease the volume of chats requiring an agent. **Note:** Your site must be integrated with **Oracle RightNow Virtual Assistant Cloud Service** in order to use a virtual assistant. Refer to Configuring virtual assistant.
Workspaces/Workflows	When the desktop workflow feature is enabled, Application Appearance > Workspaces changes to Workspaces/Workflows. No action on your part is required. You can then create **desktop workflows** that can be used in place of a single workspace for each editor. Refer to Creating workflows.

Table 2: Additional Configuration Items Under Components (Continued)

Folder/Item	Description
Content Library	When Outreach or Feedback is enabled, this folder displays in the list of configuration items and contains Documents, File Attachments, Snippets, Templates, and Tracked Links explorers. You'll use these explorers to access and manage mailings, campaigns, questions, surveys, audiences, and content library items (documents, file attachments, snippets, templates, and tracked links). Refer to Explorers. **Note:** The Content Library navigation button also appears in a new navigation set when Outreach or Feedback is enabled, and you can add these explorers to the Content Library button (or any other button in new navigation sets).
Feedback	When Feedback is enabled, this folder displays in the list of configuration items and contains the Questions and Surveys explorers. **Note:** The Surveys navigation button also appears in a new navigation set when Feedback is enabled, and you can add these explorers to the Surveys button (or any other button in new navigation sets). Refer to Feedback Surveys and Feedback Questions.
Opportunity Tracking	The following items appear under Opportunity Tracking after Opportunity Tracking is enabled.
Price Schedules	Add price schedules to assign to your sales products. You can add multiple price schedules for greater flexibility when sending quotes to customers. See Adding and editing price schedules.
Product Catalog	Add your organization's sales products for use with quotes in Opportunity Tracking and **Offer Advisor** in Service. See Adding and editing sales products.
Promotions	Add promotions to offer to customers and automatic recommendations based on customer attributes and purchase history. You can also add target rules, which define groups of customers called targets, for use in promotions and product suggestions. See Setting up Offer Advisor and Creating targets. **Note:** Offer Advisor must be enabled before this item will be available. If enabled before you create your navigation set, Promotions will appear under Opportunity Tracking in the default list for the special administrator account. If enabled after you create your navigation set, you will need to manually add it to your list.

Table 2: Additional Configuration Items Under Components (Continued)

Folder/Item	Description
Quote Templates	Add quote templates and organize them into folders to automate and standardize quote generation. See Adding and editing quote templates.
Sales Periods	Add sales periods to track how sales representatives are meeting their sales quotas. See Adding and editing sales periods.
Strategies	Add strategies to track your sales processes. Also add the stages and tasks specific to each strategy. See Adding and editing strategies.
Territories	Add territories and assign each sales representative to a territory for opportunity assignments. You can add additional levels of territories (sub-territories) to cover all the geographical areas in which you do business. See Adding and editing territories.
Outreach	The following configuration items appear under Outreach after Outreach is enabled.
Campaigns Explorer	The Campaigns explorer also displays in the Outreach folder. **Note:** The Campaigns navigation button appears in new navigation sets when Outreach is enabled, and you can add this explorer to the Campaigns navigation button (or any other navigation button). Refer to Explorers.
Mailings Explorer	The Mailings explorer also displays in the Outreach folder. **Note:** The Mailings navigation button appears in new navigation sets when Outreach is enabled, and you can add this explorer to the Mailings navigation button (or any other navigation button). Refer to Explorers.
Tracked Link Categories	Add tracked link categories to group and classify your tracked links so your staff can quickly find particular tracked links. You can also generate reports to evaluate their effectiveness. See Tracked link categories.

Table 2: Additional Configuration Items Under Components (Continued)

Folder/Item	Description
Service	Optional items in this folder apply to Service.
Archived Incidents	Access outdated incidents that have been removed from your knowledge base. Refer to Accessing archived incidents. **Note:** This item does not have to be enabled, but you must manually add it to your list of items for the Configuration button.
Guided Assistance Explorer	Configure your application with an alternate search method for agents to quickly find information when working with customers on the phone or when responding to an incident and for customers when searching for answers on your customer portal. Refer to Creating guides. **Note:** This item appears under Service if you enable guided assistance before creating your navigation set.
Incident Thread Masking	Automatically mask incident thread content that matches certain common patterns, such as credit card, social security, and telephone numbers. You can also define up to five custom patterns that will be masked from view when new thread entries are created. Refer to Masking information in incident threads. **Note:** Incident thread masking must be enabled for this item to be available. Once enabled, you can add it to your list of items for the Configuration button. Contact your Oracle account manager to enable incident thread masking.
Social Monitor	Interact with your customers by searching social media services, create incidents in Service, and include social media in your Outreach and Feedback messages. **Note:** **Social Monitor** must be enabled for this item to be available. Once enabled, the Social Monitor button appears in a new navigation set, and you can add this item to the Social Monitor navigation button. Refer to Configuring social monitoring.

Important Configuring your application so your staff can work in Oracle Service Cloud is an important first step in the setup process. Another important element is managing staff sessions for site security and desktop usage metering and licensing compliance. See Session Management and Login Controls to learn about your options.

Working with configuration items

Before you begin customizing your site, take a few minutes to view the tutorial for administrators to learn about the key areas on the Service Console and some basic functionality.

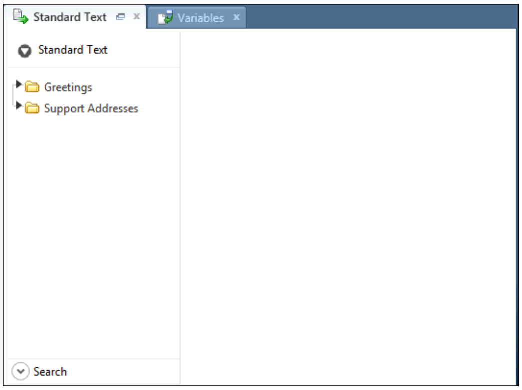
Note It's also a good idea to look at the key elements on the console from the perspective of customer service agents, sales representatives, and marketing personnel. Refer to Console overview.

To open a configuration item

1 Click the Configuration button on the navigation pane. The configuration list displays.

2 Double-click an item in the list. The item's tree displays on the content pane.

The following figure shows the content pane after double-clicking Standard Text under Service.



The tree displays the text and responses defined for your application. Some configuration items, including **standard text**, can be organized in folders. If the configuration item contains folders, as the standard text item does in our example, you can expand all of them by clicking the down arrow at the top of the tree.

You can also add folders to **custom fields** across all products, **variables** in Service, and the **product catalog** and **quote templates** in Opportunity Tracking.

Tip Tabs on the top of the content pane display all of the items you currently have open. When more than one item is open, just click a tab to return to that item or right-click a tab and select from the following options: Open in New Window, Close, Close All But This, and Close All. You can also press **Ctrl+w** or **Ctrl+F4** to close the active tab or click the Close button (X) on any content pane tab. Refer to Closing multiple records simultaneously.

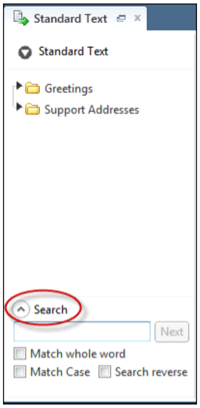
Right-click options differ for records in a **workgroup**. When you right-click the content pane tab of the primary record, your only option is to close all associated records in the workgroup. When you right-click an associated record that is the active tab, your options include Accept Changes, Cancel Changes, and Undock. Refer to Creating and using workgroups.

On administration editors, you can undock any editor by clicking the Undock button on the active tab. This action opens the editor in a separate window and lets you move between the window and console without having to close the window first.

3 To expand a single folder in the tree, click the arrow to the left of the folder.

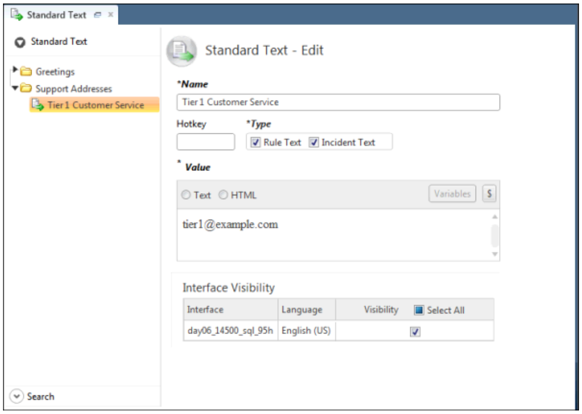
4 To change the name of a folder, click the folder.

To quickly locate an item in the tree, click the arrow next to Search at the bottom of the tree. The search menu displays.



You can search by whole word or case and also search the list from the bottom up. If your tree contains folders, results will return a folder matching the text you enter. Clicking the Next button returns any items within the folder that contain the search text.

5 To edit one of the standard text entries, click it in the tree. The editor displays the fields for the standard text.



a Make any changes you want and click Save. This saves your changes and leaves the editor open.

b To save your changes and close the editor, click Save and Close.

Important If another staff member makes changes to the same entry and saves it before you save your changes, you will receive a message to refresh or reload the editor in order to view the most current data.

6 To add a standard text entry, click New. Your new entry will appear in the active folder.

You can access the following options from a configuration item's tree and ribbon.

Table 3: Options from a Configuration Item's Tree and Ribbon

Action	Description
Add a folder	Right-click in the tree and select New Folder or right-click a folder to add a subfolder.
Add an item	Click New. The editor opens.
Delete folders and items	• To delete a folder, right-click it and select Delete. Be aware that when you delete a folder, all items in the folder are also deleted. • To delete an item, select it and click the Delete button on the ribbon. The item is removed from the knowledge base. **Note:** If the item you want to delete contains sub-items, you must delete the sub-items first. Sub-items can be added to those configuration items that offer additional levels of functionality. This includes **products**, **categories**, and **dispositions** in Service; **tracked link** categories in Outreach; and **territories** in Opportunity Tracking.
Expand and collapse folders	• Click the arrow at the top of the tree to expand all folders, and click it again to collapse them. • To expand or collapse a single folder, click the arrow to the left of the folder.
Edit an item	Click an item in the tree. The item's information displays on the editor.
Reorganize folders and items	Drag an item and drop it in the new position. When you move a folder, all items in the folder also move. You can reorder within a folder or move items to another folder. You can also drop a folder onto another folder to create a hierarchy.

Table 3: Options from a Configuration Item's Tree and Ribbon (Continued)

Action	Description
Save folders and items	• To save a new folder or item or save changes to an existing item and remain on the editor, click Save. • To save a new folder or item or save changes to an existing item and close the editor, click Save and Close.
Search the tree	Click the arrow next to Search at the bottom of the tree to display a menu for searching folders and items.

❖ Reordering items in the tree

❖ Selecting actions from a navigation or configuration list

❖ Adding folders

Adding folders

Certain configuration items can be organized in folders (**custom fields** across all products, **standard text** and **variables** in Service, and the **product catalog** and **quote templates** in Opportunity Tracking). Adding folders gives you more flexibility in organizing your data. For instance, you might want to add a folder for each type of sales product your organization sells or add folders to organize your quote templates by quote types. And once you add folders, you can move them in the tree to create the hierarchy you want.

1 Double-click the item in the configuration list. The item's tree displays on the content pane.

2 Right-click in the tree and select New Folder. The Folder editor opens and a New Folder entry appears in the tree.

3 Type the folder name and press **Enter**. The new folder displays in the tree and the Label field on the editor populates with the name of the new folder.

Tip You can also click Save or save the new folder and close the editor simultaneously by clicking Save and Close.

4 To add a subfolder, right-click a folder and select New Folder.

Reordering items in the tree

In addition to adding folders to certain configuration items to better organize and group your data, you can also rearrange folders and items in the tree using drag-and-drop operations. When you move a folder, all items in the folder also move. You can also drag a folder onto another folder to create an additional level in the hierarchy and reorder within a folder or move items to another folder.

Tip Remember that you can also add subfolders by right-clicking a folder and selecting New Folder.

3

Getting Started for Users

No matter which **channel** you use to interact with customers, you need to quickly and accurately respond to them. With Oracle Service Cloud, you have a variety of powerful tools to help ensure that every customer interaction is a positive experience.

Downloading Oracle Service Cloud and logging in

Once you have a **staff account**, just type the URL to your site and the software will download to your workstation. You can then enter your login information.

If you are the **administrator** for your organization, see Downloading Oracle Service Cloud for login instructions.

Important Cookies must be enabled on your workstation in order to work in the application.

To download Oracle Service Cloud and log in

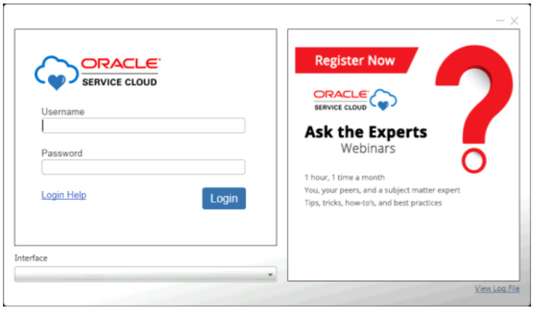
1 Open your web browser and type the following URL.

```
http://<your_site>.custhelp.com/cgi-bin/<your_interface>.cfg/php/
admin/launch.php
```

2 Click Install Oracle Service Cloud. A security message warns you that the application should not be installed unless you know that it is from a trusted source.

Note If Oracle Service Cloud has been configured to use an external identity provider (IdP) for agent authentication, an additional button (Install Oracle Service Cloud–Internal Login) displays on the Launch page. Clicking this button opens the Oracle Service Cloud Login window without embedding the IdP's login page. This lets accounts that do not have the SSO Login (SAML 2.0) profile permission log in without using the external IdP. Refer to Logging in using external identity providers.

3 Click Install. Once Oracle Service Cloud downloads to your workstation, the Login window opens. (This can take a few minutes.)



Note To view all deployment files and processes, click View Log File.

The Login window may look different from the one shown here if your administrator has customized it.

4 If you need help logging in, for example, if you've forgotten your password, click Login Help.

5 Type your user name in the Username field. Your user name and password are defined in your staff account and both are case sensitive.

Important

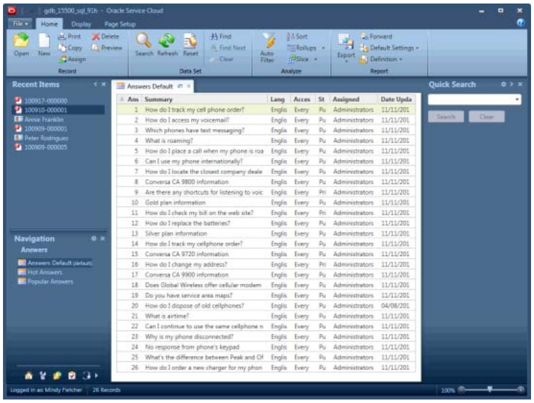
- If you attempt to log in to this application using the same user name and interface name as another staff member who is already logged in on a different workstation, and the **cache files** are stored in the same location for the two instances, you will receive a message that the application is already running and the subsequent session will not be started. However, if you are using the same user name and interface as another staff member, but the cache files are *not* stored in a shared location (in a non-virtualized environment), the cache files will not be overwritten and the second session will start, overriding and ending the first session.
- If you attempt to log in to the same site you are already logged in to on the same workstation using the same user name and interface, or another staff member is already logged in on that workstation with the same user name and interface, the initial instance will be brought to focus and no message appears.
- Although user names and passwords are case sensitive, two staff accounts with user names that are identical except for case cannot be logged in on the same workstation at the same time. If you attempt to do so, the Login window closes and the console for the first staff member logged in will be brought to focus and no message appears.

6 If you have been assigned a password, type it in the Password field. (Passwords are optional in Oracle Service Cloud.)

Tip The Interface field displays the name of the interface you entered in step 1. The drop-down menu contains the names of any additional interfaces installed for this site, beginning with the first interface installed.

7 Click Login. The **Service Console** opens after the system updates and loads all necessary support files.

The application icon now appears in your system tray. Hover over the icon to view your site name.



What you see when you initially log in depends on how your application is configured and what permissions have been assigned in your **profile**.

Tip After downloading Oracle Service Cloud and logging in the first time, access your application from Start > All Programs > RightNow > RightNow <your site name>.

- Application structure
- Deploying Oracle Service Cloud to multiple staff members
- Adding your branding on the Login window
- Configuring Login Help

After logging in

Oracle Service Cloud is set up to automatically log you out after a specific period of inactivity on the console (by default, fifteen minutes). Once your session expires, you will receive a Console Locked message, and you must re-enter your password to resume work without any loss of data.

After you enter your password and are reauthenticated, a new session is created and you can continue working with any loss of data.

If you choose to exit the application, all your unsaved work will be lost. In addition, after entering four incorrect passwords, you will be locked out of the console and must re-launch the application. Any unsaved work will be lost.

Important If you log in through an identity provider (that is, using the **single sign-on** process), you will **not** have the opportunity to re-enter your password to continue working in the application. Any unsaved work will be lost.

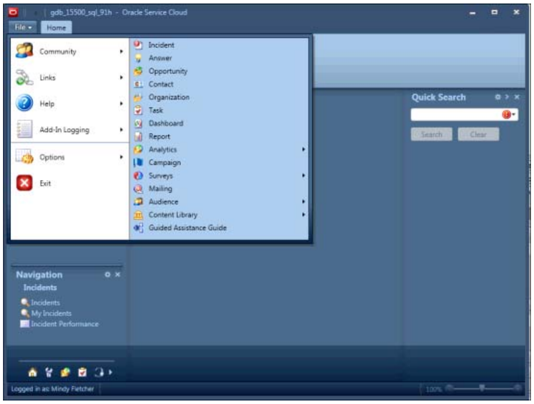
- ❖ Automatically logging out inactive sessions
- ❖ Logging in using external identity providers

Console overview

Whether you respond to **incidents** to answer customer questions, create and send **mailings** to contacts, or work **opportunities** and send **quotes** to customers, you can access everything you need from the Service Console (also called the agent desktop). And while the interface is easy to navigate, we recommend that you take the time to learn about the key areas on the console and how to perform some basic tasks. You can also watch the tutorial for an overview.

File menu

Click File next to the Home tab on the ribbon to access a menu of options for working in your application.



The file menu is divided into two panels. The left panel contains content-dependent options at the top, meaning that the options you see depend on what is currently displayed on the **content pane** (for example, a Print option appears when a report is open). Below this section are global options, meaning they are constant and will always appear on the file menu no matter what is displayed on the content pane (Community, Links, Help, Add-In Logging, Options, and Exit). The panel on the right side of the menu contains shortcuts for adding **records** and items to the knowledge base.

The following options are available from the file menu.

Table 4: File Menu Description

Section and Option	Description
Content-dependent Options	The top section on the left panel contains options for performing actions on what is displayed on the content pane. These options will change to reflect the active tab on the content pane. **Note:** You can add content-dependent options to the **Quick Access toolbar**. See Customizing the Quick Access toolbar.
Global Options	This section on the left panel contains options for accessing other areas in the application. Global options display no matter what is displayed on the content pane. **Note:** You can also add global options to the Quick Access toolbar.
Community	Select Community to access the following options.
Discussion Forum	Select this option to participate in discussion forums with other customers.

Table 4: File Menu Description (Continued)

Section and Option	Description
Idea Lab	Select this option to access a feedback forum where you and other customers can submit ideas, collaborate on development, vote for your favorite ideas, and see which ideas are being implemented.
Support Knowledge Base	Select this option to search for answers on our support site, submit questions, and access your account information.
Documentation	Select this option to access documentation for all Oracle Service Cloud products.
Tutorials	Select this option to take any of our tutorials, which walk you through product functionality and features based on user personas (administrators, users, and sales representatives). You can choose tutorials for any release of Oracle Service Cloud.
Best Practices	Select this option to explore our best practice guides to improve the customer experience you deliver.
Training	Select this option to access the Oracle University website for information about training classes and available delivery channels.
Developer Resources	Select this option to access our developer community to help you configure, manage, and extend Oracle Service Cloud beyond the enterprise.
Links	Select Links and choose from the following options.
Oracle Service Cloud Interfaces	Select this option to access any of the interfaces defined for your application and their associated **Service Console** and **customer portal**. (The link for the customer portal is called End-user.)
Office Integration	Choose from the following options. • **Install Outlook Integration**—Select this option to install Outlook Email Sync, Outlook Contact Sync, and Outlook Task Sync. • **Install Incident Reference Number Smart Tag**—Select this option to install the Oracle Service Cloud SmartTag so you'll be able to open incidents on the **agent desktop** from email messages in Microsoft Outlook. **Note:** Outlook integration must be enabled for these options to be available.

Table 4: File Menu Description (Continued)

Section and Option	Description
Oracle Service Cloud Customer Portal	The Site Administration option lets you access the Customer Portal Administration site. **Note:** The development area must be enabled in order for this option to appear (MOD_CP_DEVELOPMENT_ENABLED at Common > Oracle Products > Modules).
Site Administration	Select this option to set a cookie for viewing the development pages or one of the other available page sets (production, staging, and reference implementation). From this option you can also create custom widgets and view documentation about all widgets. Other functions include page set mapping, defining data fields, identifying framework and widget versions, viewing logs, and staging and deploying your customer portal. **Note:** You must also have customer portal permissions in your profile for this option to appear.
External Links	Select this option to access any custom links defined for your application. Custom links can include commonly used URLs or any website you may need to access.
Help	Select Help to access the help contents, help index, help search, documentation and tutorials for all Oracle Service Cloud products, and product version information. **Note:** Context-sensitive help is available throughout the application when working with reports, records, editors, and explorers. (The context-sensitive Help button is located on the far right of the ribbon.)
Add-in Logging	Select Add-in Logging to view the current or previous log file. See Logging add-in activity.
Options	Select Options to change your staff account settings, **local settings**, and password. You can also customize the content pane and navigation pane display, set tool windows visibility, and return tool windows to their default locations. See Accessing application options.
Exit	Select Exit to log out of the application.

Table 4: File Menu Description (Continued)

Section and Option	Description
Create new items	On the right panel is a list of all the records and items you can add to the knowledge base. The order of records and items in your list is selected by your administrator in your **navigation set** and the products and components that are enabled. **Note:** The options in this list are added to your navigation set for the file menu. If a record or item hasn't been added, then it won't appear in the list even if you have permission in your profile to create the record or item. Likewise, if your navigation set contains options to create records and items from the file menu, but you haven't been assigned permissions in your profile, then those options will not appear in the list.
Dashboard (Ctrl+Shift+b)	Select this option to create a dashboard. See Creating dashboards.
Report (Ctrl+Shift+r)	Select this option to create a custom report. See Creating reports.
Image	Select this option to create a report image. See Images explorer.
Style	Select this option to create a report style. See Styles explorer.
Chart Style	Select this option to create a chart style. See Chart Styles explorer.
Color Scheme	Select this option to create a color scheme. See Color Schemes explorer.
Text Field	Select this option to create a text field to add to a custom report or dashboard. See Text Fields explorer.
Contact (Ctrl+Shift+c)	Select this option to add a contact. See Adding contacts.
Organization (Ctrl+Shift+o)	Select this option to add an organization. See Adding organizations.
Task (Ctrl+Shift+t)	Select this option to add a task. See Adding tasks.
Answer (Ctrl+Shift+a)	Select this option to add an answer. See Adding answers.
Incident (Ctrl+Shift+i)	Select this option to add an incident. See Adding incidents.
Asset (Ctrl+Shift+n)	Select this option to add an asset. See Adding asset products.
Opportunity (Ctrl+Shift+p)	Select this option to add an opportunity. See Adding opportunities.
Campaign (Ctrl+Shift+g)	Select this option to create a campaign. See Creating campaigns.

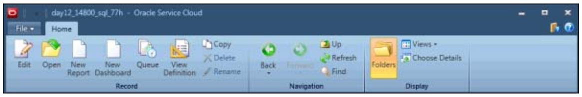
Table 4: File Menu Description (Continued)

Section and Option	Description
Surveys	Select this option to create a survey or survey question. See Creating surveys and Creating questions.
Mailing (Ctrl+Shift+m)	Select this option to create a mailing. See Creating mailings.
Audience	Select this option to create a contact list or segment. See Adding contact lists and Creating segments.
Content Library	Select this option to create a document, template, snippet, tracked link, or file. See Content Library.
Guided Assistance Guide (Ctrl+Shift+e)	Select this option to create a guide to assist staff members and customers in locating answers. See Creating guides and Finding answers using guided assistance. **Note:** Guided assistance must be enabled for this option to appear in the list and you must have permission in your profile to create guides.

- Configuring Outlook integration
- Opening the Customer Portal Administration page
- Customizing the Links menu

Ribbon

Next to the file menu is the ribbon, which displays on all **reports**, **records**, and **explorers**.



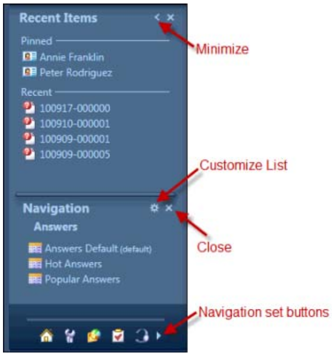
The ribbon consists of tabs and buttons for performing actions on an entire report, individual records in a report, or items in an explorer tree or list. Refer to Working with the ribbon.

Tip If nothing opens on the content pane when you log in, the ribbon will be empty. See Changing navigation pane settings to define what opens on the content pane when you log in.

Navigation pane

On the left side of the console is a navigation pane containing Recent Items and Navigation tool windows. There's also a navigation pane on the right containing the Quick Search tool window, which you can use to search for any record or item in the knowledge base. Although this setup is part of the default configuration, the tool windows can be put in any order or displayed in separate, floating windows. Tool windows can also be removed from the console. Refer to Moving tool windows.

The following figure shows the default configuration for the left navigation pane. The Answers **navigation list** is the active list in this example, displayed by clicking the Answers button on the navigation pane.



The majority of your work will begin on the left navigation pane where you can select the reports, records, and other items you need. At the top is Recent Items, which lists the records and items you have recently opened. Next is the Navigation tool window, which contains all of the navigation buttons in your **navigation set**.

Each record type (answers, assets, contacts, incidents, opportunities, organizations, and tasks) and component (such as analytics, campaigns, mailings, and surveys) has a corresponding navigation button. Your administrator has created a navigation set containing the navigation buttons you can access and assigned it to your profile. This determines the buttons and associated navigation lists that appear on the navigation pane. (The **Configuration button** may also be part of your navigation set if your administrator added it.)

Note By default, the navigation list that appears when you log in will be the navigation list that was active when you logged out.

Navigation lists are organized in a tree and can contain any of the following items.

- **Folders**—Folders are used to organize reports, dashboards, and other items in a navigation list.
- **Reports**—Reports include records reports (answers, assets, contacts, incidents, opportunities, organizations, or tasks), **standard reports**, and **custom reports**.
- **Dashboards**—Dashboards are any combination of individual reports shown together in one report on the content pane.
- **Explorers**—Explorers display information on the content pane in hierarchical folders and are available for certain components and configuration items. Explorers can be added to any navigation list. Refer to Explorers.
- **Miscellaneous items**—**Notifications**, **archived incidents,** and the **social monitor** component are just a few of the other items that can be placed in a navigation list.

❖ Changing navigation pane settings

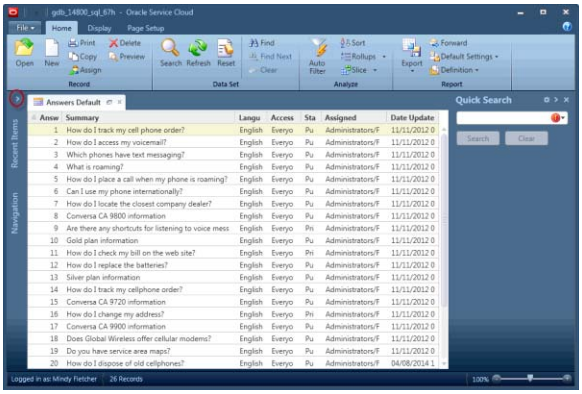
❖ Customizing navigation and configuration lists

❖ Opening reports

❖ Creating dashboards

Tool window buttons

The buttons next to each tool window title let you customize a single window or all windows. For instance, the top tool window on each navigation pane (both left and right in the default console configuration) contains a Minimize button, which collapses the navigation pane so all tool windows on that navigation pane run down the side of the console.



In this example, only the left navigation pane is collapsed. The right navigation pane, containing Quick Search, is maximized. To maximize the left navigation pane, click the right arrow at the top.

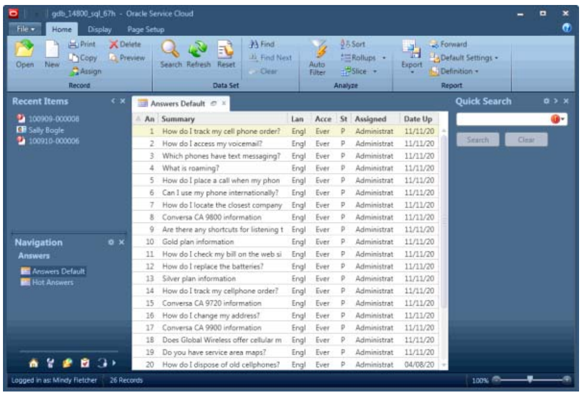
You can also close individual tool windows by clicking X (Close) next to a window title and customize the items in any navigation list and the Quick Search menu by clicking the Gear (Customize List) button. Refer to [Customizing navigation and configuration lists](#).

Moving tool windows

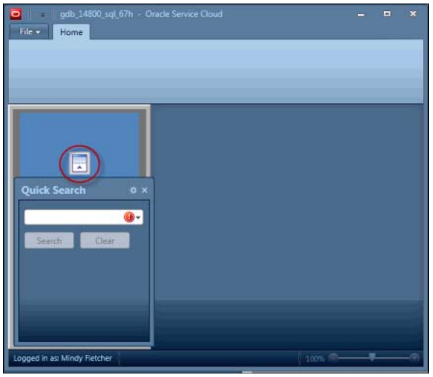
Being able to move tool windows gives you the flexibility to arrange your console to suit your own work preferences. You might want all windows to remain on the navigation pane but want them in a different order. Or you might want to move all tool windows to the left or right navigation pane or to the status bar to create more space on the content pane. Plus, you can return the windows to their default locations at anytime. Click File and select Options > Reset Tool Windows or refer to [Changing your personal settings](#) and select the Reset Local Settings check box.

In the default console configuration, Recent Items and Navigation display on the left navigation pane and Quick Search displays on the right.

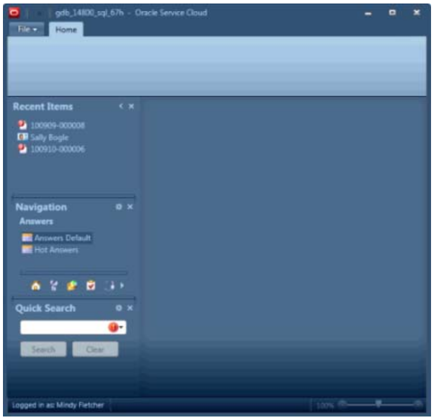
Click to view



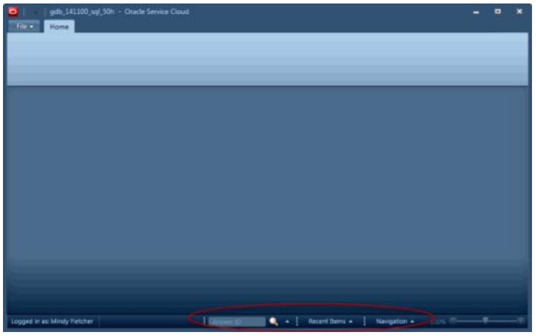
When you drag a window to another area on the console, the content pane momentarily changes to light gray, the area where you can dock the window is highlighted in blue, and a docking area indicator displays. In the following example, we're moving the Quick Search tool window to the left navigation pane.



Once you release your mouse, Quick Search is docked on the left navigation pane.



Using the same technique, you can move all tool windows to the status bar.



When a tool window is docked to the status bar, just click its button to display a full flyout. For the Quick Search tool window, the first docked filter displays on the button. Simply type an entry and click the Search button. If you want to change to another Quick Search report, click the arrow next to the Search button to display the full Quick Search menu.

Tip To move a tool window from the status bar, move your pointer to the dotted divider line to the left of the tool window you want to move and drag it to its new location.

Selecting actions from a navigation or configuration list

Once you display the list you want, just double-click a report or other item to open it on the **content pane**. You can also right-click any item to select other actions. Be aware that certain actions require one or more profile permissions.

Table 5: Available Actions from Navigation and Configuration Lists

Right-Click	Available Actions
Report or Other Item	Select from the following actions.
Open	Select this action to open the report or item on the content pane. **Note:** This is the only right-click option available for configuration items.
Open in New Tab	Select this action to open a second copy of a currently open report in a new tab on the content pane. **Note:** This action is available only when you right-click a report that is already open.
Queue	Select this action to manually schedule the report to run in the background.
View Report Definition	Select this action to view the report definition in a new window.

Table 5: Available Actions from Navigation and Configuration Lists (Continued)

Right-Click	**Available Actions**
Edit Report Definition	Select this action to edit the report. If you select this action for a **standard report**, the report does not open. Instead, the content pane displays options for creating a **schedule** to generate and distribute the report and for changing profile permissions for the report if your profile allows you to assign permissions. Also, a message displays at the top of the content pane telling you that this is a read-only report. **Note:** This action will not display if you do not have appropriate Analytics permissions in your profile.
The remaining right-click actions appear only if you have the Customize Navigation Sets permission in your profile.	
Remove from List	Select this action to remove the report or item from your navigation or configuration list. You will be prompted to confirm the removal.
Set as Default	Select this action to set the report or item as the default for this list. Default items have Default appended to their name. When you right-click a default item, this option changes to Unset as Default. **Note:** The item you set as the default will automatically open on the content pane when the item's navigation or configuration list displays when you log in. For information about the other options available when you log in, see Navigation Pane Settings Description.
Folder	Select from the following actions. **Note:** Folder options do not apply to the configuration list. However, folders can be renamed and removed from a configuration list on the Navigation Sets editor.
Rename	Select this action to rename a folder in a navigation list.
Remove from List	Select this action to remove a folder and all of its contents from the navigation list.

Reordering items

Using drag-and-drop functionality, you can reorder the items in your navigation and configuration lists. You can also move a folder and its contents or move an item from one folder to another. You can reorder items from the navigation pane or from the Customize List window, described in [Customizing navigation and configuration lists](). Keep in mind, however, that you must have the Customize Navigation Sets permission in your profile to change the order of items in your lists.

- ❖ Queuing reports
- ❖ Viewing and exporting report definitions
- ❖ Analytics permissions
- ❖ Creating a navigation set for the administrator
- ❖ Creating navigation sets

Customizing navigation and configuration lists

If your **profile** lets you customize your navigation set, a Gear button (Customize List) displays at the top of the Navigation tool window.

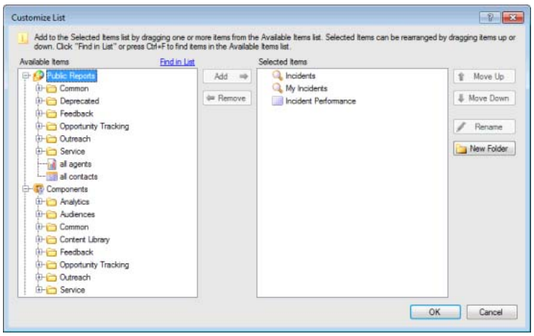
You can add any **report** or **dashboard** you have permission to run, search for items to add, search for a report or item to add, add multiple items at the same time, remove items, and rearrange items in your list. You can add items only from the Available Items list, not folders. (Folders do not apply to Quick Search reports.)

Important This procedure customizes only your navigation list, not the **navigation set** assigned in your profile.

To add items to or remove items from a navigation or configuration list

1 Display the list you want to change.

2 Click the Gear button. The Customize List window opens.



The tree under Available Items on the left lists all the folders for the reports and components you have permission to access. The tree under Selected Items on the right displays the contents of your list.

3 To add an item, expand the appropriate folder under Available Items.

a Select the item and click Add. You can also double-click the item or drag the item to your list and drop it where you want it to display.

b To add multiple items at the same time, press **Ctrl** while making your selections and click Add.

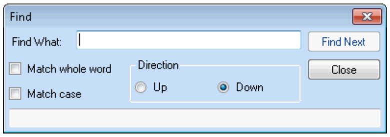
Tip To set an item as the default for the list, right-click the item under Selected Items and select Set as Default. The item will automatically open on the content pane when that item's list displays when you log in.

4 To remove an item, select it and click Remove. Other ways to remove items include right-clicking an item and selecting Remove from List or selecting an item and pressing **Delete**.

5 Click OK. Your changes are saved and the window closes.

To search for an item to add

1 Click Find in List above Available Items. The Find window opens.



2 Type your search term in the Find What field.

3 Click Find Next.

4 To match case or whole word, select the appropriate check box.

5 To specify the direction of the search in Available Items, select the Up or Down radio button.

Tip As you type, the system highlights the first item in the list that begins with the letters you enter. If this is the item you want, close the window. Otherwise, continue typing or click Find Next to scan for the next occurrence. If no match is found, a message displays on the bottom of the window.

6 If your search returns a match and you want to add it to your list, close the window and click Add.

7 Click OK. Your changes are saved and the window closes.

To organize items in a list

1 To reorder items in the list, select an item and click Move Up or Move Down. This action moves the item up or down one position. You can also drag an item to where you want it in the list.

Tip The Move Up and Move Down buttons are context-sensitive. For instance, if you select the first item in your list, the Move Up button is disabled. Likewise, if you select the last item in your list, the Move Down button is disabled.

2 To add a folder to your list, click New Folder and name the folder.

If no item in your list is selected, the new folder is placed at the end of the list. If an item is selected, the new folder is placed immediately after the selected item. And if a folder is selected, the new folder is placed beneath the parent folder. This button is disabled when you have multiple items selected in your list.

3 To rename a folder, select a folder, click Rename, and type the new name.

4 Click OK. Your changes are saved and the window closes.

❖ Customizing profiles
❖ Adding Quick Search reports
❖ Customizing navigation sets

Selecting actions from the recent items list

The records and items you've recently opened are listed in the Recent Items tool window. By default, the last ten items you opened are listed, but you can increase or decrease that number if you want. See Changing navigation pane settings.

Tip Configuration items are not tracked in the recent items list.

You can double-click an item to open it or right-click an item to display additional actions. Unlike navigation lists, which require a profile permission for certain actions, all staff members can perform the following actions from the recent items list.

Table 6: Available Actions from Recent Items

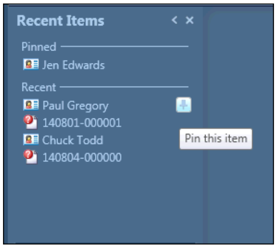
Right-Click	**Available Actions**
Open	Select this action to open the item on the content pane.
Copy Tooltip to Clipboard	Select this action to copy the item's tooltip to the clipboard. You can then insert the tooltip in another record or item. Tooltips vary according to the item or record type. For instance, an incident tooltip contains the reference number, subject, contact name, contact ID, contact email address, contact phone number, and organization name; the tooltip for an answer contains the answer summary, answer ID, language, and answer access levels; and the tooltip for a mailing contains the mailing name.
Copy Text to Clipboard	Select this action to copy the item's name or summary information to the clipboard. You can then insert the text in another record or item. For instance, copying text to the clipboard for an answer copies the text in the Summary field. Copying text to the clipboard for an incident copies the number in the Reference # field. And copying text to the clipboard for a mailing copies the mailing name.
Remove from List	Select this action to remove the item from the recent items list.

Tip Recent items also appear in other areas of the product to help you quickly select commonly used items when updating record fields. Refer to Searching from open records and Assigning records.

Pinning recent items

By default, the last ten records and items you opened appear in your recent items list, but you can increase or decrease that number whenever you want. However, there might be times when you have an item that you don't want to scroll off the recent items list, no matter how many items you've set to appear in your list. For those instances, you can pin one or more items to ensure they remain in your recent items list for as long as you need.

Click the Pin icon that appears when you hover over an item. Pinned items appear at the top of the Recent Items tool window.



When you no longer want an item pinned, just hover over it and click the Unpin icon.

- ❖ [Changing navigation pane settings]
- ❖ [Searching from open records]
- ❖ [Assigning records]

Displaying buttons in your navigation set

By default, one row of buttons displays at the end of the Navigation tool window no matter which navigation list is active. Clicking the right arrow next to the row of buttons displays the remaining buttons in your navigation set and options to show more or fewer buttons.

- **Show More Buttons**—Select this option to add a navigation button in a large format. As you add a button, its smaller version is removed from the bottom of the navigation pane. This action adds large buttons one at a time.
- **Show Fewer Buttons**—Select this option to show fewer navigation buttons in the large format. Selecting this option removes the buttons one at a time. As each large button is removed, its smaller version is added to the bottom of the navigation pane.

Tip You can also change the number of buttons that display by pointing to the slider bar and dragging the bar up or down when the pointer becomes a double-headed arrow.

To change the order of the buttons on the Navigation tool window, refer to Changing navigation pane settings.

Content pane

The content pane is the area of the console that displays the report or other item you select from a **navigation list**, from your list of recent items, or from the **file menu**. The content pane also displays results from a search. The exact placement of the content pane depends on whether you have one or two navigation panes on the Service Console. In the default configuration, the content pane displays in the middle of the console.

You may work with any of the following items on the content pane.

- **Reports**—Access a **custom report** to edit the report definition or a **standard** or custom report to generate the report.
- **Dashboards**—Access a dashboard, which is any combination of reports that display together in one report.
- **Records**—Access a report containing a list of **records** and select one or more to open. See Opening records. You can also open an individual record from the Recent Items tool window. See Selecting actions from the recent items list.
- **Explorers**—Access any of several components and configuration items that display information in hierarchical folders. See Explorers.
- **Notifications**—Access your messages when there is a change in the status of your **incidents** and **answers** in Oracle RightNow Cloud Service (Service), **mailings** and **campaigns** in Oracle RightNow Outreach Cloud Service (Outreach), or **opportunities** in Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking). You will also receive a notification when you are assigned a new incident, answer, or opportunity. See Opening your notifications.
- **Search results**—Access items and records from a standard search or a **Quick Search**. See Searching for records. (The Quick Search menu is a default tool window that displays on the navigation pane. See Navigation pane for details about tool windows.)

To change the way information displays on the content pane, including the content pane tabs, see Changing view options.

Content pane tabs

Tabs on the top of the content pane display all the items you currently have open. When more than one item is open, just click a tab to return to that item or right-click a tab and select from the following options: Open in New Window, Close, Close All But This, and Close All. You can also press **Ctrl+w** or **Ctrl+F4** to close the active tab or click the Close button (X) on any content pane tab. Refer to Closing multiple records simultaneously.

Right-click options differ for records in a **workgroup**. When you right-click the content pane tab of the primary record, your only option is to close all associated records in the workgroup. When you right-click an associated record that is the active tab, your options include Accept Changes, Cancel Changes, and Undock. Refer to Creating and using workgroups.

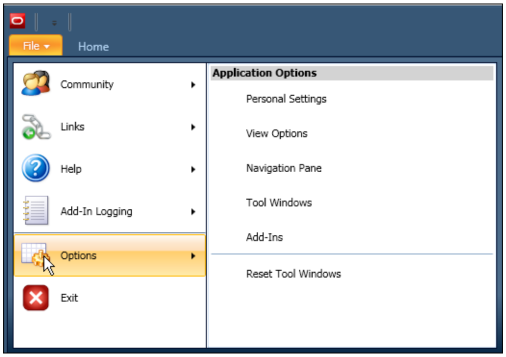
Tip On certain workspaces editors, including incidents, contacts, organizations, and tasks, you can undock an open record by clicking the Undock button on the active tab or the Undock button on the ribbon. This action opens the record in a separate window and lets you move between the window and console without having to close the window first.

- Opening reports
- Using dashboards

Accessing application options

Once you become familiar with the **agent desktop**, you may want to customize certain areas based on your personal preferences and what works best for you. You can change settings specific to your **staff account** that will be reflected when you add certain records to the knowledge base, change your password, and customize how the **navigation pane**, **content pane**, and **tool windows** display.

Click File and select Options on the left. The application options display on the right.



Application options are described in the following table.

Table 7: Application Options Description

Option	Description
Personal Settings	Select this option to change settings in your **staff account** and certain **local settings**. See Changing your personal settings.
View Options	Select this option to change how information displays on the content pane, including content pane tabs; change the color and tint of the interface; and display the date, server time, and time zone in the status bar. See Changing view options.
Navigation Pane	Select this option to change the order of the buttons on the navigation pane, change the number of items that display in the recent iems list, and choose what displays on the content pane when you log in. See Changing navigation pane settings.
Tool Windows	Select this option to choose which tool windows (Recent Items, Navigation, and Quick Search) are visible. See Changing tool window visibility.
Add-Ins	Select this option to view the list of add-ins that are active (enabled) for your profile and the interface you are logged in to. Inactive add-ins are also displayed in the list. See Viewing available add-ins for your profile.
Communication Center	Select this option to customize your chat notification settings. See Changing chat options. **Note:** **Oracle RightNow Chat Cloud Service** (Chat) must be enabled for the Communication Center option to be available.

Table 7: Application Options Description (Continued)

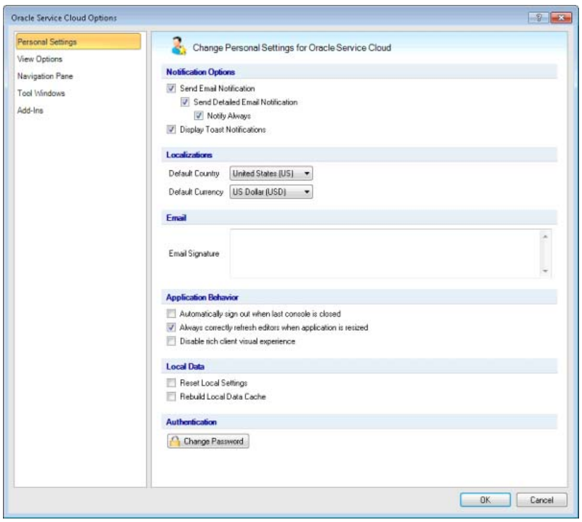
Option	Description
Reset Tool Windows	Select this option to return the tool windows to their default locations. **Note:** You can also return tool windows to their default locations by selecting the Reset Local Settings check box in your personal settings. See Changing your personal settings.

Changing your personal settings

Some personal settings apply to options in your **staff account** and some settings apply to local settings, the interface defaults in Oracle Service Cloud. Any staff account changes you make from the Personal Settings option will also be made to the corresponding settings in your staff account.

To change your personal settings

1 Click File and select Options > Personal Settings.



2 Select from the following options.

Table 8: Personal Settings Description

Field/Button	Description
Notification Options	This section contains options for changing how you receive notifications. **Note:** Changes you make here will also be made to the corresponding settings in your staff account.
Send Email Notification	Select this check box if you want an email sent to your default email client (your external email application) when you receive a notification while you are not logged in to Oracle Service Cloud. An email will be sent to your email client the first time a notification is delivered while you are logged out. Subsequent notifications won't generate an email until you log in and out of the system. **Note:** This check box is disabled if you don't have an email address specified in your staff account. In addition, you must select this check box in order to select the Send Detailed Email Notification and Notify Always check boxes that follow.
Send Detailed Email Notification	Select this check box if you want an email containing detailed information sent to your default email client (your external email application) when you receive a notification while you are not logged in to Oracle Service Cloud. An email will be sent to your email client the first time a notification is delivered while you are logged out. Subsequent notifications won't generate an email until you log in and out of the application.
Notify Always	Select this check box if you want to receive an email for every event that triggers a notification even if you are logged in to Oracle Service Cloud.
Display Toast Notifications	Clear this check box if you don't want to receive notifications in a desktop alert, or toast. By default, when you log in to Oracle Service Cloud, you will receive a desktop alert listing new notifications. The message displays for several seconds in a window on the lower right of the screen. See Opening your notifications. **Note:** This is a local setting, an interface default setting.

Table 8: Personal Settings Description (Continued)

Field/Button	Description
Localizations	Options in this section let you change settings that apply when you add certain records such as opportunities. **Note:** Changes you make here will also be made to the corresponding settings in your staff account.
Default Country	Click this drop-down menu to change the default country in your staff account. United States is the default.
Default Currency	Click this drop-down menu to change the default currency in your staff account. U.S. Dollar is the default.
Time Zone	Click this drop-down menu to select the time zone in which you are working. **Note:** This setting does not apply to all staff members and therefore may not appear.
Email	The option in this section lets you edit your email signature.
Email Signature	If you have an email address specified in your staff account and the permission to customize your signature, make your changes in this text box.
Application Behavior	Options in this section let you select application behavior settings.
Automatically Sign Out when Last Console is Closed	Select this check box to prevent the Exit message from displaying when you close the last console or select Exit on the file menu. **Note:** This is a global setting stored on your workstation and applies to all the interfaces on this site that you can access.
Always Correctly Refresh Editors when Application is Resized	Clear this check box to ensure that editors load faster on the console. This option displays *only* when Oracle Service Cloud is installed on 64-bit operating systems. **Important:** This option is designed to compensate for a Windows limitation when resizing one or more windows on 64-bit operating systems. However, when this option is enabled, which it is by default, you may experience more screen flickering and editors may load more slowly. Also, be aware that when you clear this option, editors that have been resized may not refresh properly.

Table 8: Personal Settings Description (Continued)

Field/Button	Description
Disable Rich Client Visual Experience	Select this check box to use software rendering instead of hardware rendering on the console display. **Note:** This option is effective if you have limited hardware, such as a slow graphics card, which might cause repainting or display issues. However, if you have adequate hardware, selecting this check box may slow down operations.
Local Data	This section contains options for resetting your **local settings** and refreshing your local cache.
Reset Local Settings	Select this check box to reset local settings to the interface defaults.
Rebuild Local Data Cache	Select this check box to remove your local cache entries and request current copies from the server.
Authentication	The option in this section lets you change the password for logging in to your application.
Change Password	Click this button to change your password. See Changing your password.

3 Click OK.

- ❖ Adding and editing staff accounts
- ❖ Rebuilding your local cache

Rebuilding your local cache

You can remove your local cache entries while logged in and request current copies from the server without manually deleting the files. Your local cache files store all option lists data (any data accessed from a drop-down menu or menu list, such as customizable menu items) plus additional data such as **report** and **workspace** definitions, **questions**, **documents**, and **standard text**. If you aren't sure whether your local copy of common data matches the data on the server, rebuild your local cache to retrieve the most up-to-date data.

To rebuild your local cache

Important Contact your administrator or supervisor before rebuilding your local cache.

1. Click File and select Options > Personal Settings.
2. Select the Rebuild Local Data Cache check box under Local Data.
3. Click OK. A prompt asks you to confirm your request.
4. Click Yes. A progress bar displays on the content pane.

Once all data is received from the server and written to the cache, the progress bar and window close.

Changing your password

Although passwords are optional in Oracle Service Cloud, your organization may have security policies that require all staff to use a password to log in. If this is the case, your staff account contains a password you must use each time you log in. You may also need to change your password at regular intervals.

To change your password

Important If your profile contains the SSO Login (SAML 2.0) permission for **single sign-on**, you cannot change your password in Oracle Service Cloud. See Agent login.

1. Click File and select Options > Personal Settings. Your personal settings display.
2. Click Change Password on the bottom of the window.
3. Type your current password and press **Tab.** Don't forget that your password is case sensitive.
4. Type the new password and press **Tab.**

Tip If an entry does not meet your organization's password requirements, such as password length or character repetition, the system highlights the incorrect entry.

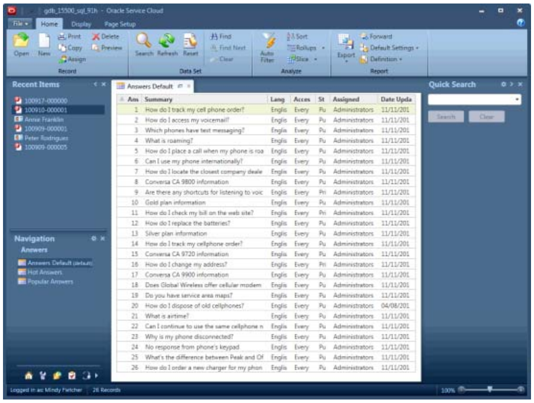
5. Retype your new password.

6 Click OK. The Oracle server verifies your password history (both current and new passwords) and, if errors are found, displays the requirements that were not met.

Changing view options

As you become familiar with your application and navigating the console, you may want to change the way information displays on the **content pane**. By default, when you open an item, it appears in full window display.

Click to view

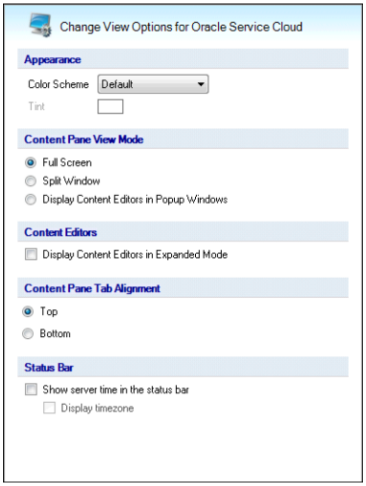


You can change the default content pane display to a split window or pop the content pane in a new window. You can also change the placement of the **content pane tabs**, change how information displays in records, change the interface color, and display date, time, and time zone in the status bar.

Tip All view options are **local settings**.

To change your view options

1 Click File and select Options > View Options.



2 Select from the following options.

Table 9: View Options Description

Field	Description
Appearance	The options in this section apply to the interface color.
Color Scheme	Click this drop-down menu to change the interface color scheme.
Tint	Click this color box to select a tint for the interface color. You can also define a custom color.
Content Pane View Mode	This section contains options for changing how information displays on the content pane.
Full Screen	Leave the default, Full Screen, if you want the report or item to appear in full window display.
Split Window	Select this radio button to display your items in a split window. In split window, explorers always open on the top half of the window and all other items open on the bottom. Drag the divider in the middle of the content pane up or down to show more of one record or item.

Table 9: View Options Description (Continued)

Field	Description
Display Content Editors in Popup Windows	Select this radio button to pop the content pane in a new window. For instance, if you add a record or open one to edit, the record opens in a separate window. Selecting this option applies to the next editor you open, not any that are currently open. **Note:** Selecting this option places the window on top of the console, which prevents the window from disappearing behind other applications, but you must close the window before returning to work on the console. As an alternative to this option, you can undock administration and workspaces editors from the console and work between the console and a separate window without having to close the window first. See Content pane tabs and Creating and using workgroups.
Content Editors	This section contains a setting for changing how records display on the content pane.
Display Content Editors in Expanded Mode	Select this check box so you can scroll through all of a record's fields rather than clicking tabs to access specific field information.
Content Pane Tab Alignment	This section contains options for choosing where the content pane tabs appear.
Top	By default, content pane tabs display at the top of the content pane.
Bottom	Select this radio button to display content pane tabs on the bottom of the content pane.
Status Bar	This section contains options for displaying the server time and time zone in the status bar.
Show Server Time in the Status Bar	Select this check box to display the date and server time in the status bar of the console. **Note:** Selecting this check box enables the Display Time Zone check box so you can select that option as well.
Display Time Zone	Select this check box to display the time zone next to the server time in the status bar.

3 Click OK.

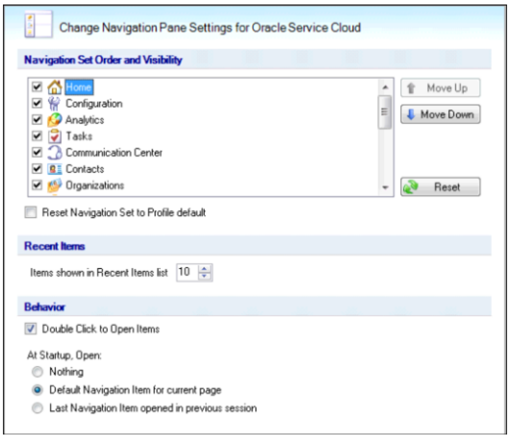
Changing navigation pane settings

Navigation pane settings determine the order of the **navigation buttons** and the **Configuration button** on the navigation pane, which buttons display, and what opens on the content pane when you log in. You can customize these and other settings to suit your specific work responsibilities and preferences.

Important Navigation pane settings are **local settings**. Consequently, any customizations you make from this option, except for resetting your navigation set, will be removed if you select the Reset Local Settings check box from the Personal Settings option. See Reset Local Settings.

To change your navigation pane settings

1 Click File and select Options > Navigation Pane.



2 Select from the following options.

Table 10: Navigation Pane Settings Description

Field/Button	Description
Navigation Set Order and Visibility	This section contains a list of all the navigation buttons in your navigation set and the order in which they display on the navigation pane. All buttons are selected by default. **Note:** Depending on your **profile** permissions, you may also have the Configuration button in your navigation set and it will display in this list as well.
Buttons List	Clear the check box next to any button that you do not want to appear on the navigation pane. Clearing a check box does not remove the button from your navigation set. It just prevents the button from displaying, and you can display it again at any time.
Move Up	After selecting a navigation button, click this button to move the navigation button up one position in the list.
Move down	After selecting a navigation button, click this button to move the navigation button down one position in the list.
Reset	Click this button to reset the order of the buttons that appear on the navigation pane to the order defined in your navigation set.
Reset Navigation Set to Profile Default	Select this check box to remove all customizations you have made to your navigation lists and reset to your profile's default navigation set. See Customizing navigation and configuration lists. **Note:** This check box won't appear unless you have the Customize Navigation Sets permission set in your profile.

Table 10: Navigation Pane Settings Description (Continued)

Field/Button	Description
Recent Items	This section contains an option for defining how many items you want in the recent items list. Recent items are interface specific and include those records and items you have recently opened. Keep in mind that the system does not track configuration items in the list. **Note:** If you make a change to a field on the Contacts or Organization tab of an incident, the contact or organization record will not appear in this list. However, if you open the contact from the incident or the organization from the contact record (by clicking the contact or organization and selecting Open), the record will appear in your recent items list.
Items Shown in Recent Items List	Type a number or click the arrows to change the number of items to show in this list. The default is 10 items and the maximum is 40. **Note:** Recent items associated with disabled products will not appear in the list. For instance, if you edit an opportunity and then Opportunity Tracking is disabled, the opportunity will no longer appear in your list.
Behavior	This section contains options for choosing how to open items on the content pane and what, if anything, opens when you log in.
Double Click to Open Items	Clear this check box to open items with a single click. By default, you must double-click a report or any item in your navigation list to open it on the content pane. **Note:** This setting also affects the way you open configuration items.
At Startup Open:	The options in this section determine what displays on the content pane when you log in. **Note:** By default, the navigation list or configuration list that appears when you log in will be the same list that was displayed when you logged out.
Nothing	Select this radio button if you want the last selected item in the navigation list to be selected but not opened.
Default Navigation Item for Current Page	Clear this radio button if you don't want the default item for the navigation list to automatically open on the content pane. **Note:** This radio button is selected by default. When the navigation list or configuration list does not have a default item, nothing will open.

Table 10: Navigation Pane Settings Description (Continued)

Field/Button	Description
Last Navigation Item Opened in Previous Session	Select this radio button if you want the last item that was open when you logged out to automatically open when you log in, even if it is not in the list that displays when you log in.

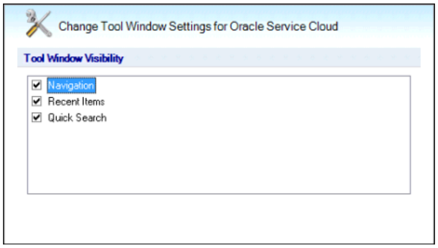
3 Click OK.

Changing tool window visibility

In addition to manually closing tool windows from the navigation pane (Tool window buttons), you can also change tool window visibility from your application options.

To change tool window visibility

1 Click File and select Options > Tool Windows.



2 Clear the check box next to any tool window you want to hide. All tool windows are visible by default.

3 Click OK.

Note You also have the option to add a custom tool window to the Service Console. Using NAVPANE_CUSTOM_WEB_CONTROL_URL (RightNow User Interface > Tool Bar > General), you can embed a web page on the navigation pane. Once you add a fully qualified domain name in the Value field, a Custom Web Control tool window will display in the Tool Window Visibility list. However, you must select the check box in the list in order to display your custom tool window on the console. You can then move it just like any of the default tool windows.

- [Selecting actions from a navigation or configuration list]
- [Moving tool windows]
- [Selecting actions from the recent items list]

Explorers

Certain components and configuration items display data in hierarchical folders similar to Windows Explorer. The main elements and basic functionality of explorers in Oracle Service Cloud are the same, but options may differ slightly from one explorer to another.

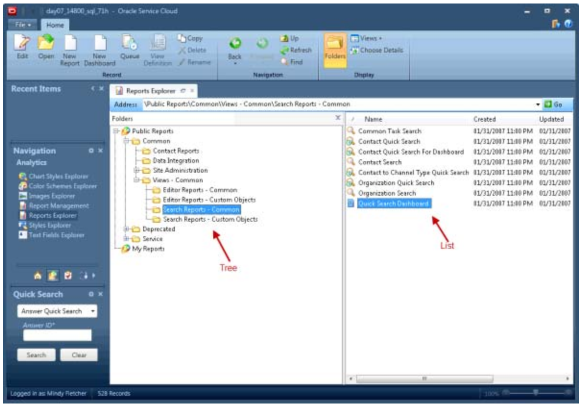
Important Explorers can be added to any **navigation list** or your **configuration list**, just like any report or other item. For instance, the list of **campaigns** in your application display in an explorer, yet you can add the Campaigns explorer to a navigation list other than the Campaigns navigation list.

To open the Reports explorer

1 Click the Analytics button on the navigation pane.

2 Double-click Reports Explorer in the navigation list. The explorer opens on the content pane.

Tip Although the default requires that you double-click an item to open it, you can change the default so that items open with a single click. See Changing navigation pane settings to select this option.



The following explorers are available in Oracle Service Cloud. Certain components contain multiple explorers.

Table 11: Explorers Description

Component/ Configuration Item	Description
Analytics	This component contains Reports, Styles, Chart Styles, Color Schemes, Images, and Text Fields explorers. See Analytics Explorers.
Campaigns	See Outreach Campaigns for information about the campaigns component and the Campaigns explorer.
Mailings	See Outreach Mailings for information about the mailings component and the Mailings explorer.
Surveys	This component contains Surveys and Questions explorers. See Creating surveys, and Creating questions.
Content Library	This component contains Documents, Tracked Links, Files, Templates, and Snippets explorers. See Content Library.
Audiences	This component contains Segments and Contact Lists explorers. See Audiences.
Navigation Sets	See Creating navigation sets for information about this configuration item and the Navigation Sets explorer.

Table 11: Explorers Description (Continued)

Component/ Configuration Item	Description
Workspaces/Workflows	See Workspaces explorer and Creating workflows for information about the Workspaces and Workflows explorers for these configuration items. **Note:** The desktop workflow feature must be enabled for Workflows to display. When disabled, only Workspaces displays under Application Appearance in the configuration list.
Client Workflow Images	See Adding images for use on workspaces for information about this configuration item and the Client Workflow Images explorer.
Scripts	See Scripts explorer for information about this configuration item and the Scripts explorer.
Guided Assistance	See Creating guides for information about this configuration item and the Guided Assistance explorer.

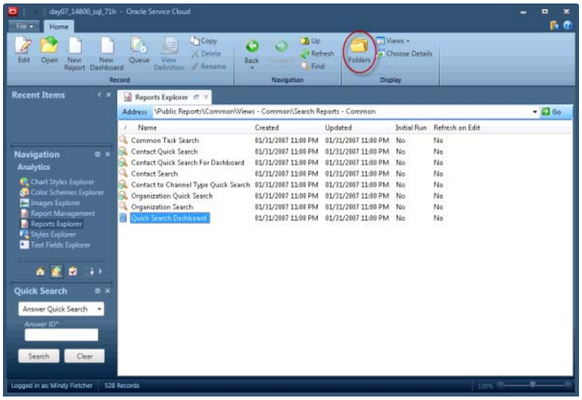
Display states

Explorers display in one of three states: Folders On, Folders Off, and Search On. The display state determines what information you see and what functionality is available. You change states using the Folders and Find buttons on the ribbon.

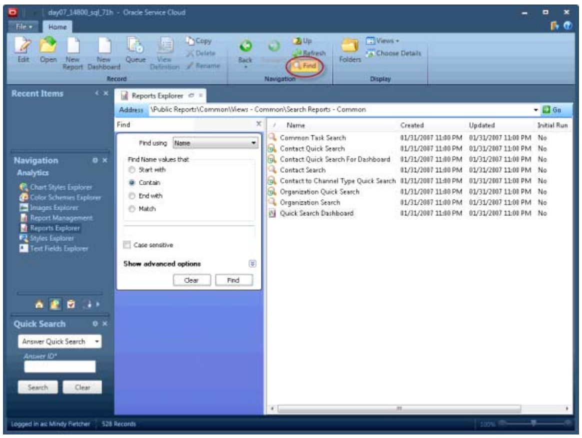
Folders On—In the default Folders On state, explorers display a folders tree on the left and a detailed list of the selected folder's contents (subfolders and items) on the right. The columns that display in the list are specific to each explorer. For instance, the Reports explorer shows Created, Updated, Initial Run, and Refresh on Edit columns, while the Mailings explorer might show Last Launched, Sent, and Clicked columns.

Folders Off—When you turn off folders, the tree is hidden and the content pane displays only the detailed list of the selected folder's contents. However, the folder hierarchy is maintained. Depending on where you are in the hierarchy when you turn off folders, you can double-click a folder to drill down or click Up to move up one level.

Click Folders to turn off folders. (You can also click X on the top right of the folders tree to turn off folders.) Click Folders again to display the tree and turn folders on.



Search On—The third explorer display state is Search On. The left side of the content pane displays the Find menu. Click Find to change to Search On. Click it again to turn off search. (You can also click X on the top right of the Find menu to turn off search.)



Tip Turning off search puts the explorer in the Folders Off state. To turn off search and display the folders list, click Folders instead of closing the Find menu.

Searching in explorers

The steps for searching are the same in all explorers. You can search any of the available columns in the list by selecting a column from the Find Using drop-down menu. Three **data types** are supported in explorer searches: strings (words), dates, and integers (numbers). The data type of the column you select determines the available search criteria.

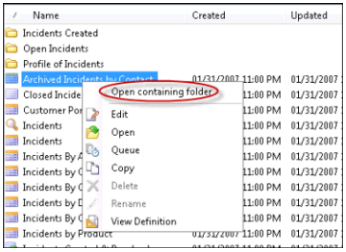
- **String**—The Name column is the default search column in all explorers. Because this is a string data type, you can search for strings that start with, contain, end with, or match the value you enter in the search box. You can also match the case by selecting the Case Sensitive check box.
- **Date**—If the column you select is a date data type, you can search for dates before, on, or after today's date. You can also click the calendar to display the current month's calendar and select another day, or click the arrows at the top of the calendar to change months.
- **Integer**—If the column you select is an integer data type, you can search for values that are less than, equal to, or greater than a number. Either type a number in the search box or select one using the arrows.

To search for a report from the Reports explorer

1. Double-click Reports Explorer in your navigation list. The explorer opens on the content pane.
2. Click Find. The left side of the content pane displays a Find menu, hiding the folders tree.
3. Click the Find Using drop-down menu and select a column to search.
4. Select a radio button for your search criteria.
5. Type your search text in the text box and click Find. The search results display in the list on the right side of the content pane. You will receive a message when no matches are found.
6. To remove the text entered from the previous search, click Clear.

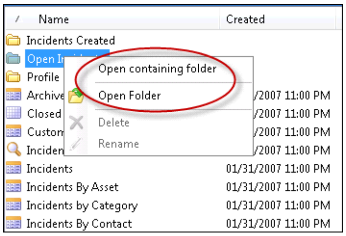
Performing actions on search results

The actions you can perform after a search vary according to the search results and your profile permissions. In addition to the common actions you can initiate from the ribbon or by right-clicking a file, you have an additional option—Open Containing Folder—when you right-click a file returned in an explorer search.



Select Open Containing Folder to display the folder containing the selected file. This automatically closes the Find menu and returns the explorer to the Folders On display state.

Right-clicking a folder returned in your search provides another option in addition to Open Containing Folder.



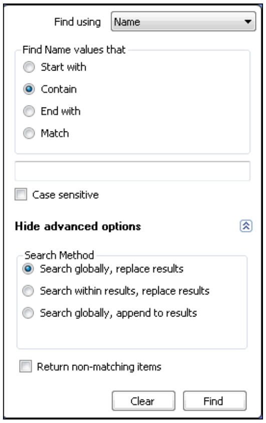
- **Open Containing Folder**—Select this option to display the parent folder in the tree.
- **Open Folder**—Select this option to display the folder in the tree.

Both actions close the Find menu and return the explorer to the Folders On display state.

Advanced search options

You can use advanced search options to remove the results from your search, search your current results, or keep your current results and add results from your next search. By default, conducting a new search removes the previous search results.

Click Show Advanced Options on the bottom of the Find menu. (You can click anywhere on the line to display the advanced options.) The option then changes to Hide Advanced Options.



The following options are available for conducting an advanced search.

Table 12: Advanced Search Options

Option	Description
Search globally, replace results	Select this radio button to remove the results from the previous search and replace with results from this search. This is the default option.
Search within results, replace results	Select this radio button to search only the current results and keep only those that match this search.
Search globally, append to results	Select this radio button to keep results from the previous search and add results from this search.

You can also select the Return Non-Matching Items check box to return all files that do *not* match your search criteria.

Selecting actions from the tree

The primary way of moving around explorers is from the tree, although you can also select actions and change focus in the explorer from the list, ribbon, and address bar.

Note Depending on the permissions in your profile and the explorer you are working in, certain actions may not be available. For instance, if you select a **standard report** in the Reports explorer, the Delete action from the list and the button on the ribbon are not available since you can't delete standard reports.

You have the following options from the tree.

Table 13: Explorer Tree Options

Option	Action
Change the list	Select a folder in the tree to change the list of subfolders and items that appear.
Expand or collapse all folders	Right-click a folder to expand or collapse all folders in the tree. You can also click the plus or minus sign next to a folder to expand or collapse a single folder.
Add a folder	Right-click a folder and select New Folder. A new folder is created under the selected folder and you are given the opportunity to name it. **Note:** This option is not available when you right-click a root or standard folder.
Delete a folder	**Caution!** Deleting a folder deletes all of its contents as well. This action cannot be reversed. Right-click a folder and select Delete. When you select this action, you will be asked to confirm the deletion. **Note:** This option is not available when you right-click a root or standard folder.
Rename a folder	Right-click a folder and select Rename. The selected folder is put into an editable state. **Note:** This option is not available when you right-click a root or standard folder.

Table 13: Explorer Tree Options (Continued)

Option	Action
Reorganize folders	Drag and drop a folder and its contents into another folder and move items from one folder to another. **Note:** Drag-and-drop may be restricted by permissions in your profile. Also, you cannot execute a drag-and-drop that would result in a folder containing more than 12 levels.

Selecting actions from the list

The actions available when working with the list depend on the explorer and the list of items. Some actions can also be initiated from the ribbon. The actions available also depend on whether you right-click a subfolder or an item. You have the following options from the list.

Table 14: Explorer List Options

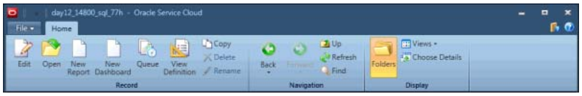
Option	Action
Open a subfolder	Right-click a subfolder and select Open Folder. This action causes the parent folder to be selected in the tree and its contents to display in the list. This option is available only when you right-click a folder. You can also double-click a folder to open it.
Edit an item	Right-click an item and select Edit. This action is available only when you right-click an item. You can also double-click the item to open it for editing. **Note:** In the Reports explorer, double-clicking will run the report.
Open an item	Right-click an item and select Open to view the item. This action is available only when you right-click an item.
Queue a report	Right-click a report and select Queue. This action manually schedules the report to run in the background. **Note:** This option is available only on the Reports explorer.
Copy an item	Right-click an item and select Copy. Select this action when you want to add an item that contains many of the same attributes as the item you right-click. This option is not available when you right-click a folder.

Table 14: Explorer List Options (Continued)

Option	Action
Delete a subfolder or item	**Caution!** Deleting a folder deletes all of its contents as well. This action cannot be reversed. Right-click a subfolder or item and select Delete. You will be asked to confirm the deletion. You can also select a subfolder or item and press **Delete**. **Note:** This option is not available when you right-click a standard folder.
Rename a subfolder or item	Right-click a subfolder or item and select Rename. The folder or item is put into an editable state for you to rename. **Note:** This option is not available when you right-click a standard folder.
View a report definition	Right-click a report and select View Definition. The report definition opens in a new window.
Add a folder	Right-click in the white space of the list and select New Folder. Once you name the folder and press **Enter,** the new folder displays in the list and also under the parent folder in the tree.
Reorganize folders and items	Drag and drop a folder and its contents into another folder and move items from one folder to another using drag-and-drop. You can also drag folders or items in the list and drop them onto a folder in the tree. (You cannot, however, drag from the tree to the list, since dragging a folder into one of its descendants is never permitted.) **Note:** Certain explorers may not permit drag-and-drop operations.
Resize and re-sort columns	Drag the left column boundaries to resize columns. Click a column header to re-sort the data in ascending or descending order.

Selecting actions from the ribbon

Many of the actions you initiate from the explorer list can also be selected by clicking a button on the ribbon. The explorer ribbon contains only the Home tab. Clicking certain buttons, such as New and Open, changes the tabs and buttons that are available. The Help button is located on the far right of the ribbon. Click this button to access help for the current task.



Shortcut keys are also available for all ribbon buttons so you can type a key combination to perform an action rather than clicking a ribbon button. Press **Alt** plus the first letter of the ribbon tab that you want to display shortcut keys for. (For instance, press **Alt+h** to display the shortcut keys for buttons on the Home tab.) This is a one-time action. Once you use a short-cut key, the ribbon returns to its default display.

The following buttons are available on the explorer ribbon.

Table 15: Explorer Ribbon Description

Group/Button	Description
Record	
Edit	Click this button to edit the selected item in the list. You can also right-click the item and select Edit or double-click the item.
Open	Click this button to open the selected item in the list. You can also right-click the item and select Open.
New Report	Click this button to create a **custom report**. **Note:** This button appears only on the Reports explorer ribbon. Other explorers contain a New button.
New Dashboard	Click this button to create a **dashboard**. **Note:** This button appears only on the Reports explorer ribbon.
Queue	Click this button to manually schedule the report to run in the background. When a queued report has been generated, a toast notification displays with a link to open the report. (This option is useful for reports or dashboards that you think may query or return a large amount of data.) You can also right-click the report and select Queue. **Note:** This button appears only on the Reports explorer ribbon.

Table 15: Explorer Ribbon Description (Continued)

Group/Button	Description
View Definition	Click this button to view the report definition in a new window. You can also right-click the report and select View Definition. **Note:** This button appears only on the Reports explorer ribbon.
Copy	Click this button to copy the selected item in the list. You can also right-click the item and select Copy.
Delete	**Caution!** Deleting a folder deletes all of its contents as well. This action cannot be reversed. Click this button to delete the selected item or folder in the list. You can also right-click the item or folder and select Delete or select the item and press **Delete.** **Note:** You cannot delete a root or standard folder.
Rename	Click this button to rename the selected subfolder or item in the list. You can also right-click the item or subfolder and select Rename. **Note:** You cannot rename a root or standard folder.
Navigation	
Back	Click this button to return to the last folder you accessed. The list on the right populates with the folder's contents, just as if you had manually selected a folder in the tree. Initially, this button is disabled. You can also click the arrow on the far right of the address bar to display the paths of the last ten folders and items accessed. The most recent entry is at the top of the list.
Forward	Click this button to move forward in the history of recently accessed folders and items. The forward list is populated as soon as you click the Back button. You can also click the arrow on the far right of the address bar to display the paths of the last ten folders and items in the Forward list. The most recent entry is at the top of the list.
Up	Click this button to access the parent of the selected folder. When the selected folder has no parent (that is, it is a root folder), the Up button is disabled.
Refresh	Click this button to refresh the tree and list.

Table 15: Explorer Ribbon Description (Continued)

Group/Button	Description
Find	Click this button to change the explorer state to Search On. See Display states.
Display	
Folders	Click this button to switch between showing the tree and hiding it. See Display states.
Views	Click the arrow on this button to change the way the subfolders and items display in the list. Options include Tiles, Icons, List, and Details. The default is Details (subfolders and items display in column format).
Choose Details	Click this button to select which database columns you want to display and which you want to hide. The columns that are displayed have a check next to them. This button is available only when the Details view is active. (See the Views button description above.) **Note:** The Name column can never be hidden and therefore does not appear in the list of columns. However, you can display the ID column, which is hidden by default.

- Creating reports
- Creating dashboards
- Queuing reports

Changing folders from the address bar

You can also change folders and focus in the tree by typing a path, or partial path, in the address bar. As you work in the tree, the address bar is updated with the path of the selected folder whenever you change folders. Clicking Back or Forward also updates the path in the address bar.

Tip You can type just a few characters in the address bar and the system will present you with possible path completions. Use your mouse or other pointing device or the arrow key to select the path you want. Then press **Enter** or click Go to change folders.

Saving items in explorers

When you create or edit an item in an explorer, you have more than one option for saving the item. No matter which explorer you are working with, the steps are essentially the same.

To save an item in an explorer

1 Click the Home tab on the ribbon.

Note When saving a **custom report**, click the arrow on Save on the **Quick Access toolbar** and select a save option.

2 To save changes to the item without closing it, click Save.

3 To save changes to the item and close it, click Save and Close. This option is faster than saving a change and then manually closing the window.

4 To save a new item or save a copy of the item you are editing with a different name, click Save As. The Save As window opens.

Note Not all explorers contain a Save As button.

a To save the item in a custom folder, navigate to the folder. You cannot save custom items in the standard folders in either the Reports or Images explorers.
b Type a name for the item in the Name field.
c Click OK.

4

Session Management and Login Controls

Oracle Service Cloud provides a number of security measures to assist you in safeguarding your organization's data and that of your customers.

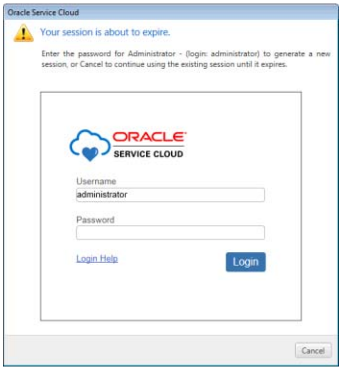
As your organization's administrator, you can expire sessions to help reduce session exploitation, control both active and inactive desktop user sessions to lower seat usage for licensing compliance, and control and track login behavior on the **administration interface**.

Forcing session expiration

Reducing session exploitation can help your organization protect its data. And Oracle Service Cloud is set up to automatically expire sessions so you can control the length of time before staff sessions expire.

The SESSION_HARD_TIMEOUT configuration setting (RightNow User Interface > General > Security) can be set for a time value between a minimum of 1 hour and a maximum of 8,760 hours (1 year). The default value is 12 hours.

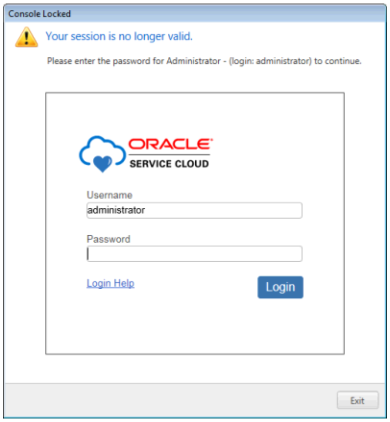
A warning message alerts staff members five minutes before their current session is set to expire and tells them to reauthenticate.



After entering login credentials, the staff member will be authenticated, a new session will be created, and the session ID will be updated throughout the product. The staff member can continue working without any loss of data.

Important Oracle RightNow Desktop Add-Ins Cloud Service (desktop add-ins), Oracle RightNow Connect Desktop Integration (JavaScript API), and co-browse will receive a notification when a new session has been created.

If a staff member dismisses the warning message (by clicking Cancel), the Service Console locks when the session expires.



After the staff member enters login credentials and is authenticated, a new session is created and the staff member can proceed without losing any work.

Agents who are chatting with customers must also enter their password to reauthenticate. If an agent does not reauthenticate, any open chat sessions are sent back into the queue for assignment to the next available agent.

Tip Although you have other ways to force staff members to reauthenticate, the session hard timeout feature should be the primary method you use since it requires no manual intervention on your part.

Controlling desktop usage

Our desktop usage administration feature is controlled by SESSION_MANAGEMENT_ENABLED. The setting is enabled by default and provides ways for you to control and manage both active and inactive sessions.

Note Contact your Oracle account manager for information about desktop usage metering and licensing compliance.

Manually logging out active sessions

While session hard timeout is the preferred way to force staff members to reauthenticate, you can also manually log out individual staff accounts when the situation warrants. This action terminates the staff member's session, locks the Service Console, and forces the staff member to reauthenticate in order to continue working. When an agent is engaged in a chat and is logged out, but then does not reauthenticate, the chat is sent back into the queue for assignment to the next available agent.

Note In order to manually log out staff accounts, staff members must have the Groups/Accounts/Distribution Lists permission on the Administration tab of the Profiles editor. Refer to Administration permissions to assign this permission.

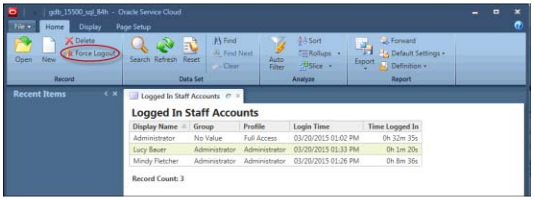
When you manually log out a staff account, the server sends the information to the client. When the staff member then tries to perform an action, like saving an open record or clicking a button, a Console Locked message displays. After the staff member enters login credentials and is authenticated, a new session is created and the staff member can proceed without losing any work. Also, the end date and time are updated in the User Transactions (*user_trans*) table in the Oracle database, enabling you to view and track your desktop user sessions.

Using the Logged In Staff Accounts standard report (Configuration > Staff Management > Logged In Staff Accounts), you can see which staff members are currently logged in, the date and time they logged in, and how long they have been logged in. You'll also see a Force Logout button on the Record group of the ribbon for logging out a selected staff account. (You can also right-click a staff account in the list and select Force Logout.)

Note If you prefer, you can create your own custom report to manually log out staff members. You'll need to use fields from the Accounts (*accounts*) and User Transactions (*user_trans*) tables to display currently logged-in staff accounts and their login start and end times.

To manually log out a staff member

1 From the configuration list, double-click Logged In Staff Accounts under Staff Management.



Tip You can also access this report from the Reports explorer at Common > Site Administration > Staff Management.

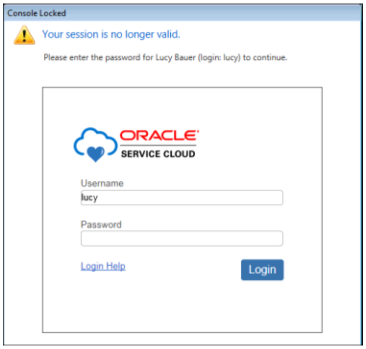
2 Select a staff account in the list and click Force Logout. A message asks you to confirm the action and warns you that all of the staff member's unsaved changes will be lost.

3 Click OK. Another message informs you that the staff member's session has been terminated.

4 Click OK.

5 Repeat steps 2–4 as necessary to log out additional staff accounts.

When a staff member tries to perform an action after being logged out, a Console Locked message displays.



Once the staff member reauthenticates (by entering the correct password), a new session is created and the staff member can proceed without losing any work.

Automatically logging out inactive sessions

In addition to manually logging out active sessions, you can also set up your application to automatically log out inactive sessions. You'll configure automatic logout of inactive sessions using a configuration setting and a profile setting, which work together to give you more flexibility in managing your desktop user sessions and maintaining site security.

- **CLIENT_SESSION_EXP**—Use this configuration setting to specify the time in one-minute intervals that a session can be inactive before a staff account is automatically logged out. The default value of CLIENT_SESSION_EXP, located at Site Configuration > Configuration Settings > RightNow User Interface > General > Security, is 15 minutes and the maximum value is 1440 (24 hours).

Note Even if you disable desktop usage administration, you can still use CLIENT_SESSION_EXP to maintain security on your site.

For security purposes, CLIENT_SESSION_EXP also applies to the **accessibility interface**.

- **Session Timeout field**—Use this field on the Profiles editor to specify a time (0–1440 minutes) other than the time defined in CLIENT_SESSION_EXP that a session can be inactive before a staff account is automatically logged out, or set this field so that staff members with a particular profile are exempt from being automatically logged out due to inactivity. By default, this field is null, meaning that the value in CLIENT_SESSION EXP will be used for automatic logout. Entering *any* value in this field overrides the value defined in CLIENT_SESSION_EXP.

Important Even if you exempt certain staff members from being automatically logged out due to inactivity, staff member sessions will still expire and staff must reauthenticate when the time set in SESSION_HARD_TIMEOUT expires.

Here's how automatic logout of inactive sessions works. Once the time of inactivity has been exceeded, the client sends a logout request to the server, which will update the end date and time in the User Transactions (*user_trans*) table in the Oracle database.

Staff members will receive a Console Locked message asking for their password to reauthenticate. After a staff member enters login credentials and is authenticated, a new session is created and the staff member can continue working with any loss of data.

For staff members who choose to exit the application, all their unsaved work will be lost. In addition, after entering four incorrect passwords, a staff member will be locked out of the console and must re-launch the application. Any unsaved work will be lost.

Agents who are chatting with customers when they are automatically logged out must also enter their password to reauthenticate. If an agent does not reauthenticate, any open chat sessions are sent back into the queue for assignment to the next available agent.

Important Staff members who log in through an identity provider (that is, using the **single sign-on** process) will not have the opportunity to re-enter their password to continue working in the application. Any unsaved work will be lost.

Configuring automatic logout by profile

You may want to exempt certain personnel from an automatic logout, or you may want to change the time that a session can be inactive before a staff account is automatically logged out. Either way, you can customize automatic logout by profile to override the time set in CLIENT_SESSION_EXP.

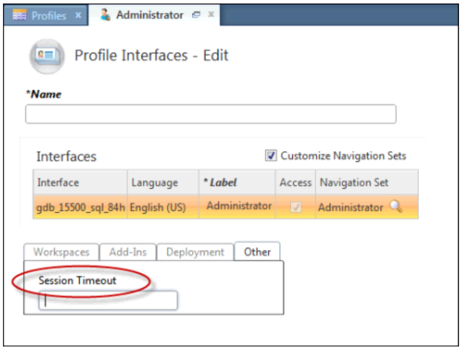
Note When SESSION_MANAGEMENT_ENABLED is disabled, this profile setting is disregarded.

To configure automatic logout by profile

1 From the configuration list, double-click Profiles under Staff Management. The report opens on the content pane.

2 Select the profile you want to edit and click Open.

3 Click the Other tab to display the Session Timeout field.



Note The default in the Session Timeout field is null, meaning that the value specified in CLIENT_SESSION_EXP will be used for automatic logout. Change the null default *only* if you want to override the value in CLIENT_SESSION_EXP.

4 To exempt staff members associated with this profile from being automatically logged out, type `0` in the field.

5 To set another value, which will override the value specified in CLIENT_SESSION_EXP, type the number of minutes in the field.

Important Even if the value in CLIENT_SESSION_EXP is set to 0, any value other than 0 in the Session Timeout field will be used to automatically log out staff members associated with this profile when the minutes of inactivity have been exceeded.

6 Click Save and Close.

7 Repeat this procedure for all the profiles you want to configure for automatic logout.

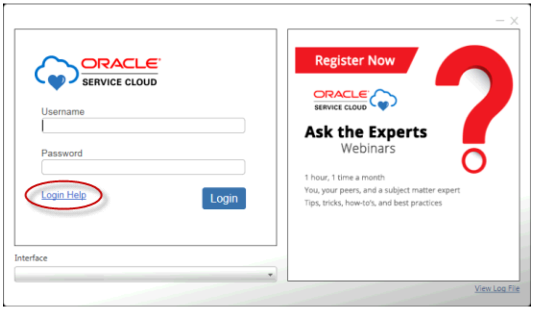
❖ Creating reports
❖ SAML 2.0 Open Login

Configuring login options

You have a number of options that can be added to your application to control login behavior and assist staff members when logging in. You can also add your organization's branding to the Login window to communicate a message to your staff members.

Configuring Login Help

Oracle Service Cloud contains an account self-service feature to assist staff members who are having problems logging in. Staff members access this feature using the Login Help link on the Login window.



Using ACCT_RECOVER_ALT and ACCT_RECOVER_STATUS, located at Site Configuration > Configuration Settings > RightNow User Interface > Tool Bar > General, you can configure your application to perform one of the following actions when staff members click Login Help.

- **Open the login procedure in online help**—In addition to providing the steps required to log in, this procedure directs staff members to their organization's administrator for their login information and explains the default behavior of the account self-service feature.
- **Send staff an email if they have forgotten their user name or password**—This is the default in ACCT_RECOVER_STATUS. When staff members click Login Help, the Account Self Service window opens.

▷ Staff members who have forgotten their user name simply type their email address and click Submit. If their email address is unique, they will receive an email containing their user name. If not unique, they will receive an email telling them to contact their administrator.

▷ Staff members who have forgotten their password select the I Forgot My Password radio button. An additional field displays.

Staff members must type their email address *and* user name. If both email address and user name match what's defined in their staff account, they will receive an email containing a link to the Password Reset page for entering a new password. As a security measure, if either user name or email is incorrect, no email is sent.

Note Use the Accounts email messages (Site Configuration > Message Templates > Administrator Emails > Accounts) to customize the emails sent to staff members when they have forgotten either their user name or their password.

- **Show alternate message**—If you want to display an alternate message to staff members when they click Login Help, change the value in ACCT_RECOVER_STATUS to **2** and type your new message in ACCT_RECOVER_ALT.

❖ [Customizing messages](#)

❖ Customizing configuration settings

Adding your branding on the Login window

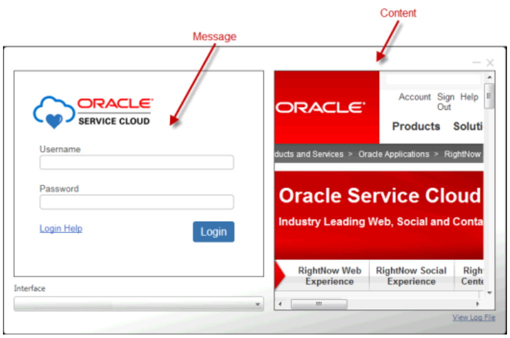
The Login window is an ideal place for you to communicate a message to your staff. Using our branding feature, you can include any message content you want when staff members log in to your application. And if your site is configured for multiple interfaces, you can customize each interface's Login window according to its audience and the message you want to convey.

Two areas can be customized using the following configuration settings (Site Configuration > Configuration Settings > RightNow User Interface > Tool Bar > General).

BRAND_CONTENT_URL—Specifies the URL used to display content on the banner area of the Login window. The default contains Oracle content announcing releases, webinars, and events.

Tip Make sure to enter a fully qualified domain name to display the web page you want. Also, the web page must use fully qualified paths to images, or the images will not display.

BRAND_WELCOME_MSG—Specifies the welcome message displayed on the Login window. Default is blank.

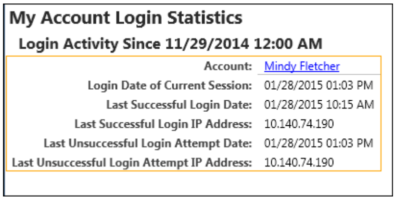


❖ Customizing configuration settings

❖ Overview of multiple interfaces

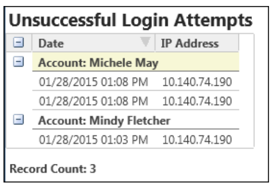
Supplying login information to staff members

You can provide staff members with details about their login activity for the previous sixty days. My Account Login Statistics, located at Common > Site Administration > Staff Management, lists when the staff member last logged in successfully, the IP address of the last successful login, when the last login attempt failed, and the IP address of the last failed login attempt. A drill-down is also available that lists all the unsuccessful login attempts since the last successful login.



You may also want to add the My Account Login Statistics report to your staff members' navigation sets. In addition, if you set this report as the default in a navigation list, and that navigation list displays when staff members log in, the report will automatically open on the content pane. In this way, your staff can track their own login activity on a regular basis.

The staff member's name in the Account column on the My Account Login Statistics report links to the Unsuccessful Login Attempts by Account report, another standard report in Oracle Service Cloud. While staff members can see their individual unsuccessful login attempts in this report, you can run the report to see all failed login attempts throughout your system and spot any trends or problems that may exist.



Limiting concurrent administration logins

Another feature you will want to know about is the ability to control the number of concurrent administration logins per site. Any range between 1 and 40,000 is allowed, and 40,000 is the default. Limiting the number of allowed sessions per site can help you manage system resources. Contact your Oracle account manager to change the default setting.

Refer to Controlling desktop usage to learn about the other ways to manage and control desktop user sessions.

Staff account locking

By default, the system locks a staff account after the staff member enters an incorrect password five times. This measure can help you and your organization maintain site security. You can change any of the password requirements at Staff Management > Password Configuration.

Login agreement functionality

You can distribute a terms of use agreement, a security statement, or any login message you choose to staff members accessing the administration interface. Your message or statement will display after staff members click Login on the Login window. Staff members must agree to the statement or message before the Service Console opens. To review or customize this setting, see LOGIN_SECURITY_MSG, located at Site Configuration > Configuration Settings > RightNow User Interface > Tool Bar > General.

Saving login credentials

For security purposes, staff members must enter their user name and password each time they log in. However, if you want to provide staff members with the option to save their login credentials, enable ACCT_ALLOW_REMEMBER_ME (RightNow User Interface > Tool Bar > General). Thereafter, each staff member's browser control will handle the user's login credentials using auto complete.

- ❖ Creating navigation sets

5

Navigation Sets

Navigation sets control the navigation lists and buttons that staff members see on the navigation pane of the agent desktop. You can create unique navigation sets for staff members who have any combination of responsibilities and assign navigation sets to staff members in their profiles. If you do not create navigation sets and assign them to profiles, staff members will not have access to navigation buttons and lists.

To understand how navigation sets, profiles, and staff accounts work together, see Navigation sets, profiles, and staff accounts.

If your installation of Oracle Service Cloud contains multiple interfaces, also see Managing staff member accessibility.

- Navigation sets, profiles, and staff accounts
- Managing staff member accessibility

Overview of navigation sets

Every staff member has a profile, and every profile must include a navigation set that all staff members with that profile use when they work in Oracle Service Cloud. A navigation set is a combination of navigation buttons and their associated navigation lists.

You can configure navigation sets to provide access to only areas of the system that staff members need to perform their job. For example, an agent working in your technical support group probably does not need access to marketing campaigns or sales opportunities. In that case, navigation lists for Campaigns and Opportunities can be left off their navigation sets.

You can create as many navigation sets as your organization needs. Then, when you add a profile, you select the navigation set that staff members with the profile will use. The staff members assigned to the profile have access to only those reports and items defined in their profile's navigation set unless you allow staff members with that profile to customize their navigation set. Refer to step 9 in To add or edit a profile.

Tip Staff members can customize their navigation set to best suit their needs. Refer to Customizing navigation and configuration lists.

Creating navigation sets

The first time you open the Navigation Sets explorer, the right side is generally empty because no navigation sets have been created. If mobile agent app is enabled on your site, a default mobile navigation set will appear on the right side. Refer to Mobile Agent App.

After you create navigation sets, the explorer displays the tree structure on the left and navigation sets on the right. The explorer includes options to copy, edit, delete, and rename any navigation set that you create.

Note The Navigation Sets explorer does not contain standard folders, but you can create custom folders to help keep your navigation sets organized. For information about working with folders, refer to Adding folders. For detailed information about explorer functionality, refer to Explorers.

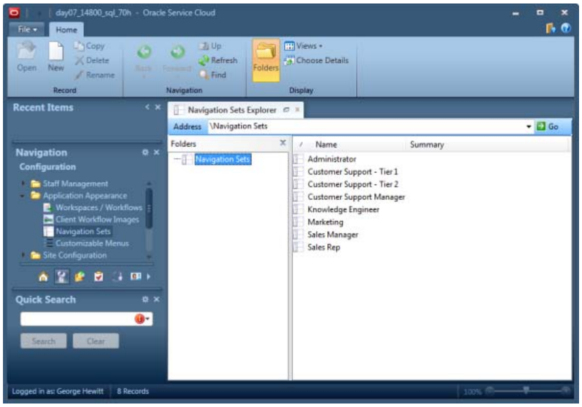
When you create navigation sets, you specify the buttons you want to appear on the navigation pane, and add reports and components to the navigation buttons. You can also add Quick Search reports to navigation sets to allow searching for contacts, incidents, or other types of records directly from the navigation pane.

Note Public and private reports and dashboards can be added to navigation buttons. However, staff members must have the appropriate Analytics permissions in their profile to open them.

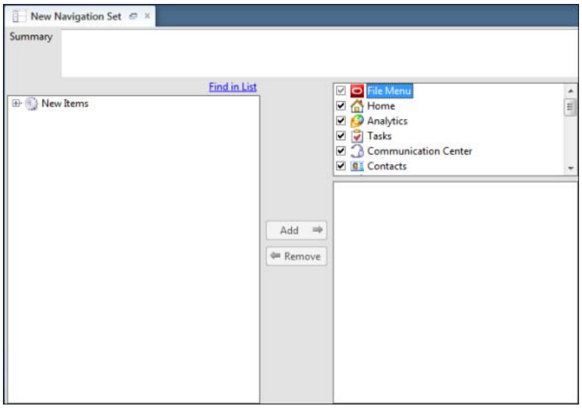
To create a navigation set

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. This opens the Navigation Sets explorer.



3 Click the New button on the Navigation Sets explorer's ribbon. The content pane displays the Navigation Sets editor.



By default, the File Menu component is selected on the right side of the content pane and New Items displays on the left. When any other component or record type is selected on the right, the left side of the content pane displays Public Reports and Components.

4 To enter information about the navigation set, type a description in the Summary field.

Note You name the navigation set when you save it.

5 To set the options available through the file menu, refer to To configure the file menu.

6 On the right side of the content pane, select the check boxes next to the types of records or components you want to include in the navigation set. All are selected by default.

Separate navigation lists can be created for each type of record or component you select. For example, select the Incidents check box to include a navigation list staff members can use when they work on incidents.

Note You cannot clear the check box next to the File Menu component, because the file menu is always available.

7 Click one of the selected record types or components to begin creating a navigation list for the record type or component.

Note Most navigation lists for the navigation buttons you select are initially empty when creating a navigation set. However, the navigation list for the Configuration button is populated with default configuration items. The items in this list can be customized using the same functionality used to customize the other navigation lists. Refer to Creating a navigation set for the administrator.

8 On the left side of the content pane, click the plus signs next to Public Reports and Components to expand the lists. Click the plus signs next to subfolders to expand them.

Tip If you know the name of a report or component you want to add to a navigation list, you can quickly locate it by clicking Find in List and searching for the item.

9 To add reports and dashboards to the navigation list, select the reports you want to add from the left column and drag them to the lower portion of the right column.

Tip You can also include reports or components by double-clicking them or by selecting them and clicking the Add button. To add more than one item at the same time, press **Ctrl** while selecting each item.

10 To add explorers to the navigation list, click the plus sign next to the appropriate product under Components in the left column, select the explorer you want, and drag it to the lower portion of the right column.

11 To add notifications to the navigation list, click the plus sign next to Common under Components in the left column, select Notifications, and drag it into the lower portion of the right column. This lets staff members open any notifications they receive. Refer to Opening your notifications.

12 To add a folder to the navigation list to help organize items in the list, click the New Folder button.

a Type the name you want for the folder.

b Drag explorers, reports, or other items to the folder.

c To rename a folder, click the folder, click the Rename button, type the new name for the folder, and click outside the folder name to save the new name.

13 To set a report, explorer, or other item as the default for this navigation list, right-click it and select Set As Default. Refer to Available Actions from Navigation and Configuration Lists.

Note The default item for a navigation list opens on login only if the navigation list was the active list when the staff member logged out last time. See To change your navigation pane settings for how staff members can change this behavior.

14 To create a navigation list for each type of record that you want to be available in the navigation set, repeat steps 7 through 13.

15 To choose the order in which the navigation buttons display on the navigation pane, click a record type or component on the upper portion of the right column and click the Move Up or Move Down button to position it in the list.

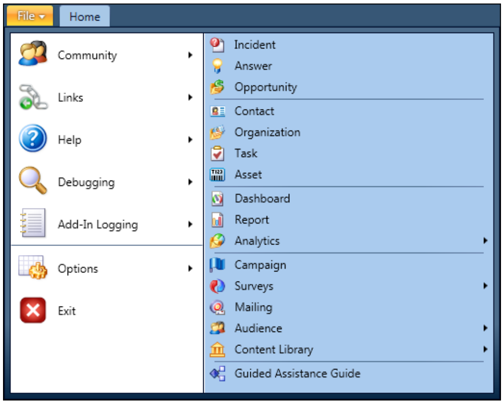
16 To add Quick Search reports to the navigation set, refer to Adding Quick Search reports.

17 Click the Save and Close button on the ribbon. The Save As window opens if you have not previously named the navigation set.

a Type a name for the navigation set in the Navigation Set Name field and click the OK button to save the new navigation set.

Configuring the file menu

The **file menu**, accessed by clicking File next to the ribbon's Home tab, includes a section on the right for creating records and items. This list is blank until you configure the file menu in navigation sets. Once you have configured it, staff members can click File and use the shortcuts you have added.



To configure the file menu

Note If you do not set any options for the file menu in the navigation set, staff members with profiles that use that navigation set do not have the option to create items using this shortcut.

If you set menu options for items that the staff member's profile does not grant permission for, those options do not appear in the file menu.

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. This opens the Navigation Sets explorer.

3 Right-click the navigation set you want to configure the file menu for and select Open.

4 If File Menu is not selected at the top of the upper portion of the right column, click it.

5 Expand New Items in the left column.

6 Select the items you want to add to the file menu and click the Add button. You can also double-click items to add them.

Tip To add more than one item at the same time, press **Ctrl** while selecting each item.

7 To add a folder to the file menu to help organize menu items, click the New Folder button.

a Type the name you want for the folder.

b Drag menu items to the folder.

c To rename a folder, click the folder, click the Rename button, type the new name for the folder, and click outside the folder name to save the new name.

8 To choose the order in which the menu options appear when File is clicked, click an item in the lower portion of the right column and then click the Move Up or Move Down button to position it in the list.

9 To group menu options, add one or more horizontal separators from the bottom of the New Items list and use the Move Up and Move Down buttons to position them.

10 Click the Save and Close button on the ribbon.

Adding Quick Search reports

You can add **Quick Search** reports to a navigation set so that staff members can access Quick Search from any navigation list on the agent desktop. Using these reports, staff members can open records, even with limited information and regardless of the type of record they are working on.

When you create a navigation set, you can define which Quick Search reports appear on the Quick Search drop-down menu on the navigation pane. The same Quick Search menu appears for every navigation button in the navigation set.

Note Remember that staff members can move or hide the Quick Search tool window and other tool windows on the navigation pane. For information about changing what appears on the navigation pane, refer to Changing tool window visibility.

Oracle Service Cloud includes the following predefined Quick Search reports.

- Answer Quick Search
- Asset Search
- Campaign Search
- Contact Quick Search
- Contact Quick Search for Dashboard
- Contact to Channel Type Quick Search
- Document Search
- Incident Search
- Mailing Search

- Outreach Task Search
- Opportunity Search
- Organization Quick Search
- Quick Search Dashboard
- Service Task Search
- Survey Search

To add Quick Search reports to a navigation set

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. The Navigation Sets explorer opens.

3 On the right side of the explorer, right-click the navigation set you want to add Quick Search reports to and select Open.

4 If the Quick Search component check box on the upper portion of the right column is cleared, select it. The Quick Search component is highlighted.

Or

If the Quick Search component check box is already selected, then click the Quick Search component to highlight it.

You may need to scroll down to locate Quick Search. If any reports are defined, they appear in the lower portion of the right column.

5 On the left side of the content pane, click the plus sign next to Public Reports to expand the list.

6 Drag a search report from the left column and drop it in the lower portion of the right column.

Tip You can also add search reports by double-clicking them or by selecting them and clicking the Add button.

7 Click the Save and Close button on the ribbon to save the modified navigation set.

Modifying navigation sets

After you create a navigation set, you can copy it to use as the starting point for another navigation set or edit it to meet changing needs. For example, you might want to include additional reports in a navigation set or remove a component from it. Occasionally, you might find that a navigation set is no longer required so you decide to delete it.

Important Remember that editing a navigation set used in a profile does not impact staff members who have permission to customize their navigation sets. Refer to Customizing navigation sets.

To copy a navigation set

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. This opens the Navigation Sets explorer.

3 On the right side of the explorer, right-click the navigation set you want to copy and select Copy. The Copy As window opens.

4 To add the copied navigation set to a folder, click the folder name.

5 Type the name of the copied navigation set in the Name field.

6 Click the OK button to close the Copy As window and return to the Navigation Sets explorer. The copy you added appears on the explorer in the folder you selected.

To edit a navigation set

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. This opens the Navigation Sets explorer.

3 Right-click the navigation set you want to edit and select Open. The navigation set opens on the Navigation Sets editor.

4 Click the record type or component you want to edit. Its navigation list displays in the lower portion of the right column on the content pane.

5 To add a report, explorer, or other item to the navigation list, expand the list of Public Reports or Components, drag the item from the left column, and drop it in the lower portion of the right column.

6 To remove a report or item from the navigation list, right-click it and select Remove.

7 Repeat steps 4 through 6 for each navigation list you want to modify.

8 Click the Save and Close button on the ribbon to save the modified navigation set.

To delete a navigation set

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. This opens the Navigation Sets explorer.

3 Right-click the navigation set you want to delete and select Delete.

Important If you try to delete a navigation set used in a profile, a message informs you that deletion is permanent and cannot be undone. If you delete the navigation set, you must edit the profile to select a different navigation set.

4 Click the Yes button at the Confirm Navigation Set Deletion message to delete the navigation set.

Assigning navigation sets to profiles

After you create navigation sets, you assign them to profiles used by your staff members. You can also assign permission allowing staff members to customize the navigation set to their individual needs.

To assign a navigation set to a profile

1 Click the Configuration button on the navigation pane.

2 Double-click Profiles under Staff Management. The report opens on the content pane.

3 Double-click the profile you want to assign the navigation set to. The Profiles editor opens.

4 Click the Search button in the Navigation Set field, select the navigation set you want staff members with this profile to use, and click the OK button.

5 To give staff members permission to change the items in their navigation lists, select the Customize Navigation Sets check box.

Note Staff members with this permission can add reports, dashboards, and explorers to their navigation lists and remove items they do not use. Changes that staff members make to their own navigation set do not impact other staff members' navigation sets. However, there are some additional considerations when this permission is granted. For information about the impacts of assigning this permission, see Customizing navigation sets.

6 Click the Save and Close button on the ribbon to save the profile.

Customizing navigation sets

If you assign the Customize Navigation Sets permission in a profile, it is important that you understand what happens when you edit the navigation set associated with the profile. Some changes you make to the navigation set automatically override changes made by staff members, while other changes have no effect on the custom navigation set.

Tip Staff members can reset their navigation set to their profile's default navigation set by accessing their navigation pane settings (File > Options > Navigation Pane), and then selecting the Reset Navigation Set to Profile Default check box. Refer to Changing navigation pane settings.

We recommend that you consider the following implications when updating navigation sets.

- Changing the default navigation set for a profile resets all navigation lists. All custom navigation lists are removed.
- Changing the profile for a specific staff account removes the staff member's custom navigation lists.
- Adding or removing buttons from navigation sets determines what buttons are available on staff members' navigation sets, even if those staff members have permission to customize their navigation set. After buttons are added to or removed from navigation sets, the changes are applied to staff members' navigation sets the next time they log in to the agent desktop.

- If you edit navigation sets to add or remove items, such as reports or explorers, from navigation lists, the changes you make have no effect on staff members' navigation sets if their profiles include the Customize Navigation Sets permission. To apply the changes to those staff members' navigation sets, you must edit their profiles and clear the Customize Navigation Sets check box. When you do so, all personalized navigation lists are removed and staff members use the navigation set defined in their profile.

6

Staff Management

Every staff member who accesses or works in Oracle Service Cloud requires a staff account. Staff accounts are organized in folders according to groups defined by job duties or other criteria, though you can also define secondary groupings by manager. When creating staff accounts, you specify staff member information, including the account login, phone number, and assigned profile. Profiles are created before creating staff accounts to define what products and information staff members can work with when logged in to Oracle Service Cloud.

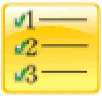
When creating a staff account, you can also specify an initial password, which can later be changed by you or the staff member after log in. You control the requirements passwords must conform to by defining the minimum password length, format, expiration options, and the number of invalid logins allowed.

Customizing profiles

Profiles let you control what areas of Oracle Service Cloud your staff members can access and what specific actions they can perform in those areas. Profiles contain general options for Oracle Service Cloud administration functions and more specific options for each of the products within the system. For example, profiles define whether your staff members can view and edit **business rules**. They also define whether your agents can respond to customers, assign incidents, conduct chat sessions in Oracle RightNow Chat Cloud Service (Chat), and perform other activities.

Important Navigation sets and custom workspaces are associated with profiles on the Profiles editor. While creating and using custom workspaces is optional, navigation sets must be created and associated with profiles before you add staff accounts. Otherwise, staff members will not have access to any records, reports, or components. Refer to Navigation Sets and Workspaces.

You may decide to define your profiles based on the structure of your organization. For example, you may want separate profiles for administrators, managers, agents, sales representatives, marketing personnel, and knowledge engineers. Once you create profiles, you can add staff accounts and assign a profile to each account.



Prerequisites

The following items must be created before adding profiles.

- **Navigation sets**—Profiles without navigation sets do not allow access to reports and other components. See Creating navigation sets.
- **Custom workspaces (optional)**—If you use custom workspaces, we recommend creating them before creating profiles so you can assign workspaces to specific profiles. See Creating custom workspaces.

To add or edit a profile

1 Click the Configuration button on the **navigation pane**.

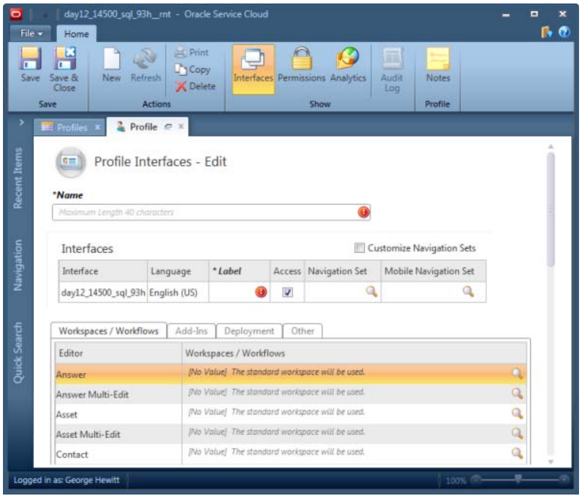
2 Double-click Profiles under Staff Management. The report opens on the **content pane**, listing the profiles that have already been created.

Tip If a profile already exists that is similar to the profile you want to create, you can copy the existing profile and edit the copy to create the new profile.

3 To add a profile, click the New button on the **ribbon**. The Profiles editor opens.

Or

To edit an existing profile, double-click the profile.



4 Type the name of the profile in the Name field.

Note When you move to another field on the content pane, the name you type is automatically added to the Label field.

5 Select the check boxes in the Access field next to the interfaces you want the profile to access.

6 If your site has multiple interfaces, click the interface you want to configure the profile for. See Configuring multiple interfaces.

Important The permissions granted for the first interface you configure are also granted for all other interfaces the profile can access.

7 Click the Search button in the Navigation Set field to specify the navigation set you want to use for the profile. The Select Navigation Set window opens.

a Select the navigation set in the list.

b Click the OK button to close the window.

8 If mobile agent app is enabled on your site, repeat step 7 for the Mobile Navigation Set field. See Editing mobile navigation sets.

9 To allow the staff accounts associated with the profile to customize their navigation set, select the Customize Navigation Sets check box. See Customizing navigation sets.

10 By default, standard workspaces are selected in new profiles. To assign custom workspaces to the profile, click the Search button next to the workspace you want to change. The Workspaces window opens.

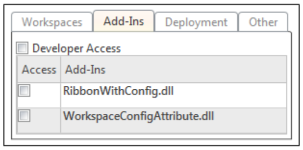
a Select the workspace you want to use.

b Click the OK button to close the window.

See Creating custom workspaces.

11 To grant access to add-ins that are installed on the site, click the Add-Ins tab.

Note Options on this tab are active when add-ins are installed using the Add-in Manager. See Installing add-ins. For information about creating add-ins, refer to the Oracle Service Cloud Connect API documentation on the RightNow Developer Community.



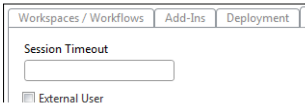
a To let staff members with this profile install add-ins on their workstations without uploading the add-in to the server, select the Developer Access check box. This option lets developers test add-ins without the add-ins being downloaded to other staff members' workstations.

Note Add-ins must be placed in subdirectories of the *%APPDATA%\RightNow_Technologies\<your_site>\<version>\Users\profile_number\AddIns* directory. Each add-in must be contained in a separate subdirectory.

b To let staff member with this profile use add-ins, select the check boxes next to the add-ins they can access.

12 To grant access to installer options, click the Deployment tab. See Deploying Oracle Service Cloud to multiple staff members.

13 To change the automatic logout setting for staff members with this profile, click the Other tab and type a value (in minutes) in the Session Timeout field. See Automatically logging out inactive sessions.



14 To create a profile for external users to have collaboration-only access, click the Other tab and select the External User check box. Service Collaboration must be enabled for this check box to appear. See Collaborating with other agents.

15 Click the Permissions button on the ribbon to grant permissions to the profile. The Permissions page opens, displaying the following tabs.

- **Administration**—This tab is selected by default when you open the Permissions page. See Administration permissions.
- **Organizations**—Click this tab to select permissions related to adding and editing organizations. See Organizations permissions.
- **Contacts**—Click this tab to select permissions related to adding and editing contacts. See Contacts permissions.
- **Service**—Click this tab to select permissions related to Service. If **Chat** is enabled on the site, chat permissions are also selected on this tab. See Service permissions and Adding Chat permissions to profiles.
- **Opportunities**—Click this tab to select permissions related to Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking). See Opportunity Tracking permissions.
- **Outlook Integration**—Click this tab to select Outlook integration permissions. Outlook integration must be enabled for this tab to appear. See Configuring Outlook integration.
- **Outreach**—Click this tab to select Oracle RightNow Outreach Cloud Service (Outreach) permissions. See Outreach permissions.
- **Feedback**—Click this tab to select Oracle RightNow Feedback Cloud Service (Feedback) permissions. See Feedback permissions.
- **Tasks**—Click this tab to select task permissions. See Tasks permissions.
- **Custom Objects**—Click this tab to select custom object permissions. Custom objects must be enabled for this tab to appear. See Custom object permissions.

16 To select Analytics permissions, click the Analytics button on the ribbon and refer to Analytics permissions.

17 To view an audit log of changes made to the profile, click the Audit Log button.

18 To add notes to the profile, click the Notes button on the ribbon. The Notes window opens.

   a Type the note you want to add.

   b Click the OK button to close the Notes window.

19 Click the Save and Close button on the ribbon to save the profile and close the editor.

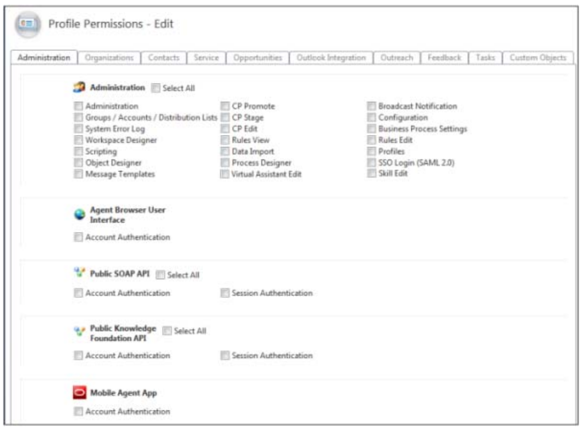
   ❖ [Creating navigation sets]

   ❖ [Creating custom workspaces]

Administration permissions

The Administration tab is the default tab of the Profiles editor's Permissions page. By enabling options on this tab, you can grant staff members permissions related to administrative functions of the system. For example, you can give permission to configure staff accounts and distribution lists, create and edit agent scripts, access business process settings, and add and edit business rules.

Tip Hover over the permissions on this tab to view the product areas the permissions impact.



To select options on the Administration tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**. The Permissions page opens with the Administration tab selected.

4 Enter the following field information.

Table 16: Administration Tab Description

Field	Description
Administration	These options define administration permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Administration section.
Administration	Select this check box to let staff members with this profile access the following options: • Custom Fields • Messages • Mailboxes • Currencies and Exchange Rates • Service Level Agreements • Response Requirements • Chat Hours • Channels • Channel Accounts • Quote Templates • Territories • Promotions • Strategies • Sales Periods • External Suppression List • Thread Type Correction
Groups/Accounts/ Distribution Lists	Select this check box to let staff members with this profile access the following options: • Staff Accounts and Groups • Distribution Lists **Note:** Staff members who have Groups/Accounts/Distribution Lists permissions can assign only those profiles with the same or lesser permissions as their profile.
System Error Log	Select this check box to let staff members with this profile access the log files under Site Configuration.

Table 16: Administration Tab Description (Continued)

Field	Description
Workspace Designer	Select this check box to let staff members with this profile access the Workspaces and Workflows explorer and designer. See Workspaces and Desktop Workflows.
Scripting	Select this check box to let staff members with this profile create and edit agent scripts. **Note:** Agent scripting must be enabled on your site to use this feature. Contact your Oracle account manager.
Object Designer	Select this check box to let staff members with this profile create and manage custom objects using the object designer. See Creating custom objects. For information about the Custom Objects tab on the Profiles editor, see Custom object permissions. **Note:** Custom objects must be enabled on your site to use this feature. Contact your Oracle account manager.
Message Templates	Select this check box to let staff members with this profile edit message templates used to customize administrator notifications, administrator email, and contact email. See Working with the Message Templates editor.
CP Promote	Select this check box to let staff members with this profile promote pages from the staging area to the production area of the customer portal site, where customers can view them. See Assigning permissions. For this check box to display, MOD_CP_DEVELOPMENT_ENABLED must be enabled on your site. See Enabling the development area. **Note:** Staff members with CP Promote permission automatically have CP Edit and CP Stage permissions.
CP Stage	Select this check box to let staff members with this profile copy development files to the staging area of the customer portal site. See Assigning permissions. For this check box to display, MOD_CP_DEVELOPMENT_ENABLED must be enabled on your site. See Enabling the development area. **Note:** Staff members who have CP Stage permission automatically have CP Edit permission.

Table 16: Administration Tab Description (Continued)

Field	Description
CP Edit	Select this check box to let staff members with this profile access the **Customer Portal Administration site** and edit customer portal pages in the development area using WebDAV. See Assigning permissions. For this check box to display, MOD_CP_DEVELOPMENT_ENABLED must be enabled on your site. See Enabling the development area. **Note:** Staff members with CP Edit permission, but not CP Stage or CP Promote permission, cannot access the Customer Portal editor. Nor can they access the Deploy tab on the Customer Portal Administration site.
Rules View	Select this check box to let staff members with this profile view business rules.
Data Import	Select this check box to let staff members with this profile import records through the Data Import Wizard and manage Data Import templates. See Importing data.
Process Designer	Select this check box to let staff members with the profile create custom processes (**object event handlers**) that run when events occur on objects in the system. See Accessing the process designer.
Virtual Assistant Edit	Select this check box to let staff members with this profile configure the virtual assistant. **Note:** For this check box to display, your site must be integrated with **Oracle RightNow Virtual Assistant Cloud Service** (Virtual Assistant). See Configuring virtual assistant.
Broadcast Notification	Select this check box to let staff members with this profile send notifications to other staff members. If cleared, the New button is grayed out on the notifications ribbon. See Sending broadcast notifications.

Table 16: Administration Tab Description (Continued)

Field	Description
Configuration	Select this check box to let staff members with this profile access the following options: • Password Configuration • Configuration Settings • Configuration Wizard • Message Bases • File Manager • Interfaces • Add-In Manager • Email Address Sharing If cleared, these options are not available. **Note:** If selected, staff members with this profile can edit message bases for all interfaces on a site, including interfaces that they do not have permission to access. See To edit the same message base on multiple interfaces.
Business Process Settings	Select this check box to let staff members with this profile access the following options: • Navigation Sets • Customizable Menus • Countries • Products/Categories/Dispositions • Standard Text • Variables • Holidays • Product Catalog • Price Schedules • Tracked Link Categories If cleared, these options are not available.
Rules Edit	Select this check box to let staff members with this profile edit business rules. See Adding rules.
Profiles	Select this check box to let staff members with this profile add and edit profiles. **Note:** Staff members who have access to the Profiles permission also have access to all other profiles and can add, edit, or delete those profiles without any restrictions.

Table 16: Administration Tab Description (Continued)

Field	Description
SSO Login (SAML 2.0)	Select this check box to let staff members with this profile log in only through an external identity provider, that is, using a single sign-on process. Several restrictions apply to staff members whose profile includes this permission. • CP permissions (CP Promote, CP Stage, and CP Edit) are disabled if they have been enabled. • Staff members cannot edit development pages in WebDAV. • Staff members cannot deploy the customer portal. • Public SOAP API is disabled if it has been enabled. • Password options on the Account Details page are disabled. See Enabling single sign-on profile permission. **Note:** Oracle Service Cloud uses the **SAML 2.0** protocol for single sign-on. For this check box to display, SSO Login (SAML 2.0) must be enabled on your site. Contact your Oracle account manager.
Skill Edit	Select this check box to let staff members with this profile configure advanced routing. **Note:** For this check box to display, Chat and Smart Interaction Hub must be enabled. Refer to Configuring advanced routing.
Agent Browser User Interface	The permission in this section lets staff members with this profile access Oracle Service Cloud using the Agent Browser UI through account authentication.
Account Authentication	Select this check box to let staff members with this profile access Oracle Service Cloud using the Agent Browser UI. **Note:** For this check box to display, Agent Browser UI must be enabled on your site. Contact your Oracle account manager.
Public SOAP API	Permissions in this section let staff members with this profile access the public SOAP API through account or session authentication.
Select All	Select this check box to select all check boxes in the Public SOAP API section.
Account Authentication	Select this check box to let staff members with this profile access the public SOAP API using their staff account login user name and password.

Table 16: Administration Tab Description (Continued)

Field	Description
Session Authentication	Select this check box to let staff members with this profile access the public SOAP API using their staff account login user name and session ID from the agent desktop when agents are logged in.
Public Knowledge Foundation API	Permissions in this section let staff members with this profile access the public Knowledge Foundation API through account or session authentication.
Select All	Select this check box to select all check boxes in the Public Knowledge Foundation API section.
Account Authentication	Select this check box to let staff members with this profile access the public Knowledge Foundation API using their staff account login user name and password.
Session Authentication	Select this check box to let staff members with this profile access the public Knowledge Foundation API using their staff account login user name and session ID from the agent desktop when agents are logged in.
Mobile Agent App	The Mobile Agent App permission in this section lets staff members with this profile access Oracle Service Cloud on a mobile device through account authentication.
Account Authentication	Select this check box to let staff members with this profile access Oracle Service Cloud on a mobile device. Refer to Getting started. **Note:** For this check box to display, Mobile Agent App must be enabled on your site. Contact your Oracle account manager.

5 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

Organizations permissions

The Organizations tab lists the possible Service, Outreach, and Opportunities states for organizations. It defines permissions for the staff members with this profile to read, edit, or delete organizations that are in the selected states. The state of an organization can be manually set by staff members when adding or editing an organization, or automatically by the system based on how the organization was added. For example, an organization that has been added while creating an incident defaults to the Service state.

There are seven states:

- Service
- Outreach
- Opportunities
- Opportunities & Outreach
- Service & Outreach
- Service & Opportunities
- Service & Opportunities & Outreach

When you define the permissions by state on the Organizations tab, consider which staff members should be able to take actions on organizations in the various states. For example, you might give agents read and edit access to organizations in any state that includes Service. However, you may decide that you do not want them to delete any organizations in the Service & Opportunities, Service & Outreach, and Service & Opportunities & Outreach states. See [Adding organizations](#).

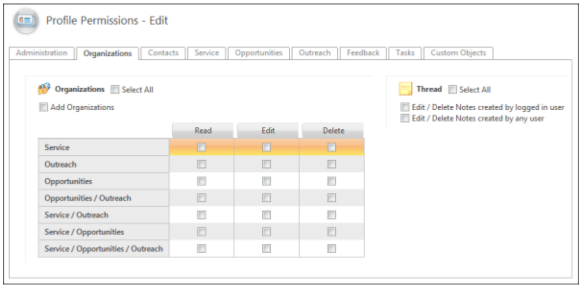
To select options on the Organizations tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Organizations tab.



5 Enter the following field information.

Table 17: Organizations Tab Description

Field	Description
Organizations	These options define the organization permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Organizations section.
Add Organizations	Select this check box to let staff members with this profile add organizations.
Permission by organization state	Organizations are classified by their state, which can be Service, Outreach, Opportunities, or any combination of the three. In this section, set the permissions for staff members with this profile to view, edit, and delete organizations in these states and combinations of states. **Note:** Click the Read, Edit, or Delete button above a column to select or clear all check boxes in the column.
Read	Select these check boxes to let staff members with this profile view organizations in the specified state.
Edit	Select these check boxes to let staff members with this profile edit organizations in the specified state.
Delete	Select these check boxes to let staff members with this profile delete organizations in the specified state.
Thread	These options determine if staff members can modify notes in organization records.
Select All	Select this check box to select all check boxes in the Thread section.
Edit/Delete Notes created by logged in user	Select this check box to let staff members with this profile edit and delete notes they have added to an organization record.
Edit/Delete Notes created by any user	Select this check box to let staff members with this profile edit and delete notes other staff members have added to an organization record.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

❖ Adding organizations

Contacts permissions

The Contacts tab lists the possible Service, Outreach, and Opportunities states for contacts. It defines permissions for the staff members with this profile to read, edit, delete, or move contacts that are in the selected states. The state of a contact can be manually set by staff members when adding or editing a contact record, or automatically by the system based on how the contact was added. For example, a contact who enters the system needing customer support would initially be classified in the Service state. If the contact expresses interest in a sales product and an opportunity is created, the contact's state changes to Service & Opportunities. See Adding contacts.

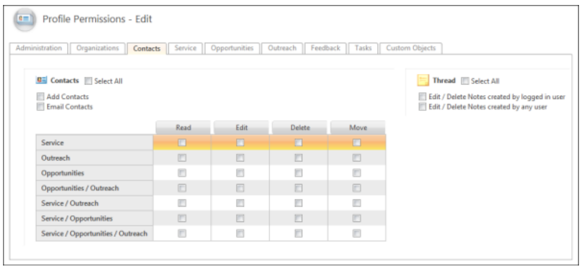
To select options on the Contacts tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Contacts tab.



5 Enter the following field information.

Table 18: Contacts Tab Description

Field	Description
Contacts	These options define the contact permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Contacts section.
Add Contacts	Select this check box to let staff members with this profile add contacts.
Email Contacts	Select this check box to let staff members with this profile email contacts from an open contact record or from the Contacts tab of an associated record. **Note:** With this permission, a staff member can click the Send Email button to the right of the Email field on a contact record or the Contacts tab to open a new message in their default email client (outside of Oracle Service Cloud). The To field in the new message is populated with the contact's email address.
Permission by contact state	Contacts are classified by their state, which can be Service, Outreach, Opportunities, or any combination of the three. In this section, set the permissions for staff members with this profile to view, edit, delete, and move contacts in these states and combinations of states. **Note:** Click the Read, Edit, Delete, or Move button above a column to select or clear all check boxes in the column.
Read	Select these check boxes to let staff members with this profile view contacts in the specified state.
Edit	Select these check boxes to let staff members with this profile edit contacts in the specified state.
Delete	Select these check boxes to let staff members with this profile delete contacts in the specified state.
Move	Select these check boxes to let staff members with this profile move contacts to different organizations.

Table 18: Contacts Tab Description (Continued)

Field	Description
Thread	These options determine if staff members can modify notes in contact records.
Select All	Select this check box to select all check boxes in the Thread section.
Edit/Delete Notes created by logged in user	Select this check box to let staff members with this profile edit and delete notes they have added to a contact record.
Edit/Delete Notes created by any user	Select this check box to let staff members with this profile edit and delete notes other staff members have added to a contact record.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

❖ Adding contacts

Service permissions

Profile settings on the Service tab let you define permissions for handling incidents, answers, assignments, assets, social monitoring, SLAs, and guided assistance guides. They also let you specify the queues staff members can access, the queue rank, pull policies and quantities, and **inbox limits**. If Chat is enabled, additional profile permissions display on the Service tab. See Adding Chat permissions to profiles.

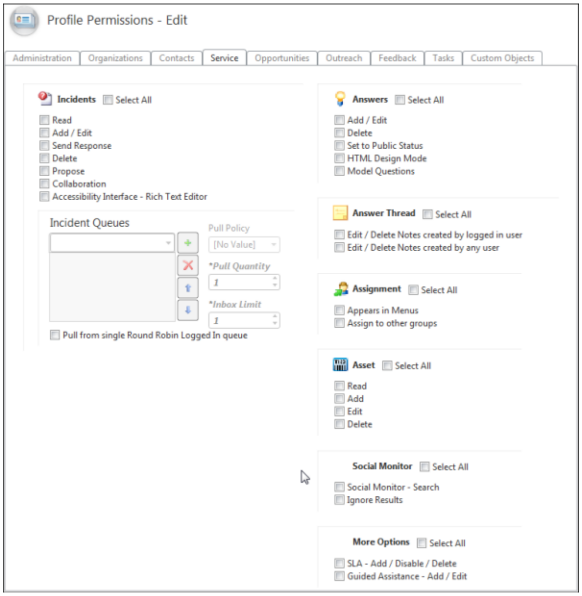
To select options on the Service tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Service tab.



5 Enter the following field information.

Table 19: Service Tab Description

Field	Description
Incidents	These options define the incident permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Incidents section.
Read	Select this check box to let staff members with this profile view incidents.
Add/Edit	Select this check box to let staff members with this profile add incidents and modify existing incidents. If cleared, incidents are read-only when opened and staff members cannot edit fields or send responses.
Send Response	Select this check box to let staff members with this profile respond to incidents through email. If cleared, staff members can add responses to an incident, but cannot send responses to contacts through email.

Table 19: Service Tab Description (Continued)

Field	Description
Delete	Select this check box to let staff members with this profile delete incidents. If cleared, the Delete button is unavailable and staff members cannot delete incidents.
Propose	Select this check box to let staff members with this profile propose incidents as answers. If cleared, the Propose button is unavailable on the incidents ribbon.
Collaboration	Select this check box to let staff members with this profile collaborate with other staff members on incidents. **Note:** For this check box to display, Service Collaboration must be enabled on your site. See Collaborating with other agents.
Accessibility Interface–Rich Text Editor	Select this check box to let staff members with this profile use the rich text editor on the **accessibility interface**.

Table 19: Service Tab Description (Continued)

Field	Description
Incident Queues	Select a queue you want to be available for this profile from the drop-down menu and click the Add (+) button. If needed, you can then select additional queues to associate with this profile, delete queues, or change their order to reflect queue priority ranking.
Pull Policy	Click this drop-down menu to select a pull policy that determines the queues that incidents are retrieved from and their order. The pull policies include: • **Manual**—Lets staff members manually pull incidents from any queues available to them, allowing them to select a particular queue. Incidents are pulled from the selected queue in order of due date. • **Strict priority**—Uses the priority ranking of the available queues to determine which queue to pull incidents from, starting with the highest ranking queue. Incidents are pulled from this queue until the staff member's pull quantity is met, the staff member's inbox limit is met, or the queue is empty. If the queue is empty before the staff member's pull quantity is met, then incidents are pulled from the queue with the next highest priority ranking. • **First due**—Uses the incident due date to determine which incidents to retrieve, pulling incidents that are nearest to their due date first. Incidents are pulled from all the staff member's available queues in the order of due date until the staff member's pull quantity is met, the staff member's inbox limit is met, or all queues are empty. Queue ranking does not affect the pull order.
Pull Quantity	Type the number of incidents to be retrieved from the queues at one time when a staff member with this profile pulls incidents. The maximum pull quantity is 99.
Inbox Limit	Type the number of incidents that can be in a staff member's inbox at one time. The maximum inbox limit is 999.

Table 19: Service Tab Description (Continued)

Field	Description
Pull From Single Round Robin Logged In Queue	Select this check box to specify that staff members with this profile will be assigned new incidents from the same round-robin logged-in queue in which the most recently solved incident originated. When the check box is not selected, all round-robin logged-in queues are considered when assigning incidents. **Note:** This setting has no effect when staff members manually pull incidents using the Fill Inbox feature.
Answers	These options define the answer permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Answers section.
Add/Edit	Select this check box to let staff members with this profile add and update answers.
Delete	Select this check box to let staff members with this profile delete answers. If cleared, the Delete button is unavailable and staff members cannot delete answers.
Set to Public Status	Select this check box to let staff members with this profile set answers to the Public status and make them available to customers. If cleared, the Public option in the Status drop-down menu is not available when adding or editing answers. **Note:** While a staff member without this permission cannot change an answer's status to Public, existing public answers can still be edited as long as the staff member has the Add/Edit permission.
HTML Design Mode	Select this check box to let staff members with this profile create an HTML answer in design mode. If cleared, the Design tab does not display and staff members can edit only in source mode.
Model Questions	Select this check box to let staff members with this profile add and delete **model questions** when creating answers. **Note:** Your site must be integrated with **Oracle RightNow Virtual Assistant Cloud Service** (Virtual Assistant) in order to use this feature. Contact your Oracle account manager. See Adding answers.

Table 19: Service Tab Description (Continued)

Field	Description
Answer Thread	These options determine if staff members can modify notes in answers.
Select All	Select this check box to select all check boxes in the Answer Thread section.
Edit/Delete Notes created by logged in user	Select this check box to let staff members with this profile edit and delete notes they have added to answers.
Edit/Delete Notes created by any user	Select this check box to let staff members with this profile edit and delete notes other staff members have added to answers.
Assignment	These options define whether staff members with this profile are available for record assignment and whether they can assign records to other groups.
Select All	Select this check box to select all check boxes in the Assignment section.
Appears in Menus	Select this check box to display staff accounts associated with this profile in assignment menus when adding or editing incidents and answers. If cleared, staff members with this profile are not available in the Assigned drop-down menu.
Assign to Other Groups	Select this check box to let staff members with this profile assign incidents and answers to other groups. If cleared, the Assigned drop-down menu when adding and editing incidents and answers contains only those selections from the staff member's group.
Asset	These options define the **asset** permissions for staff members with this profile. See To assign assets profile permissions.
Select All	Select this check box to select all check boxes in the Asset section.
Read	Select this check box to let staff members with this profile view assets.
Add	Select this check box to let staff members with this profile add assets.
Edit	Select this check box to let staff members with this profile update existing assets. If cleared, assets are read-only when opened and staff members cannot edit fields.

Table 19: Service Tab Description (Continued)

Field	Description
Delete	Select this check box to let staff members with this profile delete assets. If cleared, the Delete button is unavailable and staff members cannot delete assets.
Social Monitor	These options define the social monitoring permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Social Monitor section.
Social Monitor—Search	Select this check box to give staff members access to the social monitor controls to search the social cloud. **Note:** Oracle RightNow Social Monitor Cloud Service must be enabled on your site to use this feature. Contact your Oracle account manager.
Ignore Results	Select this check box to let staff members with this profile ignore social cloud search results. If cleared, the Ignore Result button is unavailable and staff members cannot ignore social cloud search results.
More Options	These options define whether staff members with this profile can apply SLAs and guides to records.
Select All	Select this check box to select all check boxes in the More Options section.
SLA—Add/Disable/Delete	Select this check box to let staff members assign SLA instances to contacts and organizations, and deactivate and delete SLA instances.
Guided Assistance—Add/Edit	Select this check box to let staff members add the guided assistance control to an incident workspace or customer portal pages, and to edit the guided assistance control. **Note:** Guided assistance must be enabled to use this feature. Contact your Oracle account manager.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

❖ Adding incidents

❖ Adding answers

Opportunity Tracking permissions

Options on the Opportunities tab include permissions for adding and editing **opportunities**, adding and editing **sales periods** and **quotas**, and permissions to access additional features with opportunities and **leads**.

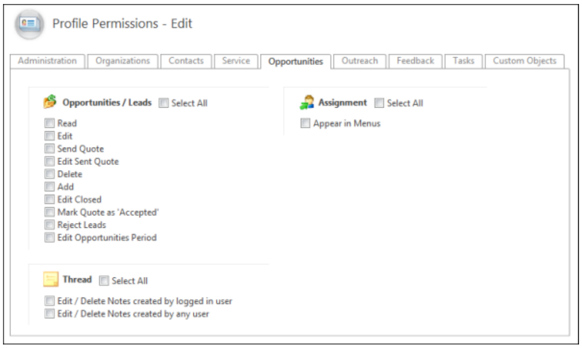
To select options on the Opportunities tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Opportunities tab.



5 Enter the following field information.

Table 20: Opportunities Tab Description

Field	Description
Opportunities/Leads	These options define the opportunity and lead permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Opportunities/Leads section.
Read	Select this check box to let staff members with this profile view opportunities.

Table 20: Opportunities Tab Description (Continued)

Field	Description
Edit	Select this check box to let staff members with this profile edit existing opportunities. If cleared, opportunities are read-only when opened and staff members cannot edit fields or send quotes.
Send Quote	Select this check box to let staff members with this profile send quotes with opportunities.
Edit Sent Quote	Select this check box to let staff members with this profile edit a sent quote.
Delete	Select this check box to let staff members with this profile delete opportunities. If cleared, the Delete button is not available and staff members cannot delete opportunities.
Add	Select this check box to let staff members with this profile add opportunities. If cleared, the New button is not available and staff members cannot add opportunities.
Edit Closed	Select this check box to let staff members with this profile update the closed date and closed value fields of opportunities. **Note:** Selecting the Edit Closed check box automatically activates the Read and Edit check boxes if they are not already selected.
Mark Quote as 'Accepted'	Select this check box to let staff members with this profile select Accepted as the status of a quote when adding or editing quotes. If cleared, the Accepted option is not available.
Reject Leads	Select this check box to let staff members with this profile reject leads.
Edit Sales Period	Select this check box to let staff members with this profile add and edit sales periods, including quotas on the Sales Periods editor. If cleared, staff members cannot access the Sales Periods editor unless their profile has the Administration check box selected on the Administration tab.
Thread	These options determine if staff members can modify notes in opportunity records.
Select All	Select this check box to select all check boxes in the Thread section.

Table 20: Opportunities Tab Description (Continued)

Field	Description
Edit/Delete Notes created by logged in user	Select this check box to let staff members with this profile edit and delete notes they have added to an opportunity.
Edit/Delete Notes created by any user	Select this check box to let staff members with this profile edit and delete notes other staff members have added to an opportunity.
Assignment	The option in this section defines whether opportunities can be assigned to staff members with this profile.
Appear in Menus	Select this check box to display staff accounts associated with this profile in the Assigned drop-down menu when adding or editing leads and opportunities, as well as the Salesperson drop-down menu when adding or editing contacts and organizations.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

❖ Adding opportunities

Outreach permissions

You can set options on the Outreach tab to grant permissions to add, update, and delete **mailings**, **campaigns**, and **documents**. You can also allow staff members with this profile to create **templates**, **snippets**, file attachments, and **tracked links**.

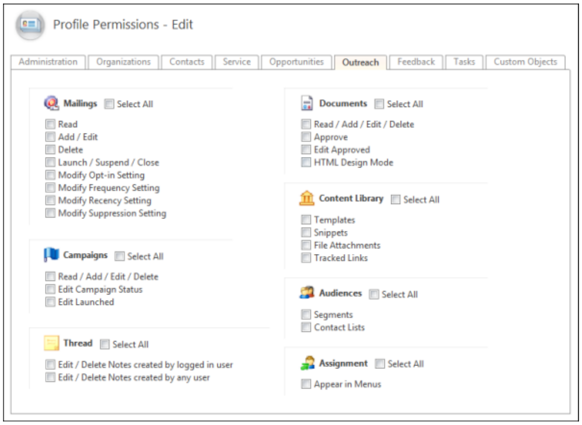
To select options on the Outreach tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Outreach tab.



5 Enter the following field information.

Table 21: Outreach Tab Description

Field	Description
Mailings	These options define the mailing permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Mailings section.
Read	Select this check box to let staff members with this profile view mailings.
Add/Edit	Select this check box to let staff members with this profile create mailings and modify existing mailings. If cleared, mailings are read-only when opened and staff members cannot edit fields.
Delete	Select this check box to let staff members with this profile delete mailings. If cleared, the Delete button is not available and staff members cannot delete mailings.
Launch/Suspend/Close	Select this check box to let staff members with this profile launch or suspend a mailing, relaunch a suspended mailing, and cancel a mailing.

Table 21: Outreach Tab Description (Continued)

Field	Description
Modify Opt-in Setting	Select this check box to let staff members with this profile change the Honor Global Opt-in setting when creating or editing a mailing.
Modify Frequency Setting	Select this check box to let staff members with this profile change the Limit Frequency of Communication setting when creating or editing a mailing.
Modify Recency Setting	Select this check box to let staff members with this profile change the Limit Recency of Communication setting when creating or editing a mailing.
Modify Suppression Setting	Select this check box to let staff members with this profile change the Honor External Suppression List setting when creating or editing a mailing.
Campaigns	These options define the campaign permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Campaigns section.
Read/Add/Edit/Delete	Select this check box to give staff members with this profile access to campaigns, including the ability to add, edit, and delete campaigns.
Edit Campaign Status	Select this check box to let staff members with this profile modify the status of campaigns.
Edit Launched	Select this check box to let staff members with this profile edit launched campaigns.
Thread	These options determine if staff members can modify notes in campaigns, mailings, or documents.
Select All	Select this check box to select all check boxes in the Threads section.
Edit/Delete Notes created by logged in user	Select this check box to let staff members with this profile edit and delete notes they have added to a campaign, mailing, or document.

Table 21: Outreach Tab Description (Continued)

Field	Description
Edit/Delete Notes created by any user	Select this check box to let staff members with this profile edit and delete notes other staff members have added to a campaign, mailing, or document.
Documents	These options define the document permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Documents section.
Read/Add/Edit/Delete	Select this check box to let staff members with this profile read, add, edit, and delete documents.
Approve	Select this check box to let staff members with this profile approve documents. If cleared, the Approved check boxes cannot be selected by staff members when adding or editing documents.
Edit Approved	Select this check box to let staff members with this profile edit a document that has been approved. If cleared, staff members cannot edit documents if the Approved check box has been selected.
HTML Design Mode	Select this check box to let staff members with this profile use the HTML editor in design mode. If cleared, the Design tab does not display and staff members can edit only in source mode.
Content Library	These options define the content library permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Content Library section.
Templates	Select this check box to let staff members with this profile view, add, edit, and delete templates.
Snippets	Select this check box to let staff members with this profile view, add, edit, and delete snippets.
File Attachments	Select this check box to let staff members with this profile view, add, edit, and delete files.
Tracked Links	Select this check box to let staff members with this profile view, add, edit, and delete tracked links.

Table 21: Outreach Tab Description (Continued)

Field	Description
Audiences	These options define the audience permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Audiences section.
Segments	Select this check box to let staff members with this profile add, edit, and delete segments.
Contact Lists	Select this check box to let staff members with this profile add, edit, and delete contact lists.
Assignment	The option in this section defines whether records related to Outreach can be assigned to staff members with this profile.
Appear in Menus	Select this check box to display accounts associated with this profile in the Assigned drop-down menu when adding or editing campaigns, mailings, or documents.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

- ❖ Creating mailings
- ❖ Creating campaigns

Feedback permissions

You can use the Feedback options to give staff members permission to add, edit, and delete **surveys** and **questions**. You can also specify permissions for enabling and disabling surveys and editing questions that have already been answered by customers.

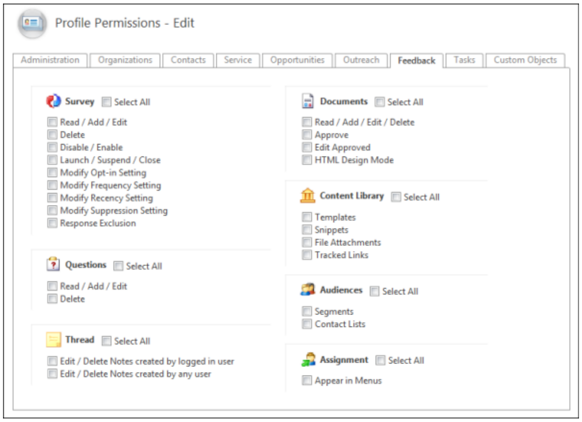
To select options on the Feedback tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Feedback tab.



5 Enter the following field information.

Table 22: Feedback Tab Description

Field	Description
Survey	These options define the survey permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Survey section.
Read/Add/Edit	Select this check box to let staff members with this profile view, create, and edit surveys.
Delete	Select this check box to let staff members with this profile delete surveys. If cleared, the Delete button is not available and staff members cannot delete surveys.
Disable/Enable	Select this check box to let staff members with this profile enable and disable surveys.
Launch/Suspend/Close	Select this check box to let staff members with this profile launch or suspend a survey, relaunch a suspended survey, and cancel a survey.
Modify Opt-in Setting	Select this check box to let staff members with this profile change the Honor Global Opt-in setting when creating or editing a survey.

Table 22: Feedback Tab Description (Continued)

Field	Description
Modify Frequency Setting	Select this check box to let staff members with this profile change the Limit Frequency of Communication setting when creating or editing a survey.
Modify Recency Setting	Select this check box to let staff members with this profile change the Limit Recency of Communication setting when creating or editing a survey.
Modify Suppression Setting	Select this check box to let staff members with this profile change the Honor External Suppression List setting when creating or editing a survey.
Response Exclusion	Select this check box to let staff members with this profile exclude specific survey responses from reports.
Questions	These options define the question permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Questions section.
Read/Add/Edit	Select this check box to let staff members with this profile access questions, including the ability to add and edit questions.
Delete	Select this check box to let staff members with this profile delete questions.
Thread	These options determine if staff members can modify notes in surveys or documents.
Select All	Select this check box to select all check boxes in the Thread section.
Edit/Delete Notes created by logged in user	Select this check box to let staff members with this profile edit and delete notes they have added to a survey or document.
Edit/Delete Notes created by any user	Select this check box to let staff members with this profile edit and delete notes other staff members have added to a survey or document.

Table 22: Feedback Tab Description (Continued)

Field	Description
Documents	These options define the document permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Documents section.
Read/Add/Edit/Delete	Select this check box to let staff members with this profile read, add, edit, and delete documents.
Approve	Select this check box to let staff members with this profile approve documents. If cleared, the Approved check box cannot be selected by staff members when adding or editing documents.
Edit Approved	Select this check box to let staff members with this profile edit a document that has been approved. If cleared, staff members cannot edit documents if the Approved check box has been selected.
HTML Design Mode	Select this check box to let staff members with this profile use the HTML editor in design mode. If cleared, the Design tab does not display and staff members can edit only in source mode.
Content Library	These options define the content library permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Content Library section.
Templates	Select this check box to let staff members with this profile view, add, edit, and delete templates.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

- ❖ Creating questions
- ❖ Creating surveys

Tasks permissions

You can use the tasks options to give staff members permission to add, edit, and delete tasks.

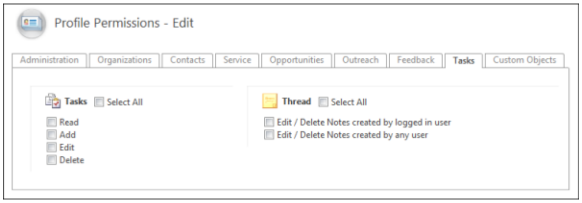
To select options on the Tasks tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Tasks tab.



5 Enter the following field information.

Table 23: Tasks Tab Description

Field	Description
Tasks	These options define the task permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Tasks section.
Read	Select this check box to let staff members with this profile view tasks.
Add	Select this check box to let staff members with this profile add tasks.
Edit	Select this check box to let staff members with this profile edit existing tasks. If cleared, tasks are read-only when opened and staff members cannot edit fields or assign tasks.
Delete	Select this check box to let staff members with this profile delete tasks.
Thread	These options determine if staff members can modify notes in tasks.
Select All	Select this check box to select all check boxes in the Thread section.
Edit/Delete Notes created by logged in user	Select this check box to let staff members with this profile edit and delete notes they have added to a task.
Edit/Delete Notes created by any user	Select this check box to let staff members with this profile edit and delete notes other staff members have added to a task.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

❖ [Adding tasks]

Custom object permissions

You must specify permissions for your staff members to read, delete, and perform other actions on **custom object** records. All deployed custom objects are listed on the Custom Objects tab of the Profiles editor and are organized by the package they are contained in. Similar permissions can be granted for each object, though the Notes permissions are available only for objects with a notes field. Permissions can also be specified when editing custom objects on the Object Designer.

Note Custom objects must be enabled for this tab to appear. Contact your Oracle account manager.

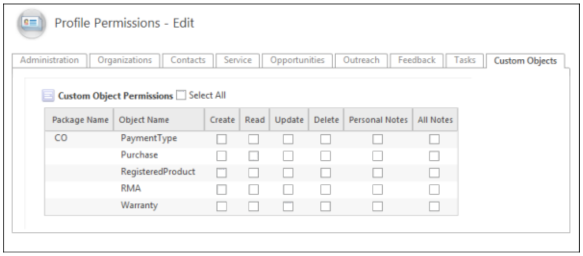
To select permissions on the Custom Objects tab

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Permissions button on the **ribbon**.

4 Click the Custom Objects tab.



5 Enter the following field information.

Table 24: Custom Objects Tab Description

Field	Description
Custom Object Permissions	These options define the permissions needed to work with records for custom objects.
Select All	Select this check box to select all check boxes on the Custom Objects tab.
Package Name	This column displays package names.
Object Name	This column displays custom object names.
Create	Select check boxes in this column to let staff members with this profile create records for the custom object.
Read	Select check boxes in this column to let staff members with this profile read records for the custom object.
Update	Select check boxes in this column to let staff members with this profile update records for the custom object.
Delete	Select check boxes in this column to let staff members with this profile delete records for the custom object.
Personal Notes	Select check boxes in this column to let staff members with this profile create, edit, and delete notes in custom object records. **Note:** This check box displays only for custom objects that contain note fields.
All Notes	Select check boxes in this column to let staff members with this profile edit and delete any notes added to custom object records, regardless of which staff member added the notes. **Note:** This check box displays only for custom objects that contain note fields.

6 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

❖ Creating custom objects

Analytics permissions

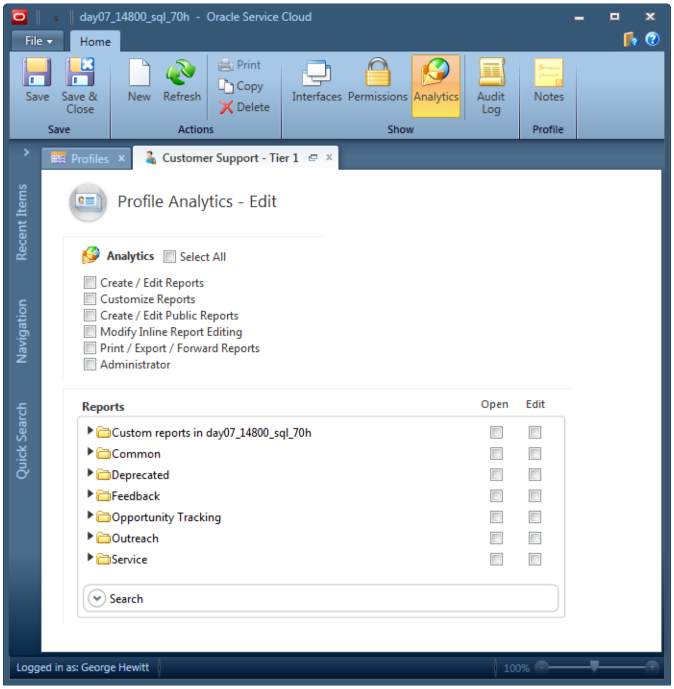
Options on the Analytics page determine the reports that staff members with this profile can access for each available **interface**. You can also assign access to the analytics features, such as creating **custom reports** and **dashboards**.

To select Analytics permissions

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Analytics button on the **ribbon**.



4 Enter the following field information.

Table 25: Analytics Page Description

Field	Description
Analytics	These options define the analytics permissions for staff members with this profile.
Select All	Select this check box to select all check boxes in the Analytics section.
Create/Edit Reports	Select this check box to let staff members with this profile create custom reports and edit custom reports they have access to. **Note:** This permission is required to open the Reports explorer.
Customize Reports	Select this check box to let staff members with this profile customize a report after it has been generated.
Create/Edit Public Reports	Select this check box to let staff members with this profile create and edit public reports and create public folders on the Reports explorer.
Modify Inline Report Editing	Select this check box to let staff members with this profile create reports with inline editing.
Print/Export/Forward Reports	Select this check box to let staff members with this profile print, export, and forward reports.
Administrator	Select this check box to give staff members with this profile administrator all analytics permissions. This permission is required to edit **standard reports**. **Note:** By selecting this check box, all other check boxes are automatically selected.
Reports	The options in this section let you select which reports staff members with this profile can run and edit. **Note:** Custom folders that do not contain reports do not display in the list of reports.
Open	Select this check box to let staff members with this profile run the reports in each folder. You can expand report folders to select individual reports.

Table 25: Analytics Page Description (Continued)

Field	Description
Edit	Select this check box to let staff members with this profile edit the reports in each folder. You can expand report folders to select individual reports.
Search	Select this option to search for a report. This feature is useful for finding a report and setting its permissions.

5 Click the Save and Close button on the ribbon to save the changes and close the Profiles editor.

❖ Viewing reports

❖ Creating reports

❖ Creating dashboards

Managing staff accounts

Using the Staff Accounts editor, you can add staff members, assign them profiles, and group them according to level, department, area of expertise, manager, or other categories that apply to your organization. These grouping options help you route incidents and opportunities to the appropriate group and to report on groups of staff members that share similar job duties or the same manager.

Adding and editing staff accounts

When you add a staff account, you define the login information for the staff member and associate a profile with the staff member. You can also define a name for the staff member to display in Chat and a signature for responding to incidents. The Staff Accounts editor is also where you enter the default country and currency.

A staff member can send **S/MIME** email using a signature, encryption, or both. To send encrypted S/MIME email, the staff member must be issued a certificate that is then uploaded to the staff account. Certificates can be obtained from an authorized **certification authority** and must contain the staff member's email address. To send signed S/MIME email, the Envelope From/Bounce Address of the outgoing email must be a mailbox address (rather than an individual staff member email address) that includes a **certificate** and a private key. See Configuring S/MIME security.

Prerequisites

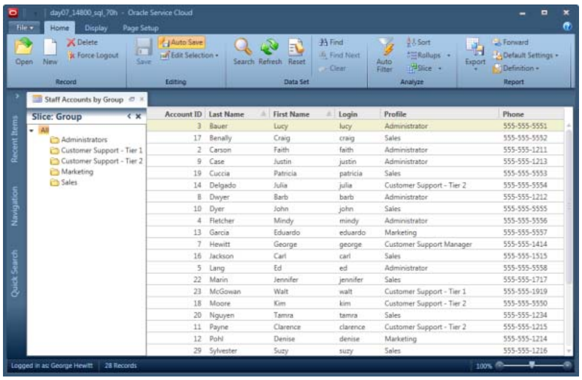
The following items must be created or configured before creating staff accounts.

- Profiles. See Customizing profiles.
- Password security options. See Configuring staff member passwords and Password protection.
- Staff account custom fields (optional). If you use staff account custom fields, we recommend creating them before creating staff accounts. See Adding and editing custom fields.

To add or edit a staff account

1 Click the Configuration button on the **navigation pane**.

2 Double-click Staff Accounts by Group (or another Accounts report) under Staff Management. The report opens on the **content pane**, listing the accounts that have already been created.

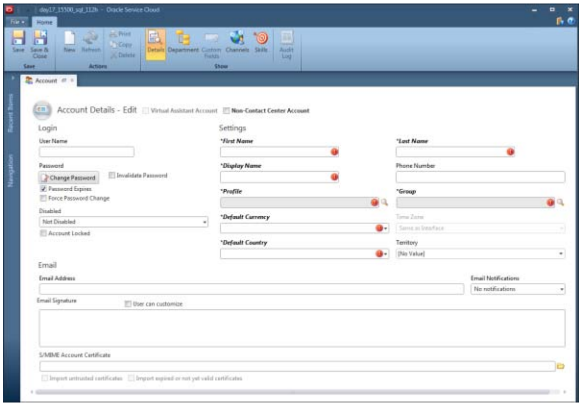


Tip By default, the standard Accounts reports (Staff Accounts by Group, Staff Accounts by Manager, and Staff Accounts by Profile) display only active accounts and accounts that have been temporarily disabled. Accounts that have been permanently disabled are not displayed. To change the accounts displayed, click the Search button on the ribbon and select the accounts you want to view. When displayed on the report, temporarily disabled accounts are shown in italic text and permanently disabled accounts are displayed in gray text.

3 To add a staff account, click the New button on the **ribbon**. The Staff Accounts editor opens.

Or

To edit a staff account, double-click the account on the report.



4 Enter the following field information.

Table 26: Staff Accounts Editor Description

Field	Description
Virtual Assistant Account	This read-only check box is selected if the staff account has been designated as the virtual assistant. Only one staff account can represent the virtual assistant. **Note:** For this check box to display, your site must be integrated with **Oracle RightNow Virtual Assistant Cloud Service** (Virtual Assistant). See Configuring virtual assistant.

Table 26: Staff Accounts Editor Description (Continued)

Field	Description
Non-Contact Center Account	Select this check box to designate this user as a non-contact center account. **Note:** For this check box to display, non-contact center user accounts must be enabled. Contact your Oracle account manager.
***User Name**	Type the staff member's user name in this field. Staff members enter their user name on the Login window. User names are case sensitive.
***First Name**	Type the staff member's first name in this field. The first name and last name appear on the bottom of the Service Console when the staff member is logged in.
***Last Name**	Type the staff member's last name in this field. The first name and last name appear on the bottom of the Service Console when the staff member is logged in.
Change Password	Click Change Password to open the Change Password window. Type the staff member's login password in the window's New Password field and type the same password in the Confirm New Password field. Passwords are case sensitive and encrypted. Keep in mind, the length of the hidden password in the text box does not indicate the length of the actual password. Click the OK button to save the password and close the Change Password window. **Note:** Passwords can be changed by staff members as long as the SSO Login permission is not enabled in the profile assigned to their staff account. If the SSO login permission is enabled, password options on the Staff Account editor are unavailable. See Enabling single sign-on profile permission.
Password Expires	Select this check box to automatically expire the password after the time period specified in the password configuration. See Configuring staff member passwords.
Force Password Change	Select this check box to require staff members to change their password the first time they log in after you update this setting in their staff account. **Note:** This check box remains selected until the staff member changes the password. After the password has been changed, the check box is automatically cleared.

Table 26: Staff Accounts Editor Description (Continued)

Field	Description
Invalidate Password	Select this check box to invalidate the staff member's password. Selecting this check box also disables the Change Password button. **Note:** Staff members without a valid password can reset their password from the Login Help link on the Login window. See Configuring Login Help. The Invalidate Password check box remains selected until the staff member resets the password. After the password has been reset, the check box is automatically cleared.
***Display Name**	Type a name for the staff member to be displayed in email communications and to customers during a chat session.
Phone Number	Type the phone number of the staff member in this field.
***Profile**	Click the Search button in this field to open the Profiles window. Select the profile you want to associate with this staff member and click the OK button to close the Profiles window. See Customizing profiles.
***Group**	Click the Search button on this field to open the Account Groups window where you assign the staff member to a group. See Adding staff accounts to groups.

Table 26: Staff Accounts Editor Description (Continued)

Field	Description
Disabled	Click this drop-down menu to define whether the staff account is disabled. You can choose from the following options. • **Not Disabled**—Select this option to make the account available for assignment to incidents and other types of records and to display the account in report filters. This is the default option. • **Disabled from Assignment**—Select this option to exclude the account from being assigned to incidents and other types of records. • **Disabled from Assignment/Report Filters**—Select this option to exclude the account from being assigned to incidents and other types of records and from appearing in report filters. • **Permanently Disabled**—Select this option to permanently disable the account. Accounts that are permanently disabled display in reports but cannot be re-enabled. The user name of a permanently disabled account can be used for a different staff account. **Note:** If an employee leaves your organization, we recommend disabling the employee's staff account instead of deleting it. When staff accounts are deleted, they no longer display in reports and are not available for use in custom reports used to track staff account actions. See Deleting staff accounts.
Account Locked	Select this check box to temporarily lock the staff account. You might choose to do this if, for example, a staff member takes a leave of absence. This check box is also selected automatically if a staff member has exceeded the number of invalid logins. Clear the check box to unlock the staff account. See Number of Invalid Logins.
***Default Currency**	Click this drop-down menu to select the currency you want to associate with the staff account. The United States dollar (USD) is the only currency option in this menu until you add others through the Currencies editor. See Adding and editing currencies.

Table 26: Staff Accounts Editor Description (Continued)

Field	Description
Time Zone	Click this drop-down menu to select the account's time zone. **Note:** This drop-down menu is unavailable for accounts with any of the following permissions selected for their profile: Administration, Incident Add/Edit, Incident Send Response, Incident Delete, or SLA - Add/Disable/Delete.
***Default Country**	Click this drop-down menu to select the country associated with this staff member. To add countries, See Adding and editing countries and provinces.
Territory	Click this drop-down menu to select the sales territory associated with this staff member. See Adding and editing territories.
External Screen Pop Port	Type the port number that the system will listen on for external screen pop requests. See Screen pops. **Note:** This field displays only if the configuration setting EXT_CONSOLE_WS_ENABLED is enabled on the Configuration Settings editor. The EXT_CONSOLE_WS_PORT configuration setting defines the port value for all staff members. However, if a value is specified in the External Screen Pop Port field, that value overrides the value specified in EXT_CONSOLE_WS_PORT. See Customizing configuration settings.
Email Address	Type the staff member's email address. This is required to receive scheduled reports and system notifications.

Table 26: Staff Accounts Editor Description (Continued)

Field	Description
Email Notifications	Click this drop-down menu to select the email notifications the staff member receives when an event occurs, such as an incident being assigned. The following options are available. • **No Notifications**—Select this option to prevent email notifications from being sent to the staff member. • **Short Notification Once**—Select this option to send a brief email notification when an event occurs and the staff member is not logged in. Subsequent events do not trigger additional notifications until the staff member logs in and logs out again. • **Detailed Notification Once**—Select this option to send a detailed email notification when an event occurs and the staff member is not logged in. Subsequent events do not trigger additional notifications until the staff member logs in and logs out again. • **Detailed Notification Always**—Select this option to send a detailed email notification for every event that triggers a notification, not just the first one. When this option is selected, the staff member receives email even when logged in.
Email Signature	Type a signature for the staff account to be appended to incident responses.
User Can Customize	Select this check box to let the staff member customize the email signature. When staff members who have this permission access options from the file menu (File > Options > Personal Settings), they can type their own signature in the Email Signature field. See Changing your personal settings.

Table 26: Staff Accounts Editor Description (Continued)

Field	Description
S/MIME Account Certificate	Click the Browse button to locate the file containing the public S/MIME account certificate. The certificate must contain the email address of the staff account. **Note:** S/MIME security options are not available for Outreach mailboxes. See Email Management.
Import untrusted certificates	Select this check box to bypass verification that the certificate file being imported or a contact certificate extracted from a signed S/MIME email is signed by a trusted certification authority. The **Techmail** utility will then import public certificates from S/MIME emails sent to this staff account that are not signed by a trusted certification authority. **Note:** Changing this setting does not affect previously imported and stored certificates.
Import expired or not yet valid certificates	Select this check box to bypass verification of the certificate date for the certificate file being imported or a contact certificate extracted from a signed S/MIME email. The Techmail utility will then accept certificates from S/MIME emails sent to this staff account that have expired or are not yet valid. This setting applies to every certificate in the certificate chain, from the root certificate through any subordinate certificates to the POP3 server's certificate. **Note:** Changing this setting does not affect previously imported and stored certificates.

5 To assign the staff account to a manager, click the Department button on the ribbon. See Organizing staff accounts by manager.

Tip The Department page can also be used to assign staff accounts to groups. In addition, the page displays other staff members assigned to the same group and manager.

6 Click the Custom Fields button on the ribbon and enter custom field information on the Custom Fields page. Any staff account custom fields created in your application appear on this page. See Adding and editing custom fields.

7 Click the Channels button on the ribbon and enter channel information using the procedure described in Social channels overview.

8 To view a log of changes that have been made to the staff account, click the Audit Log button.

9 Click the Save and Close button on the ribbon to save the changes.

❖ Customizing profiles

❖ Adding and editing custom fields

Adding staff accounts to groups

Every staff account you create must be assigned to a group. When deciding how to group your staff members, you should plan how you want them organized for reporting. For example, groups can be based on a specialty area of agents or the region of sales representatives.

You can also change the ordering of groups displayed in group lists or of staff accounts displayed in groups, such as in report filters.

To assign a staff account to a group

1 Click the Configuration button on the **navigation pane**.

2 Double-click Staff Accounts by Group (or another Accounts report) under Staff Management.

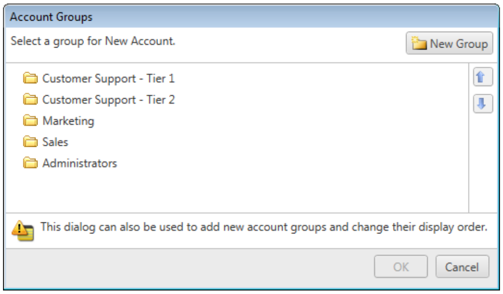
3 Double-click the staff account you want to assign to the group.

4 Click the Search button on the account's Group field. The Account Groups window opens.

Or

Click the Department tab on the **ribbon** and click the Search button on the Group field. For information about the Department page, see Organizing staff accounts by manager.

5 To assign the account to an existing group, select the group you want.

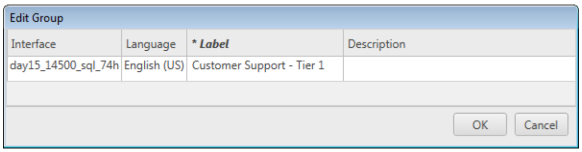


Tip Staff members with the Profiles permission on the Administration tab can change group assignments by dragging staff accounts from the open report to the Group folders on the left side of the report.

6 To assign the account to a new group, click the New Group button and type a name for the group.

7 To change the groups' display order, select the group you want to move and click the up or down arrow to move the group.

8 To rename a group or add a description to a group, right-click the group and select Edit. The Edit Group window opens.



a Type the name you want for the group in the Label field.
b Type notes or other information you want regarding the group folder in the Description field.
c Click the OK button to close the Edit Group window and save the change to the group.

9 To delete a group, right-click the group, select Delete, and click the OK button on the Confirm Delete window. You can delete only those groups that do not have associated staff accounts.

10 Click the OK button to close the Account Groups window.

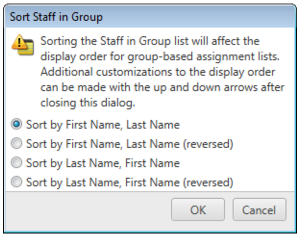
11 Click the Save and Close button on the ribbon to save the changes to the staff account and group.

To sort the staff accounts in a group

1 Open a staff account in the group you want to sort. See Adding and editing staff accounts.

2 Click the Department button on the **ribbon**. All staff members in the account's group display in the Staff in Group list. See Organizing staff accounts by manager for information about the Department page.

3 Click the Sort button above the Staff in Group list to open the Sort Staff in Group window.



4 Select the radio button next to the sort option you want.

- **Sort by First Name**—Select this option to sort the accounts in the group by first name, starting with first names beginning with A.
- **Sort by First Name (reversed)**—Select this option to sort the accounts in the group by first name, starting with first names beginning with Z.
- **Sort by Last Name**—Select this option to sort the accounts in the group by last name, starting with last names beginning with A.
- **Sort by Last Name (reversed)**—Select this option to sort the accounts in the group by last name, starting with last names beginning with Z.

5 Click the OK button to save the sort order and close the window.

6 To customize the sort order, select an account you want to move in the Staff in Group list and click the up or down arrow to move the account.

7 Click the Save and Close button on the ribbon to save the changes to the staff account.

Organizing staff accounts by manager

In addition to organizing staff members by group, you can organize them in a manager hierarchy, with staff members listed beneath their managers or team leads. You create the manager hierarchy, which is used in Opportunity Tracking, and can also be used to help you better report on the performance of managers and their staff. You can create up to twelve levels of accounts in the hierarchy.

Tip You can also view accounts in the manager hierarchy using the standard Staff Accounts by Manager report (Public Reports > Common > Site Administration > Staff Management).

To organize staff members by manager

1 Click the Configuration button on the **navigation pane**.

2 Double-click Staff Accounts by Manager (or another Accounts report) under Staff Management.

3 Double-click the account you want to assign to a manager.

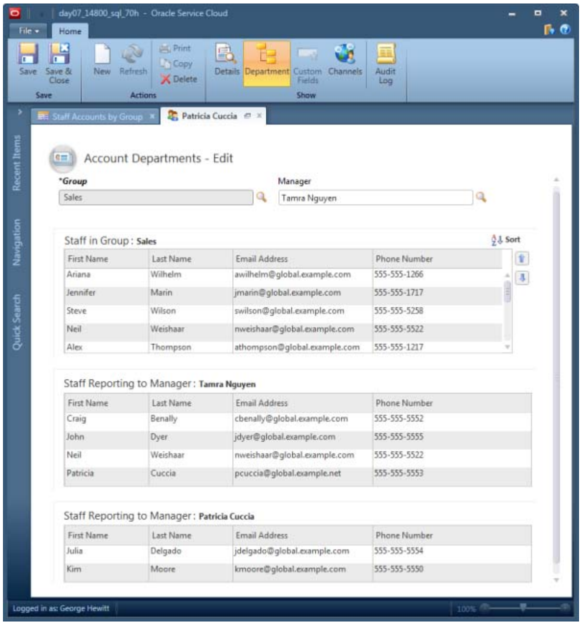
4 Click the Department button on the **ribbon**. The Department page opens where you can specify the account's group and manager hierarchy. You can also view lists displaying the other staff members in the same group and the manager hierarchy.

Tip Staff groups can be managed on the Department page. See Adding staff accounts to groups for information about creating and editing groups and adding and ordering staff accounts in groups.

Or

Staff members with the Profiles permission on the Administration tab can change group assignments by dragging staff accounts from the open report to the Group folders on the left side of the report.

The following figure shows the Department page for a staff account who reports to another manager and who has two subordinates.



5 Click the Search button in the Manager field to open the Account Manager Hierarchy window.

6 Select the manager you want to assign the account to.

7 Click the OK button to close the window.

8 Click the Save and Close button on the ribbon to save the changes to the staff account.

Deleting staff accounts

Staff accounts can be deleted like other types of records in Oracle Service Cloud. However, it is important that you understand what happens when you delete a staff account. Staff accounts that are deleted are completely removed from your site. They no longer display in reports and are no longer available for use in custom reports you use to track the actions of staff accounts. For this reason, when an employee leaves your organization, we recommend disabling the account instead of deleting it. See Adding and editing staff accounts.

To delete a staff account

1 Click the Configuration button on the **navigation pane**.

2 Double-click Accounts by Group (or another Accounts report) under Staff Management.

3 Select the staff account you want to delete.

4 Click the Delete button on the **ribbon**. A message asks you to confirm the deletion.

5 Click the Yes button to delete the staff account.

Configuring staff member passwords

You can enhance your staff members' password security through options that allow you to prevent repeated invalid login attempts and to set password length, character requirements, and expiration options.

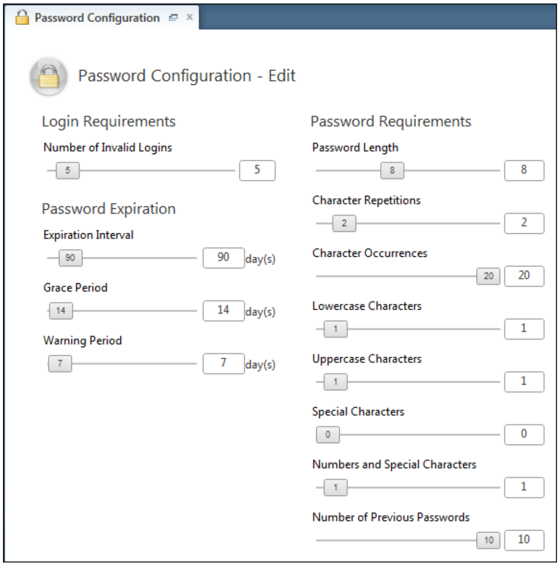
Important You must configure staff member passwords before adding staff accounts.

Password configuration is an important part of security for your organization and for your application. To learn about the tools you can use for password security, see Password protection. Also see Account Self-Service Settings for Passwords and Customer Portal Settings for Passwords.

To configure password requirements

1 Click the Configuration button on the **navigation pane**.

2 Double-click Password Configuration under Staff Management. The **content pane** displays the Password Configuration editor.



3 Enter the following field information.

Table 27: Password Configuration Description

Field	Description
Login Requirements	This section contains the option to establish a limit on invalid login attempts.
Number of Invalid Logins	Drag the slider to the number of failed login attempts you want to allow before the system locks out the account. Alternately, type the number you want to the right of the slider. A value of 0 disables this function. The default value is 5. **Note:** Only administrators possessing Groups/Accounts/Distribution Lists permissions can unlock a staff account. After a successful login, the invalid login count is reset to 0.

Table 27: Password Configuration Description (Continued)

Field	Description
Password Expiration	This section contains options to customize time periods that affect password expiration. **Note:** If the Password Expires check box is cleared for a particular staff account, it overrides any password expirations defined in the password configuration settings.
Expiration Interval	Drag the slider to the number of days that passwords stay in effect. Alternately, type the number you want to the right of the slider. After adding a staff account or updating the account password from the Staff Accounts editor or the Change Password window, the expiration date value is reset. A value of 0 turns password expiration off. The default value is 90.
Grace Period	Drag the slider to the number of days after the password expires in which staff members can enter a new password and still be allowed to log in. Alternately, type the number you want to the right of the slider. Once the grace period ends, staff members' accounts are locked, and you must reset the expiration date or the password. The default value is 14.
Warning Period	Drag the slider to the number of days before the password expires in which staff members will be alerted to the approaching expiration date. Alternately, type the number you want to the right of the slider. During the warning period, staff members can log in normally and are notified of the number of days until the current password expires. The default value is 7.
Password Requirements	This section contains options to customize the format of staff account passwords and limit their reuse.
Password Length	Drag the slider to the minimum number of characters required for a staff account password. Alternately, type the number you want to the right of the slider. The default value is 8. **Note:** Password length cannot exceed 20 characters.
Character Repetitions	Drag the slider to the maximum number of consecutive repeated characters permitted in a password. Alternately, type the number you want to the right of the slider. For example, if Character Repetitions is set to 2, then a password such as 11011011 would be allowed, but 1110000 would *not* be allowed. The default value is 2.

Table 27: Password Configuration Description (Continued)

Field	Description
Character Occurrences	Drag the slider to the maximum number of times a character can be used in a password. Alternately, type the number you want to the right of the slider. For example, if Character Occurrences is set to 2, then a password such as 10123456 would be allowed, but 10101234 would *not* be allowed. The default value is 2.
Lowercase Characters	Drag the slider to the minimum number of lowercase characters required in a password. Alternately, type the number you want to the right of the slider. The default value is 1.
Uppercase Characters	Drag the slider to the minimum number of uppercase characters required in a password. Alternately, type the number you want to the right of the slider. The default value is 1.
Special Characters	Drag the slider to the minimum number of special characters required in a password. Alternately, type the number you want to the right of the slider. The default value is 1.
Numbers and Special Characters	Drag the slider to the minimum number of special characters, including numbers, required in a password. Alternately, type the number you want to the right of the slider. The default value is 1.
Number of Previous Passwords	Drag the slider to the number of passwords that will be stored in memory for each staff account. Alternately, type the number you want to the right of the slider. Staff members cannot use any of the currently stored passwords when changing passwords. The default value is 10.

4 Click the Save and Close button to save the password configuration options.

7

Customizable Menus

When you customize drop-down menus, you increase the likelihood of an organized, accurate, and up-to-date **knowledge base**, which is essential for providing an exceptional customer experience. Customizable menus help you develop logical, consistent ways to organize objects such as contacts, incidents, tracked links, and sales products in ways that are most useful to your organization. The available customizable menu items on your **navigation pane** depend on the Oracle Service Cloud products that are enabled on your site, your **navigation set**, and your **profile** permissions.

Important The Customizable Menus tree contains a System Menus folder, containing default menu items, and a Custom Menus folder, which you can use to create menu items for menu-only **custom objects**. Refer to Adding and editing custom object menus.

If custom objects is not enabled on your site, the tree will not contain any folders and only the default menu items will be listed in the tree. Contact your Oracle account manager to enable custom objects.

Select one of the following customizable menu items to learn how to add and edit the item.

- Answer access levels
- Answer statuses
- Asset statuses
- Billable tasks
- Channel types
- Chat agent statuses
- Chat session queues
- Competitors
- Contact roles
- Contact types

- Countries
- Custom object menus
- Incident queues
- Incident severities
- Incident statuses
- Industry types
- Lead rejection types
- Opportunity statuses
- Organization address types
- Price schedules
- Product catalog
- Products/categories/dispositions
  - ▷ Product linking
- Tracked link categories
- Win/loss reasons

Common customizable menus

Customizing drop-down menus helps organize and classify information in the **knowledge base** beyond the already flexible alternatives that are available. When you add menu options that staff members can select while working with records, you increase the accuracy and usefulness of the knowledge base.

You can add the following types of common menu options.

- Countries—Maintain accurate, consistent address data for contacts and organizations by adding the countries and provinces your organization does business in.
- Organization address types—Add organization address types when you need more flexibility than that offered by the standard billing and shipping addresses.
- Contact types—Add contact types to help you organize contacts in ways that are most useful to your organization.
- Price schedules—Establish various **pricing schedules** that can be applied to **sales products**.
- Product catalog—Use the **product catalog** to add, edit, and categorize sales products and assign price schedules to them.

- Custom object menus—Use **custom object** menus to add, copy, and delete custom object menu items.

Adding and editing countries and provinces

Adding countries and provinces to the **knowledge base** helps maintain accurate address information. Because the countries and provinces appear in drop-down menus when staff members enter contact and organization information, consistent names and abbreviations for unfamiliar countries are guaranteed. You can also define format **masks** to require that staff members use the same format when entering phone numbers and postal codes.

The United States is automatically included, and you can add any other country where you have contacts and organizations. Provinces cannot be added independently, but must be associated with the appropriate country. You can add them when you add the country or at a later time when you edit the country. When staff members enter an address and select a country, the State/Prov field contains a drop-down menu of the states or provinces associated with that country.

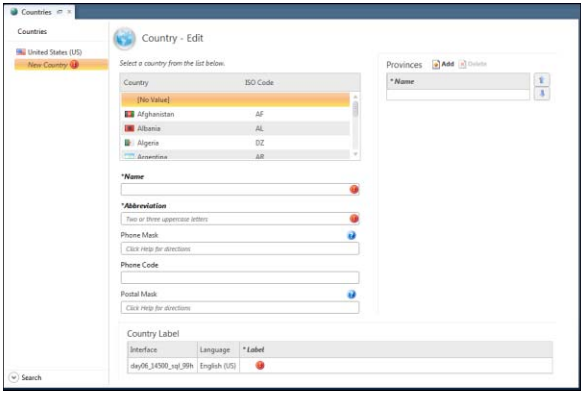
You can also delete countries and provinces on the Countries editor by clicking the Delete button on the ribbon. When you delete a country or province, any contacts and organizations that were associated with that country or province no longer have a country or province association.

To add or edit a country or province

1. Click the Configuration button on the **navigation pane**.
2. Double-click Countries under Internationalization. The Countries tree displays on the **content pane**.
3. To add a country, click the New button on the **ribbon** to display the editor.

   Or

   To edit a country, click it in the tree.



4 Enter the following field information.

Table 28: Countries Editor Description

Field	Description
*Name	Select a country from the Country/ISO Code list at the top of the editor or type the name of the country in the field.
*Abbreviation	When you select a country from the list on the editor, the Abbreviation field is populated with the country's 2- or 3-digit abbreviation. This may or may not be the same as the ISO code for the country, which appears in parentheses after the name in the list of countries. **Note:** If you typed a country name instead of selecting one from the list, the country does not have an ISO code. As a result, the Locate Address button next to the Address field on a contact, organization, or incident is disabled.
Phone Mask	Type a mask to restrict what staff members can type in the phone number field. For information about formatting masks, refer to Input masks.
Phone Code	Type the international phone code for the country.
Postal Mask	Type a mask that restricts what staff members can type when they enter postal codes for contacts in this country. For information about formatting masks, refer to Input masks.

5 To add a province, click the Add button (in the Provinces section on the right side of the editor) to add a field in the Name column, and type the province name in the field.

6 To edit the name of a province associated with the country you are editing, select the province name and type the new name.

Note You can move provinces within the list using the up and down arrows next to the Provinces list.

7 Click the Save and Close button on the ribbon to save the country and provinces before closing the editor.

Adding and editing organization address types

Organization address types allow you to maintain multiple addresses for the organizations in the **knowledge base**. The default address types are Billing and Shipping. When your organization needs other address types, you can add as many as you need. For example, you might find it useful to have an international address type or a headquarters address type. You can delete any address type except Billing by selecting it and clicking the Delete button on the ribbon.

Caution When you delete an organization address type that has been used in an organization record, this action deletes all address data previously associated with that address type.

To add or edit an organization address type

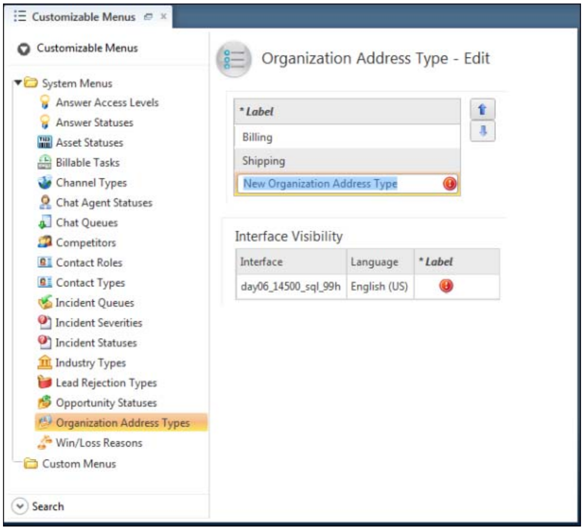
1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

3 Click the arrow next to the System Menus folder to expand the list.

4 Click Organization Address Types to display the editor.

5 To add an address type, click the New button on the **ribbon**.
Or
To edit an address type, click it in the tree.



6 Type a name for a new address type or edit an existing name in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 Click the Save and Close button on the ribbon to save the organization address type and close the editor.

Adding and editing contact types

Using contact types, you can organize the contacts in your knowledge base into classifications that are important to your organization. When staff members add or edit contacts, they can select the contact type from the menu options you add. You might want to add contact types that reflect the position of a contact, such as manager, buyer, agent, and assistant. Or you could add contact types that reflect a contact's function with respect to your organization, such as technical expert, decision maker, and reference.

To add or edit a contact type

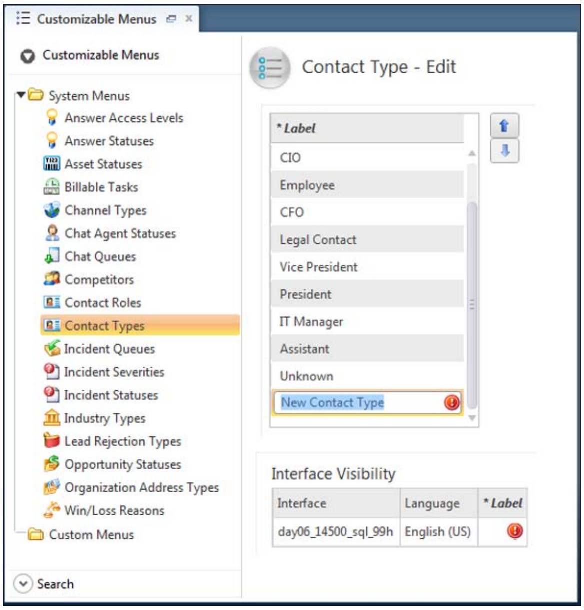
1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

3 Click the arrow next to the System Menus folder to expand the list.

4 Click Contact Types to display the editor.

5 To add a contact type, click the New button on the **ribbon**.
Or
To edit a contact type, click it in the tree.



6 Type a name for a new contact type or edit an existing name in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 Click the Save and Close button on the ribbon to save the contact type and close the editor.

Adding and editing price schedules

Multiple price schedules provide greater flexibility for pricing **sales products**. You may price a sales product differently for preferred customers, or you may have various price schedules for customers in different countries.

ORACLE SERVICE CLOUD Watch Tutorial

Because products in the **product catalog** can have an associated price schedule, you should add price schedules before you add sales products.

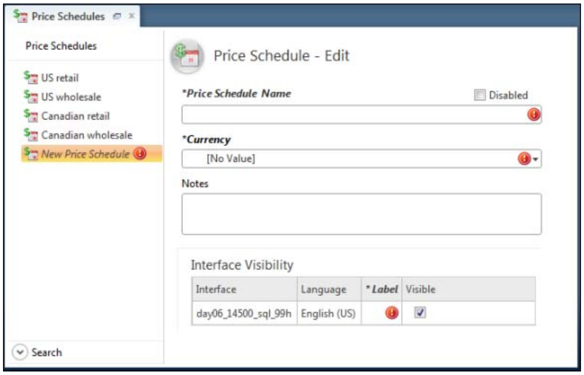
Important The Delete option is not available for price schedules that are associated with sales products. If you want to delete a price schedule associated with a sales product, first edit the sales product to remove the price schedule association.

To add or edit a price schedule

1. Click the Configuration button on the **navigation pane**.
2. Double-click Price Schedules under Opportunity Tracking in the **configuration list**. The Price Schedules tree displays on the **content pane**.
3. To add a price schedule, click the New button on the **ribbon** to display the editor.

   Or

   To edit a price schedule, click it in the tree.



4. Enter the following field information.

Table 29: Price Schedules Editor Description

Field	Description
*Price Schedule Name	Type the name of the price schedule. The item name in the Price Schedules tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.

Table 29: Price Schedules Editor Description (Continued)

Field	Description
Disabled	Select this check box to prevent the price schedule from appearing in the Price Schedule drop-down menu when selecting a price schedule for a sales product.
*Currency	Click this drop-down menu and select a currency. Currency options are added on the Currencies/Exchange Rates editor. Refer to Adding and editing currencies.
Notes	Type any notes you want to add to the price schedule.
Interface Visibility	Clear the check box if you do not want the sales product to be visible on the interface.

5 Click the Save and Close button on the ribbon to save the price schedule and close the editor.

Adding and editing sales products

When you add **sales products**, you define the **product catalog** used to create **quotes** and **Offer Advisor** promotions and suggestions. You also add sales products to use as customer **assets**. Refer to Adding asset products.

You can enable or disable sales products, establish visibility, add identification fields, enter product descriptions, associate **price schedules**, associate a **service product**, and enter custom field values. Since sales products can be associated with price schedules and service products, you should add price schedules and service products first. Refer to Adding and editing price schedules and Adding and editing products, categories, and dispositions.

Important If you try to delete a sales product that is used in an Offer Advisor promotion by selecting it in the tree and clicking the Delete button on the ribbon, a dependency conflict window opens and notifies you that deletion is not allowed.

To add or edit a sales product

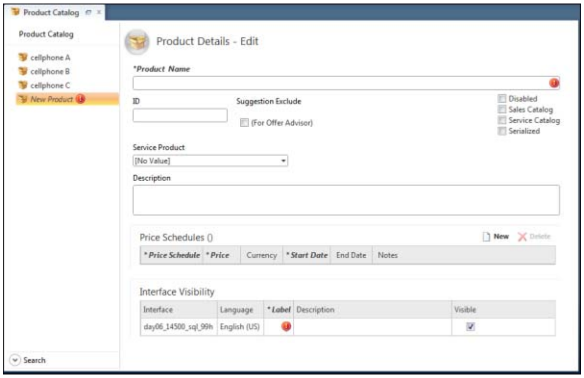
1 Click the Configuration button on the **navigation pane**.

2 Double-click Product Catalog under Opportunity Tracking in the **configuration list**. The Product Catalog tree displays on the **content pane**.

3 To add a sales product, click the New button on the **ribbon**. The Product Details editor opens.

Or

To edit a sales product, click it in the tree.



4 Enter the following field information.

Table 30: Product Details Editor Description

Field	Description
*Product Name	Type the sales product name. The item name in the Product Catalog tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.
ID	Type an identifier for the sales product in this field. This can be a catalog number, product name, or any other identifier your organization wants to use.
Suggestion Exclude	Select this check box to exclude the sales product from being automatically suggested to a customer through Offer Advisor. If cleared, the product is eligible for suggestion to customers who match Offer Advisor's purchase history data. Refer to What is Offer Advisor.
Disabled	Select this check box to prevent the sales product from displaying when creating a quote, promotion, or customer asset or from being available as a suggested product in Offer Advisor.

Table 30: Product Details Editor Description (Continued)

Field	Description
Sales Catalog	Select this check box to make the sales product available for use in Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking) and Offer Advisor. Refer to Adding sales products to quotes and Selecting details for promotions. If cleared, or if the Disabled check box is selected, the sales product will not be available in Opportunity Tracking or Offer Advisor.
Service Catalog	Select this check box to make the sales product available for use in Oracle RightNow Cloud Service (Service). See Adding asset products. If cleared, or if the Disabled check box is selected, the sales product will not be available in Service.
Serialized	Select this check box to prompt customers and agents to enter a serial number when using this sales product as a customer asset. See Adding asset products.
Service Product	Click this drop-down menu to associate a **service product** with the sales product. See Adding asset products.
Description	Type a description of the sales product that can be viewed by sales reps when they add products to quotes. Refer to Adding sales products to quotes.
Price Schedules	Select one or more price schedules as described in Adding price schedules to sales products.
Interface Visibility	Clear the check box if you do not want the sales product to display when staff members add products to quotes while creating or editing an opportunity. **Note:** The sales product will remain displayed on the Promotions editor. Refer to Adding promotions.

5 To add information for any sales products custom fields, click the Custom Fields button on the ribbon and enter the information. Depending on the type of field, you can type text in a field, select a date from a drop-down calendar, select a menu option, or select a radio button. (To add sales products custom fields, refer to Adding and editing custom fields.)

6 Click the Save and Close button on the ribbon to save the sales product and close the editor.

Adding price schedules to sales products

Price schedules provide an additional method for classifying information about sales products, but their use is optional. If you do not create price schedules or add them to sales products, the sales products are not available to staff members creating quotes. Only those products associated with the selected price schedule can be used in a quote. Refer to Adding sales products to quotes.

To add a price schedule to a sales product

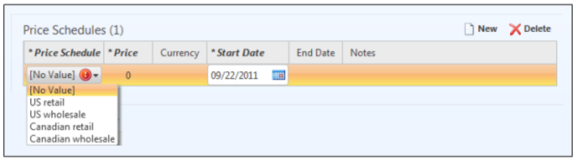
1 Click the Configuration button on the **navigation pane**.

2 Double-click Product Catalog under Opportunity Tracking in the **configuration list**. The Product Catalog tree displays on the **content pane**.

3 Click a product in the tree to open the Product Details editor.

4 Click the New button to the right of Price Schedules. A row is added to the table.

5 Click the Price Schedule drop-down menu and select a price schedule. (The menu options are the price schedules that have already been added. Refer to Adding and editing price schedules.)



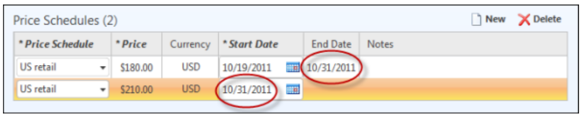
6 Enter the following field information.

Table 31: Price Schedule Field Descriptions

Field	Description
*Price	Double-click this field and type a price.
Currency	This read-only field is determined by the price schedule you select.

Table 31: Price Schedule Field Descriptions (Continued)

Field	Description
*Start Date	Click each month, day, and year component of this date field and type an effective start date for the price schedule. Or click the calendar and select a date. **Note:** When you add a price schedule, this field is populated with the current date.
End Date	This read-only field is blank if you select only one price schedule for the sales product. However, if you add the same price schedule with a different price, the start date for the later-starting price schedule becomes the end date for the earlier-starting price schedule, as shown in the following figure.
Notes	Type any notes you want to add to the price schedule.



7 Click the Save and Close button on the ribbon to save the price schedule for the sales product and close the editor.

Adding and editing custom object menus

After menu-only **custom objects** are created and deployed, you can manage them in Customizable Menus. You can add, copy, and delete custom object menu items through the Custom Object Menu editor. Refer to [Creating menu-only custom objects](#).

To add a custom object menu item

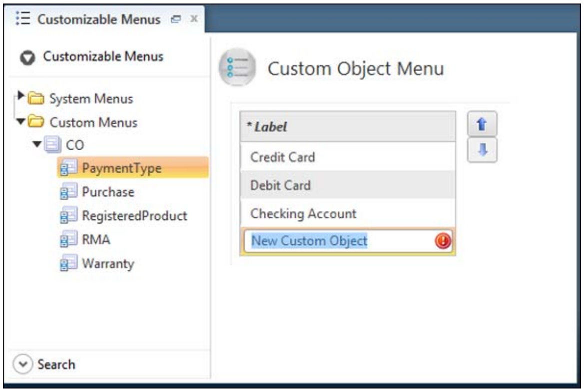
1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree opens on the **content pane**.

3 Click the arrow next to the Custom Menus folder to expand the list.

4 Select a custom menu item in the tree. The Custom Object Menu editor displays on the content pane.

5 Click the New button on the ribbon. The new menu item is added to the Custom Object Menu editor.



6 Type a name for the menu item.

7 Click the Save and Close button on the ribbon.

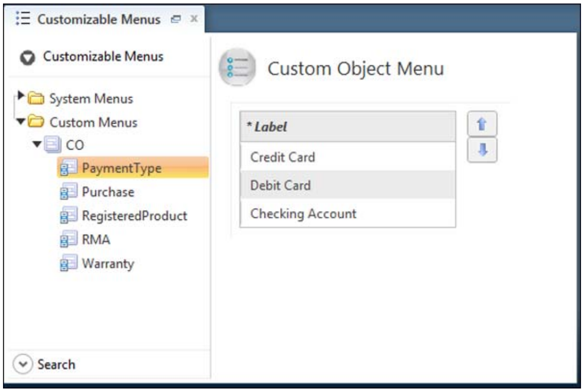
To edit a custom object menu item

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree opens on the **content pane**.

3 Click the arrow next to the Custom Menus folder to expand the list.

4 Select a custom menu item in the tree. The Custom Objects Menu editor displays on the content pane.



5 To change the display sequence of a menu item, select it in the tree and click the up or down arrow next to the Label column.

6 To rename a menu item, select it on the editor and type the new name.

7 To copy a menu item, select it on the editor and click the Copy button on the ribbon.

8 To delete a menu item, select it on the editor and click the Delete button on the ribbon.

❖ Creating custom objects

❖ Creating menu-only custom objects

Service customizable menus

Keeping your knowledge base organized and up-to-date is an important way to provide superior customer service. When you create custom drop-down menus with the exact options you need, staff members can classify **incidents** and **answers** using those options, and customers can select specific **products** and **categories** to refine their searches for answers. Both customers and staff members benefit from the flexibility that results when you classify incidents and answers in ways that make the most sense for your organization.

You can add the following types of classification options in Oracle RightNow Cloud Service (Service).

- Products/categories/dispositions—Add products and categories for grouping incidents and answers, resulting in more accurate search results for staff members and customers. Use dispositions as a way to record the final resolution of a solved incident.

- Product linking—Link products to categories and dispositions so menus display only the links that are relevant to the selected product. This feature ensures more accurate data recording and simplified searching for incidents and answers.
- Incident statuses—Add custom incident statuses to track the state of an incident.
- Incident severities—Define incident severity levels for classifying incidents.
- Incident queues—Identify queues that can be used for routing incidents automatically or manually based on the criteria you establish.
- Chat session queues—Identify queues that can be used for routing chat session requests.
- Chat agent statuses—Add custom statuses to describe an agent's availability to chat with customers and assist other agents with their chat sessions.
- Answer statuses—Add custom answer statuses for increased classification of answers in the knowledge base.
- Answer access levels—Add custom answer access levels for increased control over the information that is visible to staff members and customers.
- Billable tasks—Define billable tasks for classifying and recording how agents spend their time working on incidents.
- Channel Types—Add channel types for contacts so they can associate their Twitter, YouTube, and Facebook user names through the **customer portal**.

Organizing information with products, categories, and dispositions

When you use products and categories to group incidents and answers, your knowledge base is more organized. As a result, staff members and customers can quickly find answers to their questions. For example, a company that manufactures and sells cellular phones might add products such as Smart Phones, Camera Phones, and Accessories. Categories might include Technical Specifications and Warranty Information.

Products and categories organize data in the same ways, and you can choose to use either or both when you configure Service. If you use both, incidents and answers can be organized into specific classifications, and customers can search for answers using product and category filters. You can create up to six levels each of products and categories and specify the number of levels agents must enter when working with incidents. Although products and categories are powerful options for keeping the knowledge base well organized, you are not required to use them.

An incident's **disposition** refers to the way the incident is ultimately solved. You may want to require that agents select a disposition before they save an incident when they change the status to Solved. Dispositions do not appear on the **customer portal**.

Incident dispositions can provide important information and insight about your organization's interactions with customer. You can add as many dispositions as you need, and you can also add sub-levels of dispositions to a total of six levels. For example, you might have a top-level disposition of Sent to Regional Billing. With additional levels, you can organize incidents into specific sub-dispositions such as East Coast, Midwest, Rocky Mountain, and Pacific Northwest. Service lets you define the number of disposition levels agents must select before marking an incident solved.

Use the following steps to configure product, categories, and dispositions.

- **Define levels of products, categories, and dispositions on the administration interface**—Set the number of product, category, and disposition levels you want to require on the administration interface. Refer to Defining number of levels.
- **Define levels of products and categories on the customer portal**—Set the number of product and category levels you want to require customers to select on the Ask a Question page. Refer to Setting the required levels of products and categories.
- **Add products, categories, and dispositions**—Add the products and categories you want to use for grouping answers and incidents in the knowledge base. The products and categories you add appear to staff members who work with answers and incidents on the **content pane**. They also appear on the customer portal for customers to use when searching for and subscribing to answers. Add dispositions so agents can indicate how an incident was ultimately resolved. Refer to Adding and editing products, categories, and dispositions.
- **Link products to categories**—To restrict category selections to only the categories associated with a selected product, enable and configure **product-category linking**. Product-category linking affects staff members working with incidents and customers searching on the customer portal. Refer to Product linking.
- **Link products to dispositions**—To restrict staff member selection of dispositions based on the incident's product, enable and configure **product-disposition linking**. Refer to Product linking.

Defining number of levels

You can use up to six levels of products, categories, and dispositions to classify incidents and answers in the knowledge base. By creating sub-products, for example, you can let your customers further refine their searches. This also lets staff members classify incidents and answers more precisely. If you have created multiple levels of products, categories, and dispositions, you can also define the number of levels that staff members are required to select on the administration interface.

To specify the number of required product levels for incidents

Note Although this procedure describes how to configure the number of product levels on an incident workspace, follow these same steps to define the Minimum Level value for the Category and Disposition fields.

1 Click the Configuration button on the **navigation pane**.

2 Double-click Workspaces under Application Appearance. The Workspaces explorer displays on the **content pane**.

3 Right-click the custom incident workspace where you want to specify the number of product levels and select Open.

Note You cannot edit the standard incident workspace, but you can copy it and edit the copied workspace.

4 Select the Product field on the design space.

5 Click the arrow on the Minimum Level button on the ribbon's Design tab and type the number of required product levels. The acceptable values range from 0 to 6.

6 Click the Save button on the Quick Access Toolbar to save the edited incident workspace.

7 Assign this workspace to the applicable **profile**. Refer to Customizing profiles if you need help with this process.

❖ Editing workspaces
❖ Customizing profiles

Adding and editing products, categories, and dispositions

Customers can use products and categories to narrow their search results on the **customer portal**. Because the search results are filtered through these classifications, the search finds answers that are more likely to resolve customers' questions. Likewise, agents can search for incidents and answers based on products and categories when responding to incidents. They can also classify incidents and answers when they work on them by selecting products and categories, thereby increasing the organization of information within the **knowledge base**.

Before you add products and categories, take some time to plan how you want use them to organize incidents and answers. For example, if you have many products that share a common set of support issues, you might want to add a top-level product name to group them instead of using individual product names. Or you might want to add sub-product levels to further filter the products. Top-level products and categories classify incidents and answers in broad groupings, but you can add five more levels of sub-products and sub-categories to further refine classification.

When agents classify incidents according to their disposition, your knowledge base contains the information you need to understand how incidents have been closed. Additional levels of sub-dispositions allow you to further refine the classification of incidents.

Note Although the following procedures describe working with products, the procedures to add and edit categories and dispositions are identical. Simply replace product information with category or disposition information where appropriate.

To add or edit a product

1 Click the Configuration button on the **navigation pane**.

2 Double-click Products/Categories/Dispositions under Service. The **content pane** displays separate columns for products, categories, and dispositions.

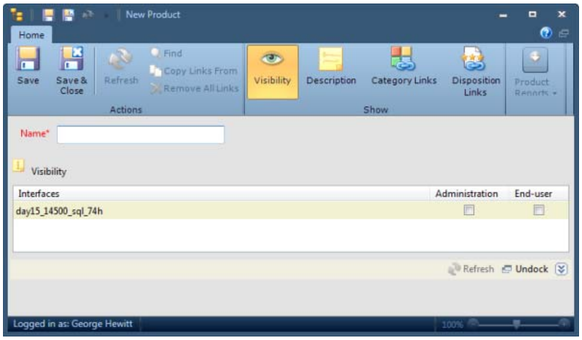
Note By default, the editor displays all three columns, indicated by the highlighted Products, Categories, and Dispositions buttons in the Show group on the **ribbon**. To hide one or more columns, click the associated button so that it is no longer active. The column is removed from the editor until you click the button again or until you close and reopen the editor.

3 To add a product, click in the Products column and click the New button on the ribbon. The New Product window opens.

Or

To edit a product, right-click it and select Edit.

Tip To add a product at the same level as a selected product, right-click the product and select Add Sibling. To add a sub-product, right-click and select Add Child.



4 Type the name of the product in the Name field. The word you type in the Name field is a keyword for all answers associated with this product. When customers search by the product's name, all answers associated with this product are returned.

5 To make the product visible to staff members working with incidents, select the Administration check box.

Note Regardless of interface or visibility settings, all service products and categories are visible when adding or editing answers on any interface.

6 To make the product visible to customers on the **customer portal**, select the End-user check box. (The End-user check box is not available when adding or editing dispositions.)

Important Selecting the visibility settings for a parent level does not automatically set the same settings for the parent's sub-levels. Visibility must be set individually for each. You can also make sub-products visible even if the parent product is not visible.

7 To enter a description for the product, click the Description button on the ribbon and type information in the Description field.

8 Click the Save and Close button on the ribbon. The product appears in the Products column.

To add a sub-product

1 Right-click the product you want to add the sub-product to and select Add Child. The New Product window opens.

Or

Select the product you want to add the sub-product to, click the arrow on the New button on the **ribbon**, and select Child.

2 Type the name of the sub-product in the Name field.

3 To enter information about the sub-product, click the Description button on the ribbon and type comments in the Description field.

4 Select each visibility check box where you want the sub-product to appear.

5 Click the Save and Close button on the ribbon to save the sub-product. The sub-product appears below the product you added it to.

Note You can also define a subordinate relationship by dragging one product and dropping it onto another product. See Reordering products, categories, and dispositions.

To edit visibility settings for multiple products simultaneously

1 In the Products column, press **Ctrl** while selecting each product.

2 Click the Edit button on the ribbon. The Multi-Edit window opens.

3 Select the Visibility check box.

4 To make the products visible to staff members working with incidents, select the Administration check box.

Note Regardless of interface or visibility settings, all service products and categories are visible when adding or editing answers on any interface.

5 To make the products visible to customers on the **customer portal**, select the End-user check box. (The End-user check box is not available when editing the visibility of dispositions.)

6 Click the Save and Close button on the ribbon.

Reordering products, categories, and dispositions

You can reorder products, categories, and dispositions as necessary, including creating subordinate relationships.

Note You cannot move an item when another item of the same type is open on the editor. For example, if you are editing a product, you cannot move any other product until you close the product editor.

To change the order of a product

1. Click the Configuration button on the **navigation pane**.
2. Double-click Products/Categories/Dispositions under Service. The **content pane** displays separate columns for products, categories, and dispositions.
3. Select the product you want to move and hold down the mouse button or other pointing device.
4. Drag it to its new position in the Products column. If you want to make the product a subproduct of another product, drag it onto the other product and drop it.
5. Release mouse button.

Deleting products, categories, and dispositions

You can delete products, categories, and dispositions that do not have sub-levels. When deleting a product or other item that has sub-levels, you must delete all of the sub-levels first. You also cannot delete multiple products, categories, or dispositions simultaneously.

Important You do not receive a dependency conflict warning when you delete products, categories, or dispositions used in rules. Rules that use the deleted item may no longer function as expected, requiring you to edit the rules and reactivate the rule base. Refer to Adding rules.

In addition, you do not receive a dependency conflict warning when deleting products or categories that are used in answers. Answers that are associated with deleted products or categories may not display as expected. We recommend viewing the Answers by Category and Answers by Product reports before deleting products or categories that may be associated with answers.

To delete a product that has sub-products

1. Expand the highest product level to display all sub-products.
2. Right-click each sub-product and select Delete, or click the Delete button on the **ribbon**. A message asks you to confirm each deletion. Repeat this step until all sub-products have been deleted.
3. Right-click the product and select Delete.

Product linking

Service provides you with the flexibility and precision to organize answers and incidents using customizable menu items, including **products**, **categories**, and **dispositions**. However, if your organization has large numbers of categories or dispositions, staff members and customers must review long lists of menu items to find appropriate options. You can simplify their choices with product linking.

When products are linked to categories, only the linked categories are displayed when customers select products on the **customer portal** or when staff members select products while working on incidents. When products are linked to dispositions, only the linked dispositions are displayed when agents select products for incidents. Product linking is a powerful tool for enhancing efficiency for both staff members and customers.

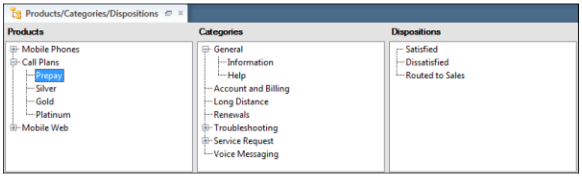
Note When product links have not been defined or product linking has been disabled, all categories and dispositions are available, regardless of the selected product. Product-category linking is independent of product-disposition linking, so you can enable one or the other or both.

Linking overview

Leaf products are those products that do not have any sub-products. Similarly, leaf levels of categories have no sub-categories and leaf-level dispositions have no sub-dispositions. Links can be created only between leaf levels of products and categories and between leaf levels of products and dispositions.

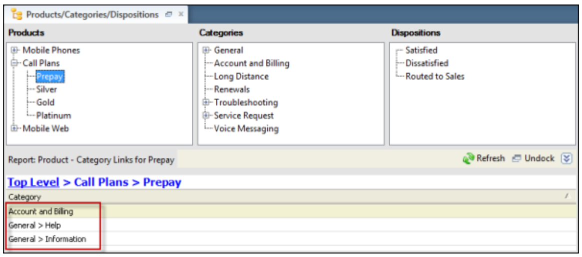
However, implicit linking occurs between the parent levels of products, categories, and dispositions that are linked. Parent products implicitly contain the same links that the leaf products below them contain. In other words, a parent product’s links are “inherited” from their leaf products.

Assume, for example, you want to link a leaf-level product called Prepay to categories, and the Prepay product is a sub-product of Call Plans. Also assume that none of the other leaf products under Call Plans have category links.



When you edit the Prepay product and select the Category Links button, assume you select the General category, which creates two links, one to each of its leaf categories: Information and Help. Also assume you select Account and Billing, which is a leaf category (no sub-categories).

When you save your links, return to the Products/Categories/Dispositions editor, and drill down on the Category-Links report, you see the three categories you just linked to the Prepay product: General > Information, General > Help, and Account and Billing.



Although you linked the leaf product, Prepay, to the categories, its parent product (Call Plans) was implicitly linked to the same categories. So even though you cannot directly link a parent product to categories, you implicitly link it by linking one or more of its leaf products.

Linking products to categories and dispositions

Service can automatically create links to categories and dispositions based on answers and incidents in the **knowledge base**, or you can manually define the links for each product. When you manually link products, you can select and link products one at a time or you can select multiple products to link in one operation.

Note The greater the number of products, categories, and dispositions your organization uses, the more flexibility product linking can offer. However, this requires you to carefully consider how you link products to categories and dispositions. If you create too many links, you risk losing the efficiency product linking offers. If you create too few, you may prevent customers and staff members from selecting the appropriate category or disposition.

To create links automatically

Caution This action replaces all product-category and product-disposition links (including any you have created manually) with the automatically created links. Carefully review this procedure before creating links automatically.

1 Click the Configuration button on the **navigation pane**.

2 Double-click Products/Categories/Dispositions under Service. The top levels of products, categories, and dispositions are listed in columns on the editor.

3 To create product-category links automatically, click the Auto-Build button on the ribbon and select Product-Category Links. A message opens to tell you that you cannot use the editor during the linking process and that all existing product-category links will be deleted.

   a Click the Yes button to continue. This schedules the automatic linking process for the next time **Dbstatus** runs (which happens every fifteen minutes). The editor is inactive until the Auto-Build process is complete, so you cannot edit products, categories, or dispositions during that time.

Note A link is created for every product-category combination of **leaf** products and leaf categories associated to answers in the knowledge base. In other words, in any given answer, every leaf product associated with the answer is linked to every leaf category associated with the answer.

4 To create product-disposition links automatically, click the Auto-Build button on the ribbon and select Product-Disposition Links. A message opens to tell you that you cannot use the editor during the linking process and that all existing product-disposition links will be deleted.

   a Click the Yes button to continue. This schedules the automatic linking process for the next time Dbstatus runs (which happens every fifteen minutes). The editor is inactive until the Auto-Build process is complete, so you cannot edit products, categories, or dispositions during that time.

Note A link is created for every product-disposition combination of leaf products and leaf dispositions associated to incidents in the knowledge base that were created within the last thirty days. In other words, every leaf product associated with an incident is linked to every leaf disposition associated with the incident.

5 To edit the automatically generated list of product links, refer to the following procedures.

Now that you have created links, you must enable product linking for them to take effect. Refer to Enabling linking.

To create links for one product at a time

1 Click the Configuration button on the **navigation pane**.

2 Double-click Products/Categories/Dispositions under Service.

3 In the Products column, identify the product you want to link.

Tip Remember that you can link categories and dispositions only to products that are **leaf** products. If the product you select has sub-products, the Category Links and Disposition Links buttons are disabled on the product editor.

   a To view sub-products under a product, click the + sign next to a product to expand it.
   b To find a product, click the Find button on the ribbon and type a search term in the Find window. The first product that matches your search term is highlighted in the tree. To continue searching, click the Find Next button.

4 Right-click the product you want to link and select Edit. The product editor opens.

5 To create category links, click the Category Links button on the ribbon. The category tree displays on the content pane.

a Select the check boxes for each category you want to link to the product.

Note If you select a category that has sub-categories, all sub-categories are linked to the product. If you select a sub-category, all levels of its parent category are implicitly linked.

b Click the Save button to save the category links for the product.

6 To create disposition links, click the Disposition Links button on the ribbon. The disposition tree displays on the content pane.

a Select the check boxes for each disposition you want to link to the product.

Note If you select a disposition that has sub-dispositions, all sub-dispositions are linked to the product. If you select a sub-disposition, all levels of its parent disposition are implicitly linked.

b Click the Save and Close button on the ribbon to save the disposition links for the product.

Now that you have created links, you must enable product linking for them to take effect. Refer to Enabling linking.

To create or remove links for multiple products simultaneously

1 Click the Configuration button on the **navigation pane**.

2 Double-click Products/Categories/Dispositions under Service.

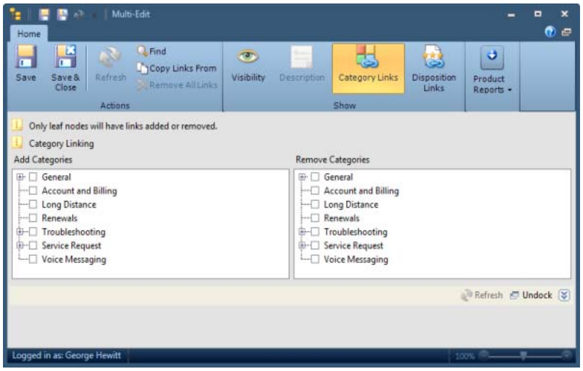
3 On the Products/Categories/Dispositions editor, select the first product you want to link.

4 Press the **Ctrl** key while selecting additional products.

5 After selecting the last product, right-click and select Edit. The Multi-Edit window opens.

6 To create or remove category links, click the Category Links button on the ribbon.

Note Although you can select top-level products on the editor, linking occurs only with **leaf-level** products. If you want to create links for all of a top-level product's leaf products, you must select each of the leaf products separately instead of selecting only the top-level product. Because linking occurs only between leaf-level products, categories, and dispositions, the links you create while multi-editing do not apply to any top-level products you select, but only to the leaf-level products you select. (However, once you have created links to leaf products, the parent product is implicitly linked.)



a To link categories to the selected products, select the check boxes for each category you want to link in the Add Categories column.

b To remove category links from the selected products, select the check boxes for each category you want to remove the link from in the Remove Categories column.

c Click the Save button to save the category links.

7 To create or remove disposition links, click the Disposition Links button on the ribbon.

a To link dispositions to the selected products, select the check boxes for each disposition you want to link in the Add Dispositions column.

b To remove disposition links from the selected products, select the check boxes for each disposition you want to remove the link from in the Delete Dispositions column.

c Click the Save button to save the disposition links.

Now that you have created links, you must enable product linking for them to take effect. Refer to Enabling linking.

Linking categories and dispositions to products

Product linking is bidirectional. Besides linking products to categories and dispositions, you can also link categories and dispositions to products. The following procedures are similar to linking products to categories and dispositions.

To link categories to products

1 Click the Configuration button on the navigation pane.

2 Double-click Products/Categories/Dispositions under Service.

3 In the Categories column, right-click the category you want to link and select Edit. The category editor opens.

Note You must select a leaf category (that is, one that has no sub-categories). If you select a category that has sub-categories, the Product Links button on the editor is disabled.

4 Click the Product Links button on the ribbon. The products tree displays on the content pane.

5 Select the check boxes for the products you want to link to the category.

Tip If you select a product that has sub-products, all sub-products are linked to the category. If you select a sub-product, all levels of its parent product are implicitly linked.

6 Click the Save and Close button on the ribbon to save the product links for the category.

Now that you have created links, you must enable product linking for them to take effect. Refer to Enabling linking.

To link dispositions to products

1 Click the Configuration button on the navigation pane.

2 Double-click Products/Categories/Dispositions under Service.

3 In the Dispositions column, right-click the disposition you want to link and select Edit. The disposition editor opens.

Note You must select a leaf disposition (that is, one that has no sub-dispositions). If you select a disposition that has sub-dispositions, the Product Links button on the editor is disabled.

4 Click the Product Links button on the ribbon. The products tree displays on the content pane.

5 Select the check boxes for the products you want to link to the disposition.

Tip If you select a product that has sub-products, all sub-products are linked to the disposition. If you select a sub-product, all levels of its parent product are implicitly linked.

6 Click the Save and Close button on the ribbon to save the product links for the disposition.

Now that you have created links, you must enable product linking for them to take effect. Refer to Enabling linking.

Enabling linking

Enable product-category linking when you want to restrict the display of categories to only those that are linked to the selected product. This affects agents working with incidents and customers searching on the **customer portal**. Enable product-disposition linking when you want to restrict the dispositions agents can select when working with incidents to only those associated with the product they have selected.

Product-category linking and product-disposition linking are independent, so they are enabled separately. You can enable either or both types of linking.

To enable product linking

1 Click the Configuration button on the navigation pane.

2 Double-click Products/Categories/Dispositions under Service.

3 To enable product-category linking, click the Enable button on the ribbon and select Product-Category Linking.

4 To enable product-disposition linking, click the Enable button on the ribbon and select Product-Disposition Linking.

5 Log out and then log back in for the changes to take effect.

Copying product links

You might want a product to have the same category or disposition links as another product. In that case you can simply copy the category links or disposition links from the original product, and those links are applied to the product you are editing. If you want to copy both category and disposition links, you must copy them each separately as described in the following procedure.

To copy product links

1 Click the Configuration button on the navigation pane.

2 Double-click Products/Categories/Dispositions under Service.

3 Right-click the product you want to copy links to and select Edit to open the product editor.

Or

Select multiple products using the **Ctrl** key, right-click, and select Edit to open the Multi-Edit window.

4 To copy category links, click the Category Links button on the ribbon.

Or

To copy disposition links, click the Disposition Links button.

5 Click the Copy Links From button on the ribbon. The Copy Links from Product window opens.

6 If necessary, expand the product tree to display the product you want to copy links from.

7 Select the product you want and click the OK button. The Copy Links from Product window closes.

8 Click the Save and Close button on the ribbon.

Note If the product you are editing already has existing links, these links are not removed by copying links from another product. Instead, the product now contains both its original links as well as the copied links.

Removing product links

There may be times when you want to remove product-category or product-disposition links, such as when your organization modifies dispositions as a result of a business process change. You can manually remove product links one at a time. You can also remove multiple product links in one operation using the multi-edit mode, described in To create or remove links for multiple products simultaneously.

To remove a link

1 Click the Configuration button on the navigation pane.

2 Double-click Products/Categories/Dispositions under Service.

3 Right-click the product you want to remove links from and select Edit.

4 To remove category links from the product, click the Category Links button.
   - a To remove all category links from the product, click the Remove All Links button.
   - b To remove specific category links, clear the check boxes for the categories you no longer want to link to this product. (All associated implicit links are also cleared.)
   - c Click the Save button.

5 To remove disposition links from the product, click the Disposition Links button.
   - a To remove all disposition links from the product, click the Remove All Links button.
   - b To remove specific disposition links, clear the check boxes for the dispositions you no longer want to link to this product. (All associated implicit links are also cleared.)
   - c Click the Save and Close button.

Disabling product linking

Even after you have created product links, you can disable the product linking feature. When the feature is disabled, staff members can select any product-category and any product-disposition combination when they work with incidents. On the customer portal, customers can select any product-category combination when they conduct a search or request notifications.

To disable product linking

1 Click the Configuration button on the navigation pane.

2 Double-click Products/Categories/Dispositions under Service.

3 To disable product-category linking, click the Enable button and clear the Product-Category Linking check box.

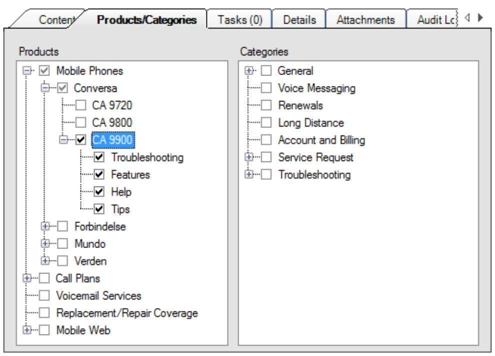
4 To disable product-disposition linking, click the Enable button and clear the Product-Disposition Linking check box.

5 Log out and then log back in for the changes to take effect.

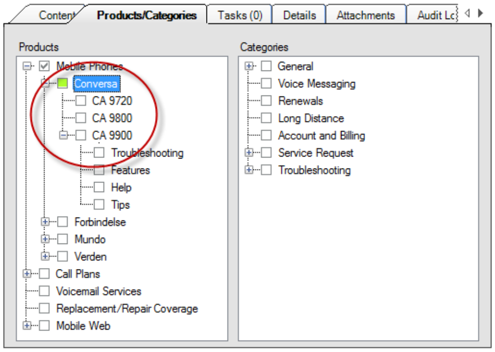
Product linking when working with answers

Regardless of whether product linking is enabled and regardless of what categories are linked to products, all products and all categories are available on the Products/Categories tab when you add or edit an answer.

When you select a product that has sub-products (including one or more levels of sub-products), all sub-products below the product you selected are also selected, all the way down to the leaf level. Any parent product levels are also selected implicitly. In the following figure, selecting CA 9900 automatically selects that product's sub-products. It also implicitly selects the two parent levels: Conversa Phones and Mobile Phones.



There may be times when you want to associate an answer with a top-level product but you do not want to associate that product's sub-products with the answer. In that case, you can right-click the product to select it without selecting any of the sub-products. Instead of a check mark next to the product, you will see the check box filled in with the color green, as shown in the following figure, where the Conversa product is selected but its sub-products are not.



The ribbon for the standard answer workspace contains a Validate Category Links button that lets you determine if the products and categories you selected for the answer are linked. If the categories you selected are linked to selected products, a message informs you that all selected categories are linked to at least one selected product. If you select one or more categories that are not linked to the products you selected, a message lists the categories that are not linked to any of the selected products.

Reports for products, categories, dispositions, and product linking

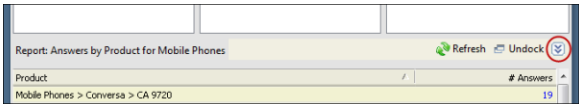
You can view **reports** on the Products/Categories/Dispositions editor.

To view a report

Note This procedure describes how to display a product report, but the procedure is the same for viewing category and disposition reports.

1. Click the Configuration button on the navigation pane.
2. Double-click Products/Categories/Dispositions under Service.
3. Select the product you want to view a report for.
4. Click the Product Reports button and select one of the available options: Visibility, Answers, Incidents, Category Links, or Disposition Links. The report displays on the lower part of the editor.
5. To see the answers, incidents, or category or disposition links associated with the product, click the value in the # column. A list of all records or links is displayed.

6 To minimize the report, click the button with two down arrows at the far right of the report header.



7 To display the same report for a different product, select the product and click the Refresh button (the one in the report header, not the one on the ribbon).

8 To copy information in a report column (for example, to copy an incident reference number so you can search for the incident), right-click the item and select Copy Cell to Clipboard.

Reports can also be viewed when you are editing an individual product, category, or disposition. The reports are available as buttons on the editor ribbon.

The following reports are available for products.

- **Visibility**—Shows the product and all sub-products with check marks in the Admin and End-user columns that indicate where the product is visible on each interface.
- **Answers**—Shows the product, including any sub-products, and the number of answers associated with each. You can then drill down on the number of answers to view all answers associated with the specific product.
- **Incidents**—Shows the product, including any sub-products, and the number of incidents associated with each. You can then drill down on the number of incidents to view all incidents associated with the specific product.
- **Category Links**—Shows the number of category links for the selected product. (If the selected product is a parent product, category links are displayed for each of the sub-products that is linked to a category.) You can drill down on the number of links to view the category links for each product.
- **Disposition Links**—Shows the number of disposition links for the selected product. (If the selected product is a parent product, disposition links are displayed for each of the sub-products that is linked to a disposition.) You can drill down on the number of links to view the disposition links for each product.

The following reports are available for categories.

- **Visibility**—Shows the category and all sub-categories with check marks in the Admin and End-user columns that indicate where the category is visible on each interface.

- **Answers**—Shows the category, including any sub-categories, and the number of answers associated with each. You can then drill down on the number of answers to view those answers.
- **Incidents**—Shows the category, including any sub-categories, and the number of incidents associated with each. You can then drill down on the number of incidents to view those incidents.
- **Category Links**—Shows the number of product links for the selected category. You can drill down on the number of links to view the products linked to each category.

The following reports are available for dispositions.

- **Visibility**—Shows the disposition and all sub-dispositions with check marks in the Admin column that indicate where the disposition is visible on each interface. (Dispositions are not visible on the customer portal so End-user visibility is not an option.)
- **Incidents**—Shows the disposition, including any sub-dispositions, and the number of incidents associated with each. You can then drill down on the number of incidents to view those incidents.
- **Disposition Links**—Shows the number of product links for the selected disposition. You can drill down on the number of links to view the products linked to each disposition.

Adding and editing incident statuses

An incident's status is its state in the **knowledge base**. Service has four default incident statuses: Solved, Unresolved, Updated, and Waiting. Additionally, there are three default **status types**, which are Solved, Unresolved, and Waiting. These are displayed in the drop-down menu in the Status column on the editor. Not surprisingly, the Solved incident status uses the Solved status type. Likewise, the Waiting status uses the Waiting status type, and the Unresolved status uses the Unresolved status type, which is also used by the Updated status. You can rename the default statuses, but you cannot change their types, which are disabled on the Incident Statuses editor. The following list describes the default incident statuses.

- **Solved**—The incident has been resolved.
- **Unresolved**—The incident has been recently added, either by an agent or a customer.
- **Updated**—The incident has been updated by a customer through the Your Account page or by replying to an agent's email.
- **Waiting**—An agent has responded to the incident and is waiting for a response from the customer. If the customer does not respond within the time specified in CI_HOURS (Agedatabase Utility > Batch Processing > Close Incidents), **Agedatabase** sets the incident status to Solved.

Service can automatically set an incident's status when agents send a response. This is a property of the Incident Thread relationship item that can be set when you create an incident **workspace**. The property is called Status Change on Response, and you can set it for one of the following options:

- The status does not change when an agent sends a response.
- The status changes to Waiting.
- The status changes to Solved.

For information about setting properties for relationship items on workspaces, refer to Workspace and Script Elements.

The four default incident statuses may be enough for your organization. However, if additional incident statuses can help you better organize the incidents in the knowledge base, you can add them. When you add an incident status, you must assign it to one of the three default status types.

Important If you delete a custom incident status, all incidents set to that status are changed to the default status with the same status type. For example, if you delete a custom incident status with the status type Solved, all incidents that were associated with that status are changed to the Solved incident status with the Solved status type.

To add or edit an incident status

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

3 Click the arrow next to the System Menus folder to expand the list.

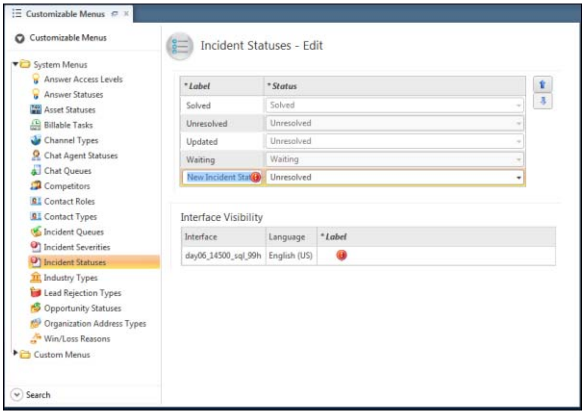
4 Click Incident Statuses to display the editor.

5 To add an incident status, click the New button on the **ribbon**.

Or

To edit an incident status, click it in the tree.

Tip You can change the names of the default incident statuses, but the functionality of each remains the same. Incidents with the same status type behave the same way, regardless of their name.



6 Type a name for a new incident status or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 Click the Status drop-down menu and select a status type. The options include Unresolved, Solved, and Waiting. Once you save an incident status, you cannot change its status type.

8 Click the Save and Close button on the ribbon to save the incident status and close the editor.

Adding and editing incident severities

Your organization might find it useful to classify incidents by their severity level so that agents can resolve the highest severity incidents first. Additionally, reports that include incident severity can be useful management tools.

To add or edit an incident severity level

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

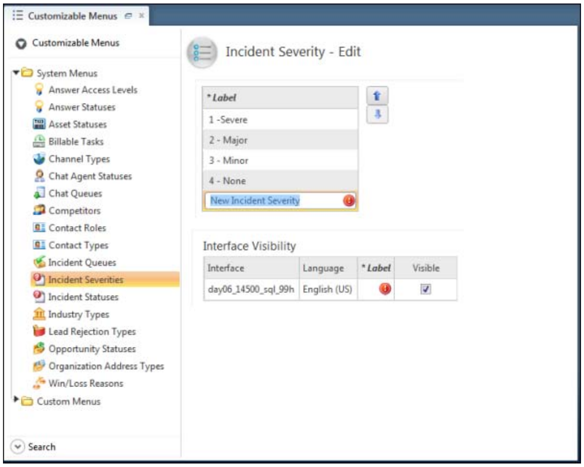
3 Click the arrow next to the System Menus folder to expand the list.

4 Click Incident Severities to display the editor.

5 To add an incident severity, click the New button on the **ribbon**.

Or

To edit an incident severity, click it in the tree.



6 Type a name for a new incident severity or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 If you do not want the incident severity to be visible on the **interface**, clear the Visible check box.

8 Click the Save and Close button on the ribbon to save the incident severity and close the editor.

Incident queues

Using incident **rules**, you can route unresolved incidents into different **queues** based on the criteria you define. For example, you might add queues for different product lines or service areas. Or you might have a first tier for basic customer service and additional tiers for problems of increasing complexity. When you create **profiles** for staff accounts, you can assign one or more queues to each profile and specify how incidents are pulled from that queue. Based on their profile, agents can retrieve a specified number of incidents from the queues to which they have access.

Queues also help you manage incident escalation to meet your organization's service level agreements (**SLAs**), balance agent workload, and track agent productivity and efficiency.

The following steps provide an overview for managing queues.

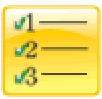
- **Add queues**—You can select a default queue to which all new incidents are automatically routed, and you can add multiple incident queues for effective incident routing. Refer to Adding and editing incident queues.
- **Assign queues to profiles**—You can define available queues, queue ranking, pull policy, pull quantity, and inbox limit for staff members with the profile. Refer to Customizing profiles.
- **Create business rules to populate queues**—You can create business rules to automatically assign incoming incidents to incident queues based on conditions you specify. Incident rules have a Set Field > Queue ID action you can use to route queues based on the conditions of the rule. Refer to Adding rules.
- **Instruct agents about queues**—Agents can manually pull incidents from queues assigned in their profile. When agents log out, the unresolved incidents in their inbox remain there unless they assign them back into a queue. Refer to Reassigning and re-queuing incidents.
- **Monitor queues**—Agents can monitor queuing statistics through the Queues report, where queued incidents and statistics are displayed. Queue statistics can be regenerated at any time. Refer to Monitoring queues.

Adding and editing incident queues

When you add an incident queue, you can define whether the queue uses a **round-robin** incident assignment and specify the queue as the default queue where unassigned incidents are routed. You can also delete queues from the Incident Queues editor.

Important If you try to delete an incident queue that is used in a **business rule**, a window opens to display the rules that depend on the queue. Before you can delete the incident queue, you must first edit the rules so they no longer use the queue.

Prerequisites



Before you can access incident queues, your profile for Service permissions must allow incident queues. In addition to queue access, Service permissions also define queue rank, pull policies and quantities, and inbox limits. See Service permissions.

To add or edit an incident queue

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

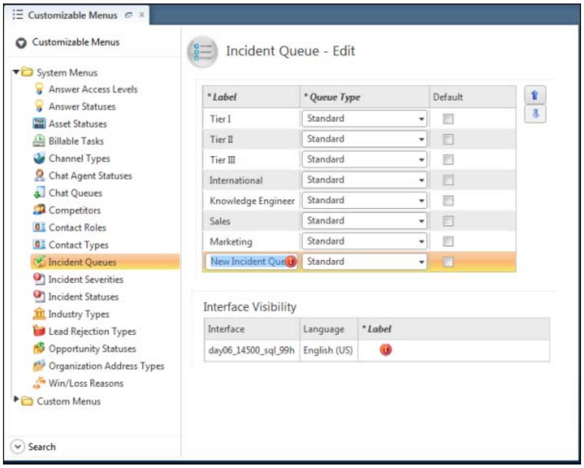
3 Click the arrow next to the System Menus folder to expand the list.

4 Click Incident Queues to display the editor.

5 To add an incident queue, click the New button on the **ribbon**.

Or

To edit an incident queue, click it in the tree.



6 Type a name for a new incident queue or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 Click the Queue Type drop-down menu and select one of the following options: Standard, Round Robin (All), or Round Robin (Logged In).

Tip A round-robin queue automatically assigns incidents in this queue to agents in a rotating fashion. For example, if four agents are assigned to the round robin queue, incidents are assigned in this order: Agent1, Agent2, Agent3, Agent4, Agent1, Agent2, and so on. If you select Round Robin (All), incidents are assigned to all staff members whose profile includes the queue, even if they are not logged in.

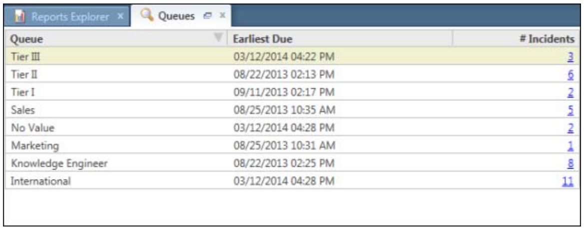
8 If you want this incident queue to be the default queue, select the Default check box.

Note Only one queue can be the default queue. If a default queue has already been identified and you select the default check box for this queue, this queue becomes the default.

9 Click the Save and Close button on the ribbon to save the incident queue and close the editor.

Monitoring queues

Staff members with the appropriate permissions can monitor incident queues using the Queues report. Depending on their **profile**, this report may appear in any **navigation list** designated by the **administrator**. See Service permissions.



Queue	Earliest Due	# Incidents
Tier III	03/12/2014 04:22 PM	3
Tier II	08/22/2013 02:13 PM	6
Tier I	09/11/2013 02:17 PM	2
Sales	08/25/2013 10:35 AM	5
No Value	03/12/2014 04:28 PM	2
Marketing	08/25/2013 10:31 AM	1
Knowledge Engineer	08/22/2013 02:25 PM	8
International	03/12/2014 04:28 PM	11

The Queues report lets staff members drill down to display the agents who are currently handling incidents and the incidents themselves. For a real-time snapshot of all queues at any time, click the Refresh button.

Adding and editing answer statuses

An answer's **status** controls whether it is public and describes its state in the **knowledge base**. Service provides four default answer statuses, described in the following list. Every answer status is associated with a **status type** that is either Public or Private.

- **Private**—The Private answer status prevents answers from being displayed on the **administration interface** and the **customer portal**. It is associated with the Private status type.
- **Proposed**—Answers with the Proposed status are incidents that agents have submitted as potential answers for the knowledge base. Proposed answers are associated with the Private status type.
- **Public**—Answers with the Public status are visible on the customer portal. Public answers have a Public status type.

- **Review**—The Review answer status means the answer should be evaluated to determine if it is still necessary. An answer's status is set to Review when it has been part of the knowledge base for a specified amount of time or when its solved count reaches zero. Refer to Aging of Solved Count. Answers with a Review status are associated with a Private status type by default.

If you want to organize the answers in the knowledge base with a greater level of classification than that offered by the default answer statuses in Service, you can add more answer statuses.

Important If you delete a custom answer status, all answers with that status are changed to have either a Public or Private status, depending on the status type of the deleted answer status. For example, if you delete a custom answer status with a Public status type, all answers that were associated with that status are changed to Public status with the Public answer status type.

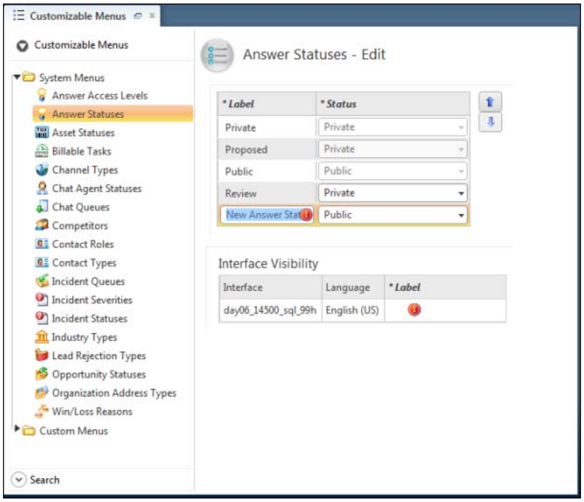
To add or edit an answer status

1. Click the Configuration button on the **navigation pane**.
2. Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.
3. Click the arrow next to the System Menus folder to expand the list.
4. Click Answer Statuses to display the editor.
5. To add an answer status, click the New button on the **ribbon**.

   Or

   To edit an answer status, click it in the tree.

Tip You can change the names of the default answer statuses, but the functionality of each remains the same. Answers with the same status type behave the same way, regardless of their name.



6 Type a name for a new answer status or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 Click the Status drop-down menu and select Public or Private.

Note After you save the answer status, you cannot edit its status type. Answers set to the Private status type are not visible on the customer portal, even if you select end-user visibility on the answer's **access level**. They are also not visible on the administration interface.

8 Click the Save and Close button on the ribbon to save the answer status and close the editor.

Adding and editing answer access levels

Answer access levels provide a way to control which answers in the knowledge base become public and visible to customers. Service has the following default answer access levels.

- **Help**—The Help answer access level provides online help to customers through context-sensitive answers.

- **Everyone**—The Everyone answer access level makes answers visible to all staff members and customers.

Note You cannot delete the Help and Everyone answer access levels, although you can rename them.

In addition to the default answer access levels, you can add custom answer access levels to allow specific contacts and organizations to view certain groups of answers that are not available to all customers. You control the answers customers can view when you create a service level agreement (**SLA**) and select custom access levels to associate with it. Customers with that SLA can view answers having those custom access levels. Refer to Creating SLAs for information about assigning answer access levels to an SLA.

Important In order for answers to appear on the customer portal, the **Status**, **Language**, Access Level, **Product**, and **Category** fields must be set to a visibility that allows access by customers. If even one field does not allow visibility, the answer is not visible on the customer portal. In addition, if you have sections within an answer with restricted visibility, that section must be assigned an access level associated with the answer and have end-user visibility selected. Refer to Controlling answer visibility.

Sibling answers with access levels that are at or below the contact's SLA are visible to the contact. Refer to Sibling answers.

To add or edit an answer access level

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

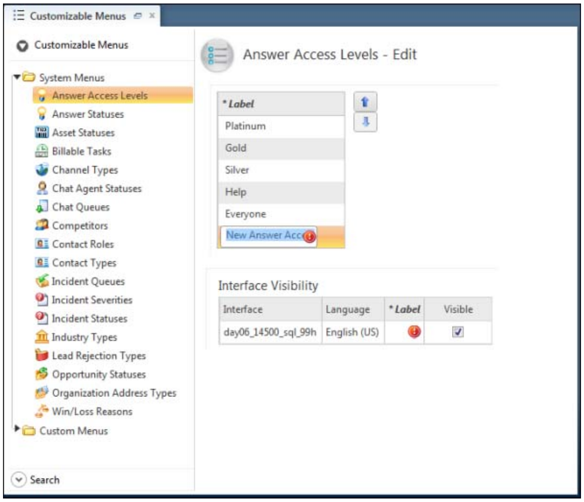
3 Click the arrow next to the System Menus folder to expand the list.

4 Click Answer Access Levels to display the editor.

5 To add an answer access level, click the New button on the **ribbon**.

Or

To edit an answer access level, click it in the tree.



6 Type a name for a new answer access level or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 If you do not want the answer access level to be visible on the **interface**, clear the Visible check box.

8 Click the Save and Close button on the ribbon to save the answer access level and close the editor.

Adding and editing billable tasks

The Time Billed feature in Service lets you track the amount of time agents spend on customer issues and questions. When you enable this feature, agents can add their time to an incident as they work on it.

Service contains one default billable task, Miscellaneous, and you can add any custom billable tasks that meet your organization’s needs. For example, you might add a Telephone billable task to see how much time agents are spending on the telephone answering customer questions. Refer to Tracking your time to learn how agents record billable time when they work on incidents.

Important You cannot delete the Miscellaneous billable task. If you delete a custom billable task, all occurrences of that task in incidents have no value and you may lose valuable time-tracking information.

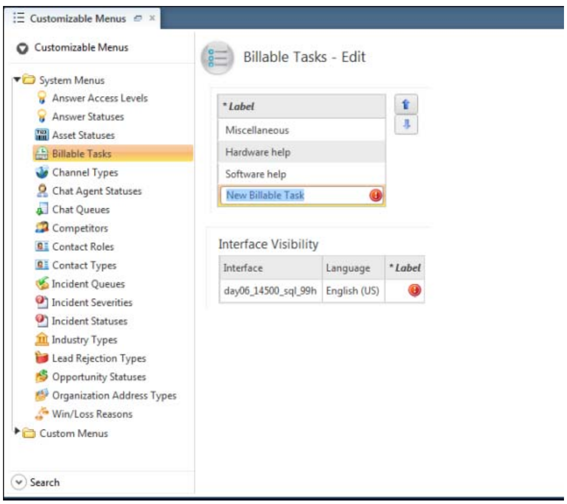
The standard incident **workspace** contains the Time Billed tab. To enable the feature on other workspaces, add the Time Billed relationship item to the workspace. Other Time Billed properties include the ability to require agents to enter time billed before they mark an incident solved or whenever they edit an incident. These properties are Time Required for Edit and Time Required for Solved. Refer to [Creating custom workspaces](#).

To add or edit a billable task

1. Click the Configuration button on the **navigation pane**.
2. Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.
3. Click the arrow next to the System Menus folder to expand the list.
4. Click Billable Tasks to display the editor.
5. To add a billable task, click the New button on the **ribbon**.

   Or

   To edit a billable task, click it in the tree.



6. Type a name for a new billable task or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.
7. Click the Save and Close button on the ribbon to save the billable task and close the editor.

Editing channel types

Channel types are used by contacts to provide their user names for Twitter, YouTube, and Facebook through the **customer portal**. By providing user name information, the contact's incidents are automatically associated with the contact. This assists agents in identifying and responding to contacts who are using Twitter, YouTube, and Facebook. For complete details and procedures about social channels in Oracle Service Cloud, see Channels.

If given the proper visibility through the Channel Types editor, contacts and staff members can add and edit channel type user names.

- Contacts can add and edit their Twitter, YouTube, and Facebook user names through **widgets** on the customer portal. Refer to Input widgets.
- Staff members can add and edit Twitter, YouTube, and Facebook user names for contacts from a custom contact **workspace**.

Important The standard contact workspace does not contain a field for channel usernames. If you want your agents to add information about channel user names, you must add the Channel Usernames field to a custom contact workspace and assign that workspace to the **profile** used by agents. Refer to Creating custom workspaces.

To add the Channel Usernames field to a contact workspace

1. Click the Configuration button on the **navigation pane**.
2. Double-click Workspaces under Application Appearance. The Workspaces explorer opens.
3. Right-click the custom contact workspace you want to add the field to and select Open.

Note You cannot edit the standard contact workspace, but you can copy it and edit the copy.

4. Click the Insert Field tab on the ribbon.
5. Click the Channel Usernames field, move the cursor to where you want to position the field on the workspace, and click to place the field.
6. To change the field label, adjust the size, make it a read-only field, or make it a required field, click the field on the workspace and select options on the ribbon's Design tab.
7. Click the Save and Close button on the ribbon.

8 Assign this workspace to a profile used by your agents. Refer to [Customizing profiles] if you need help with this process.

To edit a channel type

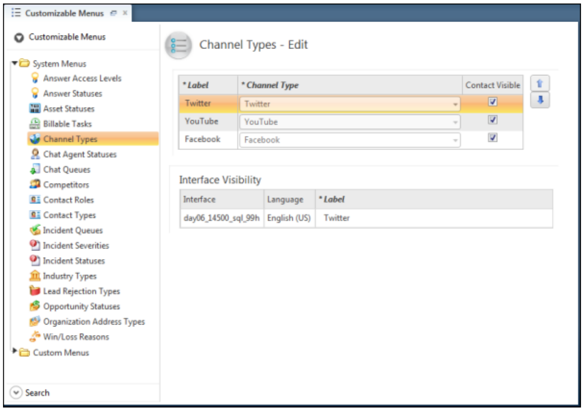
1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree opens on the **content pane**.

3 Click the arrow next to the System Menus folder to expand the list.

4 Click Channel Types in the tree. The Channel Types editor opens on the content pane.

5 To rename a channel type, click it in the Label column. The Interface Visibility section displays.



6 Type the revised channel type name in the Label column in the top section of the Channel Types editor. The Label field in the Interface Visibility section is revised as you type.

Note The Interface Visibility section contains the names of all available **interfaces**, the languages they are implemented in, and the language-specific label of the channel. When using multiple-language interfaces, you must type the label in the Label field in the language of the interface.

7 To remove channel type visibility for staff members and contacts, clear the Contact Visible check box next to the applicable channel type. This removes staff member visibility for the channel type in the Channel Usernames field on the custom contact workspace. In addition, visibility is removed from the applicable widget on the customer portal.

8 To change the display sequence of channel types on the custom contact workspace and the customer portal, click the up or down arrow next to the Contact Visible column.

9 Click the Save and Close button on the ribbon.

Outreach customizable menus

Oracle RightNow Outreach Cloud Service (Outreach) is an email and campaign solution for delivering personalized, richly formatted email communications to targeted segments of customers and prospects and for launching full-scale marketing campaigns. Tracked link categories provide an option for classifying **tracked links** in **mailings** and **surveys** and are useful for reporting purposes.

Tracked link categories

You can add tracked link categories to your Outreach and Oracle RightNow Feedback Cloud Service (Feedback) applications to group and organize tracked links. When tracked links are assigned to categories, you can enhance your reporting on customer clicks of links in your mailings and surveys. You can also see how certain categories performed and which are getting the most hits. For example, you could create tracked link categories for each of your product offerings on your website. You can also delete tracked link categories on the editor.

Important Use care when deleting tracked link categories. When you delete a tracked link category, the category is set to Unspecified and you may lose tracking data as a result.

To add or edit a tracked link category

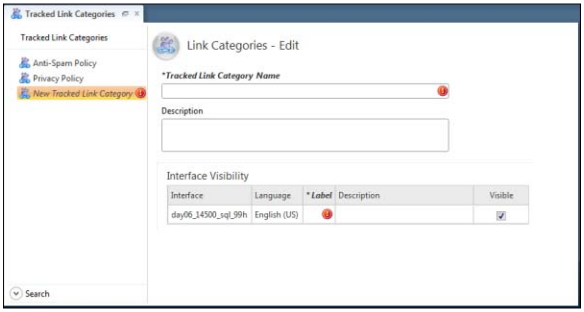
1 Click the Configuration button on the **navigation pane**.

2 Double-click Tracked Link Categories under Outreach. The tree displays on the **content pane**.

3 To add a tracked link category, click the New button on the **ribbon**.
Or

To edit a tracked link category, click it in the tree.

Tip To add another parent-level tracked link category in the same session, you must first press **Ctrl** and click the highlighted category in the tree (to deselect it) before clicking the New button.



4 Type a new name or edit an existing one in the Tracked Link Category Name field. The Label field in the Interface Visibility section is populated or revised as you type.

5 To add a description to the tracked link category, type one in the Description field. The Description field in the Interface Visibility section is populated or revised when you move the cursor to a different field or save the tracked link category.

6 If you do not want the tracked link category to be visible on the **interface**, clear the Visible check box.

7 Click the Save and Close button on the ribbon to save the tracked link category and close the editor.

Adding levels of tracked link categories

By adding levels of tracked link categories to Outreach and Feedback, you can further classify your tracked links. You can add a subordinate category level by selecting a tracked link category and clicking the New button on the ribbon. You can create up to six levels of tracked link categories.

To add levels of tracked link categories

1 Click the Configuration button on the **navigation pane**.

2 Double-click Tracked Link Categories under Outreach. The tree displays on the **content pane**.

3 Click the tracked link category you want to add a level to and click the New button.

4 Type the name and description of the sub-category.

5 Click the Save button. The new category level appears under the category in the tree.

6 Click the Save and Close button on the ribbon to save the sub-category and close the editor.

Opportunity Tracking customizable menus

Opportunity Tracking lets you develop logical ways to organize **opportunities** so sales representatives can find the information they need. With Opportunity Tracking customizable menus, sales representatives can categorize information while they work on opportunities. Based on the data collected in customizable menus, managers and sales representatives can create reports that help identify trends and keep your **knowledge base** up-to-date.

- Contact roles—Add contact roles to classify the role of contacts in opportunities. Contact roles allow staff members to identify the same contact by different roles in different opportunities.
- Opportunity statuses—Use opportunity statuses to identify the current state of opportunities in the knowledge base.
- Competitors—Adding competitors to your knowledge base helps your organization track won and lost opportunities by competitor.
- Win/loss reasons—Identify win/loss reasons to determine what contributes to the outcome of opportunities.
- Industry types—Use industry types to identify those your customers are associated with.
- Lead rejection types—Use lead rejection types to identify reasons for rejecting prequalified opportunities.

Adding and editing contact roles

Contact roles allow sales representatives to identify contacts according to their role in opportunities. Contacts can be associated with multiple opportunities, but their roles in each opportunity can be different. For example, a contact might be a buyer in one opportunity and a reference in another.

By defining contact roles, your sales representatives can select a contact role for the contacts associated with an opportunity. Based on this information, your staff members know which contact to work with at each point in the sales cycle.

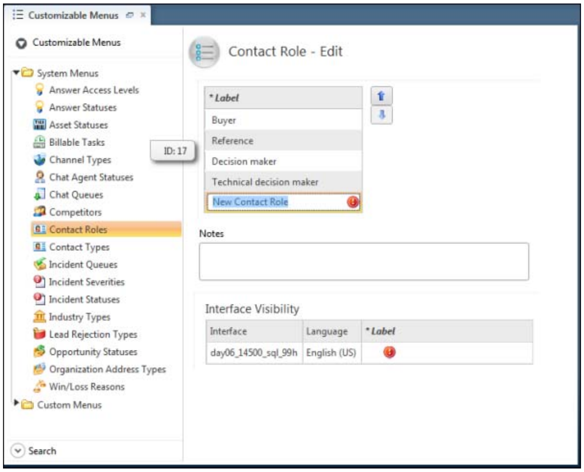
Note Contact roles are specific to Opportunity Tracking. Therefore, staff members see the Set Contact Role button only when they edit contacts that are associated with an opportunity.

To add or edit a contact role

1. Click the Configuration button on the **navigation pane**.
2. Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.
3. Click the arrow next to the System Menus folder to expand the list.
4. Click Contact Roles to display the editor.
5. To add a contact role, click the New button on the **ribbon**.

   Or

   To edit a contact role, click it in the tree.



6. Type a name for a new contact role or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 Type any notes regarding the contact role in the Notes field.

8 Click the Save and Close button on the ribbon to save the contact role and close the editor.

Adding and editing opportunity statuses

Opportunity statuses represent the current state of opportunities in your **knowledge base**. The seven default opportunity statuses include **Lead**, **Reject**, **Active**, **Closed**, **Lost**, **Inactive**, and **Dead**. Besides the default opportunity statuses, you can define additional statuses if you need them.

When staff members assign a status to an opportunity, one of the seven default opportunity **status types** is also assigned. For example, if your organization uses a Pending custom opportunity status that is assigned the Active status type, any opportunities set to the Pending status will be considered active. The default status types are displayed in the drop-down menu in the Status column on the editor.

Important If you delete a custom opportunity status, all opportunities set to that status are changed to the default status with the same status type. For example, if you delete a custom opportunity status with the status type Active, all opportunities that were associated with that status are changed to the Active opportunity status with the Active status type.

To add or edit an opportunity status

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

3 Click the arrow next to the System Menus folder to expand the list.

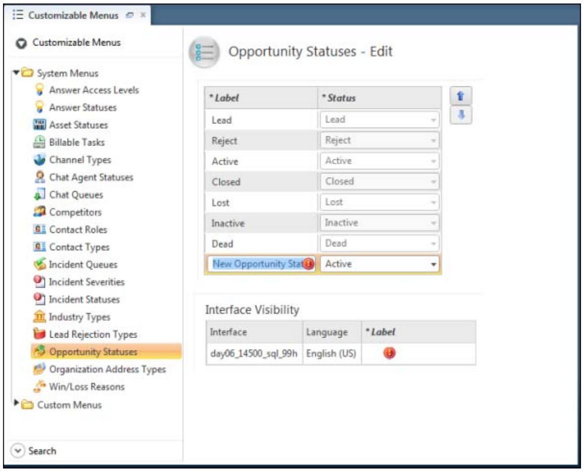
4 Click Opportunity Statuses to display the editor.

5 To add an opportunity status, click the New button on the **ribbon**.

Or

To edit an opportunity status, click it in the tree.

Tip You can change the names of the default opportunity statuses, but the functionality of each remains the same. Opportunities with the same status type behave the same way, regardless of their name.



6 Type a name for a new opportunity status or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 Click the Status drop-down menu and select a status type. Once you save an opportunity status, you cannot change its status type.

8 Click the Save and Close button on the ribbon to save the opportunity status and close the editor.

Adding and editing competitors

A competitor is any individual or organization who is selling goods or services in the same industry as your organization. When adding or editing an opportunity, sales representatives can select from a list of competitors that you define. Using this information, you can track which other parties are competing for your opportunities and whether your organization is winning or losing to them.

To add or edit a competitor

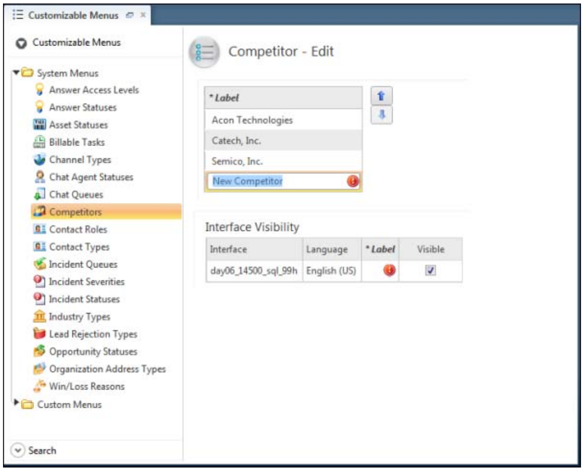
1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

3 Click the arrow next to the System Menus folder to expand the list.

4 Click Competitors to display the editor.

5 To add a competitor, click the New button on the **ribbon**.
Or
To edit a competitor, click it in the tree.



6 Type a name for a new competitor or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 If you do not want the competitor to be visible on the **interface**, clear the Visible check box.

8 Click the Save and Close button on the ribbon to save the competitor and close the editor.

Adding and editing win/loss reasons

When adding or editing an opportunity, sales representatives can select from a list of win/loss reasons that you define. Using this information, you can track the main reasons why your organization is winning or losing opportunities.

To add or edit a win/loss reason

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

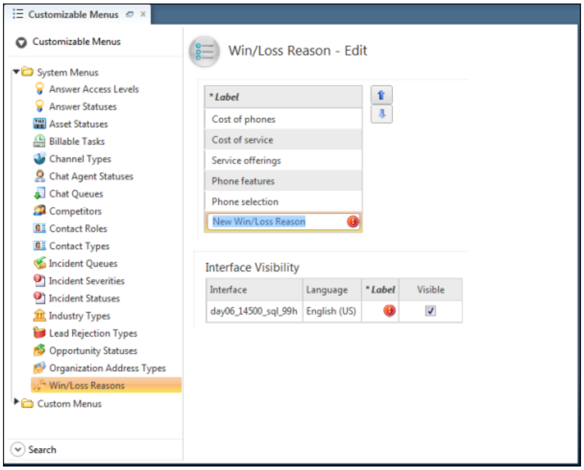
3 Click the arrow next to the System Menus folder to expand the list.

4 Click Win/Loss Reasons to display the editor.

5 To add a win/loss reason, click the New button on the **ribbon**.

Or

To edit a win/loss reason, click it in the tree.



6 Type a name for a new win/loss reason or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 If you do not want the win/loss reason to be visible on the **interface**, clear the Visible check box.

8 Click the Save and Close button on the ribbon to save the win/loss reason and close the editor.

Adding and editing industry types

Industry types allow staff members to classify organizations according to the industry they are associated with. When adding or editing an opportunity, sales representatives can select from a list of industry types that you define. Using this information, you can track which industries your customers are associated with.

Important The standard opportunity **workspace** does not contain a field for industry type. If you want your sales representatives to add information about industry types, you must add the Industry field to an opportunity workspace and assign that workspace to the **profile** used by sales representatives. The following procedure is an overview of adding this field to an opportunity workspace. Refer to Creating custom workspaces.

To add the Industry field to an opportunity workspace

1 Click the Configuration button on the **navigation pane**.

2 Double-click Workspaces under Application Appearance. The Workspaces explorer opens.

3 Right-click the custom opportunity workspace you want to add the field to and select Open.

Note You cannot edit the standard opportunity workspace, but you can copy it and edit the copy.

4 Click the Insert Field tab on the ribbon.

5 Click the Opportunity Fields button and select Organization Fields to view organization fields you can add to the workspace.

6 Click the Industry field, move the cursor to where you want to position the field on the workspace, and click to place the field.

7 To change the field label, adjust the size, make it a read-only field, or make it a required field, click the field on the workspace and select options on the ribbon's Design tab.

8 Save the workspace.

9 Assign this workspace to the profile used by sales representatives. Refer to Customizing profiles if you need help with this process.

To add or edit an industry type

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

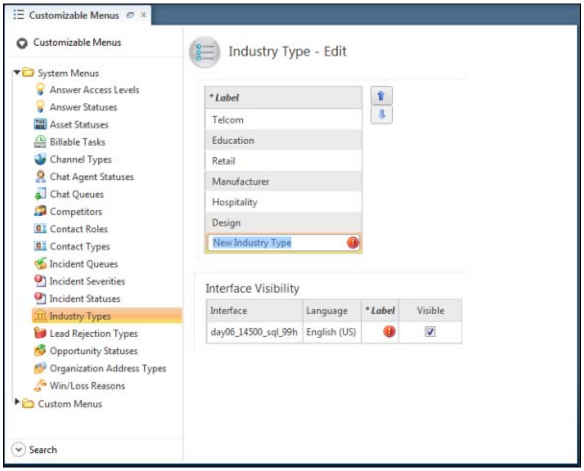
3 Click the arrow next to the System Menus folder to expand the list.

4 Click Industry Types to display the editor.

5 To add an industry type, click the New button on the **ribbon**.

Or

To edit an industry type, click it in the tree.



6 Type a name for a new industry type or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 If you do not want the industry type to be visible on the **interface**, clear the Visible check box.

8 Click the Save and Close button on the ribbon to save the industry type and close the editor.

Adding and editing lead rejection types

A lead is an opportunity that has been prequalified by your marketing or service department, associated to a sales stage with a Lead status type, and assigned to a sales representative. Sales representatives can either accept or reject a lead.

When sales representatives reject leads, they must select from a list of lead rejection types. Using this information, you can track why leads are being rejected.

To add or edit a lead rejection type

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

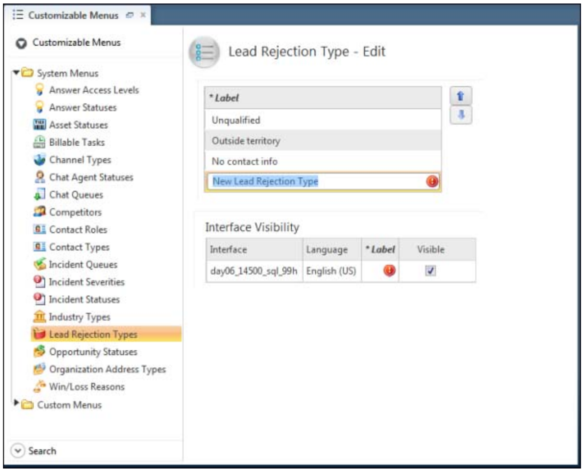
3 Click the arrow next to the System Menus folder to expand the list.

4 Click Lead Rejection Types to display the editor.

5 To add a lead rejection type, click the New button on the **ribbon**.

Or

To edit a lead rejection type, click it in the tree.



6 Type a name for a new lead rejection type or edit an existing one in the Label field. The Label field in the Interface Visibility section is populated or revised as you type.

7 If you do not want the lead rejection type to be visible on the **interface**, clear the Visible check box.

8 Click the Save and Close button on the ribbon to save the lead rejection type and close the editor.

8

Business Rules Management

Business rules are powerful tools for simplifying and automating common business tasks. They link data from all Oracle Service Cloud products in the knowledge base, resulting in a responsive, consistent customer experience.

Business rules route incidents to the suitable support person, notify an engineer when answers in the knowledge base should be reviewed, and automatically answer customer questions. They send marketing emails and surveys. They escalate overlooked opportunities and set strategies based on conditions you define. Rules also update contacts and organizations, set custom fields, and assign tasks. For specific examples of business rules with a discussion of the logic used to create them, see Business rules examples.

Business rules overview

Business rules help you provide a consistent, accurate, and timely experience for customers while streamlining the efficiency of staff members. When the rules engine updates information automatically and immediately, your entire organization has access to a knowledge base that is accurate and current in every customer interaction. For example, marketing staff members always know a customer's email preferences, even when the customer changes opt-in choices. Sales representatives can be sensitive to a prospective customer when they know the customer is experiencing technical support issues. And agents can reinforce your organization's marketing campaigns when they know what emails a customer has received.

Besides the many advantages of keeping the knowledge base accurate and current, business rules also let staff members work efficiently and consistently. When you create rules to answer routine customer questions, customers enjoy an immediate response. At the same time, staff members work more productively without the distraction of repetitive tasks. As a result, they can deliver more responsive customer service and follow-up.

What is a business rule?

A business rule is simply an "if-then" statement: If these conditions apply, then take this action. For example, if a customer has a billing question, then route the incident to an accounting staff member. If a new contact is from the East Coast, then send a marketing email about the opening of a New York store. If an agent proposes an answer for the knowledge base, then route that answer to the knowledge engineer for review.

Business rules can also include an Else clause. If the conditions of the rule are not met, the Else clause specifies the action that should be taken. For example, if a customer has a billing question, a rule can route the incident to accounting. If the question is not about billing (that is, the incident does not match the rule's condition), you can add an Else clause to route it to technical support.

How are rules organized?

Oracle Service Cloud products have eight rule types. These include:

- Oracle Service Cloud
  - ▷ Contact
  - ▷ Organization
  - ▷ Task
- Oracle RightNow Cloud Service (Service)
  - ▷ Incident
  - ▷ Answer
  - ▷ Chat
  - ▷ Offer Advisor
- Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking)
  - ▷ Opportunity

Each of these sets of rules—including the associated states, functions, and variables—is a rule base. The entity to which a rule base applies—answer, incident, contact, chat, opportunity, organization, target (for Offer Advisor rules), or task—is known as the *object type*.

Important Every object type has its own rule base, and every rule base is separate from other rule bases. The contacts rule base processes only contacts, the organizations rule base processes only organizations, and so on.

How are rules processed?

The rules engine is the software that processes the rules in a rule base. The rules engine begins processing when:

- Staff members add or edit answers, contacts, incidents, opportunities, organizations, or tasks.
- Customers submit questions on the Ask a Question page.
- Customers update their contact records or incidents.
- Customers request chat sessions.

The rules engine looks at every new or updated object and checks to see if the conditions of any rules are met. If a rule's conditions are met, the action associated with that rule occurs.

Assume, for example, you add a contact. Adding the contact triggers the rules engine to begin processing rules in the contact rule base. The rules engine applies rules to the contact, checking to see if the contact matches the conditions of any of the rules. If the contact matches the conditions of a rule, the rules engine executes the action in that rule. The action might apply an SLA to the contact, set the state, send a marketing email, or perform any other action in the contact rule base. If the contact matches conditions in multiple rules, the actions of all those rules occur.

The next time the contact record is updated by the customer or a staff member, the rules engine processes the contact again.

Important The rules engine is triggered when the contact (or other object) is updated, not when the rule base is updated. If you create or edit a rule, objects are not evaluated to see if they meet the conditions of the new or updated rule. Rules processing happens only when objects are added or updated.

Incorporating business rules in your organization

Now that you have a basic understanding of rules processing, consider the many ways you can use rules to automate workflow in your organization. The following applications include common ways to use business rules. For specific examples of business rules, see Business rules examples.

Route incoming incidents—Use rules to route incoming questions to the most qualified staff member, group, or queue based on criteria you define, such as product, incident severity, or language.

Escalate answers, incidents, opportunities, and tasks—Assess potential problems and alert managers to critical issues by using escalation levels. Identify tasks with elapsed deadlines, and escalate incidents that have not received timely responses. Escalate answers to ensure adequate review, and follow up on opportunities to prevent ignoring potential sales. See Escalating answers, incidents, opportunities, and tasks.

Update answers, contacts, incidents, opportunities, organizations, and tasks and notify staff members—Create rules to consistently handle and track updates to answers, contacts, incidents, opportunities, organizations, and tasks and notify staff members when assignments have changed.

Suggest answers to incoming questions—Business rules let you suggest answers to customers' questions before they submit them. When rules successfully answer questions, fewer incidents are added, reducing agents' workloads.

Create SLA instances for contacts and organizations—Automatically apply SLA instances for contacts and organizations. For example, create a rule to apply SLA instances to all customers who submit questions about a new product. See Creating SLAs.

Route chat requests to queues—Route requests for chat sessions to a specific queue to manage chats optimally. See Chat for information about chat sessions.

Send marketing email—Send email to contacts who meet specific conditions. For example, send a regional email message to all contacts within a specific geographic area or a product-specific message for opportunities with a certain status. See Creating mailings for complete details about creating, managing, and sending marketing email.

Conduct surveys—Automatically distribute surveys to customers to monitor customer satisfaction and other performance measures. See Creating surveys for complete details about creating, managing, and sending surveys.

Define target customers for promotions—Use Offer Advisor rules to assign customers who meet certain criteria to specific target groups. Then agents who are solving incidents can use Offer Advisor to present offers to eligible customers. See Offer Advisor Administration for information about configuring Offer Advisor and Working with incidents to learn how agents use the feature.

Planning business rules

Before you begin creating rules for your organization, it is important to examine your business processes, including how you update contacts and organizations, handle incidents and answers, route requests for chats, follow up opportunities, and define targets for marketing promotions.

Once you have a clear idea of the processes your organization uses, you can develop an effective method for applying business rules to automate these processes. This section describes the essential steps to help you get started.

Identify and outline business processes—To create a more efficient system for handling routine procedures, first outline the procedures to determine what processes can be automated.

For example, if you routinely assign questions about one product to a certain queue, you can create a rule to automatically route those incidents to the queue. Or if opportunities are not followed up promptly, rules can escalate those opportunities after a certain amount of time.

Review the following list of questions to trigger ideas for designing business rules that can increase efficiency in your organization.

- How do you handle incoming customer questions?
- What is the review process when answers are created?
- What happens when incidents are reassigned to other agents?
- How does management get involved when incidents remain unresolved?
- What happens when sales opportunities are identified?
- How are prospective customers contacted?
- How do you identify target groups for promotions?
- How can you group incoming customer questions and route them most effectively?
- Which inquiries are not being handled properly?
- What other processes can you use to automatically route and manage incoming questions, responses, and updates?

Develop a rules flowchart—Flowcharts are useful for viewing and grouping processes to determine the best way to apply business rules. Creating a flowchart can help you:

- Organize business processes.
- Gain process consensus between management and staff.
- Develop a blueprint for staff training.
- Develop thorough testing methods with less backtracking.
- Create an overview of the information management process.
- Provide a future point of reference.

Review functionality of rules—After mapping your organization's processes, review what rules can do to automate them. When you understand how rules function, you can begin planning ways to implement them. See Elements of rules and rule bases.

Create rules—Once you understand how rules work, you can create rules to automate business processes. Begin by reviewing the flowchart of current processes to determine the most appropriate methods for automating routine processes. See Creating rule bases for procedures to create rules.

Prioritize processes for applying rules—You must consider the organization of states, functions, and rules to ensure that rules perform as you intend them to. Rules in a state process in order until all the rules process or until a rule transitions to a function or a different state or stops processing. For information about how rule actions are executed, see Action execution.

Verify and fine-tune rules—An important part of configuring rules is verifying that they perform as expected. For help with this, see Verifying rules using the rule log.

Train staff—Once you set up rule bases, you must train your staff. They should be familiar with how your organization handles routine business procedures, how rules automate those procedures, and how their positions play a role in rules processing.

Evaluate processes and rules as required—Once you start adding rules to automate processes and become more familiar with them, you can consider more efficient and effective ways to route and manage data. Periodically reevaluate your business processes looking for more effective ways to handle questions, responses, updates, and opportunities. Also reevaluate when your organization experiences workflow changes. For example, update routing rules when staff accounts are added or removed.

As you examine your business processes and think about automating them with rules, it is helpful to understand how to design effective business rules. Elements of rules and rule bases provides an overview of the elements of business rules so you can begin designing and working with rules.

Elements of rules and rule bases

Before you create a rule base, you should be familiar with the elements of rules and rule bases and how these elements are related. The left side of the content pane displays the rules in each of the rule base's states and functions as well as a list of the rule base's variables. The right side of the content pane is the editor, which lets you add and edit states, functions, and variables for a rule base. This is also where you add and edit conditions and actions for individual rules.

States and functions

States and functions provide a way for you to organize business rules and define the sequence for processing rules. Each rule base must have at least one state—the initial state—before rules processing can begin.

The states and functions are listed alphabetically in the Rules tree, and the rules within each state and function are listed in the order in which you want them to execute.

You can add as many states as you need for each stage of your business. You can set up rules in the initial state, for example, that are applied to all new opportunities (or other object type, depending on the rule base). Then, depending on the conditions of rules in the initial state, you can transition the opportunity into another state to continue processing the rules in that state.

For example, you might want to evaluate each new opportunity and assign it to a specific sales group. You could add rules in the initial state that transition to states called Government Agencies, Educational Institutions, or Medical Groups, depending on the industry type of the organization. Those states could contain rules that are unique to opportunities in the different industries.

Like states, functions are also containers for rules. Functions are useful for grouping sets of rules that you want to use in several places. You can set up many separate rules that call the same function, or set of rules, thereby reducing the number of individual rules you need. When a rule in one state calls a function, all the rules within that function process. After all the rules in the function process, the rules engine resumes processing in the original state with the next rule in that state.

Note The primary difference between states and functions is what happens when the rules engine processes the last rule. When the last rule in a state is processed, the rules engine stops processing (unless it encounters a stop processing rule before the last rule or it transitions to a function or another state). When the last rule in a function is processed, the rules engine returns to the next rule in the state from which the function was called.

While functions are powerful tools for grouping rules, avoiding duplication, and making maintenance easier, you are not required to use them in a rule base. You can still take advantage of the powerful features of business rules by adding as many states as you need based on the processes you want to automate and then creating rules within each state.

Variables

A variable is a piece of data with a value that can change during rules processing. You define what its default, or starting, value should be. Then, based on conditions you specify, the variable can be modified by rule actions. You can also use the value of a variable as a condition of a rule. The value of the variable is temporary, existing only during the particular rules processing session. When rules processing is started the next time, the variable's value is reset to the default value.

Conditions

Remember that a rule is basically an "if-then" statement. If something meets this condition, then take this action. The "if" statement is the rule's condition. An example of a condition statement is "If the contact's state equals Montana." Each rule base has a unique set of conditions that the rules engine can use to evaluate the object.

Note Keep in mind that having multiple conditions in a rule is more common than having only one. For the sake of simplified discussion, assume that any singular "condition" referenced in this section may actually be a set of conditions.

Logical expressions

When you add two or more conditions, rules processing uses a logical expression to define the relationship of the conditions. Logical expressions join conditions using an AND (&) or an OR (|) relationship between them. For example, you might want to look for customers who have purchased Product A and who have also purchased a one-year warranty. Or you might want to find customers who have purchased Product A or Product B. The default logical expression joins all condition with AND. If you want all conditions to apply, it is not necessary to edit the logical expressions.

Actions

Actions comprise the "then" part of an "if-then" rule or the "then" and "else" parts of an "if-then-else" rule. If the conditions you specified in a rule are met, then the rules engine implements the rule's actions. The list of available actions depends on the rule's object type. An action can be as simple as stopping the rules processing or more complex, such as assigning an incident to an agent, sending that agent a notification, and defining an escalation process if the incident is not resolved within a certain time frame.

Opening rule bases

When you open a rule base and edit it, the system maintains the active rule base while you edit a copy in the Rules editor. Your changes are not saved until you activate them. This prevents any disruption in rules processing during the editing process and ensures you can revert to a functional rule base should you make any accidental changes while editing.

Because opening a rule base to make changes creates a copy of the active rule base, this action changes the Last Updated column on the Rules editor (or the Edited date when you view active rules), regardless of whether you make any changes.

Viewing active rules

If you want to view the rule base and its rules without making changes, it is a good idea to use the View Active option rather than Edit. This prevents creating an unnecessary copy of the active rule base. Additionally, when you do open a rule base to edit it, you can immediately tell if changes have been made. This prevents overwriting another staff member's work and helps you develop a consistent policy for tracking changes to the rule base. See Viewing rule bases for the procedure to view states, functions, and rules within a rule base and additional information about how changes to a rule base are tracked.

Creating rule bases

An object's rule base includes all the rules, states, functions, and variables associated with that object. The process for creating a rule base consists of creating all the elements that make up the rule base and includes the following main steps, which are explained in greater detail in this section.

- Open the Rules editor and select the object type of the rule base (answer, contact, incident, chat, opportunity, organization, task, or Offer Advisor) on the ribbon.
- Create an **initial state** for the rule base.
- Add additional states, functions, and variables as necessary.
- Add rules to each state and function.
- Reorder the rules within states and functions as necessary.
- Activate the rule base.
- Verify that the rules are performing as expected.

Adding states and functions

Rules processing for new objects begins in the state you have designated as the initial state. (Existing objects begin in whatever rule state they were in when they were last updated.) All the rules in a state process in the order you specify. The only way rules other than those in the initial state process is if rules in that state have actions that transition to another state or call a function. Otherwise, rules processing for new objects ends when the rules engine reaches the last rule in the initial state.

Important The Offer Advisor rule base is an exception to the requirement for an initial state. Because only one state—Targets—is permitted for this type of rule, this state is the default when you open Offer Advisor rules. You cannot add states or functions in Offer Advisor rules. See Setting up Offer Advisor.

By default, when rules processing transitions to another state or calls a function, it begins processing all the rules in that state or function and continues until it reaches the end. However, you can stop processing by adding an action such as Stop Processing Rules, Transition State and Stop, Transition State and Continue, or Call Function. See Choosing actions for descriptions of these actions.

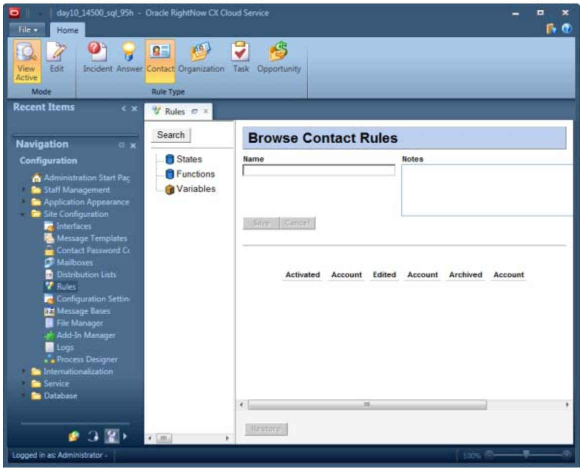
The following procedures explain how to add a state and a function to the contact rule base. However, the steps are the same for adding states or functions to any rule base.

To add a state

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the Contact button on the ribbon to view active contact rules.



Note When viewing active rules in a rule base, you see the rules that are currently used to manage contacts or other records on your site.

4 Click the Edit button on the ribbon to enter the edit mode. The rules you see in this mode are not used on your site until you activate them. See Compiling and activating rule bases.

5 Right-click States and select New State.

6 Type the name of the state in the State Name field. (Choose meaningful names for states based on the processes you want to automate. For example, you might name the initial state Initial or Created, and name other states Updated, Work in Progress, Review, or whatever best describes the rules within the state.)

7 To add a note about the state, type comments in the Notes field.

8 To make this state the initial state, select the Initial State check box. You must have one state (and only one) designated as the initial state before you can **compile** the rule base.

9 Click the Save button to save the state, which now appears in the Rules tree.

10 To add more states, repeat steps 5 through 9.

To add a function

1 While editing a rule base, right-click Functions in the rules tree and select New Function. The Functions editor is activated.

2 Type the name of the function in the Function Name field. Use a name that identifies the function's performance, for example, "Escalation."

3 To add a note about the function, type comments in the Notes field. After you save the function, you can hover over it in the tree to view the note.

4 Click the Save button to save the function, which appears in the tree.

5 To add more functions, repeat steps 1 through 4.

Adding variables

A variable is a temporary data item that is assigned a default value at the start of rules processing. The variable can be modified by rule actions during processing. Other rules can then use it as a condition for triggering certain actions based on its value. The value of the variable is not stored in the database, so it returns to its default value the next time the **rules engine** begins processing.

Note A custom field can be used to accomplish the same function as a variable. If you are questioning whether to use a custom field or a variable, ask yourself whether you need the data for future reference. A variable is temporary, so it returns to the initial value each time the rules engine is run. The custom field, on the other hand, is fixed. That is, at the end of rules processing, it stores the final value in the database to be available at the start of the next round of rules processing for the object.

Rule variables are useful when you want to accumulate a value and save it conditionally or perform some action based on the accumulated value. A common example of a variable is a score. You can modify a variable based on whether the object being evaluated matches rule conditions. Then you can assign different actions based on the variable's value. For an example of a rule using a variable, see Creating a variable to measure service quality.

The actions for each type of variable are listed in the following table.

Table 32: Rule Actions for Variables

Variable Data Type	Actions
Integer	• Set equal to an absolute value. • Increment by *n*. • Decrement by *n*. • Set equal to the value of another integer variable or custom field.
Text Field	• Set equal to an absolute string. • Prepend character string. • Append character string. • Set equal to the value of another character variable or custom field. **Note:** See Setting custom fields and variables for information about how leading and trailing spaces are handled when rule actions are used to set variables.
Date Field	• Set equal to an absolute value. • Increment by *n* days. • Decrement by *n* days. • Set equal to the value of another date variable or custom field or object date or date/time field.
Date/Time	• Set equal to an absolute value. • Increment by *n* days, hours, or minutes. • Decrement by *n* days, hours, or minutes. • Set equal to the value of another date/time variable or custom field or object date or date/time field.

The following procedure describes the steps to add a variable or edit an existing one.

To add or edit a variable

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the button on the ribbon for the rule type you want to add the variable to. The incident rule base is selected by default.

4 Click the Edit button on the ribbon.

5 Right-click Variables in the Rules tree and select New Variable. The editor is activated.

Or

Right-click a variable and select Edit Variable.

6 Enter the following field information.

Table 33: Rule Variables Editor Description

Field	Description
Rule Variable Name	Type the name of the rule variable in this field.
Data Type	Select the variable's data type. The options include Integer, Text Field (to a maximum of 255 characters), Date Field, and Date/ Time. After you have saved a variable, you cannot edit its data type.
Default	Type a value that will be the variable's initial value every time the rules engine is invoked in the rule base.
Notes	Type any note you want to add to the variable. The note will be visible when you hover over the variable in the tree.

7 Click the Save button to save the variable.

Note To delete a variable, right-click it, select Delete Variable, and confirm that you want to delete the variable. If the variable you are trying to delete is used in any rule, a variable **dependency** list shows which rules use the variable. You must delete the condition or action of any rule using the variable before you can delete the variable. See Resolving dependencies.

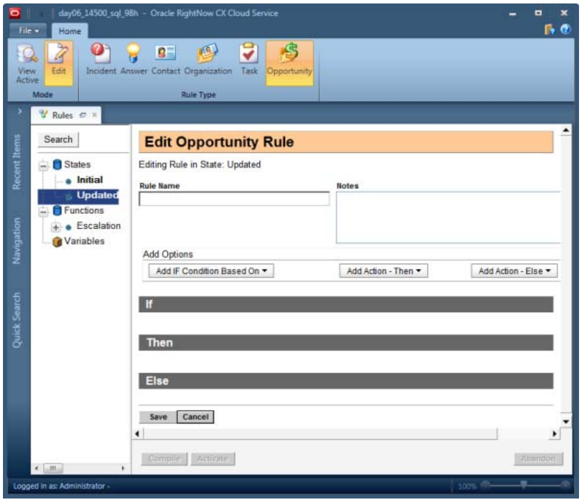
Adding rules

Once you add states and functions for an object type, you can add rules. The basic steps for adding a rule are similar for all types of rules, although the condition and action options available vary by rule type. The following procedure illustrates how to add a rule to route a new sales opportunity to a sales manager.

Caution An extremely high number of complex rules can cause the system to run out of memory and cause errors. If, for example, you have more than 675 highly complex rules (each with 20 conditions, 20 Then actions, and 20 Else actions), memory errors are likely to occur. More than 1,000 rules of moderate complexity (3 conditions, 5 Then actions, and 3 Else actions) can be run without error, although it may take more than a minute to save the rule base.

To add a rule

1. Click the Configuration button on the navigation pane.
2. Double-click Rules under Site Configuration.
3. Click the Opportunity button on the ribbon to view active opportunity rules.
4. Click the Edit button on the ribbon to enter the edit mode.
5. Right-click the state or function you want to add the rule to and select New Rule.



6 Type the name of the rule in the Rule Name field.

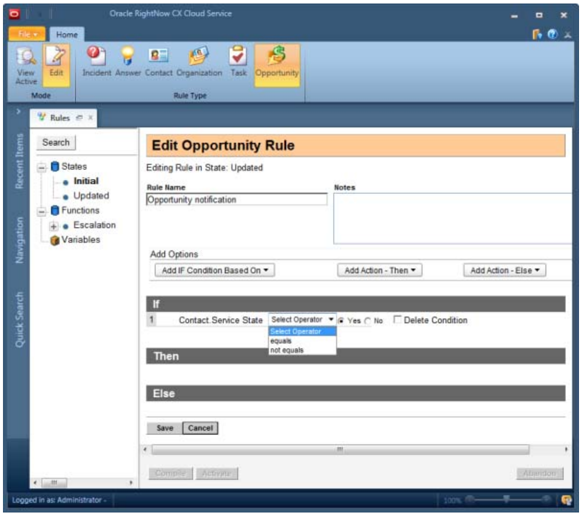
7 To add a note about the rule, type comments in the Notes field. Add any information or special instructions that may be helpful when staff members hover over the rule in the Rules tree.

8 To add a condition, click the Add IF Condition Based On button. Opportunity rule conditions include Opportunity, Contact, Organization, and Rule Variables (if variables have been added), each with a drop-down menu containing the fields for the condition. (Rules for other object types have different menus for selecting conditions. See Choosing conditions for a description of the conditions for each object.)

Note You might decide you want the rule's actions to apply to all opportunities. In that case, you can create a rule that has only actions, but no conditions. The actions must be added to the Then clause.

a Select Opportunity, Contact, Organization, or Rule Variables to display the drop-down menu of fields, and select the field for the condition. (This example uses Contact with Service State as the selected field because the intention is to identify contacts who have entered the system through customer support.)

b Click Select Operator and select the operator that applies to the field you selected. (In this example, the operator is "equals." Different operators appear in the Select Operator drop-down menu when you select different fields.) See Choosing operators for operator descriptions.



c Enter the value. Different fields have different values. For descriptions of the values for each field in the different types of rules, see Choosing conditions.

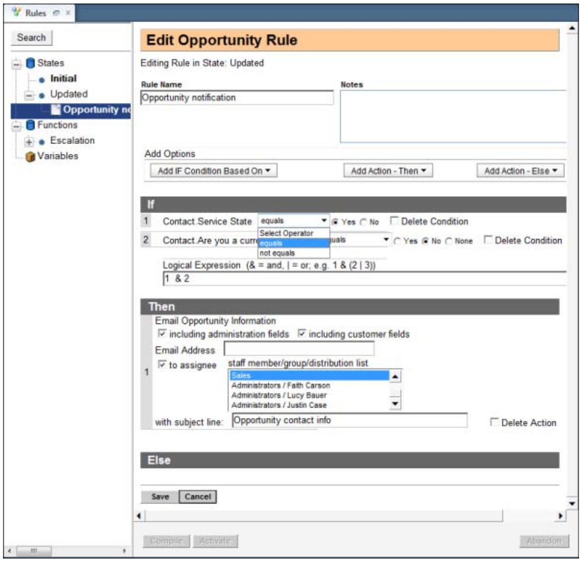
9 To add another condition to the rule, repeat step 8. You can require that only one of the conditions be met before the rule action is executed, that all of them are met, or that some combination is required. To understand the relationships when a rule contains multiple conditions, see Editing logical expressions.

In this example, a second condition using a contact custom field called "Are you a current customer?" is added, and the field is set equal to No. This identifies customers who have expressed enough interest to call customer support, but who are not yet contacts.

Note To delete a condition after you have added it to a rule, select the Delete Condition check box. The editor is refreshed.

10 Click the Add Action–Then button to choose the action that will be executed if the conditions are met. In this example, the action is sending an email to a sales manager. See Choosing actions for a description of the actions for each object type.

11 Select the To Assignee check box. You will also need to select a staff member, group or distribution list from the drop down. For example, to send the opportunity email to Sales, scroll down and select Sales.



12 To add an action to the Else clause, click the Add Action–Else button and select an action. For example, contacts that do not match the rule's conditions have an Opportunities or Outreach state or are already contacts. In that case, you might want to add an action that sends these contacts a survey to determine customer satisfaction.

Note You can delete an action after adding it to a rule by selecting the Delete Action check box. The editor is refreshed.

13 To add more actions to the rule, repeat step 10 or 11, depending on whether you want to add the action to the Then or the Else clause.

14 Click the Save button to save the rule. If the rule is successfully saved, it appears in the Rules tree under the appropriate state or function. If the save is not successful, a message prompts you to replace an invalid value or add a missing value.

Note Rule validation prevents saving meaningless rules. For example, a rule with no condition automatically executes the actions in the Then clause. If the rule also contains an Else clause, the rule is invalid because a non-existent condition cannot be unmatched. Rules with no action are also invalid.

Choosing conditions

The conditions of a rule comprise its "if" statement. If these conditions are met, then perform the action specified in the rule. Examples of conditions include "If the contact's state equals Montana," "If the incident's customer thread contains 'warranty'," or "If the forecast for the opportunity is greater than $5,000." The basic form of a condition is "If [this object] [has this relationship to] [the basis for comparing the object]."

Tip It is not necessary to add conditions to a rule. If, for example, you want the rule's action to be applied to all objects, simply do not add any condition to the rule.

A condition contains these primary elements:

- **Field**—The field is the element you want to consider in the rule. In the previous examples, the fields are state, customer thread, and forecast. Each type of rule (answer, contact, incident, chat, opportunity, organization, Offer Advisor, and task) has a set of fields that are used to add conditions for its rules.
- **Operator**—The operator is the relationship between the field and the value. In the preceding examples, the operators are equals, contains, and greater than. The selection of operators varies with the field. Some are simply "equals" and "not equals," while others express more complex relationships. See Choosing operators.
- **Value**—The value is the comparison you want to make with the field. In the examples, the values are Montana, warranty, and $5,000. The format of the value changes, depending on the field. You might select a menu option, type a string of text, or select a check box or radio button to define the value.

The fields are organized according to their type. In the first example ("If the contact's state equals Montana"), the "state" field is a contact field. The second example has the field "customer thread," which is an incident field, and the third example's field, "forecast," is an opportunity field.

When you click the Add IF Condition Based On button, a list of field types specific to the type of rule appears, each with a drop-down menu of the available fields. For example, contact rules let you select Contact and Organization fields, while incident rules let you select Incident, Contact, and Organization fields. The following table lists the available field types for each rule base.

Table 34: Field Types for Rule Bases

Rule Base	Field Types
Answer	• Answers
Chat	• Incident • Contact • Organization
Contact	• Contact • Organization
Incident	• Incident • Contact • Organization
Opportunity	• Opportunity • Contact • Organization
Organization	• Organization
Offer Advisor	• Incident • Contact • Organization • Purchased Products
Task	• Tasks • Opportunity • Incident • Answers • Contact • Organization

Some conditions depend on how you have configured your site. Customizable menu items, such as products, categories, and dispositions, appear as conditions only if they have been added. If the rules engine does not detect the presence of customizable menu items, custom fields, and other items, such as SLAs, mailboxes, Outreach emails and mailings, and Feedback surveys, they do not appear in the list of conditions. If you add them while you create rules, you must close the Rules editor and reopen it in order for them to display.

Note You can add items to a customizable menu that already has items in it without needing to close the Rules editor for them to be visible.

In addition to the fields that are specific to each type of rule, all rules can use rule variables for rule conditions. If no variables have been defined in the rule base, the Rule Variables field type is disabled.

Relative time conditions

Several rule conditions let you select a date and time. For example, you might want to add a rule with the condition "If the task due date is within the range from April 1 to April 30." The following conditions allow date/time selection.

- Banner Updated for answers, contacts, incidents, opportunities, and organizations
- Acquired and Created for contact rules
- Created, Updated, Initial Contact, Forecast Close, Date Closed, Lost Date, and Recall for opportunity rules
- Acquired for organization rules
- Purchased Products Date Purchased for Offer Advisor rules
- Completed Date, Created, Updated, Due Date, Planned Completion Date, and Start Date for task rules

The ability to set a condition based on a specific date and time (whether that date/time value is before, after, equal to, or within a range you specify) is a useful tool. However, there may be times when you want to set a relative date/time value. For example, you may want a condition "If the task due date is less than 8 hours from now." In that case, you can select a relative time for the rule's condition. Relative time calculates the number of minutes or hours from the current time or from a specific event, such as time created or time updated.

The following procedure shows you how to set a relative time condition using a task's due date, but the procedure is the same for setting other relative time conditions.

To select the relative time condition using a task's due date

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the Task button on the ribbon.

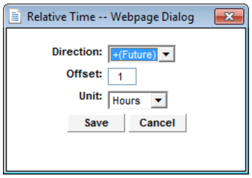
4 Click the Edit button on the ribbon.

5 Right-click the rule you want to add the relative time condition to and select Edit.

6 Click the Add IF Condition Based On button and select Tasks > Due Date. In this example, assume you want to send a reminder email to staff members who have tasks due within the next eight hours.

7 Select the Relative check box to set the condition based on a time relative to the task's due date.

8 Click the drop-down menu above the Relative check box. The Relative Time window opens.



9 Complete the fields on the Relative Time window.

  a Click the Direction drop-down menu and select + (Future).
  b Type 8 in the Offset field.
  c Click the Unit drop-down menu and select Hours.
  d Click the Save button to save your settings and close the Relative Time window.

10 Click the drop-down menu next to the condition's Relative check box and select what the time you specified in step 9 is relative to. For instance, if you wanted the rule to be triggered eight hours after a task is created, you could select *Tasks.Created* from the menu. For our example, you can leave the menu set to the default value of "Now," since you want this rule to be triggered eight hours after any event occurs that causes the rule to be checked (such as when a task is edited).

11 Click the Select Operator drop-down menu and select Less Than, since we want the rule to be triggered when a task's due date is less than the relative time we specified.

With this type of condition, you must add an action before you can save the rule. See Choosing actions.

Custom fields and masks in conditions

Before reviewing the conditions for each type of rule, it is important to understand how custom fields are handled and how to enter conditions for fields that use masks.

If you have added custom fields for contacts, organizations, incidents, answers, or opportunities, they will appear in the condition drop-down menu. See Adding and editing custom fields.

Some fields have masks that let you define a format for a field to ensure that staff members enter them correctly. For example, you might want to define a custom field for a catalog number that uses a mask to force the correct sequence of letters, numbers, and formatting characters.

Important When you add a condition for any field that uses a mask, you must omit the formatting characters when you enter the value for that condition. For example, if you add a custom field with the ULF-M#M#, the entered data consists of an uppercase alphabetic character, a hyphen, and two numbers, such as M-63. If you want to create a rule using the custom field as a condition, the value for the condition must be "M63" and not "M-63" with the hyphen.

Previous fields in conditions

Many conditions have "Previous" fields, including, for example, Previous Status, Previous Escalation Level, Previous Assigned, Previous Group, and Previous Strategy Hierarchy. These fields all contain the value currently stored in the database. The field reflects the value when the object is added or updated or when rules processing begins. The purpose of this field is to allow detection of any changes that occur to this field.

Conditions for each rule base

The following table links describe conditions for the objects in each type of rule base. The first column lists the field, the second column describes what the field refers to, and the third column describes how to select the value, based on its format. For example, formats may include text that you type or a menu option you select. (When the format of a value consists of menu selections, you can choose multiple options by pressing **Ctrl** while making each selection. Or if the value displays check boxes, you can make multiple selections.)

Important Some conditions depend on how you have configured your site. Customizable menu items, such as products, categories, and dispositions, appear as conditions only if they have been added. If the rules engine does not detect the presence of customizable menu items, custom fields, and other items, such as SLAs, mailboxes, Outreach emails and mailings, and Feedback surveys, they do not appear in the list of conditions. If you add them while you create rules, you must close the Rules editor and reopen it in order for them to display.

You can add items to a customizable menu that already has items in it without needing to close the Rules editor for them to be visible.

In addition to the fields that are specific to each type of rule, all rules can use rule variables for rule conditions. If no variables have been defined in the rule base, the Rule Variables field type is disabled.

- Click here for answer conditions.
- Click here for contact conditions.
- Click here for incident conditions.
- Click here for opportunity conditions.
- Click here for organization conditions.
- Click here for purchased product conditions.
- Click here for task conditions.

Answer conditions

When choosing answer conditions, select from the following fields and enter the value in the specified format.

Table 35: Conditions for Answers

Field	Description	Selecting the Value
Answer Access	The answer’s access level.	Select an access level from the menu.
Status	The answer’s status.	Select a status from the menu.
Previous Status	The answer’s previous status.	Select a status from the menu.

Table 35: Conditions for Answers (Continued)

Field	Description	Selecting the Value
Assigned	The staff account in the answer’s Assigned field.	Select a staff account from the menu.
Group	The group in the answer’s Assigned field.	Select a group from the menu.
Previous Assigned	The answer’s previous assigned staff account.	Select a staff account from the menu.
Previous Group	The answer’s previous group.	Select a group from the menu.
Language	The selected language installed from a language pack.	Select a language from the menu.
Escalation Level	The answer’s escalation level. **Note:** This field is set through rules in the database and cannot be edited in the record. To view an answer’s escalation level, click the Info button on the ribbon when the answer is open.	Select an escalation level from the menu.
Previous Escalation Level	The answer’s previous escalation level.	Select an escalation level from the menu.
Updated From	The source of the most recent answer update.	Select the check box that indicates where the answer was most recently updated.
Banner Note	The information entered by a staff member in the banner.	Type text in the field.
Banner Flag	The importance of the banner.	Select an importance level from the menu.
Banner Updated	The date and time the banner was last updated.	Click the drop-down menu to open the current month’s calendar and select a date and time the banner was updated. Or select a relative time.
Banner Updated By	The staff member who last updated the banner.	Select a staff member from the menu.

Table 35: Conditions for Answers (Continued)

Field	Description	Selecting the Value
Product	Products added on the Products/Categories/Disposition editor. For information about adding products, see Adding and editing products, categories, and dispositions.	Select the appropriate product check boxes.
Category	Categories added on the Products/Categories/Disposition editor. For information about adding categories, see Adding and editing products, categories, and dispositions.	Select the appropriate category check boxes.

Contact conditions

When choosing contact conditions, select from the following fields and enter the value in the specified format.

Table 36: Conditions for Contacts

Field	Description	Value Format
Last Name	The contact's last name.	Type text in the field.
First Name	The contact's first name.	Type text in the field.
Source	The source of the contact.	Select the check box for the source of the contact.
Updated From	The source of the most recent contact update.	Select the check box that indicates where the contact was most recently updated.
Email–Primary	The contact's email address.	Type text in the field. **Note:** The maximum number of characters allowed in this field is 80.

Table 36: Conditions for Contacts (Continued)

Field	Description	Value Format
Email–Primary Invalid	Whether the contact's primary email address is determined to be invalid as a result of bounced email processing.	Select the Yes or No radio button.
Email–Alternate #1	An alternate email address.	Type text in the field. **Note:** The maximum number of characters allowed in this field is 80.
Email–Alternate #1 Invalid	Whether the contact's first alternate email address is determined to be invalid as a result of bounced email processing.	Select the Yes or No radio button.
Email–Alternate #2	A second alternate email address.	Type text in the field. **Note:** The maximum number of characters allowed in this field is 80.
Email–Alternate #2 Invalids	Whether the contact's second alternate email address is determined to be invalid as a result of bounced email processing.	Select the Yes or No radio button.
Login	The contact's user ID.	Type text in the field.
Contact Type	Any contact type you have added. See Adding and editing contact types for information about adding contact types.	Select a contact type from the menu.
Marketing Organization Name	The name of the organization as it is used by Outreach.	Type text in the field.
Street	The contact's street address.	Type text in the field.
City	The contact's city.	Type text in the field.
State/Province	The contact's state or province.	Select a state or province from the menu.
Country	The contact's country.	Select a country from the menu.
Postal Code	The contact's postal code.	Type text in the field.

Table 36: Conditions for Contacts (Continued)

Field	Description	Value Format
Office Phone	The contact's office phone number.	Type text in the field using any formatting characters that appear in the record.
Office Phone (Unformatted)	The contact's office phone number regardless of formatting characters.	Type a numeric string in the field.
Mobile Phone	The contact's mobile phone number.	Type text in the field using any formatting characters that appear in the record.
Mobile Phone (Unformatted)	The contact's mobile phone number regardless of formatting characters.	Type a numeric string in the field.
Fax Phone	The contact's fax number.	Type text in the field using any formatting characters that appear in the record.
Assistant Phone	The phone number for the contact's assistant.	Type text in the field using any formatting characters that appear in the record.
Assistant Phone (Unformatted)	The contact's assistant's office phone number regardless of formatting characters.	Type a numeric string in the field.
Home Phone	The contact's home phone number.	Type text in the field using any formatting characters that appear in the record.
Home Phone (Unformatted)	The contact's home phone number regardless of formatting characters.	Type a numeric string in the field.
Service State	The Service check box selection for the **State**.	Select the Yes or No radio button.
Opportunities State	The Opportunity Tracking check box selection for the State.	Select the Yes or No radio button.
Outreach State	The Outreach check box selection for the State.	Select the Yes or No radio button.

Table 36: Conditions for Contacts (Continued)

Field	Description	Value Format
Disabled	The Disabled Flag status on the contact record.	Select the Yes or No radio button.
Global Opt-in	The contact's decision to receive mailings.	Select the Yes or No radio button.
Survey Opt-in	The contact's decision to participate in surveys.	Select the Yes or No radio button.
Email Format Preference	The contact's preference for email format (text, HTML, multipart, or unspecified).	Select a mail type from the menu.
Acquired	The date the contact was acquired as a customer.	Click the drop-down menu to open the current month's calendar and select a date the contact was acquired. Use the arrows at the top to change the month if necessary.
Created	The date the contact record was created.	Click the drop-down menu to open the current month's calendar and select a date the contact was acquired.
Banner Note	The information entered by a staff member in the banner.	Type text in the field.
Banner Flag	The importance of the banner.	Select an importance level from the menu.
Banner Updated	The date and time the banner was last updated.	Click the drop-down menu to open the current month's calendar and select a date and time the banner was updated. Or select a relative time.
Banner Updated By	The staff member who last updated the banner.	Select a staff member from the menu.

Incident conditions

When choosing incident conditions, select from the following fields and enter the value in the specified format.

Incident rules use all fields with the exception of Chat Queue ID. Fields used by the other rule types (chat, Offer Advisor, and task rules) are indicated in the fields' descriptions.

Table 37: Conditions for Incidents

Field	Description	Value Format
Customer Thread	All customer threads in the incident.	Type text in the field.
Staff Thread	All staff response threads in the incident.	Type text in the field.
Proposed Response	The incident's Proposed Response field (uncommitted response thread).	Type text in the field.
Reference #	The incident's Reference # field. (Also used in task rules.)	Type text in the field.
Subject	The subject of an incoming email or incident. This also refers to the Subject field on the Ask a Question page or API incident source. (Also used in task rules.)	Type text in the field.
Status	The incident's status. (Also used in task rules.)	Select a status from the menu.
Previous Status	The incidents's previous status.	Select a status from the menu.
Previous Assigned	The staff member previously assigned to the incident.	Select a staff account from the menu.
Previous Group	The group previously assigned to the incident.	Select a group from the menu.
Channel	The source of an incoming incident or outgoing response. Channels are grouped as standard email channels (CSS Email, MA Email, Phone, Fax, Post, CSS Web, MA Web, Chat, and Email) and social channels (Community, Twitter, YouTube, RSS feeds, and Facebook).	Select a channel from the menu.

Table 37: Conditions for Incidents (Continued)

Field	Description	Value Format
Created By	The staff member who added the incident. (Also used in task rules.)	Select a staff account from the menu.
Assigned	The staff member assigned to the incident. (Also used in task rules.)	Select a staff account from the menu.
Product	Products added on the Products/Categories/Dispositions editor. For information about adding products, see Adding and editing products, categories, and dispositions. (Also used in chat, Offer Advisor, and task rules.)	Select the appropriate product check boxes.
Category	Categories added on the Products/Categories/Dispositions editor. For information about adding categories, see Adding and editing products, categories, and dispositions. (Also used in chat, Offer Advisor, and task rules.)	Select the appropriate category check boxes.
Disposition	Dispositions added on the Products/Categories/Dispositions editor. For information about adding dispositions, see Adding and editing products, categories, and dispositions. (Also used in task rules.)	Select a disposition from the menu.
Language	The selected language installed from a language pack. (Also used in chat and task rules.)	Select a language from the menu.
Created	The time the incident was added.	Type text in the field using the format hh:mm or use the up or down arrows to scroll to a time. **Note:** This condition can use the unique "in/not in response interval" operators. See Choosing operators.

Table 37: Conditions for Incidents (Continued)

Field	Description	Value Format
Group	The group assigned to the incident. (Also used in task rules.)	Select a group from the menu.
Interface	The interface of the Ask a Question, incident, or API incident source. (Also used in chat, Offer Advisor, and task rules.)	Select an interface from the menu. **Note:** Use this field to apply a rule to a specific interface. For information about applying rules when multiple interfaces have been implemented, see Multiple Interfaces.
Mailbox	The Service and Outreach mailboxes that have outgoing email enabled. (Also used in task rules.)	Select a mailbox from the menu.
Customer SmartSense	The SmartSense rating calculated for all customer threads in the incident. See SmartSense Emotive Rating.	Select a SmartSense rating from the menu.
Staff SmartSense	The SmartSense rating calculated for all staff response threads in the incident. See SmartSense Emotive Rating.	Select a SmartSense rating from the menu.
Email Header	Text in the header of an email that adds an incident. **Note:** EGW_SAVE_EMAIL_HEADERS (RightNow Common > Service Modules > RightNow Email) must be enabled for this condition to appear on the drop-down menu. Only current header information is available for rules processing. If the incident header is updated by an agent or customer, the original header information is no longer available. (Also used in task rules.)	Type text in the field.
Source	The source of the incident.	Select the check box for the source of the incident.

Table 37: Conditions for Incidents (Continued)

Field	Description	Value Format
Updated From	The source of the most recent incident update.	Select the check box that indicates where the incident was most recently updated.
Escalation Level	The incident's escalation level. (Also used in task rules.) **Note:** This field is set through rules in the database and cannot be edited in the record. To view an incident's escalation level, click the Info button on the ribbon when the incident is open.	Select an escalation level from the menu.
Previous Escalation Level	The incident's previous escalation level.	Select an escalation level from the menu.
Queue ID	The incident's assigned queue. See [Adding and editing incident queues](). (Also used in task rules.)	Select a queue ID from the menu.
Mailing ID	The mailing that prompted a response, thereby adding the incident. This field appears only if you have created mailings in Outreach. See [Creating mailings](). (Also used in task rules.)	Select a mailing from the menu.
Response Sent	The agent selection in the Send Response check box when solving the incident.	Select the Yes or No radio button.
Last Survey Score	The score from the most recent survey associated with this incident. (Also used in task rules.)	Type a numerical value in the field.
Severity	The incident's severity. See [Adding and editing incident severities](). (Also used in task rules.)	Select an incident severity option from the menu.
Banner Note	The information entered by a staff member in the banner.	Type text in the field.
Banner Flag	The importance of the banner.	Select an importance level from the menu.

Table 37: Conditions for Incidents (Continued)

Field	Description	Value Format
Banner Updated	The date and time the banner was last updated.	Click the drop-down menu to open the current month's calendar and select a date and time the banner was updated. Or select a relative time.
Banner Updated By	The staff member who last updated the banner.	Select a staff member from the menu.
Incoming Mailbox	The Service and Outreach mailboxes that have incoming email enabled.	Select a mailbox from the menu.
SLA Instance ID	The SLA that has been applied to the incident. See Creating SLAs.	Select an SLA from the menu.
Chat Queue ID	The incident queues for chat rules. See Adding and editing chat session queues.	Select a Chat Queue ID from the menu.

Opportunity conditions

When choosing opportunity conditions, select from the following fields and enter the value in the specified format.

Table 38: Conditions for Opportunities

Field	Description	Value Format
Status	The opportunity's status (lead, reject, active, closed, lost, inactive, dead, or unspecified).	Select a status from the menu.
Previous Status	The opportunity's previous status.	Select a status from the menu.
Escalation Level	The opportunity's escalation level. **Note:** This field is set through rules in the database and cannot be edited in the record. To view an opportunity's escalation level, click the Info button on the ribbon when the opportunity is open.	Select an escalation level from the menu.
Previous Escalation Level	The opportunity's previous escalation level.	Select an escalation level from the menu.

Table 38: Conditions for Opportunities (Continued)

Field	Description	Value Format
Assign	The staff member assigned to the opportunity.	Select a staff account from the menu.
Previous Assigned	The staff member previously assigned to the opportunity.	Select a staff account from the menu.
Interface	The interface where the opportunity was added.	Select an interface from the menu.
Name	The name of the opportunity.	Type text in the field.
Source	The source of the opportunity.	Select a check box for the source of the opportunity.
Updated From	The source of the most recent opportunity update.	Select the check box that indicates where the opportunity was most recently updated.
Strategy Hierarchy	The strategy hierarchy for the opportunity. See Adding and editing strategies.	Select a check box for the opportunity's strategy hierarchy.
Previous Strategy Hierarchy	The opportunity's previous strategy hierarchy.	Select a check box for the opportunity's previous strategy hierarchy.
Created	The date and time the opportunity was added.	Click the drop-down menu to open the current month's calendar and select a Created date. Use the arrows at the top to change the month if necessary.
Created By	The staff member who added the opportunity.	Select a staff account from the menu.
Updated	The date and time the opportunity was updated.	Click the drop-down menu to open the current month's calendar and select an Updated date. Or select a relative time.
Updated By	The staff member who updated the opportunity.	Select a staff account from the menu.

Table 38: Conditions for Opportunities (Continued)

Field	Description	Value Format
Manager Forecast	The manager forecast for the opportunity.	Click the drop-down menu and type a value in the Amount field. Click the Currency drop-down menu and select the currency.
Manager Forecast Committed	The Yes or No selection in the Manager Commit field.	Select the Yes or No radio button.
Rep Forecast	The sales representative's forecast for the opportunity.	Click the drop-down menu and type a value in the Amount field. Click the Currency drop-down menu and select the currency.
Rep Forecast Committed	The Yes or No selection in the Rep Commit field.	Select the Yes or No radio button.
Closed Value	The value the opportunity closed at.	Click the drop-down menu and type a value in the Amount field. Click the Currency drop-down menu and select the currency.
Summary	Information entered in the Summary text field of the opportunity.	Type text in the field.
Territory	The territory for the opportunity. See Adding and editing territories for information about adding territories.	Select a check box for the opportunity's territory.
Initial Contact	The date of the opportunity's initial contact.	Click the drop-down menu to open the current month's calendar and select the date of initial contact.
Forecast Close	The date the opportunity is forecasted to close.	Click the drop-down menu to open the current month's calendar and select a date when the opportunity is forecasted to close.

Table 38: Conditions for Opportunities (Continued)

Field	Description	Value Format
Date Closed	The date the opportunity closed.	Click the drop-down menu to open the current month's calendar and select a date when the opportunity closed.
Cost of Sale	The total cost of a sale.	Click the drop-down menu and type a value in the Amount field. Click the Currency drop-down menu and select the currency.
Returned Value	The value of products returned by a customer.	Click the drop-down menu and type a value in the Amount field. Click the Currency drop-down menu and select the currency.
Last Survey Score	The score from the most recent survey associated with this opportunity.	Type a numerical value in the field.
Lost Date	The date the opportunity status was set to Lost.	Click the drop-down menu to open the current month's calendar and select the date when the opportunity was lost.
Recall	The date the contact for the opportunity should be called again.	Click the drop-down menu to open the current month's calendar and select the date for calling the contact for the opportunity.
Lead Rejection	The lead rejection reason selected by the staff member for the opportunity. See Adding and editing lead rejection types.	Select a lead rejection reason from the menu.
Lead Rejection Description	The text stored in the lead rejection reason field in the opportunity.	Type text in the field.
Win/Loss Factor	The win/loss factor selected by the staff member for the opportunity. See Adding and editing win/loss reasons.	Select a win/loss factor from the menu.

Table 38: Conditions for Opportunities (Continued)

Field	Description	Value Format
Win/Loss Description	The text entered as the win/loss description in the opportunity.	Type text in the field.
Banner Note	The information entered by a staff member in the banner.	Type text in the field.
Banner Flag	The importance of the banner.	Select an importance level from the menu.
Banner Updated	The date and time the banner was last updated.	Click the drop-down menu to open the current month's calendar and select a date and time the banner was updated. Or select a relative time.
Banner Updated By	The staff member who last updated the banner.	Select a staff member from the menu.

Organization conditions

When choosing organization conditions, select from the following fields and enter the value in the specified format.

Note Two default organization address types are included by default: Billing and Shipping. When selecting the Street, City, State/Province, Country, and Postal Code fields under Organization, you can see separate entries for each address type, as well as for any custom organization address types that have been added. See Adding and editing organization address types.

Table 39: Conditions for Organizations

Field	Description	Value Format
Organization Name	The name of the organization.	Type text in the field.
Source	The source of the organization.	Select the check box for the source of the organization.

Table 39: Conditions for Organizations (Continued)

Field	Description	Value Format
Updated From	The source of the most recent contact update.	Select the check box that indicates where the organization was most recently updated.
Street	The organization’s street address.	Type text in the field.
City	The organization’s city.	Type text in the field.
State/Province	The organization’s state or province.	Select a state or province from the menu.
Country	The organization’s country.	Select a country from the menu.
Postal Code	The organization’s postal code.	Type text in the field.
Service State	The Service check box selection for the **State**.	Select the Yes or No radio button.
Opportunities State	The Opportunity Tracking check box selection for the State.	Select the Yes or No radio button.
Outreach State	The Outreach check box selection for the State.	Select the Yes or No radio button.
Industry Type	The organization’s industry. See Adding and editing industry types.	Select an industry type from the menu.
Acquired	The date the organization was acquired as a customer.	Click the drop-down menu to open the current month’s calendar and select a date the organization was acquired. Use the arrows at the top to change the month if necessary.
Banner Note	The information entered by a staff member in the banner.	Type text in the field.
Banner Flag	The importance of the banner.	Select an importance level from the menu.

Table 39: Conditions for Organizations (Continued)

Field	Description	Value Format
Banner Updated	The date and time the banner was last updated.	Click the drop-down menu to open the current month's calendar and select a date and time the banner was updated. Or select a relative time.
Banner Updated By	The staff member who last updated the banner.	Select a staff member from the menu.

Purchased products conditions for Offer Advisor rules

Offer Advisor rules have a single purpose: to define targets—that is, groups of customers—that meet the conditions you specify. Regardless of the condition you select, the default action is always "Contact will match this target."

In addition to incident, contact, and organization conditions for Offer Advisor rules, you can also select a unique Purchased Products condition. This condition is a combination of three conditions, all of which must be met by a purchased product entry in order for the Purchased Products condition to be met. These criteria are product, price, and date purchased.

When choosing conditions for an Offer Advisor rule, select from the following fields and enter the value in the specified format.

Note Offer Advisor must be enabled on your site for this object type to appear. Contact your Oracle account manager.

Table 40: Conditions for Purchased Products

Field	Description	Value Format
Product	Sales products purchased by the customer. See Adding and editing sales products.	Select a product from the menu.
Price	The dollar value of a customer's purchases.	Click the drop-down menu and type a value in the Amount field. Click the Currency drop-down menu and select the currency.

Table 40: Conditions for Purchased Products (Continued)

Field	Description	Value Format
Date Purchased	The date of a customer's purchases.	Click the drop-down menu to open the current month's calendar and select a purchase date. Use the arrows at the top to change the month if necessary.

Task conditions

When choosing task conditions, select from the following fields and enter the value in the specified format.

Table 41: Conditions for Tasks

Field	Description	Value
Status	The task's status.	Select a status from the menu.
Previous Status	The task's previous status.	Select a status from the menu.
Assign	The staff member the task is assigned to.	Select a staff account from the drop-down menu.
Previous Assigned	The staff member previously assigned to the task.	Select a staff account from the menu.
Completed Date	The date the task was completed.	Click the drop-down menu to open the current month's calendar and select a task completion date. Use the arrows at the top to change the month if necessary.
Created	The date the task was added.	Click the drop-down menu to open the current month's calendar and select the date the task was added.

Table 41: Conditions for Tasks (Continued)

Field	Description	Value
Updated	The date the task was last updated.	Click the drop-down menu to open the current month's calendar and select the date the task was updated.
Updated From	The source of the most recent task update.	Select the check box that indicates where the task was most recently updated.
Due Date	The date the task is due.	Click the drop-down menu to open the current month's calendar and select the task's due date.
Escalation Level	The task's escalation level. **Note:** This field is set through rules in the database and cannot be edited in the record. To view a task's escalation level, click the Info button on the ribbon when the task is open.	Select an escalation level from the menu.
Previous Escalation Level	The task's previous escalation level.	Select an escalation level from the menu.
Name	The name of the task.	Type the task's name in the field.
Percent Complete	The percentage of the task that is complete.	Type a value in the field.
Planned Completion Date	The date the task is scheduled to be completed.	Click the drop-down menu to open the current month's calendar and select the planned completion date for the task.
Priority	The task's priority.	Select a priority from the menu.
Start Date	The date the task is started.	Click the drop-down menu to open the current month's calendar and select a start date for the task.

Table 41: Conditions for Tasks (Continued)

Field	Description	Value
Type	The type of task, which means the type of record the task is associated with.	Select a task type from the menu.

Choosing operators

An operator expresses the relationship between a condition's field and its value, determining how the field is applied to the value of the condition. For example, in the condition "If an answer's assignment equals customer support," the operator is "equals." Each field has its own set of operators, depending on what is logical for that field. A rule with the condition "If an answer's assignment is greater than or equal to customer support," for example, has no relevance and cannot be applied to an answer.

The following table describes the operators used in business rules.

Table 42: Operators Description

Operator	Description
equals	The field matches the value exactly, including case.
not equals	The field does not match the value.
is null	The field does not contain a value.
is not null	The field contains a value.
less than	The field is less than the value.
less than or equal to	The field is less than or equal to the value.
greater than	The field is greater than the value.
greater than or equal to	The field is greater than or equal to the value.
in range	The field is within the range you specify. You must indicate a beginning and ending value when you select this operator.
not in range	The field is not within the range you specify. You must indicate a beginning and ending value when you select this operator.

Table 42: Operators Description (Continued)

Operator	Description
contains	The field matches only text string values. This operator uses word stemming, but only in the Summary field, Subject field, and incident threads. Stemmed searches are not case sensitive. For example, if you want the rule to apply to different forms of a word, such as singular, plural, or a different verb tense, select "contains" and enter the singular form as the value. When you include multiple words in the value, the rule applies when the text strings contain all the words, which do not have to occur sequentially.
does not contain	The field does not contain the text string in the value. This operator uses word stemming, but only in the Summary field, Subject field, and incident threads. Stemmed searches are not case sensitive. **Note:** Word stemming is not supported for custom fields, only text strings.
matches regular expression	The field matches the regular expression entered in a text string value. **Note:** The regular expression compiler validates the expression. If an error code is returned, the rule is not saved. For information about regular expressions, which can allow greater matching flexibility, see Regular Expressions.
does not match regular expression	The field does not match the regular expression entered in a text string value. **Note:** The regular expression compiler validates the expression. If an error code is returned, the rule is not saved. For information about regular expressions, which can allow greater matching flexibility, see Regular Expressions.
in response interval	This operator is used only with the Incident Created condition for incident rules to indicate that the incident was added within normal working hours. That is, the incident was added within the response requirements of the SLA associated with the incident or within the default response requirements if no SLA is associated with the incident. The data in the condition's hh:mm field is not used when this operator is selected.

Table 42: Operators Description (Continued)

Operator	Description
not in response interval	This operator is used only with the Incident Created condition for incident rules to indicate that the incident was not added within normal working hours. That is, the incident was added outside the response requirements of the SLA associated with the incident or outside the default response requirements if no SLA is associated with the incident. The data in the condition's hh:mm field is not used when this operator is selected.
modified this edit	This operator indicates that the field's value has been changed during the current edit of the object. This change can occur manually as a result of staff member or customer edits or automatically through a utility or rule action. All values use this operator.
not modified this edit	This operator indicates that the field's value was not changed during the current edit of the object. All values use this operator.

Editing logical expressions

Logical expressions use AND (&) and OR (|) to define the relationship between a rule's conditions. The following shows an example of a logical expression in an incident rule.

To edit the logical expression after you have defined conditions, simply click in the Logical Expressions field and make the changes. Use logical expressions when you want to link the conditions in the following ways.

- You want all conditions to apply in order for the rule to initiate its action. Use AND (&) to link the conditions. The expression 1 & 2 & 3 means that the rule's action occurs only when all three conditions are met.

Note Because the default logical expression is AND, it is not necessary to use a logical expression when you want all conditions to apply. If you delete the logical expression in this case, the conditions remain linked by AND.

- You want any one of the conditions to apply in order for the rule to initiate action. Use OR (|) to link the conditions. The expression 1 | 2| 3 means that the rule's action occurs if any one of the three conditions are met.

- You want to group the conditions. Using parentheses, you can create an expression such as 1 & (2 | 3). This expression requires that condition 1 be met and that either condition 2 or condition 3 must also be met.

Note If you do not use parentheses, AND always has precedence over OR, which determines the order of execution. In that case, 1 & 2 | 3 requires that both conditions 1 and 2 be met or that condition 3 be met.

Choosing actions

The condition is the "if" part of a rule's "if-then" statement, and the action is the "then" part. The action specifies what occurs to the object (answer, contact, incident, chat, opportunity, organization, target, or task) when the condition is met.

Actions are also used in the optional **Else clause** when you want to specify what actions should occur when the object does not match the rule's conditions.

Every action that is available in an object's Then clause is also available for the Else clause. An action that is restricted to a single use in the Then clause (for example, the action of setting an incident status can be used only once) is also restricted to a single use in the Else clause, although you can use the same action in both clauses of a rule.

Before you define actions for rules, review the following descriptions to learn how actions are executed. This section also describes actions that move an object from one state to another, call functions, and stop rule processing.

Action execution

The rules engine can execute actions immediately when a record is saved, or it can defer the action until a later time. All actions that modify an object (answer, contact, incident, chat, opportunity, organization, target, or task) are executed immediately upon saving the record. For example, an action can change the status of an incident, set an answer access level, or set a custom field. These actions are executed before the next condition is evaluated. Actions that transition to another state or function or those that stop processing are also executed immediately.

All other actions are passed to the API as deferred actions. Some of these delayed actions are executed immediately after the rules engine finishes processing, while others are flagged to be handled later. Examples of actions that are executed immediately after rules processing include applying SLA instances and sending email. Events such as escalation are scheduled to be handled later.

You must select an object event handler from the Execute Object Event Handler drop-down menu to trigger an external event action.

Note For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. See Adding object event handlers.

Important External events have been deprecated and might be permanently removed in a future release. The Execute External Event option was disabled in the February 2015 release.

When business rules are triggered (by adding or updating an object), the rules engine processes every rule in the initial state, and continues processing until it reaches the last rule, regardless of how many rules have already been matched. Unless otherwise directed, the rules engine processes only the rules in the initial state. To process rules in other states or functions, you must set an action for one or more rules in the initial state to transition to another state or function. The following actions are available for all rule bases (assuming that additional states and functions exist to be transitioned to).

- **Stop Processing Rules**—Stops processing, regardless of how many rules remain in the state. Use this action when you do not want the object compared to any more rules in this or any other state.

  When you select the Stop Processing Rules action, the rules engine stops evaluating the object against the rules base. However, the action does not prevent future processing of the object. When the object is updated, the rules engine will process it again. If you want to prevent the object from being processed in future updates, create a state that has no rules and transition the object into it.
- **Call Function**—Transitions to the function you specify and processes the rules in the function. Once the actions in the function rules are executed, control returns to the next action in the rule that called the function.

  If you call a function that contains a rule with either an action to stop processing or to transition to another state, the rules engine never returns to the rule that called the function. For example, assume the calling rule contains two actions in the following order: 1) call a function containing a rule with a stop processing action, and 2) assign the incident to a specific queue. In this example, the queue assignment is never made because the prior action stopped processing.
- **Transition State and Stop**—Transitions to the state you specify and stops processing. Use this action when you want the object moved from one state to another, such as from the Created state to the Updated state, but you do not want processing to con-

tinue. In effect, you are setting up the object for the next edit so rules processing starts at the appropriate state. For example, depending on your business process, you may want to set up a separate state for incidents that have been updated so they do not continue to be compared to rules in the initial state.

- **Transition State and Continue**—Transitions to the state you specify and continues processing all the rules in that state until all of those rules process (unless you add another action to stop processing, transition to another state, or call a function). Use this action when you want the object to continue to be compared to the rules in the state you transition to.

You can add certain actions without selecting a value. With this functionality, the rule actions are consistent with values that can be set to No Value in records. For example, you can save an incident without assigning it to a staff member (by selecting the No Value option). Actions that can be added without selecting a value (that is, the value is set to No Value) include:

- Set Product
- Set Category
- Set Disposition
- Set Mailbox
- Set Assigned
- Set Queue

Note Keep in mind, however, that you must assign a value to any required field. For example, if products and categories are required, you cannot select a No Value option to the Set Product action in a rule.

Action order

In general, the order of a rule's actions is unimportant. The exceptions are the Append Thread actions and the Do Not Send Response action.

Append Thread actions depend on order because the appended information is added to the outgoing email response in the same order that the rule's actions occur in the rule.

The following Append Thread to Response actions are added to the response thread in whatever order you specify in the rule's actions so that you can effectively format the outgoing email response.

- Append Response Template to Response Field
- Append Existing Solution (by Answer ID) to Response Field

- Append SmartAssistant Response to Response Field

Important If the Append Response to the Uncommitted Response Buffer action is used in conjunction with multiple Append Thread actions, all appended items are added to the uncommitted response rather than the incident thread. This does not apply to the Append Response Template to Notes Field action.

The Do Not Send Response action is used to prevent automatic incident update responses if you use a message system outside of Oracle Service Cloud to deliver your responses. The Do Not Send Response action should always be added as the last rule to ensure that it is applied to all responses. If it does not execute last, another rule could request a response causing an automatic response through Oracle Service Cloud.

Rule dependencies for Send actions

If you delete an email or survey that is used in a Send action in a contact, incident, or opportunity rule, you can still activate the rule base but the rules engine will not process the action. No error will be logged to indicate that the mailing or survey was not sent.

Setting custom fields and variables

You can define rule actions that set custom fields and variables. When a custom field or variable has a text field data type or a custom field has a text area data type, you can create a rule to perform any of the following actions on the custom field or variable.

- Set equal to a literal text string
- Prepend with a literal text string
- Append with a literal text string
- Set equal to the value of another custom field or variable

When you enter a text string, the system removes any leading or trailing spaces before it inserts the custom field or variable in the database. For example, if you set a custom field to the value **hello** and then add an action that appends the word **there** to the same field, the resulting value will be **hellothere**. To create spaces between the words, use quotation marks. In this example, set the custom field to **"hello"** and append **" there"** (with a space before the **t** in **there**) to get the result **hello there.**

Note Notice that the quotation marks are removed in the result. The quotation marks at the beginning and end of a string are removed, but any quotation marks that are embedded in the string will remain in the string.

Escalation actions

Escalation actions can help your organization track answers, incidents, opportunities, and tasks. You define the conditions that will schedule an object's escalation and what actions you want to occur when that escalation level is reached. Escalation is discussed in detail in Escalating answers, incidents, opportunities, and tasks.

Actions for rule bases

This section contains descriptions of the actions available for rules within each object type. The available actions depend on the rule's object type. The following four actions, available in all rule bases and described in Action execution, are not included in these tables.

- Stop Processing Rules
- Call Function
- Transition State and Stop
- Transition State and Continue

Important Some actions depend on items you have added. This includes customizable menu items, such as products, categories, and dispositions, as well as custom fields, SLAs, mailboxes, Outreach emails and mailings, and Feedback surveys. If you have not entered any menu options for incident severity, for example, "Severity" will not appear as an action for incident rules. You can add incident severity levels, but you must close the Rules editor in order for them to appear in the list of actions. If, however, you already have severity levels and add another one, it will appear without you needing to close the Rules editor.

- Click here for actions for answer rules.
- Click here for actions for contact rules.
- Click here for actions for incident rules.
- Click here for actions for chat rules.
- Click here for actions for opportunity rules.
- Click here for actions for organization rules.
- Click here for actions for Offer Advisor rules.
- Click here for actions for task rules.

Actions for answer rules

When choosing actions for an answer rule, select from the following fields.

Table 43: Actions for Answer Rules

Action	Description
Set Field	Select Set Field to set or change one of the following fields for an answer. The changes are evident when working with an answer. When you select a field for the action, make a selection from the menu options that appear.
Answer Access	Sets the Access Level field to the access level you select. To select multiple access levels, press **Ctrl** while making each selection.
Assigned	Sets the Assigned field to the staff account you select.
Status	Sets the Status field to the status you select.
Banner Flag	Sets the importance of the flag to the level you select from the drop-down menu and adds any text you type in the Banner Note field.
Set Custom Field	Select an answer custom field and set the value. **Note:** You must add an answer custom field to your site in order for it to display. See Adding and editing custom fields.
Set Variable	Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable's **data type**. **Note:** In order for variables to display, they must be added to the Rules tree. See Adding variables.
Email	Select this action to send the following email notifications.
Send Escalation Notification	Sends an escalation notification to the staff member, group, or distribution list you select. You can also select a check box to send the escalation notice to the staff person assigned to the answer. **Note:** If multiple recipients are selected, press **Ctrl** and click a recipient to add it to (or clear it from) the list of selected recipients.

Table 43: Actions for Answer Rules (Continued)

Action	Description
Execute Object Event Handler	Select this action to trigger an external event and then select the type of object event handler from the drop-down menu. **Note:** For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. See Adding object event handlers.
Send Notification to Answer Sibling Assignee(s)	Sends a notification to the owners of sibling answers.
Escalate	Escalate the answer to the selected level and set other escalation settings. See Escalating answers, incidents, opportunities, and tasks.
Clear Escalation	Clear the escalation level. See Escalating answers, incidents, opportunities, and tasks.

Actions for contact rules

When choosing actions for a contact rule, select from the following fields.

Table 44: Actions for Contact Rules

Action	Description
Set Field	Select one of the following options and make a selection to set the field. **Note:** At least one of a contact's **state** fields must be set to Yes. If the contact has two of its three states (Service, Opportunities, and Outreach) set to No and a rule's action sets the third state to No, the action will not be executed.
Service State	Select Yes or No to set the Service state on the contact record.
Opportunities State	Select Yes or No to set the Opportunity Tracking state on the contact record.
Outreach State	Select Yes or No to set the Outreach state on the contact record.
Global Opt-in	Select Yes or No to set the contact's global opt-in choice.

Table 44: Actions for Contact Rules (Continued)

Action	Description
Survey Opt-in	Select Yes or No to set the contact's survey opt-in choice.
Disabled	Select Yes or No to disable the contact record. **Note:** You might want to use this action to disable any contact records that have been created through spam email. To do this, create a rule with a condition for an email address containing the domain name and an action to set the contact to disabled.
Contact Type	Click this drop-down menu and select an option.
Banner Flag	Sets the importance of the flag to the level you select from the drop-down menu and adds any text you type in the Banner Note field.
Set Date Acquired	Click the drop-down menu on the left, select one of the following options, and then click the drop-down menu on the right. • Equals—With the current month's calendar open, select the date acquired. Use the arrows to change the month if necessary. • Increment by—In the open window, select direction, offset, and units for incrementing the acquired date. • Decrement by—In the open window, select direction, offset, and units for decrementing the acquired date. • Equal to the Value of—Select one of the following time options: now, the date the contact was acquired, or the date the organization was acquired.
Modify Service Level Agreements	Select one of these options to create or terminate an SLA instance.
Create SLA Instance	Lets you select an SLA from the drop-down menu and apply it to the contact.
Terminate Existing SLA Instance	Terminates the contact's SLA instance. This action does not terminate an SLA instance that was created during the current editing session, only a previously existing one.
Set Custom Field	Select a contact custom field and set the value. **Note:** You must add a contact custom field to your site in order for it to display. See Adding and editing custom fields.

Table 44: Actions for Contact Rules (Continued)

Action	Description
Set Variable	Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable's **data type**. **Note:** In order for variables to display, they must be added to the Rules tree. See Adding variables.
Email	Select one of these options to send an email to the contact. **Note:** If you delete an email or **transactional survey** that is used in a rule, the rule base can still be activated, but the action will not be executed, and you will not be notified that the email was not sent.
Send Marketing Email	Sends the **mailing** you select from the drop-down menu to the contact. The default time for sending the mailing is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the mailing.
Send Transactional Survey	Sends the survey you select from the drop-down menu to the contact. The default time for sending the survey is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the survey. The survey will only be sent to the contact once per incident regardless of how many times the rule is matched.
Execute Object Event Handler	Select this action to trigger an external event and then select the type of object event handler from the drop-down menu. **Note:** For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. See Adding object event handlers.
Execute External Event	This option was disabled in the February 2015 release. **Important:** External events have been deprecated and might be permanently removed in a future release. Instead, use the Execute Object Event Handler action described in the previous row.

Actions for incident rules

When choosing actions for an incident rule, select from the following fields.

Table 45: Actions for Incident Rules

Action	Description
Set Field	Select Set Field to set or change one of the following fields for an incident. The changes are evident when working with the incident. When you select a field for the action, make a selection from the menu options that appear. If customizable menu options have not been created, the Set Field action for that option (product, category, disposition, queue, or severity) does not appear on the menu.
Assigned	Sets the Assigned field to the staff account you select.
Status	Sets the Status field to the status you select.
Product	Sets the Product field to the product you select.
Category	Sets the Category field to the category you select.
Disposition	Sets the Disposition field to the disposition you select.
Interface	Sets the Interface field to the interface you select.
Queue ID	Sets the Queue field to the queue you select.
Mailbox	Sets the Mailbox field to the mailbox you select. Only those mailboxes enabled for outgoing mail are options on this menu.
Severity	Sets the Severity field to the severity level you select.
Banner Flag	Sets the importance of the flag to the level you select from the drop-down menu and adds any text you type in the Banner Note field.
Apply SLA Instance	Credits the incident against the SLA for the contact or organization and lets you apply an SLA instance if one does not exist.
Set Custom Field	Select an incident custom field and set the value. **Note:** You must add an incident custom field to your site in order for it to display. See Adding and editing custom fields.

Table 45: Actions for Incident Rules (Continued)

Action	Description
Set Variable	Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable's **data type**. **Note:** In order for variables to display, they must be added to the Rules tree. See Adding variables.
Append Thread	Select this action to append any of the following to the incident Note or Response fields. **Note:** These actions should appear in the order you want the response to be formatted. For example, if you want standard text to appear before suggested answers in the response, add the Append Response Template to Response Field action before adding the Append SmartAssistant Response to the Response Field action. The Append Response Template to Notes Field appears only in the incident thread, not in the response.
Append Response Template to Notes Field	Appends the **standard text** you select to the incident's Note field. This action is available only if you have added standard text and selected the Rule Text check box on the Standard Text editor. See Adding standard text.
Append Response Template to Response Field	Appends the standard text you select to the incident's Response field. This action is available only if you have added standard text and selected the Rule Text check box on the Standard Text editor. See Adding standard text.
Append Existing Solution (by Answer ID) to Response Field	Appends the solution for the Answer ID you enter to the incident's Response field. See Standard answer workspace for information about answer fields, including Answer ID.
Append SmartAssistant Response to Response Field	Appends the **SmartAssistant** suggested answer links to the incident's response. **Note:** If you restrict the SmartAssistant suggested answers by product or category, the product or category value must appear in the subject or message text of the incident in order for matching answer links to be generated.

Table 45: Actions for Incident Rules (Continued)

Action	Description
Append Response to the Uncommitted Response Buffer	Use this action in conjunction with any of the Append Thread actions except Append Response Template to Notes Field. This action appends the content you add to the incident response to the incident's proposed response field rather than the incident thread. Content in the proposed response can be edited before it is saved to the thread.
Email	Select this action to send the following email notifications. **Note:** If you delete an email or transactional survey that is used in a rule, the rule base can still be activated, but the action will not be executed, and you will not be notified that the email was not sent.
Send Email Response to Sender	Sends an email to the sender containing the incident subject and response. To also include the question and incident details in the email, select the appropriate check boxes. Do not add this action unless you have selected one of the incident rule actions that append a thread to an incident response. See actions available under Append Thread in this table.
Email Incident Information	Sends a copy of the Question Receipt email message to the address you type in the field or select from a menu. You can also send the information to the staff person assigned to the incident. To include administration fields and customer fields, select the appropriate check boxes. Administration fields must be selected before you can select customer fields. Administration fields include the reference number, subject, date created, date last updated, status, assigned staff member, and the incident thread, including private notes. Customer information includes the contact's email address, first and last names, contact type, title, office phone number, organization, and any contact and organization custom field data.
Send Escalation Notification	Sends an escalation notification to the staff member, group, or distribution list you specify. You can also select a check box to send the escalation notice to the staff person assigned to the incident. **Note:** If multiple recipients are selected, press **Ctrl** and click a recipient to add it to (or clear it from) the list of selected recipients.

Table 45: Actions for Incident Rules (Continued)

Action	Description
Send Marketing Email	Sends the mailing you select from the drop-down menu to the contact for the incident. The default time for sending the mailing is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the mailing. **Note:** This option does not appear if Outreach is not enabled and if no mailings have been created.
Send Transactional Survey	Sends the survey you select from the drop-down menu to the contact for the incident. The default time for sending the survey is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the survey. The survey will only be sent to the contact once per incident regardless of how many times the rule is matched. **Note:** At least one transactional survey (set for rule visibility) must have been added in order for this option to appear.
Send Receipt Email	Sends a receipt email to the contact associated with an incident that was created through **channels** other than email or the Ask a Question page. In other words, if an incident is created by an agent on behalf of a customer, this action sends an email to the contact.
Execute Object Event Handler	Select this action to trigger an external event and then select the type of object event handler from the drop-down menu. **Note:** For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. See Adding object event handlers.
Execute External Event	This option was disabled in the February 2015 release. **Important:** External events have been deprecated and might be permanently removed in a future release. Instead, use the Execute Object Event Handler action described in the previous row.
Do Not Create Incident	Select this action to prevent an incident from being added. **Note:** When an incident is being updated, this action has no effect.
Do Not Send Email Receipt Message	Select this action to prevent the normal transmission of the email receipt message to the sender. If the incident meets the rule conditions, an automatic response is not sent to the customer.

Table 45: Actions for Incident Rules (Continued)

Action	Description
Do Not Send Response	Select this action to prevent an automatic response from being sent when an incident is updated. For example, if your responses are delivered through a message system outside of Oracle Service Cloud, you can use this rule to suppress an automatic response. **Note:** To ensure all responses are suppressed, this rule must be executed last.
Assign Incident to Staff Member Assigned the Answer	Select this action to assign the incident to the same staff member who is assigned the answer. **Note:** This action has meaning only when the incident source is End-User Pages > Feedback on Answers. A rule with this action fires only when an incident is created, not when it is subsequently edited.
Escalate	Select this action to escalate the incident to the level you select and set other escalation settings. See Escalating answers, incidents, opportunities, and tasks.
Clear Escalation	Select this action to clear the escalation level. See Escalating answers, incidents, opportunities, and tasks.

Actions for chat rules

When choosing actions for a chat rule, select from the following fields.

Note Actions that send or open a survey display only if surveys are enabled for use in chat rules.

Table 46: Actions for Chat Rules

Action	Description
Chat Queue ID	Select this action to assign the chat to the queue you select from the drop-down menu.
Set Variable	Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable’s **data type**. **Note:** In order for variables to display, they must be added to the Rules tree. See Adding variables.

Table 46: Actions for Chat Rules (Continued)

Action	Description
Send Survey When Chat Completes	Select this action to send a **transactional survey** when a chat session ends. You can select the survey you want to send, and the period of time to wait before the survey is sent.
Pop-Up Survey when Chat Completes	Select this action to open a **website link survey** in a new window when a chat session ends. You can select the survey you want to display and the percentage of times you want to show the survey.
Pop-Up Survey when Chat Request Canceled	Select this action to open a weblink survey in a new window when a chat session is canceled. You can select the survey you want to display and the percentage of times you want to show the survey.
Terminate Chat Request	Select this action to terminate the chat request.
ReQueue Chat Request in	Select this action to re-queue the chat request in the number of seconds you specify.

Actions for opportunity rules

When choosing actions for an opportunity rule, select from the following fields.

Table 47: Actions for Opportunity Rules

Action	Description
Set Field	Select Set Field to set or change one of the following fields for an opportunity. The changes are evident when working with the opportunity. When you select a field for the action, make a selection from the menu options that appear.
Assign	Sets the Assigned field to the staff account you select from the drop-down menu.
Status	Sets the Status field to the status you select from the drop-down menu.
Reject Lead	Identifies the reason the lead was rejected. Select a status from the first drop-down menu of available statuses with the Reject status type. Then select a lead reject type from the second drop-down menu. Finally, type a lead rejection description in the text field.

Table 47: Actions for Opportunity Rules (Continued)

Action	Description
Interface	Sets the Interface field to the interface you select from the drop-down menu.
Banner Flag	Sets the importance of the flag to the level you select from the drop-down menu and adds any text you type in the Banner Note field.
Set Strategy Hierarchy	Sets the strategy hierarchy to the strategy you select from the drop-down menu.
Territory	Sets the territory hierarchy to the territory you select from the drop-down menu.
Set Territory Hierarchy Based on Assigned	Sets the territory hierarchy to the territory of the staff member to whom the opportunity is assigned.
Set Date Initial Contact	Sets specific opportunity dates. For each of these date fields, click the drop-down menu on the left, select one of the following options, and then click the drop-down menu on the right. • Equals—With the current month's calendar open, select the date. Use the arrows to change the month if necessary. • Increment by—In the open window, select direction, offset, and units for incrementing the date. • Decrement by—In the open window, select direction, offset, and units for decrementing the date. • Equal to the Value of—Select one of the available options from the drop-down menu.
Set Lost Date	
Set Recall Date	
Date Closed	
Win/Loss Factor	Identifies the reason for winning or losing the opportunity. Select a win/loss factor from the drop-down menu and type a win/loss description in the text field.
Set Custom Field	Select an opportunity custom field and set the value. **Note:** You must add an opportunity custom field to your site in order for it to display. See Adding and editing custom fields.
Set Variable	Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable's **data type**. **Note:** In order for variables to display, they must be added to the Rules tree. See Adding variables.

Table 47: Actions for Opportunity Rules (Continued)

Action	Description
Email	Select this action to send the following email notifications. **Important:** If you delete an email or **transactional survey** that is used in a rule, the rule base can still be activated, but the action will not be executed, and you will not be notified that the email was not sent.
Email Opportunity Information	Sends the opportunity information to the email address you select from a menu of staff members, groups, and distribution lists. (Press **Ctrl** to make multiple selections.) You can also select a check box to send the information to the staff person assigned to the opportunity. To also include administration fields and customer fields, select the appropriate check boxes.
Send Escalation Notification	Sends an escalation notification to the staff member, group, or distribution list you specify. You can also select a check box to send the escalation notice to the staff person assigned to the opportunity.
Send Marketing Email	Sends the **mailing** you select from the drop-down menu to the contact for the opportunity. The default time for sending the mailing is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the mailing.
Send Transactional Survey	Sends the survey you select from the drop-down menu to the contact for the opportunity. The default time for sending the survey is 0 hours, but you can specify the number of minutes, hours, or days after rules processing ends that you want to send the survey. The survey will only be sent to the contact once per incident regardless of how many times the rule is matched.
Execute Object Event Handler	Select this action to trigger an external event and then select the type of object event handler from the drop-down menu. **Note:** For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. See Adding object event handlers.

Table 47: Actions for Opportunity Rules (Continued)

Action	Description
Execute External Event	This option was disabled in the February 2015 release. **Important:** External events have been deprecated and might be permanently removed in a future release. Instead, use the Execute Object Event Handler action described in the previous row.
Escalate	Select this action to escalate the opportunity to the level you specify and set other escalation settings. See Escalating answers, incidents, opportunities, and tasks.
Clear Escalation	Select this action to clear the escalation level. See Escalating answers, incidents, opportunities, and tasks.

Actions for organization rules

When choosing actions for an organization rule, select from the following fields.

Table 48: Actions for Organization Rules

Action	Description
Set Field	Select one of the following options and make a selection to set the field. **Note:** At least one of an organization's **state** fields must be set to Yes. If the organization has two of its three states (Service, Opportunities, and Outreach) set to No and a rule's action sets the third state to No, the action will not be executed.
Service State	Select Yes or No to set the organization's Service state.
Opportunities State	Select Yes or No to set the organization's Opportunity Tracking state.
Outreach State	Select Yes or No to set the organization's Outreach state.
Banner Flag	Sets the importance of the flag to the level you select from the drop-down menu and adds any text you type in the Banner Note field.

Table 48: Actions for Organization Rules (Continued)

Action	Description
Set Date Acquired	Click the drop-down menu on the left, select one of the following options, and then click the drop-down menu on the right. • Equals—With the current month's calendar open, select the date acquired. Use the arrows to change the month if necessary. • Increment by—In the open window, select direction, offset, and units for incrementing the acquired date. • Decrement by—In the open window, select direction, offset, and units for decrementing the acquired date. • Equal to the Value of—Select one of the following time options: now, the date the contact was acquired, or the date the organization was acquired.
Modify Service Level Agreements	Select one of these options to create or terminate an SLA instance.
Create SLA Instance	Lets you select an SLA from the drop-down menu and assign it to the organization.
Terminate Existing SLA Instance	Terminates the organization's existing SLA instance. This action does not terminate an SLA instance that was created during the current editing session, only a previously existing one.
Set Custom Field	Select an organization custom field and set the value. **Note:** You must add an organization custom field to your site in order for it to display. See Adding and editing custom fields.
Set Variable	Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable's **data type**. **Note:** In order for variables to display, they must be added to the Rules tree. See Adding variables.
Execute Object Event Handler	Select this action to trigger an external event and then select the type of object event handler from the drop-down menu. **Note:** For objects to display in the Execute Object Event Handler drop-down menu, they must be added on the process designer and then the process model must be deployed. See Adding object event handlers.

Table 48: Actions for Organization Rules (Continued)

Action	Description
Execute External Event	This option was disabled in the February 2015 release. **Important:** External events have been deprecated and might be permanently removed in a future release. Instead, use the Execute Object Event Handler action described in the previous row.

Action for Offer Advisor rules

Regardless of the conditions for Offer Advisor rules, the only action that occurs is pre-defined: "Contact will match this target." See Creating target rules.

Actions for task rules

When choosing actions for task rules, select from the fields described in the following table.

Important Task rules are executed first when a task is updated at the same time as another object. Therefore, task actions based on non-task conditions are executed using the current value for the object rather than the updated value. For example, assume you have created a contact rule that sets a contact's Opportunities state to Yes if the contact's global opt-in value is Yes. Also assume you have created a task rule that escalates a task if the contact's Opportunities state equals Yes. If a staff member updates the contact for a task by setting the global opt-in to Yes and then saves the task, the task will not be escalated. Because the task rule is executed before the contact rule, the contact's Opportunities state is not yet updated to Yes, so the task's escalation does not happen.

Table 49: Actions for Task Rules

Action	Description
Set Field	Select Set Field to set or change one of the following fields for a task.
Assign	Sets the Assigned field to the staff account you select.
Status	Sets the Status field to the status you select.
Priority	Sets the task's priority to the priority you select.
Set Due Date To	Sets the task's due date to the date you select.

Table 49: Actions for Task Rules (Continued)

Action	Description
Set Planned Complete To	Sets the task's planned completion date to the date you select.
Task Start Date	Sets the task's start date to the date you select.
Task Complete Date	Sets the task's complete date to the date you select.
Set Custom Field	Select a task custom field and set the value. **Note:** You must add a task custom field to your site in order for it to display. See Adding and editing custom fields.
Set Variable	Set the variable to an absolute value, increment or decrement the variable, or append or prepend a character string. The available actions depend on the variable's **data type**. **Note:** In order for variables to display, they must be added to the Rules tree. See Adding variables.
Email	Select this action to send the following email notifications.
Email Task Information	Sends the task information to the email address you select from a menu of staff members, groups, and distribution lists. **Note:** Press **Ctrl** to make multiple selections.
Send Escalation Notification	Sends an escalation notification to the staff member, group, or distribution list you specify. You can also select a check box to send the escalation notice to the staff person assigned to the task.
Escalate	Select this action to escalate the task to the level you specify and set other escalation settings. See Escalating answers, incidents, opportunities, and tasks.
Clear Escalation	Select this action to clear the escalation level. See Escalating answers, incidents, opportunities, and tasks.

Escalating answers, incidents, opportunities, and tasks

The escalation function in business rules helps your organization track answers, incidents, opportunities, and tasks. You can use rules for escalation to scan for problems, such as lack of follow-up by a staff member. Then the rule's actions occur, such as reminding the assigned staff member, notifying a manager, or sending an email to a customer.

Every escalation requires two rules. The first one specifies the conditions that schedule an escalation and create an escalation level. The second rule defines the actions that occur when the escalation level is reached.

To help you start thinking about escalation functions, the following questions might remind you of situations you want to automate.

- How are answers, incidents, opportunities, and tasks assigned to staff members?
- How soon should answers be reviewed after being proposed or created?
- What is an acceptable response time for incidents?
- What time frame is acceptable for sales representatives to contact new opportunities?
- What happens if a task is not completed by its scheduled completion date?
- Who should be notified if answers, incidents, opportunities, or tasks are not handled in a timely manner?
- What happens if the next level responder does not take action?

Escalation overview

The following overview describes the main steps necessary to create and implement rules that escalate incidents. (The process is the same to escalate answers, opportunities, and tasks.) The following sections describe the procedure in greater detail.

Step 1—Outline the chain of events for responding to an incident. For example, be sure you understand how much time an agent has to respond to an incident before the agent's supervisor should be notified. Continue this process through all levels of escalation.

Step 2—Add an escalation function to the incident rule base. See Adding states and functions.

Step 3—Add the first rule to the escalation function. This rule creates the escalation level and defines the conditions that cause the rules engine to set an escalation level. For example, the condition might be a previous escalation level or an Unresolved incident status. This is the first rule of the escalation function. See To create a rule that sets the escalation level.

Step 4—Add the second rule to the escalation function. This rule specifies the action to take when the incident reaches the defined escalation level. For example, you might add an action to notify a supervisor. See To create a rule that triggers actions on an escalated object.

Step 5—Repeat steps 3 and 4 for every escalation level.

Step 6—Now you must add a rule that calls the escalation function. Create a rule with no conditions and an action that calls the escalation function you created in step 2, and add this rule to the initial state as the second-to-last rule.

Note Normally, you want the other rules in the state to be applied prior to escalation, and the last rule in a state is usually an action to transition to the next state.

Step 7—Repeat step 6 for every state in the incident rule base.

What happens now when an incident is added or updated? The rules engine applies all rules in the initial state to the incident, including the rule that calls the escalation function. When it calls the escalation function, the rules engine begins processing the rules in the function, comparing the incident to the conditions of each rule. If the incident matches the conditions of a rule, the rules engine schedules the escalation and defines when it should escalate to the specified escalation level.

Then, during a scheduled run, the **Dbstatus** utility compares the incident to the escalation schedule and, if the time indicated in the escalation action has passed, it sets the incident's escalation level to the one defined in the rule.

Because the incident has just been modified by having an escalation level set, the rules engine reprocesses the incident. When it applies the rules in the escalation function to the updated incident, the escalation level now matches the conditions of the second rule in the escalation function. Consequently, the escalation action (such as notifying a supervisor) occurs. Rules can escalate an incident multiple times before it is solved.

The scheduling of escalation involves the following escalation options.

- **Relative time**—Calculates the number of minutes or hours from a specific day of the week or from an event, such as time created or time updated. The relative time field must have a value for this option to be meaningful. For example, if you escalate an incident based on initial response and a response has not been sent yet, escalation cannot be scheduled.

- **Response interval**—Uses the work hours defined in your default response requirements. When you select this option, only working hours are used to determine relative time. If you clear this check box, incidents may escalate during non-working hours.

Note The Response interval escalation option is available only in incident rules.

- **Revalidate**—Verifies that the object continues to match the rule's conditions after being updated. If it no longer matches, the object is removed from the scheduled escalation queue.
- **Recalculate**—Reschedules escalations that are based on events (such as time updated or time of last response) when the object is updated and continues to meet the rule's conditions. For example, if you schedule an escalation four hours after an incident is updated, the original escalation schedule is recalculated if the incident is updated before four hours elapse. The updated escalation is scheduled for four hours after the most recent update.

Note When the rules engine schedules an escalation but the Recalculate option is not selected, updating the object does not update the scheduled escalation. The escalation remains scheduled until it is executed or until revalidation removes it. For example, if you set an incident escalation action +4 hours relative to "Now," the rules engine schedules escalation when the rule first executes. If the incident is updated and the conditions still match, the escalation time continues to be based on the original time, not the updated time.

- **Clear Escalation action**—Prevents escalation. For example, you might schedule escalation to ensure that a response is sent within a certain time frame, but you should clear escalation after the response has been sent. It is a good practice to select the Revalidate option to cancel the scheduled escalation when the Clear Escalation action is executed.

Important Unlike incidents and tasks, answers and opportunities never reach a state where they cannot be escalated, as incidents do when they are solved and tasks do when they are completed. To help you manage these escalations, use the Clear Escalation action to prevent escalation and the Revalidate option to ensure scheduled escalations are removed.

Before you create escalation levels, you must understand the **Dbstatus** utility, which escalates objects and runs by default four times an hour.

What is Dbstatus?

One function of the Dbstatus utility is updating the escalation level of answers, incidents, opportunities, and tasks. Although the rules engine sets the escalation level for an object, Dbstatus updates the object. During one of its scheduled runs, Dbstatus notes the time, then searches the knowledge base looking for answers, incidents, opportunities, and tasks that have a scheduled escalation time less than the current time. It then updates those objects with the defined escalation level.

After Dbstatus updates the object, the rules engine reprocesses the object to see if it now matches other rules in the escalation function. This allows multiple steps of escalation based on the number of escalation levels you created.

Important Rules to escalate tasks, incidents, and opportunities use the configuration settings and message bases associated with the interface of the object being escalated. Answer escalations process using the configuration settings and message bases of the interface from which Dbstatus runs.

Adding rules for escalation

While escalation processes are most commonly applied to incidents, as in the following example, they can also be useful for managing answers, opportunities, and tasks. To see an example of rules for escalation, see Escalating incidents.

The following procedures show you how to create a rule that sets an escalation level and how to create a rule that performs an action when the escalation level is applied to the incident.

Tip We recommend creating a separate function where you can place escalation rules. The following procedures assume that the rules you create are placed in an escalation function. See To add a function.

Escalation rules always come in pairs. The following procedure describes how to create the escalation level for any incident that matches the rule's conditions. It tells **Dbstatus** to set the incident's escalation to the defined level when the time for escalation has passed. The next rule must specify what you want to happen after the incident reaches this escalation level. To do this, create another rule in the escalation function, as described in the second procedure, (creating a rule that triggers actions on an escalated object).

To create a rule that sets the escalation level

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the button on the ribbon for the rule type you want to create. The incident rule base is selected by default.

4 Click the Edit button on the ribbon.

5 Right-click the escalation function where you want to place the new rule and select New Rule.

6 Type the rule's name in the Rule Name field.

7 Add the conditions that will trigger the escalation. See To add a rule.

Tip When you create a rule to escalate an incident or other object that has not yet been escalated, you can add a condition of Escalation Level equals Unspecified to ensure that you don't escalate an object that already has an escalation level previously set by another rule.

8 Click the Add Action–Then button and select Escalate.

9 Enter the following field information.

Table 50: Escalation Action Description

Field	Description
Escalate to Level	Type a name for the escalation level you are creating in this field.
Relative	Select this check box to trigger escalation at a time relative to a day or event, which you select from the drop-down menu to the right of the check box. In the drop-down menu to the left of the check box, select a value to establish the time relationship to the event. For example, you might select a relative time such as +4 hours relative to Time Created. Clear this check box to base escalation on absolute time.

Table 50: Escalation Action Description (Continued)

Field	Description
	This field lets you schedule the escalation using absolute time. That is, you set the specific time you want rather than scheduling escalation relative to another time. Click the drop-down menu to open the current month's calendar and select the escalation date. To change the date or time, click the value you want to change and type a new value. Click anywhere in the date or time to set the exact date and time you want the answer, incident, opportunity, or task to escalate to this level. **Note:** This option appears only if the Relative check box is cleared.
	Click the arrow to open a window for selecting direction, offset, and units for the relative time value. +1 Hours is the default. Enter direction, offset, and unit for this field, and click the Save button. **Note:** This option appears only if the Relative check box is selected.
Direction	Select + (future) or – (past) to indicate the direction of the offset for the escalation time from the relative time you define. For example, you might want to escalate an incident 8 hours after (+8 Hours) the time of the last response or an opportunity 4 hours before (– 4 Hours) the Forecast Close time.
Offset	Select this field and type a new value to change the number of minutes or hours before or after the relative time.
Unit	Click the drop-down menu and select minutes or hours.

Table 50: Escalation Action Description (Continued)

Field	Description
	Click the arrow to display the drop-down menu and select Now, Today, Tomorrow, any day of the week, or any of the answer, incident, opportunity, or task options listed below. This establishes the base time to which **Dbstatus** applies the relative escalation time. You must select the Relative check box to display the menu. If you select Today, Tomorrow, or any day of the week, the time associated with that date field is midnight. Therefore, if you create a rule to escalate an answer or an opportunity +3 hours relative to Wednesday, the escalation would be scheduled for the next Wednesday at 3 A.M. The same scenario holds true for incident escalation only if the Use Response Intervals check box is cleared. If the Use Response Intervals check box is selected, the schedule for escalation depends on the work hours that have been set since only work hours are counted. If, for example, work hours on Wednesdays begin at 6:00 A.M., escalation for the incident would be scheduled for Wednesday at 9:00 A.M.
Answers	Select one of the following escalation options based on the time the answer was added or updated or is scheduled to be reviewed or published.
Answers.Created	Select this option if you want the escalation time to be calculated from the time the answer was added.
Answers.Updated	Select this option if you want the escalation time to be calculated from the time the answer was updated.
Answers.Review On	Select this option if you want the escalation time to be calculated from the time the answer is scheduled to be reviewed.
Answers.Publish On	Select this option if you want the escalation time to be calculated from the time the answer is scheduled to be published.
Incidents	Select one of the following escalation options based on the time the incident was added, updated, or responded to, or the time it is due.
Incident.Created	Select this option if you want the escalation time to be calculated from the time the incident was added.
Incident.Updated	Select this option if you want the escalation time to be calculated from the time the incident was updated.

Table 50: Escalation Action Description (Continued)

Field	Description
Incident.Date Last Responded	Select this option if you want the escalation time to be calculated from the time the incident was last responded to. **Note:** If the database contains no value for this field (because only the initial response has been recorded with no subsequent responses), the escalation action will not occur.
Incident.Date Initial Solution Response	Select this option if you want the escalation time to be calculated from the time of the initial solution to the incident. **Note:** If the value for this field in the database is null (because the incident has not been responded to yet), the escalation action will not occur.
Incident.Date Due	Select this option if you want the escalation time to be calculated based on the relative time due set in your default response requirements.
Opportunities	Select one of the following escalation options for opportunities.
Opportunity.Created	Select this option if you want the escalation time to be calculated from the time the opportunity was added.
Opportunity.Updated	Select this option if you want the escalation time to be calculated from the time the opportunity was updated.
Opportunity.Initial Contact	Select this option if you want the escalation to be calculated from the date the customer for the opportunity was initially contacted by a sales representative. The time associated with this date field is midnight. Therefore, if you create a rule to escalate +3 days relative to Time Initial Contact and the initial contact occurred on Monday morning, the escalation would be scheduled for midnight on Thursday. **Note:** If the value for this field in the database is null (for example, if the customer for the opportunity has not been contacted yet), the escalation action will not occur.

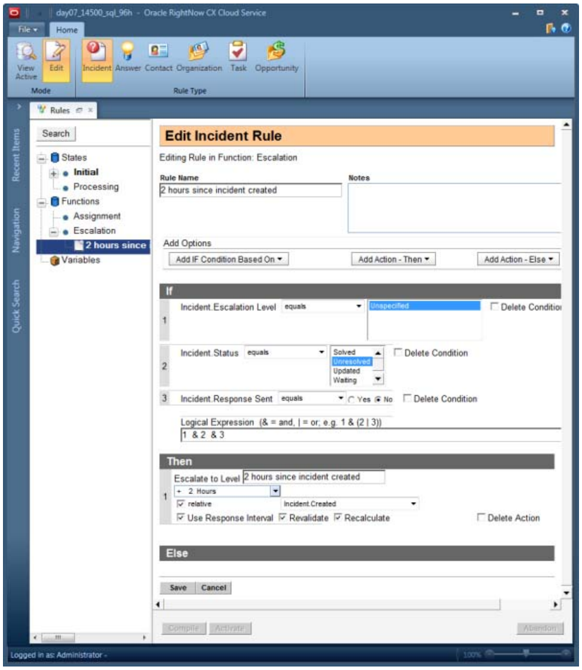
Table 50: Escalation Action Description (Continued)

Field	Description
Opportunity.Forecast Close	Select this option if you want the escalation to be calculated from the date the opportunity is forecasted to close. The time associated with this date field is midnight. Therefore, if you create a rule to escalate 12 hours before the forecasted close (that is, –12 hours relative to Time Close Forecasted) and the opportunity was forecasted to close on Friday, the escalation would be scheduled for Friday noon. **Note:** If the value for this field in the database is null (for example, the opportunity does not have a forecasted close date yet), the escalation action will not occur.
Opportunity.Date Closed	Select this option if you want the escalation to be calculated from the date the opportunity closes. The time associated with this date field is midnight. Therefore, if you create a rule to escalate 6 hours after the close date and the opportunity closed on Tuesday, the escalation would be scheduled for 6:00 A.M. Wednesday. **Note:** If the value for this field in the database is null (for example, the opportunity has not closed yet), the escalation action will not occur.
Opportunity.Lost Date	Select this option if you want the escalation to be calculated from the date the opportunity was lost.
Opportunity.Recall	Select this option if you want the escalation to be calculated from the date the customer for the opportunity should be called again.
Tasks	Select one of the following escalation options for tasks.
Tasks.Completed Date	Select this option if you want the escalation time to be calculated from the date the task was completed.
Tasks.Created	Select this option if you want the escalation time to be calculated from the date the task was added.
Tasks.Due Date	Select this option if you want the escalation time to be based on the task's due date.
Tasks.Planned Completion Date	Select this option if you want escalation to be based on the planned completion date of the task.

Table 50: Escalation Action Description (Continued)

Field	Description
Tasks.Start Date	Select this option if you want escalation to be based on the task's start date.
Tasks.Updated	Select this option if you want escalation to be based on the date the task was updated.
Use Response Interval	Select this check box to use the work hours defined in the default response requirements set up for your organization. If you clear this check box, incidents meeting the conditions may escalate during non-working hours and holidays. For information about default response requirements, see Defining response requirements. **Note:** This check box applies only to incident escalation and does not appear with escalation actions for tasks, answers, and opportunities.
Revalidate	Select this check box to revalidate the answer, incident, opportunity, or task, which means that if it is edited and no longer matches the conditions of this rule, the escalation action is removed from the scheduled escalations queue. Once an escalation that requires revalidation has been scheduled, the conditions of the rule must continue to match when the object is updated. If they do not, the pending escalation is canceled.
Recalculate	Select this check to recalculate escalation time for the answer, incident, opportunity, or task when it is updated. The rules engine reschedules escalation based on the relative time value, such as four hours after Time Updated. **Note:** You must select a relative time value that is not static in order for the Recalculate feature to be meaningful. If you select a static value, for example, Time Created, escalation is not rescheduled because Time Created remains static even when the object is updated. If, however, you select Time Updated, escalation is rescheduled because the Time Updated value changes when the object is updated.

The following shows a rule that sets an escalation level.



10 Click the Save button to save the rule.

To create a rule that triggers actions on an escalated object

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the button on the ribbon for the rule type you want to create. The incident rule base is selected by default.

4 Click the Edit button on the ribbon.

5 Right-click the escalation function where you want to place the new rule and select New Rule.

6 Type a name for the rule in the Rule Name field.

7 Click the Add IF Condition Based On button and select Escalation Level equals <Escalation Level>. This is the name of the escalation level created in the rule that sets the escalation level. See To create a rule that sets the escalation level.

8 Click the Add Action–Then button to add the appropriate actions based on your business process. For example, the rule's action could be to send an escalation email to the incident's assigned staff member. See Choosing actions.

9 Click the Save button to save the rule.

You have now created a rule that sets the escalation level and a rule that specifies the actions to be taken when the escalation level is detected during rules processing. As you create additional rules to set escalation levels and perform actions, remember that only rules in the initial rule state initially process unless those rules transition to another state or call a function. In order for the rules engine to process the rules in the function you place your escalation rules in, you must have a rule that calls the escalation function.

To add more escalation levels and actions, perform the steps described in To create a rule that sets the escalation level and To create a rule that triggers actions on an escalated object. Once you have created your escalation rules, activate the rule base. See Compiling and activating rule bases.

Searching rule bases

You can search for names of states, functions, rules, and variables in rule bases, whether you are viewing active rules or editing them. This lets you easily find the items you need to view or edit, especially when working in a rule base that contains a large number of rules and other items.

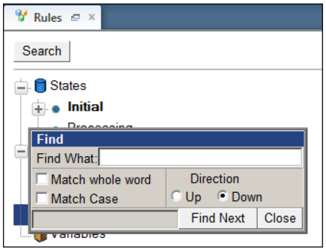
To search a rule base

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the button on the ribbon for the rule base you want to view. The incident rule base is selected by default.

4 Click the Search button located above the tree. The Find window opens.



5 Type the text you want to find in the rule base tree in the Find What field. By default, the search is not case sensitive.

Tip Wildcards are automatically added to the beginning and end of the text you type. This lets you search for items using text strings that are in the items' names but that are not at the beginning or end of the names. For example, typing b in the Find What field returns all items containing the letter b.

6 To make the search case sensitive, select the Match Case check box.

7 To locate items in the tree only if their names exactly match the search value you enter, select the Match Whole Word check box.

8 To search for items starting at the bottom of the tree and proceeding up, select the Up radio button. To reverse the order of the search, select the Down radio button.

9 Click the Find Next button to locate the first state, function, rule, or variable in the rule base that matches the text you entered. Click Find Next again to locate subsequent items in the tree that match the text.

10 Click the Close button when you are finished with the search to close the window.

Compiling and activating rule bases

Whenever you make changes to a rule base, you must compile it to ensure that no errors exist, and you must activate it so the changes take effect. Compiling lets you examine the state transitions and function calls to ensure that the rule base correctly reflects your intentions. You can compile the rule base as many times as necessary to ensure that it functions as planned.

You can activate the rule base when the compiling process convinces you that it functions the way you intend it to. Activating the rule base archives the version of the rule base that existed before you began making changes and incorporates the changes into the current rule base. Until you activate the rules you have been editing, they will not process any records. To view the rules that are currently active, see Viewing rule bases.

Important Whenever you make any changes to a rule base, you must activate the rule base in order for the changes to take effect. However, activating the rule base does not automatically evaluate items in the knowledge base and execute rules in the updated rule base. Assume, for example, you have updated the incident rule base to include a rule that applies an SLA instance to all incidents from a specific organization. Activating that rule base does nothing to change existing incidents from that organization because the rules engine is invoked only when incidents are added or updated, not when rule bases are activated.

The following procedures use contact rules as an example, but you can compile or activate any type of rule using the same procedure.

To compile a rule base

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the Contact button on the ribbon and then click the Edit button on the ribbon to view the contact rules you will compile.

4 Click the Compile button. A message asks you to confirm that you want to compile the rule base.

5 Click the OK button. The compiler engine checks rules, states, and functions. If no errors occur, a message lets you know the rule base compiled correctly.

6 Click the OK button. You can now continue editing the rule base.

To activate a rule base

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the Contact button on the ribbon and then click the Edit button on the ribbon to view the contact rules you will activate.

Tip You can check whether changes to a rule base have been activated by comparing the Created and Last Updated dates. If these dates and times are not the same, then changes have been made, but the updated rule base has not been activated. In addition, the date in the Last Updated column is red to alert you that changes have not been activated.

4 Click the Activate button. A message asks you to confirm that you want to activate the rule base.

5 Click the OK button. The compiler engine checks rules, states, and functions. If no errors occur, a message lets you know the rule base compiled correctly.

6 Click the OK button. If objects are in the Null state or a state that has been removed, see Objects in the Null state. If no objects need to be reassigned to a different state, a message lets you know that the rule base has been activated.

7 Click the OK button to close the message and stop editing rules.

To abandon changes to a rule base

Caution This action deletes all of the changes you have made to the rules, functions, states, and variables in the current editing session.

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration.

3 Click the button on the ribbon for the rule base you want to abandon. The incident rule base is selected by default.

4 Click the Edit button on the ribbon to view the rules currently in the edit state.

5 Click the Abandon button on the Rules editor. A message asks you to confirm that you want to delete all of the changes made in this editing session.

6 Click the OK button to delete the copy of the rule base you are editing, including all states, functions, rules, and variables. All of the changes you have made are deleted, and the rule base reverts to the last activated version.

Objects in the Null state

If the knowledge base contains records that were created before the rule base for that record type was activated, those records are considered to be in a null state. This means they will not be processed by the rule base when they are next edited unless you move them into an active state in the rule base. Records may also need to be reassigned to an active state if you delete the state where they previously existed so that the rule base will process them when they are updated.

If records associated with the rule base are in a null state when you activate the rule base, you will see a message similar to:

Move the 114362 contacts in state with ID value of Null to ____

You can then click the drop-down menu to select the state where the records should be assigned.

The records you move to an active state are not processed by the rule base just because you move them to a new state. However, they will be processed the next time they are edited unless they remain in the Null state or a state that has been deleted. In those cases, they will never be processed.

Note If you have deleted escalation levels when editing a rule base, you must also select new values for those levels. If you select Null to replace the existing escalation level value, pending escalations are deleted and the objects are not escalated. See Escalating answers, incidents, opportunities, and tasks.

To change state values when activating a rule base

1. When you see a message about moving records in a null state, click the drop-down menu and select the state you want to move the records to.
2. Click the Save button. A message lets you know the rule base was activated.
3. Click the OK button to exit the rule base.

Viewing rule bases

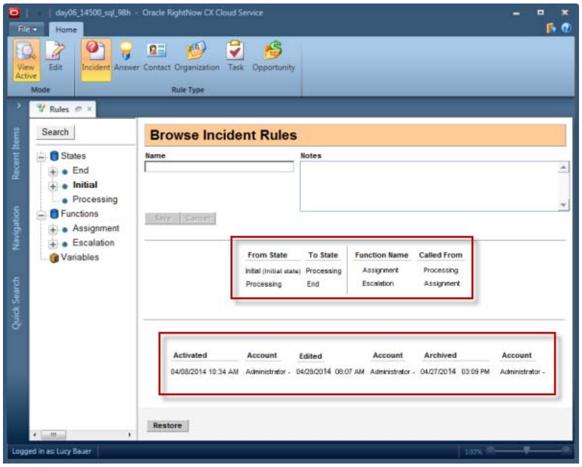
When you open the Rules editor, the View Active button on the ribbon is selected. When you view active rules, you see the rules, states, functions, and variables in the selected rule base that are currently active that impact the incidents and other types of records on your site. Unless you intend to make changes to your rule base, it is a good idea to use the View Active option instead of Edit to prevent accidental modification of the rule base and help you track changes to the rule base. When changes to the rule base are necessary, you can tell if someone else has already begun making changes by looking at the Last Updated column on the Rules editor or the Edited date when reviewing the active rule base.

In addition to viewing the rule base without editing it when you select View Active, you also have the option of restoring the archived rule base. If, after viewing the rule base, you decide you want to revert to the previously archived version of the rule base (that is, the last one that had been activated prior to the current version), you can restore the archived version. After restoring the archived rule base, you must activate it in order for the restored version to become the new current version.

Note Remember that you can prevent staff members from editing rules by clearing the Rules Edit check box on the Administration permissions tab of the Profiles editor, but still allow them to view rules by selecting the Rules View check box. See Administration permissions.

To view a rule base

1. Click the Configuration button on the navigation pane.
2. Double-click Rules under Site Configuration.
3. Click the button for the rule type you want to view. Since the View Active button is selected on the ribbon by default, the rules displayed on the content pane are the active rules on your site. The incident rule base is selected by default.



The content pane displays the dates the rule base was activated, edited, and archived and the staff member who performed these actions. It also displays the transitions from one state to another and the states from which functions are called.

An entry in the Edited column indicates that a copy of the active rule base has been created. A staff member may have made changes or simply used the Edit option to open the rule base.

4 To view a state, right-click the state and select View State.

5 To view a function, right-click the function and select View Function.

6 To view a rule, right-click the rule and select View Rule.

To restore the archived version of the rule base

1 Click the Configuration button on the navigation pane.

2 Double-click Rules under Site Configuration and select the rule type button for the rule base you want to restore. The incident rule base is selected by default.

3 Click the Restore button. You are asked to confirm that you want to restore the archived rule base.

4 Click the OK button to confirm the restoration of the archived rule base.

5 Click the Activate button to activate the restored version of the rules base.

Important If you close this window without activating the rules base, the restored version is abandoned and the current version of the rules base remains active.

Modifying rule bases

You can modify a rule base, including all states, functions, and the rules contained in each. You can change the names of states, functions, and rules, and change the conditions and actions in rules. You can also duplicate, reorder, and delete rules, and move rules to other states or functions.

Caution If you delete a state or function, you also delete all the rules within the state or function.

Modifying a rule base lets you:

- Edit a rule to change any of its properties.
- Duplicate a rule to change its name, conditions, or actions. This option makes it easy to add a rule with similar properties.
- Delete a rule.
- Temporarily disable a rule to prevent it from being considered when the system is processing workflow.
- Move a rule to another state or function or change the order of a rule within a state or function by dragging and dropping.

Note Regardless of how you modify a rule base, you must activate it in order for the changes to take effect. See Compiling and activating rule bases.

Right-click any rule in the rule base and select one of the following options.

- **Edit**—Make the changes and save the rule. If the rule was not successfully updated, a message indicates the value that is not valid.
- **Duplicate**—Rename the rule, make the necessary changes, and save the new rule.

- **Delete**—A message asks you to confirm the deletion.
- **Disable/Enable**—The tree refreshes and a lock icon appears next to the rule to reflect its disabled status. The menu option changes to Enable when you right-click a disabled rule.

Verifying rules using the rule log

You can use the rule log to view the list of rules that have fired against a specific answer, contact, incident, opportunity, organization, or task. This lets you verify that the new rule base works as intended and that no unintended actions occur as a result. The rule log also identifies whether the Then or Else clause was used to process the rule.

When testing escalation, you may have to run **Dbstatus** manually. However, keep in mind that manually running Dbstatus to confirm an object's escalation also escalates everything that has reached the scheduled escalation time, not just the object you are testing. See What is Dbstatus?

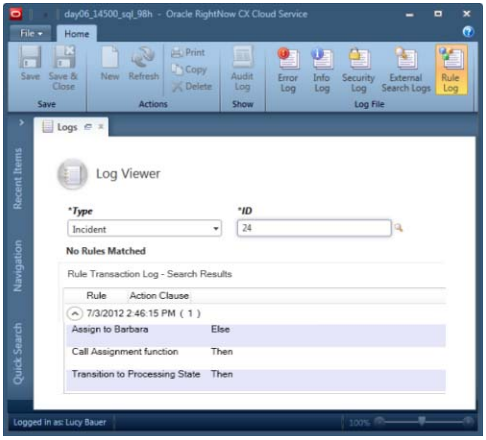
Note Be certain to configure email settings before you construct rules to check inquiries and responses that were sent by email. See Email Management for information about customizing email configuration settings.

To verify a rule

1. Add and save a record, such as an incident, that matches the conditions of the rule.
2. Obtain the ID number of the object you want to view.
   a. Open the record on a workspace, click the Info button on the ribbon, note the ID number, and close the record.
   Or
   b. Open a report that includes the ID number of the record, such as the incident ID (*incidents.incident_id*) field. Note the ID number and close the report.
3. Click the Configuration button on the navigation pane.
4. Double-click Logs under Site Configuration.
5. Click the Rule Log button on the ribbon. The rule log opens on the content pane.
6. Click the Type drop-down menu and select the type of record you want to view.

7 Type the ID in the field and click the Search button.

The following figure shows a rule log for an incident that hit three rules.



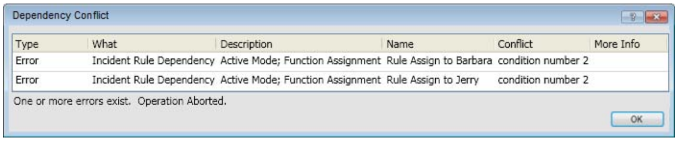
8 Check that the appropriate rules were applied to the record. If not, check the rules' conditions and actions to see why the record processed as it did. (See procedures beginning with Creating rule bases.)

Note The rule log may contain more than one entry, depending on when it was last purged. The **Agedatabase** utility purges the log after a configurable period of time (with a default of 30 days). The rule log may also indicate no matching rules.

Resolving dependencies

If any of your rule conditions or actions refer to specific Oracle Service Cloud items (such as rule variables, staff accounts, or queues) and you attempt to delete that item, the system first checks to see if the item is related to business rules. If it is, a dependency conflict may occur.

You will not receive a dependency conflict warning if you delete a product, category, or disposition used in a rule. However, if you try to delete a custom field that is used in incident rules, you will see a Dependency Conflict window that describes the conflicts.



Before you can delete the custom field, you must resolve the dependency by editing or deleting the rule that causes the dependency.

Important If you delete an email or survey that is used in a Send action in a contact, incident, or opportunity rule, you can still activate the rule base but the rules engine will not process the action. No error will be logged to indicate that the mailing or survey was not sent.

Business rules examples

Business rules are useful tools that help you simplify and automate common business tasks. This section provides examples of rules to help you better understand rules and create rule bases that can streamline your organization's business practices.

Keep in mind there may be more than one way to accomplish the same objective using business rules. You may find other conditions and actions that let you achieve the same results as the sample rules described in this section. For complete details about working with business rules, including an overview of rules as well as procedures for creating rule bases, adding and editing rules, activating rule bases, and troubleshooting, see Business Rules Management.

Routing customer support questions

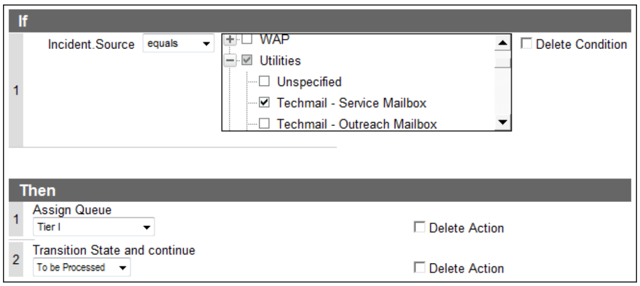
One of the more common uses of business rules is to route incidents to the most appropriate staff member, group, or queue based on the criteria you define. These conditions can be related to the incident itself or to a field in the contact or organization record associated with the incident.

It might make sense to route certain types of incidents to a specific staff member. But the rules engine cannot determine what staff members are logged in, so you risk having the incident assigned to a staff member who is not at work when the incident is routed. To ensure a timely response for your customers, a better practice is to assign incidents to queues that all logged-in agents can pull from.

In the examples in this section, each rule has two actions: to route the incidents that match the criteria to the queue for Team A and then to move the incidents to a different state called "To be Processed." (Best practice recommends you move incidents out of the initial state after the rules engine has routed them so the rules engine does not continue to process an incident using the rules of the initial state whenever it is updated.) In reality, you might have additional actions in any given rule. For example, after assigning an incident to a queue, you may want to append **SmartAssistant**-suggested answers to the incident before you transition it to a different rule state.

Routing incidents by source

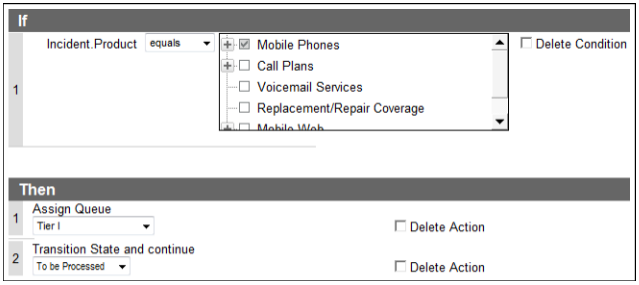
You may have one queue dedicated to handling incidents that originate from the Ask a Question page on your customer portal, another one for replying to email incidents, and another for chat requests. If this is how your support team is organized, you will need a rule in the initial state for each type of incident source. The following figure shows the kind of rule you can use to route incidents to a specific queue or staff member.



It is also a good idea to add a final rule to catch any incidents that enter your system through other sources so they can be assigned to a staff member instead of being overlooked.

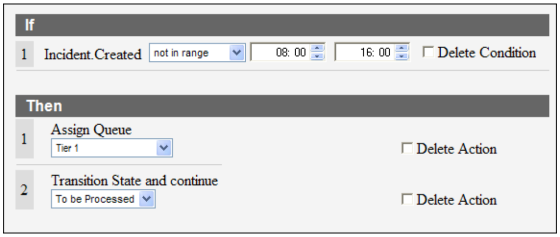
Routing incidents by products or categories

Routing incidents by products or categories lets you direct them to the staff members who are experts in those areas. This may be especially useful if members of your support team have highly specialized areas of knowledge. The following figure is an example of a rule that routes incidents by their associated product.



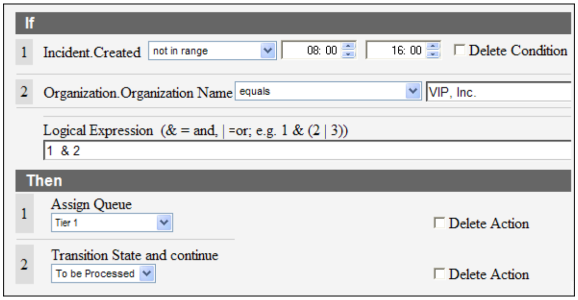
Routing incidents by time created

You may decide to route incidents based on the time of day they are created. If a customer submits a question before or after your support staff's normal working hours, you may want to route the incident to a backup staff member or queue who can respond to the customer. The following figure shows a rule that routes an incident to Team A anytime an incident is submitted outside the normal working hours of 8:00 A.M. to 4:00 P.M.



Note You can accomplish the same goal by using the operator In Response Interval. This operator is used only with incident rules to indicate that the incident was added within normal working hours. "Normal working hours" means either the **response requirements** of the SLA associated with the incident or the default response requirements if no SLA is associated with the incident.

You might not want to route every incident created outside working hours to a backup queue. Instead, you may decide to route only those that are added by certain customers. In that case, you can add another condition for the type of SLA the customer has or for the customer's organization.



Note The default logical expression joins the conditions with AND, meaning that both conditions must be met to trigger the action. If the logical expression used OR (|), the action would be triggered if either one of the conditions was met.

Other incident routing conditions

Besides source, products, categories, and time created, you can route incidents based on several other conditions. The following list describes some of the more common incident conditions. For a complete list, refer to Incident conditions.

- **Subject and threads**—You might want to find all incidents that contain a specific word or phrase or, conversely, exclude those incidents from being impacted by a rule's actions. You can set conditions to search for text in the incident's subject as well as customer and staff threads.
- **Status**—Setting the incident status as a rule condition lets you find and act on all incidents with the specified status. For example, you might want to send a reminder email to all customers who have an incident with the status **Waiting**.
- **Previous fields**—It might be useful to note when an incident's status, assigned staff member or group, or escalation level changes during rules processing. You can specify the previous value (that is, the value for the field stored in the database when the incident is added or updated or when rules processing begins) for these fields as conditions for incident rules.
- **Assigned staff member, group, or queue**—If one of your staff members is out of the office unexpectedly, you might want to create a rule to reassign that person's incidents. Similarly, one group or queue might have a heavier than normal volume of incidents and you may want to create a rule to direct some or all of those incidents to a different group or queue.

- **SmartSense ratings**—You might want to email incidents that have strongly positive customer **SmartSense** ratings to the staff member's supervisor so that management can recognize agents who are serving customers well. It might also be useful to let management know when a staff member's SmartSense rating is negative so corrective action can be taken if necessary. Refer to SmartSense Emotive Rating.

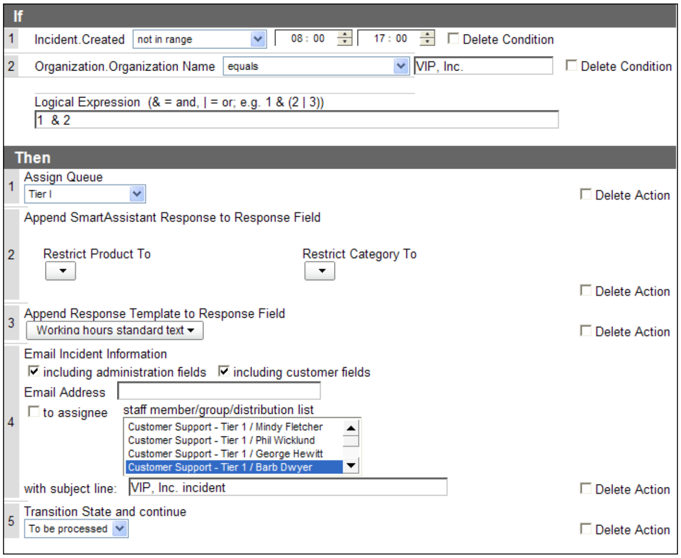
You can also route incidents based on rules you create using conditions for contacts and organizations. For example, you might want to route incidents based on a customer's geographic region, the date your organization acquired them as a customer, or their industry.

Building on basic incident routing rules

You can see from the examples presented so far that rules for routing incidents can be simple. But they serve as the building blocks for developing more complex rules. In this section, you will add to the rule that routes incidents created outside working hours by customers from a particular organization. (Click here to see the figure of the original rule.)

Assume that your organization wants to send a reply email to the customer who submits the incident. The reply should include suggested **SmartAssistant** responses to the question and list normal working hours. Also assume that you want to set the banner **flag** to high importance and send the incident to a customer support supervisor who can follow up if necessary to ensure that the customer receives a reply.

The rule will resemble the following figure.



Note Notice in the revised rule that the Transition State action must be last in order for the other actions to be processed. Once you have added an action to stop processing rules or transition the state, the Add Action button is no longer available. As a result, you must first delete the existing Transition State and Continue action from the original rule, add the intermediate actions, and then add the Transition State and Continue action.

Using the Else clause when routing incidents

Rules are if-then statements: If this condition occurs, then take this action. And you can probably use rules to accomplish everything you want to without ever using the Else clause. But using the Else clause can simplify your rules. Maybe you want incidents with a high severity level to be routed to one queue and those with any other severity level to be routed to a second queue.

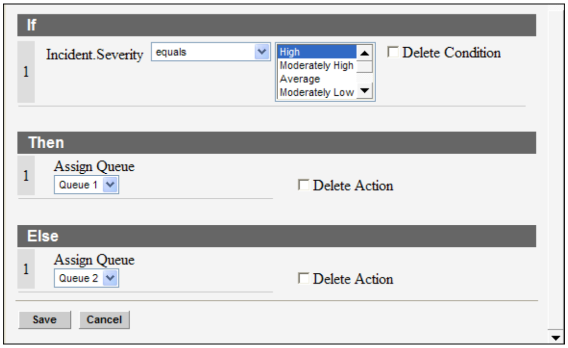
Your rules could look like this:

- If Incident.Severity equals High, set queue ID to Queue 1.
- If Incident.Severity equals Average, set queue ID to Queue 2.
- If Incident.Severity equals Low, set queue ID to Queue 2.
- If Incident.Severity equals None, set queue ID to Queue 2.

Depending on the number of severity levels your organization uses, you can see that this could get unwieldy rather quickly. So instead, you might create a different set of rules to accomplish the same thing:

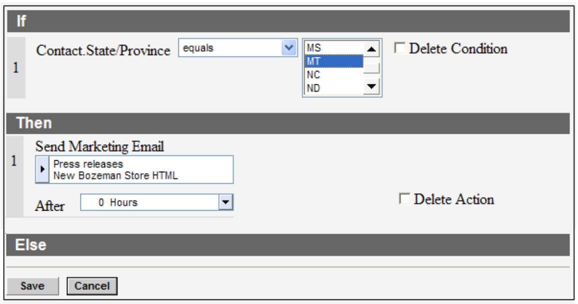
- If Incident.Severity equals High, set queue ID to Queue 1.
- If Incident.Severity not equals High, set queue ID to Queue 2.

Even though this is more manageable than the first scenario, the Else clause offers you a single-rule solution.

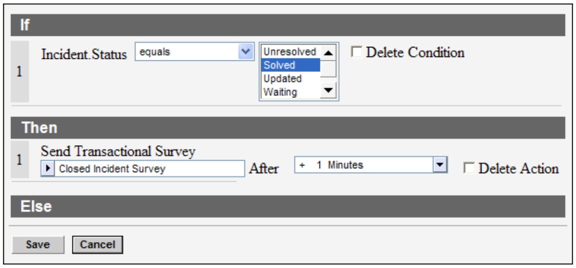


Sending emails and surveys

Rules can automate some of your marketing efforts. Assume, for example, that you want to send a message to all new customers in a specific geographic area to let them know about a new store opening in their region. To accomplish this, your contact rule might look like the following figure.



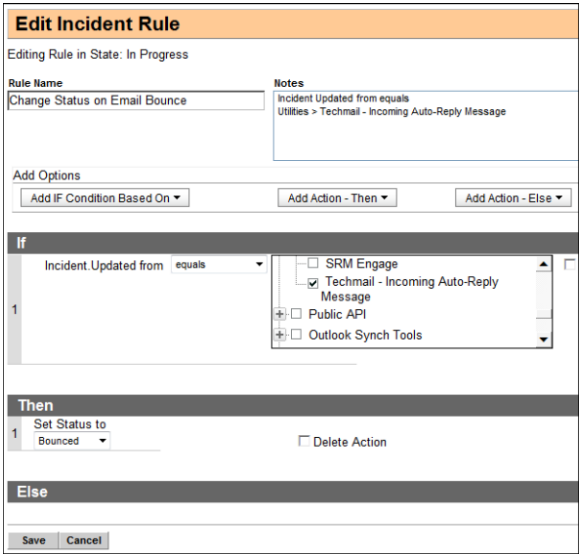
Sending a survey is similar. The following figure shows an incident rule that sends a customer support satisfaction survey when an incident is solved.



Tip We recommend setting the survey to send at least +1 minute after the incident is solved. Otherwise, if you leave the setting to its default value of zero hours, the customer would receive the survey before they receive the Incident Solved notification.

Setting incident status in response to an event or action

You can set rules to change the status of an incident when an event occurs or an action is taken. In this example, when an email is not delivered to the recipient and triggers an automated reply instead (that is, it bounces), the incident status is set to Bounced. This alerts staff members that the email wasn't received. They can then resend the email or use an alternate contact method. This example uses the "From Techmail–Incoming Auto-Reply Message" source in the Transactions (transactions) table.



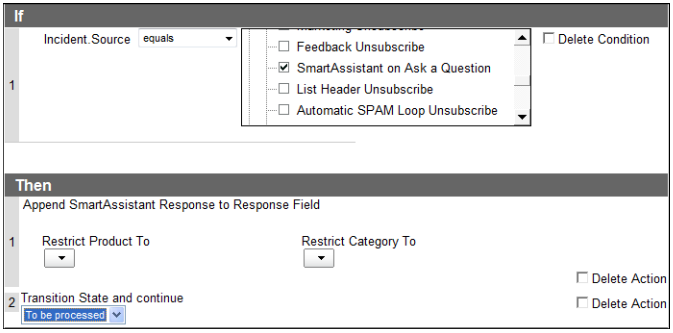
Suggesting answers before questions are submitted

The example rule described in Building on basic incident routing rules contained the action Append SmartAssistant Response to Response Field. This action offers suggested solutions to your customers when they submit an incident and may help them resolve their issue themselves without requiring help from your support team.

SmartAssistant works by evaluating the text of the customer's question and determining which answers in the knowledge base best match the question. It then presents a list of these answers (to the maximum number specified in SA_NL_MAX_SUGGESTIONS) to the customer in one or both of two ways:

- On the Ask a Question page of the customer portal before the customer completes submitting the question
- In the response thread of the incident that gets sent to the customer

To display the suggested solutions when the customer clicks the Continue button on the Ask a Question page but not append them to the incident response thread, the incident source condition must be equal to SmartAssistant on Ask a Question.



To append the suggested solutions to the incident response thread but not display them when the customer submits a question, the incident source must be equal to Ask a Question.

And to offer the suggested solutions to the customer when they ask the question and in the incident response thread, the condition for the incident source should have the check boxes for both SmartAssistant on Ask a Question and Ask a Question selected.

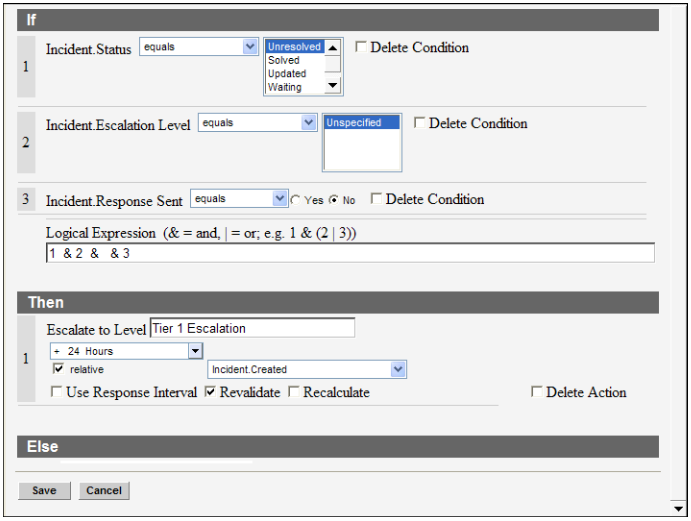
Escalating incidents

Business rules let you escalate answers, incidents, opportunities, and tasks according to the conditions you define. Escalation lets you identify potential problems and take action before actual problems ensue. You might want to escalate incidents that have not been resolved within your organization's default **response requirements**. You can escalate answers that have been lingering in the review process and prevented from being published. Task escalation lets you notify staff members when tasks are pending, and opportunity escalation prevents a potential sale from being overlooked.

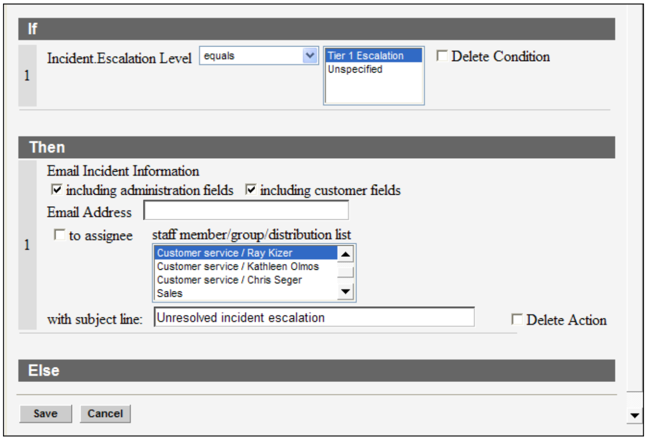
This example shows how to create rules to escalate incidents. You will first want to create a separate function that contains all the rules for escalation so that you can call the escalation function from any state in the incident rule base.

Each escalation action contains two rules. The first rule specifies when the incident should be escalated and creates an escalation level, and the second rule spells out what must happen when the escalation level defined in the first rule is reached.

The following figure shows an example of the first escalation rule. In this case, assume you want to trigger escalation if the incident status is unresolved, the incident has no current escalation level, and no response has been sent to the customer. In its action, this rule creates an escalation level called Tier I escalation, which will be triggered 24 hours from the time the incident was created. (Because the Use Response Interval check box is cleared, the 24 hours is calculated based on actual clock time. If it were selected, only your organization's normal working hours would be used to calculate the time.) The Revalidate check box is selected, which means that any updates to the incident will cause the rule's conditions to be evaluated to see if they still match. If, for example, an agent responds to the customer, you do not want the escalation to occur. The Recalculate check box is cleared because the escalation time is relative to the time the incident was created, which is a static value that does not change during rules processing.



This first rule tells the **Dbstatus** utility to set an incident's escalation level when the incident matches the rule's conditions. Now you need to create a rule that says what should happen when the incident reaches this escalation level. The second rule resembles the following figure. Notice that one of your conditions must be that the incident escalation level equals the level you created in the first rule. If necessary, you can also add other conditions to this rule.



Now you have created a rule to set the escalation level for any incident that matches the conditions and a rule to specify what action should be taken when the escalation level is detected during rules processing.

Creating a variable to measure service quality

A variable is a temporary data item that is assigned a default value at the start of rules processing. You can define rule actions that update the variable during rules processing, and you can also define conditions based on the value of the variable.

Note A custom field can also accomplish the same function as a variable. The difference is that the value of the custom field is stored in the database at the end of rules processing. If its value changed during rules processing as a result of actions applied to it, that value remains and is the one the custom field contains the next time the object is processed by the rules engine. In contrast, the value of a variable is not stored in the database so its value is always 0 when rules processing begins the next time.

A common example of a variable is a score that you set and modify according to the conditions you define. Then you can assign different actions based on the variable's value.

Assume, for example, that you want to be sure your management team is aware of high priority service issues. For the purpose of this example, the following assumptions are made.

- Your organization expects your agents to communicate positively with all customers.

- Because the XYZ Corporation constitutes a significant part of your business, you want to be sure that contacts from that company are satisfied with the service they receive from your organization.
- You want to be especially sure that managers from the XYZ Corporation are happy with your service.

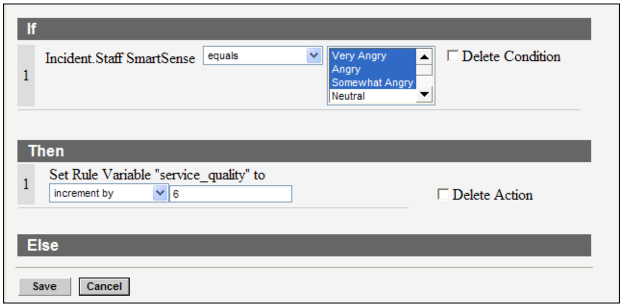
Here are the steps you can take to create rules based on service quality measurements.

Step 1—Create a variable called *service_quality*.

Step 2—Create rules that set the value of the variable. Because you want the variable to change based on different conditions, you will need multiple rules to accomplish this. Rather than add these rules to a state, it is a good idea to create a function that scores the incident. Then you can call the function from multiple states instead of having to add the set of rules to each state you want to run them from.

First create a function called Service Quality Scoring. Then create rules within the Service Quality Scoring function that assign the appropriate weighting to the various factors you want to track. You might choose to create a set of incident rules similar to the following to identify service issues.

- If the staff member's **SmartSense** rating is Somewhat Angry, Angry, or Very Angry, increment the variable *service_quality* by +6.



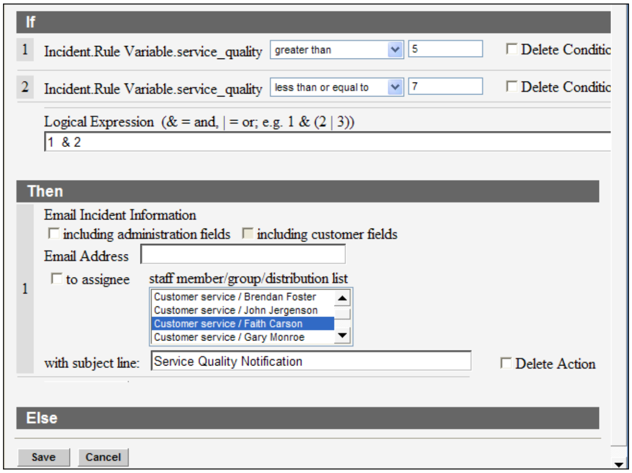
Next add the following rules to the function.

- If the staff member's SmartSense rating is Neutral, increment the variable by +1.
- If the organization is the XYZ Corporation, increment the variable by +2.
- If the customer SmartSense is Somewhat Angry, Angry, or Very Angry, increment the variable *service_quality* by +6.
- If the **contact type** is Manager or Vice-President, increment the variable by +2.

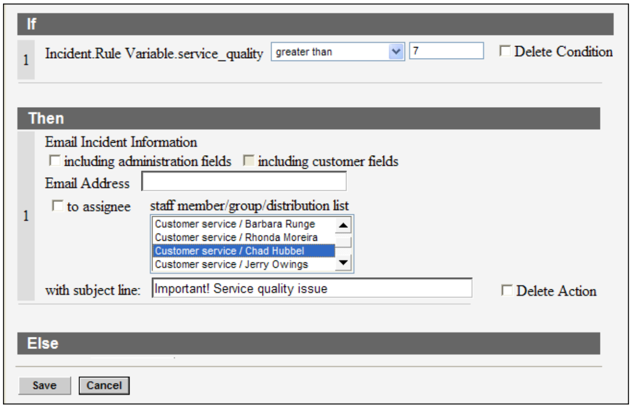
Now you have created five rules within the Service Quality Scoring function that will increment the *service_quality* variable when any of the conditions are met. You might decide that high values of this variable warrant attention from a customer support supervisor or manager, so you can now create rules that depend on the value of the variable.

Step 3—Create rules that specify the actions for different values of the variable. Your rules might look like those in the following two figures.

- If *service_quality* is greater than 5 and less than or equal to 7, email the incident information to the customer support supervisor at your organization.



- If *service_quality* is greater than 7, email the incident information to the manager of customer support.



Using these rules, you can see that no email is triggered if a manager (+2) at XYZ (+2) is happy or neutral (no change because rule conditions are not met) and if the agent SmartSense rating is neutral (+1 for neutral). In this situation, the variable is 5 (2+2+1).

Any time a staff member's SmartSense rating registers anywhere in the angry range, the customer support supervisor is notified because the variable is at least 6. Also notice that any angry customer will trigger a notification to the supervisor because the variable is also 6.

An unhappy (+6) manager (+2) from XYZ (+2) results in a *service_quality* variable of at least 10, and possibly more, depending on the agent's SmartSense rating. This situation triggers an email to the manager of your customer support department.

Whenever the rules engine begins processing a new or updated incident, the value of the *service_quality* variable is initialized at 0 again.

Applying SLAs and crediting incidents to SLAs

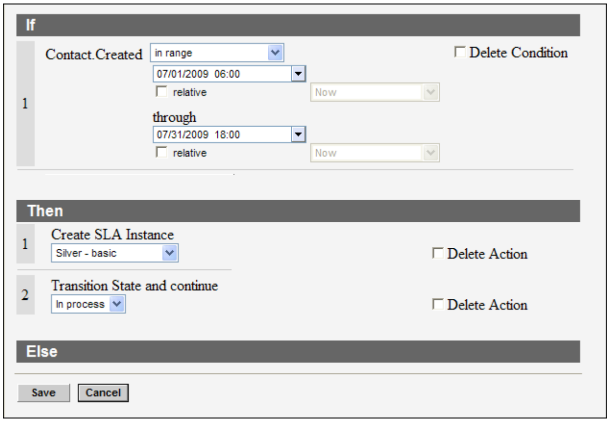
Business rules let you apply SLAs (service level agreements) automatically to your customer records. You can apply SLAs using contact, organization, or incident rules.

When you apply an SLA to a customer (either automatically through business rules or manually through the Service Console), you define a certain level of customer support the customer is entitled to. Then, when the customer submits an incident, the incident can be credited against the SLA, effectively reducing the number of remaining incidents by one. In addition to using business rules to apply SLAs to the customer record, you can also use them to credit an incident to an SLA.

Note Remember that SLAs can be applied only to contacts that are not associated with organizations. If a contact belongs to an organization, the SLA must be applied to the organization. Then, any incidents submitted by contacts belonging to the organization will be credited to the organization's SLA.

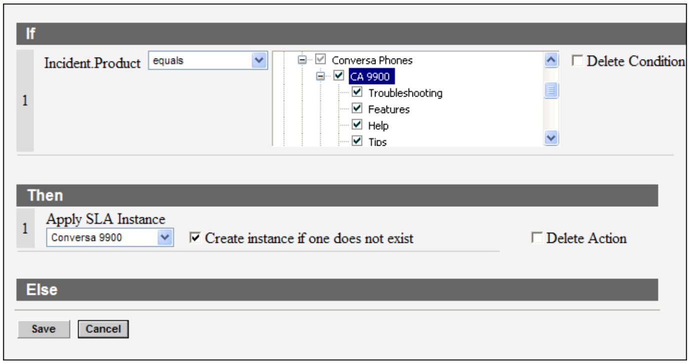
Before you add rules to apply an SLA, you first need to create the SLA. Refer to Creating SLAs.

Assume you want to apply an SLA to all customers whose contact records are created during the month of July. When you click the Add Action–Then button, first select Modify Service Level Agreements and then select Create SLA Instance. Your rule might resemble the following figure.



Instead of using contact or organization rules to apply an SLA, there may be times you want to apply an SLA based on the conditions of an incident. For example, assume your organization has just released a new product that is causing customers some confusion. When customers submit a question to your support team through the Ask a Question page regarding that product, you want to automatically assign them an SLA that allows them to submit a certain number of additional incidents regarding that product for a specified time period.

Unlike contact and organization rules, incident rules do not have a Modify Service Level Agreements > Create SLA Instance action. In incident rules, the action that credits the instance to an SLA also lets you create an instance of the SLA for the customer if one does not already exist. (If the SLA had already been applied to the contact, it is not necessary to select the check box for Create Instance If One Does Not Exist.) The rule you create will resemble the following figure.



Relative time conditions

Several rule conditions let you select a date and time. For example, you might want to add a rule with the condition "If the task due date is within the range from April 1 to April 8." The following conditions allow date/time selection.

- Banner Updated for answers, contacts, incidents, opportunities, and organizations
- Acquired and Created for contact rules
- Created, Updated, Initial Contact, Forecast Close, Date Closed, Lost Date, and Recall for opportunity rules
- Acquired for organization rules
- Purchased Products Date Purchased for target rules
- Completed Date, Created, Updated, Due Date, Planned Completion Date, and Start Date for task rules

The ability to set a condition based on a specific date and time (whether that date/time value is before, after, equal to, or within a range you specify) is a useful tool. However, there may be times when you want to set a relative date/time value. For example, you may want a condition "If the task due date is less than 8 hours from now." In that case, you can select a relative time for the rule's condition. Relative time calculates the number of minutes or hours from the current time or from a specific event, such as time created or time updated.

The following figure shows a rule that can be used to notify a staff member who has been assigned a task that is due within the next eight hours.

Custom Fields

When you first implement Oracle Service Cloud, you might find that additional fields are needed to collect the information you require. For example, a company that sells shoes might need to store the customer's shoe size. By adding custom fields to your **knowledge base**, you can be sure you are collecting the information required to best meet your organization's needs. Once you've added custom fields, you can add them to **workspaces** and **scripts**, use them as search filters in reports, and use them as audience filters in Oracle RightNow Outreach Cloud Service (Outreach) and Oracle RightNow Feedback Cloud Service (Feedback).

Adding and editing custom fields

When adding a custom field, you can specify whether it is visible and editable on the **Service Console** and, for some custom fields, visible and available to gather details on the **customer portal**. You can also specify a **data type** for the field, choose whether the field is required or not, and set a default value. **Text field** data types allow you to create an input mask to require that information entered in the field matches a defined format.

Note A combined maximum of 500 custom fields and **system attributes** can be created for each **standard object**. That is, if you have 100 incident custom fields, you could create 400 system attributes for the incident object. In addition, a combined maximum of 9 custom fields and system attributes can be indexed for each standard object. Refer to Creating system attributes.

The following table describes the types of custom fields.

Table 51: Custom Field Types

Custom Field Type	Description
Common	You can add the following types of Common custom fields: Staff Account, Contact, Organization, Sales Products, and Task.
Staff Account	Add this type of custom field to store additional information about your staff members in their staff account (for example, their hiring date). Staff account custom fields appear on the Custom Fields page of the Staff Accounts editor. **Tip:** You can organize custom fields in the Staff Accounts editor by creating folders in the Custom Fields editor.
Contact	Add this type of custom field to gather additional information about your contacts (for example, their age). Contact custom fields can be displayed when adding or editing a contact record, while engaged in a chat session, and on the customer portal.
Organization	Add this type of custom field to gather additional information about your organizations (for example, the number of employees in the organization). Organization custom fields can be displayed when adding or editing an organization.
Sales Products	Add this type of custom field to specify additional information about sales products in your product catalog (for example, international product availability). Sales products custom fields appear on the Custom Fields page of the Product Custom Fields editor.
Task	Add this type of custom field to store additional information about tasks for your staff members when adding or completing a task.
Service	You can add the following types of Service custom fields: Incident and Answer.
Incident	Add this type of custom field to gather additional information about customers' questions (for example, model and serial numbers). Incident custom fields can be displayed when adding or editing an incident and on the Ask a Question and Support History pages.

Table 51: Custom Field Types (Continued)

Custom Field Type	Description
Answer	Add this type of custom field to store and provide additional information about answers in your knowledge base (for example, version numbers the answer applies to). Answer custom fields can be displayed when adding or editing an answer and on the Answers and answer detail pages.
Opportunity Tracking	You can add the following types of Opportunity Tracking custom fields: Opportunity and Quote.
Opportunity	Add this type of custom field to gather additional information about opportunities (for example, the contact's previous service or product). Opportunity custom fields can be displayed when adding or editing an opportunity.
Quote	Add this type of custom field to store additional information about the sales quotes sent to customers (for example, the date the quote was requested). Quote custom fields can be displayed when adding or editing an opportunity.

You can create folders to group and organize your custom fields in the Custom Fields tree. By dragging and dropping custom fields in the tree, you can reorder them or move them into folders. Refer to Adding folders.

Adding custom fields is similar for each of the custom field types. Although this section contains the procedure for adding a contact custom field, use the same procedure to add all other types of custom fields.

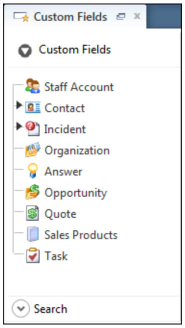
Important When you add or edit custom fields, those modifications may be completed in real time or scheduled and performed in the background. Staff members and customers can continue to use your site while the background operation is in progress.

Once a custom field operation is scheduled, it cannot be modified or aborted.

To add or edit a custom field

1 Click the Configuration button on the **navigation pane**.

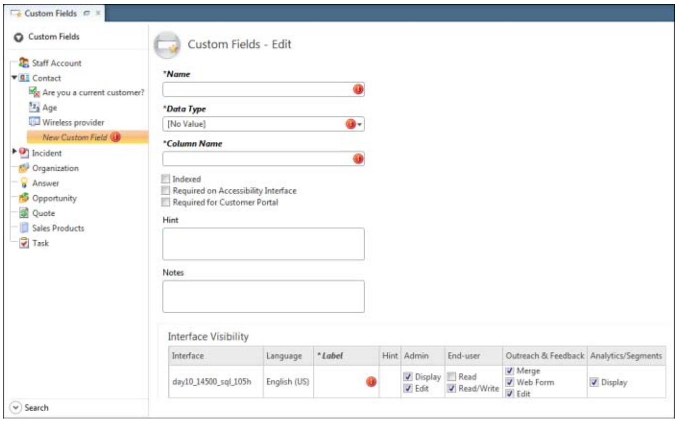
2 Double-click Custom Fields under Database. The **content pane** displays the Custom Fields tree.



3 To add a contact custom field, click Contact in the Custom Fields tree and click the New button on the **ribbon**. The editor opens.

Or

To edit a contact custom field, click it in the tree.



4 Type the name of the custom field in the Name field.

Tip You can assign a shortcut key to the custom field after you have added it on the workspace designer. See step 9 in To add a field to a workspace or script.

5 Click the Data Type drop-down menu and select the data type for this field. The following table contains a description of each data type. You cannot change the data type when editing an existing custom field.

Table 52: Custom Fields Data Types

Data Type	Description
Date Field	Select this option to add a custom field for entering a date. For staff members, the date is entered using a calendar. For customers on the customer portal, the date is entered using separate drop-down menus for month, day, and year.
Date/Time	Select this option to add a custom field for entering a date and time. For staff members, the date is entered using a calendar and the time is entered through a separate field. For customers on the customer portal, the date is entered using separate drop-down menus for month, day, year, hour, and minute.
Integer	Select this option to add a custom field for entering numeric values (for example, product or registration numbers). Integer fields can contain up to 10 digits.
Menu	Select this option to add a field with a drop-down menu from which customers and staff members can select an item. **Note:** Menu type custom fields are the only custom fields that display in answer reports through Oracle RightNow Wireless. Refer to Oracle RightNow Wireless.
Text Area	Select this option to add a text box (1-4000 characters).
Text Field	Select this option to add a text field (1-255 characters). **Note:** Masks can be used only with Text Field data types. Refer to Input masks.
Yes/No	Select this option to add a field with a Yes and No radio button.
Opt-in	Select this option to add a custom field that lets customers opt in or out of Outreach mailings and Feedback surveys. **Note:** This option is available only when adding a contact custom field.

6 Enter the following field information. The available fields vary depending on the selected data type.

Table 53: Custom Fields Editor Description

Field	Descriptions
Field Attributes	Select from the following field attributes. The data type you selected determines which field attributes are available.
*Column Name	Type the name of the field as you want it to appear in the database. You cannot use spaces or punctuation, and the value cannot start with a number. The column name in the database will be appended with the prefix c$. For example, if you add a custom field with the column name calling_plan, it will appear in the database as c$calling_plan.
Indexed	Select this check box to add a database index. This is useful if you want to use this field as a fixed or run-time filter in reports. **Indexing**, although not necessary, can make searching more efficient when the field is frequently searched on. **Note:** Indexing is not available for the text area and Yes/No data types. Also, only nine custom fields can be indexed per database table.
Required	Select this check box to make the custom field required when you **initially** add the field to a workspace. This setting can be overridden by the field's behavior properties in the workspace. Refer to Setting hidden, required, and read-only properties. **Note:** This option is available only for staff account and sales product custom fields.
Required on Accessibility Interface	Select this check box to make the custom field required on the **accessibility interface**. Selecting this check box will also make the custom field required when you **initially** add the field to a workspace. However, this setting can be overridden by the field's behavior properties in the workspace. Refer to Setting hidden, required, and read-only properties. **Note:** This option is available only for answer, contact, incident, and organization custom fields.
Required for Customer Portal	Select this check box to make the custom field required on the customer portal. **Note:** This option is available only for contact and incident custom fields.

Table 53: Custom Fields Editor Description (Continued)

Field	Descriptions
Hint	Type additional prompt information to display on the administration interface and the customer portal. The hint appears to customers to the right of the custom field in a smaller font than the name. It appears to staff members when they hover over the field on the administration interface. The hint field can contain up to 4000 characters.
Notes	Type any notes about the custom field in this text box.
Data Details	Select from the following data details. The data type you selected determines which fields are displayed in this section.
Mask	Type an input mask to restrict what can be typed in the field when you select Text Field as the data type and the Plain Text or Phone as the usage. For instructions on using masks, refer to Input masks. **Note:** This option is available only with text field data types.
Default Value	Select or type a default value for this field. Default options depend on the type of field. For example, a Yes/No field has three options from which you can choose a default (Yes, No, None). Other field types require you to type in a value.
Menu Items	Click the Add button at the top of the Data Details section to add a menu item. The added items appear at the bottom of the list. To delete an item in the menu, select the row containing the item and click the Delete button at the top of the Data Details section. Use the up and down arrows to change the order of menu items. **Note:** This option is available only with menu data types. If you have selected this data type, you must enter at least one menu item.
Sort by Sequence in Reports by Default	Select this check box to make the custom field order the default sorting option for menu custom fields in reports. If you do not select this check box, the default option will be alphanumeric sorting.
Name	Type the name of the item in the Name column of the menu items grid.
Default	Select the Default check box to make a menu item the default selection in the drop-down menu.

Table 53: Custom Fields Editor Description (Continued)

Field	Descriptions
Label	Type the label of the menu item for each interface. **Note:** Each language can have a different label. In interfaces that have the same language as the primary interface, the Label field will always match the menu item Name field.
Size of field	Type the maximum number of characters for this field. This option is available for text fields. Text fields can contain up to 255 characters. **Note:** This field is required if you have selected the text field data type. This field will be automatically completed if the field has a mask. Refer to Input masks.
Minimum	Type the minimum value for this field. This option is available for integers. Integers can contain up to 10 characters. **Note:** This field is required if you have selected the integer data type. The smallest value allowed for this field is -2147483645.
Maximum	Type the maximum value for this field. This option is available for integers. Integers can contain up to 10 characters. **Note:** This field is required if you have selected the integer data type. The largest value allowed for this field is 2147483647.
Usage	Click this drop-down menu to select how the custom field is displayed when editing a record containing the custom field. • Plain Text—The value of the custom field is displayed as a plain text field. • URL—The value of the custom field is a URL and staff members can click a button to open the URL in a web browser. • Email Address—The value of the custom field is an email address and staff members can click a button to send an email. • Phone Number—The value of the custom field is displayed as a phone number. **Note:** This option is available only with the text field data type.

Table 53: Custom Fields Editor Description (Continued)

Field	Descriptions
Interface Visibility	Select the interface visibility options and create labels and hints for this field on each interface. For a description of visibility options, see Setting custom field visibility.
Label	Type the text prompt for the custom field. This is the prompt that staff and customers will see on the interface. **Note:** Each language can have a different label. In interfaces that have the same language as the primary interface, the Label field will always match the Name field.
Hint	Type the hint that will appear when staff and customers hover over the field label. **Note:** Each language can have a different hint. In interfaces that have the same language as the primary interface, the Hint field in the Interface Visibility grid will always match the primary Hint field.

7 Click the Save and Close button to save the custom field and display it in the tree.

8 Click Yes to confirm that you want to add or edit your custom field.

Note If your site has 100,000 or more rows in its database table, a flag appears next to the custom field in the Custom Fields tree along with the label “Scheduled” or “In Progress.” Once the operation is complete, the Custom Fields tree is refreshed and the flag and label no longer appear.

Setting custom field visibility

When adding custom fields, you have several visibility options. The visibility options define where and how custom fields are presented on the **administration interface** and the **customer portal**. For example, you can make a contact custom field visible to staff members when adding an incident, but restrict their ability to edit it.

Custom fields with end-user visibility are displayed on the customer portal. If you display a custom field that is not editable by customers, it does not appear on the Ask a Question page. There are other ways to determine visibility on the customer portal, such as **widgets** and page code. Refer to Custom fields input and output.

Important Answer, incident, contact, opportunity, organization, quotes, and tasks custom fields must also be added to the appropriate record's **workspace**. Refer to Adding fields to workspaces and scripts.

The Admin Edit visibility setting must be selected in order for a custom field to be available to add to workspaces and **scripts**. Once a custom field is added to a workspace or script, its visibility, read-only, and required attributes are determined by the properties set in the workspace or script. Refer to Adding and editing custom fields.

The following visibility settings are available for custom fields.

Table 54: Custom Field Visibility Descriptions

Field	Description
Staff Account	The following visibility options are available for staff account custom fields.
Admin Edit	Select this check box to allow staff members to set the value of this field when adding or editing a staff account. If cleared, the field will not be visible on the Custom Fields page of the Staff Accounts editor.
Analytics/Segments Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports. Selecting this check box also allows the use of this field for filtering and grouping in segments.
Contact	The following visibility options are available for contact custom fields.
Admin Display	Select this check box to allow the custom field to be added to contact workspaces and to display the custom field when adding and editing contact records.
Admin Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding or editing a contact record. **Note:** You cannot select this check box if the Admin Display check box is cleared.

Table 54: Custom Field Visibility Descriptions (Continued)

Field	Description
End-User Read	Select this radio button to allow customers to view this custom field when updating their profile through the Your Account page. The custom field appears to the customer, but cannot be edited. **Note:** You cannot select this radio button if the End-User Edit check box is cleared.
End-User Read/Write	Select this radio button to allow customers to set the value of the custom field when updating their profile through the Your Account page. **Note:** You cannot select this radio button if the End-User Edit check box is cleared.
Outreach and Feedback Merge	Select this check box to allow the custom field to appear when adding a **merge field** in Outreach or Feedback. If cleared, the custom field will not be available in the menu of fields on the Merge Field window.
Outreach and Feedback Web Form	Select this check box to allow the custom field to appear on the Web Form Field window when adding or editing a document or survey with a web form. If cleared, the custom field will not be available in the menu of fields on the Web Form Field window.
Outreach and Feedback Edit	Select this check box to allow the custom field to appear when setting a field through a campaign or survey flow. If cleared, the custom field will not be available in the menu of fields on the Set Field window.
Analytics/Segments Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports. Selecting this check box also allows the use of this field for filtering and grouping in segments.
Incident	The following visibility options are available for incident custom fields.
Admin Display	Select this check box to allow the custom field to be added to incident workspaces and to display the custom field when adding and editing an incident.
Admin Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding or editing an incident. **Note:** You cannot select this check box if the Admin Display check box is cleared.

Table 54: Custom Field Visibility Descriptions (Continued)

Field	Description
End-user Display	Select this check box to display the custom field on the Support History page when customers view a previously submitted incident.
End-user Edit	Select this check box to allow customers to set the value of this field when submitting an incident through the Ask a Question page.
Chat Display	Select this check box to allow this field to be added to chat workspaces and to allow customers to set the value of this field when requesting a chat session from the Live Help page. **Note:** To be able to add an incident custom field to a chat workspace, you must also select the Admin Display check box.
Answers Migrate on Propose	Select this check box to migrate the value of the custom field when an incident becomes an answer. The value of the custom field is placed in the Notes field of the **proposed answer**.
Outreach and Feedback Merge	Select this check box to make the custom field available when adding a merge field in Outreach or Feedback. If cleared, the custom field will not be available in the menu of fields on the Merge Field window.
Analytics/Segments Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports. Selecting this check box also allows the use of this field for filtering and grouping in segments.
Organization	The following visibility options are available for organization custom fields.
Admin Display	Select this check box to allow the custom field to be added to organization workspaces and to display the custom field when adding and editing organization records.
Admin Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding or editing an organization record. **Note:** You cannot select this check box if the Admin Display check box is cleared.

Table 54: Custom Field Visibility Descriptions (Continued)

Field	Description
Analytics/Segments Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports. Selecting this check box also allows the use of this field for filtering and grouping in segments.
Answer	The following visibility options are available for answer custom fields.
Admin Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding and editing answers.
End-user Display	Select this check box to display the custom field to customers on the answer details page.
Analytics Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports.
Opportunity	The following visibility options are available for opportunity custom fields.
Admin Display	Select this check box to allow the custom field to be added to opportunity workspaces and to display the custom field when adding and editing opportunities.
Admin Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding or editing an opportunity. **Note:** You cannot select this check box if the Admin Display check box is cleared.
Outreach and Feedback Merge	Select this check box to make the custom field available when adding a merge field in Outreach or Feedback. If cleared, the custom field will not be available in the menu of fields on the Merge Field window.
Analytics/Segments Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports. Selecting this check box also allows the use of this field for filtering and grouping in segments.
Quotes	The following visibility options are available for sales quotes custom fields.
Admin Display	Select this check box to allow the custom field to be added to quote workspaces and to display the custom field when adding and editing quotes.

Table 54: Custom Field Visibility Descriptions (Continued)

Field	Description
Admin Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding or editing a quote through an opportunity. **Note:** You cannot select this check box if the Admin Display check box is cleared.
Analytics Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports.
Sales Products	The following visibility options are available for sales products custom fields.
Admin Edit	Select this check box to allow staff members to set the value of this field when adding or editing a sales product. If cleared, the field will not be visible on the Custom Fields page of the Product Custom Fields editor.
Quotes Display	Select this check box to display the custom field when adding or editing a product in an opportunity's quote. The custom field appears on the Quote Product Edit window. **Note:** You cannot select this check box if the Admin Edit check box is cleared.
Quotes Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding or editing a product in an opportunity's quote. The custom field appears on the Quote Product Edit window. **Note:** You cannot select this check box if the Admin Edit check box is cleared.
Purchased Products Display	Select this check box to add the custom field to the *purchased_products* database table. The field is not visible to staff members or customers. **Note:** You cannot select this check box if the Admin Edit check box is cleared.
Purchased Products Edit	Select this check box to add the custom field to the *purchased_products* database table. The field is not visible to staff members or customers. **Note:** You cannot select this check box if the Admin Edit or Purchased Products Display check box is cleared.

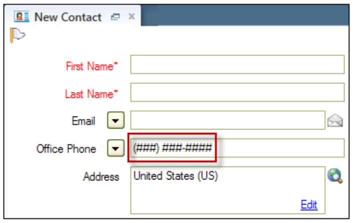
Table 54: Custom Field Visibility Descriptions (Continued)

Field	Description
Analytics/Segments Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports. Selecting this check box also allows the use of this field for filtering and grouping in segments.
Task	The following visibility options are available for task custom fields.
Admin Display	Select this check box to allow the custom field to be added to task workspaces and to display the custom field when adding and editing tasks.
Admin Edit	Select this check box to allow staff members to enter or change the value of the custom field when adding or editing a task. **Note:** You cannot select this check box if the Admin Display check box is cleared.
Analytics Display	Select this check box to allow the custom field to be used as a filter or output column in custom reports.

❖ Custom fields input and output
❖ Adding fields to workspaces and scripts
❖ Setting hidden, required, and read-only properties

Input masks

Input masks are defined patterns that determine the format of information that can be typed in a **text field**. Input masks are useful for preventing data entry errors when a text field has a specific input format that must be followed (for example, a phone number that must include parentheses and a hyphen).



To define a mask pattern, two characters are required to represent one character or digit in a masked text field. The first character does not display in the masked text field, but acts as a rule to define the acceptable input format. The second character displays in the masked text field and acts as an input hint for staff members and customers.

The following table describes the first and second characters that define mask patterns. For specific examples, refer to Input mask examples.

Table 55: Input Mask Characters

Mask character	Description
First character	
F	Formatting character (space, hyphen, parentheses)
U	Uppercase letter
L	Lowercase letter
M	Ignore case (lowercase, uppercase, and numbers are acceptable)
Second character	
#	Numeric (number only)
A	Alphanumeric (either letter or number)

Table 55: Input Mask Characters (Continued)

Mask character	Description
L	Alpha (letter only)
C	Alphanumeric or formatting character

Input mask examples

The following table describes input mask types, their associated patterns, and how they display to staff members and customers in text fields.

Tip In a masked text field, the # symbol signifies a numeric character and the @ symbol signifies an alphabetic or non-numeric character. Formatting characters, such as spaces, hyphens, and parentheses, are static so staff members and customers cannot replace them with other characters.

Table 56: Input Mask Examples

Mask Type	Mask Pattern	Masked Text Field
Social Security Number 123-45-6789	M#M#M#F-M#M#F-M#M#M#M#	###-##-####
Phone number (123) 456-7890	F(M#M#M#F)F M#M#M#F-M#M#M#M#	(###) ###-####
U.S. zip code 12345-6789	M#M#M#M#M#F-M#M#M#M#	#####-####
Canada postal code A1B 2C3	ULM#ULF M#ULM#	@#@ #@#

10

Custom Objects

Custom objects allow **administrators** and developers to rapidly build and extend applications that support unique business processes. By creating custom objects, you can seamlessly integrate organization-specific data with Oracle Service Cloud, allowing you to manage and report on the data in the same way you manage and report on **incidents**, **contacts**, and other **standard objects**. Because custom object data is stored in the database, you can add custom objects to **workspaces**, **workflows**, **custom reports**, and **navigation sets**.

Note Building a complete custom object solution often requires creating different types of custom objects, including packages, objects, menu-only objects, and system attributes. For the sake of simplified discussion, these items are all referred to as custom objects in this documentation unless stated otherwise.

You can take your time when initially creating custom objects to ensure they are correct since they are not written to the database until you deploy them. In addition, since you can export custom objects and import them into other Oracle Service Cloud sites, you can create, deploy, and test custom objects on a non-production site, export them, and then import them into your production site. Refer to Deploying custom objects.

After deploying objects that have the appropriate option selected, workflow and workspace types are automatically created for them and additional profile permissions are made available. This allows your staff members to work with custom objects exactly as they work with standard objects. For example, if you create and deploy an object to store product registration information, a new workspace type will be created that you can use to create new product registration workspaces. You can then add the workspace to your navigation set and edit your **profile** to grant permissions to manage product registration information. **Standard reports** are also automatically created for objects that have associated workflows and workspaces so you can quickly locate specific custom object records and view the relationships between objects. Refer to Using custom objects.

Accessing the object designer

In order to access the object designer, you must have the Object Designer permission on the Administration tab of your profile's Permissions page. You can then create custom objects, import objects that were created on other sites, and deploy custom objects to your database. Refer to Administration permissions. You may also need to add the Object Designer component to your navigation set. Refer to Creating a navigation set for the administrator.

Due to the high degree of change that can be made to your application and database using custom objects, we recommend that few staff members are granted permission to use the object designer.

After performing these steps, you will be able to access the object designer, where you can create objects, import objects that were created on other sites, and deploy custom objects to your database.

- Creating custom objects
- Exporting and importing custom objects
- Deploying custom objects
- Using custom objects

Creating custom objects

Several types of items are available to use in your custom objects solutions, and all are created using the Objects Designer. While some solutions may require one or two of these items, other, more complex, solutions might require all of these items.

- **Package**—Packages are containers that store objects, menu-only objects, and system attributes. Refer to Organizing custom objects.
- **Object**—Objects contain fields, indices, and relationships that you define. You can create fields with different **data types** and other options, and some predefined fields are available for notes, transactions, and other items. When you create and deploy an object, a new table containing the fields you specify is added to the database. Refer to Creating objects.
- **Menu-Only Object**—Menu-only objects contain only menu options that you define. These are created to populate options in menu fields you want to add to multiple objects. Unlike objects, menu-only objects do not have options for fields, indices, and relationships (relationships to menu-only objects are created automatically when you

use menu-only objects in an object). When you create and deploy a menu-only object, a new table containing the menu options is added to the database. Refer to Creating menu-only custom objects.

- **System Attribute**—System attributes are fields that can be added to **standard objects**, such as incidents and contacts. You can select data types, indices, and define relationships for these fields. System attributes can be used in workspaces and reports, just like custom fields can. However, unlike custom fields, system attributes can be used in relationships in custom objects but cannot be used on **customer portal** pages. When you create and deploy a system attribute, a new field is added to the table for the appropriate standard object (such as the *incidents* table). Refer to Creating system attributes.

Note You can add a maximum of 200 objects, and each package can contain up to 25 objects. Menu-only objects do not count toward these limits.

The relationships you define between objects and system attributes help define what you can do with your custom object solution. For items to interact with one another, relationships must be created between them. You can define relationships between objects, system attributes, and standard objects. For example, if you created a product registration custom object, you could create a relationship between it and the *contacts* table. You could also create an object to store information about locations where the product could be purchased, and then create a relationship between the objects. Using this scenario, you could track who registered the product and where they purchased it, managing information in a single **workspace** and displaying it in **custom reports**. Refer to Defining relationships.

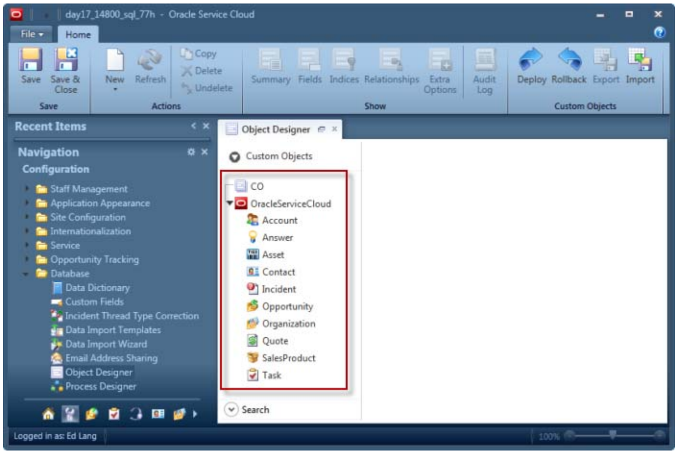
Before you create any custom objects on your production site, we recommend that you create and deploy them on a test site to ensure they function as expected. However, you can edit or delete custom objects if necessary, whether they have been deployed or not. Refer to Editing and deleting custom objects.

Important Only one staff member can edit or create objects in the object designer at a time. An option to override the lock on the object designer is displayed if you attempt to edit or create an object when another staff member is already doing so.

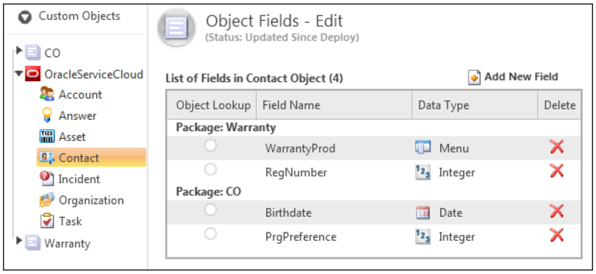
Organizing custom objects

Objects, menu-only objects, and system attributes are all stored in packages that you create. You can place objects in any package you want, but storing related objects in the same package helps you manage them. The object designer includes one default package, named CO, to give you a head start when creating custom objects. You can add objects, menu-only objects, and system attributes to this package, just like you can with any of the packages you create.

The object designer's tree also includes a list of standard objects under the OracleServiceCloud entry to help you manage system attributes, as shown here.



System attributes are stored in packages just like objects are, but it can be challenging to manage numerous system attributes that are stored in several packages. The entries in the OracleServiceCloud list display all the system attributes created for different standard objects. For example, if you click the Contact entry in the OracleServiceCloud list, you will see all the system attributes that have been created for the contacts **standard object**, grouped by the package they are in. An example showing four contact system attributes in two packages is shown here.



Creating objects

When you create an object, you are creating a new table in the database. You can specify fields, indices, and database relationships for each object you create.

To create an object

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. The object designer opens on the content pane.

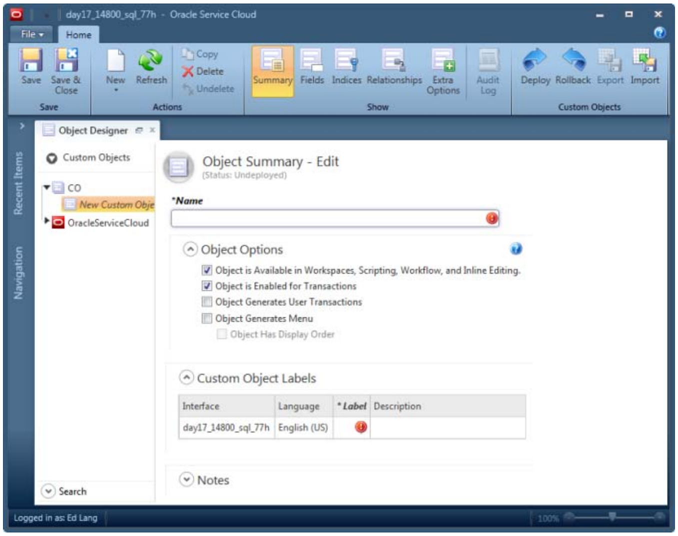
3 Select a package you want to add the custom object to.

Or

To create a new package for the object, click the New button on the ribbon and select Package. Type the name you want for the package. Package names must be between two and eleven characters in length.

Note You can also add custom objects to the default CO package. Package names are used in the names of tables created in the database for custom objects. For example, if you create a Warranty object in the CO package, the resulting table name will be *CO$Warranty*.

4 Click the New button on the ribbon and select Object. The Summary page displays.



5 Type a name for the object in the Name field. The name you define identifies the object in the database. Staff members generally see the custom object's label, defined in step 7, when working with the object.

Note Object names must start with a letter, cannot contain special characters other than the underscore character (only single underscores are allowed), and cannot contain more than twenty characters. In addition, certain words cannot be used as object or field names since they are reserved for use by other processes. If you attempt to save an object that uses a reserved word, a validation message informs you that the name must be changed.

6 Enter the following field information.

Table 57: Summary Page Description

Field	Description
Object Options	Select options in this section to specify where the object is available and other options.

Table 57: Summary Page Description (Continued)

Field	Description
Object is Available in Workspaces, Scripting, and Workflow	Select this check box to make the fields available for use in scripts, workspaces, and workflows. Standard reports and workflow types are created automatically for objects that have this option enabled. Objects do not require this option to be used in custom reports. Refer to [Agent desktop](). **Note:** This option is enabled by default.
Object is Enabled for Transactions	Select this check box to enable tracking of all create and update actions taken on the object's unique records. The transaction data is stored in the Custom Object Transactions (*co_trans*) table and can be viewed using the Audit Log workspace relationship item. **Note:** This option is enabled by default.
Object Generates User Transactions	Select this check box to enable tracking of create, update, and cancel actions taken on the object's unique records by staff members. The transaction data is stored in the Custom Object Transactions (*co_trans*) table and can be viewed using custom reports.
Object Generates Menu	Select this check box to have the object generate a menu used to populate values in menus added to other custom objects. The options in the menu are populated by the values in the **lookup field** specified for the object that generates the menu. For example, if custom object A generates a menu, you can select the menu to populate a menu field you add to custom object B. If object A's lookup field is set to Labels, and the object has three records created for it with labels of "One," "Two," and "Three," the menu in custom object B that is populated by object A will display values of "One," "Two," and "Three." **Note:** Since a menu item is added for each record created for objects that generate a menu, you will want to enable this option only for objects that will have few records created for it.
Object Has Display Order	Select this check box to make the options in the menu generated by the object sortable by sequence numbers that you specify when creating records for the object. Selecting this check box automatically adds a DisplayOrder field to the object's table that can then be added to the object's workspace. **Note:** This option is available only when the Generates Menu check box is selected.

7 To specify a label for the custom object that is different from the name entered in step 5, type the label you want in the Label field under Custom Object Labels. Labels are language specific, so you can use different labels for interfaces with different languages.

Note When an object is initially named, the object's label is automatically populated with the object's name. If the object's name is later edited, the label is not automatically updated.

8 To add a description for the custom object, type the description you want in the Description field under Custom Object Labels. Descriptions are language specific, so you can enter different descriptions for interfaces with different languages.

9 To add notes about the custom object that you or other staff members can read, such as why the object was created, click the arrow next to Notes.

  a Type the note you want in the text field.
  b Click the Add button next to the text field.
  c To add additional notes, repeat steps a and b.
  d To delete notes that have previously been added, click the Delete button next to the note you want to remove.
  e To save changes to the notes, click the Save button on the ribbon.

Note You can add or delete notes in custom objects even after they are deployed.

10 Click the Fields button on the ribbon to add predefined or customized fields to the object. Refer to Adding fields to custom objects.

11 Click the Indices button on the ribbon. The ID field is **indexed** by default, as are fields configured to be object lookups. Fields that have the Is In Single-Field Index option enabled also appear on this page.

Note Indexing a field that is frequently queried can help speed up queries, and you can define up to thirty indices per custom object. However, indexing a large number of fields can result in decreased performance.

12 To add an index to a field, click the Add New Index button.

13 Click the Add Field to Index drop-down menu and select the field you want to index. The selected field displays in the List of Indices in Object area. All field types, except Yes/No and Long Text fields, can be indexed.

Important Each object can have up to eighteen indices for each object. However, this limit also includes indices that are added automatically for each child field used in relationships you create for the object. Refer to Defining relationships.

14 To add a multiple-field index, select the index you want to edit, click the Add Field to Index drop-down menu, and select the field you want to add to the index. The fields in the index display in the List of Fields in Index area.

Note Up to four fields can be used in multiple-field indices.

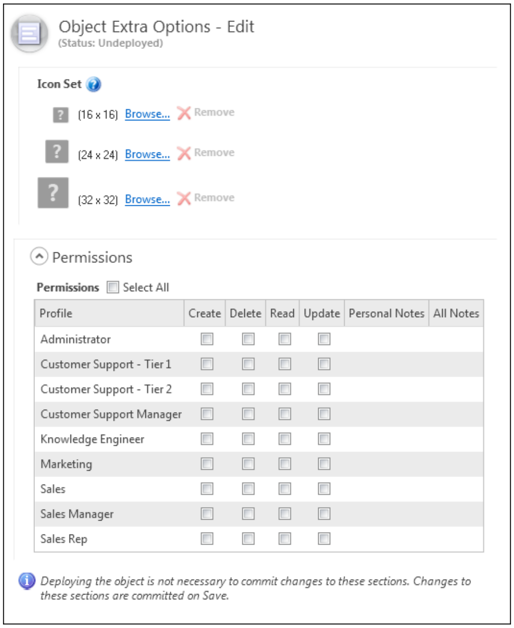
15 To remove a field from an index, select the index you want to edit and click the Delete button next to the field in the List of Fields in Index area.

Note When a field that is used in a multiple-field index is deleted from a custom object, the entire index is automatically removed.

16 Click the Relationships button on the ribbon to define and view table relationships for the object. Refer to Defining relationships.

17 Click the Extra Options button on the ribbon.

Important Changes made on the Object Extra Options page take place when you save the object. Deployment is not necessary.



18 To associate icons with the object to display in the interface, click Browse next to the following image sizes and select the image you want to use.

- **16x16**—Icons of this size are used in record tabs on workspaces, the New Workspace window, and the Workspaces and Scripts explorers.
- **24x24**—Icons of this size are used on navigation buttons.
- **32x32**—Icons of this size are used on the Insert Fields tab of the workspace designer and in flow elements on the workflow designer.

19 Select the check boxes for the permissions you want to grant to staff members associated with each profile. The following permissions are available for each profile. These permissions can also be defined on the Profiles editor.

Table 58: Edit Objects Permissions

Field	Description
Select All	Select this check box to select all permission check boxes for all profiles.

Table 58: Edit Objects Permissions (Continued)

Field	Description
Create	Select check boxes in these columns to allow staff members to create, delete, read, or update records for the custom object.
Delete	
Read	
Update	
Personal Notes	Select check boxes in this column to allow staff members to create, edit, and delete notes in custom object records. **Note:** This check box displays only for custom objects that have the Notes check box selected on the Summary page. Refer to step 6.
All Notes	Select check boxes in this column to allow staff members with this profile to edit and delete any notes added to custom object records, regardless of which staff member added the notes. **Note:** This check box displays only for custom objects that have the Notes check box selected on the Summary page. Refer to step 6.

20 Click the Save and Close button on the ribbon to save the changes to the custom object. A validation is performed when either the Save or Save and Close button is clicked. Any validation errors, such as a missing field name, display in a message and must be corrected before the object can be saved.

21 Deploy the custom objects when you are ready. Refer to Deploying custom objects.

Adding fields to custom objects

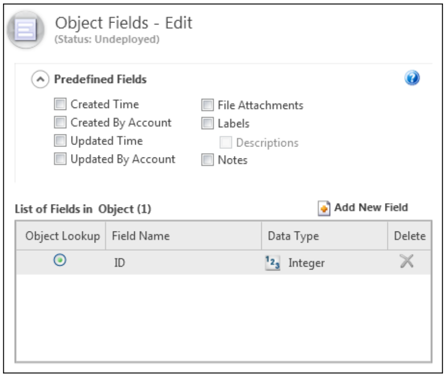
You add fields to objects and system attributes from the object designer's Fields page. When creating fields, you select the field type and specify options for the field that change depending on the type of field you create. While the options on the Fields page are similar when editing objects and system attributes, there are some differences, which are noted in the procedure.

To add a field to a custom object

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. Select the object or system attribute you want to add a field to (refer to To create an object and Creating system attributes).

3 Click the Fields button on the ribbon. The Fields page when editing an object is shown as follows. This page does not include the Predefined Fields section when editing system attributes.



Every custom object includes an Integer ID field. This field contains a unique value for each custom object record that is created.

Note Each object can contain a maximum of 500 fields, but the actual number of fields you can add is restricted by the amount of space each field uses in the database. For example, while an object could have 500 fields with a Yes/No data type, far fewer fields with a Text data type would be allowed since text fields use much more space in the database than Yes/No fields.

4 To add predefined fields to the object, select the fields you want in the Predefined Fields area of the page. Predefined fields are not available for system attributes. The following fields are available.

Table 59: Predefined Fields Description

Field	Description
Created Time	Select this check box to add the CreatedTime field to the object's table. This field tracks when custom object records are created and is updated automatically.

Table 59: Predefined Fields Description (Continued)

Field	Description
Created by Account	Select this check box to add the CreatedByAccount field to the object's table. This field tracks which staff members create custom object records and is updated automatically. **Note:** When you add this field to a custom object, a relationship to the *accounts* table is automatically created. Refer to Defining relationships.
Updated Time	Select this check box to add the UpdatedTime field to the object's table. This field tracks when custom object records are edited and is updated automatically.
Updated by Account	Select this check box to add the UpdatedByAccount field to the object's table. This field tracks which staff members update custom object records and is updated automatically. **Note:** When you add this field to a custom object, a relationship to the *accounts* table is automatically created. Refer to Defining relationships.
File Attachments	Select this check box to add the FileAttachments field to the object's table. Add this field to allow file attachments to be added to custom object records. **Note:** When you add a file attachment to a custom object record, you can change the file name, but the Description and Display Name properties that can be specified for attachments added to standard object records, such as incidents, are not available.
Labels	Select this check box to add the Labels field to the object's table. This field should be added if individual records in the custom object require their own visible labels. (For example, each incident status on your site has a distinct label and each status is a unique record in the *incident statuses* table.) **Note:** A separate Label field is created for each language used on your Oracle Service Cloud site. This allows you to enter a different label for each language.
Descriptions	Select this check box to add the Descriptions field to the object's table. This field is used to store text descriptions of records you add to the object.
Notes	Select this check box to add a Notes field to the object's table where notes about individual records can be stored.

5 To add a customized field to the custom object, click the Add New Field button and select the type of data the field will store. The following data types are available.

Table 60: Data Types Description

Data Type	Description
Yes/No	Select this option to add a field to store Yes or No values (stored as 1 and 0, respectively, in the database). Staff members use drop-down menus to enter values in Yes/No fields.
Date	Select this option to add a field to store a date. Staff members can type values in date fields or select dates using a calendar.
Date/Time	Select this option to add a field to store a date and time. Staff members can type values in date/time fields or use a calendar to select dates.
Integer	Select this option to add a field to store numeric values (for example, product or registration numbers). Integer fields can store numbers from -2147483648 to 2147483647.
Text	Select this option to add a text field. Text fields can be configured to store text, email addresses, or URLs.
Menu	Select this option to add a field with a drop-down menu from which staff members can select items. **Note:** Only one value can be selected at a time in custom object menu fields.

6 Enter the following information for the field. Some options are disabled when using certain field types.

Table 61: Field Information Description

Field	Description
Name	Type the name you want for the field. The name you specify is used in the database. To specify a different display name for the field, type a label name in the Interface Label area, which is also described in this table. **Note:** The name cannot exceed 30 characters.

Table 61: Field Information Description (Continued)

Field	Description
Field Options	Select options for customized fields in this area. Some options are disabled for certain field types.
Is Auto Update	Select this check box to automatically update the field's value when the record is updated. **Note:** This option is available only for fields with Date, Date/ Time, or Integer data types. Auto-update fields are read-only.
Is Nullable	Select this check box to allow null values in the field. Entering values in fields that allow null values is optional when editing a record. **Note:** Fields in deployed objects that have this option selected cannot be later edited to remove the option. However, fields in deployed objects can be edited to add this option. This option is always enabled for system attribute fields. Refer to Creating system attributes.
Is Read Only	Select this check box to give the field read-only access. When this option is selected, values stored in the field cannot be edited but can be used to display information. A default value must be specified for fields that have this option selected. **Note:** This option is available only for fields with Date, Date/ Time, or Integer data types.
Is In Single-Field Index	Select this option to add an **index** entry for the field in cases where the field is the only field in the index. To add a multiple-field index, click the Indices button on the ribbon. Refer to step 14 in the procedure to create a custom object. **Note:** This option is available only for fields with Date, Date/ Time, Integer, or Text data types.
Yes/No Field Settings	Click the Constant Default drop-down menu and select a default value for the field. The available options are None, Yes, and No.
Date and Date/Time Field Settings	Select options for Date and Date/Time fields in this area.

Table 61: Field Information Description (Continued)

Field	Description
Dynamic Default	Click this drop-down menu to select a value used to dynamically populate the field. The dynamic values available for Date and Date/Time fields are the current date or the current time, respectively. This field is set to None by default. **Note:** Dynamic default values are written to a record when the record is saved to the database. When editing an existing record, the dynamic default value is incremented only when another field is edited and the record is saved.
Constant Default	Type a value in this area to use as a default for the field or click the calendar to select a date from a calendar. When you select a date from the calendar for a Date/Time field, the time is automatically set to 12:00 A.M. If you want a different time, you can type it in the field.
Minimum Value*	Type a value in this area or click the calendar to select the minimum date allowed in the field. You can enter dates between January 1, 1902 and January 16, 2038. **Note:** This option is available only for Date fields.
Maximum Value*	Type a value in this area or click the calendar to select the maximum date allowed in the field. You can enter dates between January 2, 1901 and January 17, 2038. **Note:** This option is available only for Date fields.
Integer Field Settings	Select options for integer fields in this area.
Dynamic Default	Click this drop-down menu to select a value used to dynamically populate the field. The dynamic values available for integer fields are the current staff member's account ID or an incremental value. This field is set to None by default. **Note:** Incremental values apply to individual records. All records with dynamic default integer fields initially have a value of 1 in the field. In addition, dynamic default values are written to a field when the record is saved to the database. When editing an existing record, the dynamic default value is incremented only when another field is edited and the record is saved.
Constant Default	Type a value in this area to use as a default for the field. This option is disabled when an option other than None is selected in the Dynamic Default field.

Table 61: Field Information Description (Continued)

Field	Description
Minimum/Maximum	Type the minimum and maximum values allowed for the field in these fields.
Text Field Settings	Select options for text fields in this area.
Field Usage	Click this drop-down menu to select the type of text field you want to create. The following field types are available. • **Plain Text**—Select this option to configure the text field to store from 1 to 255 characters. The maximum number of characters is typed in the Length of Field field. • **Long Text**—Select this option to configure the text field to store one megabyte of characters. • **Email**—Select this option to configure the text field to store email addresses, up to 80 characters in length. Validation is automatically performed on the text entered in this type of field to ensure it corresponds to email patterns defined in the DE_VALID_EMAIL_PATTERN configuration setting. • **URL**—Select this option to configure the text field to store URLs, up to 255 characters in length. Validation is automatically performed on text entered in the field to ensure it corresponds to URL patterns. **Note:** All text field types, except Long Text, can be indexed.
Length of Field	Type the maximum number of characters that plain text fields can store in this area. Values from 1 to 255 can be entered. **Note:** This option is available only for plain text fields.
Pattern	Type a regular expression string pattern to define a format that will be used to verify the contents entered in the field. The carat (^) character is automatically added to the start of the pattern and the dollar sign ($) character is automatically added to the end. This ensures that strings entered in the custom object's field match the entire regular expression. For example, if you want to create a field to store phone numbers in a format of `123-456-7890`, enter a pattern of `[0-9]{3}-[0-9]{3}-[0-9]{4}`. Refer to Regular Expressions. **Note:** This option is available only for plain text and long text fields.

Table 61: Field Information Description (Continued)

Field	Description
Case Sensitive Sorting	Select this check box to recognize case when sorting, with lowercase characters ordered before uppercase characters in ascending order. For example, if the field's contents include values of `CAT, Cat, cat,` and `CAt`, and case-sensitive sorting is enabled, the contents will be sorted as `cat, Cat, CAt,` and `CAT`.
Defacto Unique for Analytics	Select this check box to group the field's contents by the custom object's unique key or ID number rather than the field's values. For example, the First Name field in the *contacts* table is configured to use this option in reports. When running a report that groups incidents by contacts' first names, the report automatically groups by the contact ID number (*contacts.c_id*), which is the primary key in the *contacts* table. This prevents the incidents submitted by all people with the same first name from being grouped together.
Menu Field Settings	Select options for menu fields in this area.
Menu	Click this drop-down menu to select an existing menu field, menu-only custom object, or a custom object with the Object Generates Menu option selected to populate the field's menu options. A read-only relationship to the custom object associated with the selected menu is automatically created. Refer to Creating menu-only custom objects.
Dynamic Default	Click this drop-down menu to select a default value for the menu field that changes dynamically depending on which staff member uses the field and which interface the staff member is logged into. Dynamic default values can be selected for the Accounts By Group, Accounts By Manager, Interfaces, and Languages menu fields.
Constant Default	Click this drop-down menu to select a static default value for the menu field. The available options are populated by the options in the menu field.

Table 61: Field Information Description (Continued)

Field	Description
Use Current User/ Interface/Language as Default	Select this check box to set the default value of the menu field to the value that pertains to the logged-in staff member who is working with the custom object's records. This option displays only when one of the following is selected in the menu field settings drop-down menu. • **Accounts by Manager**—When this field is used, selecting the check box uses the name of the logged-in staff member as the field's default value. • **Accounts by Group**—When this field is used, selecting the check box uses the name of the logged-in staff member as the field's default value. • **Interfaces**—When this field is used, selecting the check box uses the name of the interface the staff member is currently logged in to. • **Languages**—When this field is used, selecting the check box uses the language of the interface the staff member is currently logged in to.
Interface Label	Specify field names in this section. Different labels and descriptions can be used for interfaces with different languages.
Label	Type the label you want for the field name in this text box. By default, the name specified in the Name field is used as the label. Staff members generally see the field's label name when working with the field. **Note:** When a field is initially named, the field's label is automatically populated with the field's name. If the field's name is later edited, the label is not automatically updated.
Description	Type an optional description for the field in this text box. The description displays as a tooltip when viewing the field in workspaces or the report design center.

7 To make a text or integer field a lookup field for an object, click the radio button next to the name of the field in the Object Lookup column. This option is not available for system attribute fields.

The field defined as the object lookup is automatically added as a single-field **index** to the object. If you do not specify a lookup field, the ID field is automatically selected as a lookup field. If you select the Labels check box on the Fields page, the Labels field that is added to the object is automatically selected as the object's lookup field.

Note Lookup fields help identify records when you're working with them. Values in lookup fields are displayed on the editor's tab when you're editing records and in the Recent Items list on the navigation pane. For example, when editing an incident, the incident's reference number displays on the editor's tab since Incidents.Reference # (*incidents.ref_no*) is configured as a lookup field in the database.

In addition, lookup field values are displayed in reports for fields in other tables that join to the lookup field. For example, if you create an object with a *Name* field designated as the lookup field, then define a relationship to another object with a *NameID* field and use this field to join the objects, and then run a report with *NameID* as an output column, the values in the *Name* field will be displayed in the column.

8 To delete a field that you added, click the red X next to the name of the field. The Delete button on the ribbon is used only to delete entire objects or packages with no objects in them. Refer to Editing and deleting custom objects.

9 To edit an existing field, select the field in the list of fields and make the changes you want. Most fields in deployed custom objects can still be edited, though some options may be disabled for certain field types. Refer to Editing and deleting custom objects.

10 Click the Save button on the ribbon to save the object's fields. If you are ready to deploy your custom objects, refer to Deploying custom objects.

Defining relationships

The relationships that you define for your objects determine if the data in the objects can interact with data in other custom objects or **standard objects**. Objects must be related to use fields from one object on another object's **workspace**. For example, if you want fields from the *incidents* table to be available for use on a custom object's workspace, the *incidents* table must have a relationship with the custom object. Refer to Agent desktop.

When relationships are defined, objects are either parents or children of the object you are editing. Most custom objects and standard objects can be either parents or children of other custom objects. Relationships can be made to ten standard objects:

- Accounts
- Answers
- Assets
- Contacts
- Incidents
- Opportunities
- Organizations
- Quotes (cannot be a parent in relationships)
- Sales products (cannot be a parent in relationships)
- Tasks

Note Relationships between the *quotes* and *opportunities* standard objects are not supported.

Whether you are defining parent or child relationships, two types of relationships are available.

- **Aggregation**—This creates a close relationship between records in the objects. Use this type if you want records in the child table to be automatically deleted when their parent record is deleted from the parent table. For example, **incidents** belonging to a **contact** are deleted when the contact is deleted. If several tables are joined with aggregation relationships, deleting a record in the parent table automatically deletes all related records in the other tables.
- **Association**—This creates a loose relationship between records in the objects. Use this type if records in the child table should not be automatically deleted when their associated records in the parent table are deleted. For example, deleting a staff account does not delete incidents created by the account.

When you define relationships between objects, they are joined by integer fields that contain unique values (the field contains a unique value for each record in the object). Each custom object can have one such field. For example, incidents are linked to contacts using the Incidents.Incident ID (*incidents.i_id*) and Contacts.Contact ID (*contacts.c_id*) fields. These are both integer fields that contain unique values. Refer to To create an object.

Note Relationships to menu-only objects are automatically created when the menu-only object is used to populate menu fields in custom objects. These relationships cannot be manually deleted, but are deleted when the menu-only object is no longer used to populate menu fields or when the menu-only object is deleted. Refer to Creating menu-only custom objects.

Relationship restrictions

Before you create relationships, it is important to be aware of constraints in the relationships you can add to an object.

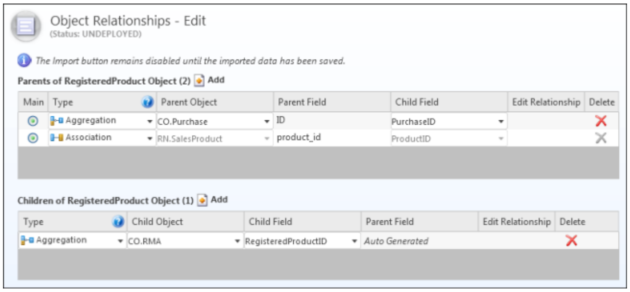
- A maximum of eighteen indices can exist for each custom object. This limit includes indices you create (refer to step 11 of the To create an object procedure) as well as indices that are created automatically. An index is added automatically for each child field used in a relationship.
- Aggregation relationships have limits that do not apply to association relationships.
  - ▷ A maximum of five aggregation relationships can be created for each object.
  - ▷ A maximum of four objects can be joined using consecutive aggregation relationships where each object is a parent of another, with object A being the parent of object B, which is the parent of object C, and so on. This limit does not apply to read-only relationships that are automatically created when certain standard menus are used to populate menu fields in the custom object.
  - ▷ Self-referencing relationships cannot be configured for Aggregation relationships. Refer to Self-referencing relationships.

To define relationships

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. Select the object or system attribute you want to edit relationships for or create a new object (refer to To create an object and Creating system attributes).

3 Click the Relationships button on the ribbon to open the Relationships page. The following screen shows an example of an object with relationships to two parent objects and one child object.



4 To add a parent relationship to the object, click the Add button next to Parents of Object.

Or

To add a child relationship to the object, click the Add button next to Children of Object.

a Click the Type drop-down menu and select the type of relationship.

Aggregation—Use this relationship type if you want records in the child table to be automatically deleted when their parent record is deleted from the parent table. For example, **incidents** belonging to a **contact** are deleted when the contact is deleted.

Association—Use this relationship type if records in the child table should not be automatically deleted when their associated records in the parent table are deleted. For example, deleting a staff account does not delete incidents created by the account.

b Click the Parent Object or Child Object drop-down menu and select the object you want to link to.

c If creating a parent relationship, click the Child Field drop-down menu and select the field in the object you are editing that you want to use as the link to the parent object.

Or

If the object does not have a field that you can use as the link, or if you don't want to use one of the existing fields, you can select Auto Generate New to have an integer field created automatically. The new field will then be added to the object you are editing, and will be used as the link to the parent table. You can view the new field on the object's Fields page.

d If creating a child relationship, click the Child Field drop-down menu and select the field in the child object that you want to use as the link to the object you are editing.

Important If the child is a **standard object**, you will need to select an integer or menu system attribute that has been created for the standard object. If a system attribute does not exist, or if you want to use a different system attribute, select Auto Generate New. A new system attribute with an integer data type will automatically be created for the standard object.

5 If you create more than one relationship to the same object, select the radio button in the Main column next to the relationship you want to use as the main relationship between the object and the custom object.

6 To delete a relationship, click the Delete button next to the relationship.

7 To edit an existing relationship, click Edit in the Edit Relationship field.

8 Click the Save button on the ribbon to save the object's relationships configuration. This also saves any system attributes that have been automatically created for standard objects in step 4. If you are ready to deploy your custom objects, refer to Deploying custom objects.

Self-referencing relationships

Self-referencing relationships can be defined for custom or standard objects that are joined by association relationships. Self-referencing relationships are configured to make an object a parent or child of itself. Workspaces for objects with self-referencing relationships can include relationship items for the object. For example, an incident workspace that includes the Incidents View relationship item can be used to associate one incident with another.

This type of configuration gives you a wide range of customization options. For example, if you have a relationship in which the *incidents* object is a parent of itself, you can configure incident workspaces to allow you to create sub-incidents or related incidents to help you track incidents related to the same issue. Or, if *contacts* is made a parent of itself, you can create contact workspaces that allow links to other contacts, such as customers living in the same residence.

❖ Agent desktop

❖ Relationship items

❖ Creating custom workspaces

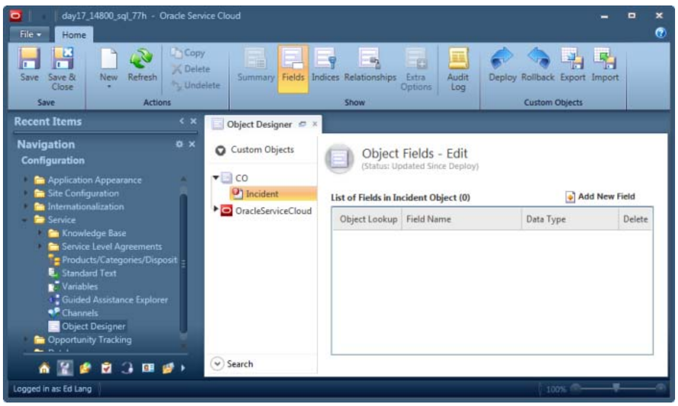
Creating system attributes

System attributes are created and managed from the object designer. You can create system attributes for accounts, answers, assets, contacts, incidents, opportunities, organizations, quotes, sales products, and tasks.

Important A combined maximum of 500 system attributes an ated for each standard object. That is, if you have 100 incident custom fields, you could create 400 system attributes for the incident object. In addition, each standard object can have a maximum of 18 system attributes and custom fields that are **indexed**.

To create a system attribute

1. Click the Configuration button on the navigation pane.
2. Double-click Object Designer under Database. The object designer opens on the content pane.
3. Select the package where you want to place the system attribute.
4. Click the New button, select System Attribute, and then select the standard object you want to create the field for. The Fields page opens.



The procedure to create system attribute fields is identical to that used to create fields for objects. Refer to Adding fields to custom objects.

5 To specify a different package for the system attribute than the one you selected in step 3, click the Package drop-down menu and select the package where the system attribute will be stored.

Or

Select Add Package to create a new package. You will need to edit the package to specify a name for it before you can click the Save button on the ribbon.

6 To define relationships for the system attribute, click the Relationships button and follow the procedure described in Defining relationships. This step is optional for system attributes. If you need to define a relationship to a custom object, you can do so when editing the object.

Note Relationships between the *quotes* and *opportunities* standard objects are not supported.

7 To define indices for the system attribute, click the Indices button and perform the steps described in steps 11 through 15 in the To create an object procedure. Adding indices to system attributes is optional.

8 Click the Save button on the ribbon to save the new field.

9 Click the Deploy button on the ribbon to deploy the new system attribute. Refer to Deploying custom objects.

After you deploy the system attribute, it can be used in reports, workspaces, and custom objects, and you can manage and edit the system attribute from the object designer.

- ❖ Creating objects
- ❖ Defining relationships
- ❖ Deploying custom objects
- ❖ Using custom objects

Creating menu-only custom objects

Menu-only custom objects store menu options for populating menu fields in other custom objects. This allows you to use the same menu lists to populate menu fields in multiple custom objects. In addition, since management of items in menu-only objects is handled from the Customizable Menus tree, it is simple to add, edit, or delete items in the menus whenever you need to.

For example, if you were creating a product registration solution, you could create a menu-only object that lists locations where customers can purchase your products. You could then create another custom object that stores when the product was purchased, who purchased it, and where they purchased it. You could use the menu-only object to populate the menu field that tracks where the product was purchased.

Configuring menu-only custom objects is straightforward since all configuration is performed on the object designer's Summary page. **Ribbon** buttons to access the Fields, Indices, Relationships, and Extra Options pages are disabled. You don't need to configure relationships to menu-only objects since they are created automatically when you use the menu-only objects to populate menu fields in other custom objects. Refer to Defining relationships.

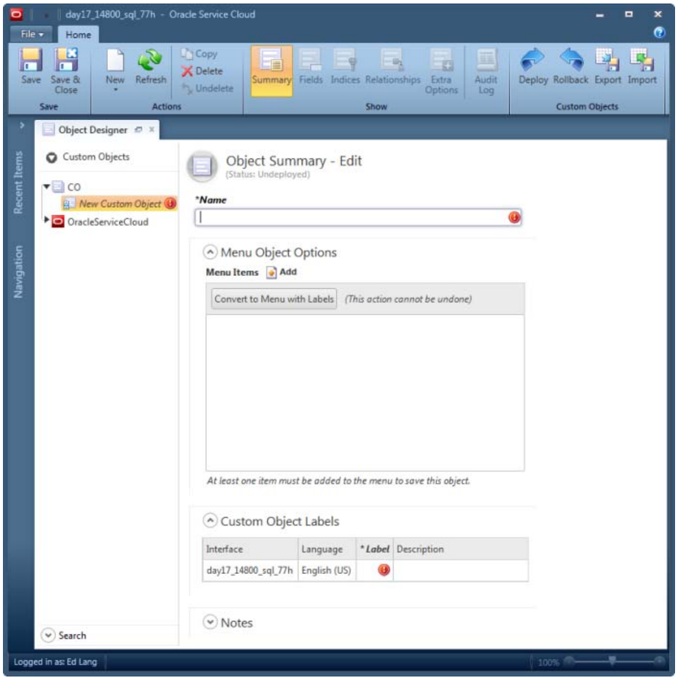
Important Changes to menu items in a deployed menu-only object are performed using the Customizable Menus configuration item. After a menu-only object is deployed, it is treated the same way as other menu objects, such as **industry types** or **incident queues**. Refer to Customizable Menus.

To create a menu-only object

1. Click the Configuration button on the navigation pane.
2. Double-click Object Designer under Database. The object designer opens on the content pane.
3. To create a package for the object, click the New button on the ribbon and select Package. Type the name you want for the package. Package names must be eleven characters or less.

Note You can also add custom objects to the default CO package. Package names are used in the names of tables created in the database for custom objects. For example, if you create a WarrantyMenu object in the CO package, the resulting table name will be *CO$WarrantyMenu*.

4. Select the package you want to add the custom object to.
5. Click the New button on the ribbon and select Menu Only Object. The Summary page displays.



6 Type a name for the object in the Name field. The name you define identifies the object in the database. Staff members generally see the custom object's label, defined in step 12, when working with the object.

Note Object names must start with a letter, cannot contain special characters other than the underscore character (only single underscores are allowed), and cannot contain more than twenty characters. In addition, certain words cannot be used as object or field names since they are reserved for use by other processes. If you attempt to save an object that uses a reserved word, a validation message informs you that the name must be changed.

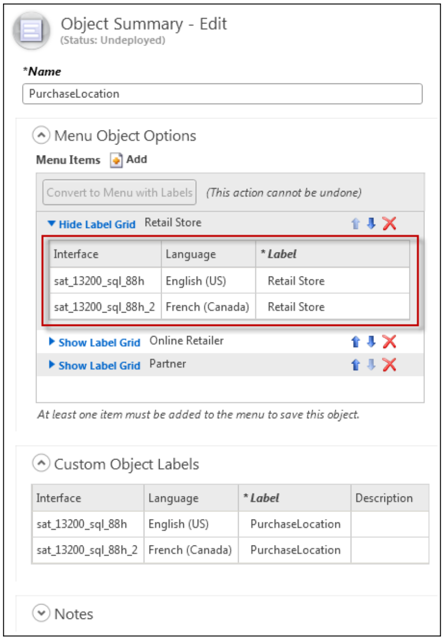
7 Click the Add button to add a menu item. A row is added to the list of menu items.

8 Click the new row and then type a name for the menu item.

9 Repeat steps 7 and 8 to add other menu items.

10 To add language-specific labels to the menu items, click the Convert to Menu with Labels button. This action cannot be undone and it cannot be selected after the object is deployed. Use this option if your site has interfaces with different languages.

a Click the Show Label Grid drop-down menu next to each menu item to display the label grid, which is shown as follows.



b Type the text you want to display for the menu item for each interface in the grid's Label field.

c To hide the grid, click Hide Label Grid.

Note After menu-only objects with labels are deployed, you can modify the text for the labels by editing the objects from Customizable Menus. Refer to Customizable Menus.

11 To change the ordering of the menu items in the list, click the up or down arrow next to the name of the item that you want to move. The item moves up or down in the menu list.

12 To specify a label for the custom object that is different from the name entered in step 6, type the label you want in the Label field under Custom Object Labels. Labels are language specific, so you can use different labels for interfaces with different languages.

Note When an object is initially named, the object's label is automatically populated with the object's name. If the object's name is later edited, the label is not automatically updated.

13 To add a description for the object, type the description you want in the Description field under Custom Object Labels. Descriptions are language specific, so you can use different descriptions for interfaces with different languages.

14 To add notes about the custom object that you or other staff members can read, such as why the object was created, click the arrow next to Notes.

a Type the note you want in the text field.

b Click the Add button next to the text field. The note you added appears below the Notes text field.

c To add additional notes, repeat steps a and b.

d To delete notes that have previously been added, click the Delete button next to the note you want to remove.

e To save changes to the notes, click the Save button on the ribbon.

Note You can add or delete notes in custom objects even after they are deployed.

15 Click the Save and Close button on the ribbon to save the menu-only object.

To use a menu-only object in a custom object

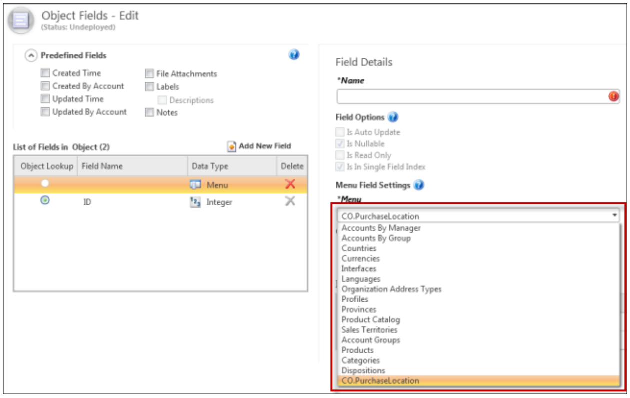
1 Edit the custom object that will use the menu field.

Tip In addition to populating menu fields in objects, you can use menu-only objects to populate the options for system attributes with menu data types.

2 Click the Fields button on the ribbon.

3 Edit or add a menu field to the custom object.

4 Under Menu Field Settings, click the Menu drop-down menu and select the menu-only object you created. The standard menu lists in your site are also available. Options to populate a sample menu field in an object are shown as follows.



5 Click the Save button on the ribbon to save your changes.

6 Deploy the custom objects when you are ready. Refer to Deploying custom objects.

Editing and deleting custom objects

Before custom objects are deployed, you can change any part of their configuration or delete them without impacting the database since they have not been written to the database. If you make numerous changes to custom objects that you later choose not to deploy, you can roll back the changes and the custom objects will revert to the state they were in at the time of the previous deployment (if the custom objects have never been deployed, all custom objects are removed).

After deploying custom objects, you can still update or delete them if necessary, although you must then redeploy them to implement the changes to the database. We recommend redeploying custom objects only if necessary since the database will be altered. Refer to Deploying custom objects.

There are some important considerations to keep in mind before you delete custom objects or fields in custom objects.

- Deleting custom objects that have relationships to other objects results in the relationships also being deleted.
- Deleting fields in custom objects that are used in relationships will also delete the relationships.

- Deleting fields from custom objects that are used in indices will also delete the indices, whether they are single-field or multi-field indices.
- When you delete menu-only custom objects that are used in menu fields in other custom objects, those menu fields are also deleted.

To edit or delete a custom object

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. The object designer opens on the content pane.

3 To edit a custom object, select it in the Custom Objects list and make your changes. Refer to Creating objects, Creating system attributes, or Creating menu-only custom objects.

Important To edit items in a menu-only custom object that has been deployed, use the Customizable Menus configuration item (located under Configuration > Application Appearance). After a menu-only object is deployed, it is treated the same way as other menu objects, such as industry types or incident queues. Refer to Customizable Menus.

4 To delete a custom object, select it in the Custom Objects list, click the Delete button on the ribbon, and then click the Yes button on the Delete Action window.

   a To restore the deleted custom object, click the Undelete button on the ribbon. This button is disabled if the custom object was not previously deployed.

5 Click the Save button on the ribbon to save the changes.

6 To write the changes to the database, you need to deploy the custom objects. Refer to Deploying custom objects.

7 Click X on the top right of the console to close the object designer.

Note If you attempt to close the object designer without saving your changes, a Data Modified message displays asking if you want to save the changes. If you select No, all changes to your objects will be lost.

To roll back changes to custom objects

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. The object designer opens on the content pane.

3 Click the Rollback button on the ribbon. A message displays to confirm the rollback.

Important After confirming the rollback in the next step, the undeployed edits made to your custom objects are immediately removed. Clicking the Save or Save and Close button on the ribbon has no impact after confirming the rollback.

4 Click the OK button on the Rollback confirmation message.

Deploying custom objects

After you create custom objects, you must deploy them to apply the changes to the database. When you deploy custom objects, the database is updated to add new fields, tables, relationships, and indices for the custom objects, so it is important that they are correct before you deploy them.

Important When a deployment occurs, the object designer is unavailable until the deployment completes. An email is sent to a specified address upon completion or if the deployment fails to complete.

When you deploy custom objects, all custom objects in all packages are deployed. Custom objects that have previously been deployed will be examined for changes. If no changes have been made to those objects since the previous deployment, the objects are ignored during deployment.

During deployment, several tasks are performed that can take some time. The custom objects are first written to a file, and then the database is updated to add the tables, fields, indices, and keys for your custom objects. Given how intensive this process is, deploying on your production site should be performed after business hours or when work on the site is at a minimum. You can schedule deployments to occur when you want and you can specify the maximum amount of time that can be granted to the deployment, so scheduling a deployment for off-peak times is easy.

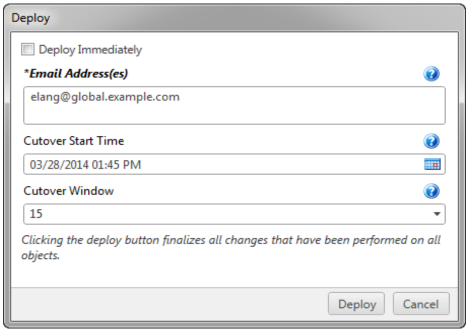
To deploy a custom object

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. The object designer opens on the content pane.

Note Before you deploy the custom objects, we recommend that you first review them to ensure that no additional changes are needed.

3 Click the Deploy button on the ribbon to open the Deploy window.



4 Type the email addresses you want to send notifications to in the Email Address field. Multiple addresses must be separated by commas. The logged-in staff account's email address is automatically added to the field. Addresses entered in this field receive emails when deployment completes or when an issue preventing deployment is encountered.

5 Specify when you want the deployment process to begin.

The amount of time required for deployments varies significantly depending on a number of factors, including the number of custom objects being deployed, the fields they contain, and the relationships that must be created. In general, deploying new custom objects takes less time than re-deploying existing custom objects to modify or add fields, since the tables for existing custom objects may contain large numbers of records that will need to be updated.

a To immediately deploy all custom objects, select the Deploy Immediately check box.

Important This option should be used with caution on production sites. If you use this option on a production site and the deployment takes a long time, your site may be negatively impacted until the deployment completes.

b To specify a time when you want the deployment process to start, enter the date and time you want the deployment to begin in the Cutover Start Time field. You can either type the date and time you want or you can click the calendar next to the field and select the date for the deployment. The default time is the current time, adjusted for the time zone defined in your staff account. The start time can be no more than forty-eight hours past the current time.

c Click the Cutover Window drop-down menu and select the amount of time after the cutover start time that the deployment process can start.

The window defines the period during which the cutover process can begin. The process may not start immediately at the specified cutover start time due to issues that may prevent the cutover from starting such as the database being unavailable or a utility being unable to run. If the cutover cannot start during this window, the deployment process is halted and an email is sent to the address specified in step 4.

Important If the deployment process fails to begin during the cutover window, you will need to open the object designer and select the deployment options again. No other options are available on the object designer until deployment completes.

6 Click the Deploy button to schedule the deployment of the custom objects. A Deploy message displays.

7 Click the Yes button to confirm the deployment. The object designer will be unavailable until the deployment completes.

After custom objects are deployed, new workspace types are made available for objects that have the Object is Available in Workspaces, Scripting, and Workflow option enabled so you can work with them in the same way you work with incidents or contacts. In addition, standard reports are automatically created for deployed objects that have this option enabled. Refer to Using custom objects.

Exporting and importing custom objects

Before you deploy custom objects on your production site, we recommend that you first test them on a test site that is similar to your production site. This helps ensure that the custom objects function as expected and interacts with other data in your site the way you want. After verifying that the custom objects are configured correctly on the test site, you can export the objects from the test site and then import them into your production site. The imported objects will include all the fields, indices, and other attributes originally configured for them. The objects' relationship configuration is also included as long as all the related custom objects are exported and imported.

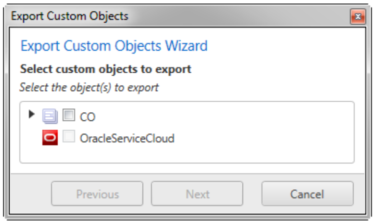
Important Only custom objects that have been deployed can be exported. In addition, only system attributes, menu-only objects, and objects that have the Object is Available in Workspaces, Scripting, and Workflow option selected can be exported. Since a maximum of twenty-five custom objects can be imported at a time (not including menu-only objects), we recommend exporting no more than twenty-five custom objects at a time. Multiple export files can be created and then imported.

To export custom objects

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. The object designer opens on the content pane.

3 Click the Export button on the ribbon. The Export Custom Objects Wizard opens.



Packages that do not contain deployed objects are disabled and cannot be selected for export. In the wizard example above, the CO package includes deployed custom objects that can be exported. The OracleServiceCloud package, which contains system attributes, is disabled since no system attributes have been created in this example.

4 Click the arrow next to a package to display the objects in the package and then select the check boxes next to the objects you want to export.

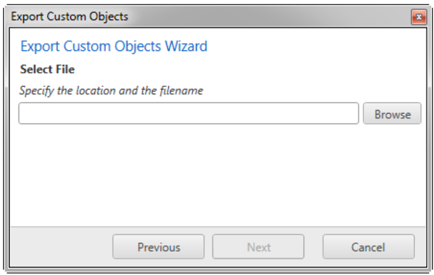
a To select all the objects in the package, select the check box next to the package name.

5 Click the Next button.

6 If the objects selected for export have aggregate child relationships to other custom objects that are not selected for export, the next page of the wizard gives you the option to also include the parent custom objects in the export. Refer to Defining relationships.

  a Clear the check boxes next to the objects you do not want to export. By default, custom objects that are aggregate parents of objects selected for export will also be exported.

7 Click the Next button.



8 Click the Browse button to open the Save As window to select the location where you want to save the export file and type a name for the file. The export file will be saved with a *.zip* extension. Click the Save button on the Save As window.

Or

If you know the path where you want to save the file and the file name you want to use, type it in the text box instead of clicking the Browse button.

9 Click the Finish button. A message informs you that the export was successful. Click the OK button to close the message and the Export Custom Objects Wizard.

10 To export additional objects, which you may need to do if exporting more than twenty-five objects, repeat steps 3 through 9.

11 Click X on the top right of the console to close the object designer.

To import custom objects

1 Click the Configuration button on the navigation pane.

2 Double-click Object Designer under Database. The object designer opens on the content pane.

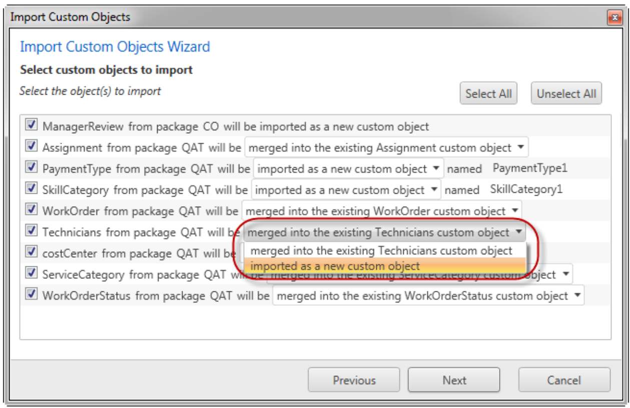
3 Click the Import button on the ribbon. The Import Custom Objects Wizard opens where you select the file to import.

4 Click the Browse button to select the *.zip* file that contains the custom objects you want to import and then click the Open button.

Or

If you know the path and file name of the import file, type it in the text box instead of clicking the Browse button.

5 Click the Next button. The next page of the wizard opens, showing you the custom objects that will be imported. Objects are displayed in the Select the Object(s) to Import area of the page, and system attributes are displayed in the Select the Field(s) to Import area, as seen here.



If you import objects with the same package and object names as existing objects on the site, you can either merge the imported objects with the existing ones or create new objects with different names. If you choose to merge the objects instead, the existing object is updated to include additional fields that are in the imported object. No changes are made to fields in the existing object that are not in the imported object.

Note Menu-only objects and system attributes cannot be merged. When these are imported into a site that has matching items with the same names, the imported custom objects will automatically be given new names.

6 Select options for the imported objects.

a To create a new custom object instead of merging a custom object, click the arrow next to the text that reads "merged into the existing custom object" and select "imported as a new custom object," as seen in the preceding screen. A default name for the new object displays next to the drop-down menu. Click the default name and type a new name in the text box to define a different name.

b To prevent a custom object from being imported, clear the check box next to it. To clear the check boxes next to all custom objects, click the Unselect All button.

Note If you clear the check boxes next to objects with a parent-child relationship and then add the child object back to the import, the check boxes next to the parent objects are selected automatically. This ensures that all objects required for a relationship are included in the import. You can then clear the check boxes next to the parent objects if you do not want to import them.

7 Click the Finish button to complete the import. A message informs you that the import was successful. Click the OK button to close the message and the Import Custom Objects Wizard.

8 To import additional objects, which you may need to do if importing more than twenty-five objects, repeat steps 3 through 7.

9 To deploy the imported objects on your site, click the Deploy button on the ribbon. Refer to Deploying custom objects.

10 Click X on the top right of the console to close the object designer.

Using custom objects

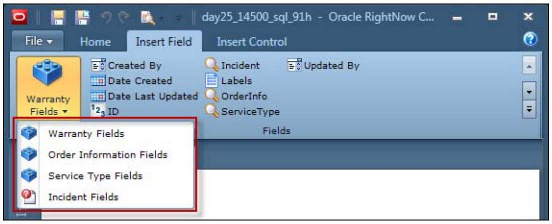
After deploying custom objects, they are treated in the same way as **standard objects** and **custom fields**. However, before you can work with custom object records or report on them, you need to perform some additional steps.

- Create **workspaces** your staff members will use to work with custom object records. Refer to Agent desktop.
- Add reports to your staff members' **navigation sets** so they can create and access custom object records. Refer to Navigation sets.
- Edit **profiles** to specify permissions for staff members to use the custom object workspaces and work with the objects' records. Refer to Profiles.
- Create some **custom reports** to track information about your custom object data, such as when records are created, the number of records created, and which staff members worked with them. Refer to Analytics.
- If you create custom objects to import existing information stored in an external database into Oracle Service Cloud, use the **Data Import Wizard** to copy the information into your site. Refer to Data Import.

Agent desktop

Deployed custom objects can be added to your agent desktop components, including **workspaces**, **workspace rules**, **workflows**, and **agent scripts**. Using objects and system attributes in these areas is no different than using **standard objects** and **custom fields**. However, where default workspaces are automatically created for standard objects, workspaces are not automatically created for custom objects so you need to create them so your staff members can add and edit records for your custom objects.

When creating workspaces for custom objects, the Insert Field tab on the workspace designer's **ribbon** gives you access to the custom object's fields as well as fields of objects that are parents of the custom object. The Insert Field tab on the workspaces editor is shown in the following figure.



In this example, the workspace is being created for the WorkOrder custom object. Since **incidents** and the Service Category custom object are both parents of the WorkOrder custom object, the fields from the parent objects can also be added to this workspace.

If an object is the child of another object in a relationship, and if both objects can have workspaces created for them, you can edit the parent object's workspace to add a relationship item for the child object. The names of the relationship items for child objects are derived from the object's label followed by "View" (for example, a relationship item for an object named Warranty will be named Warranty View). This relationship item lets you access the child object's records while working with a record for the parent object. For example, you can add the Incident View relationship item to a **contact** workspace to let you access incidents when viewing a contact record.

Important If the same object is added as a child in multiple relationships to the same parent (for example, if the contacts object is specified as the child of the incidents object in two relationships), the workspace designer's ribbon will still contain only one view item for the object. However, when you add the view item to a workspace, you can specify which report to use for the view item. This lets you define which of the child relationships the view item will use.

If you have created a self-referencing relationship between objects, such as making incidents a child of itself, you can add a view item for the object to the object's workspace. This configuration lets you create parent/child associations between different records for the same object. For example, adding the Incidents View item to an incidents workspace lets you create or edit a child incident when editing the parent incident.

Tip Browser **controls** added to workspaces can include variables in the URLs to pass information about custom object records to a web page. The variable has a format of `$package_name$object_name.field name`. For example, to pass information about a field named PaymentType in an object named WorkOrder in the CO package, append `$CO$WorkOrder.PaymentType` to the browser control's URL. Refer to Working with browser controls and the Oracle RightNow Connect Desktop Integration (**Javascript API**) documentation available at our support site.

- Defining relationships
- Creating custom workspaces
- Creating workflows
- Creating guides
- Workspace and Script Elements

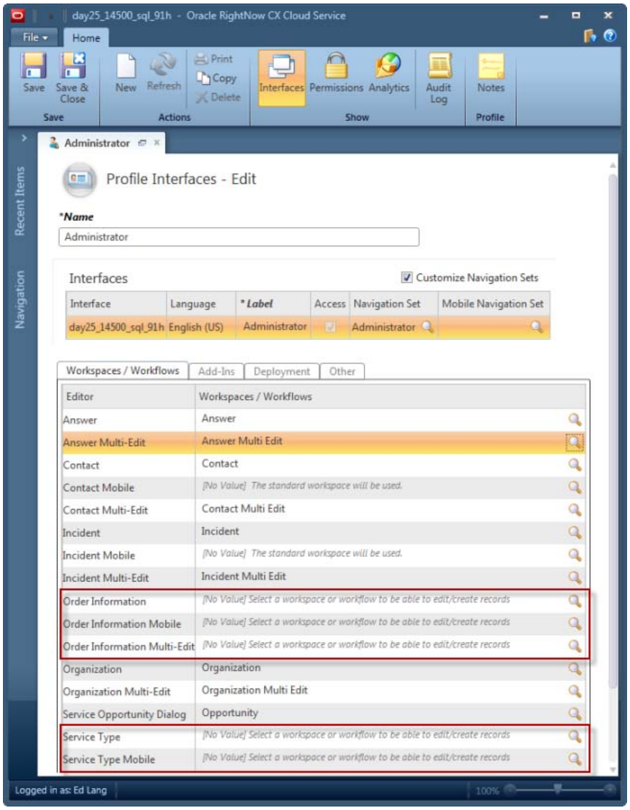
Navigation sets

Staff members who require access to custom object records must be able to open the records from their **navigation set**. **Custom reports** that are configured to let you open custom object records can be added to navigation sets, and options to create new custom object records can be added to the **file menu** using the Navigation Sets editor. Refer to Creating navigation sets and Configuring the file menu.

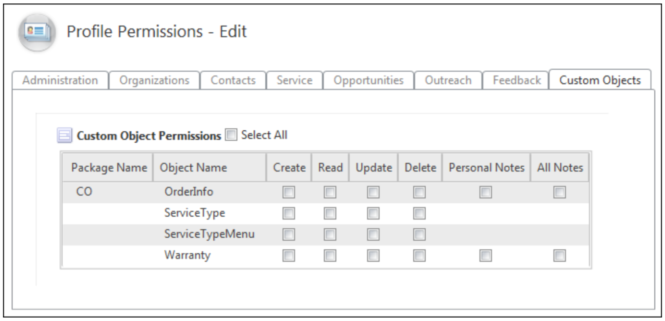
In addition, you can add standard search reports to navigation sets to help you quickly locate specific custom object records. These reports are automatically created for all deployed custom objects and are located in the Reports explorer's Public Reports > Common > Views–Common > Search Reports–Custom Objects folder. Refer to Searching for records with Quick Search.

Profiles

The **workspaces** or **workflows** you want to use to create and edit custom object records are specified in your profile. You specify workspaces or workflows for custom objects in the same way that you associate customized workspaces to edit **incidents** or other **standard objects** (refer to Customizing profiles). The following figure shows a profile that needs to have workspaces assigned for custom objects.



In addition to associating workspaces or workflows with custom objects, you need to specify permissions for your staff members to read, delete, and perform other actions on custom object records. Each deployed custom object is listed on the Custom Objects tab of the Profiles editor.



The custom objects are organized by the package they are in. Similar permissions can be granted for each object, though the Notes permissions are available only for objects with fields that have notes.

- Customizing profiles
- Custom object permissions

Analytics

Deployed objects that have the Object is Available in Workspaces, Scripting, and Workflow option enabled automatically have standard reports created for them. You can find the reports in the Reports explorer's Public Reports > Common > Views–Common > Search Reports–Custom Objects and Editor Reports–Custom Objects folders. These reports are primarily intended to be used as Quick Search reports and in workspaces to provide access to the custom object records.

All deployed custom objects are available for use in **custom reports**, so you can create the custom reports you need to track your data. Using custom object data is no different than using data in standard tables, with the exception that data in menu-only custom objects is not available for **inline editing**. Refer to Creating menu-only custom objects and Enabling inline editing.

When creating reports in the report design center, you can find your custom objects in the **data dictionary**. The fields created for system attributes and the tables created for objects each have unique naming conventions (these conventions are also followed when viewing custom objects in the Data Dictionary located at Configuration > Database > Data Dictionary).

- **System attribute fields**—Fields created for system attributes are listed in the table they are associated with, just as custom fields are. However, where the database names for custom fields are prepended with *c$*, the database names for system attributes are prepended with the name of the package they are in followed by the dollar sign. For example, after creating an incidents system attribute named ManagerReviewed in the CO package, a field named “Manager Reviewed (*CO$ManagerReviewed*)” will display in the *incidents* table.

- **Object tables**—Tables that store object data are listed by the objects’ label names. The tables’ database names are derived from the name of the object, prepended with the name of the package and the dollar sign ($). For example, an object in the CO package that is named ProdReg with a label of Product Registration displays in the data dictionary as “Product Registration (*CO$ProdReg*).”

Tip To use custom object transactional data in a custom report, you need to use fields from the Custom Object Transactions (*co_trans*) table instead of the Transactions (*trans*) table (refer to Transaction Descriptions).

Refer to Custom Reports.

Data Import

After deploying custom objects and configuring **workspaces**, **navigation sets**, and other components, you can enter data in the custom objects’ records just like you enter information for individual **incidents**, **contacts**, or **tasks**. However, you can also use the Data Import Wizard to import a large number of records into your custom objects from an external file. Data can be imported into objects as well as system attributes. Since custom objects are used to integrate your organization’s unique data into Oracle Service Cloud, you will likely want to consider using this option to copy data from an external database into your site. Refer to Importing data.

11

Custom Processes

Custom processes are predefined object event handlers (PHP scripts) that run as the result of an event occurring on **standard** or **custom objects**. Object event handlers can help your organization automate tasks based on the events that trigger them. For instance, when an incident is updated, an object event handler can be triggered to update a record in an external system. Event handlers can also be used in **rules**, **surveys**, and **campaigns**.

Overview

Object event handlers are added and managed on the process designer in a virtual container called the process model. Once you add your object event handlers, you'll need to deploy the process model in order to use the object event handlers in Oracle Service Cloud. Since the process model is not written to the Oracle database until it is deployed, you can take your time when adding object event handlers. When you are ready to test the process model, you can export it and import it into a non-production site. When you are finished testing the process model, you can export it from your non-production site, import it into your production site, and deploy it.

Important The process designer interacts with the Connect Common Object Model (CCOM), which is publicly accessible and backward compatible. The CCOM can also be accessed using Oracle RightNow Connect Web Services for SOAP and the Oracle RightNow Connect PHP API Cloud Service.

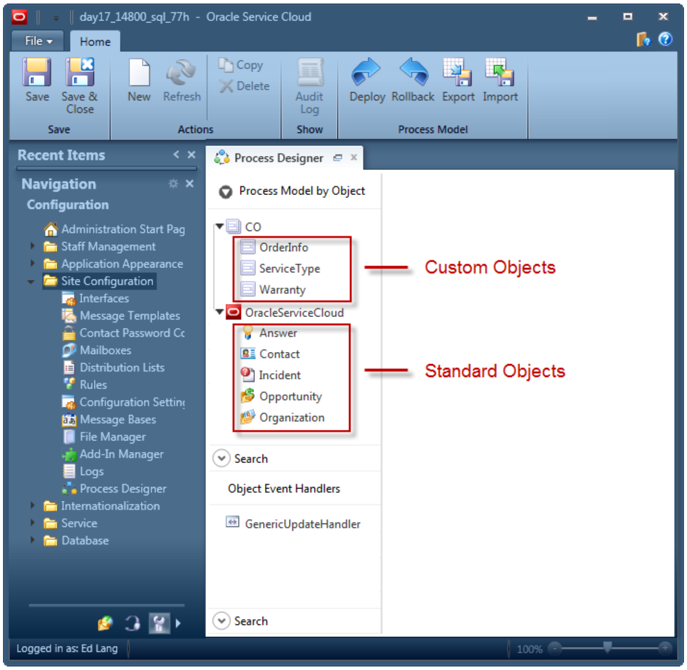
- ❖ Exporting and importing the process model
- ❖ Deploying and rolling back the process model

Accessing the process designer

To access the process designer, your profile must have the Process Designer permission on the Administration tab enabled. You can then add object event handlers and deploy the process model to the Oracle database. Refer to Administration permissions. In addition, you may need to add the Process Designer component to your navigation set to view it. Refer to Creating a navigation set for the administrator.

Note Due to the high degree of workflow change that can be made to your application when using custom processes, we recommend that few staff members are granted access to the process designer.

When you open the process designer, you will notice that the tree includes a list of **standard objects** under the OracleServiceCloud entry and **custom objects** under the CO package or other packages you create in the object designer. Only deployed custom objects are available on the process designer (refer to Creating objects and Organizing custom objects.)



The objects shown in the tree can be associated with the event handlers you add using the process designer. If you intend to use event handlers in rules, surveys, or campaigns, you do not need to associate them with objects. Refer to Triggering object event handlers.

Adding object event handlers

Object event handlers are available for both custom objects and standard objects. Custom object event handlers act on custom objects, whereas standard object event handlers act on standard objects in the Connect Common Object Model, including Answer, Contact, Incident, Opportunity, and Organization.

Important When creating an object event handler, required test harness code must be implemented in the PHP script to ensure compatibility with Oracle Service Cloud. Refer to Example object event handler script with test harness.

You can also add event handlers to use in **rules**, **surveys**, and **campaigns**. These event handlers do not need to be associated with the objects listed on the process designer. Refer to Triggering object event handlers.

Before you add an object event handler, we recommend reviewing our best practices to ensure you are aware of potential issues.

Best practices and rules for testing object event handler scripts

The following best practices can be helpful when creating and testing object event handler scripts.

- Have a complete test in mind. Consider all the expected conditions and effects of the object event handler script and test for them in the test harness.
- Handle expected and possible errors with try/catch statements.
- Consider selecting the Can Suppress check box on the process designer or including SuppressExternalEvents in a ->save in your script. If neither of these steps are performed, the script might re-enter itself in an infinite loop.
- Consider the test harness when integrating with external systems. For instance, the $run_mode parameter and the apply() method of your object event handler script can be tested to determine whether it is being run as part of a test or not. You must decide how to test against external integrations or systems.
- Objects passed after an edit contain only the data that was modified during the edit. For instance, if an incident thread is modified during an edit, only that thread is passed. Other data associated with the object (such as other incident threads) needs to be passed using a new instance of the object.
- Object event handler script headers include `Package:` and `Objects:` tags. The package tag defines the package where you place the script rather than the package where the objects are located. The objects tag defines which objects the event handler impacts. You must list the objects using their PHP names. For instance, if you have a custom object named Warranty located in the CO package, the object's name in the tag will be CO\Warranty.
- Custom processes do not affect the behavior of PHP global variables. Refer to Variable Scope in the standard PHP documentation.

Keep the following points in mind when testing an object event handler script *before* deployment.

- Any regular or error output displays in a dialog when the test is complete.
- Any errors encountered prevent the State field from being marked Tested.
- Any errors encountered within the test harness are not logged and are not counted against the runtime errors of a deployed script.

Keep the following points in mind when testing an object event handler script *after* deployment.

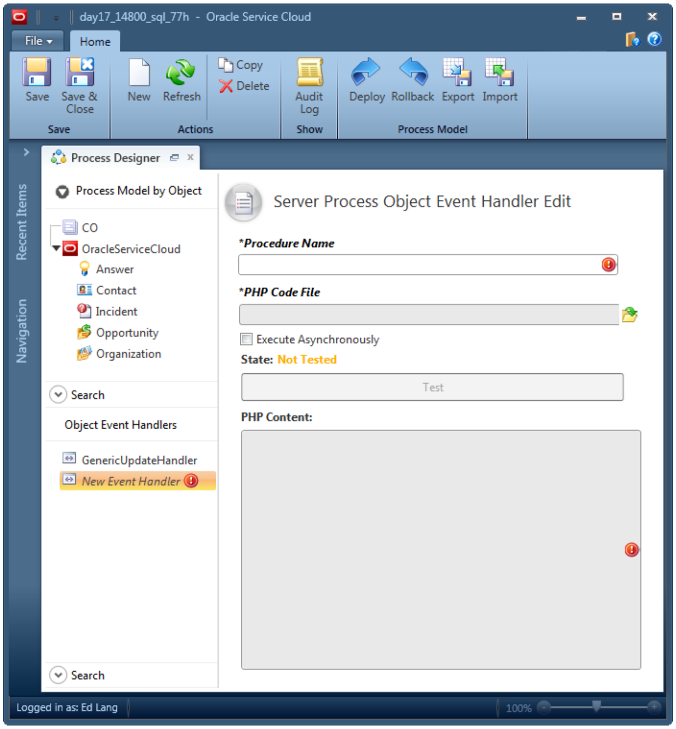
- Any deployed object event handler script that encounters five errors (without any intervening success) will be disabled and the status of the State field changes to Errored. Otherwise, the script will become disabled on or

To add an object event handler

1 Click the Configuration button on the **navigation pane**.

2 Double-click Process Designer under Site Configuration. The process designer opens on the **content pane**.

3 Click the New button on the ribbon. The Server Process Object Event Handler editor opens.

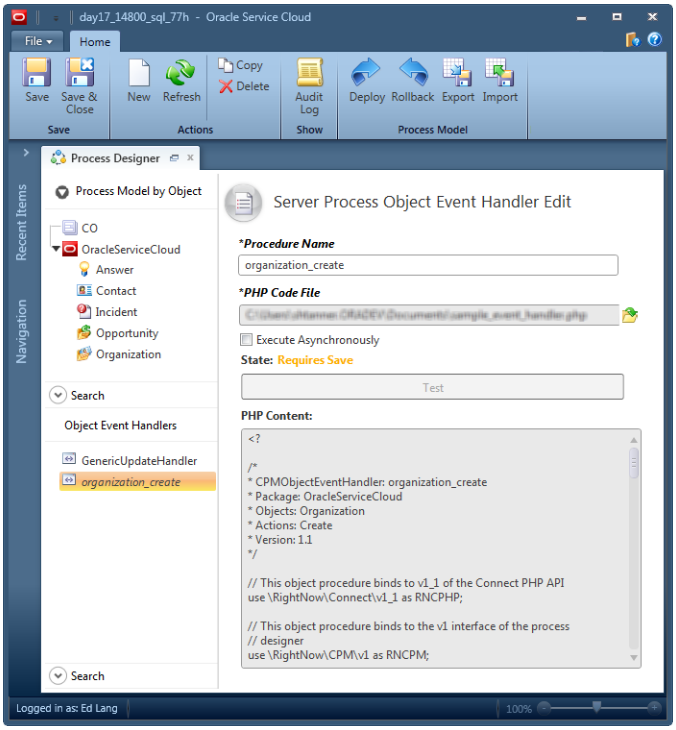


4 Type a name for the object event handler in the Procedure Name field.

Note Object event handler names must start with a letter, end with a letter or number, and contain only letters, numbers, and underscores.

5 Click the folder button next to the PHP Code File field and select a file to load. The Procedure Name field is then updated with the name of the file in the PHP Code File field, the State field displays Requires Save, and all PHP code displays as read-only in the PHP Content field.

Note We recommend that you name your PHP code file according to its event function or manually update the Procedure Name field after loading the file.



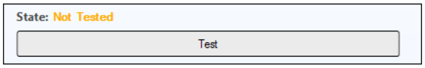
6 To execute the event handler asynchronously, select the Execute Asynchronously check box. (This option is selected automatically if the PHP script includes the async keyword.)

This option schedules the event handler to execute using a queuing system. If the first attempt fails for some reason, such as a server being unavailable, the event handler execution will be retried automatically up to four times. The first retry occurs 90 seconds later, the second occurs 450 seconds later, the third occurs 3,150 seconds later, and the fourth occurs 34,650 seconds later.

You can use this option with an event handler that does not need to execute immediately and that is not required by the operation that triggered the event. For instance, if you have an integration that updates contact information in an external database when a contact is created in Oracle Service Cloud, you can use an async event handler since the data can be sent any time.

Important Do not select this option if you are adding an event handler for use in surveys or campaigns.

7 Click the Save button on the ribbon. The status of the State field changes to Not Tested and the Test button below the field is activated.



8 Click the Test button below the State field to test the PHP code file for errors and to verify the test harness. If no errors are encountered and your test harness validates, a message displays and asks if the object event handler test result was correct.

9 Click the Yes button to acknowledge that the test ran as you expected. The message closes, the status of the State field changes from Not Tested to Tested, and the Test button is disabled.

10 Click the Save button on the ribbon to save the process model.

11 Associate the event handler with an object and event type that will trigger it. This step is not needed when creating event handlers to use in rules, surveys, or campaigns. Refer to Triggering object event handlers.

Before you can use the object event handler, the process model must be tested and deployed. Refer to Deploying and rolling back the process model.

Example object event handler script with test harness

The following example object event handler script adds a note to an **organization** when it is created in the Oracle database. The types of objects and actions the script can function with are indicated at the beginning of the script. The required test harness code is located about halfway through the script.

Note An additional sample script that uses client for URLs (cURL) to perform an action in an external database is provided in the [Oracle RightNow Connect PHP API Cloud Service]() guide.

Example

```
<?

/*
 * CPMObjectEventHandler: organization_create
 * Package: OracleServiceCloud
 * Objects: Organization
 * Actions: Create
 * Version: 1.1
 */

// This object procedure binds to v1_1 of the Connect PHP API
use \RightNow\Connect\v1_1 as RNCPHP;

// This object procedure binds to the v1 interface of the process
// designer
use \RightNow\CPM\v1 as RNCPM;

/**
 * An Object Event Handler must provide two classes:
 *    - One with the same name as the CPMObjectEventHandler tag
 *      above that implements the ObjectEventHandler interface.
 *    - And one of the same name with a "_TestHarness" suffix
 *      that implements the ObjectEventHandler_TestHarness interface.
 *
 * Each method must have an implementation.
 */

class organization_create
```

```
        implements RNCPM\ObjectEventHandler
{
    public static function
    apply( $run_mode, $action, $obj, $n_cycles )
    {
        $note = new RNCPHP\Note;
        $note->Text = "\n".date(DATE_RSS)."\n"
            ."\nA note added by " . __CLASS__
            . '::' . __FUNCTION__ . "\n";
        if (is_null($obj->Notes))
        {
            $obj->Notes = new RNCPHP\NoteArray;
        }
        $obj->Notes[] = $note;

        $obj->Name = preg_replace( '/^[aA]n* /', 'The ', $obj->Name );

        // Do not suppress because we want
        // the update flow to run.
        $obj->save();

        return;
    } // apply()

} // class organization_create

/*
    The Test Harness
*/

class organization_create_TestHarness
        implements RNCPM\ObjectEventHandler_TestHarness
{
    static $org_invented = NULL;

    public static function setup()
    {
        // For this test, create a new
```

```
            // organization as expected.
            $org = new RNCPHP\Organization;
            $org->Name = "An organization name";
            $org->Login = "a login";

            static::$org_invented = $org;
            return;
        }

        public static function
        fetchObject( $action, $object_type )
        {
            // Return the object that we
            // want to test with.
            // You could also return an array of objects
            // to test more than one variation of an object.
            return(static::$org_invented);
        }

        public static function
        validate( $action, $object )
        {
            // Add one note.
            return(count($object->Notes) === 1);
        }

        public static function cleanup()
        {
            // Destroy every object invented
            // by this test.
            // Not necessary since in test
            // mode and nothing is committed,
            // but good practice if only to
            // document the side effects of
            // this test.
            static::$org_invented->destroy().
            static::$org_invented = NULL;
            return;
        }
    }
```

Triggering object event handlers

After adding an event handler to the process designer, you need to specify how the event handler will be triggered. Using the process designer, you can associate an event handler with a standard or custom object and a create, update, or destroy action. Only event handlers specifically written for the object type and action can be selected when making these associations.

Object event handlers can also be triggered by rules, surveys, and campaigns when the conditions you specify are met. For information about using event handlers in rules, refer to Actions for rule bases. For information about using event handlers in surveys, click here. For information about using event handlers in campaigns, click here.

Note Only object event handlers written for contacts can be used in surveys and campaigns.

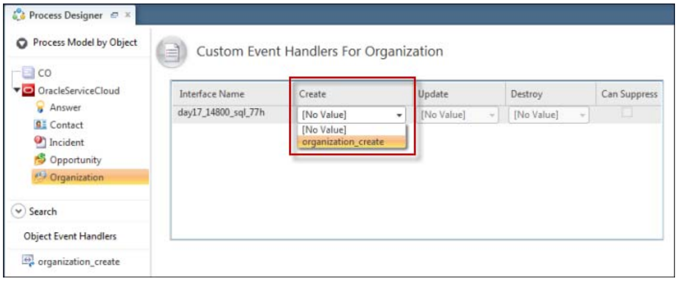
You can also associate event handlers with create, update, or delete actions performed on standard and custom objects. When the action occurs on the associated object, the event handler is triggered automatically. The event handler must be written to work with the associated object and action. For instance, the sample event handler script provided at Example object event handler script with test harness is written to be triggered when organizations are created. You associate object actions with event handlers using the process designer.

To associate event handlers with objects

1 Click the Configuration button on the **navigation pane**.

2 Double-click Process Designer under Site Configuration. The process designer opens on the **content pane**.

3 In the tree, select the custom or standard object that you want to associate with the object event handler. The Custom Event Handlers page opens and the drop-down menu under the column that is associated with the PHP code file is activated.



4 Click the drop-down menu under the applicable column (Create, Update, or Destroy) and select the object event handler that you want to associate the object with.

5 To allow the object event handler to be suppressed from the SuppressExternalEvents processing option that is part of Oracle RightNow Connect Web Services for SOAP and the Oracle RightNow Connect PHP API Cloud Service, select the check box under the Can Suppress column.

6 Click the Save button on the ribbon to save the process model.

Before you can use the object event handler, the process model must be tested and deployed. Refer to Deploying and rolling back the process model.

Exporting and importing the process model

Before you deploy a process model on your production site, we recommend that you first test it on a test site that is similar to your production site. This helps ensure that the object event handlers function as expected and interact with the Oracle Service Cloud data in the way you want. After verifying that the process model is configured correctly on the test site, you can export it from the test site and then import it into your production site.

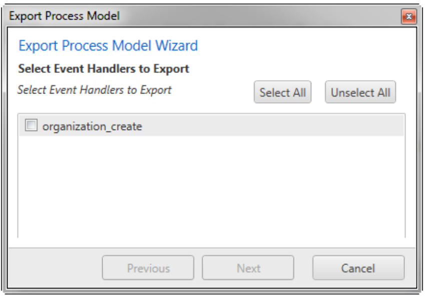
Note When exporting and importing the process model, you choose which object event handlers to include and exclude. Since you cannot save more than fifty object event handlers (with unsaved content) at one time, the maximum number of object event handlers that may be imported at one time is fifty.

To export the process model

1 Click the Configuration button on the navigation pane.

2 Double-click Process Designer under Site Configuration. The process designer opens on the content pane.

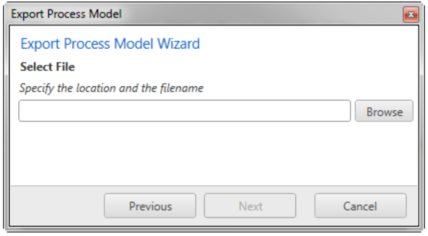
3 Click the Export button on the ribbon. The Export Process Model Wizard opens.



4 Select the check boxes next to the object event handlers that you want to export.

5 To export object event handler mappings, select the Export Event Handler Mappings check box.

6 Click the Next button to advance the wizard.



7 Click the Browse button to open the Save As window to select the location where you want to save the export file and type a name for the file. The export file will be saved with a *.zip* extension. Click the Save button on the Save As window.

Or

If you know the path where you want to save the file and the file name you want to use, type it in the text box instead of clicking the Browse button.

8 Click the Next button to complete the export. A message informs you that the export was successful. Click the OK button to close the message and the Export Process Model Wizard.

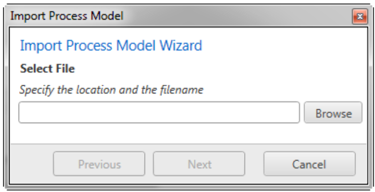
9 Click X on the top right of the console to close the process designer.

To import the process model

1 Click the Configuration button on the navigation pane.

2 Double-click Process Designer under Site Configuration. The process designer opens on the content pane.

3 Click the Import button on the ribbon. The Import Process Model Wizard opens.

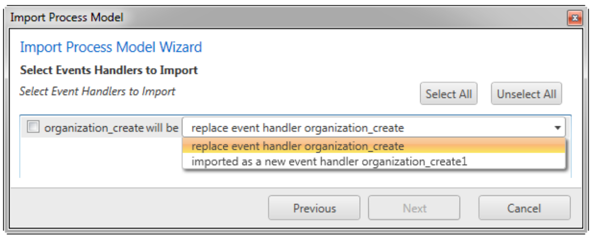


4 Click the Browse button to select the *.zip* file that contains the process model you want to import.

Or

If you know the path and file name of the import file, type it in the text box instead of clicking the Browse button.

5 Click the Next button. The next page of the wizard shows you the object event handlers that can be imported.



If you import an object event handler with the same name as an existing event handler, you can either replace (overwrite) the imported event handler or import it as a new event handler with the number “1” appended to its name.

6 Select the check boxes next to the object event handlers that you want to import.

7 Select options for the imported object event handlers.
   a To create a new object event handler, click the arrow next to the text that reads "replace event handler" and select "imported as a new event handler."
   b To prevent an object event handler from being imported, clear the check box next to it.

8 To import object event handler mappings, select the Import Event Handler Mappings check box.

9 Click the Next button to complete the import. A message informs you that the import was successful. Click the OK button to close the message and the Import Process Model Wizard.

10 To deploy the imported process model on your site, click the Deploy button on the ribbon. Refer to Deploying and rolling back the process model.

11 Click X on the top right of the console to close the process designer.

Deploying and rolling back the process model

After you create and test the process model, it must be deployed. When the process model is deployed, all object event handlers are mapped to custom and standard objects in the database and are ready for execution when an event occurs in Oracle Service Cloud. Ultimately, deployed object event handlers automate additional tasks for you based on the events that trigger them.

Because of the changes at the database level, it is important that you test the process model before deploying it. To assist you with this, export and import functionality is available so you can test the process model on a test site before deploying it to a production site. Refer to Exporting and importing the process model.

Important Be aware that if the process model changes and you choose not to deploy it, you can roll it back to revert to the state it was in at the time of the previous deployment. If the process model has never been deployed, rolling it back removes all object event handlers.

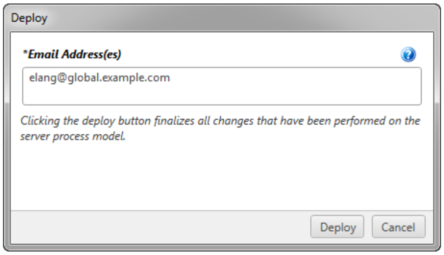
To deploy a process model

1 Click the Configuration button on the navigation pane.

2 Double-click Process Designer under Site Configuration. The process designer opens on the content pane.

Note Before you deploy the process model, we recommend that you first review the object event handlers to ensure that no additional changes are needed.

3 Click the Deploy button on the ribbon to open the Deploy window.



4 Type the email addresses you want to send notifications to in the Email Address field. Addresses entered in this field receive emails when deployment completes or when an issue preventing deployment is encountered. The logged-in staff account's email address is automatically added. Multiple addresses must be separated by commas.

5 Click the Deploy button. A message informs you that you are about to deploy the server process model, which disables the process designer until the deployment is complete.

6 Click the Yes button to close the message and start the deployment. A message notifies you when the deployment is finished and that the process designer will be refreshed.

7 Click the OK button to close the message and return to the process designer.

8 Click the Save and Close button on the ribbon.

To roll back a process model

1 Click the Configuration button on the navigation pane.

2 Double-click Process Designer under Site Configuration. The process designer opens on the content pane.

3 Click the Rollback button on the ribbon to open the Rollback window. A message informs you that all saved changes made on the process designer since the last deployment will be removed and that once a rollback has been performed, it cannot be undone.

4 Click the OK button to close the Rollback window and start the rollback process.

5 Click the Save and Close button on the ribbon.

12

Site Configuration

You can customize configuration settings, either individually or across multiple interfaces, to enable, disable, and configure Oracle Service Cloud functions. You can also change some of the text used in Oracle Service Cloud by customizing message bases, which are text strings that appear on the **administration interface** and the **customer portal**.

The Configuration Settings and Message Bases editors display as their own respective reports with category folders and run-time selectable filters that make searching easy. You can control how your output displays using either **cross tab** (default) or **rollup** views and edit values for configuration settings and message bases text inline. You can also see any changes that have been made to your configuration settings and message bases, including the old and new values, from the audit log.

Other site configuration options include the File Manager, which you can use to change wordlist and dictionary files, and the Log Viewer, which can help you troubleshoot issues your site may have.

For information about configuring customer portal pages and working with the customer portal, see Configuring Oracle Service Cloud for the Customer Portal.

Searching configuration settings

Run-time selectable filters let you define which configuration settings display on the content pane. You can search by site or interface, configuration setting type, category folder, configuration setting name, and value.

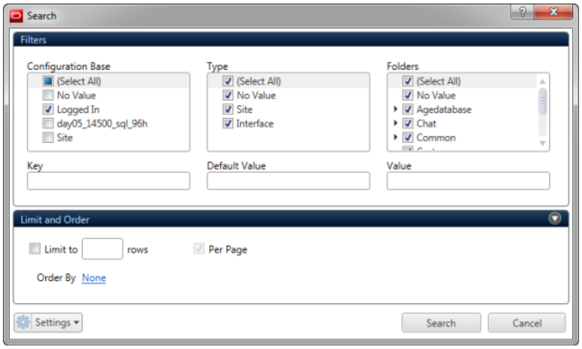
The first time you open the Configuration Settings editor, you must perform a search. Because settings are categorized as either site or interface specific, the configuration settings Search window lets you specify what type of setting you want to see.

Note Depending on your site's configuration, some settings may be hidden. If you cannot find a certain configuration setting, contact your Oracle account manager.

To search for a configuration setting

1 Click the Configuration button on the navigation pane.

2 Double-click Configuration Settings under Site Configuration. The Search window opens. (The Configuration Settings editor also opens but is inactive at this point.)



You have several options on the Search window. You can:

- Use the search fields to filter the configuration settings that are returned on the editor.
- Accept all default filters by simply clicking the Search button to return every interface-specific configuration setting on the site you are logged in to.
- Click the Cancel button to bypass the window and search using the buttons on the ribbon or the search fields on the top of the editor.
- Customize the filters and save them as your defaults by selecting Save as Default Values from the Settings drop-down menu before clicking the Search button. The next time you access configuration settings from your configuration list, the Search window does not open because the system remembers your defaults. Instead, the Configuration Settings editor opens with your previously filtered search results.
- Design the layout of your Search window by selecting Enter Search Design Mode from the Settings drop-down menu.

As you configure your application, you will likely use a combination of these options depending on the configuration settings you want to access. However, for the purpose of this procedure, we show you how to customize your search results using the filters on the Search window.

3 Select the filters, sort options, and record limit to be displayed on the editor.

Tip If you use the search default settings, every interface-specific configuration setting on the site you are logged in to will be returned. If you have a large site, you may want to consider narrowing your search to return only the settings you need to see. One way to do this is to filter the settings by category folder. If you know the main folder in which the settings you want to see are located, select only that folder from the Folders field.

The options available on the Search window are described in the following table.

Table 62: Search Window Description

Field	Description
Filters	This section displays the run-time selectable filters. If a filter displays a menu list, you can select all options in the list by selecting the Select All check box, or you can clear all options in the list by clearing the Select All check box.
Configuration Base	Select the check boxes next to the interfaces for which you want to display configuration settings. • Select All—Displays all site- and interface-specific settings. • Logged In—Displays only interface-specific settings for the interface you are logged in to. (Default) • Site—Displays only site-specific settings that are shared across all interfaces on this site. • <interface name>—Displays only interface-specific settings that apply to the selected interface.
Type	Select the check boxes next to the type of configuration setting you want to display. • Select All—Displays all site- and interface-specific settings. (Default) • Site—Displays only site-specific settings that are shared across all interfaces on this site. • Interface—Displays only those settings that are specific to the interface you are logged in to.
Folders	Select the folders that contain the configuration settings you want to display.

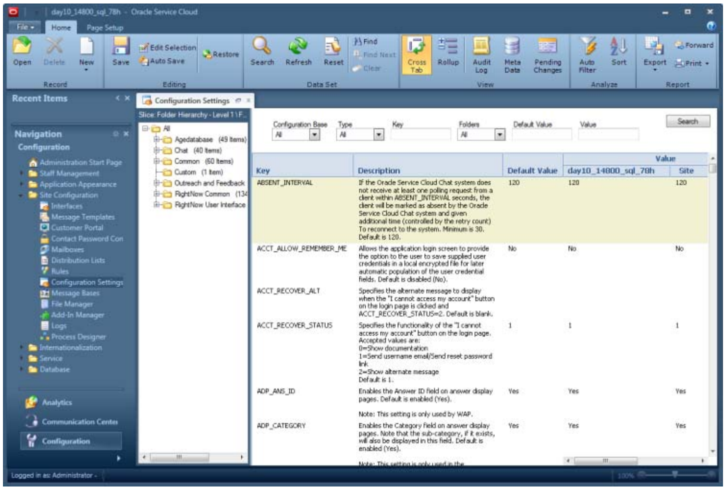
Table 62: Search Window Description (Continued)

Field	Description
Key	Type the name of a specific configuration setting in this field. This field is not case sensitive. **Note:** You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wild-card. All settings that begin with the letters you type will be returned.
Default Value	Type a default value to return settings that match the value you type.
Value	Type a value to return settings that match the value you type.
Limit and Order	Use options in this section to limit the number of rows returned and how the output should be sorted.
Limit To	Select this check box to limit the number of rows returned on each page. Limiting the records returned prevents more records being returned than can be easily viewed or printed.
Rows	Type the number of rows to be returned.
Per Page	Select this check box to change the number entered in the Rows text box from a hard limit on the total number of rows returned to a limit on the number of rows returned on each page. This is automatically selected when you select Limit To.
Order By	Click the current sort order next to the Order By field to select different sort options. The default sort order is displayed with the primary sort field listed first, followed by any subsequent sort fields. The direction each sort field is ordered in is also indicated (Asc for ascending order and Desc for descending order). See Changing sort options.
Settings	This drop-down menu gives you options to design and then save your Search window layout. It also lets you set, restore, and reset your default filter values.
Enter Search Design Mode	Select this option to design the layout of your Search window. See Customizing the Search window.
Set as Default Layout	Select this option to save your search layout as the default.
Restore Default Layout	Select this option to reset your search layout to the system default.

Table 62: Search Window Description (Continued)

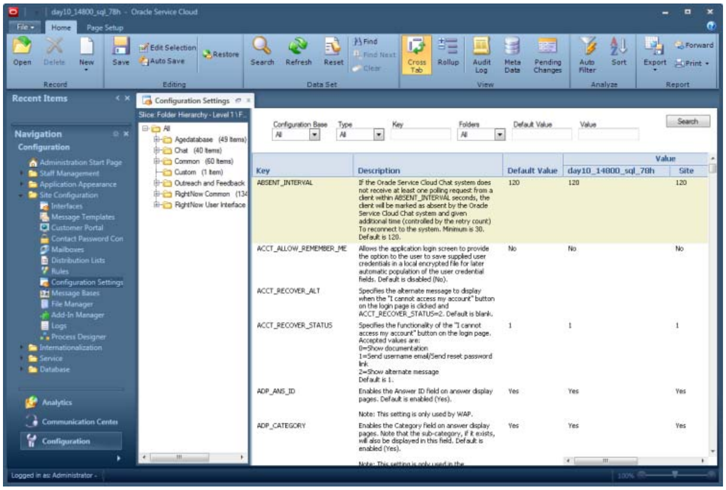
Field	Description
Save as Default Values	Select this option to save the filter values you select to the local settings on your workstation. These saved values are used as the defaults the next time you search and are logged in with the same staff account. Saving your search filters bypasses the Search window and automatically opens the Configuration Settings editor to display your previously filtered search results. **Note:** The default values are overwritten if you select different values and click this button again. If the search criteria is later edited to change filters, the default filter values stored in your local settings are ignored.
Restore Default Values	Select this option to restore the search values to the default search values. This deletes saved search values from your local settings. **Note:** This button is disabled if the current search parameters were not populated from your local settings. See Changing your personal settings.
Reset Values	Select this option to reset the search parameters' values to the default values that were populated when the editor opened. Clicking this button also resets the Search window to the default size if it has been resized.

4 Click the Search button. Your search criteria displays on the content pane.



Working with the Configuration Settings editor

After performing a search, the Configuration Settings editor displays your search results on the content pane. See [Searching configuration settings](). Reports drive the data that displays, and you can choose either cross tab or rollup mode for the layout view. In rollup view, if you have more than one interface, you can edit a configuration setting for multiple interfaces at one time. (Cross tab is the default.)

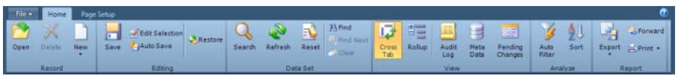


Ribbon functionality

Most of the buttons on the Configuration Settings editor ribbon reflect common Oracle Service Cloud functionality and work the same way as they do in reports. For information about working with reports in Oracle Service Cloud, see Report Management.

Home tab

From the Home tab, you can create and edit configuration settings, search and filter the data, define how you want the data to display, and export the data in a variety of formats. You can also edit values inline under the value columns.



The groups and buttons on the Home tab are described in the following table.

Table 63: Home Tab Description

Group/Button	Description
Record	The buttons in this group let you open existing configuration settings and create and delete custom settings.

Table 63: Home Tab Description (Continued)

Group/Button	Description
Open	Click this button to open the selected configuration setting.
Delete	Click this button to delete a custom configuration setting. **Note:** Standard configuration settings cannot be deleted. Therefore, this button is available only for custom settings.
New	Click this drop-down menu to create a custom configuration setting. Data type options include Text, Integer, Menu, Yes/No, and Date/Time. **Note:** You cannot change the data type after you have selected it.
Editing	The buttons in this group let you edit configuration setting values.
Save	Click this button to save your changes.
Edit Selection	Click this button to open either the Site or <interface name> window and enter the value of the selected configuration setting. **Note:** In the default cross-tab view, you can edit only one row at a time. Therefore, if more than one row is selected, this button is disabled.
Auto Save	Click this button to automatically save your inline edits. **Note:** Auto Save works only for inline edits. The Save button is disabled when Auto Save is selected. See Editing data inline.
Restore	Click this button to return the selected configuration setting to its default value.
Data Set	The buttons in this group let you search for configuration settings, refresh the display, and reset the search criteria to the defaults.
Search	Click this button to open the Search window and select criteria for run-time selectable filters. See Searching configuration settings.
Refresh	Click this button to reload the data shown using the current search criteria. **Important:** This button works differently when you edit a configuration setting. If you change a value before saving, clicking the Refresh button reverts to the previously saved value.
Reset	Click this button to reload the data shown using the default search criteria.

Table 63: Home Tab Description (Continued)

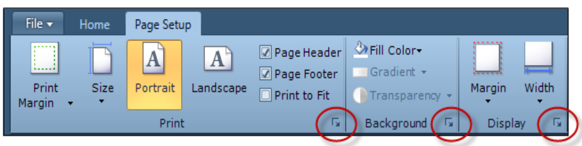
Group/Button	Description
Find	Click this button to locate text, numeric values, or special characters on the current page. Cells that contain the search value are highlighted. See Finding content in reports. **Note:** The Find button works only on the currently displayed page.
Find Next	Click this button to highlight the next instance of the search value entered on the Find window.
Clear	Click this button to clear the search value entered on the Find window.
View	The buttons in this group let you define display options, view changes that have been made, and manage failed deployments.
Cross Tab	Click this button to display configuration settings in a table format. This is the default view.
Rollup	Click this button to display configuration settings in rollup levels. The data rolls up by configuration setting name. If you have more than one interface, this view lets you edit multiple rows at once for the same configuration setting. See Displaying rollup levels and To edit the same configuration settings across multiple interfaces.
Audit Log	Click this button to view changes that have been made to the configuration settings, including when the change was made, who made the change, the affected configuration base, configuration setting name, and old and new values. You can also use run-time selectable filters to search for specific configuration settings.
Meta Data	Click this button to select criteria to display the attributes associated with configuration settings. See Exporting configuration settings.
Pending Changes	Click this button to open the Pending Changes window and view changes that failed to deploy during the save process. You can deploy all changes from this window. **Note:** Nothing displays unless there is a failed deployment.

Table 63: Home Tab Description (Continued)

Group/Button	Description
Analyze	The buttons in this group let you sort the displayed data and apply auto filtering, rollups, and slicing to the data.
Auto Filter	Click this button to enable auto-filtering. Auto-filtering provides column filtering after the report has been generated. See Using Auto Filter.
Sort	Click this button to open the Sort window and select which output columns to sort by and the sort method. See Changing sort options.
Report	The buttons in this group let you export the data, forward the data in an email, and save and restore default values. **Note:** Permission to export, print, and forward reports must be enabled in your profile for this button to display. See Analytics permissions.
Export	Click this button to export the data from a file for use with third-party applications. You can export data in the following formats: HTML, PDF, Excel, XML, Image, and Delimited. You can also copy data to the clipboard. See Exporting report output.
Forward	Click this button to send the data to individuals or **distribution lists** in an email. See Forwarding reports.
Print	Click the arrow on this button to access printing options.

Page Setup tab

The Page Setup tab lets you configure printing options. You can also change the background, margins, and width of reports.



Each tab has one or more groups containing buttons you can use to modify printing or display options. Some groups have an arrow to the right of their name that you can click to open a window. For example, you can click the arrow on the Background group to open the Display Options window.

Windows give you access to the same features you can access from the ribbon, although the windows group the options differently, and sometimes contain options not available from the ribbon.

The groups and buttons on the Page Setup tab are described in the following table.

Table 64: Page Setup Tab Description

Group/Button	Description
Print	The buttons in this group let you configure printing options and add the Page Header and Page Footer sections. Click the arrow on the Print group to open the Page Setup window. See Printing reports. **Note:** This button group displays only if your profile includes the Print/Export/Forward Reports permission. See Analytics permissions.
Print Margin	Click this button to select the size of the margins used when printing. The available options are Normal, Narrow, Medium, and Wide.
Size	Click this button to select the paper size. The available options are Letter, Legal, Executive, A3, A4, and A5.
Portrait/Landscape	Click these buttons to print in portrait or landscape mode.
Page Header/Page Footer	Select these check boxes to include a page header and page footer when printing the report.
Print to Fit	Select this check box to scale your output to your printer's default page width and send it to the printer.
Background	The buttons in this group let you add a background color. You can add a gradient color to blend into the primary color and choose how intense the colors should be with the Transparency setting. Click the arrow on the Background group to open the Display window.
Fill Color	Click this drop-down menu to select a background color.

Table 64: Page Setup Tab Description (Continued)

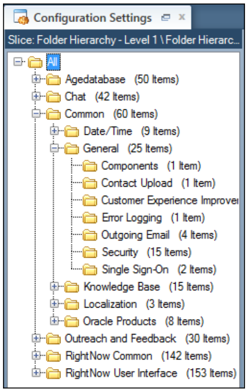
Group/Button	Description
Gradient	Click this drop-down menu to apply a gradient to the background. **Note:** This option is available only after you have selected a fill color.
Transparency	Click this drop-down menu to apply a transparency to the background. **Note:** This option is available only after you have selected a fill color.
Display	The buttons in this group let you add margins and set the width. Click the arrow on the Display group to open the Display window.
Margin	Click this button to define the amount of whitespace around the printed output. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Width	Click this button to select the width of the entire printed output. The available options are Best Fit and Fit to Window.

Folder structure

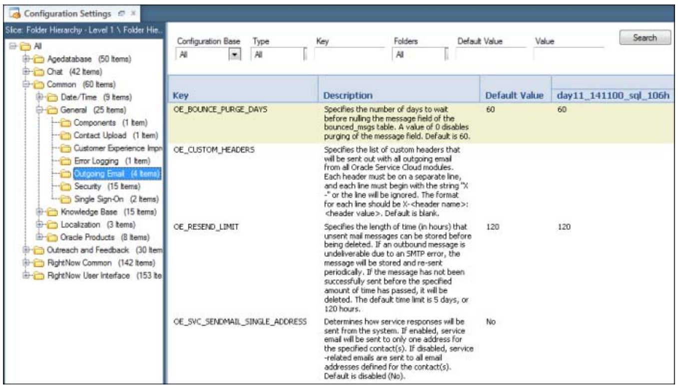
Configuration settings are organized in a hierarchical folder structure. The number of settings in each category folder display next to the folder name. Keep in mind that this number varies depending on how you have defined the filters in your search. For instance, suppose you leave the default selections, Logged In in the Configuration Base field and Select All in the Type field of your search. In this case, all settings, including settings inside each subfolder, will display on the content pane. On the other hand, if you were to select Site in the Type field, only the site-level configuration settings would display.

If you have a large site, you may want to consider narrowing your search to return only the settings you need to see. One way to do this is to filter the settings by category folder. If you know the main folder in which the settings you want to see are located, select only that folder from the Folders field.

Expand the folder contents to drill down to only the configuration settings you want to see. For example, you could navigate to the General folder under Common > General to display all settings in the General folder, including its subfolders. You could then expand the settings by each subfolder.



The following figure shows the folders expanded by the Outgoing Email folder under Common > General > Outgoing Email. In this case, the four configuration settings in the Outgoing Email folder are the only settings that display on the content pane.



Tip To display configuration settings in alphabetical order, click in the Key column header.

The following table describes the Configuration Settings editor folders and subfolder categories.

Table 65: Configuration Editor Folder Description

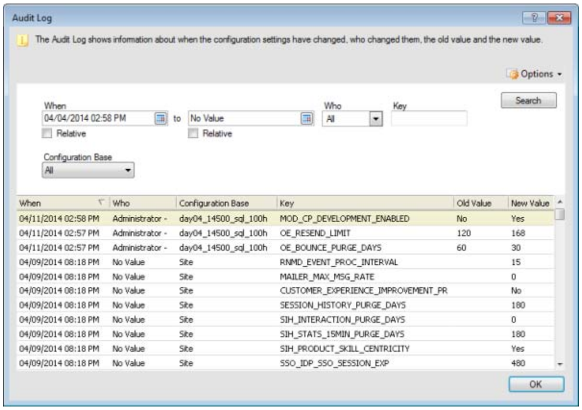
Folder	Description
Agedatabase	Expand this folder to view and edit the batch processing configuration settings that affect **Agedatabase** and database maintenance functions.
Chat	Expand this folder to view and edit configuration settings used to configure Oracle RightNow Chat Cloud Service (Chat). The subfolders include General and User Interface.
Common	Expand this folder to view and edit configuration settings that apply to the basic functionality of all Oracle Service Cloud products. The subfolders include Date/Time, General, Knowledge Base, Localization, and Oracle Products.
Outreach and Feedback	Expand this folder to view and edit configuration settings used to configure Oracle RightNow Outreach Cloud Service (Outreach) and Oracle RightNow Feedback Cloud Service (Feedback).
RightNow Common	Expand this folder to view and edit configuration settings that are common to one or more areas of Oracle Service Cloud or are used to enable functionality. The subfolders include Intent Guide, 3rd-Party Applications, Answer Review, ATG Integration, External Integration, Fusion Integration, General Analytics Options, Message Templates, Mobility, OSN Integration, Screen Pop, Service Modules, Siebel Integration, SIH, Single Sign-On, Social, Social Monitor, and Thin Client.
RightNow User Interface	Expand this folder to view and edit configuration settings used to customize the Service Console and customer portal. The subfolders include Answer Display Page, Contact Services, Customer Portal, End-User Interface, General, Login/Session Window, Misc. Customization, Miscellaneous, Open Login, Sales, Service Level Agreements, Support, and Tool Bar. **Note:** Many of the configuration settings under Answer Display Page, Contact Services, and End-User Interface apply to the customer portal. See Configuring Oracle Service Cloud for the Customer Portal.

Audit log

The audit log makes it easy for you to see changes that have been made to the configuration settings. Depending on where you are on the Configuration Settings editor, different information displays. For instance, clicking the Audit Log button on the ribbon from the main Configuration Settings editor displays the following information about the changes made.

- Date and time of change
- Who made the change
- Affected interface—Site or interface name
- Configuration setting name
- Old value
- New value

You can also search for a specific configuration setting you want to see changes for from the audit log. The following figure shows the search window for the audit log.



The search options available are described in the following table.

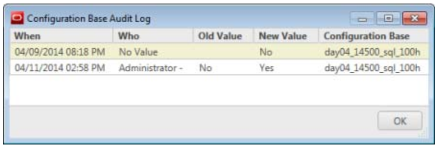
Table 66: Audit Log Search Description

Field	Description
When	Enter the start and end dates or click the calendars to select the dates for the time period of the changes you want to see. The current day is the default start date.

Table 66: Audit Log Search Description (Continued)

Field	Description
Relative	Select this check box and then click the calendar to enter relative start and end dates.
Who	Click this drop-down menu to display changes made by a particular staff member. All is the default.
Key	Type the name of a specific configuration setting in this field. **Note:** You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wild-card. All settings that begin with the letters you type will be returned.
Configuration Base	Click this drop-down menu and select the interface for which you want to display changes to configuration settings. • All—Displays all site- and interface-specific settings. • Logged In—Displays only interface-specific settings for the interface you are logged in to. • Site—Displays only site-specific settings that are shared across all interfaces on this site. • <interface name>—Displays only interface-specific settings that apply to the selected interface.

Clicking the Audit Log button with a specific configuration setting open displays changes to that setting only.

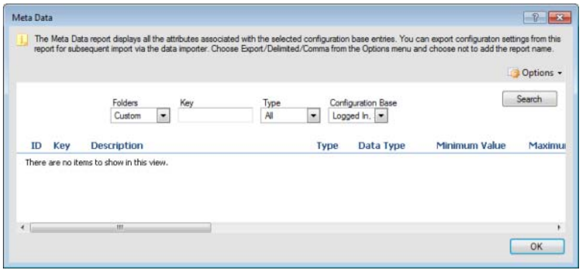


Exporting configuration settings

Exporting and importing metadata can save time, especially when you have large numbers of custom settings. You can export configuration setting metadata and then import that data into another site using the Data Import Wizard. All attributes associated with configuration settings are available for the interfaces you choose to display. Configuration setting attributes include ID, key (name), description, type (site or interface specific), data type, minimum and maximum value, maximum text length, pattern constraint, predefined menu, folder and folder ID, default value, configuration base (site or particular interface), and values.

To export metadata

1 From the Configuration Settings editor, click the Meta Data button on the ribbon. The Meta Data window opens.



2 Enter the following field information.

Table 67: Meta Data Window Description

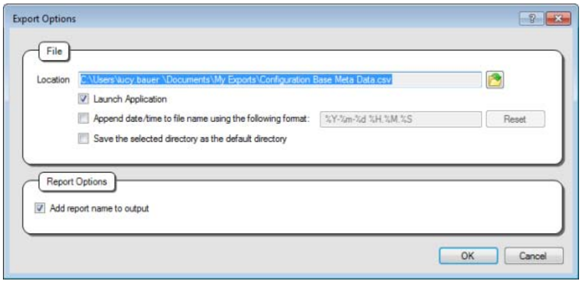
Field	Description
Folders	Select the folders that contain the configuration settings you want to display. The Custom folder is selected by default.
Key	Type the name of a specific configuration setting in this field. This field is not case sensitive. **Note:** You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wild-card. All settings that begin with the letters you type will be returned.
Type	Select the check boxes next to the type of configuration setting you want to display. • Select All—Displays all site- and interface-specific settings. (Default) • Site—Displays only site-specific settings that are shared across all interfaces on this site. • Interface—Displays only those settings that are specific to the interface you are logged in to.

Table 67: Meta Data Window Description (Continued)

Field	Description
Configuration Base	Select the check boxes next to the interfaces for which you want to display configuration settings. • Select All—Displays all site- and interface-specific settings. • Logged In—Displays only interface-specific settings for the interface you are logged in to. (Default) • <interface name>—Displays only interface-specific settings that apply to the selected interface. • Site—Displays only site-specific settings that are shared across all interfaces on this site. (Default)

3 Click the Search button. Your search results display on the content pane.

4 Click the Options drop-down menu and select Export > Delimited > Comma. The Export Options window opens.



5 Enter the following field information.

Table 68: Export Options Window Description

Field	Description
Location	Lists the default location where your CSV file will be saved.
Save As	Click this button to open the Save As window where you can specify a location (other than the default) to save your file.
Launch Application	Clear this check box if you do not want the file to open after you export it.

Table 68: Export Options Window Description (Continued)

Field	Description
Append date/time to file name using the following format	Select this check box to add the date and time to your file name. **Note:** To change the format in which the date and time is added to your file, type your preferred format in the field next to the check box and then click the Reset button.
Save the selected directory as the default directory	Select this check box to make the directory specified in the Location field your default directory.
Add report name to output	Clear this check box to remove the report name from the CSV file. **Important:** You must clear this check box to import the file from the Data Import Wizard because it uses the value specified in the Header Location field to import the data.

6 Click the OK button.

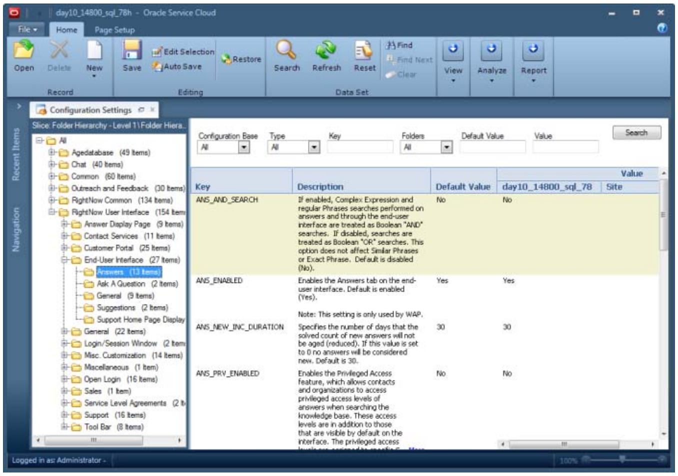
Now you can import your CSV file from the Data Import Wizard. See Importing data.

Customizing configuration settings

Configuration settings are used to enable, disable, and configure products and components and many functions and features. You can customize these settings through the Configuration Settings editor. Reports drive the data that displays on the content pane, and you can format the output returned using **cross tab** (default) and **rollup** views. In rollup view, you can edit a single configuration setting for multiple interfaces at one time.

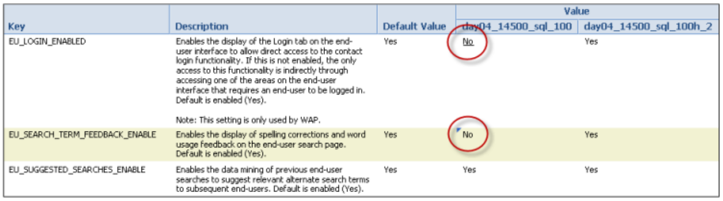
Configuration settings are organized in a hierarchical folder structure and are categorized as either shared across all interfaces (site specific) or interface specific. Also, when you create a new custom configuration setting, you define if the setting will be a site- or interface-level setting. This classification is what lets you view and edit settings across multiple interfaces at the same time. You can also edit configuration setting values inline on the content pane.

To find configuration settings, use the Search feature on the Configuration Settings editor. See To search for a configuration setting.



Editing configuration settings

While standard settings cannot be deleted and their field parameters cannot be edited, the value of a standard configuration setting can be edited, either inline or by clicking the Edit Selection button on the ribbon. You can also edit a single configuration setting across multiple interfaces at the same time using rollup mode. You can easily see when a value has been changed from the default value because an underscore displays on the changed value. If you change the value back to the default, the underscore no longer displays. When a change is pending, the edited field displays a tick mark. When you hover over the tick mark, a tooltip tells you how to save or discard your change.



Key	Description	Default Value	Value	
			day04_14500_sql_100	day04_14500_sql_100h_2
EU_LOGIN_ENABLED	Enables the display of the Login tab on the end-user interface to allow direct access to the contact login functionality. If this is not enabled, the only access to this functionality is indirectly through accessing one of the areas on the end-user interface that requires an end-user to be logged in. Default is enabled (Yes). Note: This setting is only used by WAP.	Yes	No	Yes
EU_SEARCH_TERM_FEEDBACK_ENABLE	Enables the display of spelling corrections and word usage feedback on the end-user search page. Default is enabled (Yes).	Yes	No	Yes
EU_SUGGESTED_SEARCHES_ENABLE	Enables the data mining of previous end-user searches to suggest relevant alternate search terms to subsequent end-users. Default is enabled (Yes).	Yes	Yes	Yes

To edit a configuration setting

1 Select the row that displays the configuration setting you want to edit.

2 Click the Edit Selection button on the ribbon. Either the Site or <interface name> window opens depending on the configuration setting classification (site or interface specific).

Or

Click in the Value column to edit the setting value inline.

Or

Double-click the setting to open it on the content pane and edit the Value field.

3 Type or select the new value. Editing options are specific to the field's data type. For example, if a setting can be enabled or disabled, a Yes/No drop-down menu displays in the Value field.

4 To revert to the default value, click the Restore button.

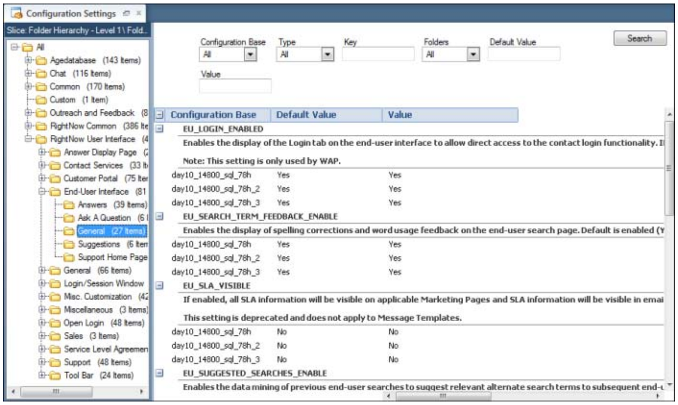
5 Click the Save button on the ribbon. The new value displays with an underscore.

Note You may be required to log out of Oracle Service Cloud and log back in for your changes to take effect.

To edit the same configuration settings across multiple interfaces

Note You cannot edit different configuration settings on the same interface at the same time. However, you can edit a single configuration setting across multiple interfaces at the same time.

1 From the Configuration Settings editor, click the Rollup button on the ribbon.



2 Press **Ctrl** while selecting the rows you want to edit. You can also press **Shift** to select multiple consecutive rows.

Note Selecting multiple rows across different configuration settings will disable the Edit Selection button.

3 Click the Edit Selection button on the ribbon.

4 Type or select the new value.

5 Click the OK button. The values of all the selected rows are updated.

6 Click the Save button on the ribbon. The new values display with an underscore.

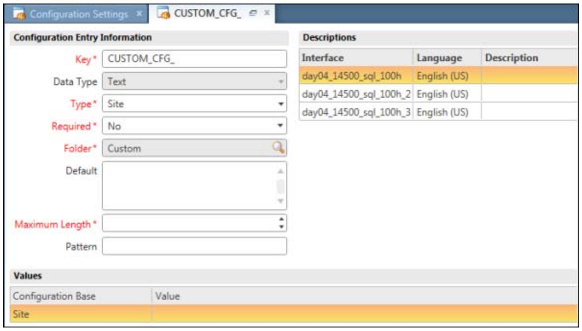
Note You may be required to log out of Oracle Service Cloud and log back in for your changes to take effect.

Creating custom configuration settings

When you create a new configuration setting, it is considered a custom setting. By default, every custom setting name starts with CUSTOM_CFG_ and is automatically assigned to a Custom folder in the folder hierarchy. You define whether your custom setting will be an interface-specific setting or one that is shared across all interfaces (site specific). For site-specific settings, you can view and edit settings across multiple interfaces at the same time. Once you create a custom setting, you can edit only its value and its folder location.

To create a configuration setting

1 Click the New button on the ribbon and select the data type: Text, Integer, Menu, Yes/No, or Date/Time. A new setting opens on the content pane.



2 Enter the following field information.

Table 69: Custom Configuration Setting Description

Field	Description
Configuration Entry Information	Fields in this section define the parameters for the custom configuration setting, including name, field type, interface level, folder location, and field length.
*Key	Type the name of your custom configuration setting after CUSTOM_CFG_, which populates in this field. All custom settings must start with CUSTOM_CFG_.
Data Type	The data type you select on the ribbon is populated in this field. **Note:** This is a read-only field and cannot be edited. If you need to make changes to the Data Type field, you must either close the new setting without saving or delete it if it has been saved.
*Type	Click this drop-down menu to select the setting type, either Site or Interface. • Site—Classifies the custom setting as shared across all interfaces. (Default) • Interface—Classifies the custom setting as interface-specific only.

Table 69: Custom Configuration Setting Description (Continued)

Field	Description
*Required	Click this drop-down menu to define whether the custom setting is required.
*Folder	Click the Search button to define a folder location for your custom setting. By default, all custom settings must be located in the Custom folder or a custom subfolder. **Note:** Ten subfolders can be nested under the Custom folder. Each subfolder can contain three child folders.
Default	Enter the configuration setting default value in this field. The format of this field varies depending on the data type.
*Maximum Length	Enter the maximum length allowed in the Value field of a Text data type field. (1-300,000 characters) **Note:** This field displays only for Text data types.
Pattern	Type a regular expression format that the configuration setting value must conform to in this field. See Regular Expressions. **Note:** This field displays only for Text data types.
*Minimum Value	Enter the minimum value allowed in the Value field of an Integer data type field. (Limited to -999999999) **Note:** This field displays only for Integer data types.
*Maximum Value	Enter the maximum value allowed in the Value field of an Integer data type field. Default is 99999. (Integer fields can contain up to 9 digits.) **Note:** This field displays only for Integer data types.
*Predefined Menu	Click this drop-down to select a predefined menu list in the Value field of a Menu data type field. Options include Currencies and Time Zones. **Note:** This field displays only for Menu data types.
Descriptions	This section displays the interface name, language, and description.
Description	Type a description of the configuration setting in this field.
Values	This section displays the interface type (either site or interface name) and lets you set custom setting values. If you have more than one interface, you can set a value for each interface.

Table 69: Custom Configuration Setting Description (Continued)

Field	Description
Value	Type the value of the custom setting in this field.

3 Click the Save and Close button. The custom configuration setting displays in the tree under the Custom folder you saved it in.

Note You may be required to log out of Oracle Service Cloud and log back in for your changes to take effect.

Configuring the administration interface

Configuration settings let you create an **administration interface** that meets the business needs of your organization. Some of the most common settings are used to specify security settings, manage notifications, define incident functionality, categorize **tracked links**, and configure **forecasting** for opportunities.

Use Oracle Service Cloud security settings to protect your site by configuring how staff members and customers will access your site, as well as which hosts are allowed access to the administration interface and the **customer portal**.

- Learn about the settings related to site protection, passwords, and file attachments in Security-Related Configuration Settings. For a complete list of security-related configuration settings, see Recommendations for Security-Related Configuration Settings.
- For an in-depth discussion about security practices in Oracle Service Cloud and how to protect your data, see Security Practices.

Notifications

Notifications are accessed from the Communications Center navigation list and contain your messages about system errors and record assignments and updates. Notifications can also display reports to show the performance of incident queues. By default, the **Agedatabase** utility purges notification messages that are older than ten days. However, you can change the number of days after which notifications are removed by changing the NOTIF_AGE_DAYS configuration setting. To learn more about the different kinds of notifications, see Notifications.

Incidents

You can specify how long incidents remain open, active, and in the database. The following table describes the configuration settings you can use to customize incident life.

Table 70: Incidents Configuration

To…	Use this setting…
Specify how many hours **waiting** incidents remain open before being closed automatically.	CI_HOURS
Specify which days to use when calculating how long an incident has been open.	CI_WAITING_CALC_DAYS
Specify the number of days after which solved incidents are deleted from the database.	PURGE_DELETE_INCIDENTS
Specify the number of days after which solved incidents go dormant.	DORMANT_INCIDENTS

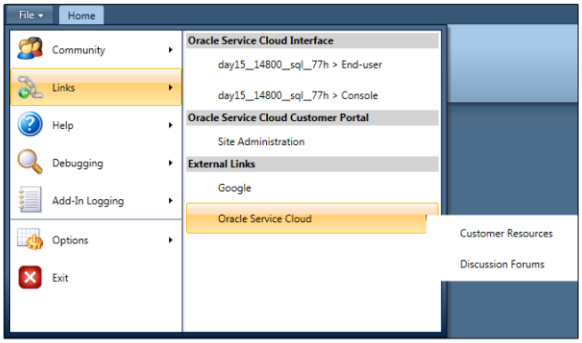
Opportunities

You can let sales representatives send **quotes** as PDF documents, though this option is disabled by default. Access the SEND_SA_QUOTE_AS_PDF configuration setting to enable this option. See Sending quotes.

Customizing the Links menu

The Links menu, accessed by clicking File, provides quick access to commonly visited URLs. By default, the list of links includes the customer portal pages of the current interface and the Service Console.

You can customize the links to meet your organization's needs by adding links to other websites your staff members may need to access. You can also add sub-menus that contain multiple links. This lets you organize your links by grouping related links under a single sub-menu title. The following figure displays a Links menu with a custom link, a separator, and a sub-menu with two links.



Note In order for the Customer Portal option to appear on the Links menu, the development area must be enabled (MOD_CP_DEVELOPMENT_ENABLED at Common > Oracle Products > Modules) and staff members must have customer portal permissions in their profile. See Assigning permissions.

Using the following procedures, you can duplicate the previous figure's custom links by defining the value of TBAR_LINK_LIST (RightNow User Interface > Tool Bar > Links) as:

```
item(1, "Google","http://www.google.com")
item(0,"","")
menu (1, "Oracle Service Cloud",(
item(1, "Customer Resources","http://www.oracle.com/us/products/
applications/rightnow/resources/index.html")
item (1,"Discussion Forums","http://communities.rightnow.com/groups/
bef552360b/summary")
))
```

To add a custom link

1 Click the Configuration button on the navigation pane.

2 Double-click Configuration Settings under Site Configuration. The Search window opens.

3 Type TBAR_LINK_LIST in the Key field and click the Search button. The Configuration Settings editor opens with TBAR_LINK_LIST displayed in table format (cross-tab mode).

4 Double-click TBAR_LINK_LIST. The setting opens in a new tab on the content pane.

Note You can also edit the Value column inline. However, this type of change is easier to make from the setting tab.

5 Type the link in the Value field using the following syntax:

```
item (#, "<link name>", "<action>")
```

The following table describes the link syntax.

Table 71: Custom Link Description

Field	Description
#	Type a link number in this field. The link number can be any positive integer. **Note:** 0 is reserved for adding separators.
“<link name>”	Type the link name as you want it to appear in the Links drop-down menu.
“<action>”	Type the URL of the website you want to open when the link is clicked.

6 To create another custom link, press **Enter** to begin a separate line, and type the link definition as defined in step 5. Type each link definition on a separate line.

7 To place a separator line between links, enter the following on a separate line between the links where you want the separator to appear:

```
item(0,"","")
```

8 Click the Save and Close button.

Note The new custom links appear under an External Links option on the Links menu after you log out and then log back in.

To add a sub-menu with links

1 Click the Configuration button on the navigation pane.

2 Double-click Configuration Settings under Site Configuration. The Search window opens.

3 Type TBAR_LINK_LIST in the Key field and click the Search button. The Configuration Settings editor opens with TBAR_LINK_LIST displayed in table format (cross-tab mode).

4 Double-click TBAR_LINK_LIST. The setting opens in a new tab on the content pane.

Note You can also edit the Value column inline on the content pane. However, this type of change is easier to make from the setting tab.

5 Type the sub-menu name and associated links in the Value field using the following syntax:

```
menu (#, "<menu name>",(
item (#,"<link name>","<action>")
item (#,"<link name>","<action>")
))
```

The following table describes the link syntax.

Table 72: Custom Link Sub-Menu Description

Field	Description
#	Type a number for the option. This sub-menu or option number can be any positive integer. **Note:** 0 is reserved for adding separators.
“<menu name>”	Type the name of the sub-menu as you want it to appear on the Links option of the file menu.
“<link name>”	Type the link name as you want it to appear in the Links sub-menu.
“<action>”	Type the URL of the website you want to open when the link is clicked.

6 To enter additional links to the sub-menu, type more “item” lines using the syntax in step 5. Type each link definition on a separate line.

7 To place a separator line between links of the sub-menu, enter the following on a separate line between the links where you want the separator to appear:

```
item(0,"","")
```

8 Click the Save and Close button.

Note The new custom sub-menu and links appear under the External Links option on the Links menu after you log out and then log back in.

Searching message bases

Message bases are text strings that appear on the administration interface, the customer portal, and in email messages and notifications. By customizing message bases with the Message Bases editor, you can change the descriptive text within your application. Message bases also provide international language support and let you change the text to accommodate regional dialects.

Run-time selectable filters let you define which message bases display on the content pane. You can search by interface, category folder, message base name, default text and custom text values.

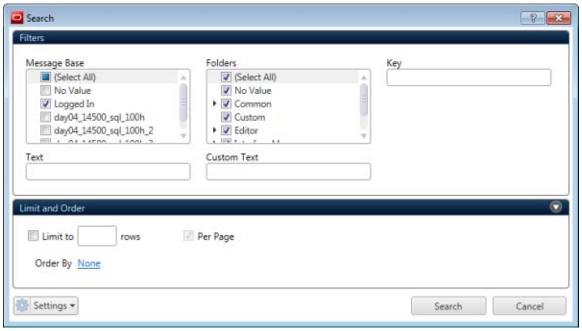
The first time you open the Message Bases editor, you must perform a search. Because settings are categorized as interface specific, the message bases Search window lets you specify what type of message base you want to see.

Once you open the Message Bases editor, you can click a message base link and locate the file in the list that appears in the left column. If you do not know the location of the message base you want to edit, you can run a report of the message bases to find the one you want to edit. The report displays each message base label, organized by location, along with the message associated with each label.

To search for a message base

1 Click the Configuration button on the navigation pane.

2 Double-click Message Bases under Site Configuration. The Search window opens. (The Message Bases editor also opens but is inactive at this point.)



You have several options on the Search window. You can:

- Use the search fields to filter the message bases that are returned on the editor.
- Accept all default filters by simply clicking the Search button to return every message base on the site you are logged in to.
- Click the Cancel button to bypass the window and search using the buttons on the ribbon or the search fields on the top of the editor.
- Customize the filters and save them as your defaults by selecting Save as Default Values from the Settings drop-down menu before clicking the Search button. The next time you access message bases from your configuration list, the Search window does not open because the system remembers your defaults. Instead, the Message Bases editor opens with your previously filtered search results.
- Design the layout of your Search window by selecting Enter Search Design Mode from the Settings drop-down menu.

As you configure your application, you will likely use a combination of these options depending on the message bases you want to access. However, for the purpose of this procedure, we show you how to customize your search results using the filters on the Search window.

3 Select the filters, sort options, and record limit to be displayed on the editor.

Tip If you use the search default settings, every message base on the site you are logged in to will be returned. If you have a large site, you may want to consider narrowing your search to return only the message bases you need to see. One way to do this is to filter the message bases by category folder. If you know the main folder in which the message bases you want to see are located, select only that folder from the Folders field.

The options available on the Search window are described in the following table.

Table 73: Search Window Description

Field	Description
Filters	This section displays the run-time selectable filters. If a filter displays a menu list, you can select all options in the list by selecting the Select All check box, or you can clear all options in the list by clearing the Select All check box.
Message Base	Select the check boxes next to the interfaces for which you want to display message bases. • Select All—Displays all message bases. • Logged In—Displays only message bases for the interface you are logged in to. (Default) • <interface name>—Displays only message bases that apply to the selected interface.
Folders	Select the folders that contain the message bases you want to display.
Key	Type the name of a specific message base in this field. This field is not case sensitive. **Note:** You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wildcard. All message bases that begin with the letters you type will be returned.
Text	Type message base default text (or a portion of the default text) to return message bases with a value that matches the text you type. **Note:** This field is not case sensitive and accepts blank spaces.
Custom Text	Type message base customized text (or a portion of the text) to return message bases with a value that matches the text you type. **Note:** This field is not case sensitive and accepts blank spaces.
Limit and Order	This section allows you to limit the number of rows returned and how the output should be sorted.
Limit To	This check box, selected by default, limits the number of rows returned. Limiting the records returned prevents more records being returned than can be easily viewed or printed.

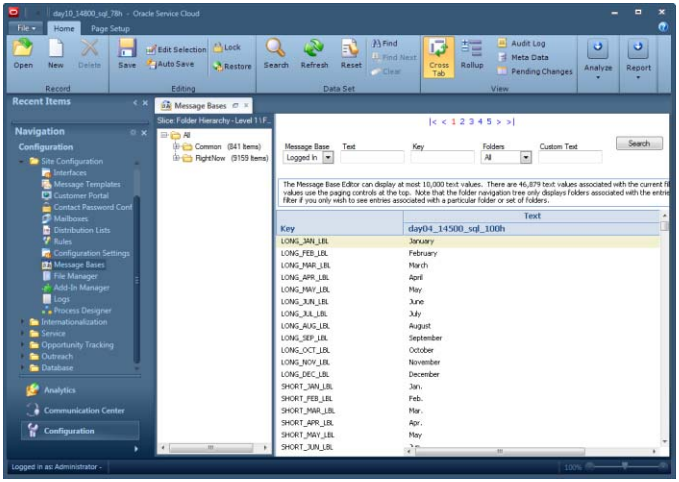
Table 73: Search Window Description (Continued)

Field	Description
Rows	Type the number of rows to be returned. The default value of 10,000 is the maximum number of rows that can be returned per page.
Per Page	Select this check box to change the number entered in the Rows text box from a hard limit on the total number of rows returned to a limit on the number of rows returned on each page. This is automatically selected when you select Limit To.
Order By	Click the current sort order next to the Order By field to select different sort options. The default sort order is displayed with the primary sort field listed first, followed by any subsequent sort fields. The direction each sort field is ordered in is also indicated (Asc for ascending order and Desc for descending order). See Changing sort options.
Settings	This drop-down menu gives you options to design and then save your Search window layout. It also lets you set, restore, and reset your default filter values.
Enter Search Design Mode	Select this option to design the layout of your Search window. See Customizing the Search window.
Set as Default Layout	Select this option to save your search layout as the default.
Restore Default Layout	Select this option to reset your search layout to the system default.
Save as Default Values	Select this option to save the filter values you select to the local settings on your workstation. These saved values are used as the defaults the next time you search and are logged in with the same staff account. Saving your search filters bypasses the Search window and automatically opens the Message Bases editor to display your previously filtered search results. **Note:** The default values are overwritten if you select different values and click this button again. If the search criteria is later edited to change filters, the default filter values stored in your local settings are ignored.

Table 73: Search Window Description (Continued)

Field	Description
Restore Default Values	Select this option to restore the search values to the default search values. This deletes saved search values from your local settings. **Note:** This button is disabled if the current search parameters were not populated from your local settings. See [Changing your personal settings](#).
Reset Values	Select this option to reset the search parameters' values to the default values that were populated when the editor opened. Clicking this button also resets the Search window to the default size if it has been resized.

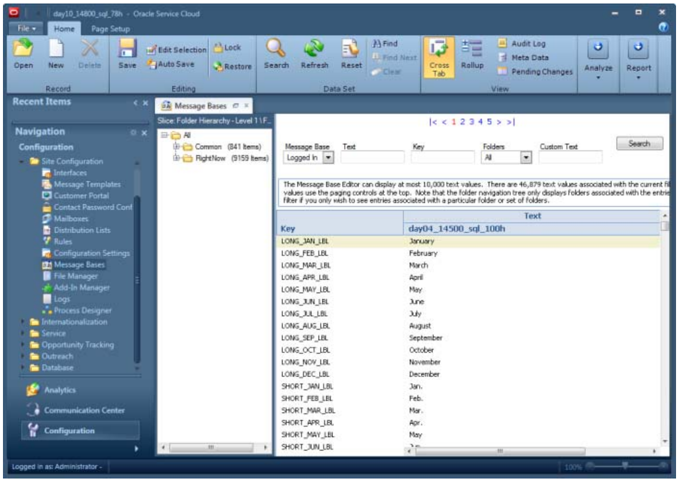
4 Click the Search button. Your search results display on the content pane.



Note Notice that each page is a clickable number across the top of the content pane. The number of folders that displays depends on which page you view and which settings are displayed. By default, the system displays, at most, 10,000 message bases per page with the folders that the text values are contained in displayed on the left.

Working with the Message Bases editor

After performing a search, the Message Bases editor displays your search results on the content pane. See [Searching message bases](). Reports drive the data that displays, and you can choose either cross tab or rollup mode for the layout view. In rollup view, if you have more than one interface, you can edit a message base across multiple interfaces at one time. (Cross tab is the default.)

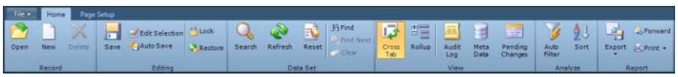


Ribbon functionality

Most of the buttons on the Message Bases editor ribbon reflect common Oracle Service Cloud functionality and work the same way as they do in reports. For information about working with reports in Oracle Service Cloud, see [Report Management]().

Home tab

From the Home tab, you can create and edit message base text, search and filter the data, define how you want the data to display, and export the data in a variety of formats. You can also edit values inline under the text columns.



The groups and buttons on the Home tab are described in the following table.

Table 74: Home Tab Description

Group/Button	Description
Record	The buttons in this group let you open existing message bases and create and delete custom message bases.
Open	Click this button to open the selected message base.
New	Click this drop-down menu to create a custom message base.
Delete	Click this button to delete a custom message base. **Note:** Standard message bases cannot be deleted. Therefore, this button is available only for custom message bases.
Editing	The buttons in this group let you edit message base text.
Save	Click this button to save your changes.
Edit Selection	Click this button to open the <interface name> window and edit the text of the selected message base. **Note:** In the default cross-tab view, you can edit only one row at a time. Therefore, if more than one row is selected, this button is disabled.
Lock	Click this button to ensure that the message base text value displays as you expect on upgrade. See To lock a text value. **Important:** Because the custom text value is always used on upgrade, and since the default value may change with new releases, locking the current value is the only way to ensure that your text stays the same from release to release. If you have entered a value in the Custom Text field, then that value is carried over on upgrade. However, if the Custom Text field is *not* populated, then the default text value is copied into the Custom Text field. In other words, once you click this button, the text value at that time (either custom text, if the Custom Text field is populated, or default text if it is not) is used from that point on, regardless of any default text value changes in a new release.
Auto Save	Click this button to automatically save your inline edits. **Note:** Auto Save works only for inline edits. The Save button is disabled when Auto Save is selected. See Editing data inline.

Table 74: Home Tab Description (Continued)

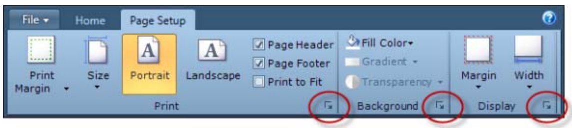
Group/Button	Description
Restore	Click this button to return the selected message base to its default value.
Data Set	The buttons in this group let you search for message bases, refresh the display, and reset the search criteria to the defaults.
Search	Click this button to open the Search window and select criteria for run-time selectable filters. See Searching message bases.
Refresh	Click this button to reload the data shown using the current search criteria. **Important:** This button works differently when you edit a message base. If you change a value before saving, clicking the Refresh button reverts to the previously saved value.
Reset	Click this button to reload the data shown using the default search criteria.
Find	Click this button to locate text, numeric values, or special characters on the current page. Cells that contain the search value are highlighted. See Finding content in reports. **Note:** The Find button works only on the currently displayed page.
Find Next	Click this button to highlight the next instance of the search values entered on the Find window.
Clear	Click this button to clear the search values entered on the Find window.
View	The buttons in this group let you define display options, view changes that have been made, and manage failed deployments.
Cross Tab	Click this button to display message bases in a table format. This is the default view.
Rollup	Click this button to display message bases in rollup levels. The data rolls up by message base name. If you have more than one interface, this view lets you edit multiple rows at once for the same message base. See Displaying rollup levels and To edit the same message base on multiple interfaces.

Table 74: Home Tab Description (Continued)

Group/Button	Description
Audit Log	Click this button to view changes that have been made to the message bases, including when the change was made, who made the change, the affected message base and name, and old and new values. You can also use run-time selectable filters to search for specific message bases.
Meta Data	Click this button to select criteria to display the attributes associated with message bases. See Exporting message bases.
Pending Changes	Click this button to open the Pending Changes window and view changes that failed to deploy during the save process. You can deploy all changes from this window. **Note:** Nothing displays unless there is a failed deployment.
Analyze	The buttons in this group let you sort the displayed data and apply auto filtering, rollups, and slicing to the data.
Auto Filter	Click this button to enable auto-filtering. Auto-filtering provides column filtering after the report has been generated. See Using Auto Filter.
Sort	Click this button to open the Sort window and select which output columns to sort by and the sort method. See Changing sort options.
Report	The buttons in this group let you export the data, forward the data in an email, and save and restore default values. **Note:** Permission to export, print, and forward reports must be assigned in your profile for this button to display. See Analytics permissions.
Export	Click this button to export the data from a file for use with third-party applications. You can export data in the following formats: HTML, PDF, Excel, XML, Image, and Delimited. You can also copy data to the clipboard. See Exporting report output.
Forward	Click this button to send the data to individuals or **distribution lists** in an email. See Forwarding reports.
Print	Click the arrow on this button to access printing options.

Page Setup tab

The Page Setup tab lets you configure printing options. You can also change the background, margins, and width of reports.



Each tab has one or more groups containing buttons you can use to modify printing or display options. Some groups have an arrow to the right of their name that you can click to open a window. For example, you can click the arrow on the Background group to open the Display Options window.

Windows give you access to the same features you can access from the ribbon, although the windows group the options differently, and sometimes contain options not available from the ribbon.

The groups and buttons on the Page Setup tab are described in the following table.

Table 75: Page Setup Tab Description

Group/Button	**Description**
Print	The buttons in this group let you configure printing options and add the Page Header and Page Footer sections. Click the arrow on the Print group to open the Page Setup window. See Printing reports. **Note:** This button group displays only if your profile includes the Print/Export/Forward Reports permission. See Analytics permissions.
Print Margin	Click this button to select the size of the margins used when printing. The available options are Normal, Narrow, Medium, and Wide.
Size	Click this button to select the paper size. The available options are Letter, Legal, Executive, A3, A4, and A5.
Portrait/Landscape	Click these buttons to print in portrait or landscape mode.
Page Header/Page Footer	Select these check boxes to include a page header and page footer when printing the report.

Table 75: Page Setup Tab Description (Continued)

Group/Button	Description
Print to Fit	Select this check box to scale your output to your printer's default page width and send it to the printer.
Background	The buttons in this group let you add a background color. You can add a gradient color to blend into the primary color and choose how intense the colors should be with the Transparency setting. Click the arrow on the Background group to open the Display window.
Fill Color	Click this drop-down menu to select a background color.
Gradient	Click this drop-down menu to apply a gradient to the background. **Note:** This option is available only after you have selected a fill color.
Transparency	Click this drop-down menu to apply a transparency to the background. **Note:** This option is available only after you have selected a fill color.
Display	The buttons in this group let you add margins and set the width. Click the arrow on the Display group to open the Display window.
Margin	Click this button to define the amount of whitespace around the printed output. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Width	Click this button to select the width of the entire printed output. The available options are Best Fit and Fit to Window.

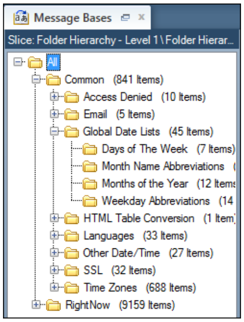
Folder structure

Message bases are organized in a hierarchical folder structure. The number of message bases in each category folder display next to the folder name. Keep in mind that this number varies depending on how you have defined the filters in your search.

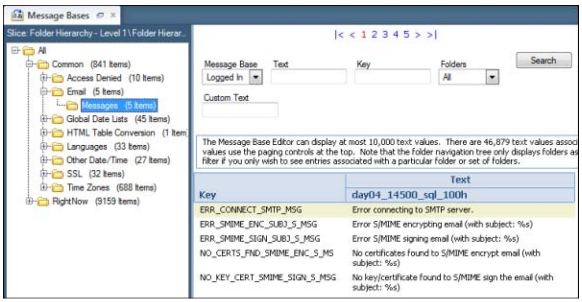
By default, the system displays, at most, 10,000 message bases per page with the folders that the text values are contained in displayed on the left. Each page is a clickable number across the top of the content pane.

If you have a large site, you may want to consider narrowing your search to return only the message bases you need to see. One way to do this is to filter the message bases by category folder. If you know the main folder in which the message bases you want to see are located, select only that folder from the Folders field.

Expand the folder contents to drill down to only the message bases you want to see. For example, you could navigate to the Global Date Lists folder under Common > Global Date Lists to display all message bases in the Global Date Lists folder, including its subfolders. You could then expand the message bases by each subfolder.



The following figure shows the folders expanded by the Messages folder under Common > Email > Messages. In this case, the five message bases in the Messages folder are the only message bases that display on the content pane.



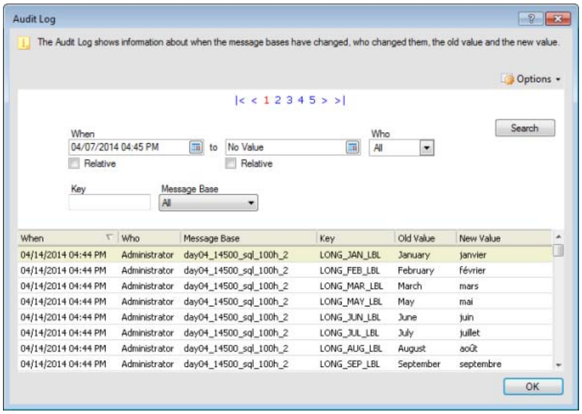
Tip To display message bases in alphabetical order, click in the Key column header.

Audit log

The audit log makes it easy for you to see changes that have been made to the message bases. Depending on where you are on the Message Bases editor, different information displays. For instance, clicking the Audit Log button on the ribbon from the main Message Bases editor displays the following information about the changes made.

- Date and time of change
- Who made the change
- Affected interface
- Message base name
- Old value
- New value

You can also search for a specific message base you want to see changes for from the audit log. The following figure shows the search window for the audit log.



The search options available are described in the following table.

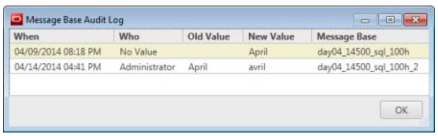
Table 76: Audit Log Search Description

Field	Description
When	Enter the start and end dates or click the calendars to select the dates for the time period of the changes you want to see. The current day is the default start date.

Table 76: Audit Log Search Description (Continued)

Field	Description
Relative	Select this check box and then click the calendar to enter relative start and end dates.
Who	Click this drop-down menu to display changes made by a particular staff member. All is the default.
Key	Type the name of a specific message base in this field. **Note:** You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wild-card. All message bases that begin with the letters you type will be returned.
Message Base	Select the check boxes next to the interface for which you want to display changes to message bases. • All—Displays all message bases. (Default) • Logged In—Displays only message bases for the interface you are logged in to. • <interface name>—Displays only message bases that apply to the selected interface.

Clicking the Audit Log button with a specific message base open displays changes to that message base only.

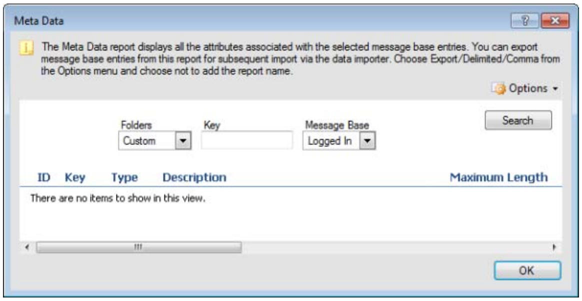


Exporting message bases

Exporting and importing metadata can save time, especially when you have large numbers of message bases. You can export message base metadata and then import that data into another site using the Data Import Wizard. All attributes associated with message bases are available for the interfaces you choose to display. Message base attributes include ID, key (name), type (site or interface specific), description, maximum length, folder and folder ID, and text and custom text values.

To export metadata

1 From the Message Bases editor, click the Meta Data button on the ribbon. The Meta Data window opens.



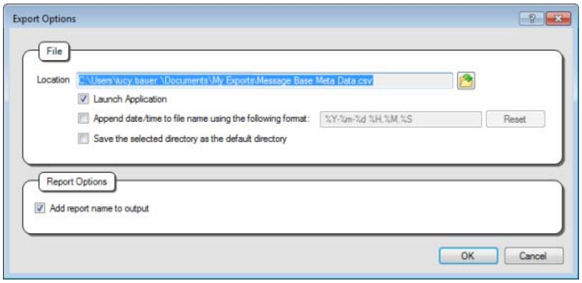
2 Enter the following field information.

Table 77: Meta Data Window Description

Field	Description
Folders	Select the folders that contain the message bases you want to display. The Custom folder is selected by default.
Key	Type the name of a specific message base in this field. This field is not case sensitive. **Note:** You can also enter just the first few letters and append either the percentage sign (%) or an asterisk (*) to serve as a wildcard. All message bases that begin with the letters you type will be returned.
Message Base	Select the check boxes next to the interfaces for which you want to display message bases. • Select All—Displays all site- and interface-specific message bases. • Logged In—Displays only interface-specific message bases for the interface you are logged in to. (Default) • <interface name>—Displays only interface-specific message bases that apply to the selected interface.

3 Click the Search button. Your search results display on the content pane.

4 Click the Options drop-down menu and select Export > Delimited > Comma. The Export Options window opens.



5 Enter the following field information.

Table 78: Export Options Window Description

Field	Description
Location	Lists the default location where your CSV file will be saved.
Save As	Click this button to open the Save As window where you can specify a location (other than the default) to save your file.
Launch Application	Clear this check box if you do not want the file to open after you export it.
Append date/time to file name using the following format	Select this check box to add the date and time to your file name. **Note:** To change the format in which the date and time is added to your file, type your preferred format in the field next to the check box and then click the Reset button.
Save the selected directory as the default directory	Select this check box to make the directory specified in the Location field your default directory.
Add report name to output	Clear this check box to remove the report name from the CSV file. **Important:** You must clear this check box to import the file from the Data Import Wizard because it uses the value specified in the Header Location field to import the data.

6 Click the OK button.

Now you can import your CSV file from the Data Import Wizard. See Importing data.

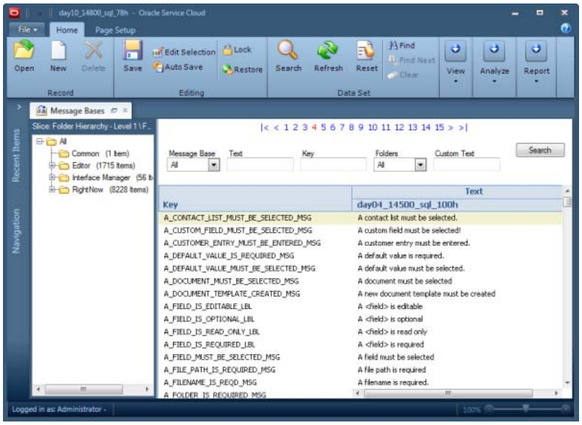
Customizing message bases

Message bases are text strings that appear on the administration interface, the customer portal, and in email messages and notifications. By customizing message bases with the Message Bases editor, you can change the descriptive text within your application. Message bases also provide international language support and let you change the text to accommodate regional dialects.

Reports drive the data that displays on the content pane, and you can format the output returned using **cross tab** (default) and **rollup** views. In rollup view, you can edit a single message base for multiple interfaces at one time. Like configuration settings, message bases are organized in a hierarchical folder structure.

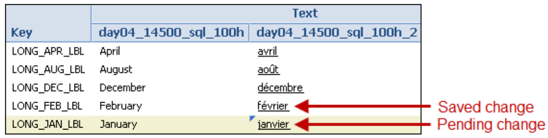
To find message bases, use the Search feature on the Message Bases editor. See [To search for a message base](#).

The following figure shows page 4 of the Message Bases editor. (Each page is a clickable number across the top of the content pane.) By default, the system displays, at most, 10,000 message bases per page with the folders that the text values are contained in displayed on the left. The number of folders that displays depends on which page you view and which settings are displayed.



Editing message bases

While standard message bases cannot be deleted and their field parameters cannot be edited, the text value of a standard message base can be edited, either inline or by clicking the Edit Selection button on the ribbon. You can also edit the same message base on multiple interfaces at the same time using rollup mode. You can easily see when a text value has been changed from the default value because an underscore displays on the changed value. If you change the value back to the default, the underscore no longer displays. When a change is pending, the edited field displays a tick mark. When you hover over the tick mark, a tooltip displays telling you how to save or discard your change.



Another feature you'll want to know about is the ability to lock your message base text values to ensure that the text displays as you expect on upgrade. Because the system always uses the custom text value on upgrade, and since the default value may change with new releases, locking the current value is the only way to ensure that your text stays the same from release to release. See the procedure that follows to lock your text values.

Caution We recommend that you document all changes made to the message bases. As you continue to edit the message bases, your installation becomes less similar to the documentation and the default product. In some cases this can make training and troubleshooting more difficult. Before you begin editing a message, you may want to copy the existing message text from the Default Text field and paste it into the Description field of the open message base. This reduces the chance of errors if you ever need to change your edited message back to the previous value.

To edit message base text

1 Select the row that displays the message base you want to edit.

2 Click the Edit Selection button on the ribbon. The <interface name> window opens.

Or

Click in the Text column to edit the text value inline.

Or

Double-click the message base to open it on the content pane and edit the Description field and/or the Custom Text field.

3 To edit the message base description, type your changes in the Description field.

4 Type or select the new custom text value.

Important Do not add hard returns to message base text. Hard returns may cause a JavaScript error to occur on the page or window where the text appears.

5 To revert to the default text value, click the Restore button.

6 Click the Save button on the ribbon. The new custom text displays with an underscore.

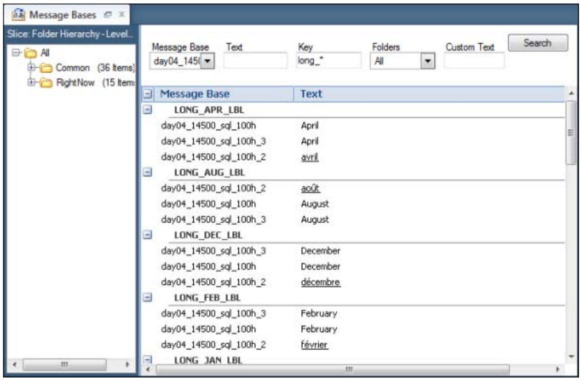
7 Verify the change by checking the page where the edited message base appears.

Note Changes to the message bases do not take effect immediately. You must log out of Oracle Service Cloud and log back in or refresh the customer portal page.

To edit the same message base on multiple interfaces

Note You cannot edit different message bases on the same interface at the same time. However, you can edit the same message base on multiple interfaces.

1 From the Message Bases editor, click the Rollup button on the ribbon.



2 Press **Ctrl** while selecting the rows you want to edit.

3 Click the Edit Selection button on the ribbon.

4 Type the new text value.

5 Click the OK button. The values of all the selected rows are updated.

6 Click the Save button on the ribbon. The new values display with an underscore.

7 Verify the changes by checking the pages where the edited message bases appear.

Note Changes to the message bases do not take effect immediately. You must log out of Oracle Service Cloud and log back in or refresh the customer portal page.

To lock a text value

1 Select a message base from the Message Bases editor.

2 Click the Lock button on the ribbon.

If you have defined a value in the Custom Text field, then that value is locked and will be used on upgrade. If the Custom Text field is *not* defined, then the default text value is copied into the Custom Text field and that value is locked. Either way, the text value will be used from that point on, regardless of any default text value changes in a new release.

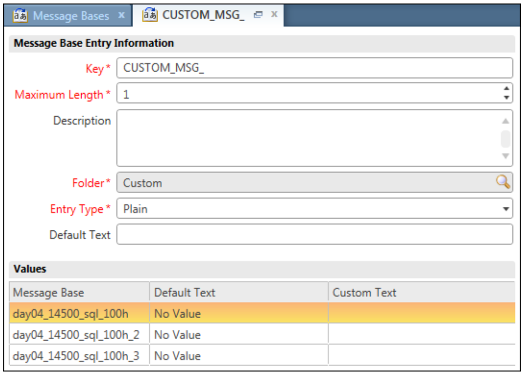
Tip If you have more than one interface, you can lock multiple message bases at the same time by displaying the report in rollup view. See To edit the same message base on multiple interfaces.

Creating custom message bases

When you create a new message base entry, it is considered custom. By default, every custom message base entry name starts with CUSTOM_MSG_ and is automatically assigned to a Custom folder in the folder hierarchy. Once you create a custom message base entry and save it, you can edit its label with custom text. You can also edit the Description field at this point.

To create a message base entry

1 Click the New button on the ribbon. A new message base entry opens on the content pane.



2 Enter the following field information.

Table 79: Custom Message Base Entry Description

Field	Description
Message Base Entry Information	Fields in this section define the parameters for the custom message base, including name, field length, description, folder location, entry type, default text, and custom text.
*Key	Type the name of your custom message base after CUSTOM_MSG_, which populates in this field. All custom message bases must start with CUSTOM_MSG_.
*Maximum Length	Enter the maximum length allowed in the Custom Text field (1-300,000 characters)
Description	Type a description of the message base in this field.
*Folder	Click the Search button to define a folder location for your custom message base. By default, all message bases must be located in the Custom folder or a custom subfolder. **Note:** Ten subfolders can be nested under the Custom folder. Each subfolder can contain three child folders.

Table 79: Custom Message Base Entry Description (Continued)

Field	**Description**
Entry Type	Select from the drop-down menu to add a plain, HTML, or hot key attribute to your message base. Both the Default Text and Custom Text fields accept plain, HTML, and hot key attributes. The HTML option lets you apply HTML to your text. For example, if you want your text to display in bold, you could type <b>Bold text</> in the fields. The Hotkey option lets you add a keyboard shortcut to your text by prepending an ampersand (&) to the text you type in the fields.
Default Text	**Important:** This field is not required. However, if you plan to export and then import your message bases, you must enter a value in this field (or under the Values section). Otherwise, the data import will return an error. Type the default text that you want to display on all interfaces. The text you type in this field populates the Default Text fields for all interfaces under the Values section. **Note:** If you want your interfaces to display different default text, leave this field blank and type your default text values in each interface row under the Values section.
Values	This section displays the interface name and lets you set your default text for each interface.
Default Text	Type the default text you want to display for each interface.
Custom Text	Type the custom text you want to display on each interface. If you define a value in this field, it overwrites the value in the Default Text field. **Note:** This field is disabled until you save your new custom message base. In other words, this field can be edited only on existing message bases.

3 Click the Save button.

Now that you have saved your message base, you can edit the Custom Text field.

4 To define a value for custom text, type it in the Custom Text field. If you define a value for this optional field, it overwrites the value in the Default Text field.

5 Click the Save and Close button. The custom message base displays in the tree under the Custom folder you saved it in.

6 To preserve your text value on upgrade, you must lock the text value. See To lock a text value.

Note Changes to the message bases do not take effect immediately. You must log out of Oracle Service Cloud and log back in or refresh the customer portal page.

Managing files

The File Manager provides direct access to files located on the hosting servers that can be used to customize your organization's application. Using the File Manager, you can view, edit, replace, and back up files that control many aspects of Oracle Service Cloud.

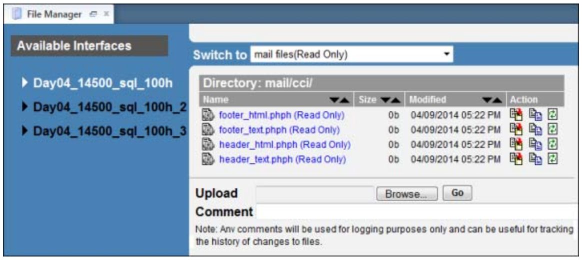
Caution Changes to the files available in the File Manager may immediately affect what customers and staff members see. Because changes to these files can have significant impact, you may want to give only certain staff members access to the File Manager. You can grant or deny access to the File Manager through the Configuration permission on the Administration tab of the staff member's **profile**. See Customizing profiles.

By default, the File Manager provides access to the most commonly modified files. For descriptions of the directories and files that are accessible using the File Manager, see File Manager directories.

To access the File Manager

1 Click the Configuration button on the navigation pane.

2 Double-click File Manager under Site Configuration. The content pane displays the File Manager.



Important By default, the *mail/cci* directory displays when you open the File Manager. However, the mail files are read-only. You can, however, copy any existing file to use in the content of your organization's system-generated notifications and emails. See Message Templates.

The Available Interfaces section contains links to the available interfaces for this installation of Oracle Service Cloud. On the right, you can select a directory from the Switch To drop-down menu to navigate to another directory. This section contains all the files located in the selected directory. Using the Upload function, you can upload a supported file to the current directory by browsing for the file.

The following table contains descriptions of the fields and buttons on the File Manager.

Table 80: File Manager Description

Field/Button	Descriptions
Available Interfaces	Select the interface for viewing or editing files in the File Manager.
Switch to	Click this drop-down menu to select the directory you want to open. For information about directory structure and individual files, see File Manager directories.
Name	This column displays the view/edit button with the file name or the folder icon with the folder name.
	Click this button to open a folder or subfolder.
	Click this button to view or edit *.php* and *.js* files.
	Click this button to view or edit *.css, .moddefs, .tlx,* and *.xml* files.

Table 80: File Manager Description (Continued)

Field/Button	Descriptions
	Click this button to view or edit *.gif, .jpg,* and *.png* files.
	Click this button to view or edit *.html* files.
	Click this button to view or edit *.txt* and *.utf8* files.
Size	This column displays the size (in kilobytes) of the folder or file.
Modified	This column displays the date that the folder or file was last modified.
Action	This column displays the actions you can take for each file, including download, move, copy, restore, and delete.
 Download	Click this button to download the file to your workstation. See Downloading and uploading files.
 Copy	Click this button to copy or move the file. See Copying and moving files. **Note:** You cannot move an original file, only a copy.
 Restore	Click this button to restore the file to the original default configuration or the last saved backup copy. See Restoring files.
 Delete	Click this button to delete a file. Only copied, moved, and uploaded files can be deleted. See Deleting files.
Upload	Type the path and name of the file you want to upload to the server in this text box. See Downloading and uploading files.
Browse	Click this button to browse for the file you want to upload.
Go	Click this button to upload the file to the directory in which you are currently located. A file must be specified in the Upload File box.
Comment	Type a comment to the log file in this field.

Backup and default files

Each directory accessible through the File Manager has an associated backup and default directory. The File Manager automatically saves a backup file in the backup directory when a file is uploaded, edited, or restored. It also maintains permanent, read-only copies of the originally installed default files in the default directory. If necessary, files that have been edited can be restored from the default file or the backup copy using the restore function. See Restoring files.

Note The files in the backup and default directories cannot be edited or overwritten, only viewed and downloaded.

We strongly recommend backing up all customized files on a disk, computer, or network so in the event that you need to revert to an old version of a file, you can restore to a working file. For information about making a backup copy of a file using the download feature, see Downloading and uploading files. For information about making a temporary backup copy of a file using the copy feature, see Copying and moving files.

Downloading and uploading files

By downloading a file, you can edit the file locally to obtain the desired results, and then upload the file to the server. The download function also lets you save backup copies of your customized files.

You can also upload files to the hosting facility. This direct access to files on the server gives you the ability to manage files and provides you with a convenient interface for uploading and downloading files.

Note In the *wordlist* and *dictionary* directories, you can upload only those files that already exist in the directory. For example, if you try to upload a file called *mydict.txt* to the dictionary directory when the actual file is *userdic.tlx*, an error message displays and the upload does not execute.

To download a file

1. Click the Configuration button on the navigation pane and then double-click File Manager under Site Configuration.
2. Select the directory that contains the file from the Switch To drop-down menu.

3 Click the Download button in the Action column for the file you want to download. A message asks you to save the file or find a program to open it.

4 Click the Save button to open the Save As window.

5 Navigate to the directory where you want to save the file and type the name of the file.

6 Click the Save button to download the file to the selected directory on your workstation.

To upload a file

1 Select the directory that contains the file from the Switch To drop-down menu.

2 Type the full path of the file you want to upload in the Upload field.

Or

Click the Browse button to open the Choose File window where you can search your local and network file systems for the file. Select the file and click the Open button. The file path and name populates the Upload text box.

Important A file name cannot include spaces or special characters. In addition, a file name that includes uppercase characters is converted to lowercase when it is uploaded. After the file is uploaded, it can be copied with a new name if the file requires a name with uppercase characters. See Copying and moving files.

3 Click the Go button to upload the file to the current directory. If the uploaded file has the same file name and extension as the file you want to replace, it automatically overwrites the file. A backup copy of the current file is saved in the backup directory before the file is overwritten.

Note Only certain file types can be uploaded through the File Manager. For a list of file types that can be uploaded into each directory, see File Manager directories.

Viewing and editing files

You can view a file to help you identify the file's purpose or to help you troubleshoot issues. If necessary, the File Manager also lets you edit files located on the hosting server.

To view a file

1 Click the Configuration button on the navigation pane and then double-click File Manager under Site Configuration.

2 Select the directory that contains the file from the Switch To drop-down menu.

3 Click the View/Edit button to the left of the file you want to view. The contents of the file are displayed on the content pane.

4 Click the Cancel button to return to the main File Manager page when you have finished viewing the file.

Note When viewing or editing a file through the File Manager, you may need to scroll down to see the Save and Cancel buttons.

To edit a file

1 From the File Manager, click the name of the file you want to edit or click the View/Edit button to the left of the file.

2 Edit the file as necessary.

3 Type a brief comment in the Comment field to help you track the editing history. For information about viewing comments, see Log file.

4 Click the Save button to save the changes. A backup copy of the current file is saved in the backup directory and the current file is overwritten with the modified file. Because saving a file impacts the backup copy of the file, you will receive a warning if you attempt to save the file without making any changes.

Copying and moving files

You can copy or move a file to the current directory or the backup directory to organize and back up your files. However, you cannot move or overwrite the files in the *default* directories.

When copying files, you may want to adopt a naming convention for old or backup copies of a working file. The File Manager default file name is *copy_<filename>*. Be consistent with whatever naming convention you choose.

To copy or move a file

1 Click the Configuration button on the navigation pane and then double-click File Manager under Site Configuration.

2 Select the directory that contains the file from the Switch To drop-down menu.

3 Click the Copy button in the Action column of the file you want to copy or move.

4 To move the copy of the file to the backup directory, select it using the directory drop-down menu under the current directory.

5 To change the resulting file name from the default *copy_<filename>*, type the new name in the text box to the right of the directory drop-down menu.

6 Type a brief comment in the Comment field to help you track the editing history. For information about viewing the editing history, see Log file.

7 Click the Save button to copy or move the file to the specified directory and file name.

8 To create additional copies of the same file, repeat steps 3 through 7.

9 Click the Cancel button to return to the directory where the copied file is located.

Restoring files

You can restore a file to the most recent backup copy in the backup directory or to the original default file in the default directory. You might choose this option if you are having problems editing a file and want to revert to an earlier version. Read-only, backup copies of all files accessible through the File Manager are created in each default directory during installation to serve as permanent backup copies. Before a file is overwritten (edited, uploaded, or restored), a backup copy is saved in the backup directory.

When you use the restore function and there is both a backup and default file, you are prompted to choose which file you want to restore. If only one file exists, either a default file or a backup file, a dialog box prompts you to confirm the restoration from the existing file.

To restore a file from the backup or default directory

1 Click the Configuration button on the navigation pane and then double-click File Manager under Site Configuration.

2 Select the directory that contains the file you want to restore from the Switch To drop-down menu.

3 Click the Restore button in the Action column of the file you want to restore. A warning message asks you to verify that you want to restore the file.

4 Click the OK button. If both backup and default files exist, you are prompted to choose either the backup or default file.

5 To restore from the default file, select the Default radio button and click the Commit button to return to the directory list of files.

6 To restore from the backup file, select the Backup radio button and click the Commit button to return to the list of files.

Deleting files

You can delete copies of files or uploaded files that you no longer need. However, you can delete only those files that you have copied, moved, or uploaded. You cannot delete the original files that were created during installation or upgrade. Before the file is deleted, a copy of the file is saved in the backup directory.

Caution Deleting a file can affect your production site. Be sure that the file you are deleting is not necessary for proper functioning of your site. Always make backup copies of files that you may need in the future.

To delete a file

1 Click the Configuration button on the navigation pane and then double-click File Manager under Site Configuration.

2 Select the directory that contains the file you want to delete from the Switch To drop-down menu.

3 Click the Delete button in the Action column of the file you want to delete. A warning message asks you to continue or cancel the action.

4 Click the OK button to delete the file.

File Manager directories

The File Manager gives you access to the directories described in the following sections along with access to the backup and default directories.

Mail files

The PHP files in the *mail/cci* directory as well as the files in the expanded File Manager have been deprecated and may be permanently removed in a future release. You can customize your message content, including headers and footers, using **message templates** instead of making changes to multiple PHP files. See Message Templates.

Note The mail files display as read-only in the File Manager so that you can copy any existing message content to your organization's system-generated notifications and emails, which are defined by the message templates.

CSS files

This directory has been deprecated and is not used by standard Oracle Service Cloud functionality. You can upload and download CSS files to the customer portal *assets* folder through WebDAV. See Understanding the Customer Portal file structure, The customer folder, and WebDAV for the Customer Portal.

Custom scripts

This directory is used to store legacy files for any customization work done on your site.

Outreach and Feedback files

Using the default files in the *ma/cci* directory, you can customize pages used with Outreach and Feedback mailings and surveys. These directories do not display if Outreach and Feedback is not enabled. The following table lists the files available in the default *ma/cci* directory.

Table 81: Files in the *ma/cci/* Directory

File	Description
bottom.phph	Used to add page elements to the bottom and right of HTML pages that have been generated by PHP scripts.
head.phph	Used to link to a cascading style sheet to add head elements to the HTML pages that have been generated by the PHP scripts.
top.phph	Used to add page elements to the top and left of HTML pages that have been generated by PHP scripts.

To learn more about customizing mailing and survey pages, see Answer ID 2477 on our support site.

Image files

This directory has been deprecated and is not used by standard Oracle Service Cloud functionality. You can upload and download image files to the customer portal *assets* folder through WebDAV. See Understanding the Customer Portal file structure, The customer folder, and WebDAV for the Customer Portal.

Chat file directories

The Chat image files directory contains the images used in Chat, including the logo used on the client window. The Chat Agent transcript images directory contains the images used to modify the Transcript section of the chat sessions workspace. The Chat Agent transcript templates directory contains the style sheet, JavaScript file, and HTML template used to modify the Transcript section of the chat sessions workspace. These directories do not display if Chat is not enabled.

Wordlist files

The files in this directory enable you to customize the words used during keyword indexing, text searching, and SmartSense rating. See SmartSense Emotive Rating.

Note The Wltool utility runs automatically after editing these files. However, if you edit the *exclude_incidents.txt* or *exclude_answers.txt* files, the Keywordindexer utility must run by Oracle Cloud Operations before your changes become active. To schedule this, submit an incident on our support site.

The following table lists the files available in this directory.

Table 82: Files in the *wl/en_US/* Directory

File	Description
aliases.txt	This file is initially empty, but you can add synonyms, phrases, or aliases to link terms specific to your industry to similar terms that may be used during a search. For example, a customer might search for an acronym, such as “GPS,” but all of your answers regarding GPS might spell out “global positioning system” rather than using the initials. The *aliases.txt* file lets you link terms that customers might search on with synonymous terms in your answers. The first word in the line is the search word that customers can enter. It can contain spaces so you can use phrases as synonyms for the search word. It cannot contain ampersands or slashes, although it can contain hyphens. All entries on the line must be uppercase and comma delimited, as shown in this example: GPS, GLOBAL POSITIONING SYSTEM, NAVIGATIONAL SYSTEM If a customer enters the first word in a line as a search word, all answers containing that word or any other term on the line are returned. In this example, a customer who enters GPS as a search word is directed to all answers containing “GPS,” “global positioning system,” or “navigational system.”
do_not_suggest.txt	This file is initially empty, but you can add terms you do not want to appear in Suggested Searches on the Answers page. Enter each word on a separate line of the text file.
exclude_answers.txt	This file contains common words such as prepositions, adverbs, and pronouns that are excluded from indexing and searching functions on the customer portal. If you have specific words that you do not want customers to be able to search on, you can add these stopwords to the *exclude_answers.txt* file to exclude them from being indexed. Stopwords must be uppercase and typed on separate lines. **Note:** Words in this file are also excluded when using **SmartAssistant** to search for an answer.

Table 82: Files in the *wl/en_US/* Directory (Continued)

File	Description
exclude_incidents.txt	This file contains common words such as prepositions, adverbs, and pronouns that are excluded from indexing and search functions on the administration interface. If you have specific words that you do not want agents to be able to search on, you can add these stopwords to the *exclude_incidents.txt* file to exclude them from being indexed. Stopwords must be uppercase and typed on separate lines. **Note:** SmartAssistant does not exclude words from *exclude_incidents.txt* when searching incidents on the administration interface or the customer portal.
exclude_responses.txt	This file contains common words such as prepositions, adverbs, and pronouns that are excluded from use in clustering responses. If you have specific words that you do not want agents to be able to search on, you can add these stopwords to the *exclude_responses.txt* file to exclude them from being indexed. Stopwords must be uppercase and typed on separate lines.
smartsense.txt	This file contains emotive override words and values that are checked before the standard emotive word list. You can add unrated words, give different ratings to already rated words, or remove words. Each word is rated between -10 and +10. Word values are used for internal calculations to result in the final displayed SmartSense ratings of +3 to -3. The word and its value must be separated by a tab. In addition, entries must be uppercase and typed on separate lines. Any changes affect new incidents, updated incidents, and text question responses in surveys. When adding words to this file, you must add all forms of the word (on separate lines), not just the root word.

Table 82: Files in the *wl/en_US/* Directory (Continued)

File	Description
thesaurus.txt	This file contains a list of words and their synonyms used in the Similar Phrases search technique on the Answers page. Words in the text search are matched with synonyms to extend the searching capability to include ontologies. The word and its synonyms must be uppercase and comma delimited as seen in this example: ABIDE, BIDE, STAY, ENDURE, STOMACH, BEAR, STAND, TOLERATE, BROOK, SUFFER where ABIDE is the main word and BIDE, STAY, ENDURE, and so on are synonyms. In *thesaurus.txt*, each word in the list is a synonym of the first word, not synonyms of each other. For example, the word "abide" has the synonyms "stay" and "endure." Endure has no synonyms, unless "endure" had its own entry. **Note:** The synonyms can be multi-word phrases, but the first term in the line must be a single word.

Asian language dictionaries

The Asian language dictionaries directory contains additional dictionary word lists that are used for part-of-speech (POS) tagging and similar phrase searching. By adding words to the user dictionary files with special parameters, you can override the default segmentation.

Note User dictionary files are available only for Chinese and Japanese languages, specifically Mandarin (*user.dict_CN.utf8*), Cantonese (*user.dict_HK.utf8*), Taiwanese (*user.dict_TW.utf8*), and Japanese (*user.dict_JP.utf8*).

You can create user dictionaries for words specific to an industry or application by adding new words, personal names, and transliterated characters of other alphabets. In addition, you can specify how existing words are segmented. For example, you may want to prevent a product name from being segmented even if it is a compound. The system performs a lookup of more than 500,000 words to determine segmentation. Using the dictionary, alias list, and keywords, you can influence how words are segmented.

If you edit a user dictionary file, you must use a specific format. The word you want to add is followed by the user dictionary part-of-speech tag (listed below), and an optional decomposition pattern (DecompPattern) in the form of a comma-delimited list of numbers specifying the number of characters from the word to include in each component of the string. (Use a zero (0) to indicate that a DecompPattern is *not* needed.)

For example, the user dictionary entry AABBCC ORGANIZATION 2,2,2 indicates that AABBCC should be decomposed into three, two-character components.

User Dictionary POS Tags for Mandarin, Cantonese, and Taiwanese (case insensitive)

- NOUN
- PROPER_NOUN
- PLACE
- PERSON
- ORGANIZATION
- FOREIGN_PERSON

User Dictionary POS Tags for Japanese (case insensitive)

- NOUN
- PROPER_NOUN
- PLACE
- PERSON
- ORGANIZATION
- GIVEN_NAME
- SURNAME
- FOREIGN_PLACE_NAME
- FOREIGN_GIVEN_NAME
- FOREIGN_SURNAME

Important Oracle Cloud Operations must run the Keywordindexer utility before your changes to the word list files are active. To schedule this, submit an incident on our support site.

Spellchecker dictionaries

The spellchecker dictionary directory, *spell/dict/,* contains an additional dictionary word list, *userdic.tlx,* which is used for spell checking and similar phrase searching. Add words you want to be included in the spell checking dictionary. Words added to this file are not flagged as misspelled during spell checking. Type each word on a separate line.

Integration files

The files in this directory are templates used for external events and email integration. Contact your Oracle account manager for help with these files.

Certificate directories

The Additional root certificates, Intermediate certificates, and Certification revocation lists directories are used to store files used for email security. See Email security overview.

Log file

The log file is a useful tool for tracking the history of a file. It records the details of the actions taken on a file (for example, uploading, restoring, copying, or deleting), including the staff member who executed the action, the IP address of the staff member's workstation, the date and time of the action, and comments. You can send the log file through email or download the log file to your workstation in either CSV (comma-separated value, or comma-delimited) or HTML format.

The following table describes the fields in the log file.

Table 83: Log File Description

Field/Button	Description
File Name	This field displays the name of the file.
User	This field displays the staff member who executed the logged action.
IP Address	This field displays the IP address of the workstation the logged action was executed from.
Date/Time	This field displays the date and time that the logged action occurred.
Change Type	This field describes the type of logged action (for example, upload, default restore, backup restore, copy, or delete).
Comment	This field contains any comments that were added by the staff member during the logged action.
Your Email Address	Type your email address to be used as the From address when the log file is sent.
Send the Log File To	Type the email address to which you want to send a copy of the log file.
Email Log File	Click this button to send the log file by email.
Comma Delimited (CSV)	Select this radio button to download the log file in CSV format.
HTML	Select this radio button to download the log file in HTML format.

Table 83: Log File Description (Continued)

Field/Button	Description
Download Log File	Click this button to download the log file to your workstation.

To email the log file

1 Type your email address in the Your Email Address field. This will be the From address.

2 Type the recipient's email address in the Send the Log File To field.

3 Click the Email Log File button.

To download the log file

1 Select the format for downloading the file (Comma Delimited (CSV) or HTML).

2 Click the Download Log File button.

3 Select the location where you want the file saved and click the Save button.

Viewing log files

Log files let you view errors and other information generated by the CGI and PHP scripts, the **Techmail** and **Agedatabase** utilities, and Oracle Service Cloud products. The log files can be helpful in troubleshooting issues with your Oracle Service Cloud application.

The following log files are available.

- **Error log**—This log contains application and data errors.
- **Info log**—This log contains informational errors, such as processing too much data.
- **Security log**—This log contains security errors, such as an invalid security string.
- **External Search log**—This log describes external searches of your site's pages performed by spiders or robots. See Indexing web pages.
- **Rule log**—This log describes the business rules that have fired against a specified record. See Verifying rules using the rule log.

The following procedure describes how to access the log files and the information in the error, info, and security logs.

To open log files

1 Click the Configuration button on the navigation pane.

2 Double-click Logs under Site Configuration. The content pane displays the log viewer.

3 Click the Error Log, Info Log, or Security Log button on the ribbon to open the corresponding log file.

4 Select the options from the drop-down menus described in the following table.

Table 84: Log File Menus Description

Field	Description
Interface	Click this drop-down menu and select the interface of the logs you want to view.

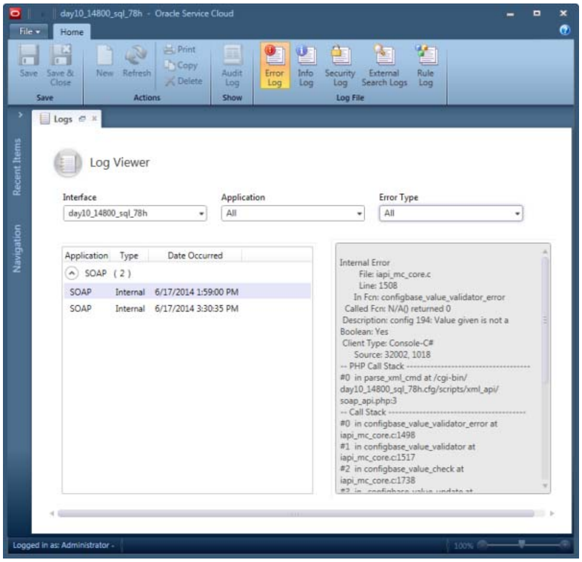
Table 84: Log File Menus Description (Continued)

Field	Description
Application	Click this drop-down menu and select the application for which you want to view messages. By default, All is selected in the menu to display messages associated with any of the applications. The following options are available. • All • Agedatabase • Bulkdel • Certool • Dataminer • DBAudit • DBStatus • DBUpdate • DQA • Kexport • Keyword Indexer • Kimport • Lang CVT • Mailer • Messagebase Compiler • Oracle Service Cloud • Oracle Service Cloud PHP • Oracle Service Cloud Upgrade • RD • Reportgen • Sawmill • Techmail • Unknown • WLTool **Note:** When you open the error, info, or security logs, all messages in the log are displayed and are grouped together by application. You can click the header for each group to expand or collapse the messages listed in the group.
Error type	Click this drop-down menu and select the type of messages that you want to view. The following options are available.
All	Select this option to see all types of messages. This is selected by default when you open the log file.
Campaign	Select this option to see messages generated by campaigns.

Table 84: Log File Menus Description (Continued)

Field	Description
Configuration	Select this option to see messages generated when using the Configuration Editor.
Internal	Select this option to see internal server errors.
POP3 Protocol	Select this option to see messages returned by **Techmail** when it is trying to retrieve email from the Service or Outreach mailboxes.
Rules	Select this option to see messages generated when rules are being processed.
SMTP Protocol	Select this option to see messages created by Techmail when it is trying to send email.
SQL	Select this option to see SQL messages returned by the database management system.
SSL	Select this option to see messages created with email using **SSL**.
Unclassified Bounce Message	Select this option to see messages generated when an Outreach email is bounced for a reason that cannot be classified.

The following figure shows the error log on the log viewer.



The columns in the error, info, and security logs display the name of the application that generated the message, the error type, and the date and time the event occurred. Details of the first message in the list are also shown.

Important Messages in the log files are removed after thirty days.

5 To view the details of a specific message, select the message on the log.

6 Click X on the upper right of the content pane to close the log viewer.

Service update notifications

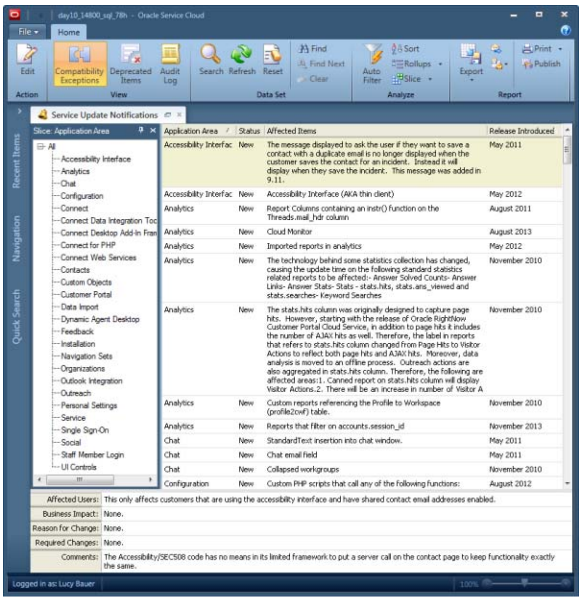
You can view changes that have been made in this version of the product that may affect you if you are upgrading from an earlier version. Two standard reports, Compatibility Exceptions and Deprecated Items, drive the data that displays on the content pane. The layout for both reports is similar, designed with a split-level display of the content pane. The top portion of the content pane is scrollable, displaying data that you can search, filter, slice, and export. The bottom portion of the content pane is always visible, displaying data specific to the row you have selected in the top content pane.

- **Compatibility exceptions**—This report describes changes that may result in different behavior or functionality from previous versions. It also describes which users are affected by the change, its business impact, and the steps you can take to remedy the effects of the change. See Compatibility exceptions.
- **Deprecations**—This report describes items that have been **deprecated** in this release, the reason for their deprecation, if replacements are available and what they are, and the migration steps you can take to replace the functionality that was deprecated. See Deprecated items.

You can choose to view all service updates data or slice the data to view only the application areas you want to see. You can also make inline edits to the Status column of each report to help you track how service updates affect your site.

Prerequisites

Before you can view service updates data, you must add the Service Update Notifications component to the **configuration list** for the Configuration button. See Creating a navigation set for the administrator.



To view Service Update Notifications

1 Click the Configuration button on the **navigation pane**.

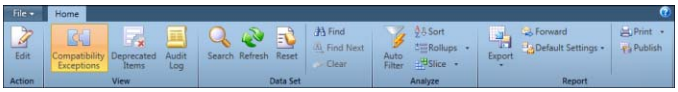
2 Double-click Service Update Notifications in the configuration list. The Compatibility Exceptions report opens.

3 To view deprecated items, click the Deprecated Items button on the ribbon.

4 To copy text from any row in the top portion of the content pane, select the text, right-click, and select Copy Cell to Clipboard.

Service Update Notification ribbon

Most of the buttons on the service update notifications ribbon reflect common Oracle Service Cloud functionality and work the same way as they do in reports. In addition to viewing Compatibility Exceptions and Deprecated Items reports, you can search and filter the report data, define how you want the data to display on the report, and export data in a variety of formats. You can also edit the Status column of each report.



The groups and buttons on the service update notification ribbon are described in the following table.

Table 85: Service Update Notification Ribbon Description

Group/Button	Description
Action	The button in this group lets you edit the Status column of the report.
Edit	Click this button to edit the Status column of the displayed report. To edit the status of multiple rows, press **Ctrl** while selecting each record you want to edit at the same time. You can also press **Shift** to select multiple consecutive rows.
View	The buttons in this group let you view and edit records using inline editing. See To edit Status inline.

Table 85: Service Update Notification Ribbon Description (Continued)

Group/Button	Description
Compatibility Exceptions	Click this button to display the Compatibility Exceptions report. This report describes changes that may result in different behavior of functionality from previous versions. It also describes which users are affected by the change, its business impact, and the steps you can take to remedy the effects of the change. See Compatibility exceptions. **Note:** The Compatibility Exceptions button is selected by default when you open service update notifications.
Deprecated Items	Click this button to display the Deprecated Items report. This report describes items that have been replaced in this release, the reason for the deprecation, if replacements are available and what they are, and the migration steps you can take to replace the functionality that was deprecated. See Deprecated items.
Audit Log	Click this button to view the audit log for the selected row.
Data Set	The buttons in this group let you search for data in the report, refresh the display, and reset the search criteria to the report's defaults.
Search	Click this button to open the report's Search window to select criteria for variables and run-time selectable filters. See Searching in reports.
Refresh	Click this button to reload the data shown using the report's current search criteria.
Reset	Click this button to reload the data shown using the report's default search criteria.
Find	Click this button to open the Find window to enter text, numeric values, or special characters you want to locate in the report's output. Report cells that contain the search value are highlighted on the report. See Finding content in reports.
Find Next	Click this button to highlight the next instance of the search values entered on the Find window.
Clear	Click this button to clear the search values entered on the Find window.

Table 85: Service Update Notification Ribbon Description (Continued)

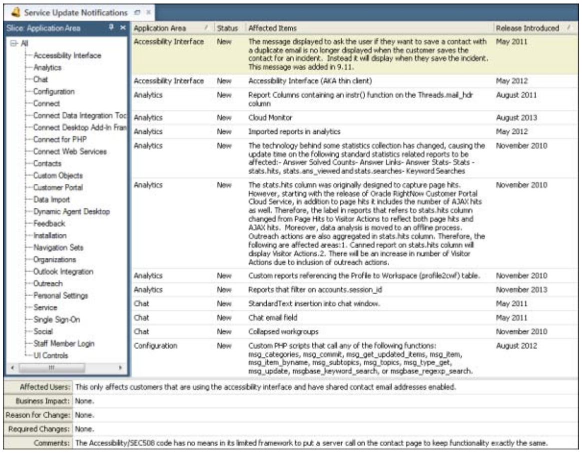
Group/Button	Description
Analyze	The buttons in this group let you sort the data shown on the report and apply auto-filtering, rollups, and slicing to the data.
Auto Filter	Click this button to enable auto-filtering in the report. Auto-filtering provides column filtering after the report has been generated. See Using Auto Filter.
Sort	Click this button to open the Sort window and select which output columns to sort by and the sort method. See Changing sort options.
Rollups	Click this button to select **rollup** options and open the Rollups window. See Displaying rollup levels.
Slice	Click this button to select slice options and open the Slice window. Slicing groups data so you can view only the subset of records you are interested in. See Slicing report data.
Report	The buttons in this group let you export the report, forward the report in an email, and save and restore default settings.
Export	Click this button to export the data from a report to a file for use with third-party applications. You can export report data in the following formats: HTML, PDF, Excel, XML, Image, and Delimited. You can also copy report data to the clipboard. See Exporting report output. **Note:** Permission to export, print, and forward reports must be enabled in your profile for this button to display. See Analytics permissions.
Forward	Click this button to send the report to individuals or **distribution lists** in an email. See Forwarding reports. **Note:** Permission to export, print, and forward reports must be enabled in your profile for this button to display. See Analytics permissions.
Default Settings	Click this button and select Save as Default to save your personalized display and data settings for a report for later use. Select Restore to remove personalized display and data settings from a report and restore the settings to those defined in the report. See To reset display and data settings.

Table 85: Service Update Notification Ribbon Description (Continued)

Group/Button	Description
Print	Click the arrow on this button to access printing options.
Publish	Click this button to save the current report as a read-only snapshot of the current data. The snapshot will be an exact representation of the current data set, including any display options or customizations. You will be prompted to name the report and save it to a folder in the Reports tree where it can be accessed through the Reports explorer. See [Reports explorer]().

Compatibility exceptions

When changes to this version of Oracle Service Cloud cause changes to existing APIs, the administration interface, functionality, or how features are configured, these changes are noted as compatibility exceptions. The Compatibility Exceptions report describes the changes, identifies who might be impacted by the change, and notes its potential business impact. It also describes the steps you can take to mitigate the results of the change.



The following report columns display on the top of the content pane.

- **Application Area**—Area of Oracle Service Cloud affected by the service update.
- **Status**—Contains a drop-down menu that can be edited inline to designate how a service update has been addressed. Status options include New, Not Applicable, and User Remediated. See [To edit Status inline]().

- **Affected Items**—Lists the application components affected by the service update.
- **Release Introduced**—Date the service update was added to the product.

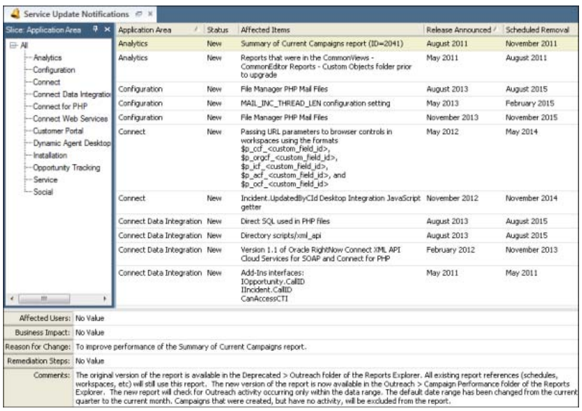
The following report rows display on the bottom of the content pane specific to the selected row.

- **Affected Users**—Lists the user types affected by the service update.
- **Business Impact**—Describes the effect of the service update on business activity.
- **Reason for Change**—Describes the cause of the required service update.
- **Required Changes**—Lists the steps required before your site can take advantage of the service update.
- **Comments**—Captures any additional explanation regarding the service update.

Deprecated items

When you click the Deprecated Items button on the ribbon, the Deprecated Items report displays. When a component or feature has been deprecated, it is usually replaced with newer functionality. Your existing functionality remains unchanged for two years, so you will not experience problems as a result of deprecation. However, you should migrate to the new functionality within that time frame.

The deprecation may occur to Oracle Service Cloud functionality or to third-party components used within the Oracle Service Cloud application, such as PHP features. When replacements are not available, the report contains information you need to review in order to modify your current functionality to phase out use of the deprecated item.



The following report columns display on the top of the content pane.

- **Application Area**—Area of Oracle Service Cloud affected by the service update.
- **Status**—Contains a drop-down menu that can be edited inline to designate how a service update has been addressed. Status options include New, Not Applicable, and User Remediated. See To edit Status inline.
- **Affected Items**—Lists the application components affected by the service update.
- **Release Announced**—Release the deprecation was announced.
- **Scheduled Removal**—Release the functionality/component is scheduled to be removed.

The following report rows display on the bottom of the content pane specific to the selected row.

- **Affected Users**—Lists the user types affected by the deprecation.
- **Business Impact**—Describes the effect of the deprecation on business activity.
- **Reason for Change**—Describes the reason for the deprecation.
- **Remediation Steps**—Lists the steps required to accommodate the deprecation.
- **Comments**—Captures any additional explanation regarding the deprecation.

To edit Status inline

1. Select the row in the report you want to edit.

   Or

   Press **Ctrl** while selecting each row you want to edit at the same time. You can also press **Shift** to select multiple consecutive rows.

2. Hover over the status until the field is highlighted in blue, and then click to activate the drop-down menu.

   Or

   Click the Edit button on the ribbon to apply edits to multiple rows.

3. Select one of the following options from the drop-down menu.
   - **New**—Designates that you still need to address the service update. New is the default option.
   - **Not Applicable**—Designates a service update that does not affect your site. For example, there may be a compatibility exception for Chat, but your site does not use Chat.

- **User Remediated**—Designates that you still need to address the issue or that you have completed the steps to address the issue. For example, you have either removed the deprecation and it is no longer an issue, or you have read the compatibility exception, understand the suggested workaround, and have remediated the issue.

4 To apply the edit inline, press **Enter** or click outside the column you are editing.

Or

Click the OK button to apply edits to multiple rows.

Changing the interface display name

You may decide you want to change the name of the interface as it displays for staff members. Changing the interface name affects only the display of the interface name as it appears to staff members on the **agent desktop**. URLs to your interface continue to use the original interface name.

To change the interface display name

1 Click the Configuration button on the navigation pane.

2 Double-click Interfaces under Site Configuration.

3 Click the interface name you want to edit.

4 Type the new interface name in the Display Name text box.

5 Click the Save and Close button on the ribbon to save the new display name.

Note To change the answers report that displays on the Answers page of your customer portal, see Changing the report on the Answers page.

Configuring currencies and exchange rates

If your organization conducts business outside of the United States, you might need to add foreign currencies to your **knowledge base**. You can add multiple currencies and set **exchange rates** for each.

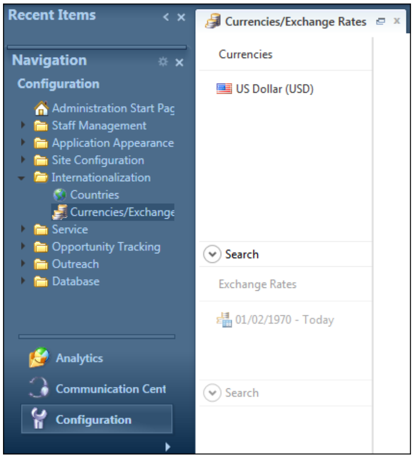
Adding and editing currencies

By adding currencies, you can define the **currency** associated with each country or province in your knowledge base. Once you create currencies, you can assign a default currency to each **staff account**, and your staff members can use them to select the appropriate currency for contacts, organizations, and **forecasts**.

Important You can add and edit currencies, but you cannot delete them.

To add or edit a currency

1 Double-click Currencies/Exchange Rates under Internationalization. The **content pane** displays the Currencies and Exchange Rates trees.



2 To edit a currency, click the currency in the tree and go to step 4.

Or

To add a currency, click the New button on the ribbon and select Currency. The Installed Cultures list opens.

Note When you select a culture, the Currency editor automatically populates with the associated culture information contained in the related region on you workstation. Once you select a standard culture and save the currency, you cannot change the culture association.

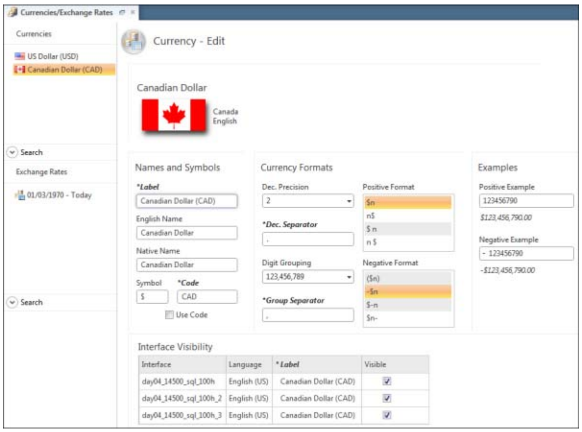
The list of installed cultures depends on the regions installed on your workstation and varies based on your operating system. You can see the list of installed regions by opening Region and Language Options in the Windows Control Panel. If the matching culture does not appear in the list, you can either add a custom currency (see step 3) or contact your organization's information technology team and have the associated language pack installed on your workstation.

3 To select a standard culture, double-click the culture that matches the currency. The Currency editor opens.

Or

To add a custom culture, double-click Custom Culture at the top of the Installed Cultures list.

Tip If you initially choose to create a custom culture, you can select a standard culture by editing the currency. This lets you associate a standard culture with the currency if the standard culture becomes available on your workstation.



4 Enter the following field information.

Table 86: Currency Editor Description

Field	Description
Names and Symbols	
Label	Type the name of the currency as it appears in the Currencies tree.
English Name	Type the English name of the currency.
Native Name	Type the name of the currency as it appears in the associated country.
Symbol	Type the symbol that represents the currency you are adding. For example, the symbol for the United States dollar is $. **Note:** You may need to use your operating system's character mapping feature to determine the keystrokes for entering symbols that do not appear on your keyboard.
Code	Type three letters to represent the currency. For example, USD is the currency code for the United States dollar.
Use Code	Select this check box to use the three-letter currency code instead of the symbol to represent the currency.
Currency Formats	
Decimal (Dec.) Precision	Click this drop-down menu to select decimal precision, which defines the number of digits displayed after the decimal symbol. For example, the decimal for the United States dollar is two decimal places ($123.44).
Decimal (Dec.) Separator	Type a symbol to represent the decimal place. For example, the decimal separator for the United States dollar is a period ($678.99).
Digit Grouping	Click this drop-down menu to select a digit-grouping format.
Group Separator	Type the symbol used to separate digit groups. For example, the digit grouping separator for the United States dollar is a comma ($1,234,567.99).
Positive Format	Select a format to represent positive and negative currency.
Negative Format	

Table 86: Currency Editor Description (Continued)

Field	Description
Examples	
Positive Example	Type the number you want used in the positive and negative currency example. An example of the positive and negative currency format (based on the currency format settings and example number) displays in the field below.
Negative Example	
Interface Visibility	
Label	Type the currency label as you want it to appear on each interface.
Visible	Select the check box for each interface where you want the currency to appear.

5 Click the Save and Close button on the ribbon.

Adding and editing exchange rates

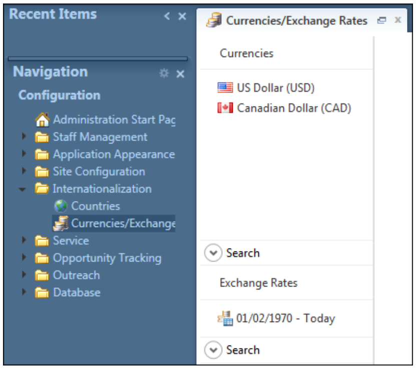
Keeping **currencies** and the associated **exchange rates** up-to-date helps your sales representatives provide the most accurate **quotes** for customers. Once you add currencies, you can add and edit exchange rates.

Prerequisites

Currencies must be created before adding exchange rates. See Adding and editing currencies.

To add or edit exchange rates

1 Double-click Currencies/Exchange Rates under Internationalization. The **content pane** displays the Currencies and Exchange Rates trees.



2 To add exchange rates, click the New button on the **ribbon** and select Exchange Rate. The Exchange Rate editor opens.

Or

To edit exchange rates, click the date in the tree.

3 Enter the following field information.

Table 87: Exchange Rates Editor Description

Field	Description
Start Date	The Start Date becomes the name of the exchange rate in the tree. Type the date that the exchange rates take effect or click the drop-down calendar and select a start date. **Note:** The start date can be a past date but not a future date.
Rates	Type exchange rates in this table. The number in the table cell is the multiplier used to convert the currency in the first column to the currency in the corresponding column.

4 Click the Save button to save the exchange rates.

Example

In this example, one U.S. dollar (USD) is equivalent to 1.10154 Canadian dollars (CAD), 5.94126 Croatian kunas (HRK), 0.78517 euro (EUR), and 0.96471 Australian dollars (AUD). Similarly, to convert other currency to U.S. dollars, multiply the number of Canadian dollars by 0.98406, the number of Croatian kunas by 0.16833, the number of euros by 1.27264, and the number of Australian dollars by 1.03650.

Exchange Rates

From: / To:	USD	CAD	HRK	EUR	AUD
USD	1.00000	1.10154	5.94126	0.78517	0.96471
CAD	0.98406	1.00000	5.86753	0.77326	0.94953
HRK	0.16833	0.17116	1.00000	0.13234	0.16255
EUR	1.27264	1.29340	7.55562	1.00000	1.22813
AUD	1.03650	1.05300	6.15173	0.81427	1.00000

Screen pops

Screen pop functionality lets you communicate with Oracle Service Cloud from a third-party program to submit a screen pop request. For instance, you can open, or "pop," a report or an editor as a new **content pane** tab on the Service Console by sending a request from a third-party application. When you pop an editor, you can view and edit records from the new window. When you pop a report, you can pass **run-time filter** values to the report and perform all normal report functions.

Note Before you can integrate the screen pop feature with an external program, it must be enabled and configured. Contact your Oracle account manager.

Configuring third-party software for screen pops

After screen pop has been enabled and configured, you must configure your third-party software to submit an HTTP GET in the proper format. You can generate the screen pop request URL by scripting Microsoft.XMLHTTP, Internet Explorer, or any other HTTP-aware controls or languages.

HTTP GET is the only supported method. All others will return a 403 Forbidden error message. In addition, a request from a computer other than the localhost will also return a 403 Forbidden error message. If HTTP GET is used from the localhost, Oracle Service Cloud will return a status code of 200 OK, 403 Forbidden, or 404 Not Found.

Note The staff member making the screen pop request must be logged in to Oracle Service Cloud at the time of the request.

Following is an example of a URL for a screen pop request.

http://localhost:<port>/screenpop?param1=value1&param2=value2

The <port> variable is populated with the value specified in the EXT_CONSOLE_WS_PORT configuration setting located at RightNow Common > Screen Pop > General. See Customizing configuration settings.

Tip You can override the EXT_CONSOLE_WS_PORT value for individual staff members by updating the External Screen Pop Port field on the Staff Accounts editor. See Adding and editing staff accounts.

The following table describes the screen pop function parameters and their available values.

Table 88: Parameters Description

Parameter	Description
t	Specifies the type of screen pop, either editor (t=editor) or report (t=report). The editor screen pop opens a record editor of the type specified by the recordType variable. The report screen pop opens the report specified by the id variable.
recordType	Specifies which editor is displayed when the console is popped. • 1—Incident • 2—Answer • 4—Opportunity • 5—Contact • 6—Organization • 7—Task • 17—Campaign (requires flowID=<int>)

Table 88: Parameters Description (Continued)

Parameter	Description
id	Specifies the ID of the record (when used with t=editor) or the report ac_id (when used with t=report) to open. **Note:** When opening an editor, a new record also opens if no ID is supplied.
<run-time filter name>	This parameter is used with the t=report parameter to specify the value of a run-time-selectable filter in the specified report. This parameter should be the filter name of a run-time filter you want to use to select data. The value should be the string you want to search on (for example, contacts.last_name=Jones or opportunites.assgn_acct_id=12).

Examples

The following URL is an example of an editor screen pop that opens a contact record with the contact_id of 23.

http://localhost:57575/screenpop?t=editor&recordType=5&id=23

The following URL is an example of a report screen pop that opens the Agent Activity report using the run-time filter accounts.display_name with the value Abby Parker.

http://localhost:101/screenpop?t=report&id=55&accounts.display_name=Abby%20Parker

13

Email Management

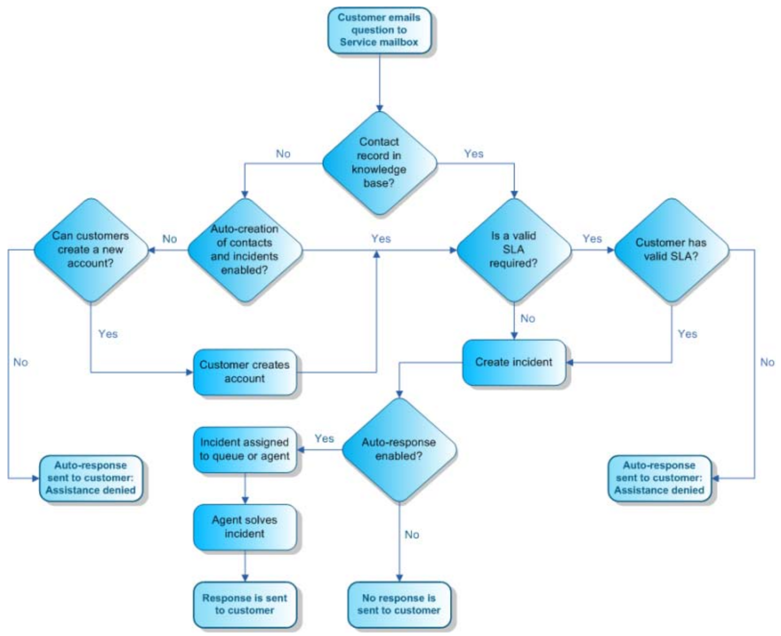
Communicating clearly and promptly through email is essential to providing great customer experiences. Handling high volumes of email efficiently requires you to give careful thought to important topics such as process, automation, and security. With Oracle Service Cloud, you can achieve high quality and efficiency in all of your service and marketing communication. Whether responding to service questions or broadcasting mailings and surveys to large audiences, the **email management** features give you complete control over the handling of inbound and outbound email messages.

Email handling in Service

Oracle RightNow Cloud Service (Service) email management system is a flexible solution for handling email communication between your customers and your customer service team. The system evaluates each incoming email to ensure it meets your criteria for service, and then manages all back-and-forth email replies between the agent and contact until the incident is resolved. Along the way, Oracle Service Cloud can automate key service functions to help your team deliver timely, world-class service.

Note A set of system-generated administrator notifications, administrator emails, and contact emails are sent to staff and contacts to support activities and events occurring throughout the system. Message templates let you quickly apply your organization's brand across all notifications and emails. You can also customize your messages, including the message content, enabling and disabling specific notifications and emails, and defining the message format as HTML or text. For complete details and procedures on working with the Message Templates editor, see Message Templates.

The following diagram illustrates how incoming customer email messages are handled in Service.



When a customer emails a question to your customer support email account, Service handles it using the following email management process.

1 **A contact record is associated**—The **Techmail** utility first searches all contact records for the email address in the Reply To field of the message's mail header. If no match is found, Techmail looks for the address in the mail header's From field. If a match is found, the contact record is associated with the incoming request. If the customer's email address is not found in an existing contact record, a new contact record is created for the customer.

Note By default, an email address cannot be shared by multiple contact records. However, when email address sharing is enabled and an email is received from an address shared by two or more contacts, Techmail invokes a contact-matching process to associate the contact. Refer to Email address sharing.

2 **Contact validity is verified**—Once the email management system identifies a matching contact record, customer information is evaluated to determine whether it meets your organization's requirements for service. If **SLAs** are required, the system checks to ensure

the customer has a valid SLA before creating an incident. If the customer does not have a valid SLA, an auto-response denying assistance is generated and sent to the customer. Refer to Configuring service level agreements.

3 **An incident is created**—Once a contact record is matched and any SLA requirements are met, Techmail creates an incident using the contents of the email message. If the message is multipart (a common MIME type containing both HTML and text versions of the same message), the text version of the message is added to the incident thread and the HTML version is discarded. If the message contains HTML only, it is converted to text and added to the thread.

4 **The incident is processed by business rules**—Upon incident creation, Oracle Service Cloud sends the contact an auto-generated receipt for the question. However, business rules are often configured to perform additional functions such as assigning an SLA, sending an auto-response, and assigning the incident to an agent for a response. Rules can also be configured to escalate the incident if the assigned agent does not answer the customer's question within a specified time period. See Business rules overview.

5 **The agent responds**—When an agent responds to the contact's question, an email is sent to the contact containing the agent response. Occasionally, a contact may reply with additional questions or information for the agent. Techmail identifies the reply message by looking for specific markers (such as the contact email address, the reference number in the subject line, and the message tracking string in the mail header) and applies the update to the incident, extending the conversation until resolved. See Email reply processing and Cross-site email management.

Note To further complement the email management process described here, additional options are available for customizing the process to meet unique business needs. For descriptions of these settings, refer to Advanced configuration for email handling.

Email reply processing

Service lets customers update incidents by replying to email messages. However, sometimes customers include the original message in their reply, quoting back the email they received. When the **Techmail** utility detects an email reply, it attempts to identify the part of the message containing the customer's reply, and strips out any text that may have been quoted back from the original message thread. In this way, new replies are added to the incident as a new entry in the incident thread, while text from previous thread entries is ignored. Techmail uses several methods to determine which blocks of text in a message consist of previous thread entries.

Most email clients mark or "block quote" the original message when replying. In text messages, the original text is often block quoted by inserting a greater than symbol (>) or a vertical bar (|) at the beginning of each line of the original text. In HTML messages, the original message is usually enclosed in block quote HTML tags (<blockquote>). Parameters in the block quote HTML tag indicate how the message should be displayed (for example, each line begins with a vertical bar or an indent). The Techmail utility's block-quoted reply detection method finds block-quoted text and removes it from the email, leaving only the reply from the customer.

Tip You can define additional characters besides > and | as block-quoted text indicators in the EGW_QUOTE_CHARS configuration setting. Refer to Advanced configuration for email handling.

If you enable EGW_REPLY_BETWEEN_ENABLED and select the Force Reply Between Lines check box, Techmail can easily separate the reply from the original email text, as customers are directed to compose their reply between two distinct line markers. If you enable the configuration setting but do not select Force Reply Between Lines on the mailbox's Incoming Email settings, Techmail first checks for a reply between the lines. If it does not find text between the markers, it looks for the > or | block-quoted text indicators or block quote HTML tags. In addition, when the Force Reply Between Lines check box is not selected, the system inserts **checksum** code at the bottom of the email so that the reply part of the email can be identified.

Tip The EGW_CHECKSUM_STYLE configuration setting defines the style that is applied to the checksum code. To make the checksum code font blend with the background color of your email, you can change the style and text formatting by editing this setting through the Configuration Settings editor. See Customizing configuration settings.

If a customer replies to multiple points within the original email, intermixing the reply with the original text, the message may contain multiple blocks of quoted text. In this case, the replies may refer to the original text above them, which may be important, so Techmail includes the entire email message in the incident.

If a customer replies within the original text, and the reply text begins with a block quote, such that the reply is indistinguishable from the original text, Techmail can determine that additional text has been added within the original text by comparing checksums in the reply to checksums in the original message. If the checksums differ, the entire email is added to the incident to ensure that no reply text is lost.

Techmail can also detect and remove "boilerplate" messaging while leaving the customer's content intact. Boilerplate messaging is text that has been added to an email message by a mail client, such as a line of embedded advertising text. This helps to ensure that the thread is not diluted with advertising and contains only information pertinent to the discussion.

Single-send email response logic

If a contact is associated with multiple email addresses, service responses are sent to *all* associated addresses by default. This means that if an incident contact has a primary email address and two alternate email addresses, every time an incident response is sent to that contact, it is sent to all three email addresses.

You can limit your responses to be sent to a single email address by enabling the site-wide configuration setting OE_SVC_SENDMAIL_SINGLE_ADDRESS (Common > General > Outgoing Email). See Advanced configuration for email handling.

Once enabled, service responses are sent only to the specified email address and agents can select which one of the contact email addresses they want to send the response to from the incident workspace. That email address value remains for the life of the incident. However, any new incidents for that contact will default to the primary email address. See Sending responses.

The default value for a response sent from the incident workspace is the primary email address. However, if the incident is created from the customer portal or a chat session (when no login is required), or by the Techmail utility, the value is set to the email address the request was sent from. Following are examples using these cases.

- **Customer portal (when no login is required)**—If the email address is available on the Ask A Question page and matches an alternate address of a contact, the alternate address is used as the response address.
- **Chat (when no login is required)**—If the email address is available on the Chat page and matches an alternate address of a contact, the alternate email address is used as the response address.
- **Techmail**—If incoming incidents are processed by Techmail, it evaluates the email address for a match from the contact record and uses the matching address as the response address.

Cross-site email management

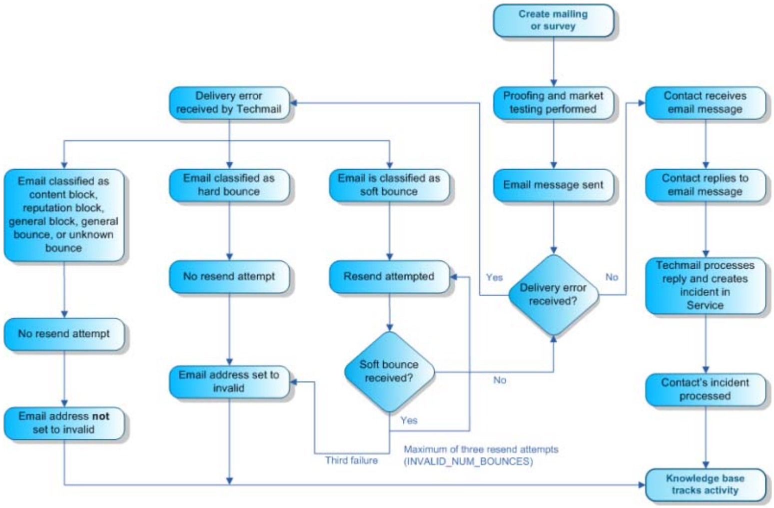
Service automatically handles email between separate Oracle Service Cloud sites and the site-specific incidents are accurately updated on each site even if unique reference numbers are used for the same incident. Therefore, you can be confident that when emails pass between sites, all incident information will be current and accurate. See Incidents overview.

For instance, suppose your organization has an airline division and a hotel division, each with its own site. Now suppose that an incident was created from the airline site about a hotel issue. An incident response is sent to the hotel site and, when processed, the incident is assigned a reference number that is appropriate for that site—a different number from the airline site reference number. An agent on the hotel site responds to the incident. In the meantime, an agent on the airline site has new information that she adds to the original incident. The system recognizes the relationship between the two incidents and both are updated appropriately on their respective sites.

Important Both sites need to be running the August 2014 version of Oracle Service Cloud or greater for cross-site email management to work.

Email handling in Outreach and Feedback

Oracle RightNow Outreach Cloud Service (Outreach) and Oracle RightNow Feedback Cloud Service (Feedback) provide an efficient system for handling all email communication related to **mailings** and **surveys**, including proofs, market tests, and delivery error notifications. The following diagram illustrates the general sequence of email communication supported by this process.



As the figure illustrates, the process of sending mailings and surveys includes a number of points where outgoing and incoming email communication can occur.

- **Message proofing**—Once a mailing or survey is designed, staff can send one or more proof versions to the necessary contacts and staff members for feedback and approval.
- **Market testing**—This option lets staff send small batches of a mailing or survey in advance to a subset of the audience to test different designs and messaging. They can then review the results before selecting and sending the final version.
- **Message delivery**—Once proofs have been approved and market testing is complete, the mailing or survey can be sent or scheduled for delivery to the remaining audience.
- **Customer reply**—A customer who receives a mailing or survey may attempt to reply to it by email. The **Techmail** utility can process these replies and convert them to incidents.
- **Delivery error notification**—In the event that a mailing or survey is sent to an address that is invalid or is experiencing technical issues, the recipient mail server may return a delivery error or "bounce" notification in the form of an email sent to the Envelope From/Bounce Address defined in your outgoing email settings. See Outgoing Email Settings. The Techmail utility can process most delivery errors and address them appropriately, as described in Email bounce handling.

Unless the From and Reply To fields are customized within a mailing or survey, the system uses the addresses defined in the default mailbox (under Configuration > Site Configuration > Mailboxes) for all proofs, market tests, and production mailings and surveys. Specifically, if the optional field, Friendly From/Branded Address is defined, then that address displays as the From address in delivered email. However, if only the Envelope From/Bounce Address is defined, and Friendly From/Branded Address is blank, then the address in Envelope From/Bounce Address is used. See Outgoing Email Settings.

This email management process applies to most basic Outreach and Feedback implementations. However, additional options exist for customizing the process to meet your organization's unique needs. Refer to Advanced configuration for email handling for descriptions of these additional options.

Adding and editing mailboxes

Mailboxes are used to define outgoing email settings and to specify the email accounts to pull email messages from. You cannot send or receive email in Oracle Service Cloud until at least one mailbox is configured and enabled for the interface you are using. **Oracle-managed Service mailboxes** and general Service mailboxes are used only with the Service application, while Outreach mailboxes are used with either Outreach or Feedback.

You can configure mailboxes to handle only outgoing email, only incoming email, or both. You can also define security settings for your mailboxes.

- **Outgoing email settings** define the identifying information to be included in outgoing email sent by the mailbox, such as the Envelope From/Bounce Address, Friendly From/Branded Address, Reply-To Address, and Display Name.
- **Incoming email settings** define the POP server, POP account, and password used to access incoming email. Other incoming settings provide methods to filter mail messages (by applying discard filters and restricting file attachments by size and file type) and forward rejected messages to another email address.

Important If you use Oracle-managed Service mailboxes, the Incoming Email Enable check box and the POP Server, POP Account, and Password fields on the Incoming Email page are read-only fields because they have already been defined by Oracle.

- **Security settings** can be used to enable SSL and S/MIME authentication for your email. Refer to Email security overview.

Important To enable processing of bounce errors in Outreach or Feedback, the Envelope From/Bounce Address in your Outreach mailbox's outgoing email settings must use the POP server and the POP account defined in the incoming settings. For example, if the POP server is mail.rnmk.com and the POP account is globalsupport, then the Envelope From/Bounce Address needs to be defined as globalsupport@mail.rnmk.com. Refer to Email bounce handling.

Using branded email domains

Using email addresses branded with your company's domain name, such as support@yourcompany.com, can help recipients recognize your organization as the sender, improving **deliverability**. However, care must be taken to ensure that bounce notifications are processed correctly. For best practice information about using branded domains to send mailings and surveys, refer to Customizing mailing message headers and Customizing survey invitation message headers.

Service mailboxes

There are two types of mailboxes that can be used with Service—Oracle-managed Service mailboxes, the recommended type, and Service mailboxes, also referred to as general Service mailboxes.

Oracle-managed Service mailboxes

We recommend using Oracle-managed Service mailboxes because of several inherent advantages. Oracle-managed Service mailboxes are mailboxes that Oracle initially configures for you by defining crucial incoming email settings. You can customize Oracle-managed Service mailbox settings that let you brand your mailbox, but settings that control the essential functions of incoming email processing are read-only. This eliminates any risk of those settings being misconfigured. Because Oracle handles these settings for you, you can be certain that your mailbox has been set up correctly. Oracle-managed Service mailboxes give you the following benefits.

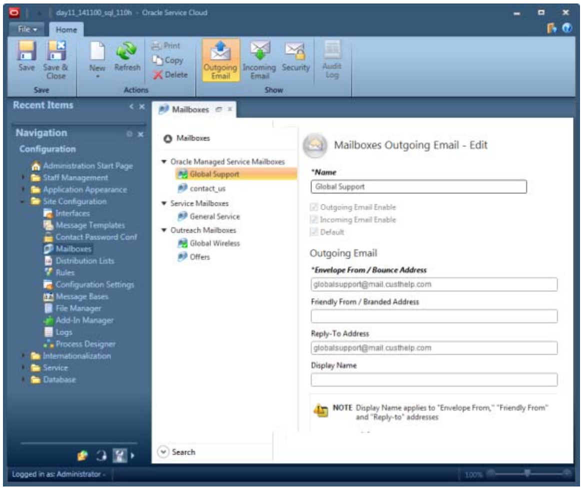
- **Easy setup**—Oracle configures crucial incoming email settings for you, such as enabling incoming email and defining your Pop Server, POP Account, and Password fields.

- **Faster and more reliable email processing**—Techmail has been designed to handle large volumes of messages through parallel message processing, which ultimately enables your staff to respond to incidents faster.
- **Reliability**—Oracle monitors Oracle-managed Service mailboxes twenty-four hours a day, seven days a week.

Note This procedure assumes that Oracle has already added an Oracle-managed Service mailbox for you. Oracle-managed Service mailboxes can be added in Oracle RightNow VCIO Cloud Service (VCIO). For information about accessing VCIO, see Answer ID 5296.

To edit an Oracle-managed Service mailbox

1. Click the Configuration button on the navigation pane.
2. Double-click Mailboxes under Site Configuration. The Mailboxes tree displays on the content pane.
3. Select an Oracle-managed Service mailbox in the tree. The outgoing email settings display on the editor.



Note Oracle-managed Service mailboxes display only if one (or more) has been added to your site. Oracle-managed Service mailboxes can be added in VCIO. For information on accessing VCIO, see Answer ID 5296.

4 Enter the following field information to enable mailbox functionality.

Important For Oracle-managed Service mailboxes, the Incoming Email Enable field is **read-only**. However, this field can be edited in VCIO. For information on accessing VCIO, see Answer ID 5296.

Table 89: Mailboxes Editor Description

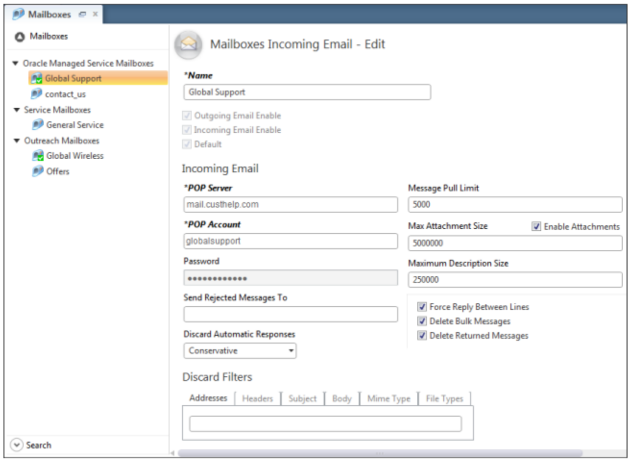
Field/Button	Description
*Name	Type the mailbox name in this field. **Note:** For Oracle-managed Service mailboxes, this field, which can be edited, is set to the name that was designated when Oracle initially added the mailbox to your site.
Outgoing Email Enable	Select this check box to enable the mailbox to send outgoing email. When this check box is cleared, the mailbox cannot send outgoing email and agents cannot respond to incidents associated with this mailbox. The default is enabled.
Incoming Email Enable	Select this check box to enable the mailbox to receive incoming email. The default is enabled. **Important:** For Oracle-managed Service mailboxes, this check box has been selected for you and is read-only.
Default	Select this check box to set this mailbox as the interface's default mailbox. You must designate one mailbox as the default. For Service mailboxes, after designating this mailbox as the default Service mailbox, the mailbox name will then display in the Mailbox field on the Details tab of the agent's incident workspace. This lets your agents easily associate incidents with the correct mailbox when responding to customers. See Adding incident information on the Details tab. **Important:** This check box is selected by default for general Service and Outreach mailboxes, but **not** for Oracle-managed Service mailboxes. When the Default check box is selected, it becomes disabled and cannot be cleared. You must set another mailbox as the default, and then save your changes in order to clear this check box.

5 Enter the following field information to configure outgoing email for this mailbox.

Table 90: Outgoing Email Settings

Field	Description
*Envelope From/ Bounce Address	Type the email address that is used as the return path for bounced emails. (For Oracle-managed Service mailboxes, this field is set to the email address that was designated when Oracle initially added the mailbox to your site.) The value in this field displays as the From address in the outgoing email unless the Friendly From/Branded Address field is defined. See Email bounce handling. **Important:** To ensure that your bounced emails process correctly, we recommend using the email address provided when your account was set up. For example, a typical Oracle-managed Service or general Service mailbox would be "example@mail.custhelp.com." A typical Outreach mailbox would be "example@mail.rnmk.com."
Friendly From/ Branded Address	Use this optional field to brand your email message. If you use this field, this is the email address your recipients will see in the email you send. For example, if you want the email address that displays to your recipients to be different from the email address defined in the Envelope From/Bounce Address, type the address the way you want it to appear in this field. **Note:** If you define an email address in this field, it displays as the From address in the outgoing email.
Reply-To Address	Typically, the reply-to address is the same as the address specified in the Envelope From/Bounce Address field, but you can use this optional field if you want customers to send their responses to a different email address. (For Oracle-managed Service mailboxes, this field is set to the email address that was designated when Oracle initially added the mailbox to your site.) The Reply-To Address field must contain a valid email address in order to receive messages. If the Reply-To Address field is not defined, then either the Envelope From/Bounce Address or the Friendly From/Branded Address is used as the default email address. **Caution:** If you use incidents, the Reply-To Address must match the Envelope From/Bounce Address unless your own mail administrator has set up SMTP forwarding for this address to automatically forward to the Envelope From/Bounce Address. See Answer ID 1272 on our support site.
Display Name	Type the name you want to appear on outgoing messages as the sender. For example, Global Wireless Customer Service.

6 To enter incoming email information, click the Incoming Email button on the ribbon. The incoming email settings display on the editor.



7 Enter the following field information.

Important For Oracle-managed Service mailboxes, the POP Server, POP Account, and Password fields are **read-only**. However, these fields can be edited from VCIO. For information on accessing VCIO, see Answer ID 5296

Table 91: Incoming Email Settings

Field	Description
***POP Server**	Type the address or IP address of the POP server. For example, the POP server for jsmith@mail.custhelp.com would be “mail.custhelp.com.” For Oracle-managed Service mailboxes, this field has been set up for you and is **read-only**. **Important:** To ensure that your bounced emails and replies process correctly, you must use the POP server configuration provided when your account was set up.

Table 91: Incoming Email Settings (Continued)

Field	Description
***POP Account**	Type the account name of the mailbox. For example, the account name for jsmith@mail.custhelp.com would be "jsmith." For Oracle-managed Service mailboxes, this field has been set up for you and is **read-only**. **Important:** To ensure that your bounced emails and replies process correctly, you must use the POP account configuration provided when your account was set up.
Password	Type the password of the mailbox. **Note:** For Oracle-managed Service mailboxes, this field has been set up for you and is **read-only**.
Send Rejected Messages To	Type an email address to send all rejected messages to, including all bounced and returned messages and automatic responses. This can help you determine why a message has been rejected so you can take action to resolve the issue if necessary.
Discard Automatic Responses	Select an option from this drop-down menu to determine the level of automatic response filtering.
Off	Select this option to turn off automatic response filtering. All automatic responses received by the mailbox are turned into incidents.
Conservative	Select this option to activate conservative response filtering. This is the default setting for new mailboxes.
Moderate	Select this option to activate moderate response filtering.
Aggressive	Select this option to activate aggressive response filtering.
Message Pull Limit	Type the maximum number of email messages to pull from the mailbox during a **Techmail** run. The remaining messages are left on the POP server until the next time Techmail runs. The default pull limit is 5,000 messages. **Note:** Messages that are filtered are not counted toward this limit. Only emails that create incidents are counted. For example, if Message Pull Limit is set to 100 and the mailbox contains 200 messages, but 50 of them are filtered by rules, Techmail pulls 100 of the remaining messages from the mailbox and leaves 50 for future processing.

Table 91: Incoming Email Settings (Continued)

Field	Description
Max Attachment Size	Type the maximum size, in number of bytes, allowed for file attachments. The default maximum size is 5,000,000 bytes (5MB). **Note:** Because this feature is designed to support incident-based work processes and is not intended to serve as a large format file repository, we recommend keeping this value low. While there is no upper limit to the value you may specify, several external factors determine the actual size limitation of files that may be received. See Answer ID 280 on our support site.
Maximum Description Size	Type the maximum size, in bytes, allowed for the incident description. If an email exceeds this limit, it is added to the incident as a file attachment and a small thread entry refers agents to the attached file. The maximum value allowed for this field is 250,000.
Force Reply Between Lines	Select this check box to require that customers type their reply between the two line markers included in an incident response email. When customers reply between these lines, Techmail separates their reply from the quoted response text and adds it as a new thread. • If this check box is selected and customers do not reply between the lines, an incident thread is not created from their reply. Another email is sent automatically to request that they reply between the lines. • If this check box is not selected and customers do not reply between the lines, Techmail looks for block-quoted text indicators to find the customer's reply. Refer to Email reply processing.
Delete Bulk Messages	Clear this check box to turn bulk messages into incidents. By default, this box is selected to delete bulk email. An email is considered bulk when the Precedence: header is set to bulk, junk, or list.
Delete Returned Messages	Clear this check box to turn returned messages into incidents. By default, this check box is selected to delete returned email. An email is considered to be returned when the From address begins with postmaster or mailer_daemon, or if the MIME type is Multipart/Report. **Note:** This option is not available for Outreach mailboxes.

Table 91: Incoming Email Settings (Continued)

Field	Description
Discard Filters	Select from any of the following filters to discard all incoming email with the specified characteristics.
Addresses	Type the email addresses you do not want to receive email from. Separate entries in the list with commas. An asterisk (*) may be used as a wildcard to match any characters. For example, to discard all email from jsmith@example.com and all example.org addresses, type: jsmith@example.com,*@example.org
Headers	Click this tab and type any strings found in any header that identifies email you want to discard. Type each entry on a separate line using up to 4,000 characters. The text comparison is not case sensitive. For example, to discard all email with any header line referencing a specific IP address or any email with the custom header of X-BulkPrecedence, type: [124.456.789.321] X-BulkPrecedence:
Subject	Click this tab and type any text found in an email subject line that identifies email you want to discard. Type each entry on a separate line. The text comparison is not case sensitive. For example, to discard all email with the following text in the subject line, type: Mortgage rates Marketing solution Bargain alert
Body	Click this tab and type any text found in an email body that identifies email you want to discard. Type each entry on a separate line using up to 4,000 characters. The text comparison is not case sensitive. For example, to discard all email with the following text in the body, type: Be your own boss If you do not wish to receive further mailings To unsubscribe

Table 91: Incoming Email Settings (Continued)

Field	Description
Mime Types	Click this tab and type a list of attachment types you will not accept in MIME format (type/subtype). The major MIME types are application, audio, image, message, model, multipart, text, and video. Separate entries in the list with commas or new lines. An asterisk (*) can be used as a wildcard to match any characters. For example, to exclude MPEG video attachments, GIF images, and all audio formats, type: video/mpeg, image/gif, audio/* **Note:** This filter blocks only matching file attachments. The remaining contents of the email continue to process.
File Types	Click this tab and type a list of attachment types you will not accept based on the file name extension. Separate entries in the list with commas or new lines. Specific file names can be specified, or an asterisk (*) can be used as a wildcard to match any characters. For example, to exclude all executable files, screen savers, and any script titled worm.vbs, type: *.exe, *.scr, worm.vbs **Note:** This filter blocks only matching file attachments. The remaining contents of the email continue to process.

8 To enter security settings, click the Security button and refer to Email security overview.

9 To view the mailbox configuration **audit log**, click the Audit Log button.

10 Click the Save and Close button to save your changes and close the editor.

General Service mailboxes

General Service mailboxes are not managed by Oracle. Therefore, you handle the entire mailbox setup yourself. If you decide to use general Service mailboxes, keep in mind that your mailbox will not be monitored by Oracle and advantages that are inherent to Oracle-managed Service mailboxes will not be available.

To add or edit a general Service mailbox

1 Click the Configuration button on the navigation pane.

2 Double-click Mailboxes under Site Configuration. The Mailboxes tree displays on the content pane.

3 Click the New button on the ribbon and select New Service Mailbox.

Or

To edit a mailbox, select it in the tree.

Note General Service mailboxes are not managed by Oracle.

4 Enter field information described in Mailboxes Editor Description to enable mailbox functionality.

5 To configure outgoing email for this mailbox, enter field information described in Outgoing Email Settings.

6 To configure incoming email for this mailbox, click the Incoming Email button on the ribbon and enter field information described in Incoming Email Settings.

7 To enter security settings, click the Security button on the ribbon and refer to Email security overview.

8 To view the mailbox configuration audit log, click the Audit Log button.

9 Click the Save and Close button to save your changes and close the editor.

Outreach mailboxes

If you use Outreach or Feedback on your site, you will also need to add an Outreach mailbox.

Important To ensure accurate processing of replies, inbound messages, and bounces, Outreach mailboxes cannot be shared with either type of Service mailbox. Techmail handles messages in Oracle-managed Service mailboxes and general Service mailboxes differently from how it handles them in Outreach mailboxes. For this reason, you must set up one mailbox for Service and a separate mailbox for Outreach and Feedback.

To add or edit an Outreach mailbox

1 Click the Configuration button on the navigation pane.

2 Double-click Mailboxes under Site Configuration. The Mailboxes tree displays on the content pane.

3 Click the New button on the ribbon and select New Outreach Mailbox. The editor opens.

Or

To edit a mailbox, select it in the tree.

4 Enter field information described in Mailboxes Editor Description to enable mailbox functionality.

5 To configure outgoing email for this mailbox, enter field information described in Outgoing Email Settings.

6 To configure incoming email for this mailbox, click the Incoming Email button on the ribbon and enter field information described in Incoming Email Settings.

7 To enter security settings, click the Security button on the ribbon and refer to Email security overview.

8 To view the mailbox configuration audit log, click the Audit Log button.

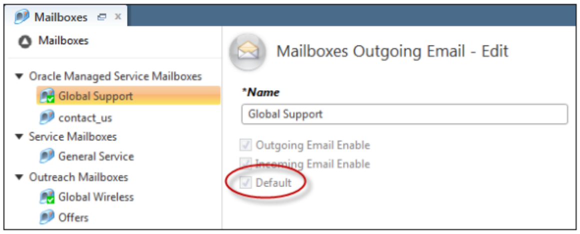
9 Click the Save and Close button to save your changes and close the editor.

Designating a default mailbox

You must designate one default mailbox for Service—either an Oracle-managed Service mailbox or a general Service mailbox. This is the mailbox that is used to send Service incident responses. After designating a default Service mailbox, the mailbox name will then display in the Mailbox field on the Details tab of the agent's incident workspace. This lets your agents easily associate incidents with the correct mailbox when responding to customers. See Adding incident information on the Details tab.

Important If you do not designate a default mailbox by selecting the Default check box, agents must manually select a mailbox each time they respond to an incident.

The default mailbox is designated by the Default check box on the editor's Outgoing Email page. Once the default mailbox is set, a green check mark displays on top of the mailbox icon in the tree.



This check box is selected by default for general Service and Outreach mailboxes, but **not** for Oracle-managed Service mailboxes. Therefore, if your Oracle-managed Service mailbox is the only Service mailbox you have, you must designate it as the default mailbox by selecting the Default check box. See Mailboxes Editor Description.

Note If you communicate with your customers through mailings and campaigns and survey your customers and prospects, you must also designate a default Outreach mailbox. See Outreach mailboxes.

Email security overview

Oracle Service Cloud provides security and privacy options for all incoming and outgoing email. Using accepted industry standards, the email security features help protect your communication in three important ways.

- **Authentication** assures the message recipient that the sender is who it appears to be and that no other parties are misrepresenting themselves as the sender.
- **Message integrity** ensures that the content of the message has not been deliberately or accidentally changed during transmission.
- **Privacy** ensures that the message is not readable by anyone other than the intended recipient.

To safeguard your email communication, Oracle Service Cloud supports SSL and S/MIME security methods along with the ability to manage certificates and authentication options. Together, these features can provide a high level of security for messages traversing the Internet between you and your customers.

Security configuration is an important part of your Oracle Service Cloud application and we realize that your organization may have unique security needs. For an in-depth discussion about security practices in Oracle Service Cloud and how to protect your data, see Security Practices.

Configuring SSL security

SSL (secure sockets layer) protocol is the industry standard for securing Internet-based data transfer. SSL encrypts the data stream during transmission to prevent the exposure of sensitive information, such as passwords, to unauthorized parties.

Servers with SSL capability have been issued a **public certificate** and a **private key** by a **certification authority**. When a client (such as **Techmail**) communicates with an SSL-enabled server, the server sends the client its public certificate for verification. After the certificate has been validated to be current and signed by a trusted certification authority, the communication channel between the client and server is encrypted and can then be used to securely exchange information. The information remains encrypted as it travels between the two parties and is secure until the server or client decrypts it at the other end.

If you are hosting a POP mail account on your own mail server, configuring an SSL connection between the Techmail utility and the mail server protects the security of email messages as they are processed.

Note SSL is not used for accessing POP accounts hosted by Oracle because the mail server and Techmail utility reside within the same secure network.

The SSL settings let you specify the method used to establish the secure connection and set conditions on how strictly Techmail validates the server's SSL certificate before connecting.

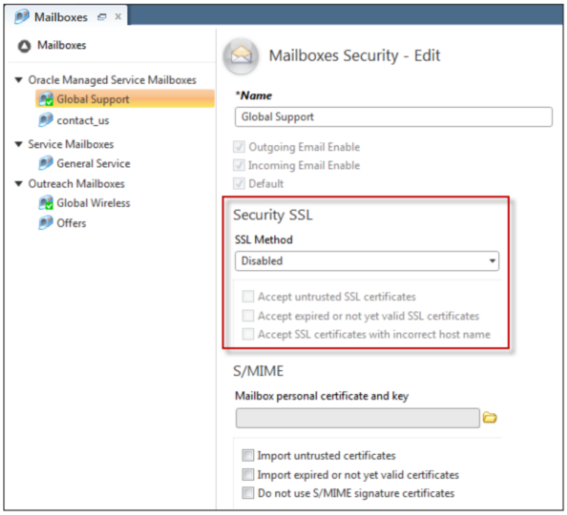
To configure SSL security settings

1 Click the Configuration button on the navigation pane.

2 Double-click Mailboxes under Site Configuration. The Mailboxes tree displays on the content pane.

3 Click the mailbox you want to edit in the tree.

4 Click the Security button on the ribbon to display the mailbox security settings.



5 Enter the following field information.

Table 92: SSL Security Settings

Field	Description
Security SSL	Select the SSL method and set certificate verification requirements.
SSL Method	Click this drop-down menu to select an SSL option that determines how Techmail retrieves messages from the mailbox.
Disabled	Select this option to use regular POP3 (on port 110) without SSL encryption. This is the default setting. **Note:** The check boxes for accepting SSL certificates are grayed out if you select Disabled for the SSL method.
Using POP3 SSL port	Select this option to use POP3 with SSL encryption on port 995.
Using STLS command	Select this option to use the standard POP3 port (port 110) with SSL encryption. After the server greeting, the “Start TLS” command is used to switch to an SSL-encrypted connection.

Table 92: SSL Security Settings (Continued)

Field	Description
Accept untrusted SSL certificates	Select this check box to bypass verification that the mail server's SSL certificate is signed by a trusted certificate authority.
Accept expired or not yet valid SSL certificates	Select this check box to bypass verification that the mail server's SSL certificate is current and not yet expired.
Accept SSL certificates with incorrect host name	Select this check box to bypass verification that the mail server's host name is the same host specified in the SSL certificate.

6 Click the Save button to save your mailbox settings.

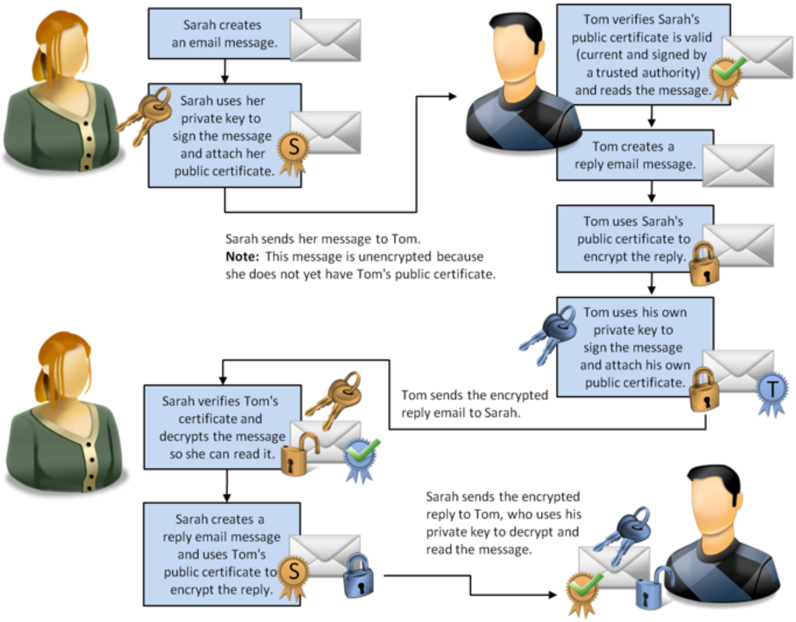
Configuring S/MIME security

In addition to SSL encryption, Oracle-managed Service mailboxes and general Service mailboxes support **S/MIME**, an industry standard for ensuring the security of message content through the use of electronic signatures, encryption, or both. An email address that uses S/MIME has a **public certificate** as well as a **private key** that corresponds to the public certificate. The public certificate authenticates the sender and can be used for encryption. The person who replies to the email can use the sender's public certificate to encrypt the reply, which can then be decrypted only by the original sender using the original sender's private key.

Note There are certain situations where S/MIME security options are **not** available.

- In Outreach and Feedback mailboxes.
- When editing multiple incidents simultaneously. You can send a response to more than one incident at a time, but you cannot use secure mail when doing so.
- When using delayed reporting on the Workspace editor. S/MIME works only if you clear the Delay Report Execution check box under the Report Behavior drop-down menu for the Contacts relationship item control on the Workspace editor's Design tab. See Report properties.

The following figure illustrates a secure correspondence between two parties, both of whom have S/MIME capability.



Customers who have S/MIME email can send messages signed with their public certificate to any Oracle-managed Service mailbox or general Service mailbox. When **Techmail** receives a signed message, it verifies and stores the customer's certificate and uses it to encrypt any response messages sent to that customer. The customer can then decrypt the response using the certificate's private key.

Note Agents responding to a signed message can send a non-encrypted response by selecting Do Not Encrypt from the incident response options. Refer to To sign and encrypt an incident response.

Service's S/MIME settings also let you set conditions on how strictly Techmail validates a customer's public certificate for incoming messages. If Techmail cannot verify a customer's public certificate, it does not update the customer's contact record with that certificate.

Tip When Techmail attempts to decrypt an incoming message or verify an attached certificate (and you have enabled EGW_SAVE_EMAIL_HEADERS to save incoming email headers), the results are appended to the saved mail header.

Note that the customer's original message is not encrypted. In order to encrypt messages sent from a customer to an Oracle-managed Service mailbox or general Service mailbox, the mailbox must be configured with its own certificate and key, as described in the following procedure. Agent response emails are then signed with the mailbox certificate which customers can use to validate the messages and send encrypted replies. Techmail uses the certificate's key to decrypt those replies and process the message contents normally.

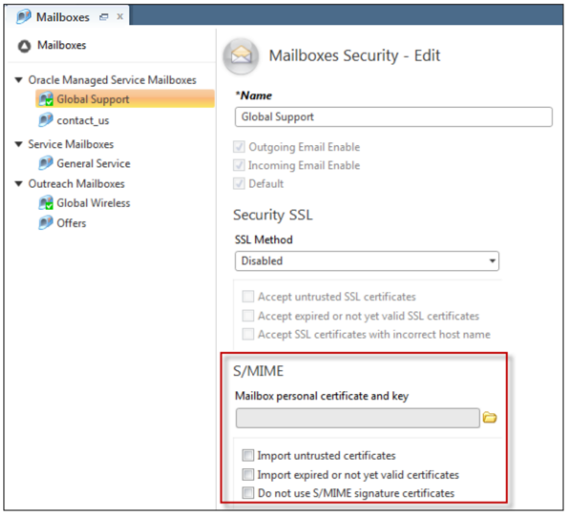
To configure S/MIME security settings

1 Click the Configuration button on the navigation pane.

2 Double-click Mailboxes under Site Configuration. The Mailboxes tree displays on the content pane.

3 Click the mailbox you want to edit in the tree.

4 Click the Security button on the ribbon to display the mailbox security settings.



5 Enter the following field information.

Table 93: S/MIME Security Settings

Field	Description
S/MIME	Identify the mailbox's public certificate/private key file and set certificate import requirements.
Mailbox personal certificate and key	Click the Browse button to locate the file containing the public certificate and private key assigned to the mailbox by the **certification authority**. The file you import should be in a password-protected Personal Information Exchange PKCS#12 format, using a *.pfx* or *.p12* file extension. It must also contain the email address of the mailbox exactly as it was entered for outgoing email. See Outgoing Email Settings. When prompted, enter the original password (the password used to encrypt the file) and the new password (the password the **private key** is to be encrypted with in the database). **Note:** The file is not imported until you click the Save button to save all mailbox settings.
Import untrusted certificates	Select this check box to bypass verification that the mailbox certificate file to be imported (set in the mailbox personal certificate and key field above) or a contact certificate extracted from a signed S/MIME email is signed by a trusted certification authority. **Note:** Changing this setting does not affect previously imported and stored certificates.
Import expired or not yet valid certificates	Select this check box to bypass verification of the certificate date for the mailbox certificate file to be imported (set in the mailbox personal certificate and key field above) or a contact certificate extracted from a signed S/MIME email. The Techmail utility will then accept certificates from S/MIME emails sent to this mailbox that have expired or are not yet valid. This setting applies to every certificate in the certificate chain, from the root certificate through any subordinate certificates to the POP3 server's certificate. **Note:** Changing this setting does not affect previously imported and stored certificates.
Do not use S/MIME signature certificates	Select this check box to allow unverified S/MIME signed emails for incident creation and updates. If this check box is selected, certificates from signed emails are not stored with the contact record.

6 Click the Save button to save your mailbox settings.

Certificate validation options

To supplement the SSL and S/MIME email security settings, Oracle Service Cloud provides you with the following resources for managing the validation and revocation of certificates. These resources are accessed using the File Manager. Refer to Managing files.

- **Trusted certification authorities**—Service uses a predefined list of trusted certification authorities for verifying certificates from POP3 servers and S/MIME email senders. This list contains well-known root certification authorities. Depending on your organization's circumstances, you may want to add or remove trusted certification authorities.
- **Certification revocation lists**—Certification authorities regularly publish certificate revocation lists, which you can use to check the validity of certificates. If you upload any lists, certificate revocation checking is automatically enabled. As a result, all root certification authority certificates that are used (in either SSL connections or email certificates) must have a corresponding certificate revocation list. If there is no corresponding list, the certification check fails.
- **Intermediate certificates**—Some certificates that are not defined as trusted root certificates still need to be stored in order to verify a customer's certificate (the one that was used to sign the customer's S/MIME email). These are called intermediate certificates and are automatically extracted from emails, requiring no intervention on your part. You can also upload intermediate certificates if, for example, you receive signed emails without the necessary intermediate certificate embedded in them.

Additionally, the configuration setting, USE_KNOWN_ROOT_CAS (Common > General > Single Sign-On), controls whether the known root certificate authorities list that is embedded within the Oracle server is consulted when verifying X509 certificates. For example, when checking S/MIME email or **SAML 2.0** signatures.

To add or remove certification authorities

1. Click the Configuration button on the navigation pane.
2. Double-click File Manager under Site Configuration. The File Manager displays on the content pane.
3. Click the Switch To drop-down menu and select Additional Root Certificates.
4. Click the Browse button and select the root certificate file you want to upload. The file should be in DER Encoded Binary X.509 *(.cer* or *.crt)* or Base-64 Encoded X.509 *(.pem)* format.

5 Click the Go button to upload the file.

6 To delete a root certificate file, click the Delete File button on the line that contains the file you want to delete.

   a Click the OK button to confirm the deletion.

To add or remove intermediate certificates

1 Click the Configuration button on the navigation pane.

2 Double-click File Manager under Site Configuration. The File Manager displays on the content pane.

3 Click the Switch To drop-down menu and select Intermediate Certificates.

4 Click the Browse button and select the intermediate certificate file you want to upload. The file should be in DER Encoded Binary X.509 *(.cer, .crt)* or Base-64 Encoded X.509 *(.pem)* format.

5 Click the Go button to upload the file.

6 To delete an intermediate certificate file, click the Delete File button on the line that contains the file you want to delete.

   a Click the OK button to confirm the deletion.

To add or remove certification revocation lists

1 Click the Configuration button on the navigation pane.

2 Double-click File Manager under Site Configuration. The File Manager displays on the content pane.

3 Click the Switch To drop-down menu and select Certificate Revocation Lists.

4 Click the Browse button and select the certificate revocation list file you want to upload. The file should be in a DER Encoded Binary *(.crl)* format.

5 Click the Go button to upload the file.

6 To delete a certificate revocation list file, click the Delete File button on the line that contains the file you want to delete.

   a Click the OK button to confirm the deletion.

Troubleshooting filtered out or rejected email

Incoming email messages are filtered out or rejected by the Techmail utility for a variety of reasons, such as the header content, email subject, or because the sender does not have a customer account (that is, a contact record in the knowledge base). The logic that determines which email messages will be processed is based on mailbox settings, configuration settings, and your site's business rules.

The Incoming Email Filter Details report (Public Reports > Service > Email Reports) can help you troubleshoot why certain emails are being filtered out or rejected by Techmail. This report lists every email filtered out or rejected in the past twenty-four hours, including the email address the message was sent to, the date the email was created, the filter type, the filter description, and the name of the mailbox from which the email was sent. Techmail stores this information in the Techmail Filter Details (*tm_filter_details*) table. For a description of information logged in this table, see the Data Dictionary located under Configuration > Database > Data Dictionary.

The following table lists the filter types associated with the Techmail Filter Details table. It also lists the settings and rules that cause a message to be filtered out by Techmail.

Table 94: Filter Type Descriptions

Filter Type	Description
techmail_filter_address	This message was filtered out because the email address matches a value on the Addresses tab in the Discard Filters section of your Incoming Email settings.
techmail_filter_header	This message was filtered out because the header information matches a value on the Headers tab in the Discard Filters section of your Incoming Email settings.
techmail_filter_subject	This message was filtered out because the email subject matches a value on the Subject tab in the Discard Filters section of your Incoming Email settings.
techmail_filter_body	This message was filtered out because content in the email body matches a value on the Body tab in the Discard Filters section of your Incoming Email settings.

Table 94: Filter Type Descriptions (Continued)

Filter Type	Description
techmail_filter_mime	This message was filtered out because the MIME type matches a value on the MIME Type tab in the Discard Filters section of your Incoming Email settings.
techmail_filter_file	This message was filtered out because the file format matches a value on the File Types tab in the Discard Filters section of your Incoming Email settings.
techmail_filter_bulk	This message was filtered out because the Delete Bulk Messages check box is selected in your Incoming Email settings. When Delete Bulk Messages is selected, bulk email messages are *not* converted to incidents. Instead, they are deleted. An email is considered bulk when the Precedence: header is set to bulk, junk, or list.
techmail_filter_returned	This message was filtered out for the following reasons: • Mailbox type = Service • Techmail determines the email is a bounced message • Delete Returned Messages check box is selected in your Incoming Email settings
techmail_filter_wrong_db	This message was filtered out because the system recognized that it came from a separate database. **Note:** No configurable setting is associated with this filter type.
techmail_filter_autoresponse	This message was filtered because of the setting in the Discard Automatic Responses field (Off, Conservative, Moderate, or Aggressive) in your Incoming Email settings. Based on this setting, the system detects industry-standard auto-responses, such as Out of Office, in the subject and header data.
techmail_filter_duplicate_incident	This message was filtered out because the configuration setting EGW_DISCARD_DUPLICATE_ENABLED is enabled (Default = Yes). In this case, any message that matches an existing incident (with the same date, email address, subject, and body) is classified as a duplicate.
techmail_filter_proof_reply	This message was filtered out because it was a reply to a proof message. Emails related to proof messages are not processed. **Note:** No configurable setting is associated with this filter type.
techmail_filter_reject_disabled	This message was filtered out because the contact record is disabled. **Note:** No configurable setting is associated with this filter type.

Table 94: Filter Type Descriptions (Continued)

Filter Type	Description
techmail_filter_reject_reply	This message was filtered out for the following reasons: • EGW_REPLY_BETWEEN_ENABLED = Yes (Default = No) • Force Reply Between Lines check box is selected in your Incoming Email settings.
techmail_filter_reject_sla	This message was filtered out because the system determined that the contact does not have a valid SLA allowing incidents to be created through email for the specified interface.
techmail_filter_reject_account	This message was filtered out because a customer account is required. The system determines a customer account is required when the following are true. • EGW_AUTO_CONT_CREATE_MA = Yes (Default = No) • EGW_AUTO_CONT_CREATE = Yes (default) • Incoming message's email address is not associated with a contact record in the knowledge base
techmail_filter_reject_rule	This message was filtered out because of how the site's business rules are defined.
techmail_filter_reject_smime_sign	This message was filtered out because of an invalid S/MIME signature certificate, which is defined by the S/MIME security settings of the mailbox.
techmail_filter_reject_smime_decrypt	This message was filtered out because of a decryption error as defined by the S/MIME security settings of the mailbox.
techmail_filter_unsubscribe	This message generates an email in an attempt to unsubscribe the user from further communication. **Note:** Techmail *does* process this unsubscribe message in order to ensure the contact is opted out. The message is considered "filtered" because no incident is created or updated as a result of the email.

Email bounce handling

Occasionally, a recipient mail server determines that an email message cannot be delivered and replies with a "bounce" notification (delivery error). To process these errors, the Envelope From/Bounce Address in your Outreach mailbox's outgoing email settings must use the POP server and POP account configured in the incoming settings.

Important To ensure that your bounced emails and replies process correctly, you must use the email address that was provided when your account was set up.

When the **Techmail** utility encounters a bounce error, it attempts to classify the error as one of the following bounce types.

Soft bounce—An email was returned because of a temporary problem with the recipient's mailbox (for example, the mailbox has exceeded its available size limit). Service incident emails that result in soft bounces are not automatically re-sent by the system. If you want to resend an incident response that has bounced, you must manually respond to the incident again. Conversely, when Techmail detects that a soft bounce has been returned from a mailing or survey invitation email, it places that message in a mail queue and attempts to resend it for up to seven days (the default value specified by the BOUNCE_RETRY_WINDOW).

However, if a contact's email address returns soft bounces three consecutive times with no contact activity in the previous fifteen days (as specified by the INVALID_NUM_BOUNCES and INVALID_NUM_DAYS configuration settings), the address is marked invalid. Once a contact's email address has been invalidated, the system does not send mailings or surveys to that address. Refer to Invalid contact email addresses.

Hard bounce—An email was returned because of a permanent problem with the recipient's mailbox, and the problem is not expected to be resolved (for example, the recipient mail server indicates that the email address does not exist). When a hard bounce is received, the contact email address is marked invalid and no resend attempt is made.

Note If email address sharing is enabled, and a shared email address is invalidated due to a hard bounce, the address is marked as invalid for each contact associated with it. Refer to Email address sharing.

General bounce—A mailing or survey invitation email was returned due to technical problems with the delivery of the message. That is, the problem is not on the sender's end nor the recipient's end, but in the transmission of the message over the network in between. It is therefore difficult to predict the likelihood of resolution. General bounces are logged in the database but no further action is taken. No resend attempt is made and the contact email address is not marked invalid.

Unknown bounce—An email was returned for a reason that could not be determined. Unknown bounces are logged in the database but no further action is taken. No resend attempt is made and the contact email address is not marked invalid.

In other cases, Techmail may receive an error code indicating that a mailing or survey invitation email was blocked by the recipient mail server. When this happens, Techmail attempts to identify the reason for the block and classifies it as one of the following block types.

Content block—An email was blocked due to its content. In other words, some part of the message content triggered a filter that prevented the message from being delivered.

Sender block—An email was blocked due to the sender's reputation. This means that the sender has not developed a trusted relationship with the recipient mail provider. See *Best Practices for Email Marketing*.

General block—An email was blocked for a reason that could not be determined.

When Techmail encounters a block error, it logs the error in the database but does not attempt to resend the message, nor does it invalidate the contact email address.

Delivery errors logged by the system can be accessed with reports, specifically the Invalid Email Address Domains report (Public Reports > Outreach > Contacts > Database Snapshot) and the Invalid Email Addresses by Mailing report (Public Reports > Outreach > Contacts).

You may also find it valuable to build a custom report using other data stored in the Bounced Messages (*bounced_msgs)* table. For example, you could create a custom report that includes the email address that the message was sent to, the text of the error received, the type of block or bounce it was classified as, and whether the email address was invalidated as a result. See Custom Reports.

Oracle Service Cloud stores a copy of the original email message for 60 days. (You can change or disable this purging interval by editing the OE_BOUNCE_PURGE_DAYS configuration setting.) See Editing configuration settings.

When a delivery error is returned from an incident response, a View Bounce Messages button appears in the header of the response thread that was bounced. Clicking this button opens a window displaying the contents of any delivery errors resulting from the response. Refer to Viewing bounced messages.

Note Because email technology is constantly evolving, Oracle Service Cloud regularly monitors delivery errors that are not categorized and attempts to classify them accordingly. If an email is blocked or bounced for a reason that cannot be determined (an unknown bounce or general block has occurred), it is often because not enough information was provided by the delivery error to classify it appropriately.

Invalid contact email addresses

In a contact workspace, an invalid email address is flagged by a warning indicator to the right of the Email field. In the database, validity is tracked for primary and alternate email addresses in three fields: *contacts.email_invalid*, *contacts.email_alt1_invalid*, and *contacts.email_alt2_invalid*. When these fields are updated, the contact **audit log** is updated accordingly. These fields can also be used in reports or as conditions in an incident or contact rule. See Creating reports and Business Rules Management.

If an agent attempts to send an incident response to a contact with at least one valid primary or alternate email address, Oracle Service Cloud sends the message to the valid address and no warning is given. However, if an agent attempts to send a response to a contact whose primary and secondary email addresses are all marked invalid, Oracle Service Cloud displays a warning message asking whether to proceed. If the agent clicks Yes, the system sends the response and sets all of the email addresses back to a valid state. However, if the response results in a bounce message that indicates an address is still not valid, **Techmail** invalidates the address once again.

Especially useful for identifying invalid email addresses is the Contacts with Invalid Email Addresses report (Public Reports > Common > Contact Reports). This report lists all contacts with one or more invalid primary or alternate email address, resulting from both hard and soft bounces. It also lists the most recent invalid date.

Tip It is not possible to override bounce detection to prevent Techmail from setting an email address to invalid. However, if a message that is not a bounce message is received from an address flagged as invalid, Techmail automatically updates the contact and revalidates the address. You can manually revalidate a contact's address by slightly modifying it, saving the record, and then reopening the record and setting it back to its original state. For example, if you change the address joe@example.com to joe@example.com.invalid and save the contact, then change it back to joe@example.com, the address is set as valid.

Email loop detection

Occasionally, an Oracle Service Cloud email message may be sent to an address that returns an automated reply (such as an out-of-office notification). If **Techmail** then receives and processes the automated reply, another Oracle Service Cloud message (such as an incident receipt or rule response) could be sent, generating another automated reply, forming an email loop.

To avoid this problem, the Techmail utility automatically terminates email loops using three detection methods.

- **Duplicate messages**—If Techmail detects that it has processed an identical email earlier in the same run, the duplicate email is deleted. Emails are considered duplicates if they are found in the same mailbox and contain the same email address, subject, send date, and body as a previous message.
- **Oracle Service Cloud messages**—Techmail also looks for any incoming message header that contains a reply-to address matching the reply-to address of any mailbox. In this way, Techmail deletes any messages originating from the system (such as receipts and escalation notifications) to prevent continuous internal email loops within Service.

- **Multiple messages**—Techmail also enforces a maximum number of messages allowed from a single email address in a specified period of time, regardless of content. By default, no more than twenty-three messages are allowed from the same address in the same twelve-hour period. Additional messages from that address within that time period indicate that an email loop has occurred and are deleted to terminate the loop.

Important To ensure accurate processing of replies, inbound messages, and bounces, Outreach mailboxes cannot be shared with either type of Service mailbox. Techmail handles messages in Oracle-managed Service mailboxes and general Service mailboxes differently from how it handles them in Outreach mailboxes. For this reason, you must set up one mailbox for Service and a separate mailbox for Outreach and Feedback.

The following table describes the configuration settings you can use to configure the Techmail email loop prevention function. See Editing configuration settings.

Table 95: Email Loop Prevention Configuration Settings

Setting	Description
RightNow Common > Service Modules > Oracle Email	
EGW_LOOP_PREVENT_ENABLED	If enabled, any email where the reply-to email address matches the reply-to email address of any Oracle-managed Service mailbox, general Service mailbox, or Outreach mailbox is discarded and no incident is created. In this way, the mailbox deletes any messages from itself, which can prevent continuous email loops. Default is enabled (Yes).
EGW_DISCARD_DUPLICATE_ENABLED	If enabled, any email having the same date, email address, subject, and body as an existing incident are classified as a duplicate message and are discarded. Default is enabled (Yes).
EGW_MAX_MSG_DURATION	Specifies the number of hours in which EGW_MAX_PER_ADDRESS is calculated. By default, the system only accepts 23 messages from a given email address in a 12-hour period. Since a high number of messages in a short period of time is reasonable, it is recommended the duration not be less than 8 hours or more than 24 hours. Default is 12.

Table 95: Email Loop Prevention Configuration Settings (Continued)

Setting	Description
EGW_MAX-_PER_ADDRESS	Specifies the maximum number of emails that are accepted from an individual email address within a EGW_MAX_MSG_DURATION hour period. This is used to identify and stop auto-responder email loops. For example, if this setting is set to 23, and 24 emails are received from the same address within EGW_MAX_MSG_DURATION hours, the 24th email from that address is discarded and no response email is sent, thereby breaking the email loop. Setting the value to zero turns off this loop detection. Default is 23.

In the rare event that Techmail's automated detection features are insufficient to prevent an email loop, you can use either of the following options to break the loop by temporarily discarding messages received from a specific email address.

- To end a loop using business rules, set up a temporary rule to delete email received from the address causing the loop. Refer to Adding rules.
- To end a loop using mailbox settings, temporarily add the email address to the Discard Addresses field for incoming email on the Mailboxes editor. See Adding and editing mailboxes and Incoming Email Settings.

Advanced configuration for email handling

To better fit our email management processes to your business needs, you can customize a variety of configuration settings to modify the system's default behavior. The settings described in the following procedures are used to configure mail processing functions such as the email gateway, contact record creation, email loop prevention, and **mailer daemon** (also called RNMD) parameters. See Working with the Configuration Settings editor.

To edit Common outgoing email settings

1. Click the Configuration button on the navigation pane.
2. Double-click Configuration Settings under Site Configuration. The Search window opens, where you can filter your search results.
3. To display all outgoing email settings, select the Site check box (in addition to the Logged In check box, which is selected by default) under the Configuration Base field.

4 Clear the Select All check box under the Folders field and then select the Common check box.

5 To search for a specific configuration setting in the Common folder, type the setting name in the Key field.

Tip You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.

6 Click the Search button. The Configuration Settings editor displays the settings in the Common folder that match your search criteria.

Tip To display configuration settings in alphabetical order, click in the Key column header.

7 Expand the folders under Common > General and edit the configuration settings under the Outgoing Email folder.

For information about a setting, click the setting and see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating custom configuration settings, see Site Configuration.

To edit Service email settings

1 Click the Configuration button on the navigation pane.

2 Double-click Configuration Settings under Site Configuration. The Search window opens, where you can filter your search results.

3 Clear the Select All check box under the Folders field and then select the RightNow Common check box.

4 To search for a specific configuration setting in the RightNow Common folder, type the setting name in the Key field. (The Key field is not case sensitive.)

Tip You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.

5 Click the Search button. The Configuration Settings editor displays the settings in the RightNow Common folder that match your search criteria.

Tip To display configuration settings in alphabetical order, click in the Key column header.

6 Expand the folders under RightNow Common > Service Modules and edit the configuration settings under the RightNow Oracle folder.

For information about a setting, click the setting and see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating custom configuration settings, see Site Configuration.

To edit Outreach and Feedback email settings

1 Click the Configuration button on the navigation pane.

2 Double-click Configuration Settings under Site Configuration. The Search window opens, where you can filter your search results.

3 Clear the Select All check box under the Folders field and then select the Outreach and Feedback check box.

4 To search for a specific configuration setting in the Outreach and Feedback folder, type the setting name in the Key field. (The Key field is not case sensitive.)

Tip You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.

5 Click the Search button. The Configuration Settings editor displays the settings in the Outreach and Feedback folder that match your search criteria.

Tip To display configuration settings in alphabetical order, click in the Key column header.

6 Expand the folders under Outreach and Feedback > General.

7 Edit the configuration settings under the specific Bounced Mail Processing, Campaigns, Invalidate Contacts, Mailer Utility, Mailings, Miscellaneous, and RNM Daemon folders.

For information about a setting, click the setting and see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating custom configuration settings, see Site Configuration.

Managing distribution lists

Distribution lists are email address lists that you can use when scheduling reports, configuring rule notifications, and forwarding incidents and opportunities. You can also use email address lists in the CC and BCC fields in incident responses. Distribution lists are used to define sets of email addresses not associated with contact records or **staff accounts** in your knowledge base.

For example, you might want to schedule an email report to be sent to a group of executives who do not have staff accounts in Oracle Service Cloud. By adding their addresses to a distribution list, you can then include that list when defining subscribers to that report.

The Distribution Lists editor consists of a list of available addresses. Addresses are included in the distribution list by selecting the check box next to them in the list.

To add or edit a distribution list

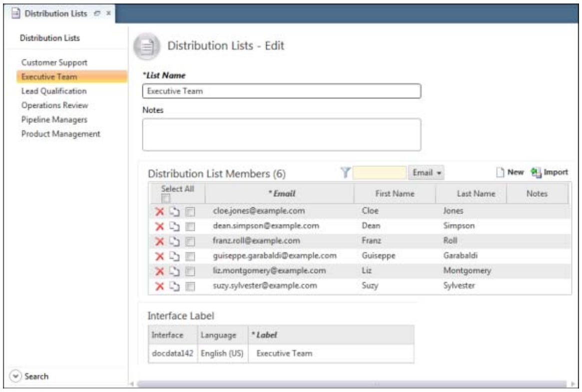
1 Click the Configuration button on the navigation pane.

2 Double-click Distribution Lists under Site Configuration. The Distribution Lists tree displays on the content pane.

3 To add a distribution list, click the New button on the ribbon.

Or

To edit a distribution list, click it in the tree.



4 Type the distribution list name in the List Name field.

5 To add an internal note about the distribution list, type it in the Notes field.

6 Enter the following field information.

Table 96: Distribution Lists Editor Description

Field	Description
Distribution List Members	This section contains the list of addresses available for the distribution list.
Filter	Type filter text and click the drop-down menu to select a column to filter the address list. **Note:** Filtering is available only when editing a list that has been saved.
New	Click this button to add a new address to the address list.
Import	Click this button to open the Import Email Addresses window and enter multiple email addresses that you want to add to the address list. You can also add first and last names for each address. Refer to Adding email addresses. **Note:** You can copy and paste a list of contact email addresses into the Email field, but each address must appear on its own line followed by a return.

Table 96: Distribution Lists Editor Description (Continued)

Field	Description
Select All	Select this check box to include all available addresses in the distribution list, or select the check box next to an individual record to include the record in the distribution list.
	Click this button to remove the selected member from the address list. **Caution:** Deleting the email address removes it from all distribution lists that it has been added to.
	Click this button to copy the selected address in the address list.
***Email**	Type the email address.
First Name	Type the first name associated with the email address.
Last Name	Type the last name associated with the email address.
Notes	Type internal notes about the email address.

7 To enter a different name for the distribution list based on interface, select the Label value next to the Language name in the Interface Label section and type the name. (This is helpful if your site has multiple interfaces of different languages.) By default, the label is set to the list name you defined in step 4.

8 To view the list **audit log**, click the Audit Log button on the ribbon.

9 Click the Save and Close button to save the distribution list and close the editor.

Adding email addresses

You can add email addresses to your distribution lists from the Import Email Addresses window. You can also copy and paste multiple addresses that are saved in another program, such as Microsoft Word, Excel, or Notepad. Once added, your new addresses can be included in any distribution list.

To add email addresses

1 On the Distribution Lists editor, click the Import button. The Import Email Addresses window opens.

2 Type the email addresses you want to add.

Or

Copy and paste multiple email addresses from another program.

Note Each address must appear on a single line followed by a return.

3 To include first and last names along with an email address, you must type that information (on a single line followed by a return) in the following order and format.

<first name>, <last name>, <email address>

For example, Lucy, Bauer, lucybauer@example.com

4 Click the OK button to add the email addresses to the distribution list. A message tells you that any changes made to distribution lists will be saved first and asks if you want to continue.

5 Click Yes. A Success window displays.

6 Click OK.

Best practices for sending email

Many external factors can impact the deliverability of email. Due to the vast amount of spam transmitted to consumers each day and the aggressive systems used to combat it, legitimate business emails are sometimes filtered without notice. In addition, customers who do not recognize the sender or contents of a valid message may regard it as spam, putting organizations at risk of having their addresses blacklisted by ISPs or email-reputation management services.

At Oracle, we follow key internal processes to protect the integrity of our hosted mail domains. In addition, we promote and enforce high standards of behavior among our customers who share resources in our multi-tenant hosting environment. However, as an administrator, it is equally important to align your processes with the best practices described here to minimize the risk of interference with your email communications.

Note The following practices apply to mail sent from Service. To review best practices for sending mailings and survey invitations, see *Best Practices for Email Marketing*.

Implement authentication—Organizations that send messages from branded domains should use a form of authentication to protect their reputations and delivery rates, while guarding against so-called “phishing” scams and forged messages.

- **Sender Policy Framework**—Sender Policy Framework (SPF) is an email authentication option that designates permitted senders of email originating from your domain, excluding those with mismatched or incorrectly specified SPF records. If your email address was supplied by Oracle using custhelp.com or rnmk.com domains, SPF has been implemented for you and no further action is needed. Otherwise, refer to Answer ID 2489 on our support site for information about implementing SPF on your site.

- **DomainKeys/DomainKeys Identified Mail**—DomainKeys (DK) and DomainKeys Identified Mail (DKIM) are email authentication options that use cryptographic signatures to designate email as originating from an authorized email delivery provider, excluding messages sent from those with unsigned or incorrectly assigned signatures. If we supplied your email address using custhelp.com or rnmk.com domains, your emails are already signed by Oracle Service Cloud and no further action is needed. Otherwise, refer to Answer ID 2701 on our support site for information about implementing DK and DKIM on your site.

Include your address and privacy policy—Edit your mail footers to include your business address and a link to your privacy policy. All emails governed by the CAN-SPAM law must contain the physical address or post office box of your organization. In addition, a link to your organization's privacy policy explaining how profile information is used can build trust with your contacts. For information about editing your mail footers, refer to Working with the Message Templates editor and Customizing the global template.

Review invalid email addresses—Use reports to regularly monitor all contacts marked as invalid. A high percentage of invalid addresses indicates a need to reevaluate your contact record maintenance practices. In addition, the Invalid Email Address Domains report helps you check for contact email addresses from well-known domains that contain common typographical errors (such as "htomail.com" instead of "hotmail.com"). For information about the email management system's handling of invalid addresses, refer to Invalid contact email addresses. For information about creating and using reports, refer to Creating Basic Reports.

Send from familiar addresses—Use easily identifiable email addresses in your mailbox configuration to help recipients recognize your organization as the sender. Do not include special (non-alphanumeric) characters, as they can cause filters to falsely identify the email as spam. For information about editing your mailbox configuration, refer to Adding and editing mailboxes.

Refine the message subject—The subject line is the first part of your message that your contacts see, so it must be concise and informative. When responding to an incident, make sure the subject clearly states the topic being discussed. If a contact fails to enter a descriptive and accurate subject, consider modifying it for clarity.

Promote addition to address books—Ask contacts to add your email address to their address books. This reaffirms their interest and ensures consistent delivery of your messages to their inbox.

Avoid using content associated with spam—Do not use all caps, special characters, or certain words often associated with spam in incident responses, as these can register false positives in many spam filters.

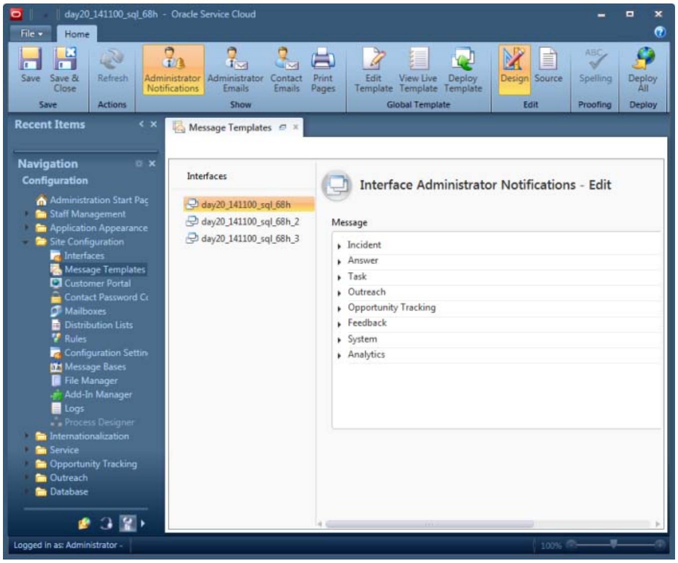
Honor abuse complaints—Regularly monitor administration accounts, such as abuse@yourdomain.com or postmaster@yourdomain.com, and honor all abuse complaints as unsubscribe requests by opting out or disabling the associated contact record.

Note The Answer Update notification message is the only subscription-based notification sent from Service and includes an unsubscribe link for each updated answer. If an answer matches multiple subscription criteria (for example, it was subscribed to by both answer ID and product), the message provides options to unsubscribe from each subscription type. In this way, a contact can unsubscribe from answers without assistance from your staff.

14

Message Templates

Message templates let you customize your administrator notifications, administrator emails, and contact emails for each interface. You can customize your message content, enable and disable notifications and emails, as well as define the message format as HTML or text. Message templates also let you quickly apply your organization’s brand across all notifications and emails, including Oracle RightNow Cloud Service (Service) email.

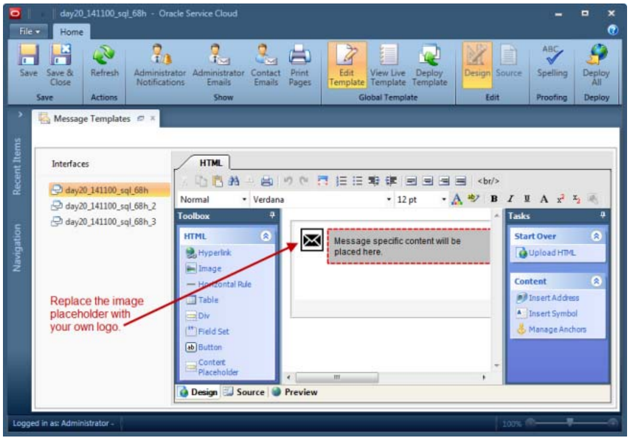


Note Staff members must have the Message Templates permission on the Administration tab of the Profiles editor in order to customize message templates. See Administration permissions.

Working with the Message Templates editor

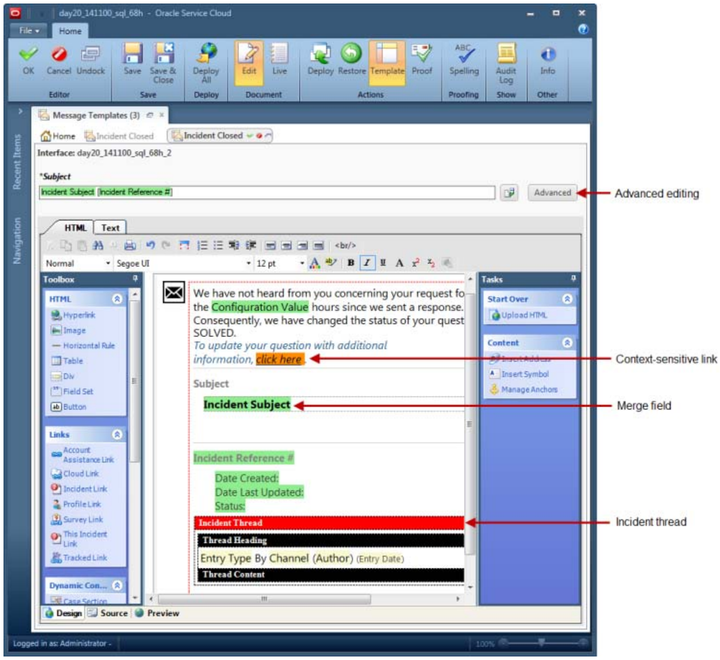
The Message Templates editor contains the global template and a set of system-generated messages. Using an HTML editor similar to the HTML editors used to create content for mailings, surveys, and answers, you can edit the global template and the messages directly on the **Service Console**. See Using the HTML editor.

The global template contains the content that frames the message-specific content in each of your individual messages. Think of the global template as a wrapper for your entire set of notifications and emails. Using the HTML editor, you can standardize the design of your outgoing messages giving them all the same look and feel. For example, you can insert your organization's logo in the header and your customer service information in the footer of the global template. When you are ready to deploy your global template, your brand can be applied to a single message or across all of your messages. See Customizing the global template.



The system-generated messages are sent to staff and contacts to support activities and events occurring throughout the system. Using an HTML editor, you can personalize your email subject lines to tailor your message to different audiences with advanced editing. You can also insert links that appear as clickable text and use merge fields to customize each message. The tools that display on the HTML editor are context-sensitive and are the logical tools you would use for the specific message you are customizing.

Additionally, you can edit multiple messages at the same time, which is especially useful if you want to compare similar messages or if you work with more than one interface. Each time you edit a message template, it opens on a sub-tab, making it easy to move between different message templates.

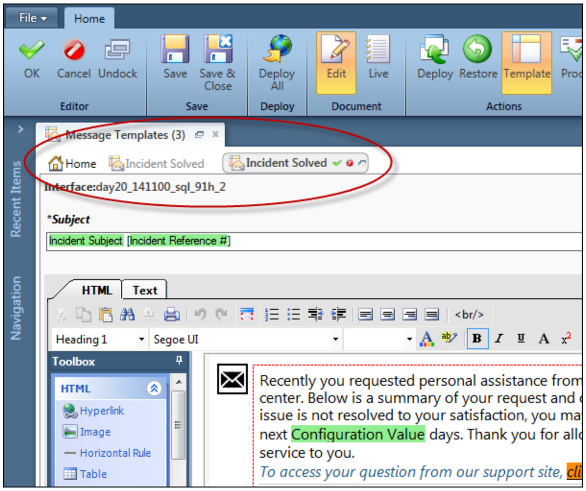


Working with sub-tabs

Using the Message Templates editor, you can work with multiple templates at the same time, which is especially useful if you want to compare similar messages or if you work with more than one interface. In addition, you can also move to other areas of Oracle Service Cloud without needing to close your message templates. For instance, say you need to open an incident while you are editing your message templates. There is no need to close the message templates you are working on because you can move to your incident workspace and come back to your message templates when you are ready.

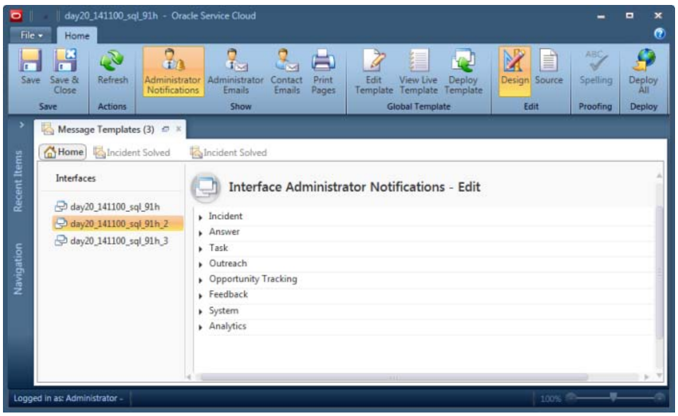
Managing multiple message templates across multiple interfaces is easy through the use of content pane sub-tabs. Here's how they work.

When you open a message template, the Home tab displays as does the tab for the message template. Both tabs appear below the Message Templates editor content pane tab and are called sub-tabs. The following figure shows the Incident Solved message template for two separate interfaces, each one open on its own sub-tab.

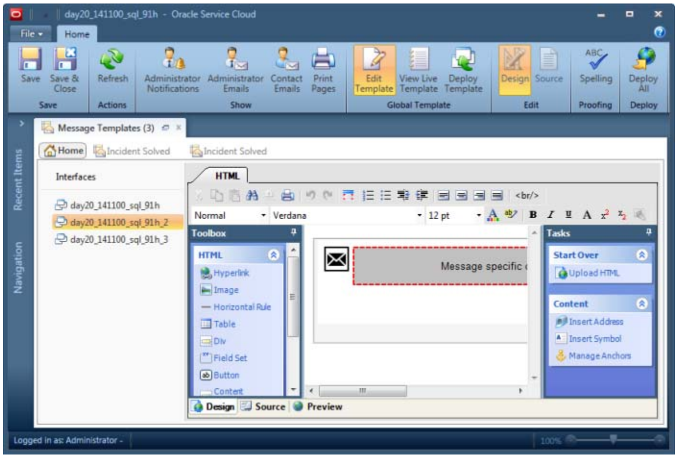


Notice the number in parentheses on the Message Templates editor tab. This identifies the number of sub-tabs you currently have open (in this case, the number 3 represents the Home sub-tab and two Incident Solved sub-tabs).

You'll use the Home sub-tab when you want to return to the Message Templates main editor to open other templates or the global template. Clicking the Home sub-tab displays the interfaces you have available on the left and a list of categories for the message type (administrator notifications, administrator emails, contact emails, or print pages) displays on the right. From here you can select a template to open or click a button on the Show group of the ribbon to change the message type.

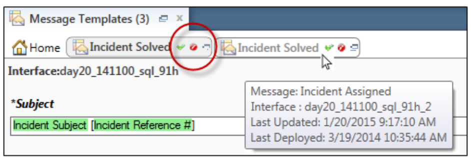


If you want to edit the global template, click the Home sub-tab, click the applicable interface on the left, and click the Edit Template button on the ribbon. See Customizing the global template.



Note Because each interface has its own global template, you cannot edit more than one global template at the same time.

Each message template sub-tab contains buttons that correspond to the buttons on the Editor group of the Message ribbon: OK, Cancel, and Undock. All sub-tabs, except for the Home sub-tab, contain these buttons for taking actions on the individual message templates. From the active sub-tab (or when you hover over an inactive sub-tab), these buttons let you save and cancel your changes as well as undock your message template without needing to use the message's ribbon buttons. Hovering over a sub-tab also shows a tooltip that includes the name of the message, interface, and the last updated and deployed dates.

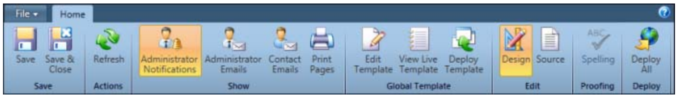


- **OK**—Clicking this button accepts the changes you have made and closes the sub-tab. However, it does not save changes to the database until you click the Save or Save and Close button on the message templates ribbon.

- **Cancel**—Clicking this button closes the sub-tab if you haven't made changes to the message template. If you have made changes, a message asks if you want to save your changes.
- **Undock**—Clicking this button undocks the message template from the editor and opens it in its own window. To redock the message to the editor, click the Dock to Console button on the window's ribbon.

Message templates ribbon

The message templates ribbon contains buttons for accessing the individual system-generated messages and for working with the global template. You can view the live global template, edit and deploy the global template, and deploy the entire set of messages and the global templates across all interfaces at the same time.



Some buttons apply only to the global template while others apply to the system-generated messages. Those differences are noted in the following table.

Note The buttons on the message templates ribbon are inactive until you select the interface you want to customize.

Table 97: Message Templates Ribbon Description

Group/Button	Description
Save	The buttons in this group commit changes to the database for the global templates as well as the messages across all interfaces.
Save	Click this button to commit pending changes and keep the editor open.
Save and Close	Click this button to commit pending changes and close the Message Templates editor.

Table 97: Message Templates Ribbon Description (Continued)

Group/Button	Description
Actions	
Refresh	Click this button to abandon pending changes and reload the most recently saved version. This button applies to the global template as well as the messages.
Show	The buttons in this group let you toggle between the different message types that are available. See Message types.
Administrator Notifications	Click this button to open the categories for administrator notifications.
Administrator Emails	Click this button to open the categories for administrator email messages.
Contact Emails	Click this button to open the categories for contact email messages.
Print Pages	Click this button to open the print templates available for viewing records and items from the agent desktop as well as printing hard copies of incidents, answers, tasks, organizations, contacts, opportunities, and quotes. See Print templates.
Global Template	The buttons in this group apply to the global template that is used to apply a standard look and feel across all of your messages.
Edit Template	Click this button to open the global template.
View Live Template	Click this button to view the most recently deployed global template. **Important:** Before you click the Deploy Template button, View Live Template displays the active version that has been deployed on your site. After you click the Deploy Template button, the version you are editing displays. However, it has yet to be committed to the database.

Table 97: Message Templates Ribbon Description (Continued)

Group/Button	Description
Deploy Template	Click this button to deploy the edited version of your global template. At this point, the deployed version is applied to the entire set of messages. Keep in mind that you have not committed this version to the database. **Important:** You must click the Save button to commit your deployed version to the database. After you save, your global template is active.
Edit	The buttons in this group define the mode (either design or source) in which the global template and the entire set of messages open on the HTML editor.
Design	Click this button to set the global template and the messages to open in design mode on the HTML editor. This is the default mode.
Source	Click this button to set the global template and the messages to show the source code on the HTML editor.
Proofing	
Spelling	Click this button to spell check the global template.
Deploy	
Deploy All	Click this button to deploy the global templates as well as the entire set of messages across all interfaces at the same time. **Important:** You must save after clicking the Deploy All button to commit your edits to the database.

Customizing the global template

The global template contains the content that frames the message-specific content in each of your individual messages. You can standardize the look of your messages by inserting your own logo. You can also customize your headers and footers to display information that needs to be communicated in all of your messages.

Note Because each interface has its own global template, you cannot edit more than one global template at the same time.

In the middle of the global template's HTML editor are two placeholders—one is an image placeholder and the other is a placeholder for the message-specific content. You can insert HTML above and below the placeholders. The global template, like all messages, is interface specific.

Tip Since the system default global template cannot be restored from the Message Templates editor, we recommend that you copy and paste the original template's HTML into a text file, such as Notepad, in case you need it at a later time. You can do this from the Source tab on the HTML editor.

To edit the global template

1. Click the Configuration button on the navigation pane.
2. Double-click Message Templates under Site Configuration. The Message Templates editor opens.
3. Select the interface you want to customize. By default, the categories for administrator notifications display on the right.
4. Click the Edit Template button on the ribbon. The global template for the interface you selected opens.
5. To insert your logo or another image, double-click the image placeholder to the right of the content placeholder. The Image Editor window opens. See Inserting images.
6. To edit the global template using the hyperlinks, buttons, and other features available on the HTML editor, see Adding HTML in design mode.
7. To customize your header and footer content, type above or below the placeholders.

8 To discard your pending changes and revert to the most recently saved global template, click the Refresh button on the ribbon.

Important The Refresh button applies only to the most recently saved global template. For example, if you have made changes and have not saved, then you can refresh to your previous version. However, once you have saved, then that is the version that is available to refresh.

9 To see the currently deployed template, click the View Live Template button on the ribbon. The content pane refreshes to display the version of the global template that is currently applied to all notifications and messages.

Tip Suppose you have made changes, but want to go back to some of the elements used in your active version. As long as you haven't deployed your template, clicking the View Live Template button lets you see a read-only version of the active content that you can copy and paste into the version your are editing.

10 To spell check the global template, click the Spelling button on the ribbon.

11 To preview your changes to the global template, click the Preview tab at the bottom of the HTML editor.

12 Click the Save button on the ribbon to save your edits to the global template.

At this point, your edits have not been deployed or committed to the database. See Deploying the global template.

Deploying the global template

When you deploy the global template, you copy the version you are currently editing to the version that is sent throughout the system to the entire set of messages. Once you deploy, you still have the option to make changes to your global template because you have not committed anything to the database. It is also true at this point that you can no longer view the active version of the global template. Once you save, your deployed version is the only one you can see.

To make your deployed version active, you must commit your changes to the database by saving after you deploy. It is only after you have saved your deployment that your global template changes are active and are also applied to the entire set of active messages.

Note Because each interface has its own global template, you cannot edit more than one global template at the same time.

To deploy the global template

1. After saving changes to the global template, click the Deploy Template button. A message asks you to confirm your decision to deploy.
2. Click the OK button. Your deployed version is copied to the version that is sent throughout the system.

Note At this point, if you click the View Live Template button, the version you are editing displays. Likewise, if you open any of your messages, your edited version has been applied, but it has yet to be committed to the database.

3. Click the Save button on the ribbon to commit your deployed version to the database.

Now, your deployed version is your active global template and is applied to your entire set of active messages.

To deploy the global template and the messages at the same time

1. After saving changes to the global template, click the Deploy All button. A message asks you to confirm your decision to deploy the global template as well as all of your messages.

Note Deploy All applies to the global templates and messages across all interfaces.

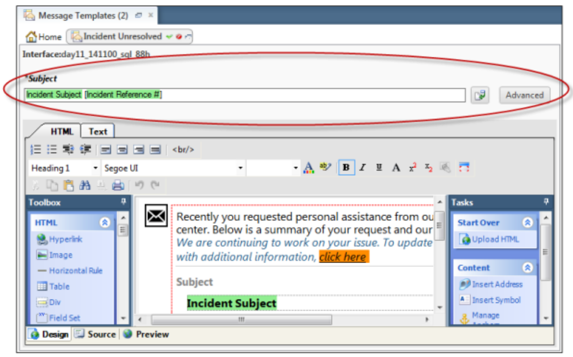
2. Click the OK button. Your deployed version is copied to the version that is sent throughout the system and the Last Deployed labels on all of your messages display “Pending...” under the message descriptions. However, neither your deployed global template nor your messages are active at this point.
3. Click the Save button on the ribbon to commit your deployed version and all of your messages to the database.

Now, your deployed version is your active global template and is applied to your entire set of messages. Your deployed messages are also active.

Customizing messages

Oracle Service Cloud provides a variety of system-generated messages that are sent to staff members and contacts to support activities and events occurring throughout the system. All messages are enabled by default, but you can disable messages that you don't need. You can also define the message format (HTML or text) as well as edit and deploy a single message or all messages.

At the top of most message templates is a subject line that you can customize to tailor your message to different audiences. You can also add **merge fields** and conditions to your subject line to further personalize your subject. See Adding conditional subject lines.



Note There are certain message templates that do not contain a subject line, such as those that forward emails and print templates as well as the Survey Proof and Send Quote templates.

Messages open with standard HTML editor tools such as links that appear as clickable and dynamic content, including **case sections**, **conditional sections**, **incident threads**, and merge fields and reports. Tools that display on the HTML editor are context-sensitive and are the logical tools you would use for the type of message you are customizing. For complete details on how to use these context-sensitive tools in messages, see Adding HTML in design mode.

Message types

The buttons on the Show group on the message templates ribbon can be used to toggle between the different types of messages that are available, including administrator notifications, administrator email messages, and contact email messages. See Message templates ribbon.

Administrator notifications—Oracle Service Cloud can send automatic notifications to alert staff members of key events such as incident escalations, answer, task and opportunity assignments, mailing completions, and system errors. You can also send custom broadcast notifications containing short text messages from the Notifications component on the **agent desktop**. Staff members are alerted to new notifications through a toast and can view all their notifications from the Notifications component. When a notification is sent to staff members who are not logged in to Oracle Service Cloud, a notification email is sent instructing them to log in to view the notification. See Opening your notifications.

Tip To send emails containing more information about the event that triggered a notification, you can select a detailed notification option from the Email Notifications menu on the Staff Accounts editor (see Adding and editing staff accounts). Staff members can also set notification preferences in their personal settings (see Changing your personal settings).

Administrator email messages—Incident, opportunity, answer, and task information can be automatically emailed to staff members by business rules or forwarded manually. Contact, organization, and asset information can be forwarded manually. Staff members can also be sent automated account assistance emails if they have difficulty logging in.

Contact email messages—Customers can receive a broad range of email messages supporting their activities on your site, such as incident receipts and responses, answer update subscriptions, and account assistance requests.

Context-sensitive tools

Oracle Service Cloud contains an HTML editor for creating dynamic content in messages. When you edit a message, you can use word processing functions to create HTML, as well as dynamic content, such as **case sections**, **conditional sections**, or **incident threads**.

You can add several types of links to your content. Links appear as clickable text when the document is used in a message. When a link is added, you have the option of defining certain attributes depending on the type of link. Links and dynamic content elements are located in the toolbox.

Important The tools that display on the HTML editor are context sensitive and are the logical tools you would use for the specific message you are customizing. Links and dynamic content that were designed with message templates in mind are described in the following table. For a complete list of links, including those not listed below, see Adding HTML in design mode.

Table 98: Context-Sensitive Tools Description

Button	Description
Links	Buttons in this section are used to insert the available context-sensitive links in your message content.
Account Assistance Link	This button inserts a link to the Account Assistance page on your customer portal where customers can request an email containing either their user name or a link to a page for resetting their password. See Inserting account assistance links.
Answer Link	Click this button to insert a link to any answer you specify. See Inserting links to answers.
Incident Link	This button inserts a link to any incident you specify in the message. See Inserting links to incidents.
Profile Link	This button inserts a link to the Account Settings page on your customer portal where customers can change their user name and update their profile information. See Inserting profile links.
Proof Comments Link	This button lets you add more than one comment field to the Survey Proof message template that is sent to proofreaders of website link surveys. See Inserting proof comments links.
Proof Survey Link	This button inserts a link to the website link survey you want your proofreaders to review. See Inserting proof survey links. **Note:** This link is included, by default, on the Survey Proof message template.

Table 98: Context-Sensitive Tools Description (Continued)

Button	Description
Setup Password	This button inserts a link to the Finish Account Creation page on your customer portal. See Inserting setup password links.
Survey Link	Click this button to insert a link to a survey. See Inserting links to surveys.
Survey Results Link	This button inserts a link to a web page that shows the survey's responses. See Inserting survey results links. **Note:** This link is included, by default, on the Survey Notification message template.
This Answer Link	Click this button to insert a link to the incident that triggered the message being sent. See Inserting links to answers.
This Incident Link	This button inserts a link to the incident that triggered the message being sent. For example, the standard Question Receipt email sends a confirmation message after a customer submits a question through the Ask a Question page, an email, or a chat session. By adding a This Incident Link to your Question Receipt message template, you can provide your customers with easy access to the incident created from their question. See To insert a this incident link.
Unsubscribe All Answers Link	This button inserts a link that lets contacts who receive answer notifications unsubscribe from future communications. See Inserting unsubscribe all answers links.
Unsubscribe This Answer Link	This button inserts an unsubscribe link to a specific answer that's been returned as the result of a repeatable answer section. See Inserting unsubscribe this answer links.
Dynamic Content	Buttons in this section are used to insert dynamic content in your message content.
Attached File List	This button inserts a list of file attachment links that will display as long as attachments have been added to the record the template is referencing. See Print templates. **Note:** This button is available only for print templates.
Answer Section	Click this button to add any repeatable answer details on your answer update notification messages. See Inserting answer sections.

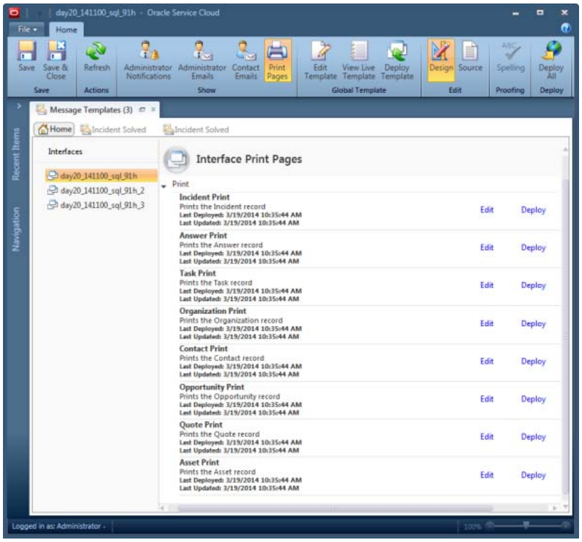
Table 98: Context-Sensitive Tools Description (Continued)

Button	Description
Case Section	Click this button to add a case section to your conditional text. See Inserting case sections.
Conditional Section	This button inserts a conditional section that you can define to filter content by contact, profile, runtime variable, or record type. For example, you could add a conditional section that displays a coupon based on the product specified in the incident. See Inserting conditional sections.
Incident Thread	This button inserts an incident thread that displays all communication between the parties associated with the incident. See Inserting incident threads.
Merge Field	Click this button to insert a merge field. See Inserting merge fields.
Merge Report	Click this button to insert a merge report. See Inserting merge reports.

For a complete list of links, see Adding HTML in design mode.

Print templates

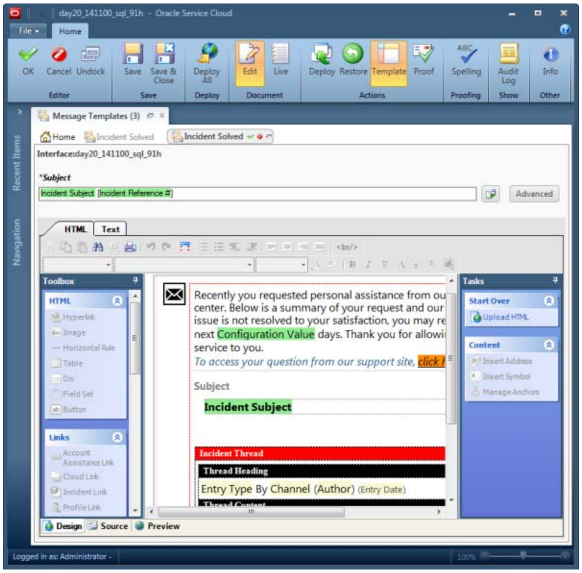
Standalone print templates are available for viewing records and items from the agent desktop as well as printing hard copies of incidents, answers, tasks, organizations, contacts, opportunities, quotes, and assets. You can customize these templates to apply your organization's brand, add dynamic content, and display any custom fields you may be using.



In addition, print templates have been designed to include a list of file attachment links. As long as file attachments exist in the record that the print template references, then that list of attachment links will display. This is especially useful for agents who frequently reference answers. See Context-Sensitive Tools Description.

Message ribbon

When you edit a message, it opens below the Message Templates editor content pane tab on its own sub-tab with several tools available on the ribbon.



The groups and buttons on the message ribbon are described in the following table.

Table 99: Message Ribbon Description

Group/Button	Description
Editor	**Note:** When you undock a message template, the label for this group changes to Commit.
OK	Click this button to save the changes you have made to the message template that is open on the active sub-tab. The sub-tab closes.
Cancel	Click this button to abandon changes you have made to your message. The sub-tab closes and the Home tab becomes the active sub-tab.
Undock	Click this button to undock the message from its sub-tab and open it in its own window.

Table 99: Message Ribbon Description (Continued)

Group/Button	Description
Console	**Note:** This group displays only when a message has been undocked.
Dock to Console	Click this button to redock the message to the editor on its own sub-tab.
Save	The buttons in this group commit changes to the database for the global templates as well as the messages across all interfaces.
Save	Click this button to commit pending changes to the database and keep the editor open. **Note:** This button is *not* available from an undocked message.
Save and Close	Click this button to commit pending changes to the database and close the Message Templates editor. **Note:** This button is *not* available from an undocked message.
Deploy	
Deploy All	Click this button to deploy the entire set of messages as well as the global templates across all interfaces at the same time. **Note:** This button is *not* available from an undocked message. **Important:** You must save after clicking the Deploy All button to commit your changes to the database.
Document	
Edit	This button, selected by default, lets you edit the message.
Live	Click this button to view the most recently deployed version of the message. **Important:** Before you click the Deploy button, the Live button displays the active version that has been saved and is live on your site. After you have clicked the Deploy button, the version you are editing displays. However, it has yet to be committed to the data-base.

Table 99: Message Ribbon Description (Continued)

Group/Button	Description
Actions	
Deploy	Click this button to deploy the working version of your message. **Important:** You must click the Save button on the message templates ribbon to commit your deployed version to the database. After you save, your message will be active.
Restore	Click this button to revert to the default system message.
Template	Click this button to remove the global template content from the message. By default, the global template is applied to all messages. Click it again to apply the global template to the message.
Proof	Click this button to send a proof email to your content reviewers. **Note:** This button sends the most recently saved version of the message. Therefore, to send a proof of the version you are currently editing, you must click the OK button on the message ribbon and then Save on the message templates ribbon.
Proofing	
Spelling	Click this button to spell check the message.
Show	
Audit Log	Click this button to view a history of changes made to the message.
Other	
Info	Hover over this button to see the message name and ID and the document ID associated with the message.

Formatting messages

By default, all Oracle Service Cloud notifications and emails are enabled and sent in multipart format, which includes text and HTML versions of the same message in a single email. You can disable most messages and you can specify the format as text only. The version that displays to recipients is ultimately determined by their mail client settings, but most mail clients display the HTML version by default.

To format messages

1 Click the Configuration button on the navigation pane.

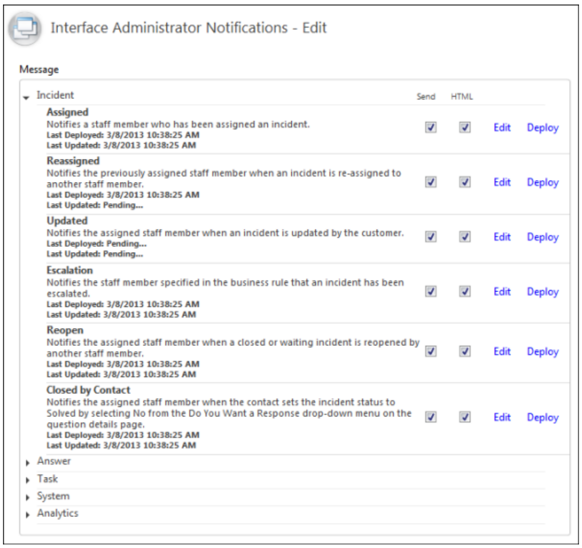
2 Double-click Message Templates under Site Configuration. The Message Templates editor opens.

3 Select the interface you want to customize. By default, the categories for administrator notifications display on the right.

4 Click the appropriate button on the ribbon's Show group. The categories for the message type (administrator notifications, administrator emails, or contact emails) display on the right.

5 Click the arrow to the left of the category to see the individual notifications or emails associated with the category.

Descriptions of each message as well as Last Deployed and Last Updated labels are listed under the category. Both labels show the date and time the latest deployment and edit was made. If a message has been edited but has not been deployed or if a deployment has not been committed to the database, the labels display "Pending..." instead of the date and time.



6 To disable any of the messages, clear the Send check box next to the message. By default, all messages are enabled.

Note Messages that do not have a Send check box cannot be disabled because they support essential functions.

7 To send the message as text, clear the HTML check box next to the message to be sent. By default, all messages are sent in multipart format.

Note Messages that do not have an HTML check box are console-only notifications and are not sent by email.

8 Click the Save and Close button.

Editing messages

When you open a message to edit, the system maintains the active message while you edit a copy on the message window. Your changes are not committed until you deploy and save them. This prevents any disruption in automatic notifications and emails during the editing process.

Because you are making edits to a copy of your message, your site's active content is not affected until you are confident in your changes and ready to deploy them. In case you make any accidental changes while editing, you can restore your message by reverting to the original system default message at any time.

You can also view your active content so that you can copy and paste it into the version you are working on. For instance, suppose you have made changes to your edited version and then want to go back to some of the elements used in your active version. This feature lets you see a read-only version of the active content that you can copy and paste into your working message.

To edit a message

1 Click the Configuration button on the navigation pane.

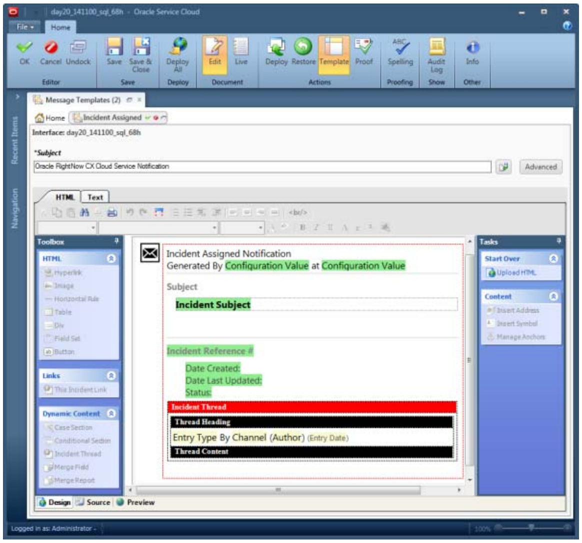
2 Double-click Message Templates under Site Configuration. The Message Templates editor opens.

3 Select the interface you want to customize. By default, the categories for administrator notifications display on the right.

4 Click the appropriate button on the ribbon's Show group. The categories for the message type (administrator notifications, administrator emails, or contact emails) and print templates display on the right.

5 Click the arrow to the left of the category to see the individual notifications or emails associated with the category.

6 Click Edit to the right of the HTML check box for the message you want to customize. The message opens on a sub-tab and becomes the active sub-tab.



7 To edit the subject of the message, type in the Subject field.

Writing effective subject lines

Because most mail clients list new messages by From address and subject, the contents of these fields are critical to having your message read. Refine your message subject to be concise yet informative and make sure it clearly states your purpose. If it isn't clear who you are or what you want, your message can be easily passed over.

8 To edit a merge field in the subject, double-click the merge field. See Inserting merge fields.

9 To add a merge field in the subject, click the Merge Field button (to the right of the Subject field) and select the field. See Inserting merge fields.

Tip You can add up to 5 merge fields to your subject line with a maximum of 400 total characters. However, remember that the best subject lines are simple, descriptive, and to the point. Also keep in mind that email clients have their own limits on the maximum number of characters allowed in subject lines. Being aware of these limits will help you determine the best subject line length for your message.

You cannot add merge fields to the subject of print templates or any of the forward-type messages.

10 To add conditional subject lines to your message, click the Advanced button to the right of the subject's Merge Field button and refer to Adding conditional subject lines.

11 Type in the content placeholder (which is designated by the area inside the red box), and edit the message using the hyperlinks, buttons, dynamic content, and other features available on the HTML editor. See Adding HTML in design mode.

12 To view your most recently deployed content, click the Live button on the ribbon.

13 To revert to the system default message, click the Restore button on the ribbon.

14 To remove the global template from your message, click the Template button on the ribbon. If you click the Template button again, the global template is reapplied to your message.

15 To spell check your content, click the Spelling button on the ribbon.

16 To preview your message, click the Preview tab at the bottom of the HTML editor.

Tip To see how your dynamic content displays, either by incident or contact, click the Search button next to the Preview Incident or Preview Contact field. The Search window opens where you can search for an incident or a contact to use when the message is previewed on the Preview tab.

17 To send your edited message to another staff member for review, click the Proof button on the ribbon. See Sending proof messages.

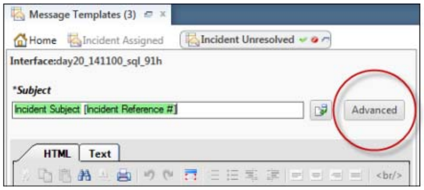
18 Click the OK button to save your edits and close the message.

At this point, your edits have not been deployed or committed to the database. See [Deploying messages](#).

Adding conditional subject lines

You can personalize your email subject lines to tailor your message to different audiences with advanced subject editing. For example, you can change the subject line dynamically based on characteristics such as product, category, or custom field. In addition to the default subject line, you can add up to ten conditional subject lines to each message template.

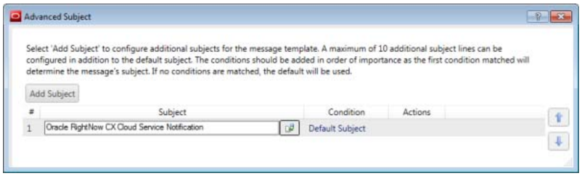
List your additional subjects in order of importance because the first one that matches will define the message's subject line. If no conditions are met, the default subject line is used. (The default subject line will always be listed last.)



Note There are certain message templates that do not contain a subject line, such as those that forward emails and print templates as well as the Survey Proof and Send Quote templates. Therefore, you cannot add conditional subject lines to these messages.

To add a conditional subject line

1 From an open message template, click the Advanced button to the right of the subject's Merge Field button. The Advanced Subject window opens.



Tip In addition to the default subject line, you can add up to ten conditional subject lines (for a total of eleven) to each message template.

2 Click the Add Subject button. The Subject Condition window opens.

3 Select the appropriate radio button for the type of condition you are adding.

Note The available options are context-sensitive and depend on the type of message template you are editing. Options can include Associated Contact, Recipient Profile, or Associated Record.

4 Select a segment, profile, or record type for the condition. When defining an associated record condition, you will also need to define an operator type and value.

Note Notice how the Title field populates based on your selection. This field populates only if you have not already typed a title.

5 To change the title populated in step 4, type the title as you want it to appear in the Title field.

6 Click the OK button to insert the subject. Each new subject line is added above the default subject line.

7 To add another subject line, repeat the applicable steps starting at step 2.

8 To edit the subject line so that it reads the way you want it to, remove the default subject line from the field in the Subject column and type the subject the way you want it to display to your customers.

9 To add merge fields to your additional subject lines, click the Merge Field button next to the Subject field. See Inserting merge fields.

Note You can add up to 5 merge fields to your subject line with a maximum of 400 total characters.

10 To edit any merge fields, right-click the merge field and select Merge Field Properties.

11 To edit a condition, click the Edit link in the Actions column and make any necessary changes to your condition.

12 To remove a condition, click the Remove link in the Actions column.

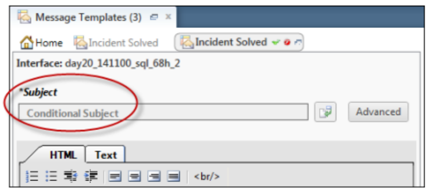
13 To reorder your additional subject lines, select the subject line you want to move and click the up or down arrow next to the Action column.

Note The default subject is always last. Therefore, you need to have more than two additional subject lines defined for the up and down arrows to be available.

14 To preview your subject lines, click the Preview tab.

Tip This is a great way to efficiently test your default subject line and any advanced subjects without the hassle of manually sending proof emails to yourself. Simply preview by applying the appropriate record that will be used by each subject.

15 Click the OK button. Notice the Subject field is now labeled Conditional Subject and is uneditable.



Note Once you add conditional subject lines to your message, you must use the advanced editing feature to make changes.

Sending proof messages

When you are finished editing your message, it's a good idea to send a proof to key staff for feedback on your design. For instance, you may need your legal department to review your language or your marketing department to review your branding. You can also customize your proof for a specific incident or contact to ensure that your dynamic content works the way you intend it to.

Important This feature sends the most recently saved version of your message. Therefore, you must save your edits to send a proof of the message you are working on.

Save works differently depending on whether you are working from a sub-tab or an undocked message. Therefore, the procedures differ slightly and are described below.

To send a proof message from a sub-tab

1 Click the sub-tab for the message you want to send and then click the Save button on the ribbon.

2 Click the Proof button on the ribbon. A message tells you to save and reopen your message. However, because you have already saved, you can continue with step 3.

3 Click OK. The Send Message Proof window opens.

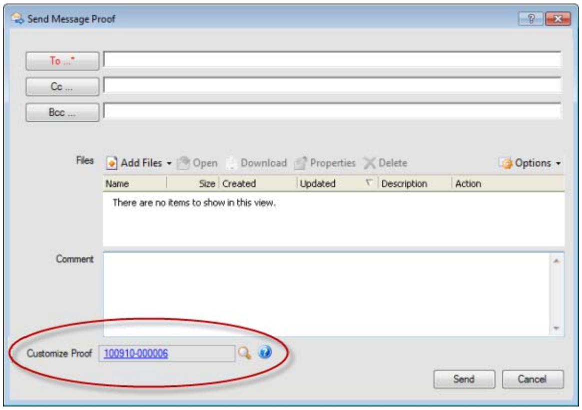
4 Type the email addresses of your reviewers in the address fields or click one of the buttons to select reviewers from a list.

5 To include any comments you want to appear in the message, type them in the Comment text box.

6 To customize your proof message so that your reviewers can see your dynamic content, click the Search button next to the Customize Proof field on the bottom of the window. Depending on the message you are editing, either the Incident Search window or the Contact Search window opens.

   a To customize your proof message by incident, type the incident reference number in the Reference # field and click the Search button. The Incident Search window closes and the reference number populates the Customize Proof field on the Send Message Proof window.

Tip You can also type part of a reference number in the Reference # field. A list of incidents that match your search criteria displays in the grid below the Reference # field. You can then select a reference number and click the Select button. The Incident Search window closes and the reference number you selected populates the Customize Proof field on the Send Message Proof window.



b To customize your proof message by contact record, type your search criteria in one or more of the available fields and click the Search button. A list of contacts that match your search criteria displays in the grid below the search criteria fields. You can then select a contact and click the Select button. The Contact Search window closes and the contact name you selected populates the Customize Proof field on the Send Message Proof window.

7 Click the Send button to send your proof message.

To send a proof message from an undocked message

1 Click the OK button on the message ribbon. Your message closes.

Important Because the system sends the most recently saved version of your message and there is no Save button on the message ribbon, you must save your edits from the message templates ribbon in order to send a proof of the message you are working on.

2 Click the Save button on the message templates ribbon.

3 Click Edit to the right of the HTML check box for the message you were editing. The message opens on a sub-tab.

4 Click the Proof button. The Send Message Proof window opens.

5 Type the email addresses of your reviewers in the address fields or click one of the buttons to select reviewers from a list.

6 To include any comments you want to appear in the message, type them in the Comment text box.

7 To customize your proof message so that your reviewers can see your dynamic content, click the Search button next to the Customize Proof field on the bottom of the window. Depending on the message you are editing, either the Incident Search window or the Contact Search window opens.

   a To customize your proof message by incident, type the incident reference number in the Reference # field and click the Search button. The Incident Search window closes and the reference number populates the Customize Proof field on the Send Message Proof window.

Tip You can also type part of a reference number in the Reference # field. A list of incidents that match your search criteria displays in the grid below the Reference # field. You can then select a reference number and click the Select button. The Incident Search window closes and the reference number you selected populates the Customize Proof field on the Send Message Proof window.

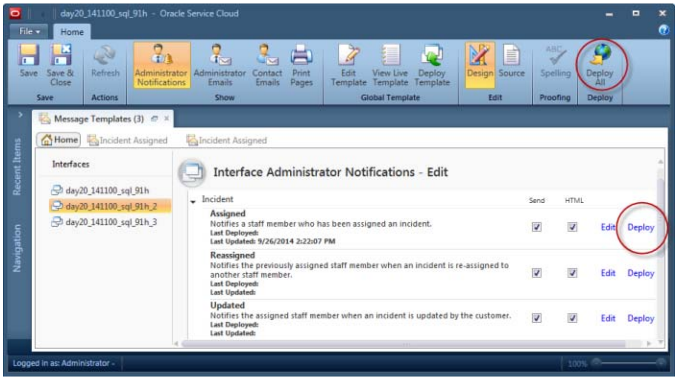
   b To customize your proof message by contact record, type your search criteria in one or more of the available fields and click the Search button. A list of contacts that match your search criteria displays in the grid below the search criteria fields. You can then select a contact and click the Select button. The Contact Search window closes and the contact name you selected populates the Customize Proof field on the Send Message Proof window.

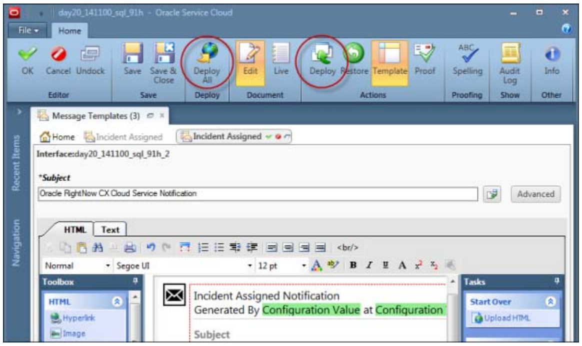
8 Click the Send button to send your proof message.

Deploying messages

There are three ways to deploy your messages.

- Click Deploy next to the message on the Home sub-tab.
- Click the Deploy button on the message ribbon.
- Click the Deploy All button on the message templates ribbon or the message ribbon.





The order in which you choose to deploy depends on several things. If you are editing only one message, it's probably most efficient to click Deploy on the message ribbon as soon as you have finished making your changes.

If you are editing several messages, you can save your changes as you make them by clicking the Save button on the message ribbon. When you are finished with all of your message edits, you can click the Deploy All button, and then click the Save button on the ribbon to commit all of your messages at the same time. Deploying all also applies to the global templates (across all interfaces) for all your messages unless you have chosen to remove it within your individual messages. This method eliminates the need for you to respond to the confirmation message that opens each time you deploy from an individual message.

Tip You can always go back to the system default message by opening your message and clicking the Restore button on the ribbon.

To deploy one message

1 Click the Deploy button on the ribbon. A message asks you to confirm your decision to deploy.

2 Click the OK button to continue.

3 Click the OK button on the ribbon. The sub-tab or editor closes depending on whether you are working from a docked or undocked message.

4 Click the Save button on the ribbon to commit your deployment.

Your deployed version is now active.

To deploy multiple messages at the same time

Note This procedure assumes you have edited more than one message and have saved your changes.

1 Click the Deploy All button on the ribbon. A message asks you to confirm your decision to deploy all messages as well as the global template.

Note Deploy All applies to the global templates and messages across all interfaces.

2 Click the OK button to confirm.

3 Click the Save button on the ribbon to commit all your deployments to the database.

Your deployed versions are now active and all of the message labels display the same date and time.

Incident response tracking

Incident response tracking lets you see how customers react to interactions they have with your agents. This helps improve your customer support because you can see if your customers are using the information you send them. For instance, suppose you are sending 500 emails a week. Incident response tracking can show you how many of those emails are opened and how many links are clicked that result in a visit to your customer portal.

In addition, incident response tracking is effective in helping you evaluate aspects of your customer experience solution, including the quality of your agent responses. Not only can you see the actions contacts take before submitting an incident, but you can also track what happens after submitting an incident. For example, suppose your agent sends an answer link in response to a contact's question. If the contact clicks the link, you can see every action the contact takes on your customer portal.

Simply stated, message templates track customer-facing incident responses, which lets you see activity related to the following contact email messages.

- **Question Receipt**—This email is sent to contacts to confirm the receipt of their question from the Ask a Question page, an email, or a chat session.
- **Rule Email**—This email is sent to a contact when the Send Response action is triggered by a business rule.
- **Incident Closed**—This email is sent to a contact when an **incident status** changes to Solved.
- **Incident Solved**—This email is sent to a contact when a staff member responds to the incident and the incident status is Solved.
- **Incident Waiting**—This email is sent to a contact when a staff member responds to the incident and the incident status is Waiting.
- **Incident Unresolved**—This email is sent to a contact when a staff member responds to the incident and the incident status is Unresolved.

You can track how often these incident response emails are viewed as well as how customers use the information that you provide in your response, such as viewed answers, clicked links, and customer portal pages that were accessed. Only unique views and clicks are tracked so you can be confident that your statistics are accurate. This also helps to keep stored data manageable.

You can also use tracked links in your messages to automatically track your hyperlinks. Before you can insert tracked links into your message content, you need to add them to your system. For complete details and procedures on adding tracked links to your system, and then inserting tracked links from the HTML editor, see Adding tracked links and Inserting tracked links.

Incident response tracking data is accessed through standard reports located in the public reports on the Reports explorer. Statistics used for this report are stored in the Message Transactions *(message_trans)* table. For a description of the information logged in the Message Transactions table, refer to the Data Dictionary located under Configuration > Database > Data Dictionary.

Important The configuration setting MESSAGE_TEMPLATES_PURGE_DAYS defines how long data in the Message Transactions *(message_trans)* table is stored. By default, data is removed after 400 days. This ensures that your database tables stay at a manageable size. You can change the value of this setting under Configuration > Site Configuration > Configuration Settings in the RightNow Common > Message Templates > General folder. See Customizing configuration settings.

- **Incident Message Statistics** (Service > Incident Reports > Incident Activity)—This report provides statistics comparing the number of incident responses sent and the number that contacts viewed over time.
- **Incident Message Transactions** (Service > Views - Service > Editor Reports - Service)—This report was designed to be added to an incident workspace. It provides statistics on run-time activity, such as message content, date and time of incident creation, message type (answer or tracked link), and if a customer portal session resulted from any contact interaction.
- **Incident Message Web Visit Details** (Service > Views - Service > Editor Reports - Service)—This report maps the incident that triggers the email as well as the customer portal session that results from a contact clicking a link in an email. It is inherently related to the Incident Message Transactions report because the run-time filter it requires is a web visit ID.

See Viewing reports and Searching in reports.

Message templates examples

This section includes scenarios where message templates can be used to accomplish more advanced and unique customization needs.

Conditional content based on message thread count

In addition to limiting the thread count on your incident thread properties, you can show content based on the number of threads that are included within the sent message. For example, if you set your message thread count to be greater than ten, when the number of threads included with the message exceeds ten, you could create a conditional section based on this message thread count threshold with content telling your customers to call the customer support team for a faster resolution.

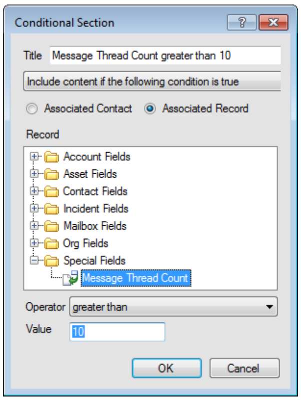
Note Keep in mind that if you have already limited the thread count in your incident thread properties, this also affects the number of threads that display. For example, if you limit your thread count to three, you'll need to make sure any conditional sections based on this message thread count do not exceed three. In other words, if you create a conditional section based on four threads and you limit the number of message threads to three, the condition will never match because the incident thread count limit will keep the message from reaching the value of four threads. See Inserting incident threads.

To define the conditional content based on message thread count

1 Add a conditional section or a case section to your message template.

2 Select the Associated Record radio button.

3 Expand the Special Fields folder and select the Message Thread Count field. See Inserting conditional sections and Inserting case sections.

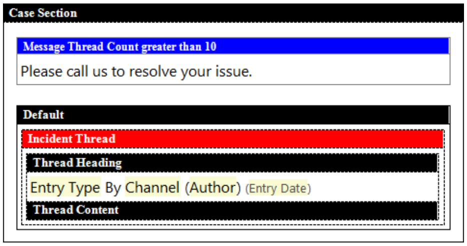


4 Select an operator from the Operator drop-down menu.

5 Type a value for the operator in the Value field.

6 Click the OK button to add the logic to your conditional content. At this point, you've defined only the If condition. Next, you need to define the content that will display.

7 Place your cursor inside the condition you just added and type the content you want to display when the condition's value is matched.



Case sections vs. conditional sections

Understanding when to use a case section instead of an independent conditional section is important so that your content is as effective as it can possibly be. For detailed descriptions of the differences as well as specific scenarios, see When to use case sections vs. conditional sections.

Branding message templates based on products within the same interface

You can also use case and conditional sections to brand your message templates based on products within the same interface. For instance, say you have one interface that represents two separate brands—each one with its own logo. You've already defined each brand as its own product. Now, you want your customer-facing message templates to display the correct logo depending on which product the message refers to.

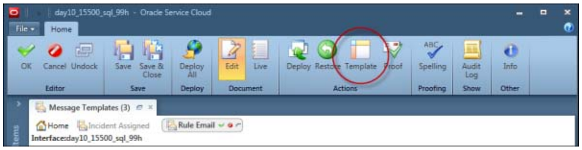
If you had a separate interface for each brand, the global template could be used to apply the same branding across the entire interface. However, since you have only one interface, the global template will not work because it is applied across *all* messages per interface.

Therefore, you must remove the global template from the individual message templates and then use case and conditional sections to display the appropriate logo based on product.

Most likely, you'll want to focus this effort on the customer-facing, incident-related message templates, although any of the messages found under the Contact Emails category should be considered. In some cases, taking a more generic approach in which the global template could be used might make more sense.

To apply product-specific logos

1 From an open message template, click the Template button on the ribbon. This action removes the global template from the message template.



2 Insert your cursor where you want your logo to display and click the Case Section button. A case section is inserted in the message template.

3 Select the conditional section inside the case section, right-click, and click Conditional Section Properties. The Conditional Section window opens.

- **a** Select the Associated Record radio button.
- **b** In the Record section, expand the Incident Fields folder and select the Product merge field.
- **c** Select Equals from the Operator drop-down menu.
- **d** Select the product you want associated with this conditional section from the Value drop-down menu.
- **e** Click OK.

See Inserting conditional sections.

4 Right-click inside the case section and select Add Conditional Section.

5 Repeat steps 3a-3d to define the condition for your second product.

6 Click inside the first conditional section and click the Image button. The Image Editor window opens.

- **a** Type the URL where the logo you want to display for this product is located. See Inserting images.
- **b** Click OK.

7 Repeat step 6 for the second conditional section.

Important Leave the Default section blank (do not delete it). This way, if the product is unknown, then no image will display.

8 Click Save.

9 Repeat steps 1-8 for each message template you want to apply different logos to.

Tip Once you define the first case section, you can easily select the case section, copy it, and then paste it into your other message templates.

At this point, your edits have not been deployed or committed to the database. See Deploying messages.

15

Data Import

With data import features, you can add new contacts, answers, **assets**, incidents, organizations, and custom objects to your Oracle database from a data file. For example, you can import lists of prospects or recently acquired customers into your knowledge base as new contacts or update existing answers to keep your database synchronized with an external knowledge base.

You can also import configuration setting values and message base text values that you have edited from the Configuration Settings and Message Bases editors. For example, suppose you want to create a site in another language and need to make changes to your text labels. You can create a **CSV** (comma-separated value) file that includes all of your message base text and do a global search and replace. Then, using the Data Import Wizard, import your file and your changes will be made to the message bases. For complete details and procedures about the Configuration Settings and Message Bases editors, see Site Configuration.

Additionally, you can import custom configuration setting and message base metadata into other sites. This can save time, especially when you have large numbers of custom settings and message bases. See Exporting configuration settings and Exporting message bases.

Oracle Service Cloud provides the following import features.

- **Data Import Wizard**—Use the powerful import wizard to map the data file to columns in the Oracle database and prescan the file for problems, such as duplicate records or invalid email addresses. After an import, you can run **external events** or business rules on the imported records. You can also add contacts to a mailing list or use them to initiate a campaign. See Importing data.
- **Data import templates**—For imports that you want to perform more than once, you can create column mapping templates that can be selected when importing data with the wizard. See Data import templates.

- **Data imports reporting**—View the Data Imports report to track information about past imports. See Data import history.

Important In order to access the Data Import Wizard and template editor, staff members must have the Data Import permission in their profile. A staff member with this profile permission can import any of the supported record types, even if the staff member's only responsibility is to import contact data for marketing purposes. See Administration permissions.

Importing data

To import data, you need a data file containing the information you want to import. The most commonly used file format is **CSV** (comma-separated value), but delimiters other than commas can also be specified.

In addition to importing data to the primary table of a supported record type, you can map data to certain database fields in associated tables. For example, when importing data to the Incidents *(incidents)* table, you can map columns to the Threads *(threads)* table to create customer proxy or note threads associated with each incident.

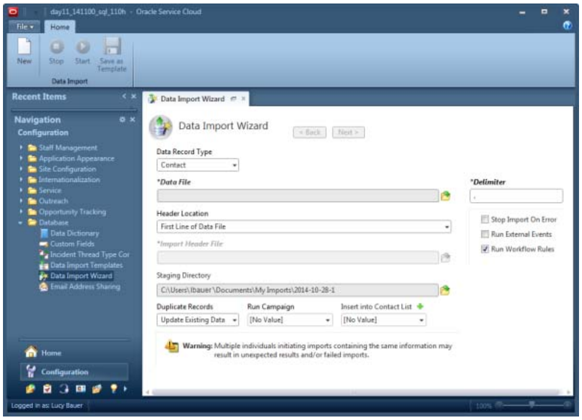
Important The data import features are designed to import specific data sets into the knowledge base, not to support full data migrations. You should be aware of the following restrictions when preparing an import.

- If Oracle RightNow Cloud Service (Service) is disabled, answer, asset, and incident record types are not available for import.
- Associated table mapping is applied only when the import creates new records. Such mapping is ignored when existing records are updated by the import.
- Only certain values can be mapped to a record's associated tables. For example, you cannot map a value for the *threads.entered* field. This value is set to the date and time the import occurred.
- The Products and Categories fields are not available for mapping to answers. If you want to associate imported answers with products or categories, you must update them manually from within Oracle Service Cloud.

To import data

1 Click the Configuration button on the navigation pane.

2 Double-click Data Import Wizard under Database. The content pane displays the Data Import Wizard.



3 Enter the following field information.

Table 100: Data Import Wizard Description

Field/Item	Description
Data Record Type	Click this drop-down menu to select the type of records you want to import.
Answer	Select this option to designate answer data as the type of record you want to import.
Asset	Select this option to designate asset data as the type of record you want to import. **Note:** Currency fields are not supported. For example, the Price field cannot be imported.

Table 100: Data Import Wizard Description (Continued)

Field/Item	Description
Config Base Entry	Select this option to designate configuration setting data as the type of record you want to import. For example, you can create a CSV file that includes your custom configuration settings and then import those settings to your other sites. The following fields are required under the Column in File and Field columns for mapping to work. Other columns may also be required depending on the data types of the configuration settings you are importing. • Key = Configuration Entry Key (entry_key) • Type = Configuration Entry Base Type (type) • Data Type = Configuration Entry Data Type (data_type) • Default Value = Default Configuration Value (default_value) **Important:** You must create a configuration base entry before you can create a configuration base value.
Config Base Value	Select this option to designate configuration setting value data as the type of record you want to import. Configuration base value records are essentially the “child” records of configuration base entries. The following fields are required under the Column in File and Field columns for mapping to work. Other columns may also be required depending on the data types of the configuration settings you are importing. • ID = Configuration Entry ID (configbase_entry_id) • Key = Configuration Base ID (configbase_id) • Value = Configuration Value (value) **Important:** You cannot create a configuration base value unless you have a configuration base entry to map it to. Therefore, you must create a configuration base entry before you can create a configuration base value.
Contact	Select this option to designate contact data as the type of record you want to import. **Note:** This is the default record type.
Incident	Select this option to designate incident data as the type of record you want to import.

Table 100: Data Import Wizard Description (Continued)

Field/Item	Description
Message Base Entry	Select this option to designate message base data as the type of record you want to import. For example, you can create a CSV file that includes your custom message bases and then import the file to your other sites. The following fields are required under the Column in File and Field columns for mapping to work. • Key = Message Base Text Key (entry_key) • Type = Message Base Entries Type (type) • Maximum Length = Message Base Text Maximum Length (max_length) • Text = Text (text) **Important:** You must create a message base entry before you can create message base text to go with it.
Message Base Text	Select this option to designate message base text data as the type of record you want to import. Message base text records are essentially the “child” records of message base entries. The following fields are required under the Column in File and Field columns for mapping to work. • ID = Message Base Entry ID (msgbase_entry_id) • Message Base = Message Base ID (msgbase_id) • Custom Text = Message Base Custom Text (custom_text) **Important:** You cannot create a message base text unless you have a message base entry to map it to. Therefore, you must create a message base entry before you can create a message base text.
Organization	Select this option to designate organization data as the type of record you want to import.
Custom Object	Select this option to designate custom object data as the type of record you want to import. **Note:** Custom objects must be enabled for this option to display. To enable custom objects, contact your Oracle account manager.
***Data File**	Click the Browse button to the right of the field to access the file containing the data you want to import. **Note:** Windows/MS-DOS format is the only supported CSV file type.

Table 100: Data Import Wizard Description (Continued)

Field/Item	Description
Header Location	Click this drop-down menu to select the location of the column headers that identify the contents of the data file.
First Line of Data File	Select this option if the column headers are located in the first row of the data file.
No Headers Specified	Select this option if there are no column headers defined for the data file.
Header File	Select this option if the column headers are located in a separate CSV file. **Note:** The header file cannot contain fewer columns than the data file.
***Import Header File**	Click the Browse button to the right of the field to access the CSV file containing your header information. This field is active when Header File is selected from the Header Location drop-down menu.
Staging Directory	Click the Browse button to the right of the field to select a location for staging the good and bad output files that are generated during the data prescan process. See Data import error handling. By default, the location is C:\Documents and Settings\<username>\My Documents\My Imports\YYYY-MM-DD-#. **Note:** The staging directory can be set to a local directory on your workstation or a shared network drive.
Duplicate Records	Click this drop-down menu and select the method used to handle records in cases where the data file and database contain duplicate records. See Duplicate record handling for data imports.
Keep Original Data	Select this option to prevent updating the database where duplicates occur. Duplicate records are not recorded as errors. **Important:** For optimal performance when adding existing contacts to a contact list, we recommend that you select this option when using the Insert Into Contact List drop-down menu. See the Insert Into Contact List description in this table. If you are importing custom configuration setting or message base metadata, you must select this option or the data import will return errors. See Exporting configuration settings and Exporting message bases.
Update Existing Data	Select this option to update the database with data from the data file where duplicates occur. Duplicate records are not recorded as errors.

Table 100: Data Import Wizard Description (Continued)

Field/Item	Description
Record Error	Select this option to prevent updating of the database where duplicates occur and to record duplicates as errors.
Run Campaign	Click this drop-down menu to select a campaign entry point for imported contact records. See Outreach Campaigns. **Note:** This option is available only when importing contacts.
Insert Into Contact List	**Important:** For optimal performance, be sure to select the Keep Original Data option in the Duplicate Records drop-down menu when using this option. See the Keep Original Data description in this table. Click this drop-down menu and select a list to associate all imported contact records with a contact list. To create a new contact list to associate with the imported records, click the New Contact List button. See Adding contact lists. **Note:** This option is available only when importing contacts.
	Click this button to create a new contact list.
***Delimiter**	Type the character used to separate columns in the data file. The default delimiter is a comma. **Note:** The tab character is not a supported delimiter.
Stop Import on Error	Select this check box to prevent any more records from being imported if an error is found during the import process. If this check box is not selected, the import continues despite any error, and only records without errors are imported. The check box is cleared by default.
Run External Events	Select this check box if you want external events to run against the data you are importing. The check box is cleared by default.
Run Workflow Rules	Select this check box if you want business rules to run against the data you are importing. The check box is selected by default.

4 Click the Next button. The content pane displays fields for defining column mapping and duplicate criteria as well as a preview of the records in the data file.

Warning: Multiple individuals initiating imports containing the same information may result in unexpected results and/or failed imports.

5 Enter the following field information.

Table 101: Column Mapping Description

Field	Description
File Encoding	Click this drop-down menu to select the encoding type of the data file. The default encoding type is UTF8.
Select Template	Click this drop-down menu to select a previously saved template to use for mapping the data file columns to the database. See To add or edit a data import template. **Note:** This menu lists only templates for the record type you are importing.
***Name**	Type a template name and click the Save As Template button on the ribbon to save the current column mapping as a template. Click the Clear button to clear the field contents. The default delimiter is a comma. **Note:** The template name must be unique for the record type, and the tab character is not a supported delimiter. See Data import templates.
Column Mappings	This section defines how columns in the data file are mapped to fields in the database.
Add	Click this button to create a new row in the column mapping grid.
Remove	Click this button to remove a selected row from the mapping grid.
Column in File	Click the drop-down menu to select the column name specified in the data file or header file, or the column number if no header was specified.

Table 101: Column Mapping Description (Continued)

Field	Description
Field	For each data column that you want to import, click the drop-down menu and select the database field that you want to map the column to. The data from the column is inserted into the specified database field. If you have specified column headers that exactly match the database field names (such as *first_name*), the system attempts to automap the field for you. If the data file contains a column that you do not want to insert into your database, leave this field set to No Value. For information about database fields, refer to the Data Dictionary located under Configuration > Database. **Tip:** If you map a column to *ma_org_name*, the Data Import Wizard populates the field with the text value from the data file. If you want to associate a contact with an organization, you can either map the *org_id* to Organization ID or map the name of the organization to Organization ID. The Data Import Wizard looks up the organization and associates the name to the correct organization. If the lookup fails, an error occurs.
Ignore on Update	Select this check box if you want this column to be inserted into the database for new records, but do not want the column updated for existing records. **Note:** This option has no effect unless you select Keep Original Data from the Duplicate Records drop-down menu.
Default Value	Enter the default value to be inserted when an imported record does not contain data for the column.

6 To map a column to a table associated with a new import record type, click Add in the section corresponding to the associated table. Table mapping is available only for new records.

- **Notes**—Maps columns to the Notes *(notes)* table for answer, contact, and organization imports. Supported fields include *chan_id* and *text*.
- **Threads**—Maps columns to the Threads *(threads)* table for incident imports. Supported fields include *chan_id, seq, note,* and *entry_type*.
- **Addresses**—Maps columns to the Organization Addresses *(org_addrs)* table for organization imports. Supported fields include *oat_id, city, country_id, postal_code, prov_id,* and *street*.

For information about database fields, refer to the Data Dictionary located under Configuration > Database.

Important Be aware of the following restrictions when preparing an import.

- Associated table mapping is applied only when the import creates new records. Such mapping is ignored when existing records are updated by the import.
- Only certain values can be mapped to a record's associated tables. For example, you cannot map a value for the *threads.entered* field. This value is set to the date and time the import occurred.

7 Enter the following field information.

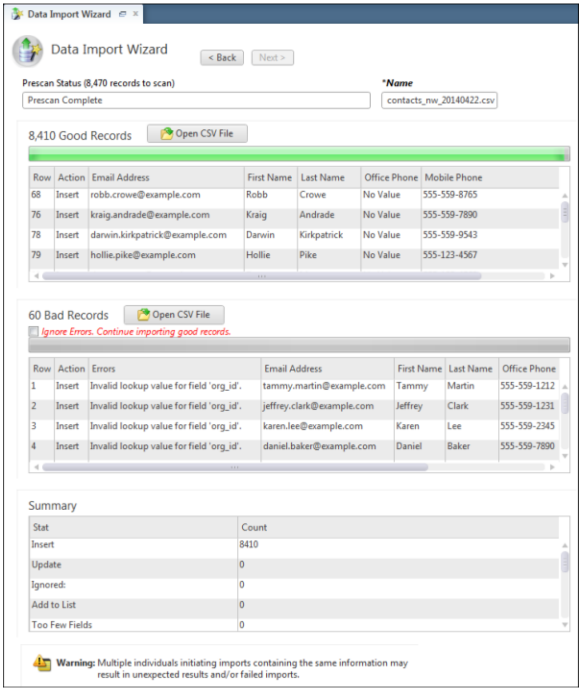
Table 102: Associated Table Mapping Description

Field	Description
Add	Click this button to create a new entry in the mapping grid.
Remove	Click this button to remove an entry from the mapping grid.
Column in File	Click the drop-down menu to select the column name specified in the data file or header file, or the column number if no header was specified.
Field	This field displays the database field that you can map a column to. The data from the column is inserted into the specified database field.
Default Value	Enter the default value to be inserted when an imported record does not contain data for the column.

8 To define custom criteria used to identify duplicate records, clear the Use Default check box and see Duplicate record handling for data imports.

9 Click the Next button. The system prescans the data file for errors (such as incorrectly formatted email addresses) and the content pane displays the results.

Note If the data file is significantly large, the prescan and import processes can take a considerable amount of time. The Data Import Wizard supports up to one million records per import. If the data file exceeds this size, you must split the data into multiple files of a million records or less.



10 Review the sample output in the good records preview to confirm that your file is mapped properly.

The Summary section of the results page displays the number of records to be inserted, updated, ignored, and added during the import process, as well as the number and types of errors returned during the prescan.

Other results include the prescan status as well counts and previews of good and bad records, as categorized by the prescan process. The good records preview consists of a random sample of up to 10,000 records that were found to be formatted correctly. The bad records preview consists of up to the first 10,000 records that resulted in an error.

For each record, the preview displays each mapped column, the data to be inserted, and the record's row number in the data file. The bad records also include an error description to assist with troubleshooting. See [Data import error handling](#).

11 To enter a name for the import as it appears on the Data Imports report, type the name in the Name field. By default, the import is given the name of the data file you are importing.

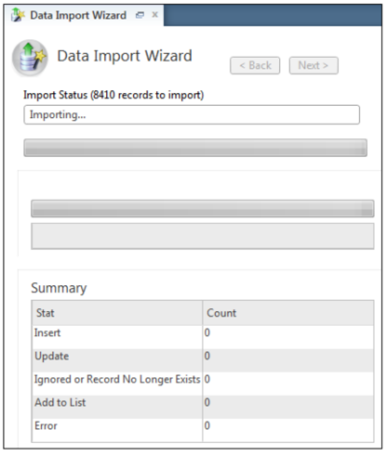
12 To see a full list of the good or bad records found during the scan process, click Open CSV File to open the list in a CSV file.

13 To view a CSV file containing the good or bad records, click Open CSV File next to the good or bad record counts.

14 To ignore errors returned by the prescan process and continue importing the records that did not return errors, select the Ignore Errors check box beneath the bad record count.

Important If errors are reported for records that you want to include in the import, you must resolve the errors before proceeding. See Data import error handling.

15 Click the Next button. The data imports to the database.



Once the import starts, the content pane displays the real-time import status, a list of any errors found during the import, and summary counts of records that were inserted, updated, ignored, added, or that experienced errors.

Note The Back and Next buttons are unavailable during the import process.

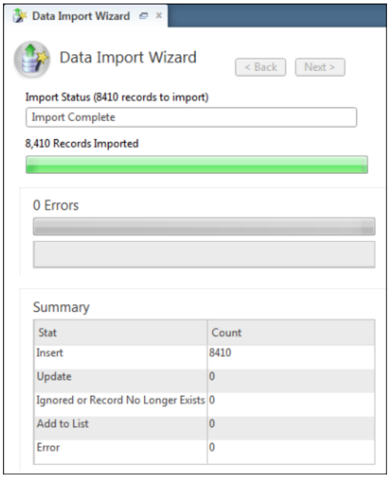
16 To pause the import process once it starts, click the Stop button on the toolbar.

a Click the Start button to resume the import.

Important Any records listed as returning errors are not imported to the database. See Data import error handling.

Also, if you close the wizard before the import is finished, the import process ends prematurely and you must begin the procedure again to complete the import.

Once the import process is complete, the Import Status field displays Import Complete.



All imported records are immediately available for use. Any additional processing that you specified on the wizard's initial screen (such as the running of a campaign, business rules, or external events) triggers automatically for the new records as soon as they are imported.

Duplicate record handling for data imports

The Duplicate Criteria section of the Data Import Wizard displays the criteria used to prevent instances of redundant records, which can be especially helpful when importing contacts. During the import process, fields listed in the criteria are compared with existing values in the primary record table in search of duplicate records. When importing contacts, duplicate values in the *email*, *email_alt1*, and *email_alt2* fields of the data file are also detected. When a duplicate is found, action is taken as specified in the Duplicate Records drop-down menu on the wizard's initial page. See Importing data.

Duplicate criteria consists of a logical expression formatted as *field_name*={*mapped column*}, where *mapped column* is the column number or header name. Multiple fields evaluate using Boolean logic.

The default expression varies based on the type of records imported and the columns mapped to the knowledge base. The following fields are automatically included as default duplicate criteria whenever they are included in the mapping grid.

- **Email Address**—When importing contacts, to simplify detection of redundant values in the primary and secondary email address fields (*email*, *email_alt1*, and *email_alt2*), the expression references them together as *any_email*. For example, *any_email*={*1*}.
- **Contact ID, Organization ID, Incident ID, Answer ID**—These fields are included as default criteria when importing their primary record type. Because these fields are unique for every record, additional criteria would not be more restrictive. For this reason, OR logic is used whenever they are added to the duplicate criteria. For example, *any_email*={*1*} OR *c_id*={*2*}.
- **First and Last Name**—If **email address sharing** is enabled, *first_name* and *last_name* is included when importing contacts. This narrows the criteria by permitting multiple contacts that share a common email address as long as they have different first or last names. For example, *any_email*={*1*} AND *first_name*={*2*} AND *last_name*={*3*}.
- **Login**—When importing contacts, this field is included in the default criteria if it is mapped. For example, *login*={*1*}.
- **Organization Name**—When importing organizations, this field is required and is always included in the default criteria. For example, *name*={*1*}.
- **Reference #**—When importing incidents, this field is included in the default criteria if it is mapped. For example, *ref_no*={*1*}.
- **Key (configuration setting name)**— When importing configuration base entries, these required fields are included in the default criteria. For example, e*ntry_key*={*Key*}.
- **ID and Key**—When importing configuration base values, these required fields are included in the default criteria. For example, *configbase_id*={*ID*} AND *configbase_entry_id*={*Key*}.
- **Key (message base name)**—When importing message base entries, this required field is included in the default criteria. For example, *entry_key*={*Key*}.

For added flexibility, you can define custom criteria by clearing the Use Default check box and entering a logical expression using any combination of mapped fields. For instance, if you want to avoid creating duplicate contacts with the same last name (mapped to column 1) and user ID (mapped to column 2), you can enter *last_name*={*1*} AND *login*={*2*}. If column headers are specified in the data file or header file, you can refer to them by header name instead, such as *last_name*={Last Name} AND *login*={User ID}.

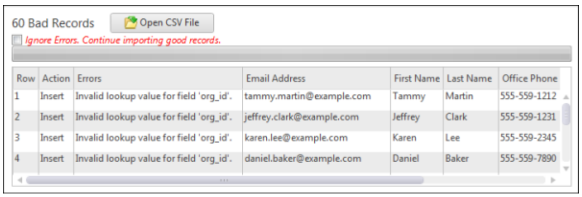
Important If you define custom criteria that does not include the email field, and email address sharing is not enabled, records matching existing contacts create new contacts with a numerical value appended to the email address. See Email address sharing.

When customizing duplicate criteria, supported Boolean operators and characters can be inserted by clicking the buttons above the criteria field or by simply typing them in.

Data import error handling

If the Data Import Wizard's prescan process returns any errors, you can select the Ignore Errors check box to ignore them and continue importing only those records that did not return errors. However, if the prescan reveals any errors involving records that you need to import, you must resolve the errors in order to proceed. You can do so by manually repairing the records in the data file and rerunning the wizard, or you can click the Back button to return to the column mapping page and either clear the mapping for columns that returned errors or map them to another field. However, if you want to import all the data as originally mapped, you need to repair the records in the data file.

To make the task of repairing the data file simpler, the prescan result page displays the erroneous data along with row numbers and error descriptions to help you locate each problem record in your original data file and correct the issue that led to the error. To view the complete list of errors in a text editor or spreadsheet program, click the Open CSV File button next to the record count.



The CSV file can also be accessed locally from the staging directory defined on the wizard's initial screen. (For most Windows operating systems, the default location is C:\Documents and Settings\<username>\My Documents\My Imports\. For Windows 7, the default location is C:\users\<username>\My Documents\My Imports\.)

The staging directory contains a subdirectory for each import with the naming convention <current date>-<import attempt number> (for example, “2010-05-15-1”). Each import’s subdirectory contains the following files.

- *<data_file_name>.bad.csv* contains all records that returned an error during the prescan process.
- *<data_file_name>.good.csv* contains all records that did not return an error.
- *<data_file_name>.badaux.csv* and *<data_file_name>.goodaux.csv* contain diagnostic information that can be provided to support for troubleshooting errors.

Once the data file is repaired, you can start the import procedure again and the errors that were addressed in the previous prescreen process should no longer occur.

In rare instances, an error may occur during import that was not detected during the prescan process. If you selected the Stop Import on Error check box on the wizard’s initial screen, the import status changes to Import Error and the process stops to prevent further records from being imported. If the Stop Import on Error check box is cleared (the default setting), the import continues despite any error and only records without errors are imported.

Data import templates

You can create data import templates for use in the Data Import Wizard. Templates allow you to skip some import wizard steps—such as mapping columns to database files and customizing duplicate criteria—when performing imports of multiple data files that have the same column ordering. This can be useful if you frequently import records from an external source where the data format does not change but the data is more current.

After a template is created, you can select it when mapping data field columns through the Data Import Wizard. See Importing data.

Important Data import features are designed to import specific data sets into the knowledge base, not to support full data migrations. For this reason, you should be aware of certain restrictions when preparing an import. See Importing data.

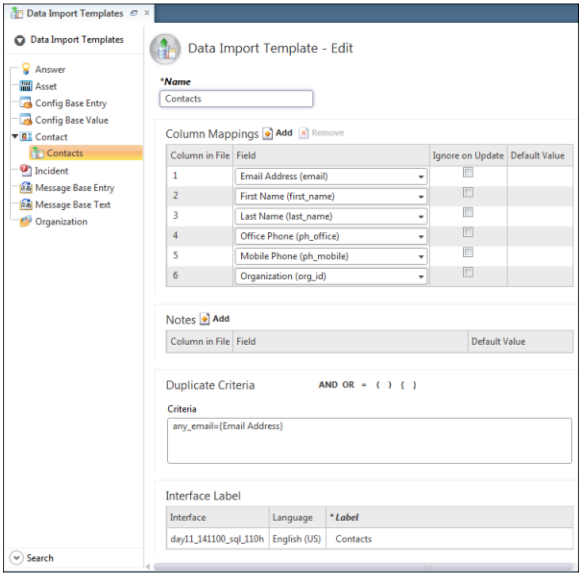
To add or edit a data import template

1. Click the Configuration button on the navigation pane.
2. Double-click Data Import Templates under Database. The Data Import Templates tree displays on the content pane.

3 To add a template, select a record type in the tree and click the New button on the ribbon to display the editor.

Or

To edit an existing template, click it in the tree.



The Data Import Templates editor consists of a set of fields for mapping columns to database fields in primary and associated tables, defining criteria for detecting duplicate records, and viewing interface visibility information for the template.

4 Enter the following field information.

Table 103: Data Import Templates Editor Description

Field	Description
***Name**	Type the name of the template.
Column Mappings	This section defines how columns in the data file are mapped to fields in the database.
Add	Click this button to create a new row in the column mapping grid.
Remove	Click this button to remove a selected row from the column mapping grid.

Table 103: Data Import Templates Editor Description (Continued)

Field	Description
Column in File	The column number that the data file will be mapped to. The maximum allowed value is 9999.
Field	For each data column that you want to import, click the drop-down menu and select the database field that you want to map the column to. The data from the column is inserted into the specified database field. If the data file contains columns that you do not want to insert into your database, leave this field blank. For information about database fields, see the Data Dictionary located under Configuration > Database > Data Dictionary. **Tip:** If you map a column to *ma_org_name*, the Data Import Wizard populates the field with the text value from the data file. If you want to associate a contact with an organization, you can either map the *org_id* to Organization ID or map the name of the organization to Organization ID. The Data Import Wizard looks up the organization and associates the name to the correct organization. If the lookup fails, an error occurs.
Ignore on Update	Select this check box if you want this column to insert to the database for new records, but do not want the column updated for existing records. **Note:** This option has no effect if you selected Keep Original Data from the Duplicate Records drop-down menu.
Default Value	Enter the default value to insert when an imported record does not contain data for the column.

5 To map a column to a table associated with the import record type, click Add in the section corresponding to the associated table.

- **Notes**—Maps columns to the Notes *(notes*) table for answer, contact, and organization imports. Supported fields include *chan_id* and *text.*
- **Threads**—Maps columns to the Threads *(threads)* table for incident imports. Supported fields include *chan_id, seq, note,* and *entry_type.*

- **Addresses**—Maps columns to the Organization Addresses *(org_addrs)* table for organization imports. Supported fields include *oat_id, city, country_id, postal_code, prov_id,* and *street.*

Note For information about database fields, refer to the Data Dictionary located under Configuration > Database.

6 Enter the following field information.

Table 104: Associated Table Mapping Description

Field	Description
Add	Click this button to create a new entry in the mapping grid.
Remove	Click this button to remove an entry from the mapping grid.
Column in File	Type the column number that the data file or header file will map to. The maximum allowed value is 9999.
Field	This field displays the database field that you can map a column to. The data from the column inserts to the specified database field.
Default Value	Enter the default value to insert when an imported record does not contain data for the column.

7 To define custom criteria used to identify duplicate records, click the Criteria field and refer to Duplicate record handling for data imports.

8 To enter a different name for the template based on interface, select the Label value next to the interface name in the Visibility section and type the name. (This is helpful if your site has multiple interfaces of different languages.) By default, each Label value is populated with the name of the template you defined in step 4.

9 Click the Save and Close button to save your template.

Data import history

Occasionally, you may want to review information about previous imports to understand how imported records were created in your site. Historical details about past imports are available in two locations, based on when the import was performed.

Imports are tracked in the Data Imports report, located in the public reports under Common > Site Administration > Data Imports. The Data Imports report contains information such as the type of records imported, start and completion dates and times, import file names, import status, and information about file locations and column mapping. The statistics used for this report are stored in the Data Imports *(data_imports)* table and can also be accessed by creating a custom report (see Creating Basic Reports). For a description of the information logged in the Data Imports table, refer to the Data Dictionary located under Configuration > Database > Data Dictionary.

16

SAML 2.0 Open Login

Oracle Service Cloud supports SAML 2.0 single sign-on (SSO) integrations, allowing your agents and customers to log in using credentials supplied by external identity providers (IdPs). Additionally, you can use Oracle Service Cloud as an IdP to provide login credentials to third-party applications. Your agents can then seamlessly log in to these applications from the **agent desktop**.

The procedures to implement your single sign-on configuration differ depending on what you want to accomplish.

- If you want your agents or customers to log in to an external IdP, from which they can then access the **Service Console** or **Oracle RightNow Customer Portal Cloud Service** (Customer Portal), refer to Logging in using external identity providers. Single logout is not supported when using this configuration.
- If you want your agents to log in on the Oracle Service Cloud login page using credentials authenticated by an external IdP, refer to Signing in using an external identity provider on the Oracle Service Cloud Login window. After logging in, Oracle Service Cloud can then act as the IdP for any internal or external service providers (SPs) configured in Oracle Service Cloud. (Refer to Logging in to external applications using Oracle Service Cloud as the identity provider.) Single logout is supported when using this configuration.
- If you want your agents to be able to access external applications from the agent desktop without being asked for login credentials, refer to Logging in to external applications using Oracle Service Cloud as the identity provider.

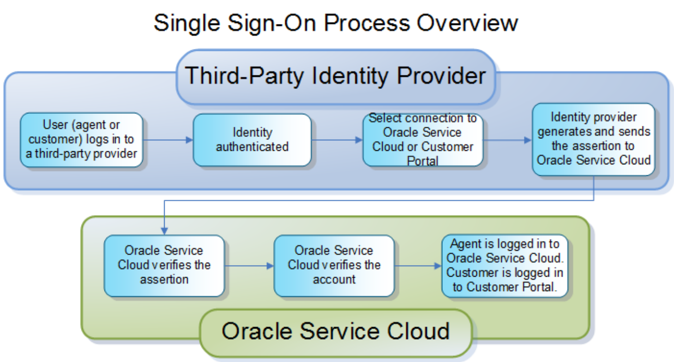
Logging in using external identity providers

Oracle Service Cloud includes single sign-on (SSO) support for agents working on the Service Console and customers using the Customer Portal. With single sign-on, agents and customers log in to a third-party identity provider outside of Oracle Service Cloud, which authenticates their identity. Then they select a connection to the Service Console (for agents) or your customer portal (for customers). Alternatively, the IdP's login page can be embedded in the Oracle Service Cloud Login window, providing a seamless method for agents to access the application and any service provider applications configured in Oracle Service Cloud. Refer to [Signing in using an external identity provider on the Oracle Service Cloud Login window](#).

When using an external page to authenticate users, the identity provider first verifies their login. It then encapsulates the result of that verification in an assertion that is signed using an X509 certificate and sends the assertion to Oracle Service Cloud. The application verifies the signature and (if successful) accepts the account information for logging in to the Oracle Service Cloud system. The assertion sent by the identity provider uses SAML 2.0 (Security Assertion Markup Language) architecture.

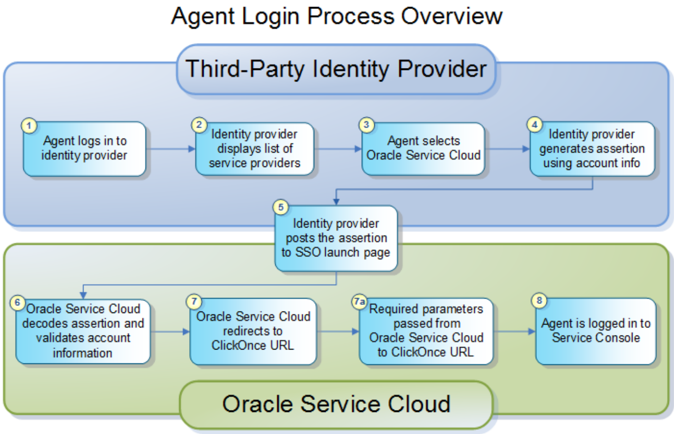
This implementation of SAML 2.0 open login lets Oracle Service Cloud accept identity provider assertions.

Important To enable single sign-on for agents, customers, or both, contact your Oracle account manager.



Agent login

The following process occurs when single sign-on is enabled for agents who work on the agent desktop, and they log in using an external IdP's login page.



1 An agent enters a user name and password to log in to the organization's identity provider (such as a PingFederate Server-based application). When the information is verified, the agent is logged in to the identity provider.

2 The identity provider displays a list of service providers, including Oracle Service Cloud, that the agent can connect to.

3 The agent selects Oracle Service Cloud.

4 The identity provider generates a signed SAML 2.0 assertion using the account login, email address, account ID, or a staff account custom field as the assertion subject. Refer to Identifying the SAML subject for agent login.

Important The assertion must be signed using W3C XML signature recommendations. If the certificate used to sign the assertion is self-signed, it must be uploaded to the Additional Root Certificates (*certs/root/*) directory in the **File Manager**. Refer to Certificate validation options. The certificate must also be listed in the SAML_20_SIGN_CERTS configuration setting or it will not be accepted for SAML signing. Refer to SSO SAML 2.0 Common Configuration Settings.

Additionally, the assertion cannot be encrypted.

5 The identity provider then submits the assertion to the Oracle Service Cloud SSO launch page using HTTP POST binding (since that is the only binding method supported). The SSO launch page is similar to the standard launch page except that it automatically starts the ClickOnce URL, which logs the agent in after validation.

6 Oracle Service Cloud decodes and verifies the assertion and validates the account by confirming that the assertion matches an account in the Oracle database.

Important Staff members logging in through an identity provider must have the SSO Login (SAML 2.0) permission enabled in their profile. Refer to Enabling single sign-on profile permission.

Because accounts cannot be created through the single sign-on process, only existing accounts can be logged in. (The public API can be used to create or update accounts if necessary.)

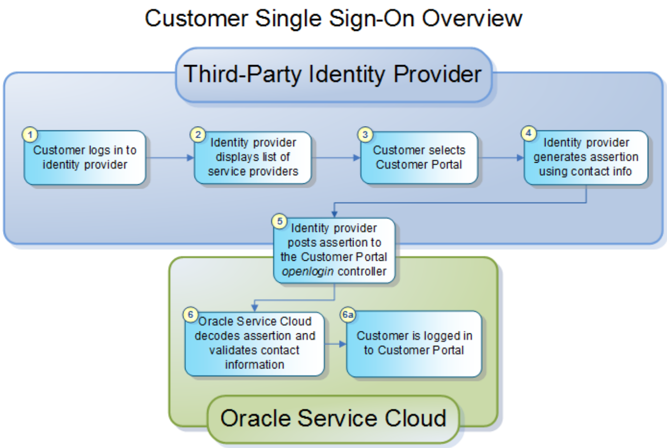
7 Oracle Service Cloud redirects the agent to the ClickOnce URL, which signals the installer to use the SSO login instead of the standard login, and passes the necessary parameters for automatic login.

8 Oracle Service Cloud verifies the account using the parameters of the ClickOnce URL for authentication. If necessary, the Oracle Service Cloud client is downloaded and installed. The application is then launched, and the agent is logged in.

Note Refer to Server and Client Configuration Issues in ClickOnce Deployments for information about browser scripting and compatibility with ClickOnce applications.

Customer login

The following process occurs when single sign-on is enabled for customers logging in to your customer portal.



1 A customer enters a user name and password to log in to an identity provider. When the identity provider verifies the information, the customer is logged in.

2 The identity provider displays a list of service providers, including your customer portal, that the customer can connect to.

3 The customer selects the customer portal.

4 The identity provider generates a signed SAML 2.0 assertion using the customer's email address, contact record ID, login name, or a contact custom field as the assertion subject. Refer to Identifying the SAML subject for contact login.

Note The assertion must be signed using W3C XML signature recommendations. If the certificate used to sign the assertion is self-signed, it must be uploaded to the Additional Root Certificates (*certs/root/*) directory in the **File Manager**. Refer to Certificate validation options. The certificate must also be listed in the SAML_20_SIGN_CERTS configuration setting or it will not be accepted for SAML signing. Refer to SSO SAML 2.0 Common Configuration Settings.

Additionally, the assertion cannot be encrypted.

5 The identity provider then submits the assertion, using HTTP POST binding (since that is the only binding method supported), to the *openlogin* controller at http://<your_site>.custhelp.com/ci/openlogin/saml/. This controller calls the SSO validation and logs in the customer.

6 Oracle Service Cloud decodes the assertion, validates the customer by confirming that the assertion matches a contact record in the database, and logs the customer in on your Support Home page. (A redirect parameter can specify that a different page opens instead. Refer to Redirecting contacts after login.)

Note Contact records cannot be created through the SSO process, so only existing customers can be logged in. (The public API can be used to create or update contacts if necessary.)

Setting up single sign-on using an external identity provider

Complete the following steps to configure single sign-on for your site.

- Contact your Oracle account manager to enable single sign-on for agents, customers, or both.
- Enable single sign-on profile permission.
- Define configuration settings.
- Set up one or more identity providers.
  - ▷ Identify the SAML subject used in the assertion for agent login.
  - ▷ Identify the SAML subject used in the assertion for customer login.

Enabling single sign-on profile permission

When single sign-on has been enabled for agents on your site, an SSO Login (SAML 2.0) permission check box appears on the Administration tab of the Profiles editor. When you add this permission to a profile, staff members with that profile can log in only through an identity provider, that is, using the single sign-on process.

For security purposes, we recommend that if the SSO Login (SAML 2.0) permission is enabled, the SEC_END_USER_HTTPS is also enabled. If both are enabled, then the SAML assertion must be sent to a secure protocol (https://). To enable SEC_END_USER_HTTPS, contact your Oracle account manager.

For an in-depth discussion about security practices in Oracle Service Cloud, see Security Practices.

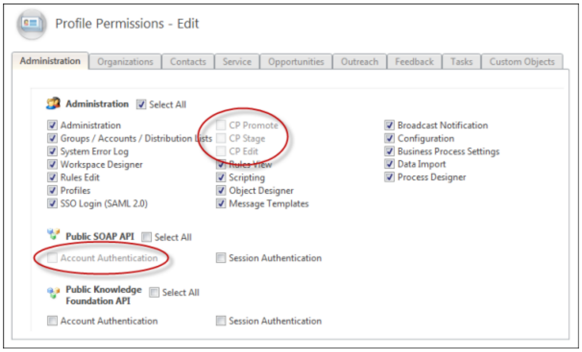
Several restrictions apply to staff members whose profile includes the SSO Login (SAML 2.0) permission. The most important one is the inability of these staff members to log in using their Oracle Service Cloud credentials. If they try to do so instead of logging in using their

IdP login credentials, they will see an access denied message. Several possible reasons for the denial are displayed in the message, including that the account belongs to a profile that allows logins only through single sign-on.

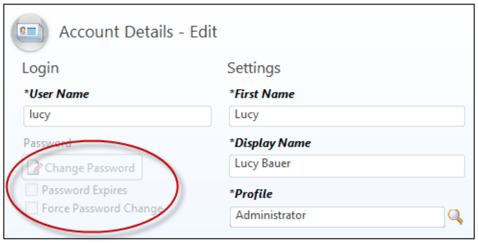
Even if you want all staff members to log in through single sign-on, we recommend that you create an administrative profile that does not have the SSO Login (SAML 2.0) permission enabled and assign at least one staff account to that profile. In the event a problem occurs with your identity provider, that account can log in to Oracle Service Cloud and change other staff member profiles (and assign them passwords, if necessary) so agents can continue to work until the problem is resolved.

When the SSO Login (SAML 2.0) permission is selected, the CP permissions (CP Promote, CP Stage, and CP Edit) are disabled if they have been enabled, and the CP permission check boxes can no longer be selected. Staff members with this profile do not have permission to edit development pages in WebDAV because WebDAV authentication requires a user name and password. Nor can these staff members deploy the customer portal. For more information about Customer Portal permission options, refer to Assigning permissions.

When the SSO Login (SAML 2.0) permission is selected, account authentication through the Public SOAP API permission is also disabled if it has been enabled, and the check boxes can no longer be selected because public SOAP API account authentication operations always require a user name and password.



Passwords cannot be changed on staff accounts assigned to profiles with SSO Login (SAML 2.0) permission enabled. The password options on the Staff Accounts editor will be disabled.



To select single sign-on permission

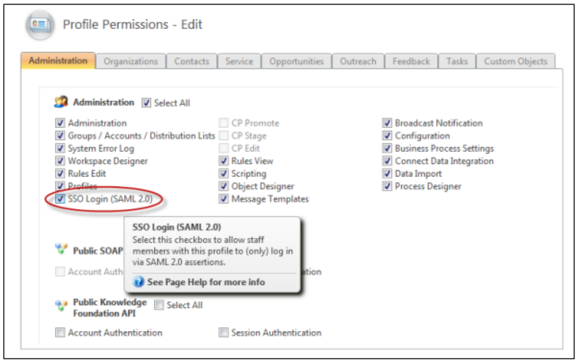
1 Click the Configuration button on the navigation pane.

2 Double-click Profiles under Staff Management and then double-click the profile you want to assign single sign-on permission to. The Profiles editor opens.

3 Click the Permissions button on the ribbon. The Permissions page opens with the Administration tab selected.

4 Select the SSO Login (SAML 2.0) check box. A warning message notifies you that all staff members having this profile will be prevented from logging in directly to Oracle Service Cloud and must instead log in through single sign-on with an identity provider. The warning message also notifies you about restrictions for the Customer Portal administration and Public SOAP API account authentication permissions.

Note Single sign-on must be enabled for this check box to display. To enable single sign-on for agents, customers, or both, contact your Oracle account manager.



5 Click the OK button.

6 Click the Save and Close button.

If you need additional help with profile permissions, refer to [To select options on the Administration tab](#).

Defining configuration settings

The configuration settings described in this procedure support the implementation of SAML 2.0 open login.

To edit single sign-on configuration settings

1 Click the Configuration button on the navigation pane.

2 Double-click Configuration Settings under Site Configuration. The Search window opens.

3 Clear the Select All check box under Folders section and then select the Common check box.

4 Click the Search button. The Configuration Settings editor opens.

5 Expand the folders under General > Single Sign-On to open the SAML_20_SIGN_CERTS and USE_KNOWN_ROOT_CAS settings on the content pane. Edit the settings under the Value column according to the descriptions in the following table. See Editing configuration settings.

Table 105: SSO SAML 2.0 Common Configuration Settings

Configuration Setting	Description
Common > General > Single Sign-On	
SAML_20_SIGN_CERTS	Identifies the only certificate(s) (a comma-separated list of SHA-1 hex thumbprints) that are accepted for SAML 2.0 signatures. The special value of "ANY-TRUSTED" may be used to accept any certificate that is trusted by the root CAs for the site. Default is blank. **Note:** If the ANY-TRUSTED setting is used, we recommend that the USE_KNOWN_ROOT_CAS setting be disabled for security reasons. **Note:** Only certificates listed in the SAML_20_SIGN_CERTS configuration setting are accepted for SAML 2.0 assertion signing. This means that if no certificates are listed in the setting—which is its default—then no certificate will be accepted for SAML signing. Listed certificates must still pass other validation criteria (that is, they must be trusted) before they can be accepted for SAML 2.0 assertion signing. If the certificate used to sign the assertion is self-signed, it must be uploaded to the Additional Root Certificates (*certs/root/*) directory in the File Manager. Refer to Certificate validation options.
USE_KNOWN_ROOT_CAS	Controls whether the known root certificate authorities list that is embedded within the Oracle server is consulted when verifying X509 certificates. For example, when checking S/MIME email or SAML 2.0 signatures. Default is enabled (Yes).

6 Click the Save button on the ribbon.

7 From the search criteria fields on the top of the editor, click the Folders drop-down menu, clear the Common check box, and then select the RightNow Common check box.

8 Click the Search button. The RightNow Common folder displays on the content pane. Expand the folders under Single Sign-On > General to open the SAML_ERROR_URL setting on the content pane.

You can use this setting to specify the URL where users will be sent if their SAML SSO log-in attempt fails. The setting supports the %error_code% and %session% placeholder variables, which are replaced with the error code the user encountered and the session of the user if the user has cookies disabled. The default value for the setting is blank. The following errors can be returned when using the %error_code% variable.

Table 106: SAML Single Sign-On Error Codes

Error name	Error ID	Description
SAML_TOKEN_REQUIRED	14	No SAMLResponse POST value was sent to the CP controller. A SAML response is required in order to start the authentication process.
SAML_TOKEN_FORMAT_-INVALID	15	The SAML response was found, but it could not be successfully Base 64 decoded.
FEDERATED_LOGIN_-FAILED	16	The call to the federated_login API call failed. This usually means that the SAML assertion succeeded, but the user does not yet exist in the database.
SSO_CONTACT_TO-KEN_VALIDATE_FAILED	17	The call to the sso_contact_token_validate API failed. This can happen in a number of ways, but the most common is that the SAML assertion contains something other than the contact login as the subject. If that login does not exist in the database, the token validation will fail.
CONTACT_DISABLED_ER-ROR	6	The SAML assertion/login succeeded, but the contact is disabled in the database.
COOKIES_REQUIRED_ER-ROR	3	The user does not have cookies enabled. Cookies are required in order to log in to CP.

9 Click the Save button on the ribbon.

Setting up identity providers

In order for Oracle Service Cloud to accept SAML 2.0 open login assertions from third-party identity providers, each identity provider needs to be configured to send the assertion URL to the Oracle Service Cloud application, either to the SSO launch page for agent login or to the *openlogin* controller for customer login (or to both).

- Identify the SAML subject used in the assertion for agent login.
- Identify the SAML subject used in the assertion for customer login.

Oracle Service Cloud can accept authentications from multiple identity providers. Configuration details vary from provider to provider, so each one must be configured separately to make the application available through the identity provider. Because the procedures vary, we cannot provide specific details. However, the following list includes some requirements and constraints you must consider as you configure an identity provider.

- Oracle Service Cloud does not support the import of SAML 2.0 metadata.
- Oracle Service Cloud does not support decryption of the SAML 2.0 assertion, so the identity provider should not be set up to encrypt the assertion. Instead, use an SSL connection for confidentiality.
- Oracle Service Cloud supports only the HTTP POST binding type, so the identity provider should be configured to send SAML responses and assertions using that method.
- The certificate used to sign the assertion must be included as part of the assertion in the XML signature.
- The identity provider server is expected to be time-synchronized with the Oracle server, so a validity range of plus or minus five minutes of the SAML assertion should be adequate.

Note If Windows ADFS (Active Directory Federation Services) is used as the identity provider, the fixed validity ranges (five minutes for *Subject.SubjectConfirmationData.NotOnOrAfter* and one hour for *Subject.Conditions.NotOnOrAfter*) can cause validation errors if the application's clock is behind the time of the identity provider, even if that difference is as small as one second. To mitigate the potential problem, a NotBeforeSkew parameter can be issued in the following PowerShell prompts.

```
PS C:\Users\Administrator> add-pssnapin
microsoft.adfs.powershell
PS C:\Users\Administrator> set-adfsrelyingpartytrust -
targetname "<relying party name>" -NotBeforeSkew 2
```

In this example, 2 refers to two minutes, but you can substitute the value you want.

Identifying the SAML subject for agent login

The parameter used to identify the SAML subject contents should be passed to the SSO launch page as a GET parameter. The subject value must be unique in order for the single sign-on to be successful. For example, if multiple staff members can have the same value for an account custom field, you should not use that custom field as the subject.

The value defines how the SAML subject is mapped to an existing staff account in the Oracle database. Only one field can be passed in the assertion subject, whose parameter name is `p_subject`. Its values include the following.

- **Account.Login**—The assertion subject is the account login, which is the preferred mapping since it requires no additional lookup from the database. That is, the value can be passed to sso_account_login( ) API. This is the default mapping value if `p_subject` is not set. The Account.Login value is case sensitive.
- **Account.Emails.Address**—The assertion subject is the account email address. The Account.Emails.Address value is case insensitive.
- **Account.ID**—The assertion subject is the account ID in the Oracle database.
- **Account.CustomFields.[customfield-name]**—The "customfield-name" variable is the actual name of the custom field in the database (and the name of the database column), and the assertion subject is the account custom field value. The custom field name is the last name in the dot-separated value. It is automatically defined with lowercase notation and the `c$` prefix.

Note The custom field value is case insensitive. The following staff account custom field data types are not supported for use in an assertion.

- Menu
- Yes/No
- Date/Time
- Date Field

The following is an example of an assertion URL that passes the value of a custom field called `accounts.c$external_id` field for the staff account being verified.

```
https://[site]/cgi-bin/[interface].cfg/php/admin/sso_launch.php?
p_subject=Account.CustomFields.ExternalPhone
```

Identifying the SAML subject for contact login

The parameter used to identify the SAML subject contents should be passed to the *openlogin* controller as a GET parameter. The format of the URL is:

<site>/ci/openlogin/saml/subject/{SAML_subject}

For example:

<site>/ci/openlogin/saml/subject/contact.emails.address

The subject value must be unique in order for the single sign-on to be successful. For example, if **email address sharing** is enabled, the potential for more than one contact having the same email address exists (even if the primary email address for one is the alternate email address of another), so you should not use the email address as the subject. A similar situation might occur with custom fields if multiple customers can have the same value for a contact custom field.

The parameter, named `subject`, is optional and defaults to `contact.login`. Its values include the following:

- **contact.emails.address**—The assertion subject is the contact email address, and the value can be the contact's primary email address or one of the alternate email addresses. The contact.emails.address value is case insensitive.
- **contact.id**—The assertion subject is the contact ID in the Oracle database.
- **contact.login**—The assertion subject is the contact login, which is the preferred mapping since it requires no lookup from the database. This is the default mapping value if `subject` is not set. The contact.login value is case sensitive.
- **contact.customfields.[customfield-name]**—The "customfield-name" variable is the actual name of the custom field in the database (as well as the name of the database column), and the assertion subject is the contact custom field value. The assertion subject is then passed to the API as `CustomField` and the name in the subject GET parameter is sent to the API as the `CustomFieldName` value. The `c$` prefix will be added if necessary.

Note The custom field value is case insensitive. The following contact custom field data types are not supported for use in an assertion.

- Menu
- Yes/No
- Date/Time
- Date Field
- Opt-in

Redirecting contacts after login

After the assertion has been verified and contacts are identified and logged in, they will be directed to your Support Home page by default. If you prefer to direct them to another page, you can add a redirect parameter to the URL that passes the subject parameter. The redirect parameter can point to any page (/app/*) or controller endpoint (/ci/* or /cc/*). It must follow the subject parameter, as shown in the following example URL.

<site>/ci/openlogin/saml/subject/contact.id/redirect/app/ask

Signing in using an external identity provider on the Oracle Service Cloud Login window

Your staff members can log in on the Oracle Service Cloud Login window using authentication from an external IdP. This lets agents log in once to be authenticated across several SP applications. Single logout is also supported, so when agents log out of any SP application, they are also automatically logged out of the IdP and any other SPs they were logged in to. Refer to Logging in to external applications using Oracle Service Cloud as the identity provider for information about configuring SPs.

Note Deployments involving Oracle Service Cloud and Oracle Sales Cloud use Oracle Identity Management since it is bundled with the Sales Cloud application.

When the staff member logs in to the IdP, an encrypted SAML token is generated and passed to Oracle Service Cloud. This method increases security since user IDs and passwords are not sent between the applications.

After being authenticated, Oracle Service Cloud provides authentication services to other SPs, alleviating the need to integrate them and the external IdP.

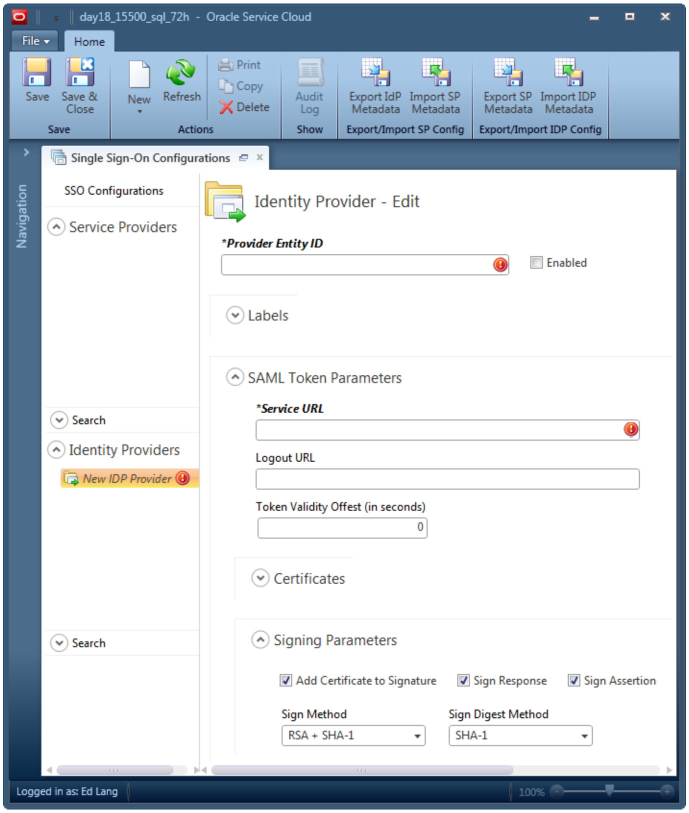
To configure an external IdP for agent authentication on the Login window

1 Enable the use of external IdPs. Contact your Oracle account manager.

2 Click the Configuration button on the **navigation pane**.

3 Double-click Single Sign-on Configurations in your configuration list. The Single Sign-On Configuration tree opens.

   a Click the New button on the ribbon and select SSO Identity Provider.



b Enter the following field information.

Table 107: Identity Provider Editor Description

Field	Description
Provider Entity ID*	Type a unique name for the IdP in this field.
Enabled	Select this check box to enable the IdP. **Note:** You can configure multiple IdPs in Oracle Service Cloud, but only one can be enabled at a time. If another IdP is already enabled, you must disable it before enabling another.
Labels*	Click the arrow next to Labels to expand the section. Type the name you want to provide for the IdP. You can specify different names to use for different interfaces and languages.

Table 107: Identity Provider Editor Description (Continued)

Field	Description
SAML Token Parameters	Enter information to configure the SAML token parameters in this section.
Service URL*	Specify the URL of the external IdP in this field. This is the URL that users are redirected to for authentication.
Logout URL	Specify the URL of the external IdP where logout requests are sent. This field is optional.
Token Validity Offset	Specify the number of seconds that the timestamp on SAML tokens is adjusted by to account for discrepancies between the Oracle Service Cloud and external IdP clocks. This field is optional.
Certificates	Click the arrow next to Certificates to expand the section. Click the folder next to Import Certificate and select the location of the certificate you want to use to validate requests and SAML tokens received from the IdP. You can also specify an alternate certificate to use when validation fails using the primary certificate.
Signing Parameters	Enter information to configure the signing method in this section.
Add Certificate to Signature	Clear this check box to prevent the signing certificate from being added to the SAML response/assertion signature.
Sign Response	Clear this check box to prevent the response part of the SAML token from being signed.
Sign Assertion	Clear this check box to prevent the assertion part of the SAML token from being signed.
Sign Method	Click this drop-down menu to select the XML signature method used to sign the SAML token. You can select from the following. • RSA + SHA-1 • RSA + SHA-256 • RSA + SHA-512
Sign Digest Method	Click this drop-down menu to select the digest method used to sign the SAML token signature. You can select from the following. • SHA-1 • SHA-256 • SHA-512

c Click Save on the ribbon to save the changes.

d Click Export SP Metadata on the ribbon to export the Oracle Service Cloud metadata to an XML file. Import the XML file that is created into the external IdP's web server. This establishes a trust relationship between the IdP and Oracle Service Cloud.

e Click Import IdP Metadata on the ribbon to import the metadata from the external IdP into Oracle Service Cloud.

f Click Save and Close on the ribbon to save your changes and close the editor.

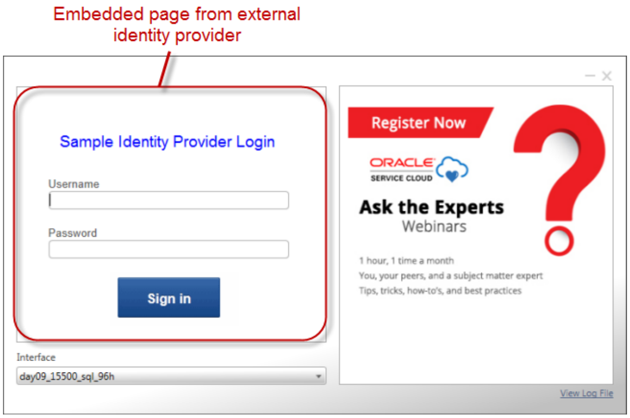
4 Create or edit a profile, click Permissions on the ribbon, and select the SSO Login (SAML 2.0) check box in the Administration section. Refer to Customizing profiles.

5 Create or edit a staff account in Oracle Service Cloud and associate the profile with it. Refer to Adding and editing staff accounts.

Important The staff account must also be a registered user in the external IdP and the user ID must match the Oracle Service Cloud user name.

Logging in

After configuring the IdP, staff members open the Oracle Service Cloud Login window as they normally would. However, the IdP's login page is now embedded in the window.

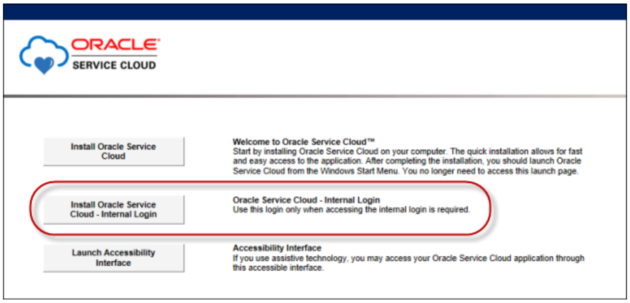


When staff members with the SSO Login (SAML 2.0) profile permission enter their login information, the IdP verifies their credentials, generates a SAML token, and sends it to Oracle Service Cloud. The SAML token is authenticated with the certificate used to sign the token. The user is then logged in to Oracle Service Cloud.

Bypassing the external identity provider

If staff members do not have the SSO Login (SAML 2.0) profile permission, the IdP can be bypassed, letting staff members log in using their Oracle Cloud Service credentials. This option is intended for troubleshooting issues with single sign-on, and is not meant to be used as a conventional sign-on process.

After configuring and enabling an IdP in Oracle Service Cloud, your site's launch page includes an internal login option.



Selecting this option loads the login window without the embedded IdP page. Following is an example of a URL for a launch page.

```
https://<your site>/cgi-bin/<interface name>.cfg/php/admin/launch.php
```

Logging in to external applications using Oracle Service Cloud as the identity provider

You can configure Oracle Service Cloud to act as an identity provider to store and authenticate credentials for other applications. This allows your agents to seamlessly access applications that reside outside the Oracle cloud from the **agent desktop**.

Important To enable the option to use Oracle Service Cloud as an identity provider, you must enable the SSO_IDP_ENABLE_EXT_APPS configuration setting and then add the Single Sign-On Configurations component to your navigation set. Refer to Site Configuration and Creating a navigation set for the administrator.

Using the single sign-on configurations editor, you can create and administer SSO service providers and SSO service applications. Service providers are containers where you group multiple service applications, so you must create a service provider before you can create a service application. Each service application in a service provider will have the same SAML response and assertion methods.

Note Service providers and applications hosted by Oracle display on the Single Sign-On Configurations editor, though you cannot modify most of their properties. You can, however, edit their labels and enable and disable them on your site. For information about hosted SSO integrations, contact your Oracle account manager.

After configuring an SSO service provider and application, you can add the application to a **workspace** where agents can then access the external application without being asked for sign-in credentials. Refer to Adding applications to the agent desktop.

When an external application is configured to use Oracle Service Cloud as the identity provider, agents will be redirected to a PHP login page if they attempt to access the external application's login page directly from a URL. Refer to Redirecting users to the Oracle Service Cloud login page.

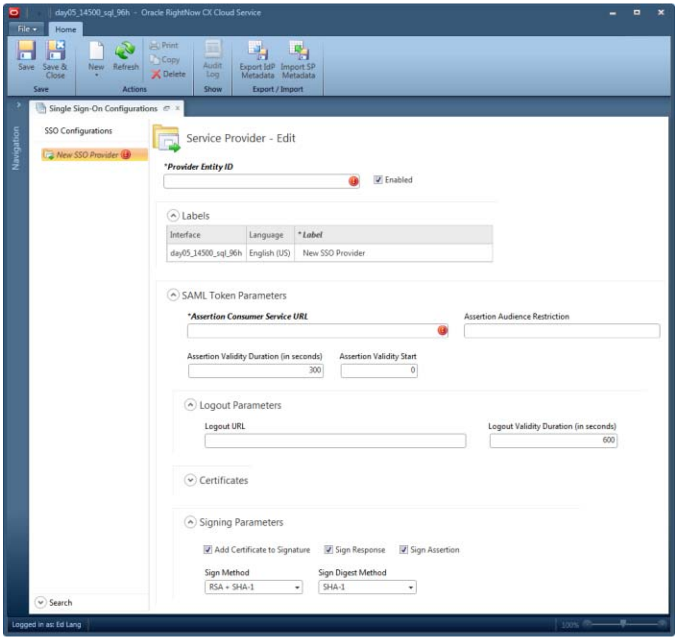
The following procedures describe how to create an SSO service provider, SSO service application, and how to view the audit log to see all related activity.

To create an SSO service provider

1 Click the Configuration button on the navigation pane.

2 Double-click Single Sign-on Configurations in your configuration list. The Single Sign-On Configuration tree opens.

3 Click the New button on the ribbon and select SSO Service Provider.



4 Enter the following field information.

Table 108: Service Provider Editor Description

Field	Description
Provider Entity ID*	Type a unique name for the service provider in this field.
Enabled	Clear this check box to prevent the service provider from being enabled for single sign-on integrations. Once you are ready to use the service provider and its associated service applications, select the check box to enable it.
Labels	Type the name you want to use for the service provider. You can specify different names to use for different interfaces and languages.
SAML Token Parameters	Enter information to configure the SAML assertion in this section.

Table 108: Service Provider Editor Description (Continued)

Field	Description
Assertion Consumer Service URL*	Type the URL where the SAML token will be posted. SAML responses and assertions will be sent to this location using HTTP POST binding.
Assertion Audience Restriction	Type the domain for which the SAML assertion is intended or for which it is valid.
Assertion Validity Duration	Type the time, in seconds, for which the SAML assertion is valid. Values can be from 0 to 86,400 (24 hours). The default value is 300 (5 minutes).
Assertion Validity Start	Type the relative offset, in seconds, to the current time when a generated SAML assertion's validity should start. Values can be from -1800 to +1800. The default value is 0.
Logout Parameters/ Certificates	The fields in these sections are used to configure certificates for single logout for external service applications when using Oracle Service Cloud as the identity provider. Refer to Single logout for SSO applications.
Signing Parameters	Enter information to configure the signing method in this section.
Add Certificate to Signature	Clear this check box to prevent the signing certificate from being added to the SAML response/assertion signature.
Sign Response	Clear this check box to prevent the response part of the SAML token from being signed.
Sign Assertion	Clear this check box to prevent the assertion part of the SAML token from being signed.
Sign Method	Click this drop-down menu to select the XML signature method used to sign the SAML token. You can select from the following. • RSA + SHA-1 • RSA + SHA-256 • RSA + SHA-512
Sign Digest Method	Click this drop-down menu to select the digest method used to sign the SAML token signature. You can select from the following. • SHA-1 • SHA-256 • SHA-512

5 Click the Save button on the ribbon to save the changes to the service provider.

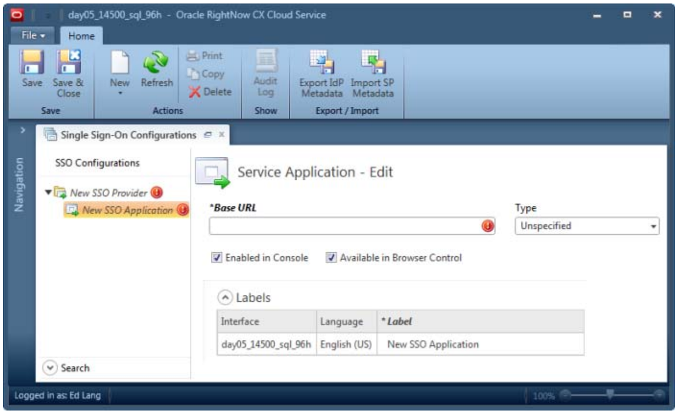
To create a service application

1 Click the Configuration button on the navigation pane.

2 Double-click Single Sign-on Configurations in your configuration list. The Single Sign-On Configuration tree opens.

3 Select the SSO service provider you want the service application associated with.

4 Click the New button on the ribbon and select SSO Service Application.



5 Type the URL that a browser using the application should navigate to in the Base URL field.

6 Click the Type drop-down menu and select the type of application. You can select ATG Web Commerce Service Center, ATG Engagement Engine, Oracle Knowledge, or Unspecified.

7 To prevent the service application from being available on the Service Console, clear the Enabled in Console check box.

8 Type the name you want to use for the service application in the Label field. You can specify different names to use for different interfaces and languages.

9 Click the Save and Close button on the ribbon to save your service application.

To view the audit log

1 Click the Configuration button on the navigation pane.

2 Double-click Single Sign-on Configurations in your configuration list. The Single Sign-On Configuration tree opens.

3 Click the name of the service provider you want to examine.

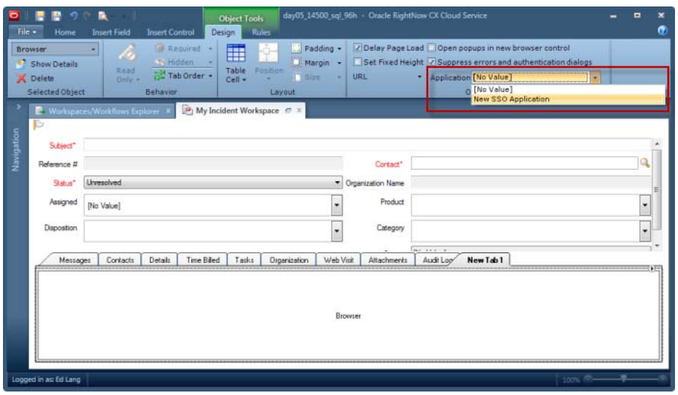
4 Click the Audit Log button on the ribbon to open the Audit Log window. The audit log displays the type of action performed, the staff member who made the change, when the action occurred, and where on the **administration interface** the action was performed.

5 Click X on the top right to close the window.

Adding applications to the agent desktop

After you configure SSO service providers and service applications, you need to add the service applications you want your agents to access to the **agent desktop**. To do so, you create or edit the **workspace** your staff members will use to access the external application.

SSO service applications you have created are available as options in workspace browser controls. After adding the browser control to the workspace, select the service application from the Application drop-down menu on the ribbon's Design tab, as shown here. Refer to [Working with browser controls]().



When your staff members use the workspace, they will be able to access the application and will not be asked for credentials.

Redirecting users to the Oracle Service Cloud login page

After configuring external applications to use Oracle Service Cloud as the identity provider, agents who attempt to directly access the external application's login page will be redirected to a PHP login page where they can enter their Oracle Service Cloud login.

If agents forget their login information, they can click Login Help on the page to recover their information. Using the ACCT_RECOVER_STATUS and ACCT_RECOVER_ALT configuration settings (Site Configuration > Configuration Settings > RightNow User Interface > Tool Bar > General), you can choose what action is taken when staff members forget their user name or password. See Configuring Login Help.

Important Setting ACCT_RECOVER_STATUS to 0 disables login help functionality on the PHP login page, since this value opens the login help procedure in the Oracle Service Cloud online documentation.

Single logout for SSO applications

If your agents use single sign-on (SSO) to log in to other applications using Oracle Service Cloud as the identity provider, they can be automatically logged out of all the service providers they are logged into when they log out of any one of them. The applications can be external or internal to the Oracle cloud (such as Oracle Policy Automation). This enhances the security for all the applications, since users would be forced to reenter their credentials once they log out of any one of them.

Single logout for internal service providers is enabled automatically and requires no configuration other than that described in To create an SSO service provider. However, configuring single logout for an external service provider requires editing the service provider configuration in the Single Sign-On Configurations editor to add logout parameters and certificates. Logout requests by external service providers must be signed using valid certificates to ensure the logout request can be trusted. External service providers can also use alternate certificates to help transition from expiring certificates. Logout requests by service providers internal to the Oracle cloud do not require certificates since they are assumed to be secure.

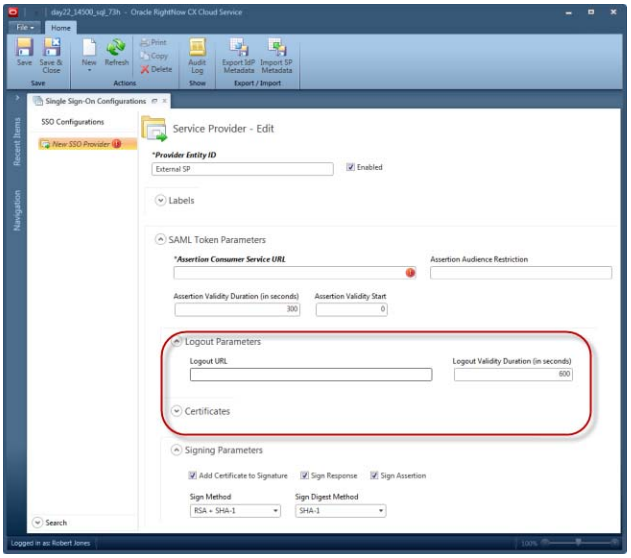
The following procedure assumes that single sign-on is enabled on your site and that you have already added the external service provider to Oracle Service Cloud.

To enable single logout for an external service provider

1 Click the Configuration button on the navigation pane.

2 Double-click Single Sign-on Configurations in your configuration list. The Single Sign-On Configurations tree opens.

3 Select the service provider you want to enable single logout for in the tree.



4 Enter the URL where the identity provider sends the logout request to the service provider in the Logout URL field.

5 Enter the number of seconds the identity provider's logout request is valid in the Logout Validity Duration field. The default value is 600 seconds.

6 Click the arrow next to Certificates to expand the section.

7 Click the folder next to the Import Certificate field to select the location of the certificate you want to use to validate logout requests. Once you select the certificate file, it is displayed in the Certificate field.

8 To use a second certificate to validate logout requests, click the folder next to the Import Alternate Certificate field and select the certificate you want to use. Using an alternate certificate is useful if you are transitioning from an expiring certificate.

9 Click the Save and Close button on the ribbon to save the changes to the service provider.

17

Add-Ins

The desktop add-in framework lets application developers add custom components, or add-ins, to Oracle Service Cloud in order to integrate with other applications on staff members' workstations. For information about creating add-ins, refer to *Connect Desktop Add-In Framework (.NET)*.

Installing add-ins

Add-ins are uploaded using the Add-In Manager. From the manager, you can provide or deny access to individual add-ins for each profile and interface. Staff members who are granted access to use add-ins will have the necessary add-in files downloaded to their workstations. For information about managing add-in permissions through profiles, refer to Customizing profiles.

Add-in file conventions

The add-in files you upload must conform to certain conventions to be recognized by the Add-In Manager.

- The files must be either *.dll* files that reference the add-in views or zipped archives.
- Zip files can contain any number of files but must not contain subdirectories. If subdirectories are included in the zipped archive, the subdirectories will be removed.
- Zip files must contain only one *.dll* file that references the add-in views. If more than one add-in is included in the zipped archive, the add-ins will not be properly activated. The *.dll* file in the zipped archive that contains the reference to the add-in views must have the same name as the zipped archive.
- The names of *.dll* files you upload must be unique and the names of the assemblies they contain must match the *.dll* file names. If the name of the assembly does not match the name of the *.dll* file you upload, the assembly will not link correctly with the profiles that should have permission to use it.

Using the Add-In Manager

The Add-In Manager lets you quickly upload files and assign **profile** permissions to use the add-ins. You can also specify custom values for .NET attributes from the Add-In Manager. You can specify different values for each profile and interface and the specified values are stored in the Oracle database. This eliminates the need to store custom values for attributes in client-side XML configuration files. The Add-In Manager is also used to remove add-ins that you no longer use.

Note The Add-In Manager is available to only those staff members with the Configuration permission selected on their profile's Administration tab. Refer to Customizing profiles.

The Add-In Manager also includes an audit log where you can view information about add-in activity.

To add or edit an add-in

1 Click the Configuration button on the navigation pane.

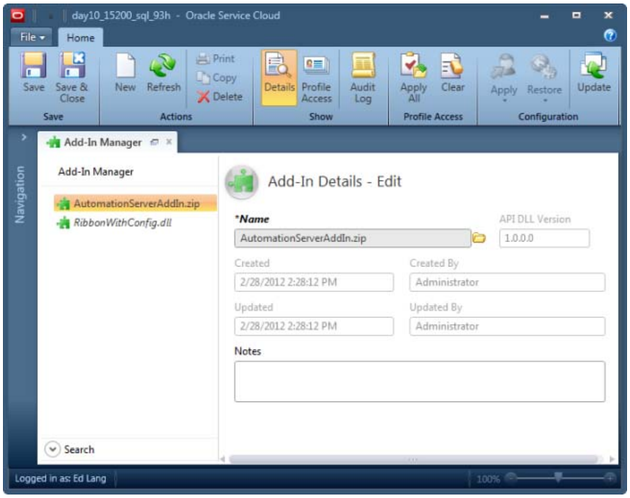
2 Double-click Add-In Manager under Site Configuration. The Add-In Manager opens on the content pane.

3 To open an existing add-in for editing, click the add-in name. If the add-in's *.dll* or *.zip* file has been modified or replaced by a different file, you can update the add-in to reflect the changes. Refer to To install an updated add-in file.

4 To install a new add-in, click the New button on the ribbon.

Important When the Open window initially displays, only *.dll* files appear. To view *.zip* files, click the Files of Type drop down menu and select Compressed Add-In Files.

a Select the add-in's file and click the Open button. The Name and API DLL Version fields on the Add-In Manager are populated.



When you add or edit an add-in, information about the add-in is displayed in the fields described in the following table.

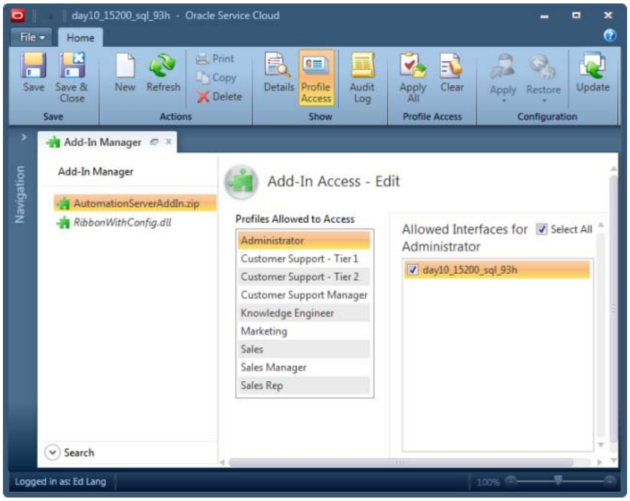
Table 109: Add-In Details Description

Field	**Description**
Name*	The name of the *.dll* or *.zip* file you uploaded.
API DLL Version	The version of the add-in API that the file was built against.
Created	The date and time the add-in was initially uploaded.
Created By	The staff member who uploaded the add-in.
Updated	The date and time the add-in was most recently updated.
Updated By	The staff member who most recently updated the add-in.

5 To select a different file for the add-in, click the Folder button in the Name field, select the file, and click the Open button.

6 To add a note to the add-in, type it in the Notes field.

7 To specify the profiles that can access the add-in, click the Profile Access button on the ribbon.



a Select the profile in the Profiles Allowed to Access section.

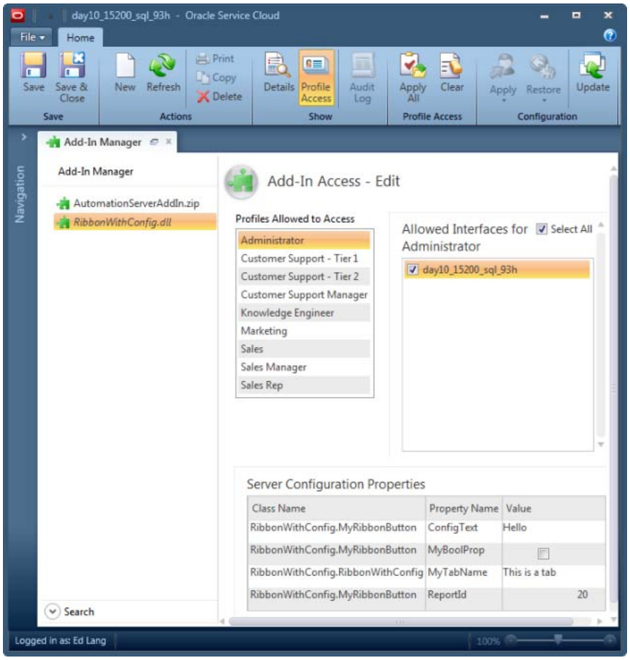
b Select the appropriate interface check boxes in this section. Only **interfaces** that the profile has permission to access are displayed in the Interfaces section.

c To give the selected profile access to the add-in on all interfaces, select the Select All check box.

d To grant add-in access to all profiles on all interfaces, click the Apply All button on the ribbon.

e To remove add-in access from all profiles and interfaces, click the Clear button on the ribbon.

When you enable the add-in for a profile and interface, the class names, property names, and default values for the add-in's configurable properties display.



8 Select the property you want in the Server Configuration Properties section and then double-click the property's Value field.

  a To change the value for a property with a string or numeric type, type the numbers or text you want for the property's value.

  b To change the value for a property with a Boolean (yes/no) type, select or clear the check box that is displayed.

9 To specify different property values for another interface, select the interface and repeat step 8.

10 To specify different property values for another profile, select the profile and repeat step 8.

11 To automatically apply the property values you specified to other profiles and interfaces, click the Apply button on the ribbon and select the appropriate option.

  a To apply the property values to all interfaces for the profile, select Apply this Configuration to All Interfaces for the Selected Profile.

  b To apply the property values to all profiles and interfaces, select Apply this Configuration to All Profiles and Interfaces.

12 To automatically remove customized property values from profiles and interfaces, click the Restore button on the ribbon and select the appropriate option.

   a To reset the values for all profiles and interfaces, select Restore the Default Configuration to All Profiles and Interfaces.

   b To reset the values for all interfaces enabled for the selected profile, select Restore the Default Configuration to All Interfaces for the Selected Profile.

13 Click the Save and Close button on the ribbon to save your changes and close the Add-In Manager.

To install an updated add-in file

1 Click the Configuration button on the navigation pane.

2 Double-click Add-In Manager under Site Configuration. The Add-In Manager opens on the content pane.

3 Click the name of the add-in you want to update.

4 Click the Update button on the ribbon.

Important When the Open window initially displays, only *.dll* files appear. To view *.zip* files, click the Files of Type drop down menu and select Compressed Add-In Files.

   a Select the add-in's updated file and click the Open button. The display is updated to reflect any changes from the updated add-in file.

5 Make any edits to the add-in that you need. Refer to To add or edit an add-in.

6 Click the Save and Close button on the ribbon to save the change and close the Add-In Manager.

To remove an add-in

1 Click the Configuration button on the navigation pane.

2 Double-click Add-In Manager under Site Configuration. The Add-In Manager opens on the content pane.

3 Click the name of the add-in you want to remove.

4 Click the Delete button on the ribbon.

Important You cannot delete add-ins when an upgrade test site exists. Refer to the [HMS Guide] for information about upgrading your site.

5 Click the Save and Close button on the ribbon to save the change and close the Add-In Manager.

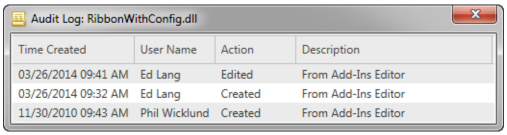
To view the audit log for an add-in

1 Click the Configuration button on the navigation pane.

2 Double-click Add-In Manager under Site Configuration. The Add-In Manager opens on the content pane.

3 Click the name of the add-in you want to examine.

4 Click the Audit Log button on the ribbon. The Audit Log window opens.



The audit log displays the type of action performed on the add-in, the staff member who made the change, when the action occurred, and where on the administration interface the action was performed.

5 Click X on the top right to close the window.

Add-ins in scripts and workspaces

Once you upload an add-in, you can place it on **scripts** and **workspaces** in the same way you add controls, such as report or browser controls.

The add-in can be displayed anywhere you want on the script or workspace or you can hide it using functionality in the script and workspace designers. You can also configure script branches and **script** and **workspace rules** to communicate with the add-in. Refer to Creating custom workspaces and Creating and editing scripts.

Add-ins in rules and branches

Once you place an add-in on a script or workspace, you can configure script branches and script and workspace rules to send information to the add-in and perform actions based on the add-in's response. For instance, if your organization handles customers whose products are still under warranty differently than customers with expired warranties, you could create a script branch that opens one script page if a customer's product is still under warranty and another page if it is not.

Important To interact with rules and branches, add-ins must include a function designed to accept information from branch and rule conditions.

This functionality could be added to your script in several ways, depending on how the add-in is written. One method would be to add a custom field to your script where customers enter their product's serial number and place an add-in on the script that compares the value entered in the custom field to a list of serial numbers that are under warranty. You would then create two script branches with the following configuration to branch to different pages on the script.

- Configure the branches to fire when a button is clicked or another action is taken on the script. For example, they could be triggered when the Next Page button on the script's navigation panel is clicked.
- Create one If condition for each branch that is checked when an add-in's control condition returns a certain value.
- When you edit the conditions, you can type the information you want to send to the add-in in the Add-In Parameter field. In this example, you could send the custom field's ID number to the add-in. The add-in would then find the value entered in the custom field on the script and compare it to an external database that contains serial numbers that are under warranty.
- Set different operators and values for the conditions in each branch. For instance, if you want the add-in to send back a response, such as "true" when it finds the serial number in the external database, set the operator to "equals" and the value to "true." Set the other branch's operator and value to "equals false."

Using this configuration, one branch would be triggered when the add-in finds that a serial number is under warranty and another branch would be triggered when the add-in finds it is not under warranty. Using script or workspace rules, you could further expand this example to update the external database with the serial number entered on the script when other conditions are met.

For details about creating script branches, refer to Adding branches. For information about script and workspace rules, refer to Workspace rules.

Safe mode

In severe cases, a malfunctioning add-in can prevent the **Service Console** from functioning properly and can even prevent **administrators** from logging in to remove the malfunctioning add-in. If this occurs and you are required to exit the **administration interface** without completing the normal logout process, the system notifies you the next time you log in that Oracle Service Cloud did not exit properly the last time, and asks if you want to log in using safe mode. Safe mode temporarily disables your add-ins, allowing you to log in and remove the malfunctioning add-in.

Analyzing add-in events and usage

Once add-ins are installed, you can view log files of the activity related to your add-ins. You can also view the add-ins that are enabled for your profile which may impact the behavior of the **Service Console**.

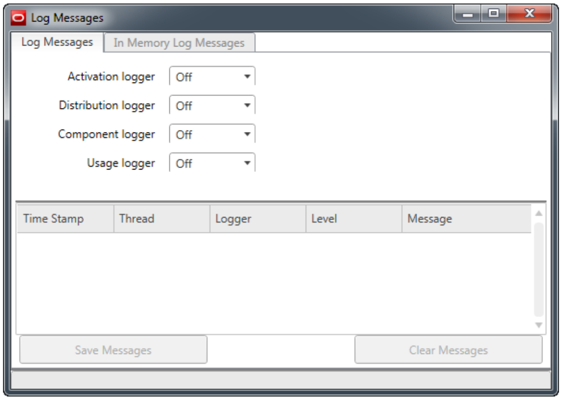
Logging add-in activity

The activity related to the add-ins that you use, or that you add or delete from the Add-In Manager, is automatically logged on the Log Messages window. Add-in logging is particularly useful for add-in developers or **administrators** who need to test or troubleshoot add-ins.

Important The entries on the Log Messages window are deleted when you log out of the **administration interface**. In addition, the messages are unique to your session and do not include messages related to other staff members' sessions. However, you can save the messages to text files for later viewing. Refer to Saving and removing log messages.

To open the add-in Log Messages window

Click **File**, select Add-In Logging, and then select View Current Log File.



Two tabs are available on the Log Messages window. The Log Messages tab shows only messages you choose to see, and the In Memory Log Messages tab displays all messages related to your add-in activity during your current session. Each message is associated with one of the message types described in the following table.

Table 110: Add-In Logging Message Types

Message Type	Description
Error	Error messages describe problems add-ins encounter that prevent them from working correctly.
Warning	Warning messages describe possible issues that may prevent add-ins from working as expected.
Information	Information messages describe events that happen to add-ins, such as when they are activated or deleted on the Add-In Manager.
Verbose	Verbose messages describe the flow of add-in actions, such as when an add-in executes an action. **Note:** Verbose messages are not displayed on the In Memory Log Messages tab.
Activity Tracing	Activity Tracing messages provide additional details about add-in activity, such as the amount of time it takes to execute an add-in action. **Note:** These messages are not displayed on the In Memory Log Messages tab.

If you want to view only certain types of messages or messages pertaining to certain activities, click the Log Messages tab and then select which message types you want to view from the drop-down menus described in the following table.

Table 111: Add-in Logging Drop-Down Menus

Drop-Down Menu	Description
Activation Logger	Message types in this drop-down menu are written to the log file when add-ins are activated or initialized. Entries will also be written when initialization fails or an exception occurs during activation or initialization.
Distribution Logger	Message types in this drop-down menu are written to the log file when add-in files are uploaded, updated, or removed.
Component Logger	Message types in this drop-down menu are written to the log file by active add-ins that use the IGlobalContext.LogMessage API.
Usage Logger	Message types in this drop-down menu are written to the log file when add-ins are used. The specific entries written to the log vary depending on the add-ins' functions.

Saving and removing log messages

All messages on the Log Messages window are removed when you log out of Oracle Service Cloud. However, you can save the messages for later viewing or remove the messages without logging out of the application. These options apply only to the messages displayed on the window's active tab.

Note You can open the log files using any text editor, or you can open them from the **Service Console** by clicking **File**, selecting Add-In Logging, and then selecting View Previous Log File.

To save log messages

1 Click File, select Add-In Logging, and then select View Current Log File to open the Log Messages window.

2 Select the tab with the messages you want to save and then click the Save Messages button. A window opens where you select the location and name of the text file containing the log messages.

To remove log messages

1 Click File, select Add-In Logging, and then select View Current Log File to open the Log Messages window.

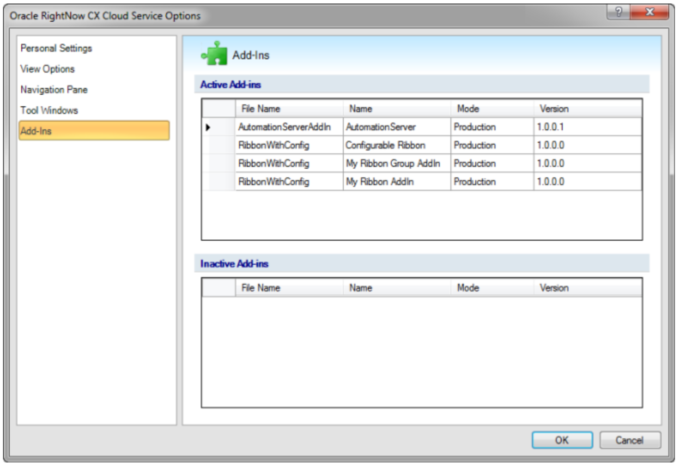
2 Select the tab with the messages you want to remove and then click the Clear Messages button.

Viewing available add-ins for your profile

The add-ins that are enabled for your **profile** can impact the behavior of the **Service Console**. Therefore, you will want to view lists of the enabled add-ins to see which ones you can access on the interface you are logged in to and add-ins that are not applicable to the current interface.

To view add-ins for your profile

1 Click **File** and select Options > Add-Ins. The list showing the add-ins enabled for your profile displays on the right.



The list displays four columns of information showing the file name, display name, mode, and version number of each installed add-in. The mode can be either production or development. Add-ins in production mode were installed using the Add-In Manager. Add-ins in development mode were manually added to the workstation, generally for testing purposes.

2 Click the OK button to close the list.

18

Multiple Interfaces

Each installation of Oracle Service Cloud initially contains one knowledge base and one interface. The knowledge base contains all the data needed to run Oracle Service Cloud and organizes it in a meaningful way by connecting the related components, such as products, answers, and staff accounts. The interface, on the other hand, is designed solely to display the data stored in the knowledge base. When you use multiple interfaces, each interface can be a unique configuration of the data in your installation's single knowledge base.

For example, you might want an interface for your retail customers that is different from the one for your corporate customers. You may need Spanish- and French-language sites in addition to your primary English-language site to serve all your North American customers. Or perhaps your company produces different product lines and you want to create an interface for your medical electronics customers that is different from the one you use for your computer system customers.

In addition to offering multiple customer sites, you can also control how information is displayed on the **agent desktop**. Using visibility settings for specific fields in each interface, you choose what can be viewed by your staff members.

Overview of multiple interfaces

Additional interfaces are **cloned** from the original, or primary interface. The new interface is then configured separately from the primary interface. The process is the same regardless of the number of interfaces that have already been created.

Important When you create customer portal pages for multiple interfaces, you must set up each one separately. See Configuring Oracle Service Cloud for the Customer Portal.

Alternatives to multiple interfaces

Before configuring multiple interfaces, you should consider whether that solution best addresses your organization's needs since other options may be more appropriate.

- **Multiple knowledge bases**—If your organization has sensitive information that you do not want to share across interfaces, you might want to consider using separate **knowledge bases** rather than multiple interfaces. When using multiple interfaces, many records on the agent desktop can be viewed by all staff members, including those with access to just one interface. For example, agents with permission to view contacts can view all contacts, regardless of the interface. Using separate knowledge bases lets you offer different support sites, just as you can with multiple interfaces, but the installations are completely separate and each site has a unique set of data.

Note Contact your Oracle account manager for information about multiple knowledge bases.

- **Privileged Access**—If you want only to grant varying levels of information to different groups of customers but do not have sensitive information and do not require a unique configuration for each interface, consider using privileged access rather than multiple interfaces. See Enabling privileged access to answers.

Interface options and settings

When you **clone** an existing interface, the new interface is initially identical to the original interface. You must make changes to the cloned interface so that it presents the information you want in the format you want it to display.

It is important to understand how all interfaces are affected by changes you make to a single interface. Some changes appear on all interfaces regardless of the interface where you created or changed them. Some changes appear only on the interface where you make them. And still other types of changes appear only on the interfaces you select. See Common items and settings, Interface-specific items and settings, and Options with interface visibility settings.

Note The configuration and analytics items in the following lists are displayed beneath their default locations on the navigation pane. However, they may display in different locations or not at all depending on your navigation set configuration. The lists also display common and interface-specific record types.

Common items and settings

Certain items and settings are shared across all interfaces and are not interface-specific. Therefore, when you add or change one of the items on one interface, it automatically appears on the other interfaces. For example, staff accounts added while logged in to one interface can be viewed and edited from any interface.

The following items are common across all interfaces.

Configuration

- Staff Management
  - ▷ Accounts
  - ▷ Profiles
  - ▷ Password Configuration
- Application Appearance
  - ▷ Client Workflow Images
  - ▷ Customizable Menus (Answer Statuses, Asset Statuses, Billable Tasks, Chat Agent Statuses, Chat Session Queues, Contact Roles, Contact Types, Incident Queues, Incident Severities, Incident Statuses, Opportunity Statuses, and Organization Address Types)
- Site Configuration
  - ▷ Distribution Lists
  - ▷ Rules
  - ▷ Site-specific configuration settings
  - ▷ Site-specific message bases
  - ▷ Process Designer
- Internationalization
  - ▷ Countries
- Service
  - ▷ Answer Stopwords
  - ▷ Service Level Agreements (SLAs appear on all interfaces. However, you must set the response requirements separately for each interface.)
  - ▷ Guided Assistance
  - ▷ Social Monitor
- Opportunity Tracking
  - ▷ Product Catalog

- ▷ Strategies
- ▷ Sales Periods
- Outreach
    - ▷ External Suppression List
- Database
    - ▷ Data Dictionary
    - ▷ Object Designer
    - ▷ Incident Thread Type Correction
    - ▷ Data Import Template
    - ▷ Data Import Wizard
    - ▷ Email Address Sharing

Analytics

- Report Styles
- Chart Styles
- Color Schemes
- Report Images
- Text Fields

Record types

- Contacts
- Organizations
- Tasks
- Standard reports
- Incidents
- Answers
- Opportunities

Interface-specific items and settings

In contrast to common items and settings, others are unique to an interface and impact only the interface they are configured on. For example, to configure a Service mailbox, you must log in to the interface the mailbox will be used with. These items are indicated in the following list.

Other items and settings, such as message bases, are interface specific, but can be configured from any interface. Before configuring the item or setting, you select the interface you want to configure.

Configuration

- Application Appearance
  - ▷ Workspaces/Workflows—Can be configured only for the logged-in interface
  - ▷ Navigation Sets—Can be configured only for the logged-in interface
  - ▷ Scripts—Can be configured only for the logged-in interface
- Site Configuration
  - ▷ Interfaces
  - ▷ Message Templates
  - ▷ Customer Portal
  - ▷ Mailboxes—Can be configured only for the logged-in interface
  - ▷ Interface-level configuration settings
  - ▷ Interface-level message bases
  - ▷ File Manager
- Service
  - ▷ External Search Configuration—Can be configured only for the logged-in interface
  - ▷ Search Priority Words—Can be configured only for the logged-in interface
  - ▷ Incident Stopwords—Can be configured only for the logged-in interface
  - ▷ Topic Browse
  - ▷ Response Requirements
  - ▷ Variables
- Opportunity Tracking
  - ▷ Promotions—Can be configured only for the logged-in interface

Record types

- Custom reports—These are configured from the interface they display on, but can display data from multiple interfaces. See Exporting report definitions to learn about copying reports from one interface to another.
- Audiences
  - ▷ Contact Lists
  - ▷ Segments

- Campaigns
- Content Library
  - ▷ Documents
  - ▷ Templates
  - ▷ Snippets
  - ▷ File Attachments
- Mailings
- Questions
- Surveys
- Tracked Links

Options with interface visibility settings

There is another set of options that may be shared across interfaces, but only if you set the visibility setting of the option to appear on the selected interfaces. The following list includes those options that can be visible on other interfaces if you set them to appear on the specific interfaces. See Editing visibility in configuration items.

Configuration

- Application Appearance
  - ▷ Customizable Menus (Answer Access Levels, Competitors, Industry Types, Lead Rejection Types, and Win/Loss Reasons)
- Site Configuration
  - ▷ Add-in Manager
  - ▷ Logs
- Internationalization
  - ▷ Currencies/Exchange Rates
- Service
  - ▷ Holidays
  - ▷ Products/Categories/Dispositions
  - ▷ Standard Text
- Opportunity Tracking
  - ▷ Product Catalog
  - ▷ Price Schedules
  - ▷ Quote Templates
  - ▷ Territories

- ▷ Strategies
- Outreach and Feedback
  - ▷ Tracked Link Categories
- Database
  - ▷ Custom Fields

Configuring multiple interfaces

The following steps summarize the procedures involved in creating and configuring an additional interface. After you have completed the first two steps, you need to decide which of the remaining steps in this section you need to implement. Your decision depends on what you want to accomplish using your interface, but it is likely that you will want to implement many, if not all of them.

1. Determining your interface needs—Decide how your staff and customers are going to use the new interface to determine how it must be configured. Your Oracle account manager can assist you in defining your objectives.

2. Defining interface properties—Change the interface name that appears on the agent desktop.

3. Managing staff member accessibility—Use navigation sets, workspaces, and profiles to establish the interfaces staff members have permission to access and work on.

4. Editing visibility in configuration items—Customize configuration items with specific visibility settings such as custom fields and products.

5. Configuring and customizing the interface—Customize the interface-specific configuration settings for each new interface through the Configuration Settings editor.

6. Creating business rules to manage multiple interfaces—Define rules to automatically assign incidents and opportunities to the proper interface and queue or staff member.

7. Configuring mailboxes—Customize your Service and Outreach mailboxes in each interface.

8. Customizing message templates—Customize the notifications and emails that can be sent to your staff members and your customers from each interface.

9. Adding answers—Determine the content you want to provide to your customers through the customer portal and create your answers.

Determining your interface needs

When you clone an interface, the new interface is a duplicate of the original interface and has the same customized configuration. For this reason, we recommend waiting to clone your interface until you complete configuring the original interface. This can help reduce the amount of customization you need to do on the cloned interface, particularly if you want the interfaces to be similarly configured.

Before you clone interfaces, you should consider how your staff members and customers will use the new interface and what changes you need to make to accomplish the intended purpose. As a starting point, consider whether the language will change, whether the new interface needs to send and receive email, what **custom fields** and customizable items you want to appear on the new interface, which configuration settings (site or interface specific) and message bases need to change, and whether you can use **business rules** to manage the new interface.

Important Because configuration settings and message bases are categorized as site or interface specific, it's critical to know which settings will affect all interfaces (site specific) and which ones will affect only one interface (interface specific). Since there are fewer site-specific settings, it is easier to identify those by searching for all site specific settings on the Configuration Settings editor. Using this search criteria, you can easily see which settings are applied across all interfaces and decide what is best for your situation. See Searching configuration settings and Searching message bases.

Also consider what level of access your staff members and customers should have to the new interface to determine if you need to modify profiles or reconfigure customer portal pages. You should also identify who, if any staff members besides you, will have administration permissions on all interfaces. Ideally, a limited number of administrators have access to all interfaces. If you have a large number of administrators, it can be challenging to prevent unwanted additions or deletions of fields or items that affect the incorrect interface.

Tip While performing this step, start thinking about naming conventions for your staff accounts, profiles, customizable menus, and custom fields. For example, the names you select for profiles configured for an internal interface could begin with "internal" to make it easier to identify the profiles that belong to the interface.

❖ Site Configuration

Defining interface properties

After your new interface is cloned, you may want to change the name of the interface as it displays for staff members. Changing the interface name affects only the display of the interface name as it appears to staff members on the agent desktop. URLs to your interfaces will continue to use the original interface name. You can also change the answers report customers will use on the interface. This is helpful if you want your customers to use a custom report you have created instead of the standard report.

Important For information about administrator notifications, administrator emails, and contact emails that you can customize for each interface, see Customizing message templates.

For information about the Chat Hours editor, see Setting chat hours.

To change the interface display name and answers report

1 Click the Configuration button on the navigation pane.

2 Double-click Interfaces under Site Configuration. The content pane displays the Interfaces tree and editor.

3 Select the interface name you want to edit.

4 Type the new interface name in the Display Name text box.

5 To change the answers report, click the Contact Visible Answers Report drop-down menu and select a report from the menu options. See Changing the answers report.

6 Click the Save and Close button on the ribbon to save the new display name.

Managing staff member accessibility

There are three components that affect how your staff members can access your interfaces: navigation sets, workspaces, and profiles. In order to present the appropriate information to staff members, and allow access to only those interfaces and features required by your organization, it is important to understand how the components work together.

Navigation sets

Navigation sets define what appears to staff members on the agent desktop. In addition to the buttons on the navigation pane, you can determine which reports staff members can access and which appear by default when the console opens or a navigation button is clicked.

By selecting proper reports for each navigation set, you can limit the results for staff members to the interface they primarily work from. For example, you may want to set the incidents reports that display in the navigation list to only those reports that filter by a particular interface. See Creating navigation sets.

Once your navigation sets are configured, you can assign them to profiles. See Customizing profiles.

Workspaces

Workspaces can help define how staff members use your interfaces. Since each profile uses separate workspaces for each interface, you can create different workspaces to accommodate staff members who use different interfaces. For example, staff members who log in to an interface used by external customers may use a contact workspace that includes the contact first name and last name fields. Staff members who log in to an internal interface may use a contact workspace that shows only the contact email address field. By using different workspaces on each interface, you can display only those fields staff members need to view or fill in on that particular interface. After your workspaces are created, you can assign them to the necessary profile. See Custom workspaces.

Profiles

Each staff member is assigned a profile that determines which interfaces the staff member can access. Profiles also determine the queues staff members can pull incidents from, so you must ensure that the profile can access the appropriate interfaces.

In addition, you can specify the navigation set and the workspaces staff members use through their profile. For each profile, you can specify the navigation set used on each interface, as well as the workspaces used for each record type on each interface.

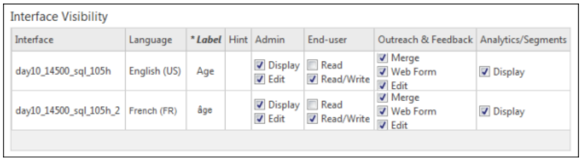
When you clone an interface, all profiles with permission to access that interface automatically have permission to access the new interface. If you do not want certain profiles accessing the cloned interface, you must edit the profile settings to remove that permission. See Customizing profiles.

Editing visibility in configuration items

You can specify the interfaces where certain configuration items appear, while others are visible across all interfaces. Those items visible on all interfaces are listed in Common items and settings. When you add one of these items to your interface, it appears on all interfaces. For example, if you add a custom **incident status**, staff members working on incidents from any interface can set an incident to that status.

Other configuration items, such as custom fields, contain visibility settings for selecting the interfaces on which they appear. These items are listed in Options with interface visibility settings. Some of these let you select the interfaces and others let you specify not only the interface, but also whether the item is visible on the customer portal or the agent desktop. If you have separate customer portal pages for different product lines, for example, you will likely want to restrict sales products to unique interfaces so that they appear only on the appropriate site.

To specify the interfaces where you want the configuration item to appear, simply select the check boxes for each interface. The following figure shows the interface visibility settings for a contact custom field.



In a multiple language installation, you can specify that configuration items appear on all interfaces but change the name for each interface to show the translated version of the item. You do this by logging in to the proper interface and typing the foreign language word in the Label field.

Configuring and customizing the interface

Each interface has its own configuration settings. When you cloned your interface, any customized configuration settings were copied to the new interface. You must manually adjust any configuration settings that should be changed for the new interface. For example, you may choose to let customers ask a question on one interface but not the other. Select the interface on the left side of the Configuration Editor to change the configuration for that interface. See Customizing configuration settings.

Note For configuration settings specific to the customer portal, see Defining configuration settings.

❖ Site Configuration

Creating business rules to manage multiple interfaces

When you create rules for multiple interfaces, you must be aware of the visibility settings for your custom fields and customizable menu items. The rules engine can access all custom fields and customizable menu items regardless of their visibility settings, so all conditions and actions that use those fields and items are available to you, even if they cannot be displayed on the interface. See Options with interface visibility settings for a complete list of options with visibility settings.

Because the rules engine does not filter fields and menu items based on their visibility on the interface, you run the risk of setting a field or menu option that is not visible. To prevent meaningless actions and ensure that the rules engine sets the field or menu item you want it to, you can specify the interface as one of the rule's conditions when you create incident, chat session routing, opportunity, and target rules. And, if the object meets certain conditions, you can use a rule action to set the interface to a different one for rule processing.

It is important that an object be processed on the correct interface because the rules engine uses the **message bases** and configuration settings of the interface associated with the object. For example, if you try to use an English-language interface to process an incident that was sent in German, any message bases used to respond to the incident will be in English. For that reason, it is important that objects be processed on the correct interface. Fortunately, rule actions let you set the interface when the rule's conditions are met.

And although you cannot set the language or mailbox in a rule's action, you can use them as conditions to set the interface in the rule. Assume, for example, you have two interfaces: one English-language interface and one German. Also assume that **Techmail** is scheduled to run only on the English interface. While you cannot change an incident's language to German in a rule, you can change its interface. And, since the interface uses the message bases of the interface processing the rule, changing the interface accomplishes the same results.

The following rule demonstrates this.

If Incident.Language equals German

Then Set Interface Name to german_interface

See Business Rules Management. For examples of commonly used business rules, see Business rules examples.

Configuring mailboxes

If you have Oracle RightNow Cloud Service (Service) enabled, you must create at least one Service mailbox for the new interface in order to send and receive email. If Oracle RightNow Outreach Cloud Service (Outreach) or Oracle RightNow Feedback Cloud Service (Feedback) is enabled, you must create at least one Outreach mailbox so you can create and send mailings and surveys. If you have multiple mailboxes for the interface, you must specify a default Service mailbox and a default Outreach mailbox. Even though you can configure your interface to send email from a single address, if you have multiple mailboxes, you must configure each mailbox separately. See Adding and editing mailboxes.

Important To ensure accurate processing of replies, inbound messages, and bounces, Outreach mailboxes cannot be shared with either type of Service mailbox (**Oracle-managed Service** or general Service). **Techmail** handles messages in Service mailboxes differently from how it handles them in Outreach mailboxes. For this reason, you must set up one mailbox for Service and a separate mailbox for Outreach and Feedback.

Note Distribution lists are not interface specific so any distribution list you add on one interface is available on all other interfaces. See Managing distribution lists.

Customizing message templates

You may want to change the notifications, emails, and print templates that can be sent to your staff members and your customers from each interface. You may also want to change the content that is sent by interface. Message templates lets you define the format of your messages and disable certain messages if they do not pertain to an particular interface. You can also customize your logo, your headers and footers, and your message content.

For example, if you have a parent company with multiple subsidiaries, each with a unique brand, the look and feel of each interface can be defined using the global template. The global template is then applied across every single message that is enabled on that interface. See Working with the Message Templates editor.

Adding answers

When you create answers to populate your knowledge base, you need to think about which interfaces you want them to appear on and then associate them with the proper answer access level. For example, you could create two custom answer access levels, Internal and External, each with visibility on different interfaces. Answers with the Internal access level would display on only the interface used by your organization’s employees. Answers with the External access level would display on only the interface used by your external customers. To have the answer appear on both interfaces, select the access level Everyone.

Although we recommend that you use answer access levels as the key element for determining answer visibility, there are other ways to control where answers are displayed and who can view them. The following table lists the other methods you can use to control the display of answers.

Table 112: Controlling the Display of Answers

Item	Method
Answer Access Levels	Select the interface you want the access level to display on.
Products and Categories	Select the interfaces where each of your products and categories are visible.
Answer Statuses	Select the Public answer status type to display answers on the customer portal. All other types restrict the display so customers cannot see them.
Languages	Create the answer on a language interface to restrict the answer display to that language.
Conditional Sections	Insert a section with certain visibility restrictions within an answer. **Note:** If a section of the answer is assigned an access level that is not visible to customers on a particular interface, but the answer is visible, then customers can view the answer but not the conditional section. See Inserting conditional sections.

19

Common Functionality

Oracle Service Cloud is designed for efficiency. One way it accomplishes this is by making procedures as similar as possible. Once you know how to attach files to an incident, for example, you can use that knowledge to attach files to any kind of record. By understanding common functionality, you improve your confidence and efficiency when working in Oracle Service Cloud.

Common functionality applies to searching, opening, forwarding, copying, printing, assigning, **flagging**, and attaching files to different types of records. Also common to Oracle Service Cloud are standard **workspaces**, audit logs, spell checking, workgroups, Outlook appointments, and notifications. Because the majority of common functions are performed using the **ribbon**, it is important that you first become familiar with it.

Working with the ribbon

All items that appear on the **content pane**—reports, explorers, and records—display a ribbon at the top of page, just below the red button at the top left of the console. The ribbon has tabs and buttons that let you work with a report, an individual record in the report, or an item in the explorer tree. Buttons are organized into groups, and each tab may include several groups.

Click any ribbon tab to display that tab's buttons. Or, with your mouse or other pointing device positioned anywhere in the ribbon, scroll down to move one tab to the right. Scroll up to move one tab to the left. The following figure shows the ribbon for an incidents report.

Notice the buttons on the Home tab. Some contain an arrow, including Open, New, Print, Copy, Assign, and Delete. Clicking the arrow rather than the button displays a list of associated records you can take the action on instead of the incident, which is the default record that the action applies to. For example, if you click the Open button, the incident that you have selected on the content pane opens. If you click the arrow on the Open button, a menu displays the records you can open (incident, contact, organization, or mailing) that are associated with the selected incident.

Some tabs, buttons, and groups always appear on the ribbon no matter what is displayed on the content pane. Others are content dependent. That is, they change to reflect what appears on the content pane and the allowable actions for that report, explorer item, or record.

Note If nothing opens on the content pane when you log in, the ribbon is empty except for the Home tab. Refer to Changing navigation pane settings to see how to define what opens on the content pane when you log in.

When you want to display a larger section of a report and do not need access to the ribbon, you can easily minimize it. You will still have access to the tabs and buttons you need.

- To minimize the ribbon, double-click any tab with focus or press **Ctrl+F1**.
- To restore the ribbon, double-click any tab or press **Ctrl+F1**.
- To display and select buttons on a tab without maximizing the ribbon, just click that tab.

❖ Changing navigation pane settings

Customizing the Quick Access toolbar

The Quick Access toolbar, which appears next to the red button at the top left of the console by default, provides shortcuts to commands on the **ribbon**. The initial set of buttons on the Quick Access toolbar is specified by what is displayed on the **content pane**, but you can customize the toolbar to add buttons you frequently use. (The customized toolbar is stored in local settings on your workstation. Refer to Changing your personal settings.)

Tip Some ribbon content cannot be added to the Quick Access toolbar, including check boxes, combination boxes, text fields, and some other input fields.

The following figure shows the default Quick Access toolbar that appears when you add or edit an incident.

To customize the Quick Access toolbar

1 To add a button to the Quick Access toolbar, right-click the button on the ribbon and select Add to Quick Access Toolbar.

2 To add a content-dependent or global option on the file menu to the Quick Access toolbar, click File, right-click the option on the left panel of the file menu, and select Add to Quick Access Toolbar.

3 To remove a button from the Quick Access toolbar, right-click the button on the toolbar and select Remove from Quick Access Toolbar.

4 To move the Quick Access toolbar from above the ribbon to below the ribbon, click the drop-down button on the Quick Access Toolbar and select Place Quick Access Toolbar Below the Ribbon.

5 To reset the Quick Access toolbar to its default settings, click the drop-down button on the Quick Access Toolbar and select Reset Quick Access Toolbar to default.

❖ Changing your personal settings

Displaying shortcut keys on the ribbon

Shortcut keys are available for all **ribbon** buttons so you can type a key combination to perform an action rather than clicking a button on the ribbon.

To display shortcut keys on the ribbon

1 While editing a record or working in an explorer, press **Alt** plus the first letter of the ribbon tab that you want to display shortcut keys for. For example, press **Alt+h** to display the shortcut keys on the Home tab of the ribbon.

2 Type the keys associated with a particular button to perform the button's action. After using this method to perform an action, the shortcut keys no longer display.

❖ Shortcut Keys

Searching for records

One way to find a specific record when a report is open is by scanning the list of displayed records to see if you can spot it. However, Oracle Service Cloud offers other much more efficient methods of searching for records. Besides simply looking in a report for a record, you have the following search options.

- Searching for records from a report—If you do not immediately see the record you want in the report, you can search for it. The filters that appear when you click the Search button depend on the report and which filters have been defined for it.
- Searching for records with Quick Search—With the Quick Search component, you can search for a specific record by entering as much or as little information about the record as you have. The list of records that match the information you enter is displayed, and you can select the one you want.
- Searching from open records—You can search for contacts and tasks from any open record that has a contact or task associated with it. You can also search for organizations from some types of open records.

❖ Searching for records from a report
❖ Searching for records with Quick Search
❖ Searching from open records

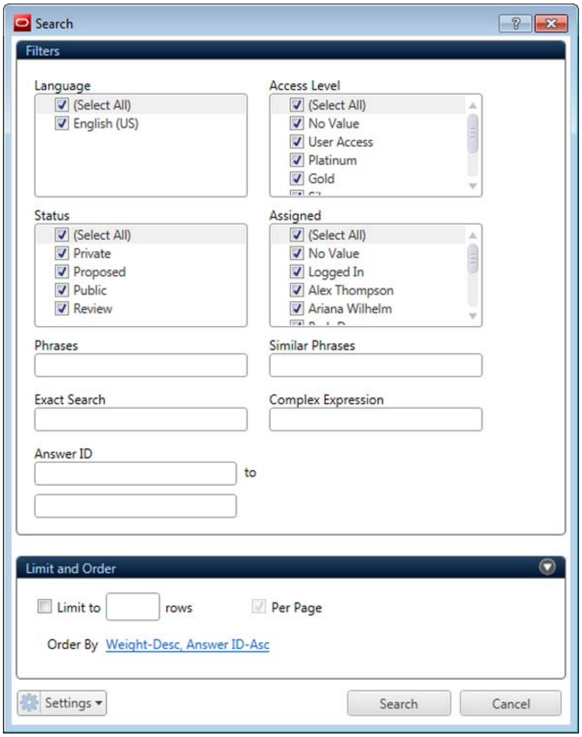
Searching for records from a report

Double-click any report in a navigation list to display a list of records in the report on the content pane. (The reports in your navigation lists are determined by the **navigation set** assigned to your profile.) The information displayed on the content pane depends on the report you selected and which fields were defined when the report was created.

When you search for records using a report's Search function, you can identify records that meet the criteria you specify. For example, you can search for incidents assigned to a certain staff member, answers that contain particular words or phrases, or tasks that are due this week. You can then sort your search results in ascending or descending order based on any of the filters you used for searching.

To search for a record from a report

1 With a report displayed, click the Search button on the Home tab of the ribbon. A Search window opens, displaying the search filters that are available for that report. (Each report uses the filters specified in the report definition.) The following figure displays the Search window for an answers report.



Tip You can resize the Search window to display all of the filters available for a given report. The size of the Search window is retained until you resize it again or reset the workstation local settings. Refer to Changing your personal settings.

2 To specify a filter that has a check box, select the check box next to each filter you want to use in your search or clear the check box for those you do not want to use.

3 To specify a date filter, click the calendar button in the field to display the current month's calendar. Then select the date. (Use the arrows at the top of the calendar to change the month if necessary before selecting the date.)

4 To specify a text filter, type text in the field. You can use an asterisk (*) as a wildcard in your search term.

a When you are searching for answers, you can use the search text type fields Phrases, Similar Phrases, Exact Search, Complex Expression, or Answer ID. Enter field information described in the following table to search on text fields.

Note All search types look for different word forms such as singular, plural, or different verb tenses. For example, searching for *reflect* will find answers that contain *reflection, reflections, reflected, reflecting,* or *reflects.*

All search types use the logical operators + (AND) and – (NOT). Insert + before a word to find answers that must include the word. Insert – before a word to exclude answers containing that word. For a list of special characters that can be used for searching, refer to Using special characters when searching.

The answer's Summary, Question, Answer, and Keywords fields are searched for matching terms.

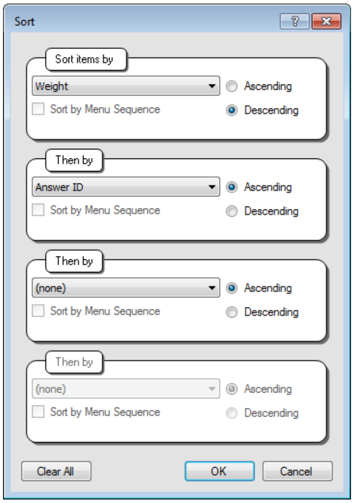
Table 113: Answer Text Field Search Options

Field	Description
Phrases	Select this search technique to search for answers containing the words in the phrase or question you type. Multi-word phrases usually produce better search results.
Similar Phrases	Select this search technique to search for answers that contain the words or phrase you type as well as answers containing synonyms for the words you enter.
Exact Search	Select this search technique to search for answers with the same pattern of words as the words you type. Only answers containing an identical pattern of words are matched, although the words in the matching answers may be separated by stopwords such as *a, an,* or *the.*
Complex Expression	Select this search technique to search for answers containing the complex expression you type. This technique allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only. Refer to Using special characters when searching.
Answer ID	Type a range of answer IDs to search for answers with answer IDs within the specified range. Wildcard characters are not supported in Answer ID searching.

5 To limit the number of records returned in the search, select the Limit To check box and type a number in the Rows field. The total number of search results is restricted to this value. If the Limit To check box is cleared, the search results are unlimited.

6 To limit the number of records returned per page to the number specified in the Rows field, select the Per Page check box. Instead of the total number of search results being limited to the value in the Rows field, every page will return that number of results.

7 To establish the order for sorting search results, click the text in the Order By field. The Sort window opens.



a Select the primary field you want to sort by from the Sort Items By drop-down menu.
b To sort by the selected field in ascending order, select the Ascending radio button. To sort in descending order, select the Descending radio button.
c To sort on additional fields, select the fields to sort on from the Then By drop-down menus. When you define multiple sort fields, the records are initially sorted by the first sort field. If any of the records have the same value for the first sort field, those records will then be sorted by the subsequent sort fields.
d To remove all sort options, click the Clear All button.
e Click the OK button to close the Sort window.

8 To save your selections as default search filters for the report, click Settings and select Save as Default Values.

9 To restore the filters to the default settings for the report, click Settings and select Restore Default Values. You can also restore the defaults from the Personal Settings option. Refer to Changing your personal settings.

10 To reset the current selection criteria to their default values that were populated when the report was opened, click Settings and select Reset Values.

Tip You can customize the Search window layout in the report you are using, and save it to your local workstation so you will see the same filter positions, sizes, and ordering when you next open the report. Refer to Customizing the Search window.

11 Click the Search button to close the Search window and display the records that match your search criteria.

❖ Using special characters when searching

Using special characters when searching

Oracle Service Cloud supports wildcard searching and also allows other characters to produce more accurate results. The following table contains a list of the characters you can use, including how the characters are interpreted as well as the importance of the placement of the characters in the text string. Also included is a list of invalid search characters.

Tip All of these guidelines apply when you are searching using a complex expression. When you are searching using phrases, similar phrases, and exact search, only the following characters apply: + - _ / @ : <> & and white space. Other punctuation is ignored and also acts as a word separator.

Table 114: Special Characters Allowed When Searching

Character	Description
+	Always considered the logical operator meaning "must include."
-	May appear in the middle of a word or number, but when it is placed at the beginning of a word or number, it is always taken to mean "must not include."
.	May appear in the middle of a word or number, but is otherwise considered punctuation.
_	May appear in the middle of a word, but is otherwise unrecognized.

Table 114: Special Characters Allowed When Searching (Continued)

Character	Description
/	May appear in the middle of a capitalized word or a number, but is otherwise considered punctuation. **Note:** And/or uses the / as punctuation to separate the word “and” from “or,” but I/O is recognized as a single word.
@	May appear in the middle of a word, but is otherwise unrecognized.
*	Allowed only at the end of a word or number. It will act as a word separator otherwise. One exception is that it is specifically recognized as a leading character when directly preceding the @ to allow regular expression searching of the sort: *@example.com.
:	Allowed within a number only. Otherwise, it is considered punctuation.
< >	Text enclosed within the angle brackets “<” and “>” is ignored. Otherwise, the angle brackets are treated as punctuation.
&	Allowed as part of an embedded word, but is otherwise considered punctuation.
Whitespace (tab, return, space)	Ignored and acts as a word separator.
~	Allowed after a word to specify a broader search on the following word by using synonym expression and spelling correction.

Searching for records with Quick Search

Quick Search functionality lets you access any record or file when you have only limited information about the item. Quick Search is an ideal way to search the **knowledge base** no matter what **navigation list** is displayed or what is open on the content pane.

For instance, you could be working on a contact record and want to view an answer without changing navigation lists. Using the Answer Quick Search report, which you can access from a drop-down menu on the Quick Search **tool window**, just enter the answer ID and click the Search button. The answer opens on the content pane, and you can take any action you need.

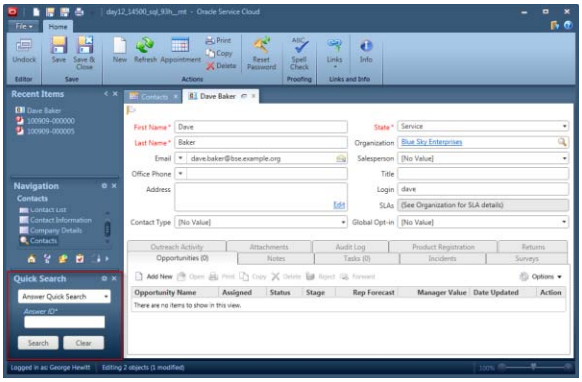
All Quick Search reports access data in the operational database instead of the report database to ensure that the most current data is always returned. Refer to Report databases.

Important Oracle Service Cloud contains a number of predefined Quick Search reports. The reports that appear in the Quick Search drop-down menu depend on what reports were added to the Quick Search button in your **navigation set**. Additionally, if you have permission to customize your navigation set, you can add and remove Quick Search reports as necessary. You cannot, however, add folders or other items to the list of Quick Search reports. See Customizing navigation and configuration lists.

- Report databases
- Customizing navigation and configuration lists

To search for an answer with Quick Search

1 Click the Quick Search drop-down menu on the Quick Search **tool window** and select Answer Quick Search.



Tip You can also press **F3** to make the Quick Search tool window active. If Quick Search is closed, pressing **F3** will open it in an undocked window.

2 Type the answer ID and click the Search button. The answer opens on the **content pane**.

Note Since the answer ID must match exactly, only one answer can match the answer ID you type. However, other quick search types allow you to enter just the first few characters of the search term, returning all records that match your partial search criteria on the content pane, where you can select the record you want.

3 To perform another search, click the Clear button to clear the Answer ID field.

Predefined Quick Search reports

The fields that display when you change Quick Search reports are unique to the type of record or file you are searching for. The following table lists the available fields in each predefined Quick Search report. Keep in mind that your list of Quick Search reports may be different from the reports described here.

Table 115: Search Fields for Predefined Quick Search Reports

Predefined Quick Search Reports	Description
Answer Quick Search	Type the answer ID.
Asset Search	Type the asset name, serial number, organization name, or contact name or select a service product from the Product drop-down list.
Campaign Search	Type the campaign name.
Contact Quick Search	Type the contact's last name, first name, or email address.
Incident Search	Type the incident reference number.
Mailing Search	Type the mailing name.
Opportunity Search	Type the opportunity name.
Opportunity Tracking Task Search	Type the task name.
Organization Quick Search	Type the organization name.

Table 115: Search Fields for Predefined Quick Search Reports (Continued)

Predefined Quick Search Reports	**Description**
Outreach Task Search	Type the task name.
Quick Search Dashboard	Type the incident reference number, contact name, organization name, or opportunity name.
Service Task Search	Type the task name.

Searching from open records

You can search for contacts, organizations, or tasks from many types of open records. For example, when you are working on an incident, you might need to search for a contact to associate with the incident. The following lists the types of searches you can do from various open records.

- Search for a **contact** from an open incident, opportunity, organization, task, asset, or contact list.
- Search for an **organization** from an open contact, incident, opportunity, task, or asset.
- Search for a **task** from an open answer, contact, incident, opportunity, or organization.

Checking recent items before searching

Make a practice of checking your recent items before searching. Just click the link in the field next to the Search button to view a list of the records you've recently worked on, if any are available. If you find the record you're looking for, select it. This is a quick way to associate a record, such as a contact, with an open record without having to conduct a search. If you don't find the record you're looking for, or if no records are available, then conduct a search using one of the following procedures.

This functionality applies only to incident, contact, organization, task, chat, asset, and custom object workspace types.

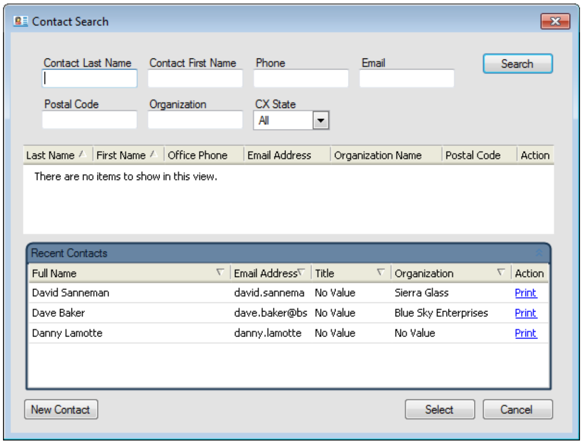
To search for a contact from an open record

1 Open the Contact Search window using one of the following methods.

If you are working on an incident, opportunity, organization, or contact list, click the Contacts tab. Then click the Add Existing button (or, for contacts lists, click the Add Contact button and select Add Existing).

Or

If you are working on an incident, opportunity, task, or asset, click the Search button to the right of the Contact field.



2 Type an entry in any of the available fields.

Tip You can use an asterisk (*) as a wildcard in your search term.

The Recent Contacts section of the Contact Search window also displays a list of recently opened contacts you can select.

3 Click the CX State drop-down menu and select from the following options (by default, all **states** are selected).

- ▷ Select All
- ▷ Service State
- ▷ Outreach State
- ▷ Opportunities State

4 Click the Search button. The contacts that match the search criteria are returned on the Contact Search window.

Note If only one contact matches the search criteria, that contact is automatically selected and the Contact Search window closes.

5 Select the contact you want to associate with the open record and click the Select button. The Contact Search window closes and the contact appears on the Contacts tab of the record (for organizations and contact lists), in the Contact field (for tasks and assets), or both (for incidents or opportunities).

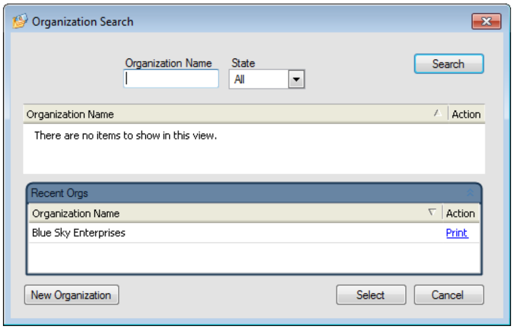
Or

If the contact does not appear in the list, click the New Contact button at the bottom left of the window to open a new contact sub-tab. Complete the fields and click the OK button. Refer to step 2 of To add a contact.

Note When the new contact sub-tab opens, it is populated with any search terms you entered in the First Name, Last Name, Email, Phone, and Postal Code fields in the Search window. If you are adding a secondary contact to the record, the address and organization name fields (including Postal Code) are populated from the primary contact's organization.

To search for an organization from an open record

1 On an open contact, opportunity, task, or asset, click the Search button to the right of the Organization field. The Organization Search window opens.



2 Type the first few characters of the organization's name in the Organization Name field. An implied wildcard is used, so all organizations that begin with the letters you type are returned in the search results.

Tip The Recent Orgs section of the Organization Search window also displays a list of recently opened organizations you can select.

3 Click the State drop-down menu and select from the following options (by default, all **states** are selected).

- Select All
- Service State
- Outreach State
- Opportunities State

4 Click the Search button. The organizations that match the search criteria are returned on the Organization Search window.

Note If only one organization matches the search criteria, that organization is automatically selected and the Organization Search window closes.

5 Select the organization you want to associate with the open record and click the Select button. The Organization Search window closes and the organization appears in the Organization field.

Or

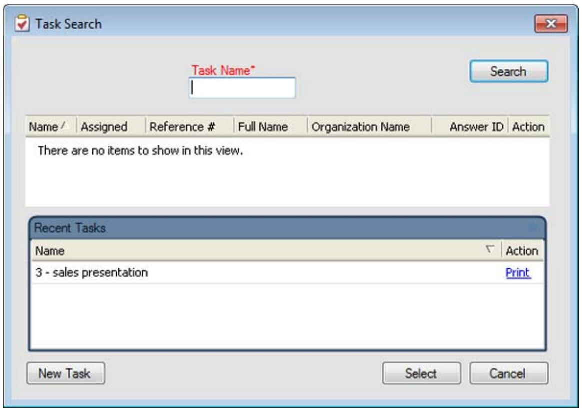
If the organization does not appear in the list, click the New Organization button to open a new organization sub-tab. Complete the fields and click the OK button. Refer to step 2 in To add an organization.

Note This procedure also applies when you want to search for and associate an organization on a new contact sub-tab opened from the Contacts tab of an incident, opportunity, organization, or contact list.

To search for a task from an open record

1 On an open answer, contact, incident, opportunity, or organization, click the Tasks tab.

2 Click the Add button and select Add Existing. The Task Search window opens.



3 Type the first few characters of the task name in the Task Name field. An implied wildcard is used so all task names that begin with the letters you type are returned.

Tip The Recent Tasks section of the Task Search window also displays a list of recently opened tasks you can select.

4 Click the Search button. The tasks that match your entry are returned on the Task Search window.

Note If only one task matches the search criteria, that task is automatically selected and the Task Search window closes.

5 Select the task you want to associate with the open record and click the Select button. The Task Search window closes and the task appears in the list of tasks on the Tasks tab.

Or

If the task does not appear in the list, click the New Task button to open a new task sub-tab. Complete the fields and click the OK button. Refer to step 2 in To add a task.

Working with records

You can work with different records when you are not actually changing the information in them. By understanding standard **workspaces** and how to open, forward, copy, and print records, you will become more efficient while working in the product suite.

Standard workspaces

Oracle Service Cloud provides a standard workspace for each record type (answers, assets, contacts, incidents, opportunities, organizations, and tasks), plus a standard workspace for quotes, quote products, and service opportunities on their respective windows. Oracle Service Cloud also contains standard chat workspaces for staff members working in Oracle Right-Now Chat Cloud Service (Chat) and standard mobile contact and mobile incident workspaces when Mobile Agent App is enabled. Each workspace defines the buttons and tabs on the ribbon, the buttons on the Quick Access toolbar, which fields are available, what toolbars and buttons are displayed on record tabs, and how the information is organized on the **content pane**.

Oracle Service Cloud also provides standard multi-edit workspaces for each record type. Each multi-edit workspace defines fields for updating more than one record in a single operation instead of performing the same action on each individual record.

Your organization may use the standard workspaces, or your administrator may have created one or more custom workspaces. No matter which workspaces your organization uses, your profile contains a workspace for each record type you have permission to access (and quotes, service opportunities, and chat workspaces, if applicable). Keep in mind that the workspace your profile uses may display a different **ribbon**, different buttons on the Quick Access toolbar, a different combination of fields, or a different location for fields on the content pane.

Tip You can drag and drop record tabs to rearrange their order on each workspace. If you rearrange tabs, the tab order for that workspace is stored in the local settings on your workstation until you reset the local settings. Refer to Changing your personal settings.

For information about working with specific records and a description of their standard workspaces, refer to any of the following references.

- **Organizations**—Refer to Organizations.
- **Contacts**—Refer to Contacts.
- **Tasks**—Refer to Tasks.
- **Incidents**—Refer to Incidents.
- **Answers**—Refer to Answers.
- **Opportunities**—Refer to Opportunities.
- **Assets**—Refer to Asset and Product Registration.

Opening records

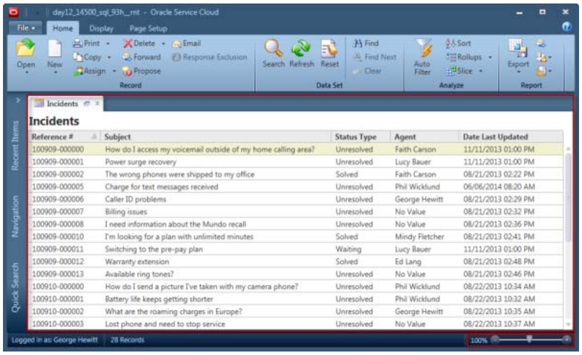
If your duties include responding to customers, publishing answers to your website, working with opportunities and sending quotes to customers, or keeping customer information up-to-date, you can easily access information and take the actions you need. The procedure to open records is the same for all record types (incidents, answers, contacts, opportunities, organizations, tasks, and assets).

To open an incident for editing

1 Click the Incidents button on the **navigation pane**.

2 Double-click an incidents report. The report opens on the **content pane**.

Tip The default setting requires that you double-click an item to open it. However, you can change the default so that items open with a single click. Refer to [Changing navigation pane settings](#).



You can zoom in and out of a report using the slider on the bottom right of the content pane. Click the plus sign to zoom in on specific details or click the minus sign to zoom out to see more of the report. You can also drag the slider left or right to decrease or increase magnification.

3 Right-click an incident and select Open > Incident. The content pane populates with the incident's information.

Additional ways to open a record include the following options.

- Selecting the record and clicking the Open button on the **ribbon**
- Clicking Open in the Action column

- Double-clicking the record

Forwarding records

There might be times when you need to forward an incident, opportunity, task, or asset. For example, you might need information from another staff member before you can reply to a customer's incident. Or maybe you need to forward an opportunity for review and approval. When you forward a record, you can forward any files that are attached to the record, send response files, and add comments. You can also customize how the forwarded information is displayed. See Customizing messages.

Note If you are adding a record instead of editing an existing one, you must first save the record before you can forward it.

To forward a record

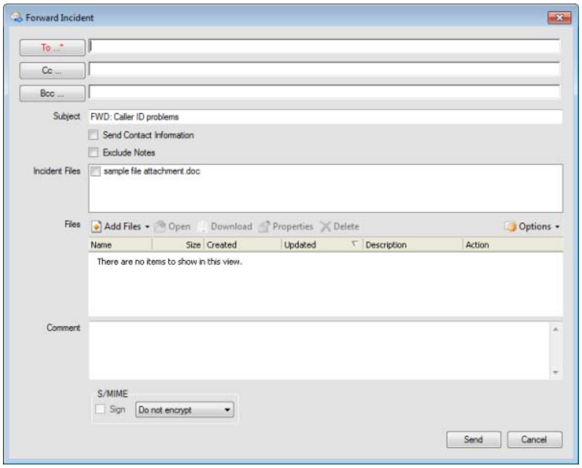
1 Right-click a record in a report and select Forward. The Forward window opens.

Or

With a record selected in a report, click the Forward button on the ribbon.

Or

With a record open, click the Forward button on the ribbon.



2 Enter the following field information.

Table 116: Forward Window Description

Field/Button	Description
To ...*	Click this button to open the Select Names window. Select the name of the recipient and click the To button to insert the name in the field. (To select additional recipients, press **Ctrl** while making your selections.) After selecting the recipient, click the OK button on the Select Names window. Refer to Selecting recipients. **Note:** You can also type the email address of the recipient in the text field.
Cc ...	Click this button to open the Select Names window, select the recipient's name, and click the Cc button. **Note:** All recipients are able to see the email addresses in the Cc field.
Bcc ...	Click this button to open the Select Names window, select the recipient's name, and click the Bcc button. **Note:** No recipients are able to see the email addresses in the Bcc field.
Subject	The subject for the incident, opportunity, task, or asset appears in this field.
Send Contact Information	Select this check box to send the primary contact information with the record. The information that is sent includes the contact's email address, first and last names, contact type, title, any phone numbers that have been entered, and any custom field information. **Note:** This check box appears only if you are forwarding an incident.
Exclude Notes	Select this check box to exclude any notes in the incident thread from being forwarded with the incident. **Note:** This check box appears only if you are forwarding an incident. If this check box is selected, the changes are retained when forwarding other incidents.
Incident Files	Files that are attached to an incident you are forwarding are listed in this field. Select the check box next to any file you want to forward with the incident. **Note:** This field is not visible when forwarding opportunities, tasks, or assets or if no files are attached to the incident.

Table 116: Forward Window Description (Continued)

Field/Button	Description
Opportunity Files	Files that are attached to the opportunity are listed in this field. Select the check box next to any file you want to forward with the opportunity. **Note:** This field is not visible when forwarding incidents, tasks, or assets or if no files are attached to the opportunity.
Task Files	Files that are attached to the task are listed in this field. Select the check box next to any file you want to forward with the task. **Note:** This field is not visible when forwarding incidents, opportunities, or assets or if no files are attached to the task.
Files	Click the Add Files button and select Browse or Search to attach files to the e-mail containing the forwarded record. See To browse for a file to attach to a record or To search for a file to attach to a record. **Note:** Files added in this field are not added to the record.
Comment	Type any comments you want to forward with the record in this field. **Note:** Text entered in the Comment field will display as the body of the email that is sent to recipients.
S/MIME	Select one or both of the security options under S/MIME.
Sign	Select this check box to sign the email with the mailbox's signature. **Note:** The Sign check box is enabled only if the outgoing email is sent from a mailbox that has a private key and certificate associated with it. Refer to Configuring S/MIME security.
Do not encrypt	Click this drop-down menu and select one of the encryption options. • Do Not Encrypt • Encrypt When Possible • Always Encrypt. **Note:** Encryption is supported if a destination email address has a public key associated with it.

3 Click the Send button to forward the record and any selected files.

❖ Message Templates

❖ Selecting recipients

- ❖ To browse for a file to attach to a record
- ❖ To search for a file to attach to a record

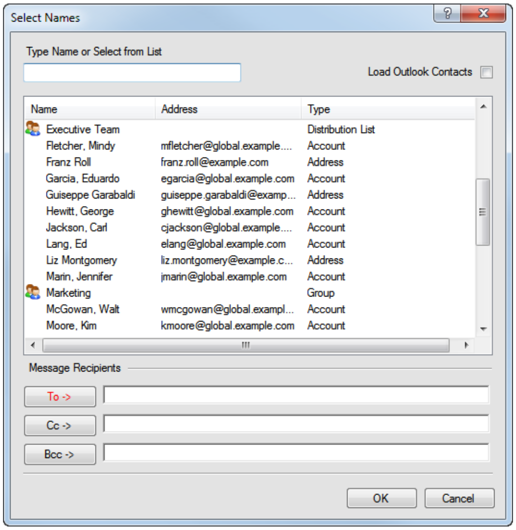
Selecting recipients

When you forward records, you can open the Select Names window from the To, Cc, and Bcc fields. From this window, you can select from folders containing all currently enabled staff accounts, staff account groups, **distribution lists**, and email addresses from all distribution lists.

Note If your administrator has not added distribution lists, the Distribution Lists and Addresses folders will not display. Refer to Managing distribution lists.

To select a recipient

1 Click the To, Cc, or Bcc buttons to open the Select Names window.



2 To import your contacts from the default Contacts folder in Outlook, select the Load Outlook Contacts check box. This is useful for displaying contacts that are not included in Oracle Service Cloud.

3 Select the name of the recipient and click the To, Cc, or Bcc button to insert the name in the field. To select multiple recipients, press **Ctrl** while making these selections.

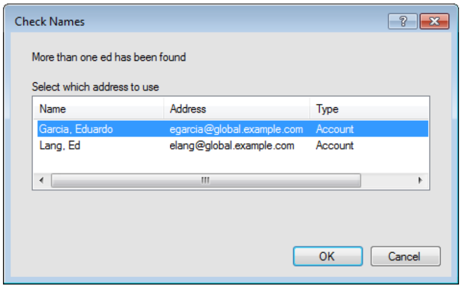
Tip You can type the first few letters of the name in the field at the top of the Select Names window. The first name in the list that matches the letters you typed is highlighted. Notice that this name may be an individual's name, an email address, or a group or distribution list.

4 Click the OK button to close the Select Names window and return to the Forward window.

5 Click the Send button to forward the record to the recipients you selected and close the Forward window.

Checking names

When forwarding records, if you type a name, a partial name, or an email address that is not found in the **knowledge base**, and then tab to the next field or click the Send button, the Check Names window opens.



This window displays suggestions for staff accounts, staff account groups, distribution lists, and email addresses based on what you entered in the To, Cc, or Bcc fields. (In this example, the name John was entered.) From this window, you can double-click a list item to select a recipient or click the Cancel button to return to the previous window and re-enter the name.

Copying records

You might want to copy a record to use as a starting point for creating another record. For example, assume you have a contact record that is associated with an organization. When you add another contact from the same organization, you might want to copy the original contact and edit the names to avoid having to re-enter organization information.

To copy a record

1 With a report open on the **content pane**, right-click the record you want to copy and select Copy. The Copy window opens.

Or

With the record open, click the Copy button on the **ribbon**.

2 Select the check box for each of the data items you want copied with the record. The following table shows the available options for each type of record. The answer items that are not check boxes are noted in the table.

Table 117: Copy Options for Each Type of Record

Record Type	Copy Options
Answer	• Access Level—Select from drop-down menu. • Language • Status—Select from drop-down menu. • Copy File Attachments • Copy Notes • Create Sibling Relationship—Select this check box to create a sibling relationship between the answer and the copy. • Save and Close Copies—Select this check box to automatically save and close copies of answers.
Asset	No copy options are displayed when copying an asset record.
Contact	• Notes • File Attachments • Contact Lists
Incident	• Threads • Incident Contacts • File Attachments **Note:** When copying an incident, the original reference number is prepended to the incident subject of the copied incident for identification purposes. When copying an incident that is associated with a social **channel**, the thread type is automatically set to Email.

Table 117: Copy Options for Each Type of Record (Continued)

Record Type	Copy Options
Opportunity	• Notes • Opportunity Contacts • Opportunity Competitors • File Attachments • Quotes • Quote Products
Organization	• Notes • Organization Addresses • File Attachments
Task	• File Attachments • Notes

3 Edit the copied record as necessary.

4 Click the Save and Close button on the ribbon to save your edits to the copied record.

Printing records

When you want a hard copy of a record, you can print it from the open record or from a report that includes the record.

To print a record

1 Right-click the record on a report and select Print. The Print Dialog window opens.

Or

With the record open, click the Print button on the **ribbon**.

2 Click File and select Print. The Print window opens.

3 Click the Print button to close the Print window and print the record.

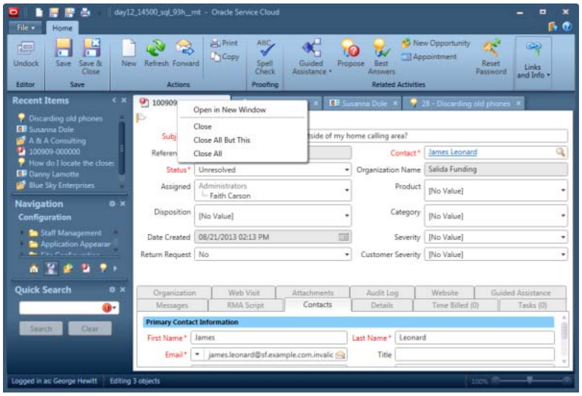
Tip When you print incidents, contacts, tasks, opportunities, answers, organizations, assets, or quotes, the format is defined by print pages in message templates. You can customize these templates from the Message Templates editor. See Print templates.

Closing multiple records simultaneously

You can close multiple open records at the same time using the right-click menu.

To close multiple records simultaneously

With multiple records open on the content pane, right-click an individual tab and select one of the following options.



- **Open in New Window**—Opens the active tab in a separate window.
- **Close**—Closes the active tab. You can also press **Ctrl+w** or **Ctrl+F4** to close the active tab.
- **Close All But This**—Closes all open tabs except the active one.
- **Close All**—Closes all tabs.

Note Right-click options differ for workgroups. For example, when you right-click the tab of the primary record in a workgroup, your only option is to close all associated records in the workgroup. Refer to [Creating and using workgroups](#).

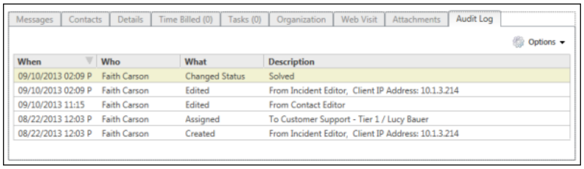
Audit logs

Tip You can click a column heading to sort the list by the column you select. Click the column heading again to reverse the list.

When you click the Audit Log tab on a record, you can see if other staff members have worked on the record. You can view each action taken on the record, when it was updated, by whom, the action performed, and a description of the action (for example, sending a response). This information is valuable for keeping track of interactions with customers, especially if more than one staff member has worked on the same record. The audit log shows any automatic changes that resulted from the application of business rules or through configuration settings. The audit log for incidents and contacts also shows any actions taken by the customer on the **customer portal**. Refer to Your Account Pages.

In addition to records (answers, assets, contacts, incidents, opportunities, organizations, and tasks), Oracle Service Cloud provides an audit log for campaigns, contact lists, documents, mailings, segments, surveys, and quotes.

Note The Audit Log tab for quotes contains additional information. Refer to Viewing the quote audit log.



Columns in the audit log are described in the following table.

Table 118: Audit Log Description

Column	Description
When	Displays the time and date the action was performed on the record or other item. By default, the most recent action is listed first.
Who	Displays the staff member who performed the action. If Administrator is listed in this column, the action was the result of a business rule or an automatic update by Oracle Service Cloud.
What	Displays the type of action performed.
Description	Displays a brief description of the action performed or provides additional information about the action.

Tip You can click a column heading to sort the list by the column you select. Click the column heading again to reverse the list.

Updating records

There are several operations that are similar for different kinds of records. Among those operations are assigning staff members and adding **flags** to records, checking the spelling, attaching files, including browsing and searching for files to attach, and working with multiple records.

Assigning records

Sometimes you might need to assign a record to another staff member. For example, a task might have been incorrectly assigned to you or you need a colleague to complete part of an incident before you can respond to a customer. Or maybe you are creating contact and organization records and need to assign a salesperson to the account based on their location.

Note The staff member you assign the record to will receive a notification. Refer to Opening your notifications.

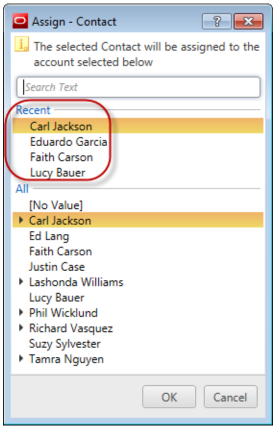
To assign a record from a report

1 With a report displayed on the **content pane** and a record selected in the report, click the Assign button on the **ribbon**. The Assign [Record] window opens to display a list of staff members who can be assigned the record. (The list shows only those staff members who have permission in their profile to work on that type of record.)

Or

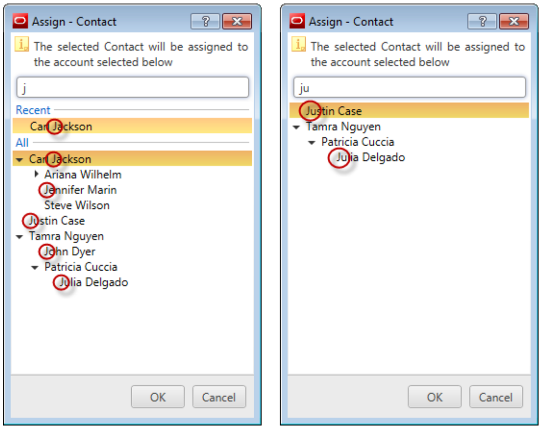
Right-click the record in the report and select Assign or Assign > [Type of record].

2 Select a staff member from the Recent list, if any appear. Up to ten of the most recent selections are shown.



Or

Use the auto-complete function to quickly find a name in the list of staff members. Begin typing the staff member or group name you want to assign the record to in the search field above the list. As you type, the list of names is filtered to show only names that contain the sequence of letters you typed, and the focus is on the first name on the filtered list. Type additional letters of the name to narrow the list further.



Note For hierarchical menus, matching names will have all of their ancestors shown in the list, and they will be expanded. The children will also be in the list, but they are collapsed.

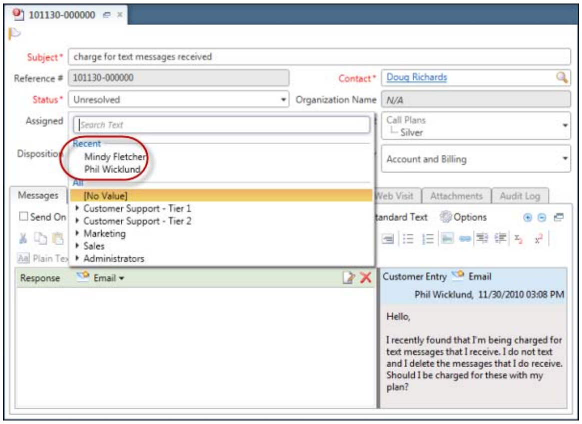
To manually search for a name in the list, click the right arrow next to a group or manager name to display the names below it.

3 With the staff member you want to assign the record to highlighted, press the **Enter** key or click the OK button. When you open the record, the staff member or group you selected will appear in the Assigned field (for answers, incidents, opportunities, and tasks) or the Salesperson field (for contacts and organizations).

To assign an open record

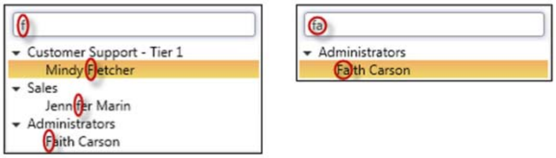
1 Click the Assigned field drop-down menu. (For a contact or organization, click the Salesperson field drop-down menu.)

2 Select a staff member from the Recent list, if any appear. Up to ten of the most recent selections are shown.



Or

If you are assigning an open contact, incident, organization, or task, use the auto-complete function to quickly find a name in the list of staff members. Begin typing the staff member or group name you want to assign the record to in the search field above the list. As you type, the list of names is filtered to show only names that contain the sequence of letters you typed, and the focus is on the first name on the filtered list. Type additional letters of the name to narrow the list further.

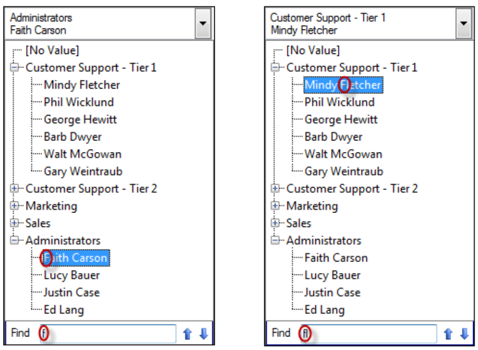


Note For hierarchical menus, matching names will have all of their ancestors shown in the list, and they will be expanded. The children will also be in the list, but they are collapsed.

To manually search for a name in the list, click the right arrow next to a group or manager name to display the names below it.

3 If you are assigning an open answer or opportunity, begin typing the name of the staff member or group you want to assign the record to in the Find field below the list. As you type, the focus moves to the first name on the list that contains the sequence of letters you typed. Type additional letters of the name to narrow the list further.

Note List hierarchy is used in determining match precedence.



a To find the next name that matches in the list, click the down arrow next to the Find field.

b To find a previous matching name, click the up arrow.

4 With the staff member you want to assign the record to highlighted, press the **Enter** key to select it.

Or

Click a staff member or group name from the list to select it.

The menu closes and your selection appears in the field.

Flagging records

The standard workspace for answer, incident, opportunity, contact, and organization records includes a flag that allows you to define the record's priority and type a message regarding the record. When other staff members open the record, the flag and text you added appear on the record.

To add a flag to a record

1 Click the area next to the white flag at the top of the **content pane**. A menu displays options for selecting the importance of the flag and editing text in the banner.

2 To change the importance of the flag from No Importance, select red (High), blue (Medium), or green (Low).

3 To add text to the flag, select Edit Flag Text and type text in the Edit Flag window that opens. Click the OK button to close the Edit Flag window.

Spell checking

Oracle Service Cloud uses three methods of spell checking. The first is an inline spell checker that automatically identifies misspelled words on various tabs and fields as you type. The second method is manual and checks any fields for which the spell check property has been selected. The third method automatically checks your spelling when you save the record.

The spell checking methods in use depend on the selections your administrator used to configure the **workspaces** for adding and editing records. On any workspace, it is possible that none of the fields have spell check enabled, that some fields are spell checked automatically, or that fields are spell checked only when you click the Spell Check button on the **ribbon**.

Important If the language of an incident is different from the language of the **interface** from which the incident response is created, the spell checker uses the dictionary that is associated with the language specified in the incident's Language field. If this value is changed during an edit of the incident, the dictionary for the newly selected language is used to check the spelling. In addition, if an incident is being edited on an interface that supports spell checking, but the incident has a language that does not support spell checking, then the Spell Check button is disabled.

❖ Creating custom workspaces

Inline spell checking

If your administrator has configured inline spell checking for fields in the **workspaces** you use, any text you type in those fields is checked in real time. Oracle Service Cloud automatically corrects any misspelled words you have added to your dictionary as well as any misspelling that has only one alternate spelling suggestion. The spell checker identifies misspelled words by underlining them with a wavy red line.

Note Words added during a spell check session are saved to your local dictionary. Future spell checking is performed using the user dictionary on the server as well as the local dictionary on your workstation.

Inline spell checking can occur when you type information on the **incident thread**, on the Notes tab for contacts, organizations, answers, opportunities, tasks, and in survey questions. When you move the cursor out of a field that contains a misspelling, the indicator for misspelling (the wavy red line) no longer appears. But it reappears when you move the cursor back to the field containing the misspelling.

To correct an inline misspelling

Right-click the misspelled word and select one of the following options.

Table 119: Spell Check Options Description

Option	Description
Suggested alternate words	Select one of the five suggestions for alternate spellings. The misspelled word is replaced with the one you selected.
AutoCorrect	Select AutoCorrect and a suggested alternate word. Whenever Oracle Service Cloud encounters this particular misspelling, it automatically replaces it with the word you selected.
Ignore All	Select this option to ignore all occurrences of this spelling in the record you are editing.
Add to Dictionary	Select this option to add the word to your personal dictionary. It will no longer be flagged as misspelled.

Manual spell checking

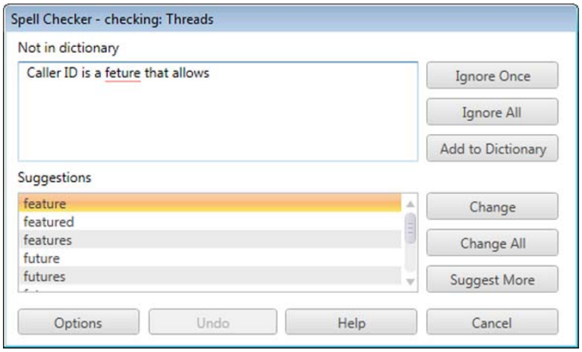
Rather than correcting each misspelled word individually as you work, you may prefer to wait until you are done typing all information for the record before you check the spelling.

Important Only the fields that are designated for spell checking are checked. Misspelled words in other fields will not be identified. If no fields have spell check properties, a message will let you know there are no fields marked for spell check.

In order to check spelling manually, the **workspace** ribbon must contain the Spell Check button. **Ribbons** are defined when your administrator creates workspaces, which are then assigned to your **profile**.

To check spelling manually

1 Click the Spell Check button. The Spell Checker window opens, and the first misspelled word is highlighted in the Not in Dictionary field.



2 Select one of the following options.

Table 120: Spell Checker Window Options Description

Option	Description
Ignore Once	Click this button to ignore this occurrence of the misspelled word.
Ignore All	Click this button to ignore all occurrences of the misspelled word during your current session.
Add to Dictionary	Click this button to add the word to your local dictionary.
Change	Click this button to replace this occurrence of the misspelling with the suggestion you select from the options in the Suggestions field.
Change All	Click this button to replace all occurrences of the misspelling with the suggestion you select from the options in the Suggestions field.
Suggest More	Click this button to find additional suggested replacements for the misspelled word.
Options	Click this button to select the spelling options you want the spell checker to use when it checks your spelling.
Undo	Click this button to undo the most recent change to a word. Additional button clicks undo one change at a time, in reverse order of the original changes. **Note:** Only the changes that have been made since the Spell Checker window was opened can be undone.
Help	Click this button to open help information for the spell checker.

Table 120: Spell Checker Window Options Description (Continued)

Option	Description
Cancel	Click this button to cancel the spell check.

3 Click the OK button at the “Spell check complete” message.

To set spell check options

1 Click the Spell Check button. The Spell Checker window opens.

2 Click the Options button. The Spell Checker Options window opens.

3 Select any spelling options you want used during the spell check and clear any you do not want used.

Note You must select either Phonetic Suggestions or Typographical Suggestions (or both) in order for the spell checker to return suggestions for misspelled words.

4 Select an option to specify speed and accuracy of the spell check.

5 Click the OK button to save your changes and close the Spell Checker window.

Automatic spell checking

Your administrator may have configured your **workspace** to automatically check spelling when you save a record. If this applies to your workspace and no spelling errors are found, you will not see any evidence of the spell checking process when you save the record. If the record contains misspellings, the Spell Checker window opens and you can make corrections as described in Manual spell checking. If you click the Cancel button to stop checking the record’s spelling, a message notifies you and asks if you still want to save the record. Click the Yes button to cancel the spell checking and save the record.

Note Your administrator may have disabled your ability to cancel an automatic spell check.

Attaching files to records

Using the Attachments tab, you can attach files to records—answers, contacts, incidents, opportunities, organizations, and tasks—as well as to campaigns, surveys, mailings, and documents. The Attachments tab lets you add files containing information that may not fit neatly into a record. For example, you might want to attach a file that contains graphic elements to an incident.

Note When one or more files are attached to a record, the Attachments tab displays a paper clip icon.

The Attachments tab contains an attachments report, which is a list of all files attached to the record. For each attached file, the report contains the file name, size, dates the file was created and updated, and a description of the file.

Tip You can drag file attachments located on your workstation and drop them onto any incident, answer, opportunity, contact, organization, or task if the Attachments tab is active.

Answer file attachments

Files that are attached to answers are not the same as file attachment answers. A file that is attached to an answer on the Attachments tab appears as an attachment within the answer on the Answers page, and is used to provide additional information. A file attachment answer appears as a clickable attachment on the Answers page, and displays the full answer content when clicked. Refer to Adding file attachment answers.

Sibling answer attachments with access levels that are at or below the contact's SLA are visible to the contact. Refer to Sibling answers.

Incident file attachments

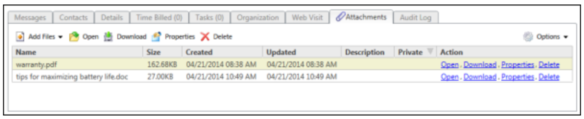
Files that are attached to incidents are not the same as files attached to incident responses. When you attach a file to an incident on the Attachments tab, that file becomes permanently attached to the incident. Likewise, if a customer attaches a file to an incident when submitting a question, that attachment also becomes permanently attached to the incident. You and other staff members can access the files from the Attachments tab of the incident, while the customer can access them from the Your Account page on the **customer portal**. In addition, some incident file attachments may be accessed from the Messages tab. Refer to Attaching files to incidents.

Note HTML email updates that are larger than the maximum description size are attached to the incident as an HTML file instead of as a text file.

In contrast to incident file attachments, files that you attach to an incident response are attached to that message only and are not stored permanently with the incident. Attaching a file to an email response lets the customer open the file directly from the email client instead of having to log in to the customer portal to view it, but there will be no record in the knowledge base or the audit log that a file was sent to the customer. See To attach files to an incident response.

Viewing the attachments report

The attachments report on the Attachments tab contains columns that provide the following information about each file attachment: file name, file size, date and time the file was created, date and time the file was updated, description, file visibility (Private column), and links for opening, downloading, and deleting the attachment. The Private column appears only for incidents and answers and displays the visibility of the attachment on the **customer portal**. Refer to Viewing attachment properties.



Attachments tab toolbar

The Attachments tab contains a toolbar for working with attachments associated with a record. The following table describes the buttons on the toolbar of the Attachments tab.

Table 121: Attachments Tab Toolbar Description

Button	Description
Add Files	Click this button and select Browse or Search to find and attach a file.

Table 121: Attachments Tab Toolbar Description (Continued)

Button	Description
Browse	Select this option to view the files and folders on your workstation and select one or more to upload and attach to the record. See To browse for a file to attach to a record.
Search	Select this option to specify a directory, all or part of a file name, and type of file. The files that match these criteria are displayed so you can select the ones you want to upload and attach to the record. See To search for a file to attach to a record.
Open	Click this button to open the file for viewing.
Download	Click this button to download the file attachment and save the file to the location you specify on your workstation.
Properties	Click this button to view or edit the properties of a file attachment. See Viewing attachment properties.
Delete	Click this button to remove the selected file attachment from the record.

Browsing and searching for files to attach to a record

When you want to attach a file to a record, you can locate the file by browsing or searching. The following procedures describe each method.

Note You can attach an unlimited number of files to a record, but each file can be no larger than 20 MB by default. Contact your administrator to learn if additional file size limitations exist on your system.

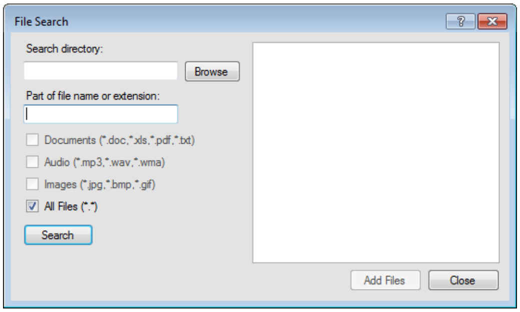
To browse for a file to attach to a record

1. Click the Attachments tab.
2. Click the Add Files button and select Browse. A window opens and displays the files and folders on your workstation.
3. Select the file to attach.
4. To attach additional files, press **Ctrl** while selecting the files.
5. Click the Open button to attach the file to the record.

To search for a file to attach to a record

1 Click the Attachments tab.

2 Click the Add Files button and select Search to open the File Search window.



3 Enter any or all of the following field information.

Table 122: File Search Window Description

Field	Description
Search directory	Type the name of the directory where you want to search for the file, or click the Browse button.
Browse	Click the Browse button to display the file structure and make a selection from the list of available directories.
Part of file name or extension	Type all or part of the file name in this field. **Note:** This field uses an implicit wildcard at the end of the entry.
Filters	To select a filtering option for narrowing the search, clear the check box for All Files (*.*), which is selected by default.
Documents (*.doc, *.xls, *.pdf, *.txt)	Select this check box to search for document files.
Audio (*.mp3, *.wav, *.wma)	Select this check box to search for audio files.
Images (*.jpg, *.bmp, *.gif)	Select this check box to search for graphics files.

Table 122: File Search Window Description (Continued)

Field	Description
All Files (*.*)	Select this check box if you do not want to restrict the search by file type.

4 Click the Search button to display a list of files that meet the search criteria.

5 Click a file to select it for uploading.

6 To attach additional files to the record, press **Ctrl** while selecting the files.

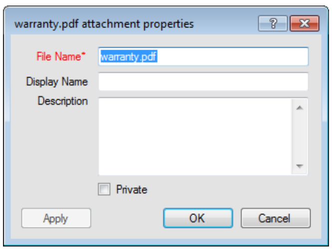
7 Click the Add Files button to upload the selected file, attach it to the record, and close the File Search window.

Viewing attachment properties

You can view properties for file attachments. You can also add file information and designate whether to **index** the file for answer file attachments.

To view attachment properties

1 Select a file attachment from the list and click the Properties button on the Attachments tab toolbar. The following figure displays the attachment properties for a file that is attached to an answer.



2 Enter the following field information.

Table 123: Attachment Properties Window Description

Field	Description
*File Name	This field displays the file name. You can change the name of the file.
Display Name	Type the name you want the file to display as on the **customer portal**.
Description	Type a description of the file to provide more information about it.
Private	Select this check box to make the attachment private. **Note:** The Private check box appears only for files that are attached to answers and incidents. Customers do not see private attachments on the customer portal.
Indexed	Select this check box to index the file. Text contained in the attachment is searched when customers perform a search on the customer portal. **Note:** The Indexed check box appears only for files that are attached to answers.

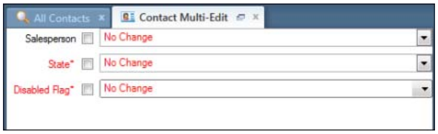
3 Click the OK button to close the Attachment Properties window.

Updating multiple records

Multi-editing allows you to update more than one record in a single operation instead of performing the same action on each individual record. This feature saves time when you need to make the same change to several records. For example, you might want to add the same **flag** to several records.

Note In addition to opening a multi-edit **workspace** that lets you make the same change to multiple records simultaneously, you can also open multiple records in a single operation by right-clicking the selected records, selecting Open Separately, and selecting the type of record you want to open. Rather than opening a multi-edit workspace, as described in To edit multiple records, this procedure opens each record separately. You can then edit each record independently of the others.

The changes you can make to multiple records depend on the workspace defined by your administrator. The following figure, for example, shows the standard workspace for multi-editing contacts.



The following table lists the fields you can edit for each record type when working on that record's standard workspace. If you are working on custom workspaces, the fields that are editable depend on the workspace your administrator configured and may include more or fewer fields than those available on the standard workspace for that type of record.

Table 124: Available Fields on the Standard Workspaces

Standard Multi-Edit Workspace	Fields Available for Multi-Editing
Answer	• Status • Assigned • Review On • Publish On • Notes • Products/Categories
Asset	• Organization • Contact • Product • Status • Date Purchased • Date Installed • Date Retired • Price • Description
Contact	• Salesperson • State • Disabled Flag

Table 124: Available Fields on the Standard Workspaces (Continued)

Standard Multi-Edit Workspace	Fields Available for Multi-Editing
Incident	• Assigned • Product • Status • Category • Queue • Disposition • Messages tab **Note:** S/MIME signing and encryption of responses are disabled when you edit multiple incidents simultaneously.
Opportunity	• Organization • Status • Strategy • Stage • Manager Forecast • Rep Forecast • Forecast Close • Assigned • Date of Initial Contact • Recall • Date Closed • Closed Value • Summary
Organization	• Salesperson • State
Task	• Assigned • Due Date • Planned Completion • Date Completed • Status • Priority • Percent Complete • Task Type (Opportunity, Incident, Answer, Campaign, Mailing, Survey, Document)

To edit multiple records

1 Double-click a report to display a list of records.

Note Remember, you can specify unique criteria to search for all records you want to update. Refer to Searching for records from a report.

2 Press **Ctrl** while selecting each record you want to edit.

3 Click the Open button on the **ribbon**. The fields that you can edit for the type of record you are working with display on the **content pane**.

4 Edit the records. Depending on the type of field, you can accomplish this in one of several ways.

Note The drop-down menus for all fields default to No Change. To remove the prior field entries for multiple records, select the check box next to the field you want to change.

a To change a field associated with a drop-down menu, click the drop-down menu and select an option.

Tip A shortcut is available for re-assigning multiple answers, contacts, incidents, opportunities, organizations, or tasks. Select the records from a report, click the Assign button on the ribbon, and select a staff member or group from the Assign window. Refer to steps through 3 in To assign a record from a report.

b To change a date field, click the drop-down menu associated with the field to open the current month's calendar and select a date. If necessary, use the arrows at the top to change the month before clicking a day.

c To change a search field, click the Search button (the magnifying glass to the right of the field), enter the search criteria in the window that opens, click the Search button, and select an option from the list of displayed results.

d To change a text field (such as the Response field on the Messages tab of the incident workspace), type the new entry for the field.

Important If a field is required when editing a record, it is also required for editing multiple records of the same type. It is possible, however, to select a value of "No Value" as a valid entry on the multi-edit workspace. The next time you edit one of the records separately, you are required to select a value for the field.

5 Click the Save and Close button to save your changes.

To delete multiple records

1 Double-click a report to display a list of records.

Caution Deleting records can affect other staff members within your organization. Deleting contacts, for example, permanently removes not only the contacts from the knowledge base, but also all incidents and opportunities for which the contact is the primary contact. Be sure you understand the consequences of deleting records before you do so. Refer to Deleting contacts.

2 Press **Ctrl** while selecting each record on the **content pane** you want to delete.

3 Click the Delete button on the report **ribbon**.

4 Click the Yes button at the Delete message to delete the selected records.

To forward multiple records

1 Double-click a report to display a list of records.

2 Press **Ctrl** while selecting each record on the **content pane** that you want to forward.

3 Click the Forward button on the report **ribbon**.

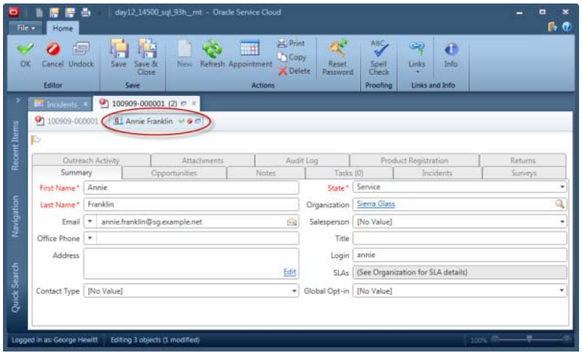
4 Follow the procedure for forwarding single records as described in To forward a record.

Note All of the files attached to all of the incidents you selected appear in Incident Files. Select the check box for every file attachment you want to forward with the associated incident. Recipients receive individual emails for each incident you forward. If an incident has file attachments and you selected the check boxes for those attachments, the forwarded incident contains the attachments.

Creating and using workgroups

Oracle Service Cloud helps you manage multiple open records without confusion by grouping all associated records into a single *workgroup*. Workgroups apply to incidents, answers, campaigns, contacts, contact lists, documents, mailings, opportunities, organizations, surveys, and tasks. When you open any type of record and then open other records associated with the initial record, you create a workgroup. The set of records in a workgroup can be saved and closed in a single operation.

For instance, the standard incident **workspace** allows you to add or edit other information associated with the incident, including contacts, organizations, and tasks. When you open a record associated with the open incident (for example, opening the contact record by clicking the contact name and selecting Open), the record opens on a sub-tab below the incident's content pane tab and becomes the active tab. This creates a workgroup consisting of an incident and a contact record.



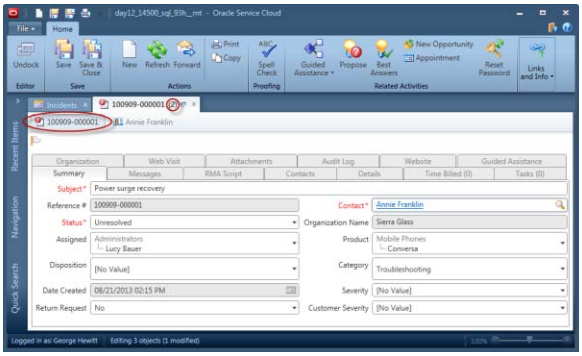
Tip Typically, you will also have an incidents report open, which you will use to open each incident.

Each time you add or edit an additional record associated with the incident, it opens on another sub-tab and becomes part of the workgroup. You can move easily between the records in the workgroup by clicking on the sub-tabs.

A record sub-tab contains buttons that correspond to the buttons on the Editor group of the ribbon: OK, Cancel, and Undock. All sub-tabs, except for the primary record (in this case, the incident), contain these buttons for taking actions on the individual record within the workgroup.

- **OK**—Clicking this button accepts changes made to the record and closes the sub-tab. However, it does not save changes to the database until you click the Save or Save and Close button on the ribbon.
- **Cancel**—Clicking this button closes the sub-tab if you haven't made changes to the record. If you have made changes, a message asks if you want to discard your changes.
- **Undock**—Clicking this button undocks the record from the editor and opens it in a new window. It remains in the workgroup. You can move between working in the window and working with other records in the workgroup without closing the window. (To redock the window to the editor, click the Dock button on the window.).

Continuing the example of the incident workgroup, clicking the incident sub-tab moves the focus to the incident in the workgroup. Since the incident is the primary record in the workgroup, there are no buttons on the sub-tab. Notice that the initial content pane tab for the primary record shows the number of records in the workgroup in parentheses.



Expanded tooltips on Save and Save and Close buttons on the ribbon and Quick Access toolbar let you know which records will be saved by each action.

- **Save**—Clicking this button saves all records in the workgroup and all editors remain open.
- **Save and Close**—Clicking this button saves all records in the workgroup but closes all editors as well.

In addition, the save icon displays on each individual record in the workgroup when you hover over one of the save buttons, another visual indicator of which records will be saved.

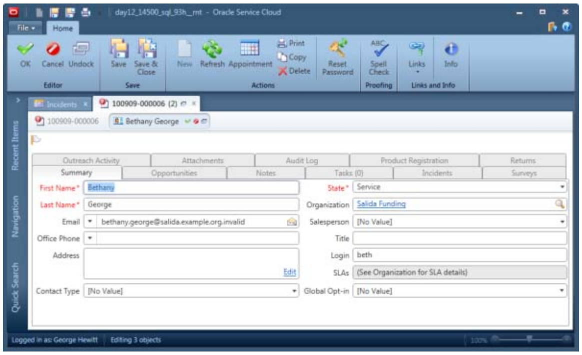
The following procedure is an example of creating an incident workgroup. Keep in mind that you can open any record for the incident, not just the ones identified in this procedure. Also keep in mind that the steps are the same for creating other types of workgroups.

To create an incident workgroup

1 Right-click an incident in an incidents report and select Open > Incident. The incident displays on the **content pane**.

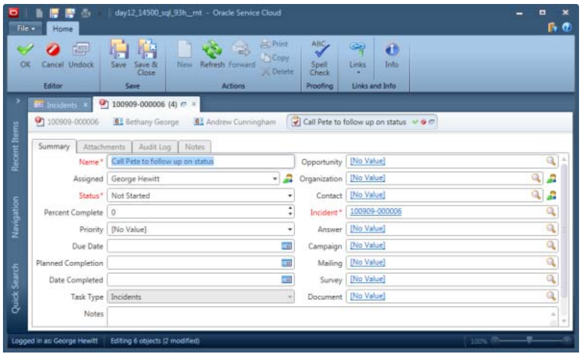
2 Click the Contacts tab.

3 Right-click a contact and select Open. The contact opens on a sub-tab.



4 To open additional records associated with the incident, repeat steps 2 through 3, replacing the references to contact information with information about the type of record you are opening.

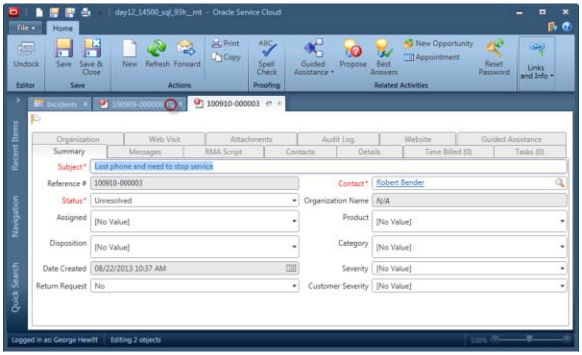
The following figure shows an incident with two contacts and a task in a workgroup.



When you click the Save button on any record in the workgroup, all records in the workgroup are saved. Likewise, when you click the Save and Close button on the **ribbon**, all records are saved and closed.

Note If you close any record in a workgroup without saving it, it does not impact your changes on any of the workgroup's other records.

Now, if you open a second incident, all the records associated with your first incident remain open, grouped on a single tab, with the number of records in the workgroup displayed in parentheses on the tab.



Just as you did with the first workgroup, you can open as many records as necessary for the second incident to create another workgroup. You can also open as many workgroups as necessary. A workgroup is active until you close it. If you reopen the incident, only the incident is opened and not the associated records that were part of the workgroup from the earlier editing session.

Adding Outlook appointments

When you add and edit contacts, incidents, opportunities, organizations, and tasks, you can create an Outlook appointment associated with the record you are working on. By default, the Appointment button is available on the standard workspaces for contacts, incidents, opportunities, and organizations and may be available on workspaces for tasks if your administrator added it.

Depending on the type of record you are creating an appointment for, Oracle Service Cloud automatically adds record information to the Outlook appointment. The following table lists the record information that is transferred to the appointment for each type of record. The table also notes the record information that becomes the subject of the appointment.

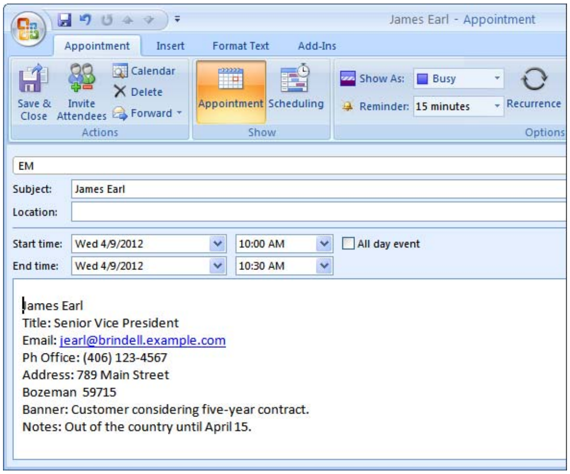
Table 125: Record Information Available in Appointments

Record	Available Information
Contact	• Name (subject of the appointment) • Title • Email • Office phone number • Address (street address, city, and postal code) • Banner text associated with the record's flag • Notes
Incident	• Subject (subject of the appointment) • Customer entry • Response • Banner text associated with the record's flag
Opportunity	• Opportunity name (subject of the appointment) • Manager estimate (Manager Value) • Sales rep estimate (Rep Forecast) • Closed value • Summary • Notes
Organization	• Organization name (subject of the appointment) • Addresses (street, city, and postal code for each available address type) • Banner text associated with the record's flag • Notes
Task	• Task name (subject of the appointment) • Due date • Planned completion date • Completed date • Percentage complete • Notes

To add an Outlook appointment

1 On a list of records, right-click the contact, incident, opportunity, organization, or task that you want to create an appointment for and select Open > [Record Type]. The record opens on the **content pane**.

2 Click the Appointment button to open the Appointment window. The available record information displays in the appointment.



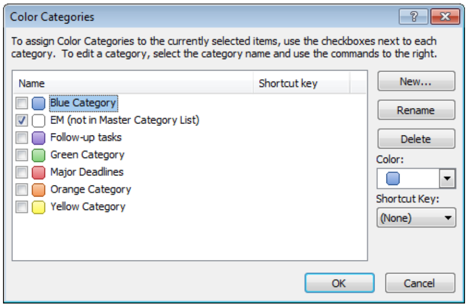
3 To add or edit any of the appointment information, type the information in the appropriate field.

4 To add a color category to the appointment, click the Categorize button and select the category. The first time you assign a default color category to an appointment, you are prompted to rename the category.

Note Oracle Service Cloud automatically adds the category EM (Experience Management) to all new appointments. The appointment category displays above the Subject field.

Or

To add multiple color categories to the appointment, click the Categorize button and select All Categories. The Color Categories window opens.



From this window you can quickly select multiple categories, rename and delete categories, change category colors, and add shortcut keys.

a Make your changes to the appointment's categories and click the OK button.

5 Click the Save and Close button on the **ribbon** to save the appointment. It now appears in your Outlook calendar.

Notifications

The Notifications component lets you view and manage the notifications you receive. If your **profile** gives you permission, you can also send broadcast notifications from this component.

Opening your notifications

Your notifications appear on the the **content pane** when you double-click Notifications from any **navigation list** that contains the Notifications component. You also receive desktop alerts, often referred to as "toast," when you first log in to Oracle Service Cloud and when new notifications are received while you are logged in. Notifications are triggered when:

- An **answer**, **incident**, **opportunity**, or **task** is assigned to you.
- An answer, incident, opportunity, or task that was assigned to you has been reassigned to another staff member.
- An answer, incident, opportunity, or task has been escalated.
- An answer is scheduled for review.
- An incident is updated, closed, or reopened.
- A **mailing** is launched or completed.
- A system error has occurred.

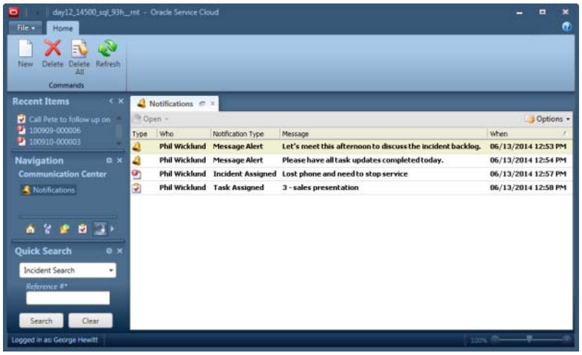
- A broadcast **notification** is sent to you from another staff member.

Important The following procedure assumes you open your notifications from the Communication Center navigation list, which is displayed when you click the Communication Center button on the navigation pane. However, the navigation list in which the Notifications component appears depends on the navigation set assigned to your profile. You can open your notifications from any navigation list that contains Notifications.

To open your notifications

1 Click the Communication Center button on the **navigation pane**.

2 Double-click Notifications. The content pane displays your notifications.



From the list of your notifications, you can send a **message**, delete one or more notifications, and refresh the display. The following table describes the buttons on the Notifications **ribbon**.

Table 126: Notifications Ribbon Description

Button	Description
New	Click this button to open the Send Notification window, where you can type a message and select a recipient. **Note:** This button is enabled only when your profile has permission to send notifications. Refer to <u>Sending broadcast notifications</u>.
Delete	Click this button to delete the selected notification.
Delete All	Click this button to delete all notifications.

Table 126: Notifications Ribbon Description (Continued)

Button	Description
Refresh	Click this button to refresh the list of notifications.

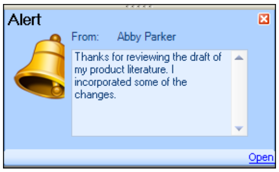
The list of your notifications contains the following column headings.

- **Type**—Displays the icon that is associated with the notification type.
- **Who**—Displays who sent the notification.
- **Notification Type**—Displays the type of notification.
- **Message**—Displays a summary of the notification.
- **When**—Displays the date and time the notification was sent.

❖ Sending broadcast notifications

Desktop alerts

When you log in to Oracle Service Cloud, you will receive a desktop alert, or toast, that lists the notifications you have received. The message is displayed in a window on the lower right section of the display for several seconds until it fades away. These notifications also appear in your list when you double-click Notifications on the navigation pane, and they remain in your list until you delete them.



If you have been sent a notification while you are logged in, the desktop alert appears when the Notifications list is automatically refreshed. The default refresh interval is fifteen minutes, but your administrator may have changed that interval. Alerts also appear if new notifications are available when you manually refresh the list.

Tip If you do not want your system to display a desktop alert when you receive a notification, you can disable alerts by clearing the Display Toast Notifications check box from your personal settings. Refer to Changing your personal settings.

❖ Changing your personal settings

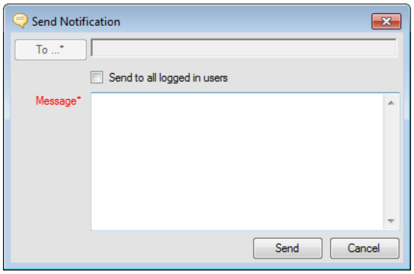
Sending broadcast notifications

Your profile may give you permission to send notifications to other staff members. If so, you can select the recipients manually or send a notification to all logged-in staff members.

To send a broadcast notification

1 Double-click Notifications on the **navigation pane**.

2 Click the New button to open the Send Notification window.

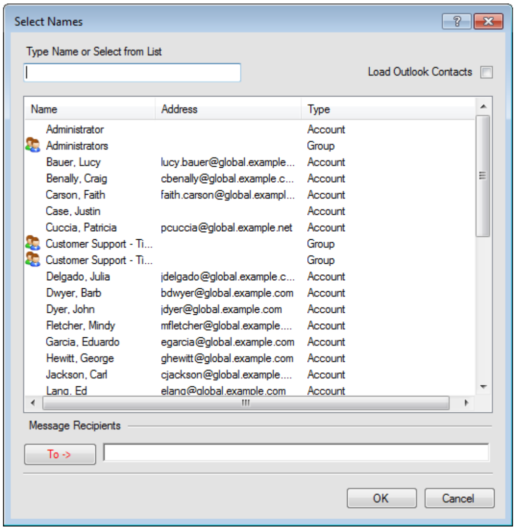


3 To send the notification to all staff members who are logged in, select the Send To All Logged In Users check box.

Note When you select this check box, you cannot select individuals because the To button is grayed out.

4 To send to selected staff members, click the To button to open the Select Names window.

Tip To import your contacts from the default Contacts folder in Outlook, select the Load Outlook Contacts check box. This is useful for displaying contacts that are not included in Oracle Service Cloud.



a Select one or more names from the list.

Tip To select multiple recipients, press **Ctrl** while making your selections.

b Click the To button to add the names to the field.

c Click the OK button to close the Select Names window. The names you selected appear in the To field of the Send Notification window.

5 Type your message in the Message field of the Send Notification window.

6 Click the Send button to send the message.

Tip You can also type the first few letters of the name you want to send the notification to in the To field of the Send Notification window. If only one staff member's name begins with those letters, the field is automatically populated when you move to the Message field. If multiple staff members' names begin with the same letters, you can select the one you want from the Check Names window that opens when you move to the Message field.

20

Organizations

Just as Oracle Service Cloud uses contact records to provide you and other staff members with a complete view of all activity for an individual customer, it can also provide you with that level of information for an **organization** and all the contacts, incidents, opportunities, and tasks associated with that organization.

Perhaps you have multiple customers from one organization. For example, a sales representative might have an opportunity that involves engineers, purchasing agents, and support managers from one organization. In those situations, it is vital to have a complete overview of all activity within the organization.

Organizations overview

An organization is a business entity with an organization record in the **knowledge base**. Organizations can refer to companies, divisions of companies, government agencies, educational institutions, or nonprofit associations.

Organization records are an optional way of consolidating customer information, but if you have several individual customers who belong to one organization, maintaining that information in an organization record is an efficient and effective way to group data.

For example, if you work for a cell phone company that provides products and services only to individual consumers, you do not need organization records in the knowledge base. If, however, you sell to business accounts that distribute cell phones to their employees, it makes sense to group all of those employees (each with an individual contact record) under the organization they are associated with. This links the data associated with each of the contacts to the organization, providing you with a single-source view of all activity within the organization.

By definition, an organization can have an unlimited number of contacts. A contact, on the other hand, can be associated with only one organization. Organizations can be structured in a hierarchy that enables you to add subsidiaries, divisions, or regional offices to accurately reflect all areas of the organization.

The **customer portal** in Oracle RightNow Cloud Service (Service) can be configured so contacts can view all **incidents** associated with their organization. When contacts view other incidents, they can often find answers to their questions, which reduces the number of incidents they submit. Refer to Allowing customers to see all incidents from their organization.

When your knowledge base contains organization records, you can track a specific organization's incidents and see trends or problem areas. You can view all of the incidents for the organization from the organization record without having to select each contact individually. Likewise, you can view all **opportunities**, **tasks**, attachments, and notes associated with the organization, and view all changes that have been made to the organization record using the **audit log**.

Organizations, contacts, and SLAs

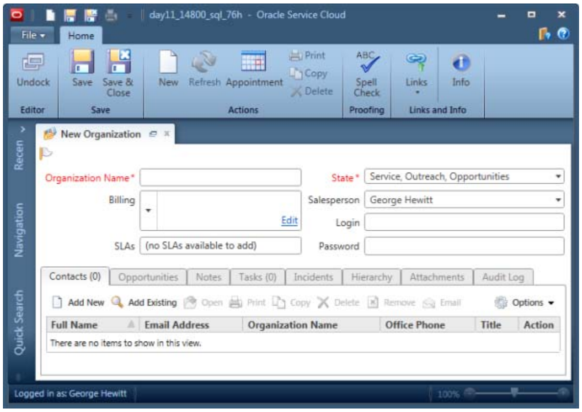
An SLA (service level agreement) is a contract that can be applied to customers, both organizations and contacts, in Service. SLAs allow you to specify and track the level and type of support a customer is eligible to receive. For example, an SLA might include the number of questions that can be submitted through different **channels** and the duration of support. Administrators create generic SLAs (that is, an SLA template) that can then be applied to specific customers. An SLA instance is a copy of the generic SLA applied to a unique customer. SLA instances can be applied automatically through **business rules** or manually by staff members. Familiarize yourself with the following points before adding or editing organizations.

- SLAs can be applied to contacts and organizations. Contacts that are not associated with an organization can have their own SLA instances. However, contacts that are associated with an organization do not have individual SLA instances. Instead, they are covered under the SLAs applied to their organization.
- Customers can view and track their SLAs on the Account Overview page of the customer portal, where SLAs are called contracts. Depending on how your administrator has configured the customer portal, all contacts associated with an organization may be able to view the responses to questions submitted by all contacts within their organization.
- Your administrator can set up business rules to automatically apply SLA instances to organizations or contacts when incidents enter the system (from the Ask a Question page, email, or chat). After applying an SLA instance, business rules can then credit the incident to the specific SLA.

- If your organization uses SLAs and you have SLA permissions set in your profile, part of your duties may be to apply SLA instances to organizations and to contacts that do not have an organization association. Refer to Applying SLAs for specific instructions about applying SLA instances.

Standard organization workspace

Oracle Service Cloud provides a standard workspace for working with organizations. The workspace defines which fields are available, what buttons are displayed on the **ribbon**, and how the information is organized on the **content pane**. The following figure shows the standard organization workspace.



Your organization may use the standard workspace, or your administrator may have created one or more customized workspaces. Your **profile** defines the workspace you see when you work with organizations, whether it is the standard workspace or a customized workspace. Refer to Standard workspaces or Custom workspaces.

Ribbon

The following table describes the buttons on the ribbon of the standard organization workspace. For information about the ribbon in general, refer to Working with the ribbon.

Table 127: Standard Organization Workspace Ribbon Description

Group/Button	Description
Editor	
Undock	Click this button to undock the organization editor from the console and display it in a separate window.
Save	
Save	Click this button to save the changes you have made to the organization and continue working. The organization record remains open. **Note:** When you save an organization, the rules engine evaluates it. If organization rules exist and the organization matches one or more rules, the record may be modified when you save it. For example, a rule can change an organization's state or set a custom field value. Refer to Business rules overview.
Save and Close	Click this button to save the organization and close the record.
Actions **Note:** With the exception of the New and Appointment buttons, the buttons in this group are not enabled until after you have saved an organization you are adding.	
New	Click this button to add an organization.
Refresh	Click this button to refresh the current organizations report.
Appointment	Click this button to add an appointment that is associated with the organization. Refer to Adding Outlook appointments.
Print	Click this button to print the organization record. Refer to Printing records.
Copy	Click this button to copy the organization record. Refer to Copying records.

Table 127: Standard Organization Workspace Ribbon Description (Continued)

Group/Button	Description
Delete	**Caution:** Deleting an organization permanently removes all contacts associated with the organization from the knowledge base. It also deletes all incidents for which the contacts are the primary contacts, and it may delete opportunities as well. Refer to Deleting contacts. Click this button to delete the organization record.
Proofing	
Spell Check	Click this button to check the spelling of any fields that have spell checking enabled. Refer to Manual spell checking.
Links and Info	
Links	Click this button to select a URL from the list of links added by your administrator.
Info	Click this button to see details about the organization, including when it was added and last updated and the record ID. If the organization record is in a rules state, that information also appears.

- ❖ Working with the ribbon
- ❖ Displaying shortcut keys on the ribbon

Record tabs

From an open organization record, you can view all contacts, tasks, attachments, notes, incidents, opportunities, and the organization's position in a hierarchy. You can also view the audit log, which lists all actions taken on the organization record by staff members and through automatic system updates.

- **Contacts tab**—Lists all contacts associated with the organization. The number of contacts associated with the organization displays in parentheses next to the tab name. For each contact, the tab displays the name, email address, organization name, office phone number, and title. You can open, print, copy, remove from the organization, send an email, and set the **contact role** from the Contacts tab. Refer to Adding contacts to organizations.

Note Contact roles are used only in Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking).

- **Opportunities tab**—Lists all opportunities associated with the organization. The number of opportunities associated with the organization displays in parentheses next to the tab name. For each opportunity, the tab displays the opportunity name, the staff person it is assigned to, status, stage, the sales representative forecast, the manager forecast, and the date it was last updated. You can open, copy, delete, print, forward, and reject an opportunity from the Opportunities tab. Refer to Working with opportunities.
- **Notes tab**—Contains all notes associated with the organization. Notes can be sorted by date. Remember that customers never see the notes added by staff members. Refer to Adding organizations.
- **Tasks tab**—Lists all tasks associated with the organization. The number of tasks associated with the organization displays in parentheses next to the tab name. For each task, the tab displays the task name, due date, completion date, staff member assigned to the task, and priority. You can open, copy, delete, print, and forward any task and mark tasks complete by clicking a button on the tab's toolbar or by right-clicking the task and making your selection. Refer to Adding tasks.
- **Incidents tab**—Lists all incidents associated with the organization. The number of incidents associated with the organization displays in parentheses next to the tab name. For each incident, the tab displays status, response time, resolution time, source, reference number, and subject. You can open, copy, delete, print, forward, and propose an incident as an answer from the Incidents tab. Refer to Working with incidents.

Note If you change the incident's contact to one that is not associated with the organization, the incident will not appear on the tab.

- **Hierarchy tab**—Contains the hierarchical structure of the organization. Refer to Creating and editing organization hierarchies.
- **Attachments tab**—Lists all attachments associated with the organization. The Attachments tab displays the file name, size, date created, date updated, and a description for each attachment. Refer to Attaching files to records.

- **Audit Log tab**—Lists all actions taken on the organization record by all staff members. Also displayed are automatic changes initiated by Oracle Service Cloud that resulted from the application of business rules. When an action is generated by the system, the Who field contains Administrator. You can also see who worked on the organization, when it was added or updated, the actions taken, and descriptions of the actions. Refer to Audit logs.

Adding organizations

You can add organizations independently of other records, or you can add them when you work on contacts. Because other staff members may have permission to add organizations, the organization you plan to add may already be in the knowledge base. To avoid duplicating organization records, search the knowledge base before adding an organization to be sure it does not already exist. Refer to Searching for records.

To add an organization

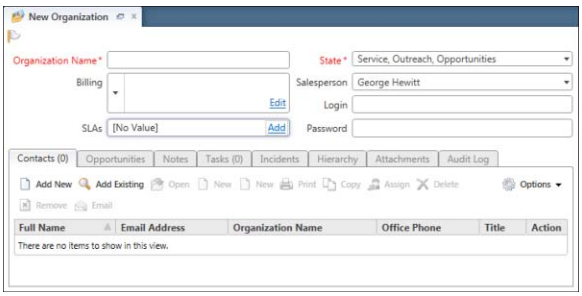
1 Click the New button on the **ribbon**.

Or

If your navigation set is configured to add organizations from the **file menu**, click File and select Organization. See To configure the file menu.

Or

Click the Search button next to the Organization field from a contact record, and then click the New Organization button on the Organization Search window. A new organization opens on a sub-tab.



2 Enter the following field information.

Table 128: Organization Fields Description

Field	Description
*Organization Name	Type the name of the organization in this field.
Billing	Click Edit in the lower right corner of the field to display a window for entering the organization's address. Type information in the Street, City, and Postal Code fields, and make selections on the Country and State/Prov. fields drop-down menus. When you select the country, the associated states or provinces appear in the State/Prov. menu. Press **Enter** when you are finished to close the window and display the address. **Note:** To select another address type, either Shipping or any custom address organization type, click the arrow and select the address type. Then complete the address information.
SLAs	Click Add or Edit in this field to open the SLA Viewer window and add or remove an SLA instance for the organization. (If you have read-only permission in your profile, the field contains View instead of Add or Edit.) Refer to Applying SLAs. **Note:** This field applies only to Service.
*State	Click this drop-down menu and select one or more of the following check boxes. • Service • Outreach • Opportunities **Note:** The State field classifies how the organization was added (whether through Service when working on an incident, Oracle RightNow Outreach Cloud Service (Outreach) when adding contacts, or Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking) when working on an opportunity). The State field may be updated automatically, and you can also update it manually.
Salesperson	Click this drop-down menu to select a salesperson assigned to the organization. This field defaults to your name on the standard organization workspace. Refer to Assigning records.

Table 128: Organization Fields Description (Continued)

Field	Description
Login	Type a name in this field to designate a login for members of the organization to use when logging in to the customer portal. If your customer portal was configured to require an organization login, customers must know the organization login name so their contact record can be associated and authenticated with the organization. Refer to Adding fields on the Create an Account page. This field applies only to Service.
Password	Type a password in this field to assign a login password to the organization. **Note:** This field applies only to Service.

3 To add **contacts** to the organization, click the Contacts tab. Refer to Adding contacts to organizations.

4 To associate the organization with a new **opportunity**, click the Opportunities tab, click the Add New button, and complete the opportunity fields. Refer to Adding opportunities.

5 To add **notes** to the organization record, click the Notes tab, click the Add button, and type your comments in the field.

Note Add notes to the organization when you want to provide information for other staff members. Notes are not visible to customers. Click the Note Channel button (next to Organization Note on the subheading of the Notes tab) to select the channel through which you gained the information you are adding to the note. Besides selecting No Channel, options include Phone, Fax, Post, CSS Web, and Email.

6 To associate **tasks** with the organization, click the Tasks tab, where you can add, edit, print, copy, assign, delete, and forward tasks associated with the organization and mark them complete. Refer to Tasks tab.

7 To associate the organization with a new **incident**, click the Incidents tab, click the Add New button, and complete the incident fields. Refer to Adding incidents.

8 To define the organization in terms of its parent or subsidiary divisions, click the Hierarchy tab. Refer to Creating and editing organization hierarchies.

9 To attach files to the organization record, click the Attachments tab. Refer to Attaching files to records.

10 To view the audit log for the organization, click the Audit Log tab. Refer to Audit logs.

11 To add a flag to the organization, click the area next to the white flag at the top of the content pane. Refer to Flagging records.

12 If the organization you are adding is on a sub-tab (because you are adding the organization to a contact), click the OK button. The sub-tab closes.

Important Closing the new organization sub-tab saves the organization data in memory, but the organization is not added to the knowledge base until you save the contact you added the organization to.

13 Click the Save and Close button on the **ribbon**.

❖ Searching for records

Adding contacts to organizations

You can add new or existing **contacts** to an organization. The existing contacts may or may not already be associated with an organization. All incidents for which the contact was the primary contact are now associated with the organization you add the contact to. Opportunities for which the contact is the primary contact do not change their **organization association** when you add the contact to the organization. For more information about contacts, refer to Contacts overview.

To add new contacts to an organization

1 Right-click the organization you want to add contacts to and select Open. On the standard organization workspace, the organization opens with the Contacts tab as the active record tab.

2 Click the Add New button on the Contacts tab. A new contact opens on a sub-tab.

3 Type the contact's first and last names in the appropriate fields.

4 Select one or more check boxes in the **State** drop-down menu.

5 To enter additional contact information, complete any of the remaining fields on any of the record tabs. Refer to Adding contacts.

6 Click the OK button to close the sub-tab and add the contact to the organization.

Important Clicking the OK button on the new contact sub-tab closes the sub-tab and saves the contact information in memory, but the contact is not added to the knowledge base until you save the organization.

7 To add more contacts to the organization, repeats steps 2 through 6.

8 Click the Save and Close button to save the organization with the newly added contacts.

To add existing contacts to an organization

1 Right-click the organization you want to add contacts to and select Open. On the standard organization workspace, the organization opens with the Contacts tab as the active tab.

2 Click the Add Existing button. The Contact Search window opens.

3 Type an entry in any of the available fields: Contact Last Name, Contact First Name, Phone, Email, Postal Code, or Organization.

Tip You can use an asterisk (*) as a wildcard in your search term.

4 Select one or more check boxes in the **State** drop-down menu.

5 Click the Search button. The contacts that match the search criteria are returned on the Contact Search window.

Note When only one contact matches the search criteria, the Contact Search window closes and that contact appears on the organization's Contacts tab.

6 Select the contact you want to associate with the organization and click the Select button. The window closes and the contact appears on the organization's Contacts tab.

7 Click the Save and Close button to save the organization.

Editing organizations

You may find yourself in the position of needing to view or update organization information. Depending on the permissions set in your **profile**, you can view organization information, edit organizations, copy, print, and delete organizations, and remove contacts from an organization.

The following procedures describe how to edit, delete, and remove contacts from an organization. Refer to Copying records and Printing records.

To edit an organization

1 Right-click the organization and select Open. The organization record opens.

2 Make the necessary changes to any field on any tab.

3 Click the Save and Close button to save the changes to the organization.

To delete an organization

Caution Deleting organization records can affect other staff members within your organization. This action permanently removes not only the organizations from the knowledge base, but also all contacts associated with the organization and the incidents and opportunities for which the contacts are primary contacts. Refer to Deleting contacts.

1 Right-click the organization and select Delete. A message asks you to confirm that you want to delete the organization.

2 Click the Yes button to delete the organization, all associated contacts, and all incidents and opportunities for which the deleted contacts are primary contacts.

To remove contacts from an organization

1 Right-click the organization and select Open. The standard organization workspace displays the organization record with the Contacts tab as the active tab.

2 In the list of contacts, right-click the one you want to remove from the organization and select Remove.

3 Click the Yes button on the message that confirms the removal of the contact.

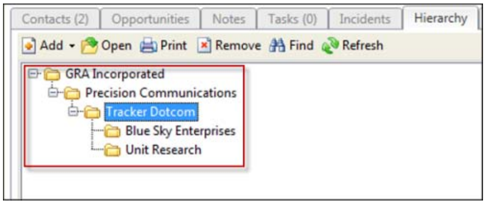
4 To remove additional contacts, repeat steps 2 and 3.

5 Click the Save and Close button. The contacts are removed from the organization but not from the **knowledge base**.

Creating and editing organization hierarchies

The Organization Hierarchy feature in Oracle Service Cloud enables you to create a hierarchy for any organization that has subordinate organizations. For example, if an organization in your knowledge base has several subsidiaries or regional or international offices, each having an organization record in the knowledge base, you can add the subordinate organizations to the parent organization, thereby creating an organization hierarchy. Once you create a hierarchy for an organization, you can easily add and remove organizations and change the order of the hierarchy structure.

An organization can have an unlimited number of subordinates, organized into a maximum of twelve levels per parent organization.



Caution Changing an organization's hierarchy can impact the incidents and opportunities associated with all organizations in the hierarchy. Therefore, make sure you understand the consequences of changing the structure of an organization's hierarchy.

To add a new organization to the hierarchy

1 Right-click the organization and select Open. The **content pane** displays the organization record.

2 Click the Hierarchy tab.

3 Click the Add button and select Add New. A new organization opens on a sub-tab.

4 Type the organization name in the field.

5 Select one or more check boxes in the **State** drop-down menu.

6 To enter additional organization information, complete any of the remaining fields on any of the record tabs. Refer to Adding organizations.

7 Click the OK button to close the new organization sub-tab and add the organization to the hierarchy of the organization you are editing.

8 To change the position of the organization you added, expand the hierarchy and drag and drop the organization.

9 Click the Save and Close button to save the change to the organization hierarchy.

To add an existing organization to the hierarchy

1 Right-click the organization and select Open. The **content pane** displays the organization.

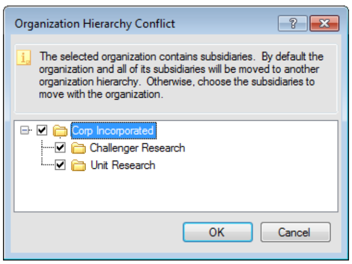
2 Click the Hierarchy tab.

3 Click the Add button and select Add Existing. The Organization Search window opens.

4 Enter search criteria in the fields to filter your organization search and click the Search button. The organizations that match your search criteria display.

5 Select an organization from the list and click the Select button. If the organization you select is not already part of a hierarchy, selecting it closes the Organization Search window and adds the organization to the hierarchy of the original organization.

Note If the organization you are adding is part of another hierarchy, a message notifies you that the selected organization contains subsidiaries. Moving the organization also moves all its subsidiaries unless you select to move only specific subsidiaries.



a To move only some of the selected organization's subsidiaries to the organization hierarchy, clear the check boxes for those you do not want to move.
b Click the OK button to close the window and move the organization and selected subsidiaries to the hierarchy.
c To view the full organization hierarchy, right-click any organization within the hierarchy and select Expand All.

6 Click the Save and Close button to save your changes to the organization hierarchy.

Editing organization hierarchies

On the Hierarchy tab, you can add a new or existing organization, open or print an organization, remove an organization from the hierarchy, find an organization in the hierarchy, and refresh to restore the hierarchy to its previously saved state and discard your edits. The following table describes the buttons on the Hierarchy tab toolbar.

Table 129: Hierarchy Tab Toolbar Description

Button	Description
Add	Click this button and select one of the following options.
Add New	Select this option to open a new organization on a sub-tab and add an organization to the hierarchy.
Add Existing	Select this option to open the Organization Search window and add an existing organization to the hierarchy.
Open	Click this button to open the selected organization and edit it.
Print	Click this button to print the selected organization.
Remove	**Caution:** Removing an organization also removes its subordinate organizations from the hierarchy. Click this button to remove the organization from the hierarchy.
Find	Click this button to open the Find window and search the hierarchy for an organization.
Refresh	Click this button to restore the organization hierarchy and discard any changes you have made.

Caution To delete an organization that is part of an organization hierarchy, first remove the organization from the hierarchy. Then delete the organization from the knowledge base. As always, use caution when deleting organizations. See To delete an organization.

21

Contacts

Customer data is the foundation of Oracle Service Cloud. It includes basic information such as a customer's name, email address, and phone number as well as information about customer service issues, opportunities, and marketing mailings opt-in status.

The contact information you add and edit becomes part of your organization's **knowledge base** and is shared with all staff members. If you are a sales representative, for example, you should know if a customer is having support issues before you try to close a sale. If you are a service agent, you can better help customers if you understand their past support questions. And if you work in marketing, you must know whether the customer prefers plain text or HTML email.

When customer information is kept up-to-date, the knowledge base provides complete information to your entire organization. The results make your job easier and provide a superior customer experience.

Contacts overview

Every customer has a contact record in the **knowledge base** that contains information about the customer. But before you can understand contacts, you must first understand how contacts and organizations are associated and also how contacts are associated with incidents and opportunities. Familiarize yourself with the following points before adding or editing contacts.

- An organization is any business entity that has an organization record in the knowledge base. For example, organizations can refer to companies, divisions of companies, government agencies, educational institutions, or nonprofit associations.
- Contacts may or may not belong to an organization. If your customers are other organizations, you might have several contacts associated with an organization record. If, on the other hand, your customers are individuals rather than organizations, every contact record represents a unique customer. It is also possible that you have both organizations and contacts as customers.

- Each contact is associated with only one organization, but an organization can have many contacts. Each contact record displays all incidents, opportunities, tasks, surveys, marketing activity, attachments, and notes for the contact, as well as the audit log, which displays all activity for the contact record.
- Every incident must have a **primary contact**. If your profile gives you the appropriate permissions, you can change contact associations and delete contact records. Because these actions can have far-reaching consequences on incidents as well as opportunities, it is important to understand what happens when you make such changes.

Changing contact associations

Changing a contact's organization association has implications for the incidents and opportunities associated with the contact. If you change the organization for a contact who is the primary contact for an incident, the incident's organization association changes to match that of the contact. Secondary contacts from a different organization remain with the incident even when you change the organization association of the primary contact.

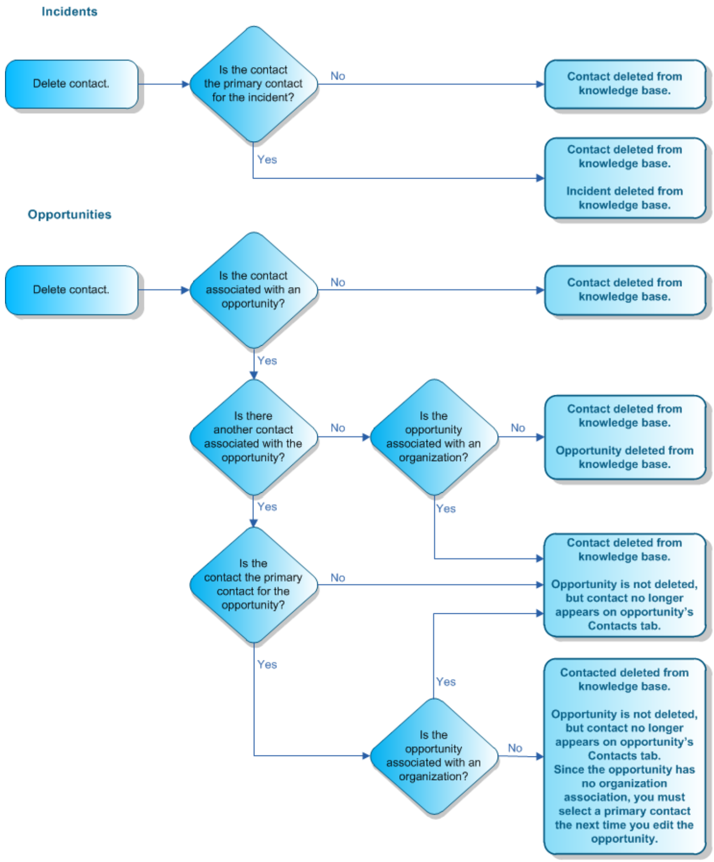
The effect of changing a contact's organization association does not change the opportunity's organization association. The contacts associated with the opportunity remain the same, regardless of the organization they are associated with. Refer to Associating contacts.

Deleting contacts

There are usually consequences when a contact is deleted. If the contact is associated with multiple incidents or multiple opportunities or both, different results may occur with each record, depending on the type of associations and the association of other contacts with the record. In cases where the contact has multiple incidents and opportunities, follow the flowchart for each record the contact is associated with to discover what will happen to the record if you delete the contact.

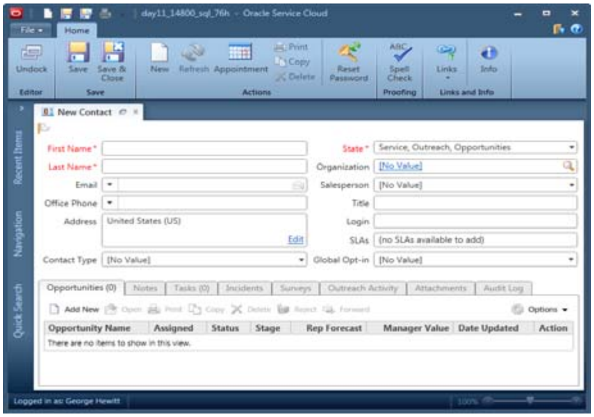
For example, assume a contact is associated with two opportunities. Also assume that the first opportunity does not have an organization association while the second one does, and that neither opportunity has a secondary contact. Deleting the contact removes the contact from the knowledge base and deletes the first opportunity. The second opportunity remains in the knowledge base, although the contact no longer appears on the Contacts tab.

Note When you delete secondary contacts for incidents and opportunities, the incidents and opportunities are not deleted.



Standard contact workspace

Oracle Service Cloud provides a standard workspace for working with contacts. The workspace defines which fields are available, what buttons are displayed on the **ribbon**, and how the information is organized on the **content pane**.



Your organization may use the standard workspace, or your administrator may have created one or more customized workspaces. Your **profile** defines the workspace you see when you work with contacts, whether it is the standard workspace or a customized workspace. Refer to Standard workspaces or Custom workspaces.

Ribbon

The following table describes the buttons on the ribbon of the standard contact workspace. For more information about the ribbon in general and the Quick Access toolbar, refer to Working with the ribbon.

Table 130: Standard Contact Workspace Ribbon Description

Group/Button	Description
Editor	
Undock	Click this button to undock the contact editor from the console and display it in a separate window.

Table 130: Standard Contact Workspace Ribbon Description (Continued)

Group/Button	Description
Save	
Save	Click this button to save the changes you have made to the contact and continue working. The contact record remains open. **Note:** When you save a contact, the rules engine evaluates it. If contact rules exist and the contact matches one or more rules, the record may be modified when you save it. For example, a rule can change a contact's state or set a custom field value.
Save and Close	Click this button to save the contact and close the record.
Actions **Note:** With the exception of the New and Appointment buttons, the buttons in this group are not enabled until after you have saved a contact you are adding.	
New	Click this button to add a contact.
Refresh	Click this button to refresh the current contact record.
Appointment	Click this button to add an appointment that is associated with the contact. Refer to Adding Outlook appointments.
Print	Click this button to print the contact record. Refer to Printing records.
Copy	Click this button to copy the contact record. Refer to Copying records.
Delete	**Caution:** To understand the consequences of this action before you delete a contact, refer to Deleting contacts. Click this button to delete the contact record.
Reset Password	Click this button to invalidate the contact's current password. **Note:** This action sends an email to the contact's primary email address. Included in the email is a link to a page where a new password can be set.
Proofing	
Spell Check	Click this button to check the spelling of any fields that have spell checking enabled. Refer to Spell checking.

Table 130: Standard Contact Workspace Ribbon Description (Continued)

Group/Button	Description
Links and Info	
Links	Click this button to select a URL from the list of links added by your administrator.
Info	Click this button to see details about the contact, including when it was added and last updated and the record ID. If the contact record is in a rules state, that information also appears.

- ❖ Working with the ribbon
- ❖ Displaying shortcut keys on the ribbon

Record tabs

From an open contact record, you can view all opportunities, notes, tasks, incidents, surveys, marketing activity, and attachments associated with the contact. You can also view the audit log, which lists all actions taken on the contact record by the customer, staff members, and through automatic system updates.

If **Oracle RightNow Social Experience communities** are enabled and your administrator has added the community **control** to a custom contact workspace, the Community Profile tab displays. The following figure shows a custom contact workspace with the Community Profile tab.

- **Community Profile tab**—If the contact you are viewing has a profile in one or more communities, information displays on the Community Profile tab for read-only purposes. The Community Profile tab contains the following tab set.
  - ▷ **Profile tab**—Contains profile information returned by the communities, such as name, company, phone, email, address, city, state, and website.
  - ▷ **Groups tab**—Lists the three most recent groups the member has joined.
  - ▷ **Posts tab**—Lists the three most recent posts made by the member. Each post provides a link that directs staff members to additional information about the post.

- ▷ **Comments tab**—Lists the three most recent comments made by the member. Each comment provides a link that directs staff members to additional information about the comment.

Note The Community Profile control can be added to incident workspaces as well.

- **Opportunities tab**—Lists all opportunities associated with the contact. The tab contains the number of opportunities associated with the contact in parentheses next to the tab name. For each opportunity, the tab displays the opportunity name, the staff person it is assigned to, status, stage, the sales representative and manager forecasts, and the date it was last updated. You can open, copy, delete, print, forward, and reject an opportunity by clicking a button on the tab's toolbar or by right-clicking the opportunity and making your selection. Refer to Working with opportunities.
- **Notes tab**—Contains all notes associated with the contact. Notes can be viewed and selected by contact or organization and sorted by date. Remember that customers never see the notes added by staff members. Refer to step 4 in To add a contact.
- **Tasks tab**—Lists all tasks associated with the contact. The tab contains the number of tasks associated with the contact in parentheses next to the tab name. For each task, the tab displays the task name, due date, completion date, the staff member assigned to the task, and priority. You can open, copy, delete, print, and forward any task and mark tasks complete by clicking a button on the tab's toolbar or by right-clicking the task and making your selection. Refer to Tasks.
- **Incidents tab**—Lists all incidents associated with the contact. The tab contains the number of incidents associated with the contact in parentheses next to the tab name. For each incident, the tab displays status, time beyond the response threshold, time beyond the resolution threshold, source, reference number, and subject. You can open, copy, delete, print, forward, and propose an incident as an answer by clicking a button on the tab's toolbar or by right-clicking it and making your selection. Refer to Working with incidents.
- **Surveys tab**—Contains all survey activity associated with the contact. The tab contains the number of surveys associated with the contact in parentheses next to the tab name. For each survey, the tab displays when the customer completed the survey, the survey score, and the type and name of the survey. The Action column lets you view the contact's response. Refer to Creating surveys.
- **Outreach Activity tab**—Contains all outreach activity associated with the contact, such as mailings that were viewed or tracked links that were clicked. The Outreach Activity tab contains the number of mailings associated with the contact in parentheses

next to the tab name. The tab displays when the activity occurred, what the activity was, a description of the activity, the name of the mailing, and any documents for each listed activity. Refer to Creating mailings.

- **Attachments tab**—Lists all attachments associated with the contact. The tab displays the file name, size, date created, date updated, and a description for each attachment. Refer to Attaching files to records.
- **Audit Log tab**—Lists all actions taken on the contact record by you, other staff members, and the customer. It also displays any automatic changes initiated by Oracle Service Cloud that resulted from the application of business rules or through configuration settings. Refer to Audit logs.

Adding contacts

Contacts can be added to the **knowledge base** by customers and staff members. A customer can add a contact record when creating an account on the **customer portal**. Staff members can add contacts using a contact workspace. They can also add them when working on incidents, opportunities, organizations, tasks, assets, and contact lists.

Note Because many staff members can have permission to add contacts, the contact you plan to add may already be in the knowledge base. To avoid duplicating contact records, search the knowledge base before adding a contact to be sure it does not already exist. Refer to Searching for records.

To add a contact

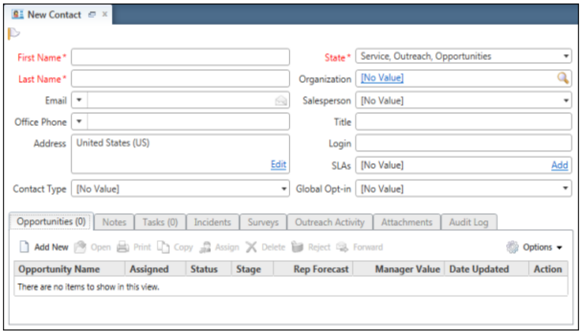
1 Click the New button on the **ribbon**.

Or

If your navigation set is configured to add contacts from the **file menu**, click File and select Contact. See To configure the file menu.

Tip You can also add a contact while working on many types of open records, using one of the following methods:

- Right-click in the Contact field of an open incident, opportunity, task, asset, or contact list, then select Add New. The new contact opens on a sub-tab, which contains the same fields and tabs as the standard contact workspace does.
- Use the Contacts tab of an open incident, opportunity, or organization record to add a new contact. Refer to Adding contacts from other records.



2 Enter the following field information.

Table 131: Contact Fields Description

Field	Description
*First Name	Type the contact's first name in this field.
*Last Name	Type the contact's last name in this field.

Table 131: Contact Fields Description (Continued)

Field	Description
Email	Type the contact's email address in this field. To add alternate email addresses, click the arrow and select Email Alt 1 or Email Alt 2. Then type the alternate email address in the field. **Note:** If you enter an email address that is already in the knowledge base, you will receive an error message and not be able to save the contact. If email address sharing is enabled, meaning multiple contacts can share the same email address, a yellow icon with a black exclamation point displays when you type an email address that is associated with a different contact in the system. If this icon appears, you can save the contact without changing the contact's email address. Email address sharing validation begins when the Email address field receives focus and ends when the field loses focus. Refer to Email address sharing.
Office Phone	Type the contact's phone number in this field. To add other phone numbers, click the arrow, select one of the options, and type the phone number in the field. The options include Mobile, Fax, Assistant, and Home.
Address	Click Edit in the lower right corner of the field to display a window for entering the contact's address. Type information in the Street, City, and Postal Code fields, and make selections on the Country and State/Prov. fields drop-down menus. When you select the country, the associated states or provinces appear in the State/Prov. menu. Press **Enter** when you are finished to close the window and display the address you entered.
Contact Type	Click this drop-down menu and select a contact type. These options are unique to your organization and were added by your administrator. Refer to Adding and editing contact types.

Table 131: Contact Fields Description (Continued)

Field	Description
Channel Usernames	Click Add in this field to open the Channel Usernames window where you can add Facebook, Twitter, and YouTube user names for contacts. Refer to Storing social media user names. **Note:** This field does not display unless your administrator has configured a custom contact workspace for the Channel Usernames field. Refer to Creating custom workspaces. In addition, contacts can provide their own Facebook, Twitter, and YouTube user names through the ChannelAllInput and ChannelAllDisplay widgets on the customer portal. Refer to Input and output widgets.
*State	Click this drop-down menu and select one or more of the following check boxes: Service, Outreach, or Opportunities. The State field classifies how the contact was added, whether through Oracle RightNow Cloud Service (Service) when working on an incident, Oracle RightNow Outreach Cloud Service (Outreach) when adding contacts, or Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking) when working on an opportunity, and what areas of Oracle Service Cloud the contact has since had activity in. The State field may be updated automatically, and you can also update it manually.
Organization	Click the Search button to the right of the Organization field to open the Organization Search window and search for an organization to associate with the contact. Refer to Associating contacts with organizations.
Salesperson	Click this drop-down menu and select the salesperson assigned to the contact. This field defaults to No Value. Refer to Assigning records.
Title	Type the contact's title in this field.

Table 131: Contact Fields Description (Continued)

Field	Description
Login	Type a name in this field to designate a login for the customer to use when logging in to the customer portal. If the customer added the contact record on the customer portal, this field displays the login the customer entered. This field applies only to Service. A login must be unique for each contact if Email Address Sharing is enabled. Refer to Email address sharing. **Note:** The login may not contain a space, single quote, double quote, less than, or greater than character. We recommend that you use ASCII characters when creating a customer login.
SLAs	An SLA is a service level agreement. Click Add or Edit in this field to add, edit, or remove an SLA instance for the contact. (If you have read-only permission in your profile, the field contains View instead of Add or Edit.) Refer to Applying SLAs. **Note:** This field applies only to Service and only for contacts that do not have an organization association. If the contact is associated with an organization, you must apply SLA instances to the organization, not the contact.
Global Opt-in	Click this drop-down menu and select Yes if the customer has opted to receive marketing mailings and No if the customer does not want to receive them.

3 To associate the contact with a new **opportunity**, click the Opportunities tab. (This tab is on top by default on the standard contact workspace.) Click the Add New button to open a new opportunity on a sub-tab, and then complete the fields. Refer to Adding opportunities.

4 To add **notes** to the contact record, click the Notes tab, click the Add button, and type your comments in the field.

Note Add notes to the contact when you want to provide information for other staff members. Notes are not visible to customers. Click the Contact Note drop-down menu to select the channel through which you gained the information you are adding to the note. Besides selecting No Channel, options include Phone, Fax, Post, CSS Web, and Email.

5 To associate **tasks** with the contact, click the Tasks tab where you can add, open, print, copy, assign, delete, and forward tasks associated with the contact and mark them complete. Refer to Tasks tab.

6 To associate the contact with a new **incident**, click the Incidents tab. Click the Add New button to open a new incident on a sub-tab, and then complete the fields. Refer to Adding incidents.

7 To view **surveys** the contact has participated in, click the Surveys tab.

8 To view **mailings** the contact has received, click the Outreach Activity tab.

9 To attach files to the contact record, click the Attachments tab. Refer to Attaching files to records.

10 To view the audit log for the contact record, click the Audit Log tab. Refer to Audit logs.

11 To add a **flag** to the contact, click the area next to the white flag at the top of the content pane. Refer to Flagging records.

12 If the contact you are adding is on a sub-tab (because you are adding the contact to a contact list, incident, opportunity, or task), click the OK button. The sub-tab closes.

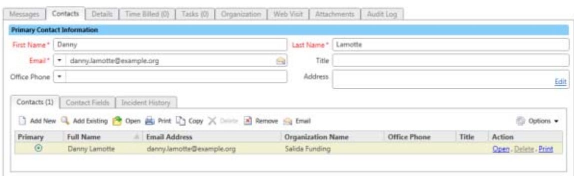
Important Closing the New Contact sub-tab saves the contact data in memory, but the contact record is not added to the knowledge base until you save the record you have added the contact to.

13 Click the Save and Close button on the ribbon.

❖ Searching for records

Adding contacts from other records

You can add or edit a contact from the Contacts tab when you work with incidents, opportunities, and organizations. The following figure shows the Contacts tab on an incident.



The following table describes the toolbar buttons on the Contacts tab. The same options are available by right-clicking any contact.

Table 132: Contacts Tab Toolbar Description

Button	Description
Add New	Click this button to add a new contact to the record. Refer to Adding contacts.
Add Existing	Click this button to search for and add an existing contact to the record. Refer to Searching for records.
Open	Click this button to open the contact record. See To edit a contact.
Print	Click this button to print the contact record. See To print a record.
Copy	Click this button to copy the contact record. See To copy a record.
Delete	Click this button to delete the contact record. Refer to Deleting contacts.
Remove	Click this button to remove the contact association from the incident, opportunity, or organization.
Email	Click this button to open your email client with an untitled message to the contact. **Note:** This button is enabled only if your profile includes permission to email contacts.
Set Contact Role	Click this button to assign a contact role to the contact. See To set a contact role. **Note:** This button is available only when editing opportunities.
Options	Click this button to display a drop-down menu of options that include actions you can take, such as printing, forwarding, publishing, or exporting the contact data.

The following columns are available on the Contacts tab.

- Primary (for incidents and opportunities)
- Full Name
- Email Address
- Organization Name
- Office Phone

- Title
- Contact Role (for opportunities)
- Action

The Action column contains Open, Delete (secondary contacts only for incidents), and Print options for the contact. You can also access these options by right-clicking the contact. Other right-click options include Copy, Remove, Email, Set Contact Role (opportunities only), and Copy Cell to Clipboard. (The right-click options are the same as those offered by the buttons on the Contacts tab toolbar.)

❖ Adding contacts
❖ Searching for records

Associating contacts

It is possible to add contacts and not associate them with any other type of record in the knowledge base. But the real value of Oracle Service Cloud comes from being able to associate contact records with organizations, incidents, opportunities, tasks, and contact lists. All staff members with permissions in their **profile**, whether they work in Service, Opportunity Tracking, Outreach, or Oracle RightNow Feedback Cloud Service (Feedback), can open and update contact records, ensuring that every staff member has the most current information about all contacts.

Associating contacts with organizations

When you know that a contact you are adding belongs to an organization that is already in the **knowledge base**, you should associate the contact with the organization. If the organization is not yet in the knowledge base, you can enter organization information for the contact to create an association between the two types of records.

You can associate a contact with an organization at any time. For example, you can associate a contact with an organization when you add the contact. Or you can edit the contact later to add the organization association. The procedure for associating a contact with an organization is the same whether or not the contact is currently associated with another organization.

Important If you change a contact's **organization association**, you also change the organization association for all incidents for which the contact is the primary contact. However, the organization association for the contact's opportunities do not change when you change the contact's organization association.

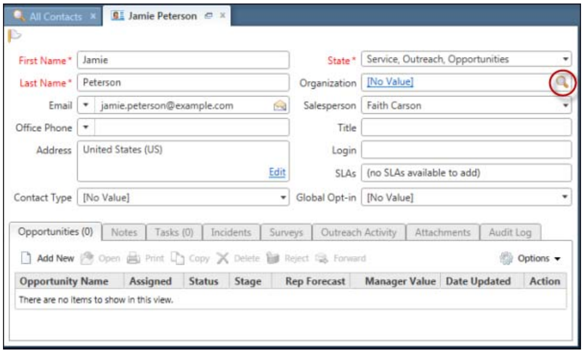
To associate a contact with an organization

1 Right-click a contact on the **content pane** and select Open > Contact. The contact record opens. If the contact is associated with an organization, the organization name appears in the record.

Or

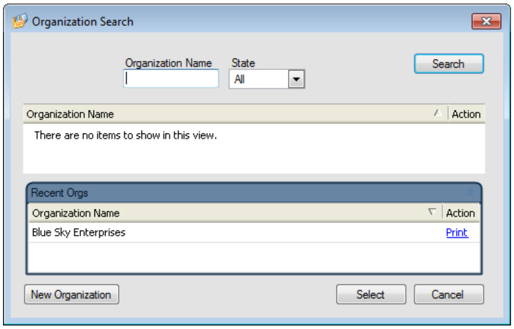
If your navigation set is configured to add contacts from the file menu, click File and select Contact. See To configure the file menu.

2 Click the Search button to the right of the Organization field.



Note You can also click the link in the Organization field, then select an organization from the list of recently viewed organizations. Refer to Checking recent items before searching.

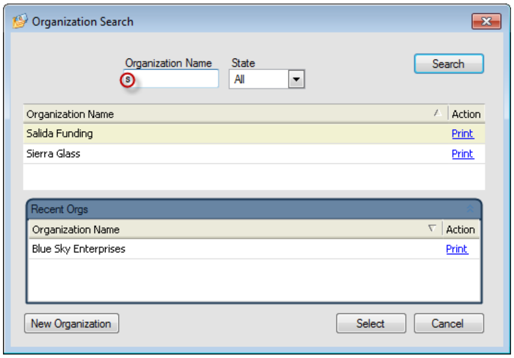
The Organization Search window opens.



3 To search by organization name, type the first few characters in the Organization Name field. An implied wildcard is used so all organizations that begin with the letters you type are returned.

4 To search by State, select any or all of the Select All, Service State, Outreach State, or Opportunities State check boxes in the drop-down menu.

5 Click the Search button. The list of organizations that match the search criteria appears.



6 Select the organization you want to associate the contact with and click the Select button or press **Enter**. The Organization Search window closes and the organization appears in the contact record.

Or

If the organization does not appear in the list, click the New Organization button to open a new organization on a sub-tab and complete the fields. (The search term you typed in the Organization Name field on the search window appears in the Organization Name field on the new organization sub-tab.) Refer to Adding organizations.

7 Click the Save and Close button to save the contact and organization.

Associating contacts with incidents

When you work on an **incident** in Oracle RightNow Cloud Service (Service) and add a new or existing contact to the incident, that contact-incident association is automatically created when you save the incident. A contact-incident association is also created when you add an incident to a contact by clicking the Incidents tab and clicking the Add New button. Refer to Adding incidents.

Associating contacts with opportunities

When you work on an **opportunity** in Opportunity Tracking and add a new or existing contact to the opportunity, the contact-opportunity association is automatically created when you save the opportunity. A contact-opportunity association is also created when you add an opportunity to a contact by clicking the Opportunities tab and clicking the Add New button. Refer to Adding opportunities.

Removing contact associations

There might be times when you want to remove a contact from a record but do not want to delete the contact from the **knowledge base**. In those instances, you can remove the contact from the incident, opportunity, organization, or contact list.

Note To remove a contact from an open task, right-click the name in the Contact field and select Clear.

To remove a contact from a record

1 On the Contacts tab of the record, select the contact you want to remove and click the Remove button on the toolbar. A message asks you to confirm that you want to remove the contact.

Or

Right-click the contact and select Remove.

2 Click the Yes button to confirm removal of the contact. The contact remains in the knowledge base but is no longer associated with the record.

3 Click the Save and Close button to save the change to the record.

Editing contacts

It is highly likely you will encounter situations where you need to update contact information for contacts that are already in the **knowledge base**. Depending on the permissions set in your **profile**, you can edit a contact record whenever you need to add or change customer information. You can also copy, print, and delete contacts and set a contact role. The following procedures assume a contacts report is displayed on the **content pane**.

Tip If you want to delete a contact but do not want to delete the incidents and opportunities associated with that contact, you can specify different contacts for the incidents and opportunities before you delete the original contact. Refer to Reassociating incidents with a different contact or Reassociating opportunities with a different contact.

To edit a contact

1 Right-click the contact and select Open > Contact. The contact record opens.

2 Make the necessary changes to any field on any tab.

3 Click the Save and Close button to save the changes to the contact.

To delete a contact

Caution Deleting contact records can affect other staff members within your organization. This action permanently removes not only the contacts from the knowledge base, but also all incidents for which the contact is the primary contact. Opportunities may also be deleted, so you must understand the consequences of deleting contacts before doing so. Refer to Deleting contacts for specific results of deleting contacts.

1 Right-click a contact and select Delete. A message asks you to confirm that you want to delete the contact.

2 Click the Yes button to delete the selected contact.

To set a contact role

1 Open an opportunities report.

2 Right-click an opportunity and select Open > Opportunity.

3 Click the Contacts tab.

4 Right-click the contact and select Set Contact Role. The Set Contact Role window opens.

5 Click the Contact Role drop-down menu and select a contact role for the opportunity's contact.

6 Click the OK button to close the Set Contact Role window.

7 Click the Save and Close button to save the contact's role for the opportunity.

Note The contact's role may be different for different opportunities, which is why it is set from the opportunity, not from the contact. For example, a contact might serve as a decision maker in one opportunity and a referral in another.

Reassociating incidents with a different contact

Deleting a contact also deletes the **incidents** for which the contact is the primary contact. If the contact is associated with incidents but is not the primary contact, those incidents will not be deleted.

If you do not want to delete the incidents for which the contact is the primary contact, you can reassociate the incidents with a different contact before you delete the original contact.

To reassociate the contact for an incident

1 Right-click the contact you want to delete and select Open > Contact.

2 Click the Incidents tab. The tab displays all incidents for which the contact is the primary.

3 Right-click the first incident and select Open. The incident opens on a sub-tab.

4 Click the incident's Contacts tab.

5 Click the Add Existing button on the toolbar. The Contact Search window opens.

6 Search for a contact on the Contact Search window using the procedure described in To search for a contact from an open record. The contact you select appears on the Contacts tab of the incident.

Important If a contact is added to an incident using the Search button next to the Contact field of the incident, the existing primary contact is automatically removed from the incident and replaced with the new primary contact. This logic also applies when clicking the contact's name in the Contact field and selecting Change or Add New.

If a contact is added to an incident using the Add New or Add Existing functionality from the Contacts tab on the incident, the primary contact remains and the new contact is added as a secondary contact.

7 Select the radio button under the Primary column for the contact you added. This makes the new contact the primary contact for the incident.

8 Click the OK button to close the incident.

9 Repeat steps 3 through 8 for every incident you want to associate with a different contact.

10 Click the Save and Close button to save the changes. The incidents you reassociated no longer appear on the Incidents tab of the contact.

Now you can delete the contact that was originally the primary contact. Refer to Deleting contacts.

Reassociating opportunities with a different contact

Clicking the Opportunities tab on an open contact displays the opportunities associated with the contact. If no opportunities are listed, you can safely delete the contact without deleting any opportunities. If the contact is associated with other opportunities but is not the primary contact, those opportunities will not be deleted when the contact is deleted.

If you want to delete the contact but not the opportunities associated with the contact, you can reassociate the opportunities with a different contact.

To reassociate the contact for an opportunity

1 Right-click the contact you want to delete and select Open > Contact.

2 Click the Opportunities tab. The tab displays all opportunities for which this contact is the primary contact.

3 Right-click the first opportunity and select Open. The opportunity opens on a sub-tab.

4 On the opportunity's Contacts tab, click the Add button and select Add Existing. The Contact Search window opens.

5 Search for a contact on the Contact Search window using the procedure described in To search for a contact from an open record. The contact you select appears on the Contacts tab of the opportunity.

Important If a contact is added to an opportunity using the Search button next to the Contact field of the opportunity, the existing primary contact is automatically removed from the opportunity and replaced with the new primary contact. This logic also applies when clicking the contact's name in the Contact field and selecting Change or Add New.

If a contact is added to an opportunity using the Add New or Add Existing functionality from the Contacts tab on the opportunity, the primary contact remains and the new contact is added as a secondary contact.

6 Select the radio button under the Primary column for the contact you added. This makes the new contact the primary contact for the opportunity.

7 Click the OK button to close the opportunity.

8 Repeat steps 3 through 7 for every opportunity you want to reassociate.

9 Click the Save and Close button to save the changes. The opportunities you reassociated no longer appear on the Opportunities tab of the contact.

Now you can delete the contact that was originally the primary contact. If the contact you deleted belonged to an organization, the opportunity remains with the organization, although the reassociated contact appears on the opportunity as well. Refer to Deleting contacts.

Email address sharing

Email address sharing gives you the ability to associate a single email address with multiple contact records, which allows a group of related contacts (such as a family or a team) to maintain individual contact records while sharing an email address.

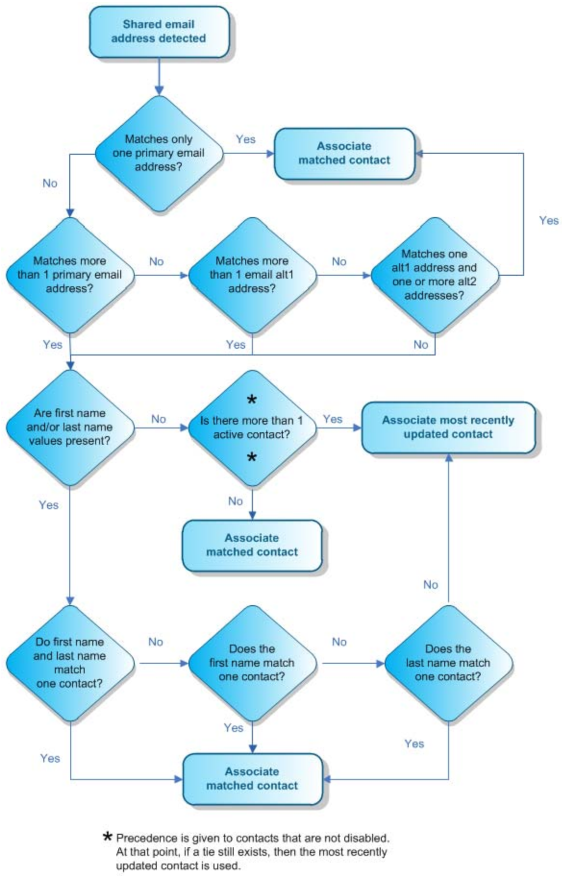
Note Contact records that share the same email address must have a unique login, or, for contacts without a login, they must include a unique combination of first name and last name, as duplicate contact records cannot exist in the knowledge base.

For example, Bill Short and Bill Short can share the same email address as long as they have different logins.

If multiple contacts' logins are left blank, their first or last name must be unique. In this case, Bill Short and William Short can share the same email address, since each name is unique.

Email addresses associated with a single contact record must be unique—that is, for a single contact, the values of *contacts.email, contacts.email_alt1,* and *contacts.email_alt2* cannot contain the same address.

Once email address sharing is enabled, records and transactions initiated by a shared email address are associated with the contact considered to be the best fit. The contact-matching process used to determine the best fit is shown in the following figure.



When shared contact addresses are in different fields (for example, *contacts.email_alt1* and *contacts.email_alt2)*, the system selects the contact whose address is in the field of highest precedence *(contacts.email_alt1)*. However, if the shared addresses are in the same field (for example, both are in *contacts.email_alt1),* the system attempts to match the values in the First Name and Last Name fields if available. If no match is found based on field precedence or name values, the system selects the contact record last updated in the database.

❖ Areas affected by email address sharing

Areas affected by email address sharing

The contact-matching process applies to areas of the product suite that associate contacts by email address, including chats, mailings, surveys, web forms, site feedback, email transactions, and Create an Account and Ask a Question requests on the **customer portal**. Contact-matching logic is used only in cases in which the contact is not explicitly identified by a cookie.

The following table lists the areas in Oracle Service Cloud that are affected when email address sharing is enabled and where you can find additional information.

Table 133: Areas in Oracle Service Cloud Affected by Email Address Sharing

Area in Oracle Service Cloud	Where to Find Information
Common	
Email management	Refer to Email handling in Service or Email bounce handling.
Data import	Refer to Importing data.
Contact workspaces	Refer to Contact Fields Description.
Outlook integration	Refer to Email address sharing in contact integration or Email address sharing in email integration.
Service	
Customer Portal	Refer to Allowing duplicate email addresses.
Oracle RightNow Chat Cloud Service (Chat)	Refer to Email address sharing in Chat.

Table 133: Areas in Oracle Service Cloud Affected by Email Address Sharing (Continued)

Area in Oracle Service Cloud	Where to Find Information
Outreach	
Mailings	When defining an audience for broadcast and transactional mailings, you can allow delivery of messages to multiple contacts who share the same email address. Audience count and web form identification are also affected when email address sharing is enabled. Refer to the following links. • Broadcast mailings—Click here to view the option for the delivery of messages to multiple contacts that are sharing the same email address. • Transactional mailings—Click here to view the option for delivery of messages to multiple contacts that are sharing the same email address. • Audience count—Click here to view the description of the Duplicate Email column on the Audience Count Details window. • Web form identification—Refer to Inserting web forms.
Feedback	
Surveys	When defining an audience for broadcast and transactional surveys, you can allow delivery of messages to multiple contacts who share the same email address. Audience count and web form identification are also affected when email address sharing is enabled. Refer to the following links. • Broadcast surveys—Click here to view the option for the delivery of messages to multiple contacts that are sharing the same email address. • Transactional surveys—Click here to view the option for the delivery of messages to multiple contacts that are sharing the same email address. • Audience count—Click here to view the description of the Duplicate Email column on the Audience Count Details window. • Web form identification—Refer to Inserting web forms.

Enabling email address sharing

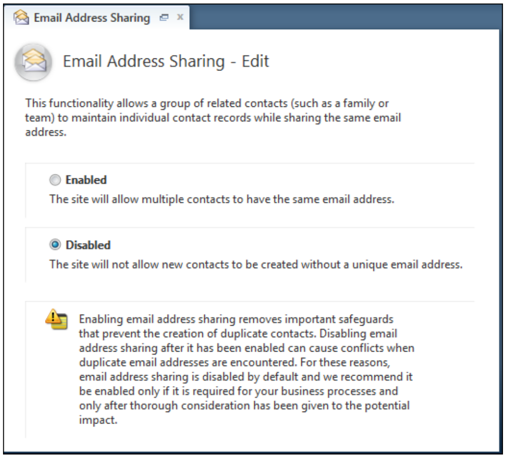
To make email address sharing available, it must first be enabled. The following procedure describes how to enable and disable email address sharing on your site.

Caution Enabling email address sharing removes important safeguards that prevent the creation of duplicate contacts and protect your reputation for sending mailings and surveys. Also, disabling email address sharing after it has been enabled can cause conflicts when duplicate email addresses are encountered. For these reasons, email address sharing is disabled by default and we recommend it be enabled only if it is required for your business processes and only after thorough consideration has been given to the potential impact.

To enable email address sharing

1 Click the Configuration button on the **navigation pane**.

2 Double-click Email Address Sharing under Database. The Email Address Sharing editor displays on the **content pane**.



3 Select the Enabled radio button.

4 Click the Save and Close button on the **ribbon**. A message warns you that duplicate email address safeguards will be removed.

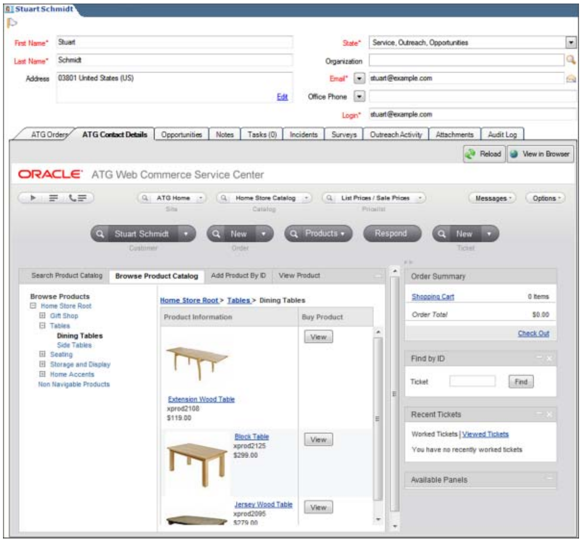
5 Click the OK button.

Note Once email address sharing is enabled, staff members who are currently logged in to Oracle Service Cloud must log out and log back in for the change to take effect.

Oracle Commerce Service Center integration

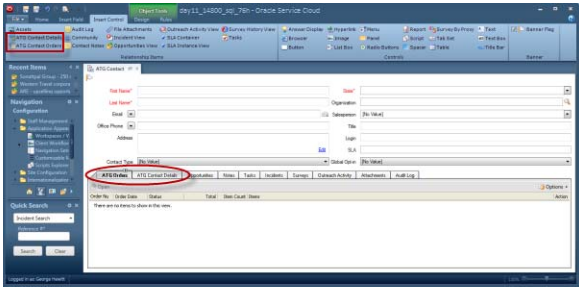
With the integration of Oracle Commerce Service Center (CSC), you can respond quickly to commerce support questions from the agent desktop. You will no longer have to switch back and forth between applications. Contacts are synchronized between CSC and Oracle Service Cloud, letting you view CSC contact information and order details on the Service Console. From there, you can take action on an existing CSC order or place a new order in CSC on behalf of the customer.

Important CSC must be enabled. Contact your Oracle account manager.



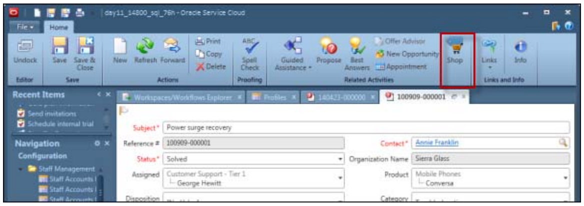
Adding CSC controls to contact workspace

You can add two controls, ATG Contact Details and ATG Contact Orders, to a custom contact workspace that give you quick access to CSC information, including contact information and order details. Refer to [Adding controls to workspaces and scripts](#).



Adding the CSC Shop button to the ribbon

You can add the CSC Shop button to the contact or incident ribbon for easy access to the CSC. The Shop button opens CSC in a new browser window. Refer to [To customize the ribbon](#).



22

Tasks

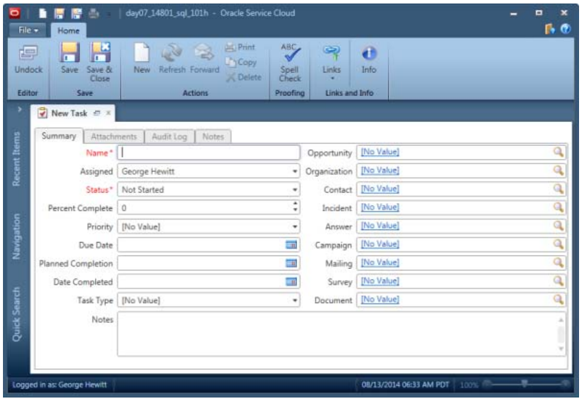
With task functionality, you can add tasks to records you are working on. In addition, you can add standalone tasks that are not related to specific records. By keeping track of all tasks in Oracle Service Cloud, you can monitor everything you must do from a single location, all but eliminating the possibility of forgetting a critical task.

Tasks overview

You can add tasks from the **file menu** or the Tasks tab on records. By familiarizing yourself with the standard **workspace** for tasks, you will know how to add and edit tasks during your workday.

Standard task workspace

The standard workspace for tasks defines which fields are available, which **ribbon** buttons are displayed, and how the information is organized on the **content pane**.



Your organization might use this standard workspace, or your administrator might have created one or more customized workspaces. Your **profile** defines the workspace you see when you work with tasks, whether it is the standard workspace or a customized workspace. Refer to Standard workspaces or Custom workspaces.

Ribbon

The following table describes the buttons on the **ribbon** of the standard task workspace.

Table 134: Task Ribbon Description

Group/Button	Description
Editor	
Undock	Click this button to undock the task workspace editor from the console and display it in a separate window.
Save	
Save	Click this button to save the task and keep it open for editing. **Note:** When you save a task, the rules engine evaluates it. If task rules exist and the task matches one or more rules, the task may be modified when you save it. For example, a rule can change a task's status or assign it to a different staff member.
Save and Close	Click this button to save the task and close it.
Actions **Note:** With the exception of the New button, the buttons in this group are not enabled until after you have saved a task you are adding.	
New	Click this button to add a task.
Refresh	Click this button to refresh the current tasks report.
Forward	Click this button to forward the task. Refer to Forwarding records.
Print	Click this button to print the task. Refer to Printing records.
Copy	Click this button to create a copy of the task that you can modify to create another task. Refer to Copying records.
Delete	**Caution:** This action cannot be undone. Click this button to delete the task.

Table 134: Task Ribbon Description (Continued)

Group/Button	Description
Proofing	
Spell Check	Click this button to check the spelling of any task fields that have spell checking enabled. Refer to Manual spell checking.
Links and Info	
Links	Click this button to select a URL from the list of links added by your administrator. Refer to Adding URL links to the Links button.
Info	Click this button to display information about the open task, including the task ID, the dates the task was added, last updated, and completed, its escalation level, and any rule state it might be in.

❖ Working with the ribbon
❖ Displaying shortcut keys on the ribbon

Record tabs

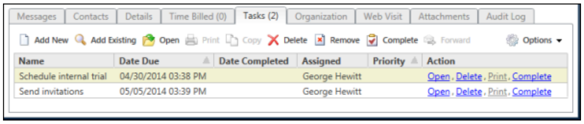
The standard workspace for tasks includes the following tabs.

- **Summary tab**—Contains all key fields for the task. You can also select a record with which you want to associate the task. Refer to Adding tasks.

  Depending on the height of the Service Console on your screen, the key fields might be displayed on the content pane, rather than on a separate Summary tab.
- **Attachments tab**—Contains the attachments associated with the task. The tab displays the file name, size, date created, date updated, and a description for each attachment. Refer to Attaching files to records.
- **Audit Log tab**—Lists the actions taken on the task, including the time the action was taken, who carried out the action, what the action was, and a description of the action. Refer to Audit logs.
- **Notes tab**—Contains task notes that can be sorted by date. Remember that customers never see the task notes added by staff members. Refer to Adding tasks.

Tasks tab

Besides adding and editing tasks on the task workspace, you can add or edit them from the Tasks tab when you are working on an answer, campaign, contact, document, incident, mailing, opportunity, organization, or survey.



The following table describes the toolbar buttons on the Tasks tab. The same options are available by right-clicking a task.

Table 135: Tasks Tab Toolbar Description

Button	Description
Add New	Click this button to open a new task on a sub-tab. Refer to Adding tasks for the procedure to complete the task fields.
Add Existing	Click this button to display the Task Search window. After finding and selecting a task, the task is added to the task list for the record. See To search for a task from an open record.
Open	Click this button to open the selected task for editing.
Print	Click this button to print the task.
Copy	Click this button to copy the task.
Delete	Click this button to delete the task.
Remove	Click this button to remove the task association. **Note:** The task is disassociated, but the task record remains in the knowledge base.
Complete	Click this button to mark the task complete. See To complete a task.
Forward	Click this button to forward the task to the selected recipients. Refer to Forwarding records.

Table 135: Tasks Tab Toolbar Description (Continued)

Button	Description
Options	Click this button to display a drop-down menu of options that include actions you can take, such as printing, previewing, forwarding, publishing, or exporting the task data.

The following columns are available on the Tasks tab.

- Name
- Date Due (date due for incident tasks)
- Date Completed (date completed for incident tasks)
- Assigned
- Priority
- Action

The Action column contains Open, Delete, Print, and Complete options for the task. You can also access these options by right-clicking the task. Other right-click options include Add, Copy, Forward, and Options. (The right-click options are the same as those offered on the Tasks tab toolbar.)

Adding tasks

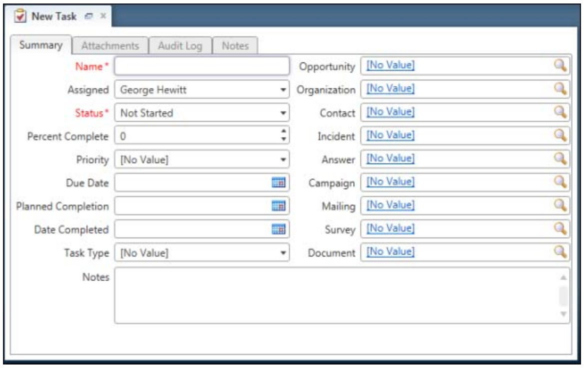
You can add a standalone task to serve as a reminder to yourself, or you can add a task to a specific record when you are working on the record. When you add a task, you not only define its name, the staff member it is assigned to, relevant dates, and other task information, but you can also associate it with existing records. Refer to Searching for records.

To add a task

1 Click the New button on the **ribbon**.

Or

If your navigation set is configured to add tasks from the **file menu**, click File and select Task. See To configure the file menu.



Note You can also add a new task from:

- **Open records**—For example, from the Tasks tab of an open incident, click the Add New button. The new task opens on a sub-tab, creating a workgroup. Refer to Creating and using workgroups.
- **Items such as mailings and campaigns**—For example, from the Tasks tab of an open mailing, click the Add New button. The new task opens in a separate window.

2 Enter the following field information.

Table 136: Task Fields Description

Field	Description
*Name	Type the name of the task.
Assigned	This field defaults to your name in the standard tasks workspace, but you can click the drop-down menu to assign the task to a different staff member if you have permission.
*Status	Click this drop-down menu and select a status. The status options include Not Started, In Progress, Completed, Waiting, and Deferred.
Percent Complete	Type a value for the percentage of the task that is complete.
Priority	Click this drop-down menu and select Low, Normal, or High as the task's priority.

Table 136: Task Fields Description (Continued)

Field	Description
Due Date	Click this drop-down menu to open the current month's calendar and select the date the task is due. Use the arrows at the top to change the month if necessary.
Planned Completion	Click this drop-down menu to open the current month's calendar and select the task's planned completion date.
Date Completed	Click this drop-down menu to open the current month's calendar and select a completion date for the task.
Task Type	Click this drop-down menu to select a task type. When you select a task type, the associated record on the right side of the content pane is highlighted to indicate that it is a required field. In other words, if you define a task as having an Opportunities task type, you must select an opportunity for the task. Refer to Using the Inherit property for task fields for a discussion about setting task fields equal to the value of the associated record's fields. It is not necessary to select a task type if you do not want to associate the task with a specific record. **Note:** If you are adding the task from an open record, the task type selection defaults to the type of record being edited.
Notes	Type any notes about the task in this field.

3 To associate the task with a record, click the Search button to the right of the field for the type of record, enter information in the search fields, and select the record you want to associate with the task.

Note If you have selected a task type, you must make a selection for the associated record (opportunity, organization, contact, incident, answer, campaign, mailing, survey, or document).

4 To set the inherit property for the Assigned, Contact, or Organization fields, refer to Using the Inherit property for task fields.

5 To attach files to the task, click the Attachments tab. Refer to Attaching files to records.

6 To view the audit log for the task, click the Audit Log tab. Refer to Audit logs.

7 To add notes to the task, click the Notes tab, click the Add button, and type your comments in the field.

Tip Add notes to the task when you want to provide information for other staff members. Notes are not visible to customers. Click the Task Note drop-down menu to select the channel through which you gained the information you are adding to the note. Besides selecting No Channel, options include Phone, Fax, Post, CSS Web, and Email.

8 Click the Save and Close button on the ribbon to save the task. If you added the task on a sub-tab of a workgroup, all records in the workgroup will be saved.

Important When adding a task in a workgroup, clicking the OK button accepts changes made to the record and closes the sub-tab. However, it does not save changes to the database until you click the Save or Save and Close button on the ribbon.

❖ Searching for records
❖ Using the Inherit property for task fields

Using the Inherit property for task fields

When a task is associated with a record, some values for that task can be “inherited” from the associated record. For example, you might add a task and define it as an opportunity task by setting the Task Type field to Opportunities. Once you have selected the opportunity you want to associate with the task, you can choose to set the assigned staff member, organization, and contact for the task to the same ones that are associated with the opportunity. Then, if you should later change the opportunity’s assigned staff member, organization, or contact, the same change will occur on the associated task.

Task type

The concept of inheritance hinges on the task type. If you do not select an option from the Task Type drop-down menu, the task field values cannot be inherited from a record associated with the task. For instance, you can use the Inherit property to make the task’s assigned staff member, organization, and contact the same as the opportunity’s values. If, however, you leave the task type unspecified, you cannot use the Inherit property for those fields.

Inheriting the Assigned field value

All of the task types—opportunities, organizations, contacts, incidents, answers, campaigns, mailings, surveys, and documents—allow the Assigned field to be inherited from the associated record. Use the Inherit property when you want the task to always be assigned to the staff member who is assigned to the record, even when the staff member assigned to the record changes. If you want a particular staff member to be assigned to the task, regardless of who is assigned to the actual record, do not use Inherit.

For example, assume you set the Assigned field of a Mailings task to Inherit. If you change the staff member assigned to the mailing, the staff member assigned to the associated task also changes to the new staff member. If you want the task to always be assigned to the same person assigned to the mailing, even if that staff member changes, select Inherit. If, on the other hand, you want a particular staff member to be assigned to the mailing task, regardless of who is assigned to the actual mailing, do not use Inherit.

Although the following procedures use the Answer task type as an example, the procedure is the same for all task types.

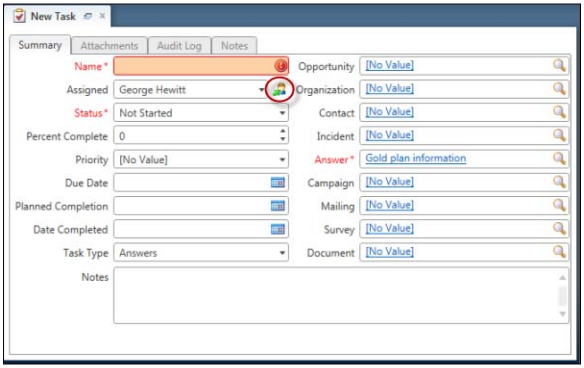
To set the Assigned field to Inherit

1 From an open task, click the Task Type drop-down menu and select Answers. The Answer field label turns red and includes an asterisk, indicating that it is now a required field, and an Inherit button appears to the right of the Assigned field.

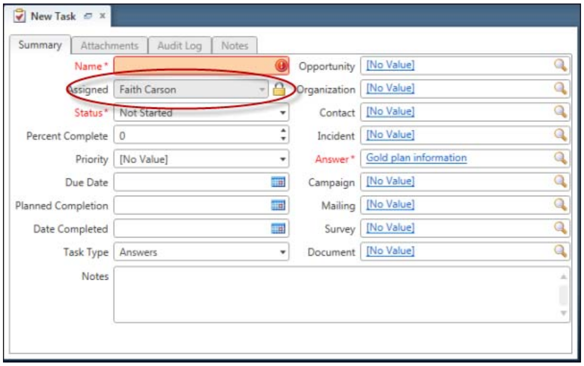
2 Select the answer you want to associate with the task.

- **a** Click the Search button to the right of the Answer field, enter information in the search fields, and click the Search button.
- **b** Select the answer you want from the list of search results and click the Select button. The Answer Search window closes and the answer appears in the Answer field of the task.

Tip If only one answer matches the search criteria, the Answer field is automatically populated.



3 Click the Inherit button to the right of the Assigned field. The Inherit button changes to Assigned Locked (with a lock symbol) indicating the field's Inherit property is active, the value in the Assigned field changes to the staff member assigned to the answer, and the field is grayed out (disabled).



To change the Assigned field from Inherit

Click the Locked button to the right of the Assigned field. The staff member name in the field remains the same, but the field is enabled and you can change the value now that the Inherit property is no longer active.

Inheriting the organization and contact values

With certain task types, you can set the organization field, the contact field, or both to inherit those field values from the associated record. For example, when you add or edit an opportunities or incidents task type, you can set the organization and contact fields to inherit those fields from the opportunity or incident. And when you add or edit a contacts task type, you can set the organization field to inherit the contact's organization.

When the task's contact, organization, or both are tied to the associated record through the Inherit property, you can ensure that the fields are the same for both the task and the record. An additional benefit is the simplicity of completing those task fields.

Although the following procedures set contact and organization fields to Inherit for an incidents task type, the procedure is the same for opportunity and contact task types.

To set contact and organization fields to Inherit

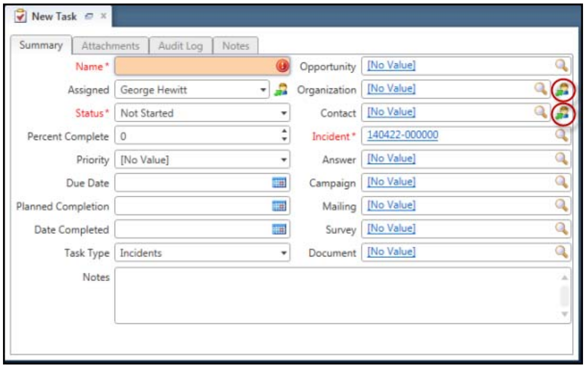
1 From an open task, click the Task Type drop-down menu and select Incidents. The Incident field label turns red and includes an asterisk, indicating that it is now a required field, and an Inherit button appears to the right of the Organization and Contact fields.

2 Select the incident you want to associate with the task.

  a Click the Search button for the Incident field, enter your search criteria in the search fields, and click the Search button.

  b Select the incident you want from the list of search results and click the Select button. The Incident Search window closes and the incident appears in the Incident field of the task.

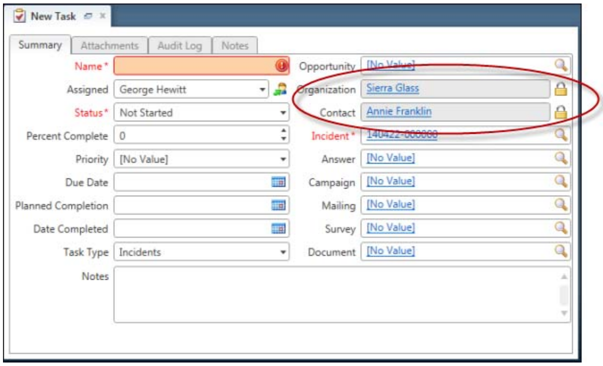
Tip If only one incident matches the search criteria, the Incident field is automatically populated.



3 Click the Inherit button to the right of the Contact field. The Inherit button changes to Contact Locked (with a lock symbol) indicating the field's Inherit property is active, the value in the Contact field changes to the contact for the incident, and the field is grayed out (disabled).

4 Click the Inherit button to the right of the Organization field. The Inherit button changes to Organization Locked (with a lock symbol) indicating the field's Inherit property is active, the value in the Organization field changes to the organization for the incident, and the field is grayed out (disabled).

Note If the incident does not have an organization, the field is locked anyway. If you later add an organization to the incident, the task's Organization field contains the same organization value as the incident.



To change the Contact or Organization field from Inherit

Click the Locked button to the right of the Contact or Organization field. The value in the field remains the same, but the field is enabled and you can change the value now that the Inherit property is no longer active.

Editing tasks

You may find yourself editing a task to update information such as the due date or completion percentage. Depending on the permissions set in your profile, you can edit, copy, and delete individual and multiple tasks, forward tasks, and mark them complete.

For information about copying and forwarding tasks, refer to Copying records and Forwarding records. To edit multiple tasks simultaneously, refer to Updating multiple records.

The following procedures assume a tasks report is displayed on the **content pane**.

To edit a task

1 Right-click the task and select Open > Task. The task opens.

2 Make the necessary changes.

3 Click the Save and Close button to save the changes to the task.

To complete a task

Right-click the task and select Complete Task.

Or

Select the task and click the Complete Task button on the report **ribbon**.

Or

Select the task and click Complete in the Action column.

In all options, you are asked to confirm that you want to set the task to complete. To set multiple tasks to complete, press **Ctrl** while selecting each task in the tasks report and then right-click and select Complete Task or click the Complete Task button on the ribbon. (If you click Complete in the Action column when you have selected multiple tasks, only the task in the row where you click Complete is updated.)

To delete a task

Caution Deleting a task removes it permanently from the **knowledge base**. When you delete answers, campaigns, contacts, documents, incidents, mailings, opportunities, organizations, or surveys that have associated tasks, any tasks associated with the records are also deleted. The type of record that a task is associated with is determined by the value of the Task Type field.

1 Right-click a task in a report and select Delete > Task.

Or

With the task open, click the Delete button on the ribbon. A Task Delete confirmation window appears.

2 Click the Yes button to delete the task.

❖ Copying records

❖ Forwarding records

❖ Updating multiple records

23

Outlook Integration

Microsoft Outlook can be integrated with Oracle Service Cloud, enabling you to share your **contacts** and **tasks** and synchronize your email. Using Outlook integration, your data will be more complete and up-to-date, and you'll no longer need to switch back and forth between applications. You can also create contacts and incidents when syncing Outlook email with Oracle Service Cloud.

Outlook integration comprises the following components:

- **Contact synchronization**—Enter contact information one time, in either Oracle Service Cloud or Outlook, and have that information shared in both applications.
- **Task synchronization**—Enter task information one time in either application and have that information shared in both applications.
- **Email integration**—Append Outlook email, including attachments, to existing contacts, organizations, opportunities, and incidents in Oracle Service Cloud.

Besides synchronizing contacts, tasks, and email between Outlook and Oracle Service Cloud, you can also implement a Microsoft smart tag in Outlook to open incidents directly from an email.

Configuring Outlook integration

To use Outlook integration, it must be enabled on your site. In addition, you or your administrator must add Outlook integration permissions to your profile and install Outlook integration software on your workstation.

The following actions must be taken to use Outlook integration.

- Enable Outlook integration. Contact your Oracle account manager.
- Add or update profiles to include Outlook integration permission. Refer to Adding Outlook integration permissions to profiles.
- Install Outlook integration software on agent workstations. Refer to Installing Outlook integration.

Adding Outlook integration permissions to profiles

You can be assigned full Outlook integration permissions (contact synchronization, task synchronization, and email integration) or any combination of the three permissions. Updating your **profile** is a necessary first step as Oracle Service Cloud will check your permissions before installing the appropriate Outlook integration components.

Important Staff members who are using Outlook 2007 must enable smart tags through Tools > Options > Mail Format > Editor Options > Proofing > AutoCorrect Options > Smart Tags.

Staff members who are using Outlook 2010 or 2013 must enable smart tags through File > Options > Mail > Editor Options > Proofing > AutoCorrect Options > Actions.

To add Outlook integration permissions to a profile

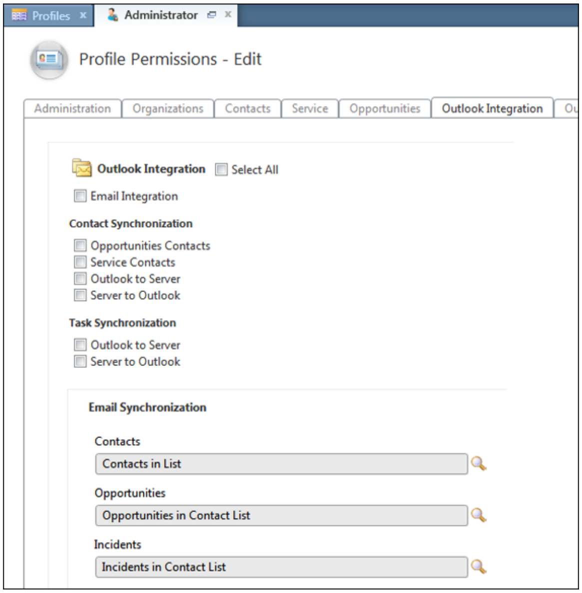
1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management. The report opens on the **content pane**.

3 Double-click the profile you want to edit. The Profiles editor opens.

4 Click the Permissions button on the **ribbon**. The Permissions page opens.

5 Click the Outlook Integration tab.



6 To select all of the check box options on the Outlook Integration tab, select the Select All check box.

7 To allow staff members to append Outlook email to contacts, organizations, opportunities, and incidents in Oracle Service Cloud, select the Email Integration check box.

8 To allow staff members to share contacts between Outlook and Oracle Service Cloud, select one or more of the Contact Synchronization check boxes.

a To share contacts that are in the Opportunities **state**, select the Opportunities Contacts check box.

b To share contacts that are in the Service state, select the Service Contacts check box.

c To share Outlook contacts with Oracle Service Cloud, select the Outlook to Server check box.

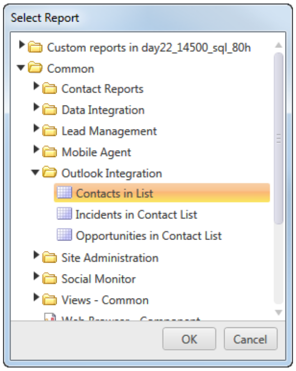
d To share Oracle Service Cloud contacts with Outlook, select the Server to Outlook check box.

9 To allow staff members to share tasks between Outlook and Oracle Service Cloud, select one or both of the Task Synchronization check boxes.

a To share Outlook tasks with Oracle Service Cloud, select the Outlook to Server check box.

b To share Oracle Service Cloud tasks with Outlook, select the Server to Outlook check box.

10 To select different email synchronization reports for determining the contacts, opportunities, and incidents to return during email synchronizations, click the Search button to the right of the report you want to change. The Select Report window opens and the Outlook Integration folder expands by default.



a After selecting a new report, click the OK button to close the Select Report window.

Note All of the Outlook integration reports are read-only standard reports that can be copied and modified. Refer to Creating reports.

11 Click the Save and Close button on the ribbon.

All staff member who will be using Outlook integration must have the profile containing Outlook integration permissions assigned to their staff account. Refer to Adding and editing staff accounts.

- ❖ Customizing profiles
- ❖ Adding and editing staff accounts

Installing Outlook integration

After Outlook integration has been enabled and you have been assigned the correct profile permissions, you must install the necessary components on your workstation. When you install Outlook integration, Oracle Service Cloud checks your profile to see which components (email, contact, and task) you have permission to share and synchronize. The installation process adds Share and Sync buttons to your Outlook toolbar.

To install Outlook integration

1 Close Outlook.

2 From Oracle Service Cloud, click File and select Links > Install Outlook Integration. The Oracle Service Cloud Outlook Sync Setup wizard opens.

3 Click the Next button to open the Select Installation Folder window.

Tip We recommend that you install Outlook integration at the default location of C:\Program Files\Oracle Service Cloud Outlook Sync.

4 To install Outlook integration in a different location, click the Browse button, select the folder where you want to install Outlook integration, and click the OK button.

5 To see a list of the drives where Outlook integration can be installed, click the Disk Cost button. Click the OK button when you are finished.

6 If you are the only staff member who uses your workstation, select the Just Me radio button.

Or

If other staff members have accounts on your workstation and must also use Outlook integration, select the Everyone radio button.

7 Click the Next button to open the Confirm Installation window.

8 Click the Next button to begin the installation. After the installation is complete, the Installation Complete window opens.

9 Click the Close button to complete the installation.

With the proper components installed, you'll want to review and possibly customize your sync options before using Outlook integration.

Selecting contact, task, and email sync options

Outlook integration contains default synchronization options, but you can make any necessary changes to the defaults. To start with, you'll enter server details and your Oracle Service Cloud user name and password. You can then customize contact and task sync options, including preferences for sync direction (such as from Oracle Service Cloud to Outlook, but not vice versa) and the types of actions that can initiate synchronization.

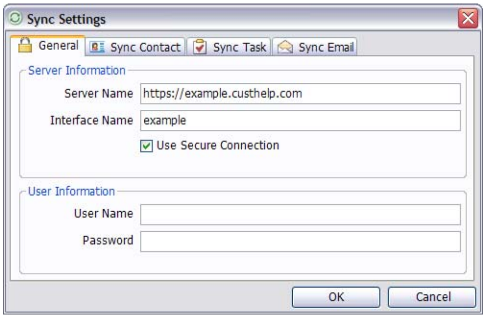
For email integration, you can choose which types of records (contact, organization, incident, and opportunity) you want Outlook email appended to. (Email integration occurs only from Outlook to Oracle Service Cloud.)

Note You must have administrative permissions on your workstation to change sync options. If you do not have administrative permissions, contact your administrator.

To select Sync Settings options

1 Open Outlook.

2 Click the arrow next to the Sync Email button and select Sync Settings. The Sync Settings window opens.



3 Enter field information described in the following table.

Table 137: Sync Settings Window General Tab Description

Field	Description
Server Information	This section contains fields for entering server information. Contact your administrator for information. These fields may already be populated with your server and interface names.
Server Name	Type the server name of the Oracle Service Cloud application.
Interface Name	Type the interface name.

Table 137: Sync Settings Window General Tab Description (Continued)

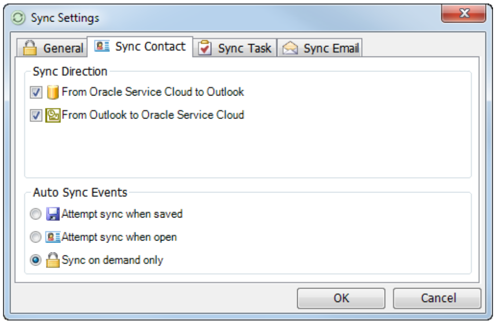
Field	Description
Use Secure Connection	Select this check box to use a secure connection between Outlook and Oracle Service Cloud.
User Information	This section contains fields for entering your Oracle Service Cloud user information.
User Name	Type your Oracle Service Cloud user name.
Password	Type your Oracle Service Cloud password.

4 Click the OK button to save your settings and close the Sync Settings window.

To select contact sync options

1 Click the arrow next to the Sync Email button and select Sync Settings. The Sync Settings window opens.

2 Click the Sync Contact tab.



3 Select from the options described in the following table.

Table 138: Sync Contact Tab Description

Field	Description
Sync Direction	This section contains check boxes for selecting the direction for contact synchronization. **Note:** Selecting only one of the contact synchronization settings results in a one-way synchronization.
From Oracle Service Cloud to Outlook	Select this check box to sync contact data from Oracle Service Cloud to Outlook. Contacts in Oracle Service Cloud are added to the Contacts folder in Outlook only if one or more of the following conditions are met. The contact is associated with an incident or opportunity that is assigned to you. The Salesperson field on the contact's record displays your name. The Salesperson field on the contact's organization record displays your name.
From Outlook to Oracle Service Cloud	Select this check box to sync contact data from Outlook to Oracle Service Cloud.
Auto Sync Events	This section contains options for selecting when you want to sync contact data.
Attempt Sync When Saved	Select this radio button to sync contact data between Oracle Service Cloud and Outlook when a contact is saved in Outlook.
Attempt Sync When Open	Select this radio button to sync contact data between Oracle Service Cloud and Outlook when a contact is opened in Outlook.
Sync On Demand Only	Select this radio button to sync contact data between Oracle Service Cloud and Outlook when you click the Share or Sync All Contacts button on the Outlook toolbar. This option is selected by default.

If both the From Oracle Service Cloud to Outlook and From Outlook to Oracle Service Cloud check boxes are selected, a two-way contact synchronization occurs. If the same data you are updating in Outlook has been updated by another staff member working in Oracle Service Cloud, the data from Oracle Service Cloud will be used during the two-way synchronization.

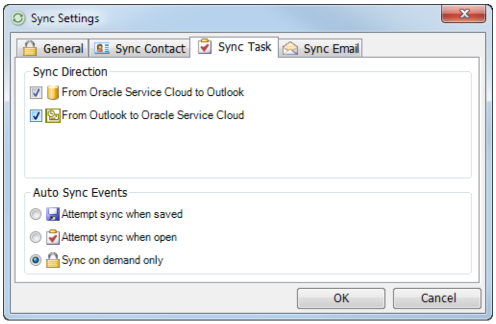
Note When a contact record is first created in Oracle Service Cloud as a result of a sync, the Salesperson field in the contact record is assigned to the staff member who performed the sync. Subsequent synchronizations do not affect this field. You can, however, manually update the Salesperson field by editing the contact record in Oracle Service Cloud.

4 Click the OK button to save the sync contact settings and close the Sync Settings window.

To select task sync options

1 Click the arrow next to the Sync Email button and select Sync Settings. The Sync Settings window opens.

2 Click the Sync Task tab.



3 Select from the options described in the following table.

Table 139: Sync Task Tab Description

Field	Description
Sync Direction	This section contains check boxes for selecting task synchronization settings. Selecting only one of the task synchronization settings results in a one-way synchronization.
From Oracle Service Cloud to Outlook	Select this check box to sync task data from Oracle Service Cloud to Outlook.
From Outlook to Oracle Service Cloud	Select this check box to sync task data from Outlook to Oracle Service Cloud.
Auto Sync Events	This section contains options for selecting when you want to sync tasks.
Attempt Sync When Saved	Select this radio button to sync task data between Oracle Service Cloud and Outlook when a task is saved in Outlook.
Attempt Sync When Open	Select this radio button to sync task data between Oracle Service Cloud and Outlook when a task is opened in Outlook.
Sync On Demand Only	Select this radio button to sync task data between Oracle Service Cloud and Outlook only when you click the Share or Sync All Tasks button on the Outlook toolbar. This option is selected by default.

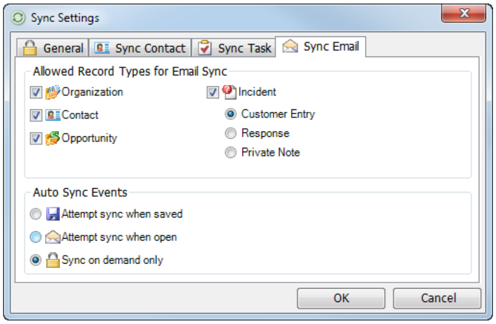
Important If both the From Oracle Service Cloud to Outlook and From Outlook to Oracle Service Cloud check boxes are selected, a two-way task synchronization occurs. If the same data you are updating in Outlook has been updated by another staff member working in Oracle Service Cloud, the data from Oracle Service Cloud will be used during the two-way synchronization.

4 Click the OK button to save the task sync settings and close the Sync Settings window.

To select email sync options

1 Click the arrow next to the Sync Email button and select Sync Settings. The Sync Settings window opens.

2 Click the Sync Email tab.



3 Select from the options described in the following table.

Table 140: Sync Email Tab Description

Field	Description
Allowed Record Types for Email Sync	This section contains check boxes for selecting the types of records that are allowed for email synchronization. All check boxes are selected by default. Email is always synchronized one way from Outlook to Oracle Service Cloud.
Organization	Select this check box to append email data from Outlook to the Oracle Service Cloud organization record associated with the contact that has the same email address as the selected email.
Contact	Select this check box to append email data from Outlook to the Oracle Service Cloud contact record with the same address as the selected email.
Opportunity	Select this check box to append email data from Outlook to one or more opportunities in Oracle Service Cloud for the contact associated with the email address.
Incident	Select this check box to append email data from Outlook to one or more incidents in Oracle Service Cloud for the contact associated with the email address. Then select one of the following options to designate how the email should be appended to records in Oracle Service Cloud: Customer Entry, Response, or Private Note. The Customer Entry radio button is selected by default.

Table 140: Sync Email Tab Description (Continued)

Field	Description
Auto Sync Events	This section contains options for selecting when you want to sync email.
Attempt Sync When Saved	Select this radio button to append email data from Outlook to Oracle Service Cloud when an email is saved in Outlook.
Attempt Sync When Open	Select this radio button to append email data from Outlook to Oracle Service Cloud when an email is opened in Outlook.
Sync On Demand Only	Select this radio button to append email data from Outlook to Oracle Service Cloud only when the Sync Email button on the Outlook toolbar is clicked. This option is selected by default.

4 Click the OK button to save the email sync settings and close the Sync Settings window.

Synchronizing contacts

While viewing or editing a contact in Outlook, you can click a button to share the contact between Outlook and Oracle Service Cloud. If two-way synchronization is set up and you click the Sync All Contacts button, all your Outlook contacts are added to Oracle Service Cloud. Before you can add Oracle Service Cloud contacts to the Outlook Contacts folder, your staff account must be associated with the contacts. At least one of the following conditions must be true for each contact that you want to add.

- The contact is associated with an incident or opportunity that is assigned to you.
- The Salesperson field on the contact's record displays your name.
- The Salesperson field on the contact's organization record displays your name.

After contact integration is set up on your workstation and the Contacts folder is selected, your Outlook toolbar contains the buttons described in the following table.

Table 141: Outlook Buttons for Contact Integration

Button	Description
	Click this button to sync the selected contact between Outlook and Oracle Service Cloud. Refer to the procedure that follows to sync a contact between Outlook and Oracle Service Cloud.
	Click this drop-down menu to display contact sync options.
Sync All Contacts	Select this option to sync all contacts between Outlook and Oracle Service Cloud. Refer to the procedure on this page to sync all contacts between Outlook and Oracle Service Cloud.
Sync Settings	Select this option to select sync options. Refer to To select contact sync options.

To sync a contact between Outlook and Oracle Service Cloud

1 From Outlook, select a contact.

2 Click the Sync Contact button.

   a If you have not previously shared Outlook data, you must enter your Oracle Service Cloud user name and password to verify your permission before continuing. A message lets you know that the contact was synchronized successfully.

b If you have previously shared data from Outlook, the Share Contact window opens to let you know that the contact was synchronized successfully.

3 Click the OK button to close the window. Oracle Service Cloud now contains a contact record associated with the contact you shared.

To sync all contacts between Outlook and Oracle Service Cloud

1 From Outlook, click the Sync All Contacts button. A Synchronization Succeeded message lets you know that the contacts were synchronized successfully.

2 Click the OK button. The Sync All Contacts window opens, confirming the number of contact records that were synchronized between Outlook and Oracle Service Cloud.

Tip To view details about the individual contacts that were synchronized, click the plus sign next to the group of contacts you want to view.

3 Click the OK button to close the Sync All Contacts window.

Email address sharing in contact integration

When email address sharing is enabled in Oracle Service Cloud, which is the ability for more than one contact to have the same email address, duplicate email addresses are detected when performing contact synchronizations between Oracle Service Cloud and Microsoft Outlook. Refer to Email address sharing.

❖ Email address sharing

Synchronizing tasks

While viewing or editing a task in Outlook, you can click a button and share the selected task or all your tasks with Oracle Service Cloud. If two-way synchronization is set up and you click the Sync All Tasks button, all your Outlook tasks are added to Oracle Service Cloud, and all your Oracle Service Cloud tasks are added to the Outlook Tasks folder.

After task integration is set up on your workstation and the Tasks folder is selected, your Outlook toolbar contains the buttons described in the following table.

Table 142: Outlook Buttons for Task Integration

Button	Description
	Select a task from the list and click this button to sync the selected task between Outlook and Oracle Service Cloud. Refer to the procedure that follows to sync a task between Outlook and Oracle Service Cloud.
	Click this drop-down menu to display task sync options.
Sync All Tasks	Select this option to share all tasks between Outlook and Oracle Service Cloud. Refer to the procedure on this page to sync all tasks between Outlook and Oracle Service Cloud.
Sync Settings	Select this option to select sync options. Refer to To select task sync options.

To sync a task between Outlook and Oracle Service Cloud

1. From Outlook, select a task.
2. Click the Sync Task button. The Sync Task window opens, confirming that the task from Outlook has been synchronized with Oracle Service Cloud.
3. Click the OK button to close the Sync Task window. Oracle Service Cloud now contains the task you shared from Outlook.

To sync all tasks between Outlook and Oracle Service Cloud

1. From Outlook, click the Sync All Tasks button. A message displays the number of tasks that were synchronized between Outlook and Oracle Service Cloud.
2. Click the OK button. The Sync All Tasks window opens, confirming the number of tasks that were synchronized between Outlook and Oracle Service Cloud.

Tip To view details about the individual tasks that were synchronized, click the plus sign next to the group of tasks you want to view.

3 Click the OK button to close the Sync All Tasks window.

Integrating email

You can append Outlook email to contacts, organizations, opportunities, and incidents in Oracle Service Cloud. Email integration can also be used to create contacts and incidents from Outlook email if no associated email address exists in the **knowledge base** at the time of synchronization.

Important Email integration is a one-way data transfer from Outlook to Oracle Service Cloud. Email data is copied from Outlook and appended to the selected records in Oracle Service Cloud.

After email integration is set up on your workstation and an email folder is selected, your Outlook toolbar contains the button described in the following table.

Table 143: Sync Email Button Description

Button	Description
	Click this drop-down menu to select email sync options.
Sync Email	Select this option to append the selected email to an existing contact, organization, opportunity, or incident in Oracle Service Cloud. If the associated email address is not in the knowledge base, you will have the option of adding a contact or incident. Refer to To append Outlook email to a record in Oracle Service Cloud.
Sync Settings	Select this option to select sync options. Refer to To select email sync options.

To append Outlook email to a record in Oracle Service Cloud

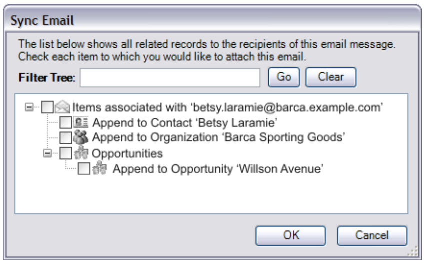
1 From Outlook, select or open the email you want to append to a record in Oracle Service Cloud.

Tip Only one email can be synchronized at a time. Selecting multiple emails will disable the Sync Email button.

2 If you selected the email in a list of messages, click the Sync Email button on the Outlook toolbar. The Sync Email window opens.

Or

If you have a new or existing email message open, click the Add-Ins tab and then click the Sync Email button.



3 To filter the list of returned records, type the contact's name, email address, organization name, or associated record name in the Filter Tree field and click the Go button. To return to the original list of records, click the Clear button.

Tip Although wildcards are not supported, you can type just a few characters in the Filter Tree field. After clicking the Go button, the system will present you with any matching records.

4 Select the appropriate check boxes associated with the addresses in the email. For example, if you select all check boxes, the same email will be added to the individual Notes tabs of the contact and organization records as well as all selected opportunities. The email text appears as a private note in the message thread of all selected incidents.

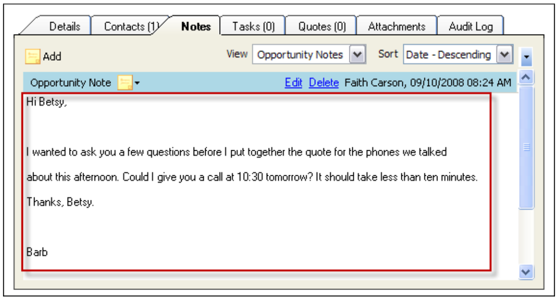
Note If the email includes attachments, you can select the attachments you want to include with the email, and they will appear on the Attachments tab of the selected record. For instance, when you select an attachment under Append to Contact, the email attachment is stored on the Attachments tab of the contact record in Oracle Service Cloud. You can also drag Outlook attachments to the Attachments tab of existing records in Oracle Service Cloud.

5 If the sender's email address does not exist in the **knowledge base**, a red exclamation point and a disabled check box display next to the email address. You can choose to add a contact record and incident using the contact's email address.

6 Click the OK button to append email to the appropriate records in Oracle Service Cloud.

After a successful synchronization, the Sync Email button is disabled for that message.

The following figure shows an email after it has been appended to the Notes tab of the opportunity.



Email address sharing in email integration

When email address sharing is enabled, which is the ability for more than one contact to have the same email address, duplicate email addresses are detected when performing email synchronizations between Oracle Service Cloud and Microsoft Outlook. If a duplicate email address is discovered, the Sync Email window displays all contacts that are associated with the email address, along with their individual records. You can choose one or more of the applicable contacts for email integration. You'll also have the option to create a new contact with the shared email address during the synchronization. Refer to Email address sharing.

- Email address sharing

Using smart tags

Outlook recognizes certain types of data in your email, such as an address, and lets you perform actions on that data. In addition, Oracle Service Cloud lets you install a smart tag that recognizes incident reference numbers contained in email messages. When you right-click the reference number in an email message, the incident automatically opens in Oracle Service Cloud.

Important

If you are using Outlook 2007, smart tags must be enabled through Tools > Options > Mail Format > Editor Options > Proofing > AutoCorrect Options > Smart Tags.

If you are using Outlook 2010 or 2013, smart tags must be enabled through File > Options > Mail > Editor Options > Proofing > AutoCorrect Options > Actions.

To install Oracle Service Cloud SmartTag

1. Close Outlook.
2. In Oracle Service Cloud, click File and select Links > Install Incident Reference Number Smart Tag. The SmartTag Setup Wizard opens.
3. Click the Next button to open the Select Installation Folder window.

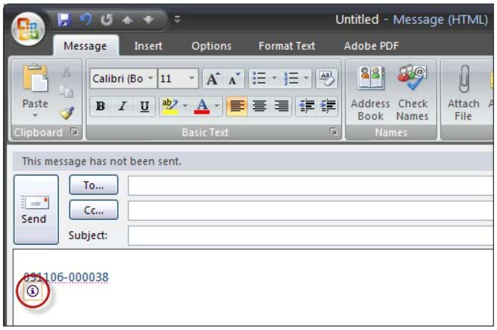
Tip We recommend that you install SmartTag at the default location of C:\Program Files\Oracle Service Cloud SmartTag.

4. To install SmartTag in a different location, click the Browse button, select the folder where you want to install SmartTag, and click the OK button.
5. To see a list of the drives where SmartTag can be installed, click the Disk Cost button. Click the OK button when you are finished.
6. Click the Next button to open the Confirm Installation window.
7. Click the Next button to begin the installation. After the installation is complete, the Installation Complete window opens.
8. Click the Close button to complete the installation.

To open an incident using Oracle Service Cloud SmartTag in Outlook

Important In Outlook 2007, the incident number is underlined with a dotted purple line, indicating it is a smart tag. In Outlook 2010 and 2013, the incident number is not underlined.

1 Hover over the incident number smart tag in the email message. The smart tag indicator appears.



2 Click the smart tag indicator and select Open Incident within Service Console.

Note If you are using Outlook 2010 or 2013, you must right-click the reference number and select Additional Actions to open the incident and view smart tag preferences.

If the **Service Console** is already open, the incident opens. If the Service Console is not open when you select Open Incident, you must log in to Oracle Service Cloud for the incident to open.

24

Reference Information

The following sections are intended for administrators and staff members. They contain information for configuring and using Oracle Service Cloud.

- Date and Time Format Tokens
- Regular Expressions
- Shortcut Keys
- SmartSense Emotive Rating

Date and Time Format Tokens

Oracle Service Cloud uses date and time format tokens to determine how dates and times are expressed throughout the application and how results are grouped in analytics.

- Date and time format tokens for analytics describes the format tokens you can use to specify date and time formats in reports.
- Date and time format tokens for configuration settings describes the format tokens you can use to specify date and time formats in configuration settings.

Date and time format tokens for analytics

The following table lists the date format tokens you can use in analytics. For a list of time format tokens you can use in analytics, refer to Time Format Tokens Used in Analytics.

Table 144: Date Format Tokens Used in Analytics

Token	Description
HH24	Displays hours in 24-hour format. For example, 1 PM = 13.
HH12	Displays the hour in 12-hour format. For example, 5 PM = 5.

Table 144: Date Format Tokens Used in Analytics (Continued)

Token	Description
HH	Displays the hour in 12-hour format. For example, 5 PM = 5.
AM	Displays the AM/PM indicator.
PM	Displays the AM/PM indicator (same function as AM).
MI	Displays the minutes as a two-digit number.
SS	Displays the seconds.
D	Displays the numeric day of the week with Sunday as zero. For example, Monday =1.
DD	Displays the numeric day of the month.
DDD	Displays the numeric day of the year. For example, April 7 = 97.
DY	Displays the three-letter abbreviation for the day of the week. For example, Monday = Mon.
DAY	Displays the full day name. For example, Monday.
WW	Displays the week of the year as a number. The week begins on a Sunday, so the first week (week 1) of a new year is the first week that contains a Sunday. For example, in 2015, the first Sunday was January 4th. This means that the dates January 1st through 3rd of 2015 are considered to part of the last week of the previous year. So, February 22, 2015 = 8.
WWW	Displays the full month name followed by the first date of the week. For example, Sunday July 27, 2008 = July 27. This can be useful to identify a week by its start date rather than simply seeing a number as provided with WW.
WEEKS	Rounds the entered date value to the beginning of the week, using Sunday as the week's start. For example, Thursday July 16, 2009 = 07/12/2009. **Note:** This token can be used only with the *date_add* and *date_trunc* functions.

Table 144: Date Format Tokens Used in Analytics (Continued)

Token	Description
IWEEKS	Rounds the entered date value to the beginning of the week, using Monday as the week's start. For example, Thursday July 16, 2009 = 07/13/2009. **Note:** This token can be used only with the *date_add* and *date_trunc* functions.
MM	Displays the month as a two-digit number. For example, November = 11.
MON	Displays the three-character abbreviated month name. For example, March = Mar.
MONTH	Displays the full month name. For example, March.
Q	Displays the numeric quarter of the year. For example, October 31 = 4.
YY	Displays the last two digits of the year. For example, 2008 = 08.
YYYY	Displays the four-digit year. For example, 2008.
YYYX	Displays the international four-digit year around the end of or beginning of the year. For example, December 31, 2008 = 2009. This is used in conjunction with WW such that all week grouping will consistently include 7 days even at the start and end of the calendar year. YYYX will return the Year for the week where Sunday is the first day of the week. For example, if grouping by Year/Week (WW), even though the dates January 1, 2015 through January 3, 2015 occur in 2015, since they are included with WW as being in week 52 (last week of 2014), YYYX will keep the year consistent and return 2014. If you are going to group by week using WW and want to include the Year number, use YYYX.
YYIX	Displays the international four-digit year. This is used in conjunction with IW such that all week groupings consistently include 7 days even at the start and end of the calendar year.YYIX will return the Year for the week where Monday is the first day of the week. For example, even though the dates December 29, 2014 through December 31, 2014 occur in 2014, since they are included with IW as being in week 1 (first week of 2015), YYIX will keep the year consistent and return 2015. If you are going to group by week using IW and want to include the Year number, use YYIX.

Table 144: Date Format Tokens Used in Analytics (Continued)

Token	Description
J	Displays the Julian date. For example, 2008-08-08 11:18:30 = 2454686.97118.
IW	Displays the international week of the year as a number. IW follows ISO 8601:1988 standards. The IW week begins on a Monday and ends on a Sunday. The first week (week 1) of a new year is the first week that contains four or more days in that year. For example, in 2015, January 1st was a Thursday. This means that the week beginning on Monday, December 29, 2014 contains 3 days in 2014 and 4 days in 2015. So, any dates in that time period will be week 1 (of the new year). For example, December 30, 2014= 01.
IWW	Displays the international full month name followed by the first date of the week. For example, Wednesday December 31, 2007 = December 31. This can be useful to identify a week by its start date rather than simply seeing a number as provided with IW.

Table 145: Time Format Tokens Used in Analytics

Token	Description
DD	Displays the number of days.
HH	Displays the number of hours.
MI	Displays the number of minutes.
SS	Displays the number of seconds.

Date and time format tokens for configuration settings

The following table lists the date and time formats you can use in configuration settings.

Table 146: Tokens Used in Configuration Settings

Token	Description
%a	Displays the three-character abbreviated weekday name. For example, Monday = Mon.
%A	Displays the full weekday name. For example, Monday.
%b	Displays the three-character abbreviated month name. For example, March = Mar.
%B	Displays the full month name. For example, November.
%d	Displays the two-digit numeric day of the month. The first through ninth days of the month are preceded by a zero (01-09).
%D	Displays the date as MM/DD/YY (same as %m/%d/%y).
%e	Displays the numeric day of the month. The first through ninth days of the month are not preceded by a zero.
%H	Displays hours in 24-hour format. For example, 1 PM = 13.
%I	Displays the hour in 12-hour format. For example, 5 PM = 5.
%j	Displays the numeric day of the year. For example, April 7 = 97.
%m	Displays the month as a two-digit number. For example, November = 11.
%M	Displays the minutes as a two-digit number.
%n	Inserts a hard return.
%p	Displays the AM/PM indicator.
%r	Displays the time as HH:MM:SS AM/PM (same as %I:%M:%S %p).
%R	Displays the time as HH:MM (same as %H:%M).
%S	Displays the seconds as a two-digit number.
%t	Inserts a tab character.

Table 146: Tokens Used in Configuration Settings (Continued)

Token	Description
%T	Displays the time as HH:MM:SS (same as %H:%M:%S).
%y	Displays the last two digits of the year. For example, 2008 = 08.
%Y	Displays the four-digit year. For example, 2008.
%z	Displays the abbreviated time zone name. For example, Mountain Standard Time = MST.
%Z	Displays the full time zone name. For example, Mountain Standard Time.

Regular Expressions

Regular expressions use **operators** and character strings to specify a set of character strings. They can be used when configuring business rules to allow more flexibility in the criteria used to route incidents. Regular expressions can also be used in mailbox filters and custom objects.

Note Since the values in drop-down menus are fixed, using regular expressions to match items in a drop-down menu (for example, Product or Category) is not supported. If you want to include an If condition for items in a drop-down menu, use EQUALS or CONTAINS instead of a regular expression.

The following table lists some of the regular expression operators that work with **business rules** and mailboxes. Oracle Service Cloud accepts any regular expression using POSIX Extended syntax.

Note Forward slash (/) delimiters are not required when using regular expressions in business rules or report filters.

The following table provides descriptions of regular expressions.

Table 147: Regular Expression Operators

Action	Description
[ ]	Matches any character in the brackets.

Table 147: Regular Expression Operators (Continued)

<table>
<tr><th>Action</th><th>Description</th></tr>
<tr><td>[0-9]</td><td>Matches any number between 0 and 9.</td></tr>
<tr><td>[A-Z]</td><td>Matches any character A-Z or a-z.</td></tr>
<tr><td>[^]</td><td>Matches any characters NOT in the brackets. The first character in the brackets must be ^.</td></tr>
<tr><td>text1 | text2</td><td>The pipe character acts as a Boolean OR, so text1 OR text2 results in a match.
Note: Do not include a pipe at the beginning or end of a regular expression.</td></tr>
<tr><td>.</td><td>Matches any single character except a new line.</td></tr>
<tr><td>?</td><td>The preceding item is optional and matched at most once.</td></tr>
<tr><td>*</td><td>The preceding item is repeated as many times as necessary to match. Also matches if preceding item is not present.</td></tr>
<tr><td>+</td><td>The preceding item is matched one or more times.</td></tr>
<tr><td>{n}</td><td>The preceding item is matched exactly n times.</td></tr>
<tr><td>{n,}</td><td>The preceding item is matched n or more times.</td></tr>
<tr><td>{n,m}</td><td>The preceding item is matched at least n times, but not more than m times, and as few times as possible.</td></tr>
<tr><td>( )</td><td>Used to group elements of the regular expression, as in arithmetic.</td></tr>
<tr><td>\w</td><td>Any alphanumeric character.</td></tr>
<tr><td>^</td><td>Match if at start of line.</td></tr>
<tr><td>$</td><td>Match if at end of line.</td></tr>
<tr><td>\</td><td>Quote or escape a character that would otherwise be interpreted as a syntactic character. Characters that must be quoted are: + ? | ( ) { }</td></tr>
</table>

The following table lists examples of how regular expressions can be used.

Table 148: Regular Expressions Examples

This regular expression...	matches...
^Example	"Example" at the beginning of a line
Example$	"Example" at the end of a line
^Example$	"Example" as the only word on the line
^...$	any line with exactly three characters
......-.....1	any reference number ending in "1"
t.e	tae, tbe, tce, t%e, tie, the, toe...
at*e	ae, ate, atte, attte, atttte...
at+e	ate, atte, attte
at?e	ae, ate
m[aeiou]t	mat, met, mit, mot, mut
cat|mat	cat, mat
lo{4}ng	loooong
lo{2,4}ng	loong, looong, loooong
ward | ward\. | ^ward	"ward" surrounded by spaces (this prevents "forward" or "backward" from matching), "ward" at the end of a sentence, and "ward" at the beginning of a line (no preceding space)

Shortcut Keys

To help you be more efficient and quickly navigate Oracle Service Cloud, default shortcut keys are included for creating records and other items, navigating the console and **content pane**, and performing functions.

Tip You can hover over buttons on **ribbons** to display shortcut keys. In addition, you can press the **Alt** key plus the first letter of the ribbon tab to display shortcut keys for the tab. Refer to Displaying shortcut keys on the ribbon.

The following table describes the shortcut keys included in Oracle Service Cloud.

Table 149: Oracle Service Cloud Shortcut Keys

Shortcut Key	Action
New Item	
Ctrl+Shift+i	Incident
Ctrl+Shift+a	Answer
Ctrl+Shift+p	Opportunity
Ctrl+Shift+c	Contact
Ctrl+Shift+o	Organization
Ctrl+Shift+t	Task
Ctrl+Shift+b	Dashboard
Ctrl+Shift+r	Report
Ctrl+Shift+g	Campaign
Ctrl+Shift+y	Survey
Ctrl+Shift+m	Mailing
Ctrl+Shift+d	Document
Ctrl+Shift+e	Guided assistance guide
Tab Switching	
Ctrl+Tab	Return to previous content pane tab in history
Ctrl+Shift+Tab	Move forward to next content pane tab in history
Ctrl+w or Ctrl+F4	Close the current content pane tab
Global	
F3	Make the Quick Search tool window active. If Quick Search is closed, pressing F3 will open it in an undocked window.
Alt+F4	Exit Oracle Service Cloud

Table 149: Oracle Service Cloud Shortcut Keys (Continued)

Shortcut Key	Action
Text Editing	
Ctrl+a	Select all
Ctrl+c	Copy
Ctrl+x	Cut
Ctrl+v	Paste
Ctrl+left/right arrow	Move forward or backward one word
Del	Delete
Record Editing	
F1	Help
F7	Spell check
Ctrl+n	New (same item type)
Ctrl+s	Save
Ctrl+Shift+s	Save and close
Ctrl+d	Forward
Ctrl+i	Information
Ctrl+p	Print
Explorers, Tree Operations, and Reports in Explorers	
F1	Help
F2	Rename
F5	Refresh
F12	Save as (available only in those explorers and reports that contain a Save As button on the ribbon)
Ctrl+a	Assign (available only in those reports that contain an Assign button on the ribbon)

Table 149: Oracle Service Cloud Shortcut Keys (Continued)

Shortcut Key	Action
Ctrl+e or Enter	Edit selected item
Ctrl+f	Find
Ctrl+r	Refresh
Del	Delete
Records Reports and Individual Records	
F1	Help
F5	Refresh
Ctrl+F1	Minimize the ribbon
Ctrl+a	Assign
Ctrl+c	Copy
Ctrl+e or Enter	Edit selected item
Ctrl+d	Forward
Ctrl+n	New (uses default new selection)
Ctrl+p	Print
Del	Delete

SmartSense Emotive Rating

SmartSense can help you determine the attitude of customers and staff members in **incident** correspondence, customer responses to Oracle RightNow Feedback Cloud Service (Feedback) **surveys**, and in posts returned from **cloud searches**. When working with incidents or reviewing survey responses or cloud search results, you can use SmartSense to determine which customers need immediate attention and when to notify supervisors or other staff members about specific incidents or situations. The emotive rating can also be used as a condition in incident rules and to detect potentially inappropriate content posted to a community.

How SmartSense works

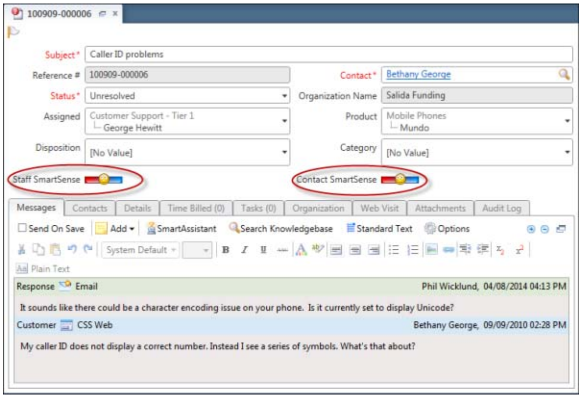
In incidents, two SmartSense ratings can be placed on the incident **workspace**: one for the customer and one for the staff member editing the incident. SmartSense scans the text and rates the words and phrases in all customer entries for the customer rating and all responses for the staff member rating.

Although the following descriptions discuss SmartSense as it applies to incidents, it also applies to surveys, cloud monitoring, and moderating community posts and comments. In surveys, responses to text questions, including SmartSense evaluations of each response, appear on the Results tab of the survey. Refer to Topic monitoring. In cloud monitoring, SmartSense ratings appear in reports next to cloud search results. Refer to Searching the social cloud. In moderating communities, SmartSense ratings may be used to automatically place posts and comments in pending status for moderator review. Refer to Content moderation.

Note SmartSense recognizes modifiers and negatives in all supported languages as well as some emoticons and acronyms. The SmartSense rating may be exaggerated if emotive words are set in all capital letters or the sentence contains an exclamation point.

When your administrator adds Contact SmartSense, Staff SmartSense, or both to the workspace you use for working on incidents, you will see the colored meter on the workspace. The following figure shows an incident workspace with both SmartSense meters displayed. The workspace you use for incidents depends on your **profile** and how your administrator configured incident workspaces.

Tip The SmartSense meter on the Results tab for responses to a Feedback text question appears the same as it does on the incident workspace.



On a new incident, both meters start at neutral. This is represented by the neutral face icon displayed in the center of the meter. Each time the incident is updated by the customer on the **customer portal**, the contact SmartSense rating is updated. When a staff member adds a response on the incident workspace, the staff SmartSense rating is updated. Current threads are weighted more heavily than earlier threads.

Note The contact SmartSense rating is not affected when a staff member updates an incident on the incident workspace by adding a customer entry. Only comments that the customer makes through the customer portal are evaluated for the SmartSense rating.

The farther to the left (the red zone of the meter), the more negative the rating, while ratings toward the right, or blue zone, are more positive.

Only response threads are considered for the staff SmartSense rating in incidents, as note threads are not evaluated. Additionally, SmartSense processes only the first 4,000 words in each incident thread rather than the entire thread, helping to make emotive indexing process faster for incident threads with a large number of words.

- Topic monitoring
- Searching the social cloud

How to evaluate SmartSense ratings

While SmartSense is an effective tool for assessing a customer's general attitude, it may not always provide a completely accurate rating. For example, if a word has several meanings, the SmartSense rating may not be exactly precise for one or more of the meanings. Also, if a word is not in the SmartSense list, it will not be considered, and sentences containing complex negation or qualification could be misinterpreted by SmartSense.

As a single rating, the SmartSense rating may be an oversimplification. If a customer writes both positive and negative remarks in an incident (for example, is pleased with the product but expresses anger or frustration about a support issue), the emotive rating may result in a neutral value, since the extreme words will balance each other. Despite these potential difficulties, SmartSense gives a useful overall estimate of emotional levels and can help you provide superior service to your customers.

Note While the SmartSense word list is proprietary and cannot be viewed, your administrator can specify word ratings that extend or override those used by SmartSense. This allows custom values for words that have specific meanings for a particular organization or industry. Refer to Wordlist files.

Your administrator can also disable SmartSense. If disabled, SmartSense evaluations are not performed on incidents, survey results, and cloud search results, and emotive rating options are not available when choosing conditions for business rules.

Dynamic Agent Desktop

The following sections are intended for administrators and staff members. They contain information and procedures for configuring and using the Oracle RightNow Dynamic Agent Desktop Cloud Service.

25

Desktop Overview

The dynamic agent desktop in Oracle Service Cloud is your staff members' portal to your knowledge base. It is comprised of a set of complementary features, each representing a different, powerful way of interacting with **records**. While each component serves a distinct purpose, they can be used together to create a highly adaptive work environment. This can help you match your customers' needs to an appropriate set of agent tools and free your staff to focus only on those parts of the process that cannot be automated.

To get the most from your agent desktop, be sure to review each feature and consider how it can help your team. The desktop features listed here share common concepts and functionality, so once you are familiar with one desktop feature, learning the others becomes easier. For example, once you learn to create workspaces, you will have most of the knowledge you need to create agent scripts.

Tip For a list of best practices for selecting the most appropriate features of the agent desktop to match your business needs, refer to *Best Practices for Implementing Contact Center Experiences*.

As you evolve beyond the default configuration to an optimized interface, you will increase agent productivity and extend the impact of their actions, producing a more dynamic, responsive operating environment.

The dynamic agent desktop consists of the following major features.

	**Workspace**—A configuration of the content pane, including the fields, controls, and ribbon that display when working with answers, assets, contacts, incidents, opportunities, organizations, or tasks; when working in Oracle RightNow Chat Cloud Service; or when working with quotes, quote products, or service opportunities. Standard workspaces are provided for each of these workspace types, and custom workspaces can be created. The workspaces staff members use depend on their profile. Refer to Workspaces.
	**Workspace rules**—Rules that dynamically adjust the display, behavior, and values of fields and controls on a workspace based on staff member actions. Each rule is triggered by one or more events and conditions. Refer to Workspace rules.
	**Guide**—An interactive tool that helps agents quickly locate solutions when composing incident responses or troubleshooting customer issues over the phone. Guides are built using controls to display questions, branches, text explanations, and answer links. They can be added to workflows, placed on workspaces, or presented on the **customer portal**. Refer to Guided Assistance.
	**Agent script**—A series of pages connected by branching logic that help agents enter information in a logical order. Scripts are built using fields and controls to display questions, text, and answers, and update records. They can be added to workflows or placed on workspaces. Refer to Agent Scripts.
	**Script rules**—Rules used to trigger actions (such as setting the value of a field or calling a named event) on script pages when specific conditions are met. Like workspace rules, each script rule is triggered by one or more events and conditions. Refer to Script rules.
	**Desktop workflow**—A sequence of workspaces, scripts, decisions, connectors, and actions presented to staff members as a dynamic interface to efficiently support and automate complex business processes. Refer to Desktop Workflows.

Add-ins—The desktop add-in framework allows application developers to add custom components, or "add-ins," to Oracle Service Cloud in order to integrate with other applications on staff members' workstations. Once you upload an add-in, you can place it on scripts and workspaces in the same way you add controls, such as report or browser controls. The add-in can be displayed anywhere you want on the script or workspace or you can hide it using functionality in the script and workspace designers. You can also configure script branches and script and workspace rules to communicate with the add-in. Refer to Add-ins in scripts and workspaces.

Defining your business needs

Time spent defining a business process is a worthwhile investment. Decisions made before implementation can save much time and trouble later on. Careful consideration of all aspects of a business process can make it more effective and easier to maintain and can help to avoid process holes and bottlenecks.

The first step in mapping your organization's processes to the agent desktop is to clearly define your business needs. Whether your goals are simple or complex, certain basic parameters should be identified and accounted for in your desktop design. Here, we'll provide you with some basic questions to help you identify the requirements and resources you will need to structure and refine your business processes.

Put simply, a process is a sequence of events—actions followed by other actions, governed by conditions and augmented by exceptions. Following is a sampling of essential questions that should be answered in preparation for defining a fully formed process.

Tip Once you have answered these questions, refer to *Best Practices for Implementing Contact Center Experiences* for best practices that include specific techniques for mapping your processes to the agent desktop and developing exceptional agent desktops.

- **What activities are you supporting?** What is your primary goal and responsibility for the process you are defining? Are you developing an entirely new process from scratch, or are there existing processes or systems that should be considered? If you are integrating with an external system, is there any functional overlap that is easier to manage within Oracle Service Cloud?
- **Who are your stakeholders?** Identify everyone who has an interest in the success (or failure) of your process. Success is defined by accounting for and delivering on all needs of your consumers, staff, group managers, directors, and executives. To achieve that success, it is important to give these stakeholders a voice when designing and testing your business process.
- **What outputs are required?** For each stakeholder, list the specific process output that they require to fulfill their needs. List any events and conditions that factor into those outcomes and, when appropriate, define alternate outcomes for cases where exceptions to those criteria occur. For example, each of the following stakeholders requires a specific output that their business process must account for:
    - ▹ A customer may need an **answer** to a question or **service** for a product they have purchased.
    - ▹ A manager may need **custom reports** to ensure that customer requests are met within a specified time period and that satisfaction scores are high.
    - ▹ A director from another department may be responsible for incorporating **customer feedback** into initiatives for new products or services.
    - ▹ A sales executive may be responsible for acting on business **opportunities** or **account issues** identified by your agents.
- **What are your channels?** How are you communicating with your customers—email, telephone, or chat? Are you monitoring the social cloud or providing a community to promote your services? Is your team logging incidents or opportunities manually, or are they being generated by some other means?
- **Who are your resources?** Identify the people who will be responsible for completing any necessary tasks. For example, who will be responsible for viewing and responding to customer inquiries? To whom will they escalate outstanding or complex issues? Who will be charged with developing and monitoring team performance? And who will be charged with maintaining these processes as needs change in the future? Do these people have staff accounts in Oracle Service Cloud with appropriate profile permissions?
- **What can be automated?** As you list the resources needed to service your stakeholders, consider each task carefully and ask yourself, "Does this output require human interaction, or can it be wholly or partly automated?" Can you reduce the number of human resources you require, or the time you require of them, while delivering full

value to your stakeholders? With desktop automation, you might be surprised how often the answer is "Yes." The more tasks that are automated, the more focused your team will be on tasks that actually require their attention.

- **What is your testing strategy?** Once your process definition is complete, how will you test it? Is it large enough that it should be rolled out in phases, or to a subset of your users in advance? Do agents have a means for providing you with meaningful feedback? The more complex your processes, the more important it is to fully test all scenarios your agents may encounter and ensure all process outputs are sufficient for stakeholder needs.

Once you have answered these questions, you are ready to begin defining your business process. At a very basic level, this involves listing the required actions, the conditions under which they occur, and any alternate outputs stemming from exceptions, and ordering them in an appropriate sequence. Then, you might sketch out a chart or detailed diagram to illustrate the flows implied by those business needs. Illustrating the order of action with a flow diagram can help you understand the finer nuances of your process and make it easier to verify your logic. For example, you may find instances where one part of a process overlaps another or creates a bottleneck, giving you the opportunity to streamline and increase the effectiveness of your flow.

Testing your desktop design

As you carefully map out and design your dynamic agent desktop, be sure to test it thoroughly before deploying to your operational environment. Here are some helpful guidelines.

- **Make frequent use of preview and validation**—As you design workspaces, guides, scripts, workflows, and rules, make a habit of correcting mistakes to your work as you go. The Home tab of each editor provides a Preview or Validate button to help you check for problems. If you correct configuration issues promptly, you will probably find them easier to resolve because your design decisions should still be fresh in your mind.
- **Account for the profile restrictions of your agents**—When you preview a workflow or a script, it will display as it would to any staff member who has the same set of profile permissions you have. To view it as it will appear to a specific staff member with different permissions, log in using a test account with the same profile as that staff member.

- **Phase in major changes**—In some cases, testing in a non-production environment may not find every conflict or hole in your process. Workspaces and workflows are specific to each profile, so if an agent desktop is designed to be used by multiple profiles across a large number of agents, you might also consider rolling it out in phases, or to a small subset of your staff before taking it fully live.
- **Invite suggestions for improvement**—Incorporate a method (such as an incident submission element or internal survey) for your agents to submit feedback about any problems found or suggestions for further refinements. And consider keeping it in place to augment your standard processes—timely, specific feedback can be just as useful during day-to-day production use as it is during the testing phase.

26

Workspaces

Workspaces define the appearance of the agent desktop when staff members add, view, and edit records in Oracle Service Cloud. When you open a record—such as an incident, contact, opportunity, or custom object—the workspace determines the layout of fields, controls, and tabs on the content pane as well as the arrangement of buttons on the ribbon and the **Quick Access toolbar**.

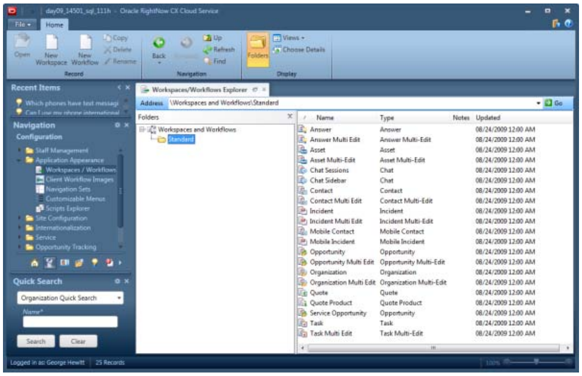
Oracle Service Cloud provides a set of standard workspaces suitable for most common record maintenance, but also gives you complete flexibility to create custom workspaces to help your staff work more efficiently. In addition, you can create **workspace rules** to dynamically change the behavior of fields and controls based on certain triggering events.

The workspaces used by staff members are defined in their staff **profile**, with one workspace associated for each type of record the profile can access. Different profiles can use different workspaces. However, each editor within a profile must be set to use a specific workspace, so all staff who share a profile will use the same set of workspaces. For example, when you create an incident workspace and assign it to the incident editor of a specific profile, all staff members with that profile will see that workspace when they add, view, or edit incidents. Refer to Customizing profiles.

Many functions used to design workspaces are also used to design agent scripts. To understand how workspaces can best be implemented in your agent desktop, you should also become familiar with **guides**, **scripts**, **script rules**, and **workflows**. For a summary of these features, refer to Desktop Overview.

Workspaces explorer

The Workspaces explorer is used to access and manage all of the workspaces on your site. With this explorer, you can browse, search, and organize workspaces in hierarchical folders on the content pane using functions similar to Windows Explorer (see Explorers).



Initially, the explorer lists only the Standard folder containing the standard workspaces. The folder is read-only and the standard workspaces cannot be opened, edited, or deleted—they exist mainly to be selected in staff profiles. However, you can copy standard workspaces to use as the basis for creating your own custom workspaces. Refer to Creating custom workspaces.

Listed next to each workspace's name is its workspace type, based on the type of record it opens. The workspace type determines which fields and controls can be added to the workspace. For example, the Incident workspace type provides access to controls and database fields that are related to incidents. In addition, some workspace types are multi-edit, meaning they are used when staff members open multiple records of the same record type at the same time (up to 250 records can be edited at once). This allows you to display one workspace when staff members open a single record and display a different workspace when they edit multiple records of the same type simultaneously.

To open the Workspaces explorer

1 Click the Configuration button on the navigation pane.

2 Double-click Workspaces under Application Appearance. The Workspaces explorer opens on the content pane.

Note If desktop workflows are enabled on your site, you will see Workspaces/Workflows listed under Application Appearance instead. Refer to Creating workflows. To enable desktop workflows, contact your Oracle account manager.

3 To display the list of standard workspaces, click the Standard folder in the tree under Workspaces.

Standard workspaces

Oracle Service Cloud provides a preconfigured set of standard workspaces, one of each workspace type, suitable for most common record editing. Each is named for its workspace type and is used as the default workspace for its corresponding editor for all new profiles.

The following table describes the standard workspaces and when they are used. Your explorer may list fewer workspaces depending on which Oracle Service Cloud products are enabled on your site. Contact your Oracle account manager for information about enabling products.

Table 150: Standard Workspaces Description

Workspace	Description
Answer	The standard answer workspace that is displayed when a staff member adds or edits an answer. Refer to Standard answer workspace.
Answer Multi Edit	The standard answer workspace that is displayed when a staff member edits multiple answers. Refer to Updating multiple records.
Asset	The standard assets workspace that is displayed when a staff member adds or edits an asset. Refer to Configuring workspaces and profiles.
Asset Multi Edit	The standard assets workspace that is displayed when a staff member edits multiple assets. Refer to Updating multiple records.

Table 150: Standard Workspaces Description (Continued)

Workspace	Description
Chat Sessions	The standard chat sessions workspace displays when an agent accepts a chat from a customer or when a supervisor monitors a chat. Refer to Chat sessions workspace overview. **Note:** The chat sessions workspace uses the chat workspace type.
Chat Sidebar	The standard chat sidebar workspace is used when transferring chats to other agents or conferencing agents into chat sessions. Refer to Transferring chats. **Note:** The chat sidebar workspace uses the chat workspace type.
Contact	The standard contact workspace that is displayed when a staff member adds or edits a contact. Refer to Standard contact workspace.
Contact Multi Edit	The standard contact workspace that is displayed when a staff member edits multiple contacts. Refer to Updating multiple records.
Incident	The standard incident workspace that is displayed when a staff member adds or edits an incident. Refer to Standard incident workspace.
Incident Multi Edit	The standard incident workspace that is displayed when a staff member edits multiple incidents. Refer to Updating multiple records.
Mobile Contact	The standard mobile contact workspace that is displayed when a staff member edits a contact in the Oracle Tap application. Refer to Mobile contact workspace.
Mobile Incident	The standard mobile incident workspace that is displayed when a staff member edits an incident in the Oracle Tap application. Refer to Mobile incident workspace.
Opportunity	The standard opportunity workspace that is displayed when a staff member adds or edits an opportunity. Refer to Standard workspace for opportunities.
Opportunity Multi Edit	The standard opportunity workspace that is displayed when a staff member edits multiple opportunities. Refer to Updating multiple records.

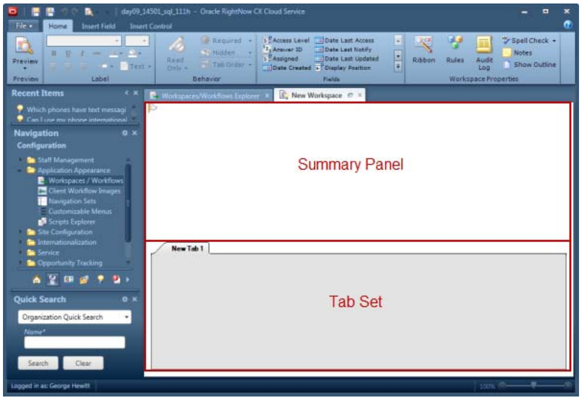
Table 150: Standard Workspaces Description (Continued)

Workspace	Description
Organization	The standard organization workspace that is displayed when a staff member adds or edits an organization. Refer to Standard organization workspace.
Organization Multi Edit	The standard organization workspace that is displayed when a staff member edits multiple organizations. Refer to Updating multiple records.
Quote	The standard quote workspace that is displayed when a staff member adds or edits a quote. Refer to Adding quotes to opportunities.
Quote Product	The standard quote product workspace that is displayed when a staff member adds a sales product to a quote. Refer to Adding sales products to quotes.
Service Opportunity	The standard service opportunity workspace that is displayed when a staff member adds or edits a service opportunity. Refer to Creating opportunities from incidents. **Note:** The service opportunity workspace uses the opportunity workspace type.
Task	The standard task workspace that is displayed when a staff member adds or edits a task. Refer to Standard task workspace.
Task Multi Edit	The standard task workspace that is displayed when a staff member edits multiple tasks. Refer to Updating multiple records.

Note Standard workspaces are not available for **custom objects** because custom objects are, by definition, nonstandard objects. However, you can create workspaces that provide access to custom objects that have Object is Available in Workspaces, Scripting, and Workflow field visibility. Refer to Creating objects and Agent desktop.

Custom workspaces

In addition to standard workspaces, Oracle Service Cloud gives you complete flexibility to create your own custom workspaces to help your staff work more efficiently. Custom workspaces are also used to provide your team with access to records stored in custom objects, which by definition have no standard workspaces of their own. Custom workspaces are created on a workspace designer (shown here) consisting of a ribbon and a design space. You define a workspace by dragging and dropping fields and **controls** from the ribbon to the design space.



The design space is the working area where you arrange fields and controls as you want them to appear on the workspace. In most standard workspaces, a summary panel at the top of the design space displays the most frequently accessed fields for the record type, while a tab set at the bottom provides controls and information related to the record, such as associated records, file attachments, and an **audit log**.

The summary panel and tab set both contain a table, hidden by default, that forms an underlying grid for aligning fields and controls. To aid you in laying out the workspace, you can display outlines around items on the design space to help you identify the table cells they are in. Refer to Design space layout options.

Once you add a field or control to the design space, you can select it to adjust its properties on the designer ribbon. The workspace designer ribbon functions are organized by the tabs described in the following table.

Table 151: Workspace Designer Ribbon Description

Tab	Description
Home	Contains buttons for managing the entire workspace. You can preview the workspace, customize the ribbon that will be displayed with the workspace, create workspace rules, add spell-check functionality, and display an outline on the workspace to guide your design. You can also add notes, review the audit log, insert fields, and alter display and behavior properties for fields and controls. **Note:** The Browser Compatibility button appears on the designer ribbon for incident, contact, organization, task, and custom object workspaces. It functions only when the Agent Browser User Interface feature is enabled. Contact your Oracle account manager for information about enabling Agent Browser User Interface.
Insert Field	Lists the fields you can add to the workspace. The type of workspace you select when creating a new workspace determines the fields available. For example, when creating an incident workspace, you can add incident, contact, and organization fields. Refer to Working with fields.
Insert Control	Lists controls and **relationship items** you can add to the workspace. Controls include spacers, tabs, scripts, reports, title bars, and other items you can use to enhance the display or add functionality. Relationship items also add functionality to the workspace, but vary based on the type of workspace you are creating. Refer to Working with controls.
Design	Displays when you select an item on the design space and contains buttons you can use to modify the properties of the selected item. For example, you can change fonts and margins for a field, or set a field to read-only if you want to display it only for informational purposes. The options available on the Design tab vary based on the control or field that is selected. For descriptions of the options available on the Design tab, refer to Design property descriptions. **Tip:** You can double-click an item on the workspace to automatically select the Design tab and populate it with properties related to the item.

Table 151: Workspace Designer Ribbon Description

Tab	Description
Rules	Displays when you select an item on the design space. Using the buttons on this tab, you can create rules that alter the workspace according to the conditions you define. For example, you can create a rule to hide a field when certain staff members use the workspace. Refer to Workspace rules.

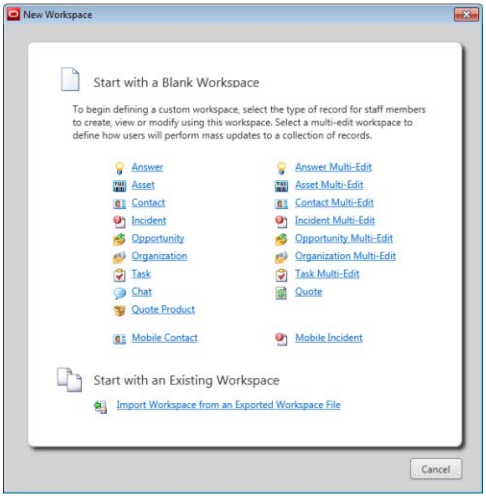
Creating custom workspaces

You can create a custom workspace from scratch by starting with a blank workspace. You can also copy an existing workspace or import a workspace from an exported workspace file to use as the basis for a new workspace. Then you can tailor the design by adding and removing fields and controls, adjusting properties, and arranging the layout to suit your business needs. Refer to Editing workspaces.

Note The following procedures describe how to create, copy, and delete workspaces. To import a workspace from an exported workspace file, refer to Exporting and importing workspaces.

To create a workspace

1 From the Workspaces explorer, click the New button on the ribbon. (If workflows are enabled, the button will be labeled New Workspace.) The New Workspace window opens.



2 In the Start With a Blank Workspace section, select a workspace type (refer to Standard workspaces). The workspace designer opens.

3 To design the workspace, refer to Editing workspaces.

4 Click the Save and Close button on the Quick Access toolbar to save and close the workspace.

To copy a workspace

1 From the Workspaces explorer, right-click the workspace you want to copy and select Copy. The Copy Workspace As window opens.

2 Select the folder to which you want to add the copied workspace.

3 Type a name for the copied workspace in the Name field.

4 Click the OK button. The workspace you added appears on the explorer in the folder you selected.

To delete a workspace

1 From the Workspaces explorer, right-click the workspace you want to delete and select Delete. A Confirm Workspace Deletion message appears.

2 Click the Yes button to delete the workspace.

Important If you delete a workspace that is selected for a standard object editor in a profile, the profile will revert to the standard workspace for the editor type. For example, if you delete a workspace that happens to be selected in a profile for the incident editor, the profile will automatically use the standard incident workspace for that editor.

If you delete a workspace that is selected for a custom object editor in a profile, the profile will revert to no workspace selection because there are no standard workspaces for custom objects.

Editing workspaces

The features available on the workspace designer are the same regardless of whether you are editing a new or existing workspace, or whether it was created from scratch, from a copy, or from an imported workspace file. However, the designer ribbon provides access only to fields, controls, and properties that apply to the workspace type. Controls specific to answers, for example, cannot be added to opportunity workspaces.

By default, most workspace types are blank on top with a single tab on the bottom. (Workspaces that are displayed in their own windows, such as quotes and quote products, are empty.) You can adjust the location of the tabbed area on the workspace by selecting the workspace on the design space and choosing the location you want from the Design tab's Tab Alignment button. You can also adjust the space allotted to the two main areas of the workspace by selecting options from the Design tab's Threshold Height and Summary Panel Height buttons. For more information about these and other workspace properties, refer to Design property descriptions.

To edit a workspace

1 Click the Configuration button on the navigation pane.

2 Double-click Workspaces under Application Appearance. (If workflows are enabled, the item is labeled Workspaces/Workflows.) The Workspaces explorer opens on the content pane.

3 Right-click the workspace you want to edit and select Open. The workspace opens on the content pane.

4 Drag the fields you want from the Insert Field tab onto the design space. Refer to Working with fields.

5 Drag the controls and relationship items you want from the Insert Control tab onto the design space. Refer to Working with controls.

6 To modify the properties for fields and controls, select the item, click the Design tab, and make the appropriate changes. Refer to Field and control properties.

7 To customize options specific to chat workspaces, click the Options button on the Home tab. Refer to Creating incidents from chat sessions.

8 To customize the workspace ribbon, click the Ribbon button on the Home tab. Refer to Customizing ribbons and Quick Access toolbars.

9 To add workspace rules that alter the display or behavior of items on the workspace or the values in its fields, click the Rules button on the Home tab. You can also select an item on the workspace and then click the Add Rule button on the Rules tab. Refer to Adding workspace rules.

Note The Rules button and Rules tab are available only when workspace rules are enabled, and are not available for multi-edit workspaces. To enable workspace rules, contact your Oracle account manager.

10 To view a history of all actions taken on the workspace, such as when the workspace was created and edited and by whom, click the Audit Log button on the Home tab.

11 To invoke spell checking on fields that have the spell checking property enabled whenever a record that uses this workspace is saved, click the Spell Check button on the Home tab and select Auto-Check Spelling on Save.

   a To permit staff members to cancel automatic spell checking, click the Spell Check button and select Allow Canceling Auto-Check. When this option is not selected, staff members will be unable to save the record if they cancel spell checking.

12 To add notes about the workspace, click the Notes button on the Home tab to open the Workspace Notes window.

   a Type any notes you want in the text field.
   b Click the OK button.

Notes added to your workspace are for internal use and are visible only when editing the workspace. They do not appear when working with records.

13 To hide the banner flag on an answer, contact, incident, opportunity, or organization workspace, click the Insert Control tab and clear the Banner Flag check box.

Note When visible, staff can use the banner flag to set an importance indicator and enter text pertaining to the record. The banner flag does not appear on asset, chat, task, quote, quote product, or multi-edit workspaces.

14 To see what your workspace will look like when it is used by staff members, click the Home tab and click the Preview button. You can choose to see the workspace as it will display when creating a record or when editing an existing record. Refer to Previewing workspaces.

15 Click the Save and Close button on the Quick Access toolbar to save and close the workspace.

Note If you save changes to a workspace that staff members are using at the time, they will need to log out and then log back in to see the changes you have applied.

Best practices for creating workspaces

When optimized properly, workspaces are extremely flexible and useful for achieving a high degree of efficiency for staff members. When developing custom workspaces for your site, keep the following best practices in mind.

- **Design for appropriate screen resolution**—Be sure to tailor workspace layouts to your agents' screen resolution. If your display is set to a higher resolution than that of the people who will use your workspace, they may find that the layout is difficult to use. Test appropriately when making design changes such as adding a column or adjusting the size of a field or add-in control.
- **Optimize your layouts**—Give careful thought to the number and sequence of controls and fields in the layout of workspaces and tabs, providing only the information, fields, and controls staff members need to do their job. Also, try to avoid nesting tab

sets, panels, and tables more than two or three levels deep. Streamlined layouts can optimize workspace performance and improve staff efficiency. They are also much easier to update as new processes are rolled out to your team.

- **Add shortcut keys and tab indexes**—Agents can be more efficient when they can keep their fingers on the keyboard. Once you have optimized your workspace layout, select a Tab Order option to specify the order in which field focus is advanced when the Tab key is pressed, such as top-to-bottom or left-to-right (refer to the Tab Order button description at Behavior properties). Add shortcut keys to the most commonly accessed fields to provide even faster navigation, and train your team to use them (refer to the Text label description of Label properties).
- **Hide or require fields**—Reduce visual clutter and improve performance by making fields visible only when they need to be, and only to agents who need access to them. For example, some fields might be required only when a new record is being created, and then hidden or displayed in a read-only format the rest of the time. When a workspace is shared by multiple profiles, you can choose to hide some of your fields from profiles of agents that don't use them. For profiles of agents that must complete a specific field, you can make that field required for that specific profile. Refer to Setting hidden, required, and read-only properties.
- **Use different tabs for different tasks**—Tabs can be used to organize alternate field layouts tailored to common tasks. For example, in addition to a base tab containing an incident discussion thread, you could create another tab containing a **guided assistance** control and fields commonly used to solve technical issues. Additional tabs could contain alternate layouts for resolving billing issues, tracking and returning orders, soliciting feedback, or creating sales opportunities. Whatever content you add, be sure each tab and field has an accurate, descriptive label. Also, be sure to order the tab set appropriately based on priority, with the most frequently used tabs first. Then set tab indexes and define shortcut keys so your agents can navigate quickly using their keyboard. Refer to Working with tab controls.
- **Delay loading data-heavy controls**—Some controls, such as reports and browsers, may take awhile to load based on the amount of data they return. To reduce the initial load time of your workspace, you can delay the loading of these controls when they are located on tabs that are not visible when the workspace is initially opened. Refer to Report properties and Working with browser controls.
- **Use scripts and workflows to simplify your workspaces**—Scripts and desktop workflows can be effective alternatives for complex workspaces. A workspace laden with a large number of fields, controls, and rules can be challenging to create, use, and maintain. By splitting up some of those processes across multiple elements, you can

reduce the risk of functional or procedural conflicts while also simplifying and improving the performance of the interface for your agents. Refer to Agent Scripts and Desktop Workflows.

Tip For best practices for mapping the agent desktop to your business processes, refer to *Best Practices for Implementing Contact Center Experiences*.

Workspace rules

The efficiency provided by custom workspaces can be extended even further using workspace rules. Workspace rules are an automation layer used to set properties for different workspace items based on actions and conditions occurring in the workspace.

Note Workspace rules are not available for multi-edit workspaces.

Workspace rules can save your agents a lot of time by simplifying or completely automating routine tasks. For example:

- If your workspace contains a lot of fields and controls, you can use rules to show only the information that is relevant based on the type of interaction, the data being entered, or the identity of the contact or agent.
- If a specific tab on the workspace correlates to a specific incident category, you could add a rule that focuses a specific tab based on the category value when the editor loads.
- If agents are required to select from a certain subset of dispositions when solving incidents, you could create a workspace rule to make the Disposition field required and hide several of its items when incidents are set to Solved.
- If incidents are escalated among groups based on product and profile, you could add a rule that sets the Assigned field to a specific group based on the product value selected and the profile of the logged-in staff member when a certain button control is clicked.

With every few clicks you save your agents, you help them become more efficient. Over time, automating your most repetitive tasks can help your team avoid distraction and better focus on the task at hand—assisting your customers.

Overview of workspace rules

With workspace rules, you can dynamically adjust the display, behavior, and values of fields and controls on a workspace based on staff member actions. (Workspace rules are not available for multi-edit workspaces.) Each rule is triggered by one or more events and conditions you define, and can result in one or more actions, including the following.

- Set the value of a field
- Set the required status of a field
- Make a field or control read-only
- Show or hide a field or control
- Show only a select group of menu items
- Open a guided assistance guide (if Guided Assistance is enabled)
- Open a specific script (if Agent Scripting is enabled)
- Create a named event to trigger another workspace rule or a script rule

In simplest terms, a workspace rule is basically a "when-then" statement you use to control the behavior of fields and controls on your workspace, such as:

- When the status is changed, then make the Product field required.
- When the disposition is changed, then make the Status field noneditable.

At a basic level, each rule defines a triggering event and a resulting action that will occur after the event is triggered. In some cases, you may find that the triggers available for rules are not precise enough to address a specific business need. You can make a rule more restrictive by adding conditions under which the event will trigger an action. If conditions are specified in a rule, actions will be triggered only if those conditions are met. For example, your rule could state that when a button is clicked, *if the status is Unresolved*, assign the record to the logged-in staff member. The button click is the triggering event, but the Unresolved status is the condition under which that event will trigger the action after the button is clicked.

There are two types of actions: Then and Else. Every rule has at least one Then action, which is the result of the triggering event and conditions. However, once conditions are specified for a rule, you can also add one or more Else actions. An Else action is triggered in cases where the rule's conditions are *not* met. For example, a rule could state that when the status changes, if the value of the status is Solved, make the Disposition field editable, *or else make the Assigned field editable*. In this case, when the rule is evaluated, the Assigned field will be made editable if the record's status has *not* been set to Solved.

Caution Since business rules are checked after workspace rules, changes made to a record by workspace rules can be overridden by business rules if the rules have similar actions. Refer to Business rules overview.

Workspace rules can be created and managed from two locations on the workspace designer's ribbon. Clicking the Rules button on the Home tab gives you an overview of all the workspace's rules. This is helpful if you need a quick look at all the rules that impact the workspace behavior. You can also add, edit, delete, and order all the rules on the workspace from this location. If you want to know which rules are associated with a specific field on your workspace, you can select the field on the design space, then click the Rules tab to view a filtered list.

Note The Rules button and Rules tab are available only when workspace rules are enabled. For information about enabling workspace rules, contact your Oracle account manager.

As with the Rules button on the Home tab, you can also view, add, edit, delete, and order any of the rules from the Rules tab.

The following table describes the buttons on the Rules tab.

Table 152: Rules Tab Description

Field	Description
Current Selection	Click this drop-down menu to view a hierarchical listing of all the items on the workspace's design space. Selecting an item from the hierarchy will select it on the design space. Refer to Selecting fields and controls using the ribbon.
Show Details	Click this button to view the properties of the selected item.

Table 152: Rules Tab Description (Continued)

Field	Description
Delete	Click this button to remove the selected item from the workspace.
Contextual Button	One or more contextual buttons may also display in the Selected Object button group, depending on the item selected. Click these buttons to modify item properties based on the selected item. Refer to Selected Object properties.
Add Rule	Click this button to open the Rule Wizard where you can add a rule.
Filter List	Click this button to filter the visibility of rules in the list.
Rules Triggered by this Object	Click this button to list only rules that use the selected item in the rules' triggers.
Rules that Reference this Object	Click this button to list only rules that use the selected item in the rules' triggers, conditions, Then actions, or Else actions.
All Workspace Rules	Click this button to list all rules configured for the workspace.
Rule List	This area lists the rules that match the filter selected from the Filter List button. **Note:** You can scroll the rule list using the up and down arrows on the list's scroll bar. You can expand the list by clicking the Expand Fields button at the bottom of the list's scroll bar.
Edit Rule	Select a rule in the rule list and click this button to edit the rule.
Delete Rule	Select a rule in the rule list and click this button to delete the rule.
Move Up	Select a rule in the rule list and click this button to move the rule up one position in the list to reorder the rules. **Note:** Rules with the same trigger run in the order listed.
Move Down	Select a rule in the rule list and click this button to move the rule down one position in the list to reorder the rules. **Note:** Rules with the same trigger run in the order listed.

❖ Desktop Overview

Adding workspace rules

You create rules using the Rule Wizard, which you can open from the Rules tab or from the Rules button on the Home tab.

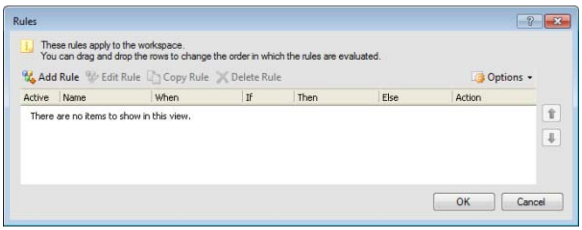
Note With some exceptions, the method used to create workspace rules is the same as that used to create script rules. The procedures to create rules from the Rule Wizard can also be used when creating script rules. Refer to Script rules.

To add a workspace rule

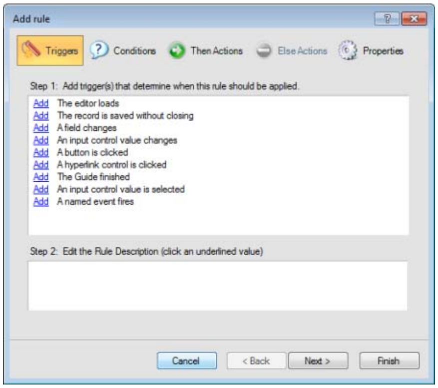
1 On the open workspace, click the Home tab and click the Rules button to open the Rules window.

Or

Select a field on the workspace and click the Rules tab.



2 Click the Add Rule button to open the Rule Wizard.



Displayed along the top of the wizard are five buttons—Triggers, Conditions, Then Actions, Else Actions, and Properties. You construct the rule by clicking each button and adding items to the rule description.

3 Select one or more triggers that will cause the rule to fire. Refer to Selecting rule triggers.

4 Click the Conditions button to add conditions that determine whether the triggering event will result in an action. Refer to Selecting rule conditions.

5 Click the Then Actions button to define the actions that should occur if the conditions are met. Refer to Adding and editing actions.

6 Click the Else Actions button to define the actions that should occur if the conditions are not met. Refer to Adding and editing actions.

7 Click the Properties button and type the name of the rule in the Rule Name field.

8 Type any notes you want to add to the rule in the Notes field.

9 To deactivate the rule, clear the Active check box.

10 Click the Finish button to save the rule.

- Working with fields
- Working with controls
- Field and control properties
- Desktop Overview

Selecting rule triggers

Rule triggers are events that occur in a workspace that cause a rule to be evaluated. If you add more than one trigger to the rule description, the rule will be evaluated after any of the selected triggers occur.

Designing for efficiency

To best support the maintenance and performance of your workspaces as they grow and change over time, always try to construct workspace rules that are scalable and suited to the need at hand. For example, rather than setting up a rule that hides a tab on a workspace when the editor loads, you might simply edit the workspace itself and set the tab to be hidden by default. Rule actions that are triggered unconditionally when "The editor loads" can be eliminated by simply having the workspace default to the desired state, which is more efficient for your system to perform.

Available triggers vary based on the fields and controls that have been added to the workspace and are described in the following table.

Table 153: Rule Triggers Description

Event	Description
The editor loads	Add this event to trigger the rule immediately after a record is opened using the workspace. **Note:** When using this trigger, rule conditions are evaluated at the time the record is opened. If any of the conditions require that items be changed after the record is opened, the rule will not fire.
The record is saved without closing	Add this event to trigger the rule immediately after a record is saved without being closed. For example, you could have a rule that runs when a staff member clicks the Save button instead of Save and Close. **Note:** This event does not affect records which are closed when saved or without being saved. This trigger should not be used as a last check before the record is saved, since it changes the values displayed in the workspace after the save occurs, not before.

Table 153: Rule Triggers Description (Continued)

Event	Description
A field changes	Add this event to trigger the rule immediately after the value of a field is changed. Once added, click the event's underlined text to select a field that will trigger the rule. Available fields vary depending on the type of workspace you are editing. For example, when creating a rule on an incident workspace, you can select fields from the *incidents*, *contacts*, and *organizations* tables. However, not every field in these tables is available for use in workspace rules. **Note:** When using this trigger, the rule is evaluated at the time any change is made to the selected field. If the selected field is a text field, the rule will be evaluated the moment any character in the field is changed. If the selected field is a currency, the rule will be evaluated when the field loses focus.
An input control value changes	Add this event to trigger the rule immediately after the value of an input control is changed to another value or to no value. Once added, click the event's underlined text to select an input control that will trigger the rule. Available input controls include any menus, radio buttons, list boxes, and text boxes that are not used to trigger other rules. **Note:** This event is available only when an input control has been added to the workspace. When using this trigger, the rule is evaluated immediately after any change is made to the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.
A button is clicked	Add this event to trigger the rule immediately after a button on the workspace is clicked. Once added, click the event's underlined text to select a button from the workspace that will trigger the rule. **Note:** This trigger is available only when a button has been added to the workspace.
An image is clicked	Add this event to trigger the rule immediately after an image is clicked. Once added, click the underlined text to select an image from the workspace that will trigger the rule. **Note:** This trigger is available only when an image has been added to the workspace.

Table 153: Rule Triggers Description (Continued)

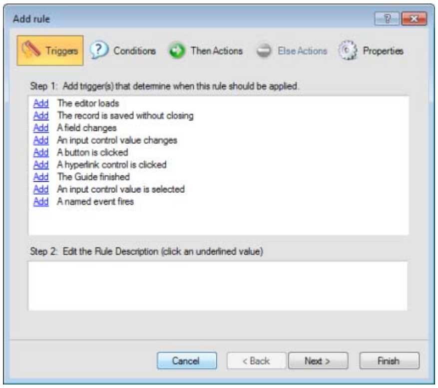
Event	Description
A hyperlink control is clicked	Add this event to trigger the rule immediately after a hyperlink is clicked. Once added, click the underlined text to select a link from the workspace that will trigger the rule. **Note:** This trigger is available only when a hyperlink has been added to the workspace.
The exit script event fires	Add this event to trigger the rule immediately after the Exit button is clicked, or when an exit script event is fired by a rule in a script placed on the workspace. Rule conditions are evaluated at the time that the event is fired. Refer to Using events in workspace and script rules.
The finish script event fires	Add this event to trigger the rule immediately after the Finish button is clicked, or when a finish script event is fired by a rule in a script placed on the workspace. Rule conditions are evaluated at the time that the event is fired. Refer to Using events in workspace and script rules.
The guide finished	Add this event to trigger the rule immediately after the Finish button is clicked in a Guided Assistance **relationship item** indicating that a staff member has finished using a guide. Refer to Adding guided assistance to workspaces. **Note:** This trigger is available only when the Guided Assistance relationship item has been added to the workspace.
An input control value is selected	Add this event to trigger the rule immediately after an input control value is selected. Once added, click the event's underlined text to select an input control that will trigger the rule. Available input controls include any menus, radio buttons, and list boxes that are not used to trigger other rules. **Note:** This event is available only when an input control has been added to the workspace. When using this trigger, the rule is evaluated at the time a value is selected from the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.

Table 153: Rule Triggers Description (Continued)

Event	Description
A named event fires	Add this event to trigger the rule immediately after a named event is fired by another rule on the workspace or by a rule in a script placed on the workspace. Once added, click the underlined text to type the name of the event that will trigger the rule. Rule conditions are evaluated at the time that the event is fired. Refer to Using events in workspace and script rules.

To add a rule trigger

1 On the Rule Wizard, click the Triggers button to list available trigger items.



2 Click Add next to the triggers you want to add to the rule description.

3 If a trigger you have added to the rule description contains underlined text, click the underlined text to specify the source of the trigger action (such as the field, control, or event name). Click here for a description of trigger actions.

4 Click the Next button to add conditions to the rule.

Or

Click the Then Actions button to add actions to the rule.

Selecting rule conditions

Rule conditions are additional criteria that determine whether a rule action will be triggered. Conditions are evaluated at the time that the trigger event occurs. If all conditions are met (and the logical expression is valid), the rule's Then actions will be taken immediately after the triggering event. If any condition in the rule is *not* met, the rule's Else actions will be taken. If no Else actions are defined and any condition is not met, no action will be taken.

Available conditions vary based on the fields and controls you have added to the workspace and are described in the following table.

Table 154: Rule Conditions Description

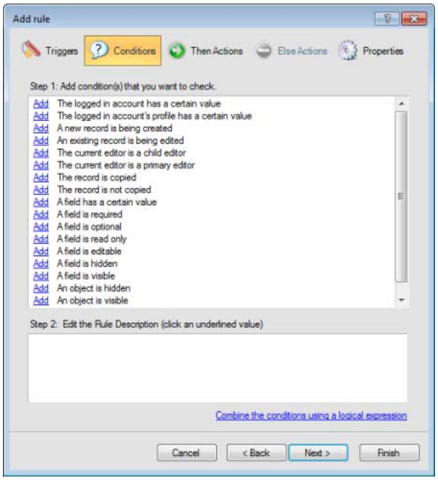
Condition	Description
The logged in account has a certain value	Add this condition to take action based on whether the logged-in account has a certain value. Click the underlined text to select the account to be evaluated.
The logged in account's profile has a certain value	Add this condition to take action based on whether the logged-in account's profile has a certain value. Click the underlined text to select the profile to be evaluated.
A new record is being created	Add this condition to take action based on whether a new record is being created.
An existing record is being edited	Add this condition to take action based on whether an existing record is being edited.
The current editor is a child editor	Add this condition to take action based on whether the record is open in a child editor.
The current editor is a primary editor	Add this condition to take action based on whether the record is open in a primary (non-child) editor.
The record is copied	Add this condition to take action if the record is being copied from another record. **Tip:** This condition can be useful if you want to automatically set field values when records are copied.
The record is not copied	Add this condition to take action if the record is not being copied from another record.
A field has a certain value	Add this condition to take action based on whether a field has been set to a specified value. Click the underlined text to select the field to be evaluated.

Table 154: Rule Conditions Description (Continued)

Condition	Description
A field is required	Add this condition to take action based on whether a field is required. Click the underlined text to select the field to be evaluated.
A field is optional	Add this condition to take action based on whether a field is optional (not required). Click the underlined text to select the field to be evaluated.
A field is read only	Add this condition to take action based on whether a field is read-only. Click the underlined text to select the field to be evaluated.
A field is editable	Add this condition to take action based on whether a field is editable. Click the underlined text to select the field to be evaluated.
A field is hidden	Add this condition to take action based on whether a field is hidden. Click the underlined text to select the field to be evaluated.
A field is visible	Add this condition to take action based on whether a field is visible. Click the underlined text to select the field to be evaluated.
An object is read only	Add this condition to take action based on whether a control is read-only. Click the underlined text to select the control to be evaluated.
An object is editable	Add this condition to take action based on whether a control is editable. Click the underlined text to select the control to be evaluated.
An object is hidden	Add this condition to take action based on whether a control is hidden. Click the underlined text to select the control to be evaluated.
An object is visible	Add this condition to take action based on whether a control is visible. Click the underlined text to select the control to be evaluated.
An input control has a certain value	Add this condition to take action based on whether an input control has a certain value. Click the underlined text to define the input control to be evaluated.
An add-in control condition returns a certain value	Add this condition to take action based on whether an add-in control returns a certain value. Click the underlined text to select the add-in control and the parameters to be evaluated. Refer to Add-ins in scripts and workspaces.

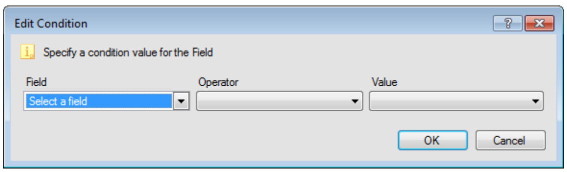
To add a rule condition

1 On the Rule Wizard, click the Conditions button to list available conditions.



2 Click Add next to the conditions you want to add to the rule.

3 If a condition you have added to the rule description contains underlined text, click the underlined text to open the Edit Condition window. Click here for a description of rule conditions. The following figure shows the Edit Condition window as it appears when defining a condition based on a field value.



a If defining a condition based on a value for a field, click the Field drop-down menu and select a field.
b Click the Operator drop-down menu and select an operator.
c Click the Value drop-down menu and select a value.
d Click the OK button to close the window.

4 To evaluate two or more conditions using a logical expression, click Combine the Conditions Using a Logical Expression. Refer to Defining logical expressions for workspace rule conditions.

5 Click the Finish button to save your condition in the rule.

Or

Click the Next button to add actions to the rule.

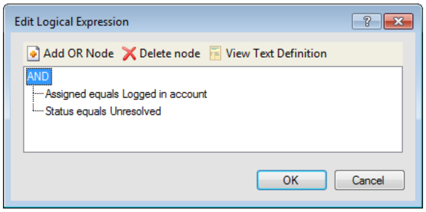
Defining logical expressions for workspace rule conditions

When you add multiple conditions to a rule, the conditions are automatically joined together to form a logical expression. The logical expression defines how the conditions are evaluated together to determine whether rule actions should be performed. By default, the logical expression uses Boolean AND logic rather than OR logic. Conditions joined by an AND operator must all be met for rule actions to be performed. When using the OR operator, any condition can be met.

To edit a logical expression

1 Add more than one condition to the rule.

2 Click Combine the Conditions Using a Logical Expression. The Edit Logical Expression window opens.



The conditions you added are automatically joined with AND logic and are displayed in an AND tree node.

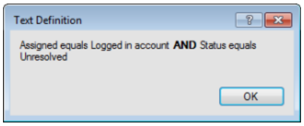
3 To add a condition joined with OR logic, click the Add OR Node button and drag the condition to the OR node.

When you add nodes to the expression, the nodes are displayed in a tree structure, with conditions displayed either under an AND node or an OR node. Conditions under the same AND node are joined to each other using AND logic. Conditions under the same OR node are joined to each other using OR logic. Conditions can be dragged from one node to another to define their logical relationships.

Caution Deleting a node from the logical expression will also delete any conditions listed beneath that node in the tree structure, and there is no Undo option.

4 To delete a node from the logical expression, select the node and click the Delete Node button.

5 To view a text definition of the conditions' logical expression, click the View Text Definition button.



a Click the OK button to close the Text Definition window.

Adding and editing actions

Immediately after a rule is triggered (and all conditions are met), its actions are performed. Actions provide a wide array of functions to meet your business needs. They can be used to set the value of a field or change its required, read-only, or visibility status. They can set the visibility of controls on the workspace. Actions can even hide individual items within menus. For example, an action can change the properties of the Status field to allow staff members to select from only two of the four incident statuses.

Every rule must have at least one Then action, which is the result of the rule being triggered and its conditions being met. Else actions can be added if conditions have been defined in the rule. Else actions can use any of the same actions as Then actions, except they are performed when the rule's conditions are *not* met.

Note If a rule action triggers a connector in a desktop workflow, the workflow will advance to the next element without running any subsequent rules in the workspace. Refer to Defining connector events and conditions.

Available actions depend on the type of workspace and the fields and controls you have added and are described in the following table.

Table 155: Rule Actions Description

Action	Description
Set the value of a field	Add this action and click the underlined text to select a field and the value you want to set for that field. **Note:** In addition to setting an absolute value, you can set relative values for some field types. Relative values are defined by adding or subtracting (or appending or prepending) a value to the field's previous value. Refer to Setting relative field values.
Set menu field to include menu items	Add this action and click the underlined text to select items you want to appear in a specified menu field. **Note:** When selecting items in hierarchical menus, you can select the parent item to add the parent and all child items to the list, or you can select only the child items you want.
Set menu field to exclude menu items	Add this action and click the underlined text to select items you want to hide from a specified menu field.
Make a field required	Add this action and click the underlined text to select a field that you want to require staff members to complete.
Make a field optional	Add this action and click the underlined text to select a field that you want to be optional (not required) for staff members to complete.
Make a field read only	Add this action and click the underlined text to select a field that you want to be uneditable by staff members.
Make a field editable	Add this action and click the underlined text to select a field that you want to be editable by staff members.
Hide field	Add this action and click the underlined text to select a field that you want to be hidden from staff members.
Show a field	Add this action and click the underlined text to select a field that you want to be visible to staff members.
Set the value of an input control	Add this action and click the underlined text to select an input control and the value you want to set for that control.

Table 155: Rule Actions Description (Continued)

Action	Description
Set the URL of a web browser control	Add this action and click the underlined text to select a browser control and specify a URL for it to load.
Assign the value of a text box control to a field	Add this action and click the underlined text to select a text box control and give its value to a text field.
Make an object read only	Add this action and click the underlined text to select a control that you want to be uneditable by staff members.
Make an object editable	Add this action and click the underlined text to select a control that you want to be editable by staff members.
Hide an object	Add this action and click the underlined text to select a control that you want to be hidden from staff members.
Show an object	Add this action and click the underlined text to select a control that you want to be visible to staff members.
Focus a tab	Add this action and click the underlined text to select a tab that you want to receive focus.
Hide a ribbon button	Add this action and click the underlined text to select a button on the ribbon that you want to be hidden. **Note:** When you choose to hide a ribbon button, all instances of the button on the workspace's ribbon will be hidden.
Show a ribbon button	Add this action and click the underlined text to select a button on the ribbon that you want to be visible.
Invoke a guide	Add this action and click the underlined text to select a guide to display to staff members. Refer to Associating answers to guides. **Note:** This option is available only if guided assistance is enabled on your site.
Prompt agent to select a guide	Add this action to prompt staff members to select a guide to display. Refer to Associating answers to guides. **Note:** This option is available only if guided assistance is enabled on your site.

Table 155: Rule Actions Description (Continued)

Action	Description
Prompt agent to search for a guide using a report	Add this action and click the underlined text to select a report and prompt the agent to search for a guide using the selected report. Refer to Associating answers to guides. **Note:** This option is available only if guided assistance is enabled on your site.
Run a script	Add this action and click the underlined text to select a script control and the script that you want to run in it. Refer to Creating and editing scripts. **Note:** This option is available only if agent scripting is enabled on your site and you have added a script control to the workspace.
Fire a named event	Add this action and click the underlined text to type the name of an event that you can use to trigger a script branch, desktop workflow connector, or another rule. Refer to Using events in workspace and script rules. **Note:** Named events let you trigger a workspace rule from a script rule or a script rule from a workspace rule. For example, you could create a script rule to fire a named event when a button control is clicked. You could then create a workspace rule to set the Status field to Solved when the named event is fired.
Execute an editor command	Add this action and click the underlined text to select an editor command that you want to run. Any of the record commands that are available as ribbon buttons for the workspace type can be selected, such as Save, Print, Propose, and Refresh.
Execute an add-in action	Add this action and click the underlined text to select an add-in action that you want to run. Refer to Add-ins in scripts and workspaces.
Add standard text to thread	Add this action and click the underlined text to select a standard text to insert into an incident thread. Any standard text that has Rule Text enabled can be inserted as a customer entry, response, or private note. **Note:** The Incident Thread **relationship item** does not need to be added to the workspace for this action to occur. However, the new thread entry will not be committed until the incident is saved.

Table 155: Rule Actions Description (Continued)

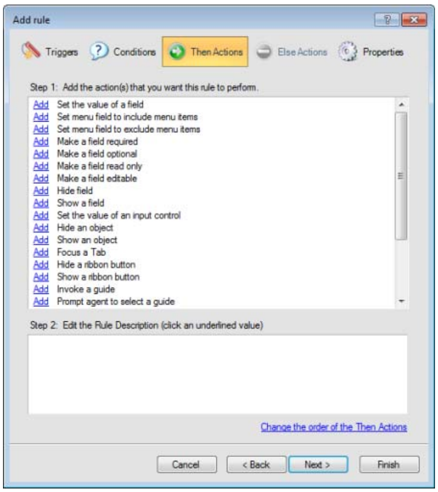
Action	Description
Display a message box	Add this action and click the underlined text to define a customized message that will display in a pop-up window. For example, you can use this action to alert the agent when an incident contains a high severity issue or is missing important information. You can define the window title and the text of the message and select an icon to indicate the message context (error, information, question, or warning).
Make the editor read only	Add this action to make all content in the editor read-only, preventing further changes from taking place to the record. For example, you could add this action to prevent agents from making changes to solved incidents.

To add or edit an action

1 On the Rule Wizard, click the Then Actions button to list available Then actions.

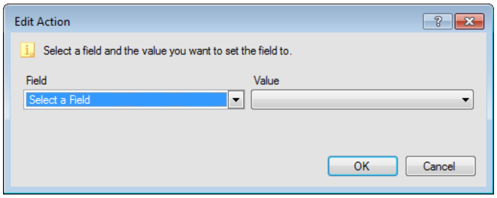
Or

Click the Else Actions button to list available Else actions.



2 Click Add next to the conditions you want to add to the rule.

3 If the action you have added to the rule description contains underlined text, click the underlined text to open the Edit Action window. Click here for a description of rule actions. The following figure shows the Edit Action window as it appears when setting a field value.



a Click the OK button to close the window.

4 To change the order of the actions listed in the rule description, click Change the Order of the Then (or Else) Actions.

a Click the action you want to move, then click the up or down arrow to move the action where you want it.

b Click the OK button to close the window.

5 Click the Finish button to save the rule.

Modifying workspace rules

Once you add rules, you can easily edit them, reorder them, or delete them once they are no longer needed. These functions can be accessed from both the Rules tab and the Rules button on the Home tab.

Important Rules are fired in the sequence in which they are listed. Adjusting them can impact how other rules affect the workspace. For example, if multiple rules set different values for the same field, the field will be set to the value assigned by the last rule in the sequence.

To modify workspace rules

1 From an open workspace, click the Home tab and then click the Rules button. The Rules window opens and lists all workspace rules.

Or

Click an item on the workspace and then click the Rules tab. The rule list displays all rules triggered by the selected item. (If you want to display the rules that reference the selected item, or all rules in the list, click the Filter List button and select the option you want.)

2 In the rule list, select the rule you want to modify.

3 To edit the rule, click the Edit Rule button. The Rule wizard opens. Refer to Adding workspace rules.

4 To copy the rule, click the Copy Rule button. The Rule Wizard opens the rule copy where you can make any needed changes to rule.

Note The Copy Rule button is available only when modifying rules using the Rules button on the Home tab. It does not appear on the Rules tab.

a Click Finish to save the rule copy.

5 To change the order of the rule, click the up or down arrow to move the rule where you want it.

Caution Deleting a rule is permanent and cannot be undone. To ensure that a rule is not needed before deleting it, you can disable it instead. To disable a rule, click the Rules button on the Home tab and clear the Active check box next to the rule.

6 To delete the rule, click the Delete Rule button.

Avoiding rule conflicts

Because processes for workspace rules, script rules, script branching rules, and workflows are often running at the same time, care must be taken to ensure that their actions do not conflict. For instance, when a script is added to a workspace, the script rules will be running even when the script does not have focus on the workspace. If a script rule and a workspace rule are configured to update the same field, an agent may find that the field does not update to the value they might expect.

For this reason, it is helpful to understand the sequence in which rules are performed. Currently, rules are processed in the following order:

1 Workspace rules

2 Script current page rules

3 Script current page's branching logic

If additional scripts appear on the same workspace, processing continues as follows:

4 Script 2 current page rules

5 Script 2 current page's branching logic

6 Script 3 current page rules

7 Script 3 current page's branching logic

While a large number of rules may be difficult to track, remember that you can avoid most common types of conflicts by limiting the number of rules you create and avoiding overlap in triggers. For example, if a workspace rule and script rule are both triggered by a change to the Category field, you will want to make sure that these rules do not act on the same field or control (such as trying to set two different values for the Product field). If they must do so, add appropriate conditions to the rules to narrow their focus and impact.

Since most trigger events are common to workspace rules, script rules, and workflow connectors, it is important to try to minimize or reserve certain types of triggers for certain functions. For example, it is generally best to avoid or minimize the number of data changed triggers (such as "A field changes") in your scripts. This is especially true for the first page of scripts, as this page will load when the workspace does and is therefore more likely to run into a conflict.

Finally, work performed in the agent desktop is augmented by another feature that is usually thought of as separate and distinct—the server-side **business rules**. Don't forget to consider your existing business rules when designing your agent desktop, especially those functions most commonly performed by rules, such as changing incident assignment. And be sure to consider your agent desktop designs when adding new business rules. Tracking functional overlaps between business rules and your agent desktop is just as important as preventing conflicts within the desktop to ensure expected results.

Previewing workspaces

When you are editing a workspace, it can be helpful to preview the workspace to see what it will look like when staff members use it. This can help you assess whether it meets your needs or if it needs further changes. The preview feature displays the workspace as it will appear to any staff member who has the same set of administration permissions as you have. To view the workspace as it will appear to a staff member with different permissions, you must log in using a staff account with the same profile as the staff member.

Note As in production, previewed reports used on report controls or **relationship items** automatically attempt to filter on the record shown using the workspace to display information related to the record. For this reason, you should make sure that each report contains at least one filter for the primary identification types for the workspace type. For example, reports used in incident workspaces should filter on incident *(i_id)*, contact *(c_id)*, or organization *(org_id)*. If such a filter does not exist, the previewed report could return all records.

To preview a workspace

1 While editing a workspace, click the Home tab.

Or

Right-click a workspace on the Workspaces explorer and select Open.

2 To view the workspace as it will appear to staff members when they add records using this workspace, click the Preview button and select New Record. A preview of the new record opens.

3 To view the workspace as it will appear with data from a specific record, click the Preview button and select Opening a Record.

a Type the record ID number.

b Click the OK button. The record preview opens.

4 To view a chat workspace as it will appear with data from a specific chat session, click the Preview button.

a Type the chat session ID. (Chat session IDs can be found on the tab of an agent's active chat session as well as the All Chats report.)

b Click the OK button. The chat preview opens.

5 Click X on the top right or press **Esc** to close the preview window.

Note When you click the Preview button on a multi-edit workspace, the workspace displays without any record data. You cannot enter a reference or ID number to view existing data as you can when you select Opening a Record on a single-record workspace.

Exporting and importing workspaces

Administrators can spend a lot of time creating and optimizing custom workspaces to support complex business processes. However, because workspaces are often comprised of fields and controls that are unique to the interface in which they were created, they cannot simply be copied between interfaces.

To save time when creating workspaces in multiple interfaces, Oracle Service Cloud lets you export a workspace as an XML file containing descriptions of all the workspace elements, including fields, controls, layout, and rules. The XML file can then be used by the import wizard to import the workspace to another interface. The export/import features can help you migrate a workspace efficiently while accounting for fields and controls that are not configured identically between interfaces. This is helpful if you have a custom workspace you like on one Oracle Service Cloud interface and want to create a copy or similar workspace on a different interface.

Note Workspace notes are not included when exporting a workspace to an XML file.

When a workspace is exported as an XML file, the file includes a hash value that will be used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing, and an error message notifies you that the file is invalid.

The XML file can be no larger than 1 MB.

To export a workspace

1. On the Workspaces explorer, right-click the workspace you want to export and select Open. The workspace opens.
2. Click File and select Export Workspace. The Save As window opens.
3. Select the directory where you want to save the workspace definition file and type the file name.
4. Click the Save button to save the workspace definition file.

To import a workspace

1. From the Workspaces explorer, click the New button on the ribbon. (If workflows are enabled, the button will be labeled New Workspace.) The New Workspace window opens.

2 Click Import Workspace from an Exported Workspace File to open the Import Workspace wizard.

3 Click the Next button.

4 Type the full path of the workspace definition file you want to import.

Or

Click the Browse button to find the file on your workstation and click the Open button.

5 Click the Next button.

6 To map the file to a workspace type, click the Map To Type drop-down menu and select the record type you want to map the workspace to. By default, the imported workspace is mapped to the same workspace type as the original workspace.

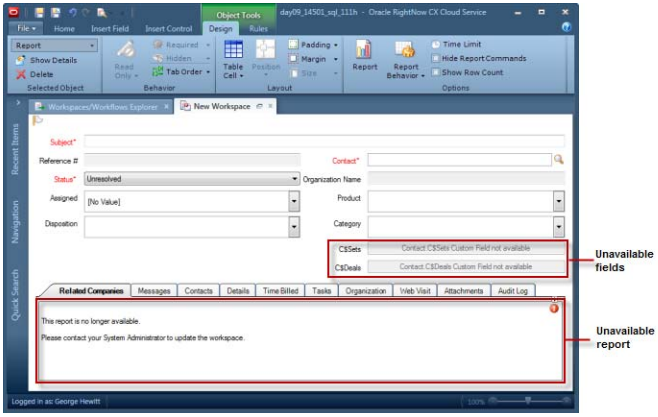
Important If items from the workspace you are importing are not used by the workspace type you are converting it to, the next window lists these invalid items and informs you that they will be replaced by spacers, field placeholders, or removed from the imported workspace. Since most database fields and workspace controls are not shared by workspace types, the majority of fields and controls will often not be included in the new workspace when you convert the type. However, this option is helpful if you want to import the general layout from a workspace with a different type.

7 Click the Next button.

8 If the workspace includes records from a custom object, click the Map To Record Type drop-down menu and select the record type you want to map the records to. If Oracle Service Cloud detects a record type of the same name already in the site, it is selected by default.

a Click the Next button.

9 Click the Finish button. The workspace designer opens with the imported workspace. Any fields on the workspace that do not exist on the site you are importing the workspace into will be indicated as unavailable, as shown here.



10 Edit the workspace to remove or replace fields that are not available. Refer to [Editing workspaces](#).

11 Click the Save button to save the workspace.

Important When you save a workspace, reports that are used by the workspace's report controls will be checked to ensure they exist on the site. If a report does not exist, a message will be placed in the control stating the report is no longer available. You can save a workspace that has invalid reports, but you will need to select new reports for the controls before they can be used by the workspace.

27

Guided Assistance

Guided assistance gives agents and customers the ability to locate **answers** or **text explanations** by selecting responses from question branches in **guides**. This lets agents quickly find information they can provide to customers when working with them on the phone, when responding to an **incident**, or when chatting. In addition, guides can be embedded in answers so customers can use them on the **customer portal**. Refer to Adding answer details and Configuring the GuidedAssistant widget.

Important Many factors control answer visibility. For instance, if an answer or section of an answer is available only to customers whose **SLAs** give them permission to view certain **answer access levels**, that answer will not be visible to customers without that SLA even if they click an answer in a guide. Refer to Controlling answer visibility.

To understand how guides can best be implemented in your agent desktop, you should also become familiar with **workspaces**, **scripts**, **script rules**, and **workflows**. For a summary of these features, refer to Desktop Overview.

Configuring guided assistance

You can create as many guided assistance guides as you need to help your agents and customers locate appropriate responses to questions related to different topics. For example, you can create guides to help agents answer questions about different products and other guides to help answer questions about service plans. Each guide can include multiple question branches, so you can use a single guide to lead agents to answers regarding different models of a product or multiple service plans.

Note These configuration options will not be available until guided assistance is enabled. To enable guided assistance, contact your Oracle account manager.

To provide guided assistance to agents and customers

1 Add the Guided Assistance explorer to your **configuration list** for the Configuration button. Refer to Creating a navigation set for the administrator.

2 Assign guided assistance permission to **profiles**. Refer to Assigning guided assistance permission to profiles.

3 Create **guides** for your agents or customers. Refer to Creating guides.

4 To display a guide to agents, add the Guided Assistance **control** to a **workspace** selected in the agent profiles. Refer to Adding guided assistance to workspaces.

5 To display a guide to customers, add the GuidedAssistant **widget** to the **customer portal**. Refer to Configuring the GuidedAssistant widget.

Assigning guided assistance permission to profiles

You first need to edit your **profile** to include permission to create **guides**. Staff members with appropriate profile permission can create, copy, delete, and rename guides from the Guided Assistance **explorer**.

Note Guided assistance permission is not available on the Profiles editor unless guided assistance is enabled on your site. To enable guided assistance, contact your Oracle account manager.

To assign guided assistance permission to profiles

1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management. The Profiles report displays on the content pane.

3 Right-click a profile and select Open. The Profiles editor displays on the content pane.

4 Click the Permissions button on the ribbon.

5 Click the Service tab and select the Guided Assistance – Add/Edit check box under More Options.

6 Click the Save and Close button on the ribbon.

Note Staff associated with the profile you have edited must log out of Oracle Service Cloud and log back in to apply the changes you have made.

❖ Customizing profiles

Creating guides

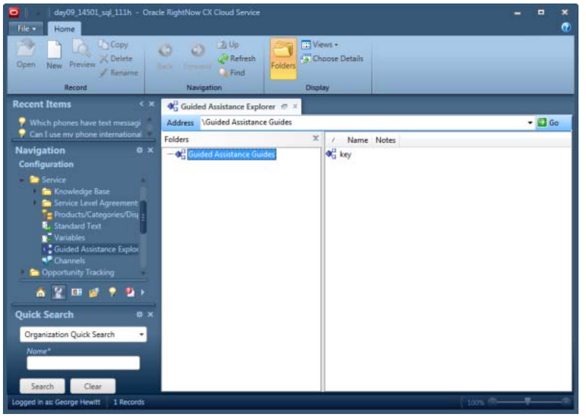
The Guided Assistance **explorer** provides all the tools you need to manage the guides you create. You can copy and delete guides and organize them in custom folders in the same way you work with items in any explorer. Refer to Explorers.

Caution If you attempt to delete a guide that is being used in another guide, a dependency warning will list each location where the guide is used and provide you with an option to cancel the deletion. If you choose to continue deleting the guide, all references to the guide will be invalidated and you will need to manually update each reference to either remove it or replace it with a valid guide.

To create or edit a guide

1 Click the Configuration button on the **navigation pane**.

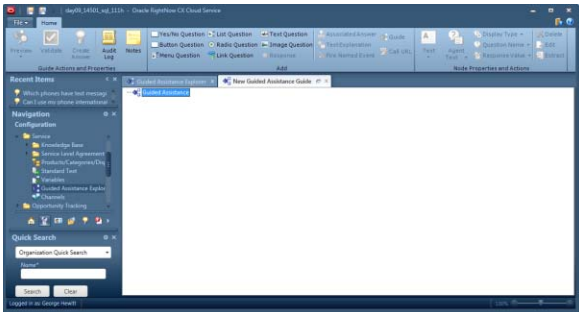
2 Double-click Guided Assistance Explorer in the **configuration list**. The Guided Assistance explorer opens on the content pane.



3 To create a new guide, click the New button on the Guided Assistance explorer's ribbon. The guided assistance designer opens.

Or

If your navigation set is configured to add guides from the application menu, click File and select Guided Assistance Guide. See To configure the file menu.



When creating a guide, you add questions to the guide, add text for the question responses, and associate answers or **text explanations** with each response. You can also insert existing guides into other guides if you have a set of common questions and answers you want to use in multiple guides.

4 To edit an existing guide, right-click the guide in the list and select Open.

The buttons on the designer's ribbon give you access to all the tools you need to preview, validate, and edit a guide. The groups and buttons on the guided assistance designer's ribbon are described in the following table.

Table 156: Guided Assistance Designer Ribbon Description

Group/Button	Description
Guide Actions and Properties	The buttons in this group let you preview the guide you create, validate the guide to ensure it is complete, create answers to add to the guide, add a note to the guide, and select a language for the guide.
Preview	Click this drop-down menu and select from the following options. **Note:** If you click on answers while testing a guide, hits will be recorded to the *clickstreams* table.
Agent Preview	Select this option to open a window displaying the guide as it will appear on the agent desktop.
Web Preview	Select this option to open a window displaying the guide as it will appear on the customer portal.
Validate	Click this button to verify that all the question branches in the guide are associated with answers or text explanations. **Note:** You can save a guide that cannot be validated, but we recommend that you correct all errors before using the guide.
Create Answer	Click this button to create a new answer associated with the guide. (That is, the guide is automatically selected in the answer's Guided Assistance field.) When staff members search for guides, a search that matches the associated answer's content will return the guide. Refer to Configuring guide searching and Adding answers.
Audit Log	Click this button to open the audit log for the guide, which shows you when the guide was created and edited, and by whom. Refer to Audit logs.
Notes	Click this button to open a text window where you can type notes for the guide. The notes can be used to explain the purpose of the guide or relay other information to agents using the guide.

Table 156: Guided Assistance Designer Ribbon Description (Continued)

Group/Button	Description
Language	Click this button to select the language to use for the guide. Only languages deployed to your site are available. **Note:** This button does not display if your site uses a single language.
Add	The buttons in this group let you add questions, responses, answers, text explanations, and other guides to the guide you are creating. **Note:** Some of the options available in this group are also available when you right-click a question or response in the guide.
Yes/No Question	Click this button to add a question with two responses. The text in the responses reads Yes and No, but you can change the text as necessary.
Button Question	Click this button to add a question with responses shown on buttons.
Menu Question	Click this button to add a question with responses shown in a drop-down menu.
List Question	Click this button to add a question with responses shown in a list.
Radio Question	Click this button to add a question with responses shown with radio buttons.
Link Question	Click this button to add a question with responses shown as links. **Note:** To add links to other websites, you must right-click a response and select Call URL. After typing the URL, double-click it to open the Edit Call URL Properties window. Next to the Parameter Pass Method field, select the Post radio button and click OK.
Text Question	Click this button to add a question with a response shown as a text box and an OK button. **Note:** All text fields are automatically marked as required on the customer portal.

Table 156: Guided Assistance Designer Ribbon Description (Continued)

Group/Button	Description
Image Question	Click this button to add a question with responses shown as clickable images. Using the Client Workflow Images explorer, you can add images to use in guides. Once you open the explorer, you can manage images the same way you do in the Images explorer. Refer to Images explorer.
Response	Click this button to add an additional response to any of the questions you have added to the guide.
Associated Answer	Click this button to open a search window to search for or select an answer to associate with the selected response. Each response can be associated with multiple answers.
Text Explanation	Click this button to add a text explanation to the selected question response. Use text explanations when you do not have an answer to associate with the response and do not want to create an answer for the purpose.
Fire Named Event	Click this button to add a named event that will fire when the response is selected. Refer to Using events in workspace and script rules.
Guide	Click this button to associate another guide with the selected response in the guide you are creating. For example, you can create a smaller guide used for a number of purposes and then add it to a larger guide with a more specific purpose.

Table 156: Guided Assistance Designer Ribbon Description (Continued)

Group/Button	Description
Call URL	Click this button to add an external URL that is called when the response is selected. You can right-click the Call URL node and select Edit to specify the URL and preview it in a browser. You can also select a parameter pass method (get or post) and view all name-value pairs that will be passed to the URL as parameters. Refer to Passing parameters through Call URL nodes. **Important:** Following a Call URL node can be unsettling to customers if they do not expect to leave the guide. To avoid confusion, you can open the URL in a separate window by editing the answer details page on the customer portal. Refer to Opening URLs in a separate window. Otherwise, be sure that the text of the question or response containing each Call URL node indicates the action that will result when the option is selected. **Note:** Call URL nodes support both absolute and relative URLs. For example, you can post the relative URL `/app/ask` to load your site's Ask a Question page.
Node Properties and Actions	The buttons in this group let you add text, images, and web pages to questions. You can also edit, delete, and export questions and all the items in the questions' branches. **Note:** Some of the options available in this group are also available when you right-click a question or response in the guide.
Text	Click this button to edit the text for the selected question or response.
Agent Text	Click this button to add explanatory text to the selected question. The agent text is displayed beneath the question and is visible only to the staff members who is using the guide.
Display Type	Click this button to change the question type for the selected question. You can change the question type to Button, Menu, List, Radio, Link, Text, or Image.
Question Name	Click this button to add a name for the question, which is used to display the question in the designer and when passing the question as a parameter name to an external URL (Call URL node).
Response Value	Click this button to set the value for the response, which is used when passing the response as a parameter value to an external URL (Call URL node).

Table 156: Guided Assistance Designer Ribbon Description (Continued)

Group/Button	Description
Delete	**Caution:** When deleting a question or response, all the images, web pages, questions, and responses beneath the item will also be deleted. Click this button to delete the selected question or response.
Edit	Click this button to open the Edit Question Properties window to change the properties of the selected question. You can also change a question's properties from the ribbon. Refer to Adding questions and responses to guides. In addition, you can select an answer associated with a question response, and then click this button to open a search window to find a different answer to associate with the response. Refer to Adding answers and text explanations to responses.
Extract	Click this button to open the Extract Guide window where you can copy the selected question branch to a new guide or to an XML file.

❖ Explorers

Adding questions and responses to guides

The questions you add to guides can be simple or complex. If you think your agents may need additional context to better understand a question, you can add a web page or an image that will appear with the question text. Refer to Adding images for use on workspaces.

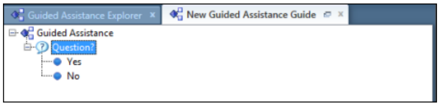
You can also save time by inserting the content from another guide into the guide you are creating. Inserting guides can save time if you have a number of common questions, responses, and answers that are used throughout a number of guides.

Tip When editing a guide, you can press **Ctrl+f** to search for specific text on the content pane. This can be helpful for locating descriptions or answer IDs referenced within a guide.

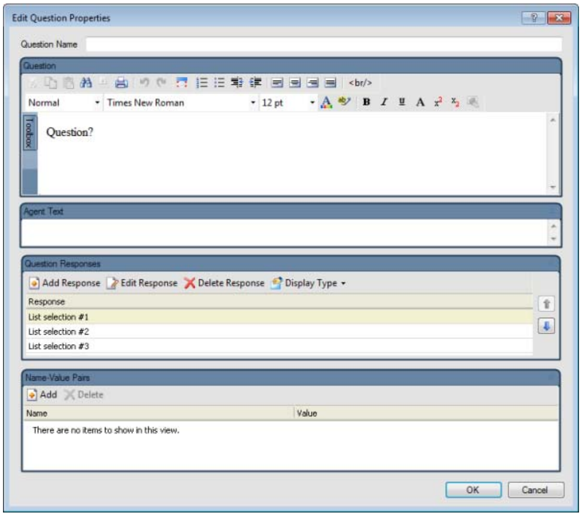
To add questions and responses to a guide

1 Select a question type button on the ribbon to add the first question to the new guide. For a description of the question types, refer to Guided Assistance Designer Ribbon Description.

Once you add a question, the designer displays the question and its responses using default text. The question is added with the default text selected for editing.



2 Double-click the text for the question. The Edit Question Properties window opens.



3 Enter the following field information.

Table 157: Edit Question Properties Window Description

Field	Description
Question Name	Type a question name to be used as the name of the parameter to be passed to a URL as defined in a Call URL node. This field is associated with the Question Name button on the ribbon.

Table 157: Edit Question Properties Window Description (Continued)

Field	Description
Question	Type the question to display in the guide. This section contains an HTML editor and toolbox to help create guides. The HTML editor and toolbox are similar to the editor and toolbox used for answers. Refer to Adding HTML answers. • When inserting an image from the toolbox, you must select a client workflow image and choose to display it either inline (in the body of the answer) or in a pop-up window. Refer to Adding images for use on workspaces and Configuring the GuidedAssistant widget. • When inserting an inline web page from the toolbox, you must specify the URL address, width, and height.
Agent Text	Type an internal note to further explain the logic in the question. This text will not display in guides and is available only to staff members. This field is associated with the Agent Text button on the ribbon.
Question Responses	Displays all question responses that are associated with the question being edited. Responses can be added, edited, and deleted. In addition, a display type can be set to change the format of the responses. This field is associated with the Response Value button on the ribbon.
Name-Value Pairs	Click this section header to display name-value pairs that are associated with the question. Name-value pairs can be added and deleted and are used in Call URL nodes to pass parameters for integration purposes. Refer to Passing parameters through Call URL nodes.

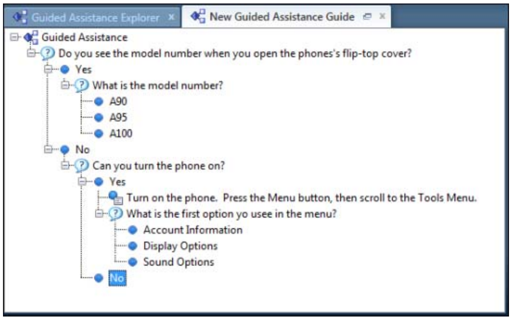
4 Click the OK button.

5 To add responses to the question, click the Response button on the ribbon. The new response is added to the question.

6 To edit a question response, double-click the response to open the Edit Response Properties window.

a Type the text and value for the response.
b Click the OK button.

7 To add another question to the guide, select one of the responses in a question you have added and click one of the question type buttons on the ribbon. The designer is updated to display the new question. When agents use the guide, they will see the new question when they choose the response the new question is branched from. An example of a designer with several questions and responses is shown in the following figure.



8 Click the Save button on the **Quick Access toolbar** to save the guide. The Save As window opens if you have not yet named the guide.

Important If there are problems with the guide (that is, if one or more questions are not associated with an answer or text explanation), a validation message will display the errors. Click the Continue button to save the guide or click the Cancel button to cancel.

If problems exist with your guide, we recommend that you fix them before making the guide available to agents.

a Type a name for the guide in the Name field.
b Click the OK button to save the guide.
❖ [Adding images for use on workspaces]

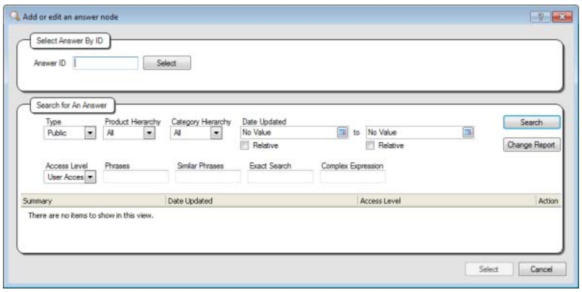
Adding answers and text explanations to responses

For a guide to be valid, all questions in the guide must be associated with responses, and all responses must be associated with other questions or with one or more public answers or **text explanations**. The following procedure explains how to associate answers and text explanations with responses.

Tip Once a guide has been saved, you can click the Create Answer button on the ribbon to create an answer to associate with your guide.

To associate answers and text explanations with question responses

1 To associate an answer with a question response, select the response and click the Associated Answer button on the ribbon. The Add or Edit an Answer Node window opens.



a If you know the ID number of the answer you want, type it in the Answer ID field and click the Select button.

b To search for an answer, enter search criteria in the fields, click the Search button, select the answer you want, and click the Select button on the bottom of the window. The window closes and the answer is associated with the response.

2 To change an answer that has been associated with a response, double-click the answer on the guided assistance designer. The Add or Edit an Answer Node window opens.

a Select a different answer and click the Select button.

The answer in the guide is replaced with the new answer.

Note When you edit a guide, you can view the answers associated with responses by right-clicking an answer and selecting View Answer.

3 To associate a text explanation with a question response, select the response and click the Text Explanation button on the ribbon.

   a Type the text you want for the explanation and press **Enter**. The explanation displays beneath the response.

4 To change the text for an explanation already added to the guide, select the explanation, click the Text button on the ribbon, and type the text you want.

   Or

   Double-click the explanation and type the text you want.

   If the text explanation exceeds 200 characters, the Edit Node Text window opens when you double-click the text explanation.

   a Type the text you want and click the OK button to save the change and close the window.

5 Click the Validate button on the ribbon to verify that each question response is associated with a public answer or a text explanation. A message opens stating that the guide successfully validated or that it contains errors.

   a Click the OK button to close the window.

Important Validation also occurs automatically when saving a guide. If validation errors occur when saving, you can click the Continue button on the Validation Results window to save without first correcting the errors. However, the guide will not function properly until all validation errors have been corrected. If problems exist with your guide, it is important to fix them before making the guide available to agents or customers.

6 Click the Save and Close button on the Quick Access toolbar to save and close the guide.

Passing parameters through Call URL nodes

A Call URL node is used to link a guide response to an absolute or relative URL. For instance, a customer-facing guide could lead customers to a solution that requires the involvement of support agents. In this case, you could add a Call URL node to route customers from the guide to your site's Ask a Question page. This can be done by entering the relative URL `/app/ask` in the Call URL properties.

Important Following a Call URL node can be unsettling to customers if they do not expect to leave the guide. To avoid confusion, be sure that the text of the question or response preceding each Call URL node indicates the action that will result when the option is selected.

You can also pass parameters through the Call URL function by defining name-value pairs in the question or response properties. For example, when linking to the Ask a Question page, you can pass parameters to automatically set values for fields such as Product, Category, or a custom field. To accomplish this, you must first update the question name to indicate the name of the parameter you want to set. You can then edit the response properties to set the value you want.

Alternately, you can add name-value pairs to question properties to declare a static parameter. Static parameters are parameters that are carried through a guide's remaining branches and are passed through any Call URL function that exists in the question's subhierarchy.

To test Call URL functions and parameters, click the Preview button and select an option for previewing your guide.

Note The following procedures assume you have created a guide containing a question and a response with a Call URL node. Refer to Creating guides.

To pass a parameter using response properties

1 From the open guide, right-click the question containing the response and Call URL node, and select Edit. The Edit Question Properties window opens.

2 In the Question Name field, type the name of the parameter you want to pass.

Note If passing a parameter to an Oracle Service Cloud field, such as a field on the Ask a Question page, use the format *table.fieldname*. For example, to pass a parameter to the Products field, type `incidents.prod`. Custom fields are indicated in the format *table.c$fieldname*, such as `incidents.c$priority`.

3 In the Question Responses section, select the response containing the Call URL node and click the Edit Response button. The Edit Response Properties window opens.

4 In the Response Value field, type the parameter value you want to pass.

Note If passing a parameter to an Oracle Service Cloud field, be sure to use a value consistent with the field's purpose and type. For example, to set a Yes/No field, use a response value of 1 for Yes and 0 for No. To pass a value to the Products field, you would type a number or number sequence corresponding to the product ID. Refer to Finding product ID numbers.

5 Click the OK button.

6 Click the OK button to close the Edit Question Properties window.

7 Right-click the Call URL node and select Edit. The Edit Call URL Properties window displays the URL, parameter pass method, and all name-value pairs that will be passed as parameters.

8 Select a parameter pass method from the Parameter Pass Method field. Available options include Get and Post.

Note The Post method must be used when passing parameters to set fields on a page, such as when setting the Product field on the Ask a Question page.

9 Click the OK button.

10 Click the Save and Close button to save your changes.

To pass a static parameter using question properties

1 From the open guide, right-click the question you want to declare the static parameter for and select Edit. The Edit Question Properties window opens.

2 Expand the Name-Value Pairs section and click the Add button.

3 Type the name of the parameter in the Name field.

Note If passing a parameter to an Oracle Service Cloud field, such as a field on the Ask a Question page, use the format *table.fieldname*. For example, to pass a parameter to the Products field, type `incidents.prod`. Custom fields are indicated in the format *table.c$fieldname*, such as `incidents.c$priority`.

4 In the Value field, type the parameter value you want to pass.

Note If passing a parameter to an Oracle Service Cloud field, be sure to use a value consistent with the field's purpose and type. For example, to set a Yes/No field, use a response value of 1 for Yes and 0 for No. To pass a value to the Products field, you would type a number or number sequence corresponding to the product ID. Refer to Finding product ID numbers.

5 Click the OK button to close the Edit Question Properties window.

6 Right-click the Call URL node and select Edit. The Edit Call URL Properties window displays the URL, parameter pass method, and all name-value pairs that will be passed as parameters.

7 Select a parameter pass method from the Parameter Pass Method field. Available options include Get and Post.

Note The Post method must be used when passing parameters to set fields on a page, such as when setting the Product field on the Ask a Question page.

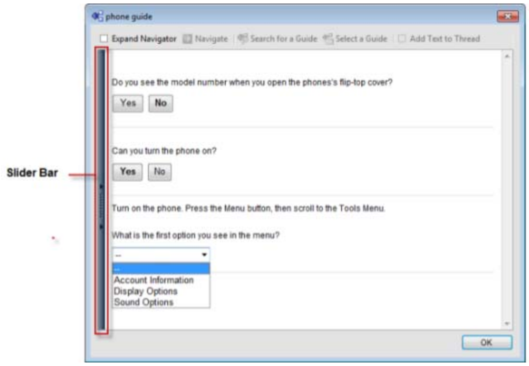
8 Click the OK button.

9 Click the Save and Close button to save your changes.

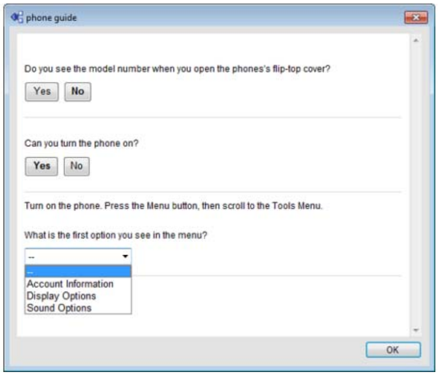
Previewing guides

You can preview a guide to confirm that it appears and functions as you want it to. The Preview button on the ribbon provides two options for previewing guides.

Agent Preview—This option opens the guide in a separate window and shows you the guide exactly as your agents will see it, including the slider bar you can expand to view the navigator. The following figure shows an example of the Agent Preview feature.



Web Preview—This option opens the guide in a separate window and shows you the guide as your customers will see it. The following figure shows an example of the Web Preview feature.



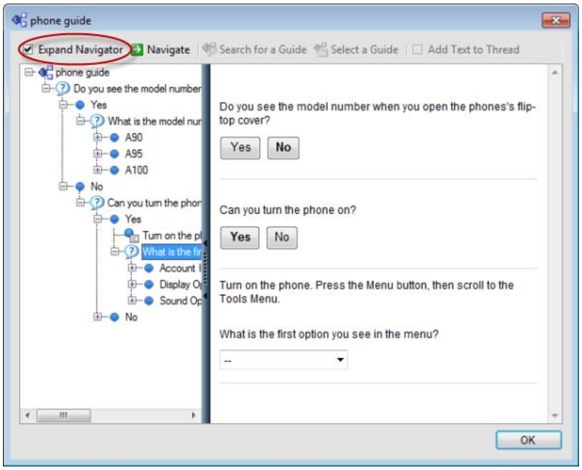
Note The Web Preview feature does not include the toolbar that is available on the Agent Preview feature. To configure display options for guides that are included in answers, refer to [Configuring the GuidedAssistant widget](#)

To use Agent Preview

1 When viewing a guide, click the Preview button on the ribbon and select Agent Preview. A window opens, showing only the first question in the guide.

2 To view the guide's contents, respond to the first question just as you would if you were an agent using the guide. Additional questions, responses, answers, and **text explanations** display as you navigate the guide's branches.

3 To view the guide's branches, select the Expand Navigator check box at the top of the window. A panel on the left side of the window displays the guide's contents.



4 To quickly view the content under a question or response, select the question or response on the left side of the window and click the Navigate button at the top of the window. The content of the question or response displays on the right.

5 Click the OK button to close the window.

To use Web Preview

1 When viewing a guide, click the Preview button on the ribbon and select Web Preview. A window opens, showing only the first question in the guide.

2 To view the guide's contents, respond to the first question just as you would if you were a customer using the guide. Additional questions, responses, answers, and text explanations display as you navigate the guide's branches.

3 Click the OK button to close the window.

Adding guided assistance to workspaces

Before your agents can use guides, you must add the Guided Assistance **relationship item** to a custom incident or chat **workspace**. Refer to Relationship items.

Once added, the Guided Assistance relationship item functions as a container for displaying guides to your staff on the agent desktop. Guides can be displayed manually, based on a guide search or selection performed by an agent. Refer to Configuring guide searching. They can also be loaded dynamically, based on a **workspace** or **script rule**. For example, you can design a workspace rule to display a guide automatically when the editor loads based on the incident's category, or you can load a different guide when an agent selects a certain incident disposition. Refer to Using guided assistance in workspace and script rules.

Note A separate Guided Assistance field can be added to answer workspaces and scripts. This field allows you to associate answers directly to guides for search-matching purposes. Refer to Associating answers to guides.

Guides can also be embedded in answers so customers can use them on the **customer portal**. Refer to Adding answer details and Configuring the GuidedAssistant widget.

- ❖ Creating custom workspaces
- ❖ Overview of workspace rules

Configuring guide searching

You can provide your agents with the ability to manually select and display guides on the Guided Assistance **relationship item**. When these options are enabled, agents can use a set of buttons at the top of the control to search for and select a guide appropriate for their needs. Refer to Finding answers using guided assistance.

Important When providing the guide search feature to your agents, you must ensure that each guide is appropriately associated to one or more answers. Refer to Associating answers to guides.

Several design options are available for the guide searching feature. By default, the Guided Assistance Search report is used when performing searches, but you can select a different search report to use instead. Also, as an alternative to displaying the default Search for a Guide and Select a Guide buttons, you can display the guide search fields inline at the top of the control. You can also choose to hide the left navigation page if you want to restrict agents from jumping freely to different sections of the guide.

In addition, when the Guided Assistance relationship item is added to incident workspaces, the Guided Assistance button is automatically displayed on the ribbon. By default, this button provides both select and search options for locating guides. However, you can edit the Guided Assistance button to show or hide either option. Or, if you do not want the Guided Assistance button to display at all, you can remove it. Refer to Customizing ribbons and Quick Access toolbars.

To edit guide searching options

1 From the Workspaces explorer, right-click the workspace containing the guide you want to edit and select Open.

2 Select the Guided Assistance relationship item on the workspace and click the Design tab.

3 Edit the following properties on the Options button group. Refer to Editing design item properties.

Table 158: Design Options for the Guided Assistance Relationship Item

Option	Description
Search Report	Click this button to select the report you want to use when searching for guides from a workspace. The report is displayed when you click the Search for a Guide button on the workspace's guided assistance panel or you click the Guided Assistance button on the incident workspace's ribbon and select Search. The report is also shown on the incident workspace's guided assistance panel when the Show Search Inline option is enabled on the incident workspace. **Note:** By default, the standard Guided Assistance Search report is used to search for guides. We recommend that you do not change the default report unless you require a custom report with different fields.

Table 158: Design Options for the Guided Assistance Relationship Item

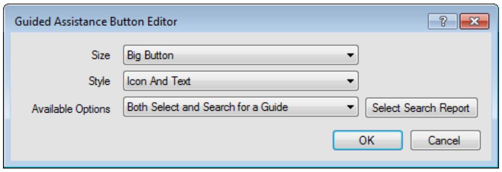
Option	Description
Show Search Inline	Selecting this option displays search fields on the workspace's guided assistance panel you can use to search for a guide. The fields that are displayed come from the search report you select for finding guides. **Note:** Selecting this option prevents the Search for a Guide and Select a Guide buttons from displaying on the workspace's guided assistance panel, though these can still be accessed from the Guided Assistance button on the incident workspace's ribbon.
Show Search Button	This option adds the Search for a Guide button on the workspace's guided assistance panel. Clicking this button on a workspace opens the Search for a Guide window where you can enter search criteria to find the guide you want. **Note:** If this check box is not selected on the workspace designer, the Search for a Guide window can still be opened from the Guided Assistance button on the incident workspace's ribbon.
Show Select Button	This option adds the Select a Guide button to the workspace's guided assistance panel. Clicking this button opens the Select a Guide window where you can select the guide you want from a list of available guides. Refer to Configuring guide searching. **Note:** If this option is disabled, the Select a Guide window can still be opened from the Guided Assistance button on the incident workspace's ribbon.
Show Navigation	This option adds the Expand Navigator check box and slider bar to the workspace's guided assistance panel. Clicking this button on a workspace allows you to view all the branches in the guide simultaneously. Refer to Previewing guides.

To edit the Guided Assistance button

1 From the open incident workspace, click the Home tab and click the Ribbon button.

2 Select the Guided Assistance button.

3 Click the Edit Button button on the ribbon editor. The Guided Assistance Button Editor opens.



4 Select the size and style options you want for the button.

5 Click the Available Options drop-down menu and select the option you want to display on the button.

- **a** Choose Select a Guide if you want only the Select option on the button. This option opens a window listing all the guides configured on your site that your agents can select from.
- **b** Choose Search for a Guide if you want only the Search option on the button. This option opens the Search for a Guide window where agents can search for the guide they want using the content from answers associated with the guide.
- **c** Choose Both Select and Search for a Guide to show both options on the button.

6 To change the search report you want to display when the Search option is selected, click the Select Search Report button to open the Select Report window.

- **a** Select the report you want agents to use to search for guides.
- **b** Click the OK button to close the window.

Note By default, the standard Guided Assistance Search report is used to search for guides. We recommend that you use this report unless you require different search options.

7 Click the OK button to save the changes to the Guided Assistance button.

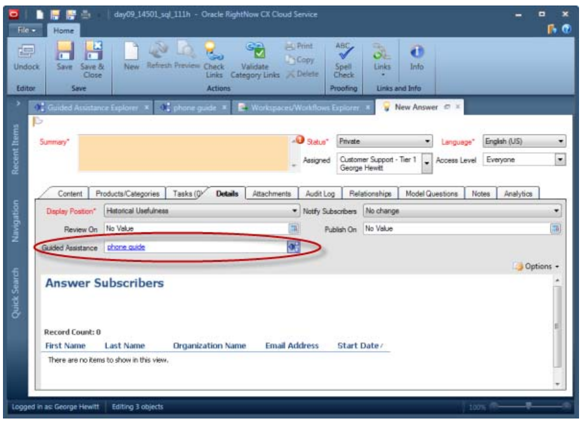
- ❖ Editing design item properties
- ❖ Customizing ribbons and Quick Access toolbars

Associating answers to guides

In order for your agents to search for guides effectively, you must understand how guide searching works and manage your content accordingly. Because guide content (such as question text) is highly contextual and not wholly descriptive of a topic, it is *not* indexed for searching. However, answers associated with each guide are very relevant to searching, so the content of those answers *is* indexed. For this reason, when a search is performed, the results are based on the content of associated answers, not on the content of the guides themselves. For example, searching for the product Phones will return guides that are associated with answers set to that product.

Therefore, in order for a guide to be searchable, you must associate it to an answer. And so that it can be searched for intuitively, the answer's content must be relevant to the topic addressed by the guide. There are two ways to associate an answer to a guide.

- **Associate the answer to a guide response**—When editing the Guided Assistance relationship item on a workspace, you can select a response on the guide and use the Associated Answer button to associate an answer to it. This creates a natural association because, in this case, the answer is part of a solution path defined by the guide. Refer to Adding answers and text explanations to responses.
- **Select a guide from the answer's Guided Assistance field**—Sometimes, a guide may not contain any responses that link to answers from the knowledge base. For example, a guide's responses could be associated only with **text explanations**. In this case, to make the guide searchable, you must associate it with an answer using the Guided Assistance field in the answer editor. On the default answer workspace, the Guided Assistance field is located on the Details tab, as shown in the following figure. (For custom workspaces, you can add the *answers.guided assistance* field from the Insert Field ribbon tab on the workspace editor.) Here, the answer is associated with a guide named Service Plan Assistance, and the guide will be returned in guide searches when the search criteria matches the answer's contents.



You do not need to associate the answer with a guide if the answer is already associated with a response in the guide. For procedures detailing how to add fields, controls, and relationship items to workspaces, and how to create workspace rules, refer to Workspaces.

Tip To help you identify guides that will be impacted by changes to guides or the removal of associated content, the Guide Dependency report lists answers and other guides that have been linked to by each guide. The Guide Dependency report can be accessed at Public Reports > Service > Guided Assistance. Refer to Reports explorer.

To associate an answer with a guide

1 With the answer open, navigate to the tab or other location where the Guided Assistance field is displayed. In the default answer workspace, this field is located on the Details tab.

2 Click the Select Guide button to the right of the field to open the Select a Guide window.

3 Select the guide you want to associate the answer with.

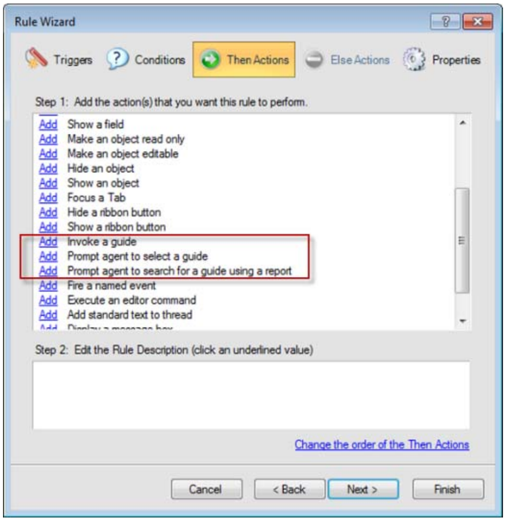
4 Click the OK button to close the Select a Guide window.

5 Click the Save and Close button on the ribbon to save the answer.

❖ Adding answer details

Using guided assistance in workspace and script rules

Guided assistance functions are available as triggers and actions when configuring rules for incident and chat workspaces. For example, you can design a rule on an incident workspace that will open a guide based on the incident's product or category. Refer to Workspace rules.



Although the Guided Assistance control is not available for scripts, incident scripts that share a workspace with a Guided Assistance control can also access these functions. For instance, in a workspace that contains both an incident script and Guided Assistance control, you can create a script rule that is triggered when the guide is completed. Refer to Script rules.

You can select the following Guided Assistance operations in supported rule types.

Table 159: Guided Assistance Functions in Workspace and Script Rules

Trigger/Action	Description
The guide finished	Select this trigger to invoke a rule when a staff member completes a guide in the workspace.
Invoke a guide	Select this action to choose a specific guide to open. When this operation is selected, you choose the guide you want from the Add Action window's Value field.
Prompt agent to select a guide	Select this action to display a list of guides to agents. Agents can then choose the guide they want to use.

Table 159: Guided Assistance Functions in Workspace and Script Rules (Continued)

Trigger/Action	Description
Prompt agent to search for a guide using a report	Select this action to display a search window where agents can search for a specific guide. **Note:** By default, the standard Guided Assistance Search report is used. If you want to select a different report, click the Select Search Report button on the window's Value field when this operation is selected.

Note Guided assistance options are also available when configuring workflow connector events leading from incident elements. Refer to Defining connector events and conditions.

- Workspace rules
- Script rules
- Defining connector events and conditions

Exporting and importing guides

Once you create a **guide**, you can export it to a guide definition file and import it into other Oracle Service Cloud interfaces to create a new guide. This allows you to create a single guide for use in several interfaces.

You can also extract a subset of the guide's questions and responses to either create a new guide or save to a guide definition file that you can then import into another site. This function also includes an option to replace the extracted branch with an embedded reference to the new guide, which can be useful for simplifying the configuration of a complex guide.

To export an entire guide

1. On the Guided Assistance explorer, right-click the guide you want to export and select Open. The guide opens on the content pane.
2. Click File and select Export Definition from the menu. The Save As window opens.
3. Select the directory where you want to save the guide definition file and type the file name.
4. Click the Save button to save the guide definition file.

To export part of a guide

1 On the Guided Assistance explorer, right-click the guide you want to extract from and select Open. The guide opens on the content pane.

2 Right-click the question at the top of the section you want to extract and select Extract. The Extract Guide window opens. By default, the selected part of the guide will be saved in the Guided Assistance explorer as a new guide.

  a Type a name for the new guide.
  b To replace the selected part of the open guide with an embedded reference to the new guide, select the Replace check box.

3 To export the selected section as a guide definition file, select the Export to File radio button.

  a Click the Browse button and select the location where you want to save the file.
  b Type a name for the new guide.
  c Click the Save button.

4 Click the Extract button. All responses, answers, and **text explanations** that are part of the extracted question's branch will be included in the extracted guide.

To import a guide definition file

1 From an open guide on the designer, click File and select Import Definition from the menu. A message appears indicating that the import process will overwrite the current open guide.

2 Click the Yes button to allow the import to overwrite the current open guide.

Note Guide definition files include a hash value that is used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing, and an error message notifies you that the file is invalid.

3 Select the guide definition file containing the guide you want to import and click the Open button. The imported guide displays on the content pane.

4 If the guide was exported from a different Oracle Service Cloud site, verify that the answers associated with question responses are correct and choose different answers if necessary.

5 Click the Save and Close button on the Quick Access toolbar to save the guide. The Save As window opens if you have not yet named the guide.

a Type a name for the guide.

b Click the OK button to save the guide.

28

Agent Scripts

Agent scripts in Oracle Service Cloud add powerful functionality to **workspaces** and **workflows**, leading staff members through a series of pages to help them enter information in a logical progression. Script pages can contain most fields and controls available to workspaces, with the exception of **relationship items**. They can also include questions and branching logic, similar to **guides**, so you can create wizards to guide staff members to different pages based on the information entered or actions taken on a previous page. Combining branching logic with page layout capabilities, agent scripting provides your staff with a methodical, efficient interface for capturing information and resolving issues.

For example, you could create a script to help your agents identify new customers and prompt for contact information before entering incident information. The script could also include questions to determine what product the customer is calling about and branching logic to guide agents to a page containing troubleshooting information and database fields for capturing information pertinent to that product.

To further extend the efficiency provided by scripts, you can add script rules. Like workspace rules, script rules are triggered by events and conditions to perform actions on script pages, such as setting the value of a field or calling a named event.

Once you create a script, it can be inserted into one or more workspaces using the Script workspace control (see Working with script controls) or presented as a standalone component of a desktop workflow using the Script workflow element (see Editing Script attributes).

Many functions used to design scripts are also used to design workspaces. To understand how agent scripts can best be implemented in your agent desktop, you should also become familiar with workspaces, **workspace rules**, guides, and workflows. For a summary of these features, refer to Desktop Overview.

Assigning scripts permission in profiles

Before you can create or access agent scripts, you first need to update your profile to include scripting permission. Staff members with scripting permission included in their profile can create, copy, and delete scripts from the Scripts explorer, as well as add them to workspaces and workflows.

Note Scripting permission is not available on the Profiles editor unless agent scripting is enabled on your site. To enable agent scripting, contact your Oracle account manager.

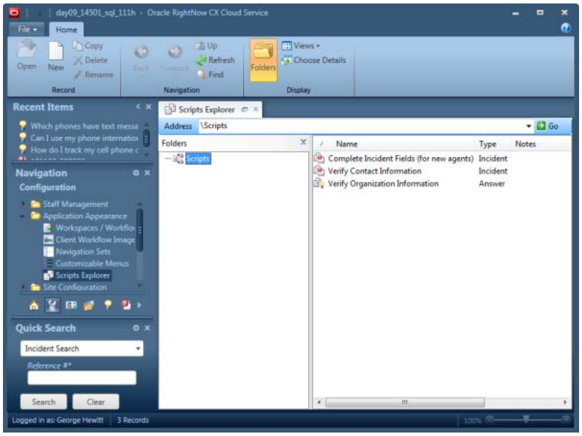
To assign scripts permission in profiles

1. Click the Configuration button on the navigation pane.
2. Double-click Profiles under Staff Management. The report opens on the content pane.
3. Right-click the profile you want to add scripts permission to and select Open. The Profiles editor opens.
4. Click the Permissions button on the ribbon.
5. Select the Scripting check box on the Administration tab.
6. Click the Save and Close button on the ribbon to save the changes to your profile.

Note Staff associated with the profile you have edited must log out of Oracle Service Cloud and log back in to apply the changes you have made.

Scripts explorer

The Scripts explorer is used to access and manage all of the agent scripts on your site. With this explorer, you can browse, search, and organize scripts in hierarchical folders on the content pane using functions similar to Windows Explorer (see Explorers).



Note Oracle Service Cloud does not include a set of standard scripts because all scripts are designed with unique content to meet specific business needs.

The explorer displays the tree structure on the left and lists scripts and custom folders on the right. Listed next to each script's name is its script type, based on the type of **record** it is used to update. The script type determines which fields and controls can be added to the script. For example, the Incident script type provides access to controls and database fields that are related to incidents. Refer to Script types.

You can create custom folders to help you organize the scripts you create by right-clicking the Scripts item in the Folders tree and selecting New Folder. Simply click a folder to display a list of the scripts it contains.

To open the Scripts explorer

1 Click the Configuration button on the navigation pane.

2 Double-click Scripts Explorer under Application Appearance. The Scripts explorer opens.

Note You can also add the Scripts explorer to any of your **navigation lists** if your profile allows. Refer to Customizing navigation and configuration lists.

Script types

Each agent script is associated with a script type, named for the type of record it updates, that determines which fields and controls can be added to the script. Oracle Service Cloud provides the following standard script types.

- Answer
- Asset
- Chat
- Contact
- Incident
- Opportunity
- Organization
- Task

In addition, you can create scripts for custom objects that have Object is Available in Workspaces, Scripting, and Workflow field visibility. Refer to Creating custom objects.

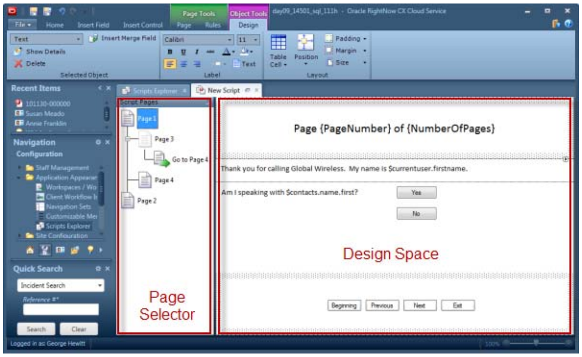
When you create a script, you need to select the type of script you want to ensure the appropriate fields are available for use in the script and that the script's type matches the type of workspace you want to add the script to. For example, when creating a script to use on an incident workspace, you would select an incident script type, giving you access to controls and database fields that are related to incidents.

The script types available to you depend on the products that are enabled in your application. For instance, Oracle RightNow Opportunity Tracking Cloud Service must be enabled in order for the opportunity script type to be available, and Oracle RightNow Chat Cloud Service must be enabled for the chat script type to be available.

Note If you plan to add your script to a workspace, the script type must match the workspace type. However, there are fewer script types than workspace types because scripts are not available for use in quote, quote product, or multi-edit workspaces. Refer to Standard workspaces.

Creating and editing scripts

Scripts are created on a script designer consisting of a design space, a ribbon, and a page selector. You define a script by dragging and dropping fields and **controls** from the ribbon onto the design space and arranging them as you want them to appear on the script page.



The design space is the working area where you arrange fields and controls as you want them to appear on the script page. When you create a new script page, the design space consists of three areas—a header and a footer shared by all pages, and a main area for content specific to the page. You can add fields and controls to any of these areas.

Each area contains a table, hidden by default, that forms an underlying grid for aligning fields and controls. To aid you in laying out the script page, you can display outlines around items on the design space to help you identify the table cells they are in. Refer to Design space layout options.

Once a field or control has been added to a page, you can select it to adjust its properties on the designer ribbon. The script designer ribbon functions are organized by the tabs described in the following table.

Table 160: Script Designer Ribbon Description

Tab	Description
Home	Contains buttons for managing the entire script. You can preview the script, add pages and branches, configure the ribbon for scripts added to workflows, add notes, view the **audit log**, add an outline around the script, and show or hide the page selector. The tab's Insert group also includes shortcuts to the controls you can add from the Insert Control tab.
Insert Field	Lists the fields you can add to the script. The type of script you select when creating a script determines the fields available. For example, you can add incident, asset, contact, and organization fields when creating an incident script. Refer to Adding fields to workspaces and scripts.

Table 160: Script Designer Ribbon Description (Continued)

Tab	Description
Insert Control	Lists controls and questions you can add to the script. Controls include spacers, tabs, title bars, and other items you can use to enhance the display or add functionality. Refer to Working with controls. Questions controls are used to configure script branching. Refer to Adding branches to scripts. **Note:** The values staff members enter in questions and their corresponding controls are available for use with the script's rules and branches, but they are not saved to the record in the database.
Page	Contains buttons for adding, editing, deleting, and ordering pages and branches. This tab also includes buttons to display or hide the header and footer on pages. Refer to Adding branches to scripts and Placing headers and footers in scripts.
Rules	Using the buttons on this tab, you can create rules that alter the script according to the conditions you define. For example, you can create a rule to assign an incident to a specific staff member when the incident is submitted by a particular organization. Refer to Script rules.
Design	This tab displays when you select an item added to a script and contains buttons you can use to edit the display of the selected item. For example, you can change fonts and margins for a field or set a field on the script to read-only if you want to display it only for informational purposes. The options available on the Design tab vary depending on the control or field selected on the script design space. For descriptions of all the options available on the Design tab, refer to Design property descriptions.

In addition to editing field and control properties on the designer ribbon, you can also right-click an item on the design space to access contextual menu options. The available options vary based on the item you right-click but generally include such actions as branching to a page, resetting tab indexes, or deleting the item.

Once a page is complete, you can use the page selector to add more branches and pages to your script (refer to Adding branches to scripts). The page selector displays a tree view of the pages and branches of the script, showing their relationship to one another. You can click a page or branch to view it on the design space or right-click to access a menu from which you can quickly add, edit, delete, or rename pages and branches. You can also use the arrow keys on your keyboard to navigate between pages, or delete a page by pressing **Delete**. Script pages that are inaccessible due to a removed branch or other reason are also indicated on the page selector.

Tip To hide the page selector, click the Home tab, click the Page Selector button, and select Show Selector to toggle it on or off. You can also select Use Large Icons on the Show Selector button to toggle between using large and small icons on the page selector.

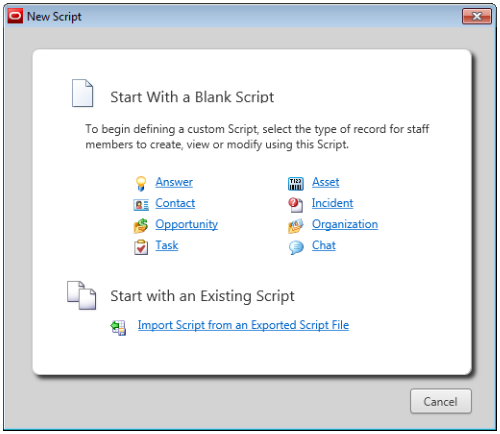
Creating agent scripts

You can create scripts from scratch by starting with a blank script. You can also copy an existing script or import a script from an exported script file to use as the basis for a new script. You can then adjust the design by adding and removing fields and controls, setting properties, and arranging the layout to suit your business needs (refer to Editing agent scripts).

Note The following procedures describe how to create, copy, and delete scripts. To import a script from an exported script file, refer to Exporting and importing scripts.

To create a script

1 From the Scripts explorer, click the New button on the ribbon. A window opens where you can select the type of script you want to create.



2 In the Start With a Blank Script section, select a script type (refer to Script types). The script designer opens.

3 Click the Save button on the Quick Access toolbar to save the script.

To copy a script

1 From the Scripts explorer, right-click the script you want to copy and select Copy. The Copy Script As window opens.

2 Select the folder to which you want to add the copied script.

3 Type a name for the copied script in the Name field.

4 Click the OK button. The script you added appears in the folder you selected.

To delete a script

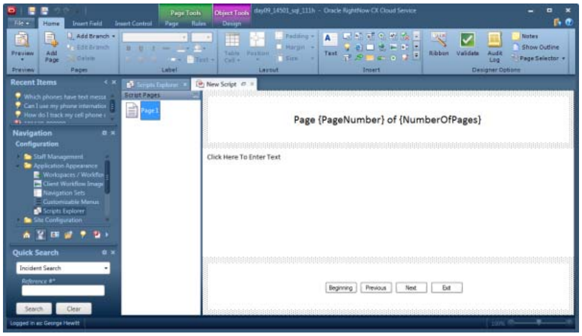
1 From the Scripts explorer, right-click the script you want to delete and select Delete. A Confirm Script Deletion message appears.

2 Click the Yes button to delete the script.

Important If you delete a script that is used in a **workspace**, the workspace will still include the Script control. You will need to edit the workspace to remove the control or select a new script for the control. Refer to Working with script controls.

Editing agent scripts

Whether you are editing a blank script or an imported script, the features you use on the script designer are the same. When creating a new script, the script designer opens with a page already added, as shown in the following figure, that contains a header, footer, and text control.



You use the options available on the ribbon's tabs to remove or edit this default content, and add fields, controls, and other pages to the script. If your script is to be used in a workflow, you can also customize the script's ribbon.

Note The fields and controls available for a script will vary depending on the type of script you are creating. For example, a contact script will provide access only to contact and organization fields.

The following procedure provides an overview of the steps needed to edit a blank incident script, though the same procedures can be used for other script types. Cross-references to more detailed editing procedures are provided in the appropriate step.

To edit a script

1. Click the Configuration button on the navigation pane.
2. Double-click Scripts Explorer under Application Appearance. The Scripts explorer opens on the content pane.

3 Right-click the script you want to edit and select Open. The script opens on the content pane.

4 Drag the fields you want from the Insert Field tab onto the design space. Refer to Working with fields.

5 Drag the controls and questions you want from the Insert Control tab onto the design space. Refer to Working with controls.

Note You can also drag controls onto the design space using the icons on the Home tab's Insert group.

6 To modify the properties of a field or control, select the item, click the Design tab, and make the appropriate changes. Refer to Field and control properties.

7 To add script rules that alter the display, content, or behavior of items on the page, click the Rules tab and then click the Add Rule button. Refer to Script rules.

8 To add a new page to the script, select the existing page on the page selector that you want the new page placed after.

a Click the Home tab and click the Add Page button. The new page is added to the script and displayed on the page selector.

9 To add a branch to the script, select the page you want to add the branch to on the page selector and create the branch by right-clicking a field or control or by using the Add Branch window. Refer to Adding branches to scripts.

10 To reposition a page in the script, drag it to the position you want on the page selector.

When you move a page, the page and all pages that branch off it are moved to the location you specify. When reordering pages, you can move a page that branches off one page to branch off a different page, or remove branching from the page completely.

Important Once a page has been moved, logic used in the branches linking the page to other pages may no longer be valid. We recommend validating the script after moving pages to ensure the script's pages can all be reached.

11 To rename a page, select the page, click the Page tab, type the name you want in the ribbon's Name field, and press **Enter**.

12 To add or remove the header and footer from script pages, click the Page tab, click the Header or Footer button, and select the option you want. Refer to Placing headers and footers in scripts.

13 To customize the ribbon for a script that is used in a workflow, click the Ribbon button on the Home tab. Refer to Customizing ribbons and Quick Access toolbars.

Note Because ribbons are not displayed on scripts when they are added to workspaces, the Ribbon button is available for scripts only if workflows are enabled on the site. For information about enabling workflows, contact your Oracle account manager.

14 To view a history of all actions taken on the script, such as when the script was created and edited and by whom, click the Audit Log button on the Home tab.

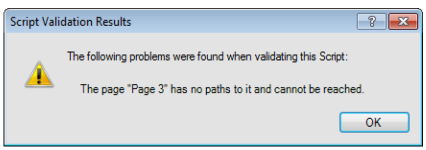
15 To add notes about the script, click the Home tab and then click the Notes button to open the Script Notes window.

a Type any notes you want in the text field.
b Click the OK button.

Note Notes added to your script are for internal use and only visible when editing the script. They do not appear when working with records.

16 To see what your script will look like when it is used by staff members, click the Home tab and click the Preview button. You can choose to see the script as it will display when creating a record or when editing an existing record. Refer to Previewing scripts.

17 To confirm that the script's pages are all accessible from a branch or a navigation button, click the Home tab and click the Validate button. The Script Validation Results window will list any inaccessible pages, as shown in the following figure.



a Click the OK button to close the window.

Note Validation is also performed automatically when you save a script. If errors are found, the Script Validation Results window will include a Cancel button, so you can correct the error before saving, and a Continue button you can click to save the script as it is. You can save and use a script that does not validate. However, until all errors are corrected, some pages or functions may be inaccessible to staff members when they use the script.

18 Click the Save and Close button on the Quick Access toolbar to save and close the script.

Note If you save changes to a script that staff members might be using at the moment, it is a good idea to have them log out and then log back in to be sure your changes have been applied.

Removing items from scripts

You can easily remove fields, controls, branches, rules, and entire pages from your script. However, it is important to be aware of the following considerations before you remove items.

- If your script has only one page, you cannot remove it.
- When you remove a table on a page, the fields and controls on the table are also removed.
- When you remove a page, all fields and controls on the page are removed along with branches and rules created from the page.
- When you remove a page with other pages branching off it, those pages are also removed.
- When you remove an item used by a rule or branch, the rule or branch will likely be impacted, and you will need to edit or delete it.
- When you remove a branch used to access a page, the page is not removed. However, this can result in an orphaned page if the deleted branch provided the only path to the page.

Important Pages that cannot be accessed by a branch or navigation button are grayed out on the page selector. When you validate the script, these pages are listed in the validation message.

To remove an item from a script

1 From your open script, select the item you want to remove on the design space.

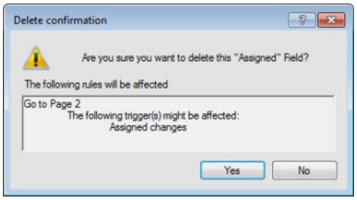
Or

Click the Design tab and select the item you want to remove from the drop-down menu on the Selected Object group.

Tip Selecting the item you want to remove from the drop-down menu helps to ensure that you select the correct item before you delete it. For example, you can be certain you select a specific field on a table rather than the entire table. Refer to Selecting fields and controls using the ribbon.

a Click the Delete button on the Design tab. The Delete Confirmation window opens, asking if you want to delete the item.

If the item you are deleting is used in rules or branches, a warning will list the affected rules and branches.



b Click the Yes button to delete the item.

2 To delete a page or branch, select the item on the page selector and click the Home tab.

a Click the Delete button. The Delete Confirmation window opens, asking if you want to delete the item.

b Click the Yes button to delete the item.

Placing headers and footers in scripts

Headers and footers can contain any of the fields or controls you can add to script pages. Unlike the content you add to other areas of a page, which is displayed only on that page, the content you add to the header and footer is shown on every page where the header and footer is displayed. For example, if you want to display contact information at the top of every page of the script, you could add the first name, last name, and phone numbers contact fields to the script header, and then display the header on all pages of the script.

By default, the header that is shown on the initial script page contains the progress label control, which shows staff members what page of the script they are on. The default footer contains the navigation panel control, which adds buttons staff members can use to move between script pages. Refer to Working with the navigation panel control.

The following procedure describes how to place the header on script pages. You use a similar procedure when placing the footer on script pages.

To place the header on script pages

1 From your open script, click the Page tab.

2 To show the header only on the selected page, click the Header button and select Show Header On This Page. The header is added to the page on the design space.

3 To show the header on all pages in the script, click the Header button and select Show Header On All Pages.

4 To remove the header, click the Header button and select Don't Show Header On Any Pages. The header is removed from all pages in your script, along with any fields or controls you added to the header.

5 To add content to the header or footer, click the ribbon's Insert Field or Insert Control tab and drag the items you want to the design space.

Working with the navigation panel control

The navigation panel contains four buttons that let you navigate between pages in the script even if there are no branches to the pages. Some of the buttons can be used in the When condition in branches and script rules, so you can create your own functionality for these buttons.

Since these buttons are available in a single control, you can quickly add the buttons to any page you want. The page footer contains this control by default. The following buttons are included in the control.

- **Beginning**—Click this button to return to the first page of the script.
- **Previous**—Click this button to return to the previous page in the script.
- **Next**—Click this button to proceed to the next page in the script. By default, this is the next page that is on the same tree level, shown on the page selector, as the current page. However, a branch can be created to load a different page when this button is clicked.

- **Exit/Finish**—Click this button to trigger any rules or branches that include the Exit Script Event Fires or Finish Script Event Fires triggers. When you are on the last page of a script, the Exit button is renamed Finish. This button is not enabled unless a rule or branch is configured to use one of these conditions.

Adding branches to scripts

Scripts use branching logic for guiding agents to specific pages based on conditions you specify. For example, you could design a script to branch to a certain page if the Organization Name field is set to a specific value.

You can also create branches that are triggered when different responses are selected from question controls, such as the Radio Question or Menu Question controls, or from the Next, Exit, and Finish buttons on the navigation panel.

Branches can be created using different methods and simple or complex logic, depending on your needs. Once you create branches, you can easily edit, reorder, and delete them using the tools available on the ribbon.

Adding branches

You can create branches quickly by right-clicking fields and controls on the design space. You can also define more complex branches using the Add Branch window. The options on the window are similar to those used to add **workspace** or **script rules**.

Tip While you can create branches from most of the controls and fields available for scripts, question controls are ideal for branching, allowing you to quickly branch to other pages using agents' responses to the questions you add to the script.

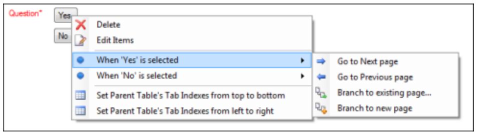
Adding branches using the right-click menu

When you want to take agents to another page in a script when they change a value in a field or a control, the easiest way to create the branch is to right-click the field or control and create the branch using options on the right-click menu.

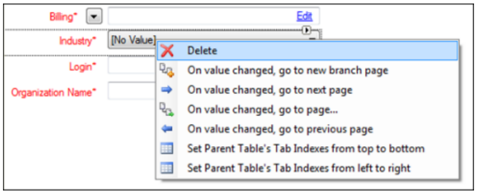
To add a branch by right-clicking a field or control

1. From your open script, select the page you want to add the branch to on the page selector.
2. Right-click the field or control on the design space that you want to branch from. A menu opens showing branching and other options.

The branching options vary depending on the item you select. You can branch from question controls when a specific question choice is selected, and you can branch from fields and controls when their value changes or when actions are taken, such as when you click a button control. The options for a Yes/No Question control are shown in the following figure.



Here are the options for an organization field.



3 To create a branch from a question control, right-click the question control and select the question response you want to trigger the branch from.

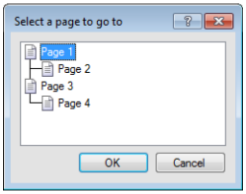
Note This step is necessary only when creating a branch from a question control.

4 Select the page you want the branch to go to. The page options vary slightly depending on the item you create the branch from and which page you are on when you create the branch.

a To branch to the next page on the same branch level as the current page, select the Go to Next Page option. This option is not displayed when creating a branch on the last page of a script.

b To branch to the previous page in the script, select the Go to Previous Page option. The previous page is the page staff members would visit before the current page when using the script. This option is not displayed when creating a branch on the first page of a script

c To branch to an existing page, select the Go to Page (or Branch to Existing Page) option. A window opens where you can select the page you want to branch to.



d To branch to a new page, select the Go to New Branch Page (or Branch to New Page) option. A new page is created and displayed on the design space where you can add the fields and controls you want.

Adding branches using the Add Branch window

Using the Add Branch window, you can create complex branches that fire when different events occur or when multiple fields are changed. Creating branches using the window is similar to creating script or workspace rules and many of the procedures you use are identical, including those to select triggers and conditions. This section provides an overview of creating a branch using the Add Branch window. For information about script rules, refer to Script rules. For detailed procedures to create workspace rules, refer to Adding workspace rules.

To add a branch using the Add Branch window

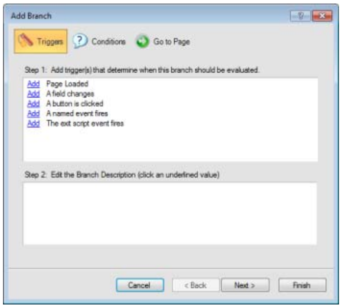
1 From your open script, select the page you want to add the branch to on the page selector.

2 Click the ribbon's Page tab and then click the Add Branch button.

Or

Right-click the page you want to add a branch to on the page selector.

3 Select whether you want to branch to a new page or a page you have already placed on the script. The Add Branch window opens.



Three buttons are displayed along the top of the Add Branch window—Triggers, Conditions, and Go to Page. You construct the branch by clicking each button and specifying the triggers that determine when the branch should be checked, what conditions must be met for the branch to take agents to a new page, and the page the branch will take agents to.

4 Select one or more triggers that will cause the branch to fire. Specifying branch triggers is identical to specifying triggers for script and workspace rules and the triggers that are available for branches are the same as those available for script rules. As with script rules, there are four triggers that are unique to scripts beyond those also available as workflow triggers.

- **Page Loaded**—Select this item to trigger the branch immediately after the page the branch is on is opened.
- **A Button is Clicked**—Select this item to trigger the branch when the Next button on the page's navigation panel is clicked to proceed to the script's next page.
- **The Exit Script Event Fires**—Select this item to trigger the branch when the Exit button on the page's navigation panel is clicked to exit the page. The Exit button displays on the script page only if there is a branch or subsequent page allowing staff members to navigate to another page. For this reason, exit script events usually occur before the script has reached a branch's final page.
- **The Finish Script Event Fires**—Select this item to trigger the branch when the Finish button on the page's navigation panel is clicked to leave the script. The Finish button displays only if there is no branch or subsequent page to navigate to from the script page. For this reason, finish script events usually occur after the script has reached a branch's final page.

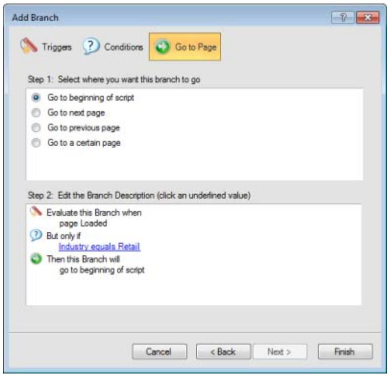
For descriptions of the other triggers and how to add them to your branch, refer to Selecting rule triggers.

Note When multiple triggers are specified, the branch's conditions will be checked if any of the triggers' actions occur. For example, the branch could be triggered when the value in a field on the script is changed *or* when a button on the script is clicked.

5 Click the Conditions button to add conditions that must be met to trigger the branch. The conditions available for script branches are identical to those available for workspace and script rules. Refer to Selecting rule conditions.

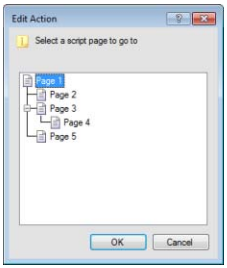
6 Click the Go to Page button to select the page you want the script to display immediately after the branch is triggered and all conditions are met.

Note This step is not necessary if you chose to create a branch to a new page in step 3 since the branch will be automatically configured to go to the new page. However, you can select a different target page if you want.



a Select the appropriate radio button to define where the branch should go when the branch conditions you specify are met. You can select Go to Beginning of Script (the first page of the script), Go to Next Page, Go to Previous Page, or Go to a Certain Page.

b If you select Go to a Certain Page, this option is added to the branch description. Click the underlined text in the branch description to open a window where you can select the page you want.



c Select the page you want to branch to.

d Click the OK button to close the window.

7 Click the Finish button to save the branch.

8 To add other branches from the page, repeat steps 2 through 7.

Important Branches are fired in the order in which they are listed. This can impact how the branches affect the script.

Managing branches

Once you add branches, you can easily edit, reorder, and delete them from the ribbon's Page tab. It is important to update existing branches when you make changes to your script to ensure the branches work as you expect. For example, when you add a new branch to a page, you need to make sure that other branches on the page do not have similar conditions. If they do, you can edit or delete the other branches, or reorder the branches so the branch you want to trigger will be checked first.

This section describes how to edit, delete, and reorder script rules using the tools available on the Page tab.

To modify branches

1 From your open script, select the page the branch is on from the page selector and click the Page tab. The branches list, located on the ribbon's Branching group, displays all the branches created on the page.

2 In the branches list, select the branch you want to modify.

3 To edit the branch, click the Edit Branch button. The Edit Branch window opens. Refer to Adding branches.

4 To change the order of the branch, click the up or down arrow to move the branch where you want it.

Important Just like script and workspace rules, branches are fired in the sequence in which they are listed. This can impact how the branches on a page affect the script.

5 To delete the branch, click the Delete Branch button.

Script rules

Just as you can create **workspace rules** to automatically perform actions on workspaces, you can create script rules to trigger actions on script pages when the conditions you specify are met. For example, you can create a rule that automatically sets the value of a field on a script page when a button on the page is clicked or when the page is opened.

Important Whereas workspace rules apply to the entire workspace, script rules impact only the script pages the rules are created on.

Once you create script rules, they can be modified if you need to change their triggers, conditions, or actions. You can also reorder the rules on your page to ensure they fire in the order you want. If you no longer need a rule, you can also quickly delete it. Refer to Managing script rules.

Generally, script rules impact only the items on the script page you add the rules to. However, using named events, you can use script rules in conjunction with workspace rules to trigger an action on a workspace when conditions on the script are met. For example, a workspace rule that sets the incident workspace's Status field to Solved can be triggered when a staff member clicks a button on a script page. Refer to Using events in workspace and script rules.

- Working with fields
- Working with controls
- Field and control properties
- Desktop Overview

Adding script rules

Just as with workspace rules, you create script rules from the Add Rule window, which is opened from the script editor's Rules tab. You specify the rule's triggers, conditions, actions, and properties just as you would when creating a workspace rule. However, there are a few triggers and actions that are unique to script rules.

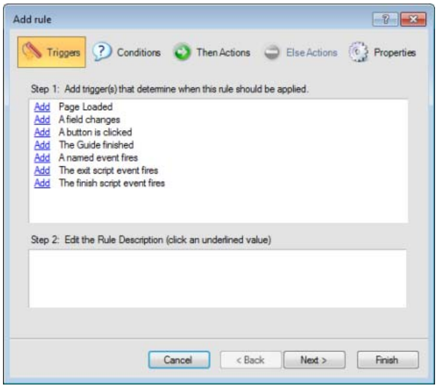
Note Creating script rules is similar to creating script branches, though branches take agents to script pages whereas rules trigger actions you specify in the rule.

This section provides an overview of the process to create a script rule and describes the triggers and actions that are unique to scripts. For detailed procedures to create script and workspace rules, refer to Adding workspace rules.

To create a script rule

1 From your open script, select the page you want to place the rule on from the page selector.

2 Click the Rules tab and click the Add Rule button. The Add Rule window opens.



Five buttons are displayed along the top of the window—Triggers, Conditions, Then Actions, Else Actions, and Properties. You construct the rule by clicking each button and adding different items to the rule description.

3 Select one or more triggers that will cause the rule to fire. There are four triggers that are unique to scripts beyond those available as workspace rule triggers.

- **Page Loaded**—Select this item to trigger the rule immediately after the page the rule is on is opened.
- **A Button is Clicked**—Select this item to trigger the rule when the Next button on the page's navigation panel is clicked to proceed to the script's next page.
- **The Exit Script Event Fires**—Select this item to trigger the rule when the Exit button on the page's navigation panel is clicked to exit the page. The Exit button displays on the script page only if there is a branch or subsequent page allowing staff members to navigate to another page. For this reason, exit script events usually occur before the script has reached a branch's final page.
- **The Finish Script Event Fires**—Select this item to trigger the rule when the Finish button on the page's navigation panel is clicked to leave the script. The Finish button displays only if there is no branch or subsequent page to navigate to from the script page. For this reason, finish script events usually occur after the script has reached a branch's final page.

For descriptions of the other triggers and how to add them to your rule, refer to Selecting rule triggers.

4 Click the Conditions button to add conditions that must be met for the rule to fire and perform the actions you specify. The conditions available for script rules are identical to those available for workspace rules. Refer to Selecting rule conditions.

5 Click the Then Actions button to define the actions that should occur immediately after the triggering event if the conditions are met. There are two actions that are unique to script rules.

- **Fire Exit Script Event**—Select this action to fire a subsequent rule that uses the Exit Script Fires condition. Using this option, you can add your own Exit button to a script page to trigger the same rule fired by the Exit button on the navigation panel control.
- **Fire Finish Script Event**—Select this action to fire a subsequent rule that uses the Finish Script Fires condition. Using this option, you can add your own Finish button to a script page to trigger the same rule fired by the Finish button on the navigation panel control.

Refer to Using events in workspace and script rules. For descriptions of the other rule actions and how to add them to your rule, refer to Adding and editing actions.

6 Click the Else Actions button to define the actions that should occur if the conditions are not met. The Fire Exit Script Event and Fire Finish Script Event actions described in step 5 are also available to use as Else actions in script rules. Refer to Adding and editing actions.

7 Click the Properties button and type the name of the rule in the Rule Name field.

8 Type any notes you want to add to the rule in the Notes field.

9 To deactivate the rule, clear the Active check box.

10 Click the Finish button to save the rule.

❖ Adding workspace rules

❖ Working with fields

❖ Working with controls

❖ Field and control properties

Managing script rules

Once you add script rules, you can easily edit them, reorder them, or delete them once they are no longer needed. This section describes how to edit, delete, and reorder script rules using the tools available on the Rules tab.

Important Rules are fired in the sequence in which they are listed. Adjusting them can impact how other rules affect the script. For example, if multiple rules set different values for the same field, the field will be set to the value assigned by the last rule in the sequence.

To modify script rules

1 From your open script, select the page the rule is on from the page selector and click the Rules tab. The rule list displays all rules created on the page.

Tip If you want to view only rules that are triggered by or that impact a specific item on the page, such as a field or control, select the item, click the Filter List button on the Rules tab, and select Rules Triggered by Selected Object or Rules that Reference Selected Object. The rule list will be updated to display only rules that are related to the selected item.

2 In the rule list, select the rule you want to modify.

3 To edit the rule, click the Edit Rule button. The Edit Rule window opens. Refer to Script rules.

4 To change the order of the rule, click the up or down arrow to move the rule where you want it.

Important Deleting a rule is permanent and cannot be undone. To ensure that a rule is not needed before deleting it, you can disable it instead. To disable a rule, edit the rule, click the Properties button on the Edit Rule window, clear the Active check box, and click the Finish button to save the change.

5 To delete the rule, click the Delete Rule button.

Using events in workspace and script rules

Script rules, workspace rules, and workflow connectors can be triggered by actions taken by staff members, such as changing a field value or saving a record. However, they can also be triggered by other rules using rule-defined events. Events are defined by adding event fire actions, which vary by event type.

- **Named Event**—Named events are defined by adding the Fire a Named Event action to a script rule or workspace rule and specifying a name for the event.
- **Exit Script Event**—Exit script events are defined by adding the Fire Exit Script Event action to a script rule. (Exit script events are also fired automatically when a staff member clicks the Exit button in a script.)
- **Finish Script Event**—Finish script events are defined by adding the Fire Finish Script Event action to a script rule. (Finish script events are also fired automatically when a staff member clicks the Finish button in a script.)

Note Although exit script events and finish script events perform similar roles, they are intended to serve slightly different purposes. Exit script events usually occur before the script has reached a branch's final page, while finish script events usually occur after the script has reached a branch's final page. In this way, you can distinguish between an early exit from the script and a case where the script was followed to completion.

Once defined as a rule action, an event can be used to trigger other rules. Any workspace rule or script rule configured for the workspace that uses the event as a trigger is run immediately after the event is fired—conditions are evaluated and, if they are matched, the rule actions are run. Events can also be used to trigger any workflow connector that is connecting from the workspace.

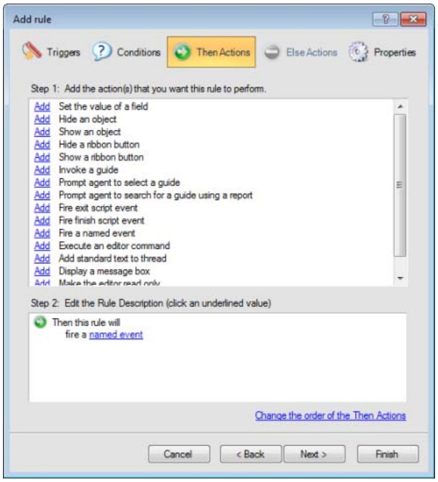
Exit and finish script events can be fired only in script rules. However, named events can be fired in either script or workspace rules. Therefore, while you can use a named event, exit script event, or finish script event to trigger a workspace rule from a script rule, only a named event can be used to trigger a script rule directly from a workspace rule. (A workspace rule could take other non-event actions that result in a script rule being fired indirectly.)

Whether you are firing a named event in a script rule or a workspace rule, the process for using it is the same. The first procedure that follows explains how to fire a named event in a rule. The second procedure explains how to use that event as a trigger for another rule. The process for using an exit script event or finish script event is similar.

To fire a named event in a rule

1 From your open script, create a new rule and specify the triggers and conditions that should run the rule. Refer to Adding workspace rules.

2 Click the Then Actions tab and click Add next to the Fire a Named Event action.



3 Click the underlined named event text in the window's Rule Description area.

4 Type a name for the named event that will fire when the rule runs.

Tip The name you specify has no restrictions on the characters you can use and is not case sensitive. However, we suggest entering a simple name since you will need to enter it again when adding the event as a rule trigger.

5 Click the OK button to save the name.

6 Click the Finish button on the Add Rule window to save the rule.

To trigger a rule when a named event is fired

1 From your open script, create the rule that you want the named event to trigger and specify conditions and actions for the rule. Refer to Adding workspace rules.

2 Click Add next to A Named Event Fires.

3 Click the trigger's underlined named event text in the window's Rule Description area to open a window where you can enter the name of the named event that you want to trigger the rule.

4 Click the OK button to close the window.

5 Specify any remaining triggers, conditions, and actions you want to use in the rule. Refer to Script rules.

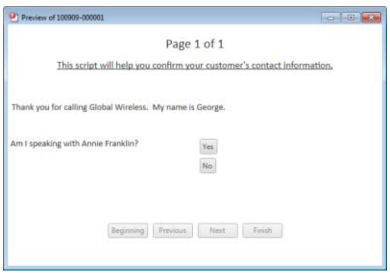
6 Click the Finish button on the Add Rule window to save the rule.

Previewing scripts

When you are editing a script, it can be helpful to see what it will look like when staff members use a workspace that includes the script. The preview feature lets you see the script as it will appear on a workspace, so you can modify it if necessary. When previewing a script, you can navigate between pages using the script's navigation buttons and branches you create to verify they function as expected.

Note When you preview a script, it will display as it would to any staff member who has the same set of profile permissions you have. To view the script as it will appear to a specific staff member with different permissions, you must log in using a staff account with the same profile as the staff member.

The following figure shows the first page of a previewed script. The page includes a header with a progress label control and a text control. The page also includes a text control with one current user merge field, a text control with two contact merge fields, and two button controls. The navigation panel control is in the script's footer.



To preview a script

1. From your open script, click the Home tab.
2. To view the script as it will appear to staff members when creating new records using a workspace with this script, click the Preview button and select New Record. A preview of the new record opens.
3. To view the script as it will appear when editing an existing record on a workspace, click the Preview button and select Opening a Record.
   a. Type the record ID number.
   b. Click the OK button. A preview of the record opens with the script's fields populated with values from the record you specified.
4. Click the X button on the window or press **Esc** to close the preview window.

Exporting and importing scripts

Scripts can be exported as XML files and stored on your workstation or network and then imported to other interfaces. This is helpful if you have a script on one interface and want to quickly create a duplicate or similar script on a different interface. An imported script becomes its own unique copy and can be modified without impacting the original.

The exported script XML file includes all of the script's elements, including fields, controls, branches, rules, and the script's layout. When you are ready to import the script, the script import wizard guides you through the import process.

To export a script

1. From the Scripts explorer, right-click the script you want to export and select Open. The script opens.
2. Click File and select Export Script. The Save As window opens.
3. Select the directory where you want to save the script definition file and type the file name.
4. Click the Save button to save the script definition file.

Note When a script is exported to a script definition file, the file includes a hash value that is used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing, and an error message will notify you that the file is invalid.

To import a script

1 From the Scripts explorer, click the New button on the ribbon. The New Script window opens.

2 Click Import Script from an Exported Script File to open the Import Script wizard.

3 Click the Next button. The next window asks you for the name of the script definition file you want to import.

4 Type the full path of the script definition file.

   Or

   Click the Browse button to find the script definition file on your workstation and click the Open button.

5 Click the Next button to select the script type.

6 Click the Map To Type drop-down menu and select a record type to map the workspace to. By default, the imported script is mapped to the same script type as the original script.

Important If items from the script you are importing are not used in the script type you are converting it to, the next window lists these items and informs you that they will be replaced by spacers, field placeholders, or removed from the imported script. Since most database fields and script controls are not shared by script types, the majority of fields and controls will generally not be included in the new script when you convert the type. However, this option is helpful if you want to import the general layout from a script with a different type.

7 Click the Next button.

8 Click the Finish button. The script designer opens with the imported script.

9 Edit the script to remove or replace fields that are not available and then save the script. Refer to Editing agent scripts.

Important When you save a script, reports that are used in the script's report controls are checked to ensure they exist on the site. If a report does not exist, a message is placed in the control stating the report is no longer available. You can save a script that has invalid reports, but you will need to select new reports for the controls before they can be used in the workspace.

29

Workspace and Script Elements

To provide you with a consistent, intuitive design environment, Oracle Service Cloud **workspace** and **agent script** editors share a common set of design elements for constructing agent desktops for your staff members. In many instances, the design space, fields, controls, and rules available for creating workspaces function the same when creating scripts. First, you add fields and controls to the design space, and then adjust each item's property so that it displays and behaves as desired. You can also customize the buttons that appear on the ribbon and the Quick Access toolbar for workspaces and for scripts that are used in workflows. Because the design tools are similar for workspaces and scripts, the experience you gain in creating workspaces can help you better understand and create scripts, and vice versa.

To understand how workspaces and scripts can best be implemented in your agent desktop, you should also become familiar with other desktop components such as **guides** and **workflows**. For a summary of agent desktop features, refer to Desktop Overview.

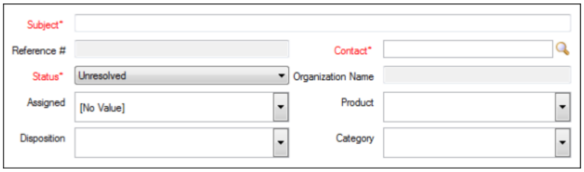
Design space layout options

The design space is the working area where you arrange fields and controls as you want them to appear on your workspace or script. On most new workspace layouts, the design space contains a summary panel and a tab set control, while script layouts feature a content area with header and footer sections. Each of these design areas contains a table, hidden by default, that forms an underlying grid for aligning fields and controls.

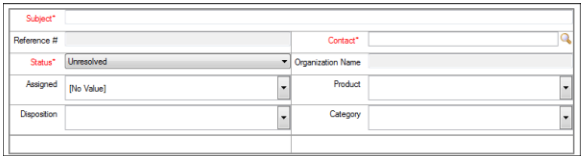
Initially, these tables contain a single row and column, and the first item added to them fills the height and width of a single cell. As you add other elements, additional rows and columns are automatically added with new cells holding each added field and control. Moving or removing an item from a cell will cause the other cells to adjust automatically to fill the space left by the removed item.

Tip Although there is no limit to the number of rows and columns allowed, you should avoid using large numbers of them so that the layout is easier to use. Also, when adding items to a workspace, try to keep fields and controls roughly the same height on the same row, since the height of the row is determined by the tallest element. For example, a date field is generally displayed with only one line of information, whereas a notes field with a text box is taller.

When adding and arranging items on the design space, it can be helpful to show the table outlines to help you identify the layout's structure. The following figure shows the fields of an incident workspace when no outline appears.



The following figure shows the same fields when the table outline has been activated.



To display or hide design space table outlines

1 From an open workspace or script, click the Home tab on the ribbon.

2 Click the Show Outline button to display the outline.

3 Click the Show Outline button again to hide the outline.

When the Show Outline button is highlighted, the table outline is displayed.

Spanning table cells

In some cases you may want a field or control to span more than one table cell. For example, if you add an incident subject line to a workspace with three columns in the table, the subject line will be only one column wide, too narrow to display much information. By spanning the field over multiple columns, you can expand the field to display the full content of the subject line. You can also span an item over multiple rows if you want it to expand vertically.

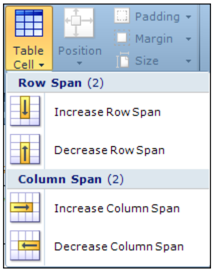
Important In order to span an item over multiple columns or rows, there must be empty table cells adjacent to the cell containing the item you are expanding.

To change the number of table rows and columns used by a field or control

1 From an open workspace or script, click the field or control that you want to edit on the design space.

2 Click the Design tab.

3 Click the Table Cell button.



Note The number of rows and columns the selected field's cell currently occupies is shown when selecting row and column span options.

4 To span the field or control over an additional table row, click Increase Row Span.

5 To span the field or control over one less table row, click Decrease Row Span.

6 To span the field or control over an additional table column, click Increase Column Span.

7 To span the field or control over one less table column, click Decrease Column Span.

8 Click the Save and Close button on the Quick Access toolbar to save and close the workspace.

Working with fields

A field holds a piece of information that is stored in the knowledge base. For example, a contact record includes fields for name, email, address, and phone number. To add a field to a workspace or script, just drag it from the ribbon and place it on the design space. You can also promote staff efficiency by defining a shortcut key in the field label that can be used to focus the field.

For information about a field on the ribbon, you can hover over it for a description. Fields are listed in alphabetical order. Different icons are displayed next to each field showing the field type, which impacts how the field will be shown. In addition, required, linkable, and customer-entered fields have unique properties when using them on workspaces and scripts.

Tip Information about each field can also be found in the Data Dictionary located under Configuration > Database.

❖ Editing workspaces
❖ Editing agent scripts
❖ Desktop Overview

Overview of fields and field types

Many fields have special properties related to their function. The following sections include information about working with the field tree, required fields, custom fields, customer-entered fields, and linkable field types.

Field types

The fields you can add to your workspace or script are shown on the Insert Field tab, and are associated with icons to indicate the type of input they accept. For example, fields that accept phone numbers are displayed with a phone icon. You can hover over a field's icon to see a description of the field and the field name as it appears on the API, regardless of any changes that might have been made to the field's message base label. The following table shows each icon and the type of field input it represents.

Table 161: Field Type Icons Description

Icon	Field Type
	Field with drop-down menu options
	Field with search capability
	SmartSense meter for rating emotional context of messages
	Field with calendar for selecting date and time
	Text box field
	Integer field
	SLA selection field
	Address field
	Email address field
	Phone number field
	Currency field
	Quote document selection field
	Contact lists field

Required fields

Oracle Service Cloud requires that certain fields always be populated when using workspaces or scripts to update certain record types. For instance, all incidents must have a contact, so the contact field is always required when it is added to incident workspaces and scripts. Likewise, opportunities must always have a contact or organization, so you must add a contact field or an organization field, if not both, to all opportunity workspaces and scripts.

In some cases, fields are required only if a record is associated with another record. For example, when using a contact workspace, if a contact is associated with an organization, the Organization Name field is required. If the contact is not associated with an organization, the field is not required.

You can save a workspace or script that does not include fields required for its type, but you must include them if the workspace or script will be used to create new records. When you place one of these required fields, you cannot edit the field's Required property since these fields are always required.

Tip Labels for required fields appear in red text with an asterisk. Fields that are not always required can be set to required by changing their Required properties or by using workspace rules.

Most fields are required by default when placed on a script page, with the exception of chat scripts. However, in many cases, you can change the field's Required property to be not required once you place it on the script.

Refer to Setting hidden, required, and read-only properties and Workspace rules.

The following table lists fields that are always required when added to each type of workspace. Fields required for each script type are the same as those required for the corresponding workspace type.

Table 162: Required Fields for Workspace Types

Workspace Type	Required Fields
Answer and Answer Multi Edit	Display Position, Language, Status, and Summary
Asset and Asset Multi Edit	Name, Product, and Date Purchased
Contact and Contact Multi Edit	Disabled Flag and State
Incident and Incident Multi Edit	Contact, Interface, State, and Status
Opportunity and Opportunity Multi Edit	Interface, Manager Commit, Rep Commit, and Status
Organization and Organization Multi Edit	Organization Name and State
Quote	Name, Forecast, and % Discount
Quote Product	Discount and Quantity

Table 162: Required Fields for Workspace Types (Continued)

Workspace Type	Required Fields
Task	Name and Status
Task Multi Edit	Status

Custom fields

The availability and behavior of custom fields in the knowledge base is affected by the following visibility settings. Refer to Setting custom field visibility.

- **Admin Display**—When selected, the custom field is available in the list of fields that can be added to the design space.
- **Admin Edit**—When selected, the custom field will be set to Read Only by default when it is added to the design space. Once the custom field has been added to the design space, this setting has no effect.
- **Chat Display**—When this option and the Admin Display check box are both selected, the custom field is available in the list of fields that can be added to chat workspaces.
- **Required on Accessibility Interface**—When selected, the custom field will be set to Required by default when it is added to the design space. Once the custom field has been added to the design space, this setting has no effect.

Note If an additional instance of a field is placed on the design space, it will automatically be set to the same Required setting as the first instance. It is not possible to set the same field to both required and non-required in the same workspace.

When a workspace or script is used by staff members, all behavior related to visibility, read-only, and required attributes is determined by the properties defined for each field. Refer to Setting hidden, required, and read-only properties.

Customer-entered fields

The following fields can be added to the Account Settings page on the customer portal so customers can personalize their knowledge base search results. These fields have a default read-only property when added to a workspace or script, and are not available on contact multi-edit workspaces.

- **Lines Per Page**—The number of items to list per page when the customer is searching on the Answers page.
- **Search Text**—The default search text to use for searching on the Answers page.

- **Search Type**—The default search method.

Linkable field types

When you add the following fields to a workspace or script, staff members can click the action link associated with the field to access special functionality.

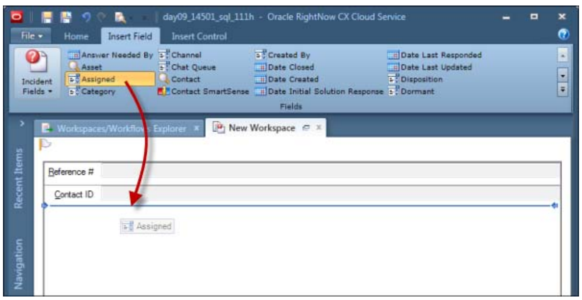
- **Email field**—This field includes a click-to-email link that opens the staff member's email client with a blank message to the selected address. This behavior can be disabled by selecting the Disable Email Icon setting on the Design tab.
- **URL field**—A custom text field set to URL usage includes a link to open a URL in a web browser.

Adding fields to workspaces and scripts

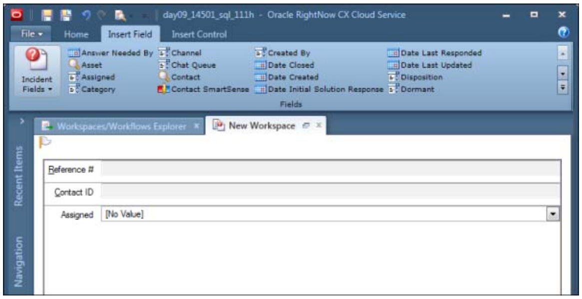
The design space is structured by a table, even if you have not enabled the display of its rows and columns by clicking the Show Outline button. How the table changes when you add fields to a workspace or script depends on several factors: where you add them, whether other fields already exist in the column or row, and whether the column or row contains controls. You can add fields above or below another field or control, or you can add them to the right or left.

For example, the following figure demonstrates how the Assigned field is selected and placed in a new row below Reference # and Contact ID on the workspace. When you select the field and hover over the workspace, a horizontal indicator shows where the field will be placed.

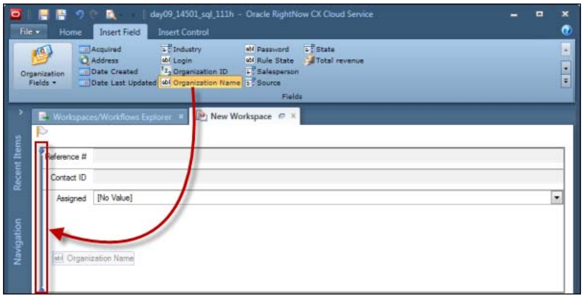
Note The following examples have the table outline displayed for clarity. To display the outline for a workspace or script, click the Show Outline button on the ribbon's Home tab.



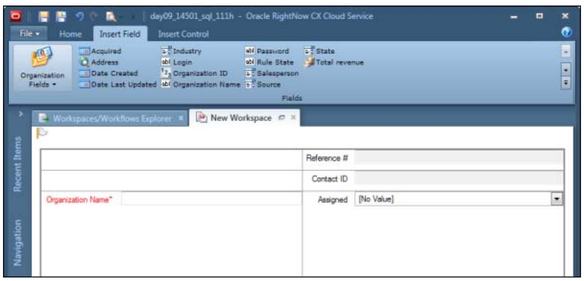
Simply click to add the field in that position.



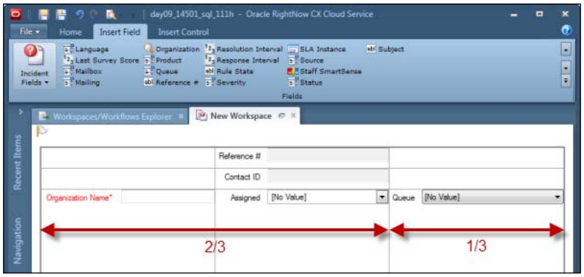
To add a field to the right or left of another field or control, click the field on the ribbon and hover over either side of a field on the design space. When the vertical indicator appears, click to add the field to the table.



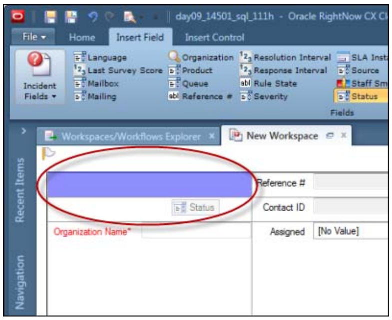
This action adds the field to a new column in the table, as shown in the following figure.



As columns are added, the original columns are evenly redistributed to make room. For example, when you add a field to the right side of a two-column table, the original columns narrow to span the left two-thirds of the workspace and the new column fills the remaining third.



When a table contains open cells, as it does in the previous figure, you can drag a field directly into one of the cells. When the field is positioned over a cell, the cell will become highlighted to show you where the field will be placed. Like the indicators, this highlight appears whether or not you have clicked the Show Outline button.

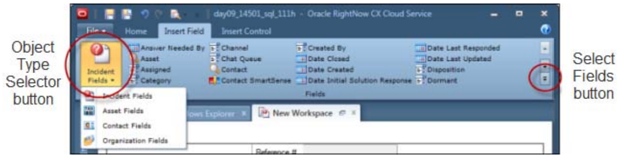


Tip You can also add a column or row to the table by right-clicking any empty cell and selecting Add Column or Add Row.

To add a field to a workspace or script

1 From an open workspace or script, click the Insert Field tab on the ribbon.

2 Click the Object Type Selector button on the ribbon.



Note The fields available depend on the type of workspace or script you are adding them to. Refer to Standard workspaces or Script types.

Custom fields can be added to the design space only if their Admin Edit visibility setting is selected. Refer to Setting custom field visibility.

3 Click the type of field you want to add to the workspace. The ribbon is updated to display the fields for the record type you select.

4 To view fields that do not fit on the ribbon, click the up and down arrows on the scroll bar on the right of the ribbon.

5 To view all the fields available for the workspace type you are editing, click the Expand Fields button below the scroll bar.

6 Click the field you want to add.

7 To add the field to an open cell in the design space table, hover over the cell and then click when it becomes highlighted.

8 To insert the field between fields or controls already added to the design space, hover the mouse between the fields or controls and then click when the line indicator appears.

9 To set a shortcut key for the field, click the Text button on the Design tab, enter a label for the field, and type an ampersand (&) in front of the character you want to be the shortcut key. For example, to allow staff members to move the focus to a field with the label "Details" by pressing **Alt+t**, type `De&tails`.

Tip You can also click the label on the design space to edit the label value without clicking the Text button.

10 To edit other field properties, refer to Editing design item properties.

Moving and deleting fields

You can easily rearrange the fields on the design space by moving them from one location to another. You can also quickly remove any fields that you no longer need.

Important Just as rows and columns can be added to a table when you add fields to the design space, the table's rows and columns will be deleted when you move or delete the only remaining field in the row or column.

To move a field on the design space

1 From the open workspace or script, click the field you want to move, keeping the left mouse button depressed.

2 Drag the field to its new location on the design space.

3 Release the mouse button to position the field in the new location.

To remove a field from the design space

1 From the open workspace or script, right-click the field and select Delete. The Delete Confirmation window opens.

Or

Select the field, click the Design tab, and then click the Delete button.

Caution The Delete Confirmation window displays a warning if the field you are deleting is used in a rule. If the rule checks or changes the value of the field you want to remove, the window will display a warning, but the rule will remain active once the field is removed. However, if the rule affects the required, visibility, or read-only properties of the field you want to remove, you will receive a warning and the rule will be disabled once the field is removed. Refer to Overview of workspace rules.

2 Click the Yes button to confirm the deletion.

Working with controls

In addition to fields, you can enhance your workspace or script by adding controls. Controls are used to place features, such as buttons, text labels, reports, tables, and tab sets, onto the design space. Depending on the control, you can modify its properties to change its appearance or add functionality. For example, you can add a title bar control to a design space and then edit the title text, font, size, and color. Most controls can be added to every type of workspace and script as many times as you want.

Note Controls are added to workspaces from the workspace designer's Insert Control tab. If your site is configured to use custom add-in components, they will also be displayed on this tab. (Your profile determines the custom add-ins you can access.) Custom add-ins can be added, moved, and deleted from workspaces in the same way as you would add, move, and deleted controls and relationship items. For information about custom add-ins, contact your Oracle account manager.

While some controls are used to increase general usefulness, others are required to edit certain information. For example, you have the option to add a workspace title with the Title Bar control, but you can use a workspace without a title bar just as easily. Alternately, it is necessary to add the Rich Text Incident Thread relationship item to a workspace to let staff members view or add incident threads. Refer to Relationship items.

Tip You can easily identify a control that has been placed on a workspace by double-clicking the control. The control's name will appear in the drop-down menu on the Design tab's Selected Object button group.

Table 163: Workspace and Script Controls Description

Control	Description
Answer Display	Displays an answer on a workspace or script. To select the answer you want, click the Answer ID button on the Design tab and type the answer ID number.
Browser	Adds a browser window to a workspace or script. Click the URL button on the Design tab to type a URL for the browser. You can also set a URL for the browser from a workspace rule or script rule. Refer to Working with browser controls.

Table 163: Workspace and Script Controls Description (Continued)

Control	Description
Button	Inserts a button control on a workspace or script. Workspace rules and script rules can be created to trigger an action when the button is clicked. For example, you can create a button that displays a hidden field when staff members click the button. Refer to Working with button and image controls.
Hyperlink	Places a hyperlink on the workspace or script. Click the URL button on the Design tab to type a URL for the link.
Image	Adds an image to your workspace or script to display a logo, a diagram, or other type of image. Properties for this control let you choose the image you want and specify how the image should be displayed. You can create workspace rules and script rules that trigger actions when images are clicked. Refer to Working with button and image controls.
List Box	Adds a list containing entries you specify that can be selected by the agent. You can create workspace rules and script rules that are triggered when one or more list items are selected. Refer to Working with list box, menu, radio button, and text box controls.
Menu	Adds a drop-down menu containing entries you specify that can be selected by the agent. You can create workspace rules and script rules that are triggered when a menu item is selected. Refer to Working with list box, menu, radio button, and text box controls.
Navigation Panel	Adds a script navigation panel that allows agents to access the beginning page, previous page, next page, or exit the script. Selection can be presented as buttons or links. By default, this control appears in button style in the script footer. You can create workspace rules and script rules that are triggered when the Exit button is clicked. Refer to Selecting rule triggers. **Note:** This control is available to scripts only.
Oracle Business Intelligence Report	Inserts a read-only Oracle Business Intelligence Report. The report path you enter must match the path used in OBIEE (Oracle Business Intelligence Enterprise Edition). Refer to Answer ID 4755 on our customer support site.

Table 163: Workspace and Script Controls Description (Continued)

Control	Description
Panel	Groups fields and controls and provides the ability to scroll within subsections of a workspace or script. You can nest a panel within a table and then add multiple fields to the panel. A scroll bar lets staff members view all fields on the panel. Refer to Working with panel controls.
Policy Automation	The Policy Automation control can be added to workspaces when Oracle Policy Automation is enabled on your site, providing access to policy administration tools for determining eligibility and tracking compliance for programs and services. For information about Oracle Policy Automation, refer to Oracle Policy Automation Cloud Service. **Note:** To enable Oracle Policy Automation with Oracle Service Cloud, contact your Oracle account manager.
Progress Label	Adds a simple progress indicator that displays the current page number and total number of pages in the script. By default, this control appears in the script header. **Note:** This control is available to scripts only.
Radio Buttons	Adds radio buttons to a workspace or script. You can create workspace rules and script rules that are triggered when a radio button is selected. Refer to Working with list box, menu, radio button, and text box controls.
Report	Places a report container on a workspace or script. Click the Report property and select the report you want to display on the workspace. Refer to Working with report controls.
Script	Adds agent scripts to a workspace. When you add this control, the Select a Script window opens where you can select the script you want to add. You can also select a different script by selecting the script control and clicking the Script button on the Design tab. Refer to Working with script controls. **Note:** This control is available to workspaces only.

Table 163: Workspace and Script Controls Description (Continued)

Control	Description
Spacer	Adds white space, fills gaps within a workspace or script, or holds a place for a field you want to insert later. When added to the design space, spacers have a light gray background to let you know where they are. However, when the workspace or script is viewed by an agent, the spacers are not visible because they are the same color as the background. You can move or delete a spacer just as you can move and delete other fields and controls.
Survey by Proxy	Adds a survey to a workspace or script that can be filled out by an agent on behalf of a customer. When this control is added, you choose the survey you want by clicking the Survey button on Design tab. If you select a survey that allows anonymous responses, you can select the Anonymous check box on the Design tab to permit survey responses to be entered when a valid contact is not associated with the record being viewed. The Survey by Proxy control is available when creating incident, opportunity, and contact workspaces and scripts. Refer to Proxy surveys. **Note:** This control is available only when Oracle RightNow Feedback Cloud Service is enabled. Polling surveys are not supported by this control. Refer to Offering customers a survey.
Tab Set	Adds a tab set to a workspace or script. Tabs can be added and renamed as desired, and multiple tab sets can be placed or nested on the design space. Refer to Working with tab controls.
Table	Adds a table to a workspace or script. Tables form a grid for aligning other fields and controls. They can also be nested in other tables. Refer to Working with tables.
Text	Adds a text block to a workspace or script. Using the buttons in the Label group on the Design tab, you can define the background color, text alignment, and content. You can also enter text, including variables, that will display when agents use the workspace. Refer to Adding text with the text control. **Note:** A text control's default background color and font match the workspace it is used on.
Text Box	Adds a text box to a workspace or script. You can create workspace rules that are triggered when agents type specific text in the text box. Refer to Working with list box, menu, radio button, and text box controls.

Table 163: Workspace and Script Controls Description (Continued)

Control	Description
Title Bar	Adds a text block to be used for headers or sections within tables. Using the buttons in the Label group on the Design tab, you can define the background color, text alignment, and content. By default, the title bar control uses a heading style font and a different background color than the rest of the workspace.

- Editing agent scripts
- Desktop Overview

Relationship items

In addition to the standard set of controls shared by workspaces and scripts, Oracle Service Cloud features a set of relationship items that provide functionality unique to certain workspaces. Relationship items are special controls, such as incident threads and audit logs, that are used when working with records and related objects. Many relationship items display a list of related objects and include basic functions for adding, editing, copying, and deleting related records, as well as removing record relationships.

Relationship items differ from the standard controls mainly in the types of workspaces they can be used on and the number of times they can be added to a workspace. While controls can be added numerous times on most types of workspaces, relationship items are specific to the type of workspace and can be added to a workspace only once.

In the standard workspaces, most relationship items appear on tabs, but you can place them anywhere on the workspace. The items you can add when you create a workspace depend on the type of workspace you create.

Tip You can easily identify a relationship item that has been placed on a workspace by double-clicking the item. The item's name will appear in the drop-down menu on the Design tab's Selected Object button group.

The following table describes the various relationship items and the types of workspaces they can be added to.

Table 164: Workspace Relationship Items Description

Relationship Item	Description
Answer Type Container	Displays the answer type options, tabs, and toolbars for adding and editing the question and answer, and a tab to preview the question and answer. This relationship item is available when creating answer workspaces.
Assets	Provides the ability to add, edit, print, copy, delete, and email assets, as well as remove their association with the primary record. The column headings for the list of assets include the asset's name, serial number, description, product, date purchased, date installed, date retired, status, and action options. The Assets relationship item is available on contact and organization workspaces.
Audit Log	Describes the actions that have been taken on the record, including when an action was taken, who performed it, what the action was, and any additional description of the action. This relationship item is available on the following types of workspaces. • Answer • Asset • Contact • Custom Object • Incident • Opportunity • Organization • Quote • Task **Note:** In answer workspaces, the **audit log** shows all actions taken on both the answer and its siblings.
Chat Control	Contains the area for composing a response to the customer and includes the buttons for adding SmartAssistant answers, searching the knowledge base, and inserting standard text. This relationship item is available on chat workspaces.
Chat Transcript Control	Contains all chat correspondence between the customer and agent, including a time stamp for each instance of sending text. This relationship item is available on chat workspaces.

Table 164: Workspace Relationship Items Description (Continued)

Relationship Item	Description
Co-browse	The co-browse relationship item can be added to incident and chat workspaces when co-browsing is enabled on your site. When using a workspace with this relationship item, agents can invite customers to a desktop-sharing session. Refer to Co-browsing with customers.
Community	The Community relationship item can be added to incident and contact workspaces when **Oracle RightNow Social Experience communities** are enabled on your site, providing access to contacts' community profiles, groups, posts, and comments within a single tabbed control.
Contacts	Provides the ability to add, edit, print, copy, delete, and email contacts, as well as remove their association with the primary record. The column headings for the list of contacts include the contact's name, email address, organization name, office phone, title, and action options. The Contacts relationship item is available on incident, opportunity, and organization workspaces.
[Custom Object] View	Provides the ability to add, edit, copy, print, and delete custom object records, as well as remove their association with the work-space's primary record. The column headings for the list of records include the object ID, labels, and action options. This relationship item is named for the custom object and is available when creating workspaces for standard objects that have been related to the custom object. Refer to Defining relationships.

Table 164: Workspace Relationship Items Description (Continued)

Relationship Item	Description
File Attachments	Provides the ability to attach, open, download, and delete files from records as well as view file properties. The relationship item displays a list of file attachments, including name, size, date created and updated, and a description. This relationship item is available on the following types of workspaces. • Answer • Contact • Custom Object • Incident • Opportunity • Organization • Task **Note:** In answer workspaces, files can be attached to the answer as well as all sibling answers.
Guided Assistance	Provides the ability to search for and open guided assistance guides to help agents quickly find answers or text explanations when working with customers. You can select properties for this relationship item to show buttons on the relationship item that agents can use to search for and select applicable guides. You can also use workspace rules to automatically open a guide on workspaces that include this relationship item, or trigger a workspace rule when a guide has been completed. Refer to Adding guided assistance to workspaces. **Note:** This relationship item can be added only to incident and chat workspaces. However, you can add the *answers.guided assistance* field to answer workspaces to associate a guide with an open answer.
Incident View	Provides the ability to view and work with incidents associated with a contact or organization. Toolbar buttons allow adding, editing, copying, deleting, forwarding, and proposing incidents and filling the inbox. The column headings for the list of incidents include the incident's status, response time, resolution time, source, reference number, and subject as well as action options. The Incident View relationship item is available when creating chat, contact, organization, and asset workspaces.
Label	Allows placement of a label on the chat workspace.

Table 164: Workspace Relationship Items Description (Continued)

Relationship Item	Description
Learned Links	Lists all answers linked to the currently open answer by visitors to your site as they browsed your knowledge base. These links are "learned" by the system as your visitors move from answer to answer. Toolbar buttons allow the ability to edit, print, preview, promote, and block and unblock links. This relationship item is available when creating answer workspaces.
Manually Related Answers	Lists all answers that have been manually linked by staff to the currently open answer. Toolbar buttons allow the ability to add, edit, copy, print, and delete answers, as well as remove their association with the primary record. This relationship item is available when creating answer workspaces.
Model Question	Provides the ability to associate an answer with a question template in Oracle RightNow Virtual Assistant Cloud Service. This relationship item is available when creating answer workspaces. Refer to Working with model questions.

Table 164: Workspace Relationship Items Description (Continued)

Relationship Item	Description
Notes	Notes relationship items can be specific to individual workspaces. • Answer Notes—Allows staff members to add notes, select the note's channel, and sort notes by date on answer workspaces. • Contact Notes—Allows staff members to add notes, select the note's channel, switch the view between contact and organization notes, and sort notes by date on contact workspaces. • Custom Object Notes—Allows staff members to add notes, select the note's channel, and sort notes by date on custom object workspaces. • Meta Answer Notes—Allows staff members to add notes that pertain to the answer's sibling answers. • Opportunity Notes—Allows staff members to add notes, select the note's channel, switch the views between opportunity, contact, and organization notes, and sort notes by date on opportunity workspaces. • Organization Notes—Allows staff members to add notes, select the channel, and sort notes by date on organization workspaces. • Task Notes—Allows staff members to add notes, select the note's channel, and sort notes by date on task workspaces. **Note:** If you want staff members to be able to edit or delete existing notes when copying records, you will need to assign Edit/ Delete Notes permissions in their profile for the appropriate record types. Refer to Customizing profiles.
Outreach Activity View	Displays a report of outreach activity associated with the contact, such as mailings that were viewed or tracked links that were clicked. If the report is populated (that is, if the contact has had outreach activity), the column headings include when the activity occurred, what the activity was, a description, the name of the mailing or tracked link, and any documents for each listed activity. The Outreach Activity View relationship item is available when creating contact workspaces.

Table 164: Workspace Relationship Items Description (Continued)

Relationship Item	Description
Opportunities View	Provides the ability to view and work with opportunities associated with a contact or organization. Toolbar buttons allow adding, editing, copying, printing, deleting, rejecting, and forwarding opportunities. The column headings for the list of opportunities include the opportunity's name, assigned staff member, status, stage, the sales representative's value, the manager's value, and the date updated, as well as action options. The Opportunities View relationship item is available when creating chat, contact, and organization workspaces.
Organization Hierarchy	Provides the ability to work with organizations to create a hierarchy in an organization workspace. Toolbar buttons allow adding, editing, printing, and deleting organizations, as well as removing their association with the primary record.
Page Peek	Displays a snapshot of the web page customers were viewing when they initiated the chat. This relationship item can be added only to chat workspaces.
Products and Categories	Displays product and category trees in order to view and define the links between products and categories for answers. The Products and Categories relationship item is available when creating answer and multi-edit answer workspaces.
Quote Products	Displays the list of products associated with a quote's selected price schedule and provides the ability to edit products for a quote. The Quote Products relationship item is available when creating quote workspaces.
Quotes	Provides the ability to view and work with quotes associated with an opportunity. Toolbar buttons allow adding, editing, printing, copying, deleting, and sending quotes. The column headings for a list of quotes include the quote's name and status, whether it was sent, the forecast, and action options. The Quotes relationship item is available when creating opportunity workspaces.

Table 164: Workspace Relationship Items Description (Continued)

Relationship Item	Description
Rich Text Incident Thread	Provides the ability to add responses, customer entries, and private notes to incidents with a variety of HTML formatting attributes, such as font, style, color, alignment, bullets, images, links, and indentation. This relationship item also includes buttons for accessing SmartAssistant, searching answers, inserting standard text, zooming in and out on thread contents, and undocking the relationship item. (The Messages tab of the standard incident workspace contains the Rich Text Incident Thread relationship item.) This relationship item is available when creating incident and incident multi-edit workspaces.
Sibling Relationships	Lists all answers that share the same product or category as the currently open answer and can also contain the same file attachments. Toolbar buttons allow adding, editing, printing, deleting, and previewing sibling answers, as well as removing their association with the primary record. This relationship item is available when creating answer workspaces.
SLA Instance View	Allows staff members to view a report of SLAs that have been associated with a contact or organization and provides the ability to add, open or disable an instance. The column headings include the SLA instance name, active date, expire date, self-service, total incidents, and action options. The SLA Instance View relationship item is available when creating contact and organization workspaces.
SLA Container	Provides the ability to select SLAs for contacts and organizations by displaying the SLA selection field, which opens the SLA Viewer for adding SLA instances. The SLA Container relationship item is available when creating contact and organization workspaces.
Survey History View	Allows staff members to view a report of surveys that have been sent to contacts. If the report is populated (that is, if the contact has received surveys), the column headings include when the survey was completed, the score, the type of survey, its name, and action options. The Survey History View relationship item is available when creating contact workspaces.

Table 164: Workspace Relationship Items Description (Continued)

Relationship Item	Description
Tasks	Provides the ability to view and work with tasks associated with a record. Toolbar buttons allow adding, editing, printing, copying, deleting, completing, and forwarding tasks, as well as removing their association with the record. The column headings for a list of tasks include the task's name, due date, completed date, assigned staff member, and priority, as well as action options. The Tasks relationship item is available when creating the following kinds of workspaces. • Answer • Contact • Incident • Mobile Contact • Mobile Incident • Opportunity • Organization
Time Billed	Provides the ability to view and enter the amount of time billed for an incident. Toolbar buttons allow adding, editing, and deleting a time billed entry. The column headings for a list of time billed entries include the starting date and time, the amount of time spent, the staff member who entered the time billed, and the task, as well as action options. The Time Billed relationship item is available when creating incident workspaces.

- ❖ Desktop Overview

Question controls

In addition to the standard set of controls shared by scripts and workspaces, Oracle Service Cloud provides a set of question controls that are used to configure branching in scripts. Questions are available as buttons, radio buttons, lists, text fields, menus, and yes/no buttons. Most of these question types are similar to standard controls—for example, you add items to a menu question in the same way you add items to a menu control. However, questions differ from other controls in a few key ways.

- Questions include labels while other controls do not. The label can be used to present the text of the question being asked.

- Questions are required by default but can be set to non-required by using the Required property on the Design tab. This differs from other controls, which are never required.
- A question added to one script page can be used in the rules and branches created on other pages in the script. Conversely, a control can be used only in the rules and branches on the script page the control is added to.
- Some question types have different properties than their corresponding standard controls. For example, the image property cannot be defined for button questions as it can for button controls.

For information about using question controls in script branching, refer to Adding branches to scripts.

Note The values that agents enter in questions and their corresponding standard controls are available for use with the script's rules and branches. However, they are not saved in the database.

❖ Editing agent scripts

❖ Desktop Overview

Adding controls to workspaces and scripts

Placing controls on a workspace or script is similar to adding fields. Like fields, controls occupy cells on the design space's underlying table. Once you add a control, you can reposition it to display anywhere on the design space. Controls can be added to tables, panels, and tab set controls, and you can place them above, below, or next to fields and other controls.

Note When you add a control to a table that already contain fields or other items, the size of the table's rows and columns is adjusted to accommodate the new object.

To add a control to the design space

1 From an open workspace or script, click the Insert Control tab on the designer's ribbon.

2 Click the control you want to add.

3 Drag the control to the design space and hover over the location where you want to place the control. A vertical or horizontal line indicates where the control will be placed on the design space.

4 Release the mouse button.

5 To edit the properties of the added control, refer to Editing design item properties.

❖ Editing workspaces

❖ Editing agent scripts

❖ Desktop Overview

Moving and deleting controls

You can easily move controls to other locations on your design space or delete them if they are no longer needed.

Note As with fields, moving and deleting controls can cause the removal of a row or column from the design space table if the control was the only remaining item in the row or column.

To move a control on the design space

1 From the open workspace or script, select the control you want to move, keeping the left mouse button depressed.

2 Drag the control to its new location on the design space.

3 Release the mouse button to position the control in its new location.

To delete a control from the design space

1 From the open workspace or script, right-click the control and select Delete. The Delete Confirmation window opens.

Caution If the control you are deleting is referenced in a workspace rule, the Delete Confirmation window will display a warning including the name of the rule. If you click Yes to delete the control, the reference will be removed and the rule will be disabled. Refer to Workspace rules.

2 Click the Yes button to confirm the deletion.

Working with button and image controls

You can add buttons to workspaces and scripts that you can use with rules to trigger actions when clicked. For example, you could add a button to a workspace to display an additional tab set when a staff member clicks it. Image controls are used to display a logo, diagram, or any other graphic. Images can also be used to trigger rules when clicked, but their more common purpose is to visually enhance the design.

Because the agent desktop uses image rendering components of Internet Explorer installed on your workstation, we recommend that your browser be configured to check for newer versions of stored pages every time web pages are visited. In this way, any image updates you perform as you design your workspace will be displayed promptly without requiring you to log out and back in to Oracle Service Cloud.

When you add a button or image to a workspace or script, it will have no effect on your rules until you configure the rules to use it. For information about using buttons and images in workspace rules, refer to Selecting rule triggers.

Adding text and images to button controls

When you add a button to the design space, the button contains default text. You can easily change the text and add an image to the button by selecting it on the design space and changing the button's properties from the Design tab. You can also size the button and specify where it should be positioned.

To add content to button controls

1 From the open workspace or script, select the button control you added to the design space.

2 Click the Design tab.

3 To change the default text on the button, click the Text button.

  a Type the text you want on the button.
  b Press **Enter** to save the text.

Tip You can change the font attributes of text on a button by selecting the button and choosing from the options on the Design tab's Label group.

4 To add an image to the button, click the Image button. The Select Image window opens, showing the images you have added using the Client Workflow Images explorer.

a Select the image you want to add to the button.

b To add a new image to the list, click Add New Image.

c To remove an image that was previously added to the button, select the No Value check box.

d Click the OK button to add the image to the button.

e To position the image on the button in relation to text on the button, click the Image Align button and select where you want the image in relation to the text. The available options are Left, Right, Top, Bottom, and Center.

Note For information about adding images for use with workspaces and scripts, refer to Adding images for use on workspaces.

5 To manually define the width of the button's margins, click the Margin button. The available options are None, Narrow, Medium, Wide, and Custom.

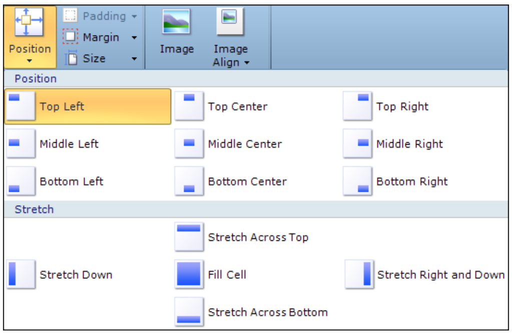
a To set custom margin widths, select Custom and enter the number of pixels you want for the button's margins in the Top, Bottom, Left, and Right fields.

6 To manually define the button's size, click the Size button on the Design tab and select Enable Auto Sizing to disable it.

a Click the Size button again and type the number of pixels you want for the button's size in the Width and Height fields.

b To re-enable auto sizing, click the Size button and select Enable Auto Sizing.

7 To position the button on the table cell that contains it, click the Position button on the Design tab to view available options.



a Select where you want the button placed on the table cell from the Position options.
b To stretch the button on the table cell, select how you want the button displayed from the Stretch options.

8 Click the Save button to save your changes.

Adding image controls

When you add an image to a workspace or script, you can specify options such as the size, position, and layout of the image.

To add an image control to a workspace or script

1 Drag the control to the design space (refer to Adding controls to workspaces and scripts). The Select Image window opens showing the images you have added using the Client Workflow Images explorer.

2 To add a new image to the list, click Add New Image.

3 Select the image you want to add and click the OK button. The image is added to the design space.

Note To select a different image, select the image you want to replace, click the Image button, and choose the new image from the Select Image window.

4 To manually define the image's size, click the Size button on the Design tab and select Enable Auto Sizing to disable it.
a Click the Size button again and type the number of pixels you want for the image's size in the Width and Height fields.
b To re-enable auto sizing, click the Size button and select Enable Auto Sizing.

5 To specify a layout for the image on the table cell, click the Image Layout button and select from None, Tile, Center, Stretch, and Zoom.

Note The Image Layout button is inactive when auto sizing is enabled.

6 To position the image on the table cell that contains it, click the Position button.
a Select where you want the image placed on the table cell from the Position options.

b To stretch the image on the table cell, select how you want the button displayed from the Stretch options.

Tip Stretch options from the Position button work best when a layout option is selected from the Image Layout button on the Design tab.

7 Click the Save button to save your changes.

Adding images for use on workspaces

Using the Client Workflow Images explorer, you can add images to use in workspaces and scripts. Once you have opened the explorer, you can add and manage images the same way you do in the Images explorer. Refer to Images explorer.

To open the Client Workflow Images explorer

Click the Configuration button on the navigation pane and double-click Client Workflow Images under Application Appearance.

Note You can add the Client Workflow Images explorer to **navigation lists** in the same way you can add other explorers. Refer to Modifying navigation sets.

Adding text with the text control

You can use text controls to add text that will display to your agents. You can also include variables to display values from the database. For example, you could add text, including the customer's name, that new agents can read when speaking with a customer who calls regarding an incident.

To add text with the text control

1 Click the Insert Control tab and add a text control to the design space.

2 Click the text control on the design space and type the text you want.

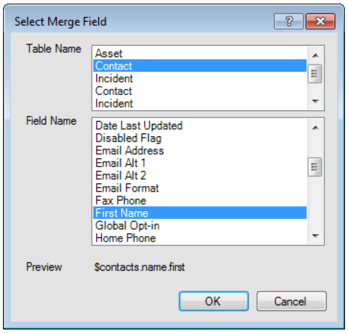
3 To change the font attributes for the text you entered, select the text you want to change and select options from the font attributes on the Design tab's Label group. Refer to Label properties for descriptions of these options.

4 To add a variable to the text, click the text control where you want to add the variable.

a Click the Insert Merge Field button on the Design tab.

Or

Right-click the control and select Insert Merge Field.



b Select the name of the database table with the field you want in the Table Name field.

Or

Select Current User to add a variable for the display information (such as the first name) of the staff member who is using the workspace or script.

Note Custom object workspaces and scripts can also use custom object fields as merge fields. However, workspaces and scripts for parent standard objects, such as contacts or incidents, cannot access these fields.

c Select the field you want to include on the text control on the Field Name field. The variable you define is displayed in the window's Preview field.

d Click the OK button to add the variable to the text control.

Working with list box, menu, radio button, and text box controls

List box, menu, radio button, and text box controls give you the ability to trigger workspace rules, script rules, script branches, or workflows from agent selections or text entries. These controls differ only in the type of input they accept from your agents and are added to workspaces in the same way you add any other control. However, with the exception of the text box control, you need to add entries to these controls that agents can select before the controls are useful.

Important The values entered in these controls are not saved in the record being edited. These controls are intended for use only with workspace rules, script rules, script branches, and workflows.

Once you add menu and list entries or radio buttons to the controls, you can create rules that are triggered when agents select the entries or buttons, or when they type certain text in a text box. You can also add rule conditions based on the value of these controls. Refer to Workspace rules.

Note You can specify options on the ribbon's Design tab for the list box, radio button, and text box controls to change their behavior or appearance. For definitions of the options for these and other controls, refer to Working with controls.

To add and edit items for list box, menu, and radio button controls

1 From an open workspace or script, click the Insert Control tab and add a list box, menu, or radio button control to the design space.

2 Select the control on the design space and click the Design tab.

Note Three default items are added to the control when you add it to the design space.

3 To change the text of an item in the control, select the item you want to edit on the items list and click the Edit Item button. The Edit Item window opens.

   a Type the text you want the item to display.

   b Click the OK button to save the new text.

Note For radio button controls, you can also edit the text of an item by simply clicking the item on the design space.

4 To add an item to the control, click the Add Item button on the Design tab to open the New Item window.

   a Type the text of the item you want to add to the control.

   b Click the OK button to add the new item to the control.

5 To change the order of an item on a control, select the item you want to move on the items list and click the Move Up or Move Down button to order the item as you want it.

6 To remove an item from the list, select the item you want to remove on the items list and click the Delete Item button.

7 To change the layout of a radio button control, select the control on the design space, click the Layout button on the Design tab, and select Horizontal or Vertical.

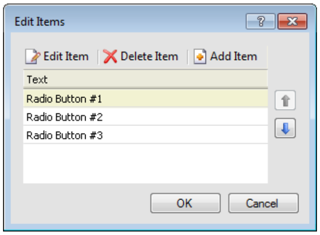
8 To allow staff members to make multiple selections from a list box, click the list box control on the design space, click the Design tab, and select the Allow Multiple Selections check box.

Managing items from the Edit Items window

If you want to add or edit several items on list, menu, or radio button controls, it can be faster to do so from the Edit Items window than from the ribbon's Design tab. You can reorder items from the window as well as add and edit items on the control.

To edit items from the Edit Items window

1 From an open workspace or script, right-click the control on the design space and select Edit List Items, Edit Items, or Edit Radio Buttons, depending on the type of control you select. The Edit Items window opens.



The window lists all the menu items, list items, or radio buttons on the control.

2 To add another item to the control, click the Add Item button and enter the item text.

3 To edit an item's text, select the item in the list and click the Edit Item button.

4 To remove an item from the list, select the item you want to remove and click the Delete Item button.

5 To reorder items in the list, select the item you want to reorder and click the up or down arrow to move the item where you want it.

6 Click the OK button to save the changes to the control's items and close the Edit Items window.

Working with report controls

Workspaces and scripts can include reports to let staff members view or access information related to the record they are editing. For example, the standard incidents workspace contains a tasks report to display the tasks associated with the incident. Most of the standard workspaces contain reports, and you can configure custom workspaces and scripts to show the reports you want to see.

Note Record command options are not applied when viewing reports in workspaces.

Using reports in standard workspaces

Many standard workspaces contain reports, most of which have row limits of 100 rows. The following table lists the reports on the standard workspaces. If you want to use a standard workspace but with a different report than the default one, you can copy the workspace and edit the copy to replace the default report with the report you want.

Table 165: Default Reports Used on Standard Workspaces

Standard Workspace/Tab or Control	Default Report
Answer	
Tasks	Tasks by Answer
Details	Answer Subscribers
Analytics	Answer Overview
Chat Sessions	
Incidents	Incidents by Contact
Contact	
Opportunities	Opportunities by Contact
Tasks	Tasks by Contact
Incidents	Incidents by Contact
Surveys	Survey History
Marketing Activity	Marketing Activity

Table 165: Default Reports Used on Standard Workspaces (Continued)

Standard Workspace/Tab or Control	Default Report
Incident	
Contacts/Contacts	Incident Contacts
Contacts/Incident History	Incidents by Contact
Tasks	Tasks by Incident
Organization/Incident History	Incidents by Organization
Organization/Contacts for Org	Organization Contacts
Web Visit	Incidents Web Visit Tab
Opportunity	
Contacts	Opportunity Contacts
Tasks	Tasks by Opportunity
Quotes	Quotes
Organization	
Contacts	Organization Contacts
Opportunities	Opportunities by Organization
Tasks	Tasks by Organization
Incidents	Incidents by Organization
Quote	
Quote Products	Quote Product List

Note Some standard workspaces also define default search reports for certain elements. For example, the Search Knowledge Base button on the Messages tab of the Incident workspace uses the Search Knowledge Base report. Refer to Selecting search reports.

Adding reports and relationship items to custom workspaces and scripts

When you add the report control to the design space, you need to select the report you want it to display. Reports used on workspaces and scripts may include run-time selectable filters and variables. However, with the exception of the reports used for search reports, these will not be available when the reports are viewed on workspaces or scripts.

Note By default, reports you add to workspaces do not run when you open the workspaces to create new records, since the records do not yet include data that can be filtered on. However, you can force reports to run for new records from the Design tab's Report Behavior button.

You can also select reports for **relationship items** to show information related to the record you are viewing. For example, the Contacts relationship item shows information about the contact related to an incident you are viewing. These relationship items are configured to use certain reports by default, but you can select different reports to use on your workspace if you want.

Note If the same object is added as a child in multiple relationships to the same parent (for example, if the contacts object is specified as the child of the incidents object in two relationships), the workspace designer's ribbon will still contain only one view item for the object. However, because new view reports are automatically created for each child relationship you define, when you add the view item to a workspace, you will be prompted to select which report to use. Refer to Defining relationships.

Reports used on report controls or relationship items automatically attempt to filter on the record being edited to display information related to the record. Therefore, these reports should contain at least one filter for the primary identification types for the kind of workspace or script you are using. For example, reports used in incident workspaces should filter on incident *(i_id)*, contact *(c_id)*, or organization *(org_id)*.

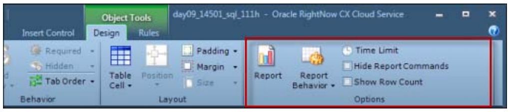
To add a report to a report control or change a report on a relationship item

1 From an open workspace or script, click the Insert Control tab.

2 Click the report control or the relationship item containing a report and drag it to the design space where you want it.

3 Select the control or relationship item on the workspace and click the Design tab. Configuration options for the report control are displayed on the Options button group.

Tip You can also double-click an object on the design space to select the Design tab and access properties related to the object.



4 Click the Report button to open the Select Report window.

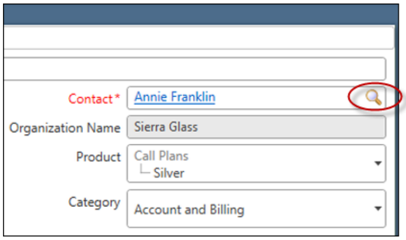
5 Select the report you want to add to the workspace and click the OK button.

6 Save the workspace.

Note If you add a report control to a workspace without selecting a report for the control, you will not be able to save the workspace.

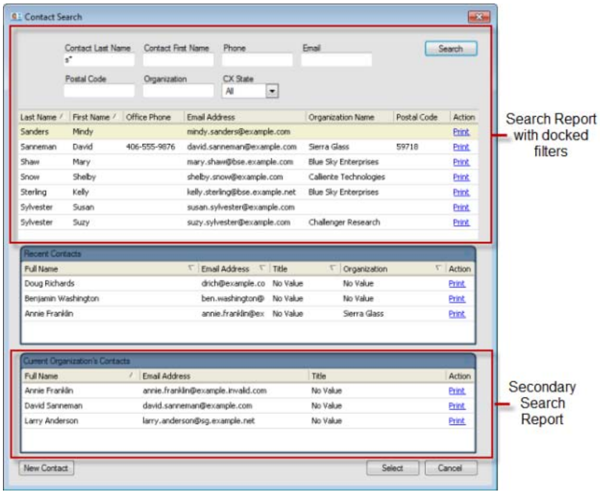
Selecting search reports

Some database fields and relationship items include search functionality that agents can use to find and associate records with the records being edited. When using a workspace or script, agents can access the search feature by clicking the Search button located next to the field or on the relationship item. For example, the button to open the Contact Search window from an incident workspace is located to the right of the contact field.



When you open a search window, the window displays a report and the report’s docked filters that are used to search for records. Some search windows also include secondary reports that are not searchable, but which can be used to display information below the primary search report. For example, a secondary search report can be used to display all contacts associated with an organization when you are searching for a contact in the primary search report.

Note Drill-down levels and report links can be used in search reports for database fields but are disabled on relationship items’ search reports.



The standard reports that are used by default with this functionality are designed to allow staff members to quickly locate the records they want. However, if the default reports do not meet your needs, you can specify the standard or custom reports you want to use for the primary and secondary search reports.

Note Searches are performed from workspaces’ search reports using docked filters. For this reason, the search reports you specify must include docked filters in order to search for records. Refer to [Docking variables and run-time selectable filters](#).

To select primary and secondary search reports for the Contacts Search window

1 From an open workspace or script, select the Contact field on the design space.
  Or
  Select the Contact relationship item on the design space.

2 Click the Design tab.

3 To change the primary search report, click the Search Report button. The Select Report window opens.

  Or

  To add a secondary search report, click the Secondary Search Report button.

Note To clear a secondary report from the Contact Search window, select the No Value check box on the lower left of the Select Report window. This check box displays only when selecting secondary search reports.

4 Select the report you want to use.

5 Click the OK button to close the Select Report window.

6 Click the Save and Close button to save your edits and close the workspace.

Report properties

In addition to selecting the report you want to appear on a workspace or script, you can modify the report's properties to enable certain behaviors and functions. The following report functions are available on the Design tab.

- **Time Limit**—Specifies the maximum amount of time a report can take to generate on the workspace. Refer to Specifying report time limits.
- **Hide Report Commands**—Hides and disables the report commands (for example, New, Open, Copy, Delete, Print, Forward, Assign, and Propose) on the workspace.
- **Show Row Count**—Displays the number of records in a report next to the tab title.

In addition, the following properties can be accessed by clicking the Report Behavior button on the Design tab.

Table 166: Report Behavior Properties

Property	Description
Delay Report Execution	Select this option if you want the report to run only when the tab the report is shown on is selected. If this option is not selected, the report runs when the workspace opens. This option is enabled by default. **Note:** If the report is visible when the workspace is opened (for example, it appears on the top tab), it will always run immediately even if the property is enabled.
Filter on Primary Key Only	Select this option if you want the report to filter only on the primary key. If this option is not selected, the report will also filter on any related objects. For example, when this option is enabled, an incidents report will use only the incident ID filter to filter the results. When the option is disabled, the report will also filter the report on the contact ID and organization ID values.
Open Existing Records in Separate Workgroup	Select this option if you want records opened from this report to be displayed in a new workgroup tab. This allows the opened record to be saved independently from the record the control is on. If this option is not selected, records will be opened on a sub-tab and edits are saved when any record in the sub-tab's workgroup is saved.
Delete Records Immediately	Select this option to delete records in the report when a staff member clicks Delete and confirms the deletion request. If this option is not selected, records will be queued for deletion and not actually deleted until the record being edited is saved.
Create New Records in Separate Workgroup	Select this option if you want new records created from a parent record to open in a new workgroup tab. This allows the new record to be saved without saving the parent record. If this option is not selected, new records will open on a sub-tab and edits are saved when any record in the sub-tab's workgroup is saved. **Note:** This property is available for the Incident View, Opportunity View, Task View, and Custom Object View relationship items.

Table 166: Report Behavior Properties (Continued)

Property	Description
Refresh Report When Data Changes	Select this option if you want the report to be run again when related data is changed. (For example, if a staff member is using a workspace that contains the Incidents by Organization or Contact report and changes the contact, the report refreshes to update with new information.) **Note:** This property is not available for the Manually Related Answers, Learned Link, Incident View, and Custom Object View relationship items.
Execute for New Records	Select this option if you want the report to run when you open the workspace to create a new record. This option is disabled by default to prevent reports that rely on data in the record from attempting to run when a new record is being created. **Note:** This property is not available for the Manually Related Answers, Learned Link, Incident View, and Custom Object View relationship items.

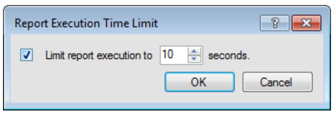
Specifying report time limits

You can specify the maximum amount of time a report can take to generate on a workspace using the Time Limit option. Specifying a time limit can improve workspace performance since workspaces are unavailable until reports on the workspace generate. If a report takes longer to generate than the time limit you specify, a warning message will display and the workspace will load without the report.

To set a time limit for a report control

1 From the open workspace or script, select the report control you want to modify.

2 Click the Design tab and click the Time Limit button.



3 Select the Limit Report Execution check box and then enter the maximum number of seconds you want to permit for a report to generate. You can select a value up to 240 seconds.

4 Click the OK button to save the time limit.

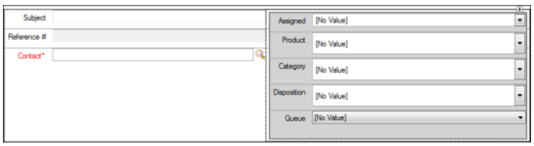
Important Reports placed on a workspace should be configured to return data that is related only to the record that is open. For example, a report on a Contact tab should return information about the contact rather than all contacts in the database. Reports that consistently time out in a workspace and cannot be further restricted should be removed from the workspace and run separately.

Working with panel controls

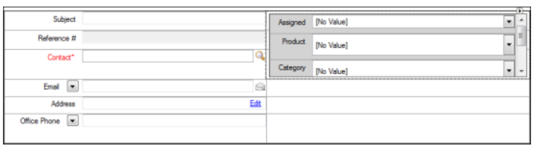
A panel is a special workspace control that provides grouping for fields and controls and lets you create scrolling subsections of the workspace. When you add more fields than the panel control can accommodate, a scroll bar appears automatically. This lets you add multiple fields to a panel even though the panel size is controlled.

You can customize each panel on your workspace to use different background colors, font colors, padding, and margins. This is helpful if you want to create distinct groupings of data on your workspace.

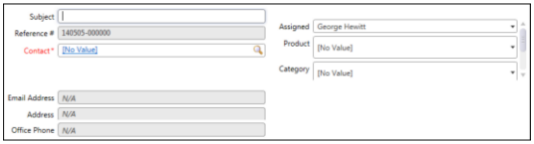
The following figure shows a panel control on the right. The panel has been defined to span three rows. The single panel contains the Assigned, Product, Category, Disposition, and Queue fields.



The next figure shows what happens to the panel control when more fields are added to the workspace, creating additional rows. Note that the panel still spans only three rows and now displays a scroll bar.



And this last figure shows how the panel is displayed to staff members using the workspace. They can scroll down on the panel to complete all fields.



Working with script controls

You can add scripts to workspaces to provide a sequence of steps and form elements for your agents to follow when working on records. Script controls can include the same fields and controls available for workspaces, and you can use the same script on as many workspaces as you want. If you want to place a set of fields and controls on several workspaces, you can add them to a script and then simply place the script on the workspaces.

Note Script controls are available only when scripting is enabled. For information about enabling scripts, contact your Oracle account manager.

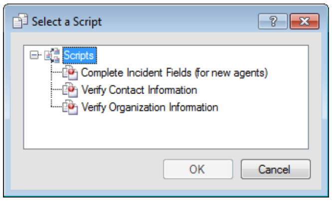
Scripts can also include pages and branching, so you can easily create a script to lead your agents through a procedure. For example, you could place a script control on an incident workspace to guide new agents through entering information for the record when a customer phones with a new incident. Refer to Creating and editing scripts.

As with workspaces, scripts are interface specific. In addition, the scripts that you can place on a workspace must be of the same type as the workspace. For example, you can place a control for an incident script on an incident workspace and you can place a control for a contact script on a contact workspace. For this reason, when you place a script control on a workspace, you can select only scripts that are of the same type as the workspace, and that were created on the same interface.

Note You can place multiple script controls on the same workspace.

To add a script control to the design space

1. From an open workspace, click the Insert Control tab and click the Script button.
2. Click the location on the design space where you want the script. The Select a Script window opens.



3 Select the script you want to use and then click the OK button.

4 To change the script used on the script control, click the script control and click the Script button on the Design tab to open the Select a Script window.

5 To change the size of the script control, select the control on the workspace, click the Design tab, select the Set Fixed Height check box, and click the Size button to type a size for the control. Refer to Design property descriptions.

Working with tables

You can add table controls to the design space to organize and align fields and controls within a set of content cells. By default, a newly placed table control features two rows and two columns containing spacers. You can adjust the number of rows and columns by editing the table properties or by inserting fields or controls around or between other fields and controls in the table. You can also enhance the appearance of a table by adjusting colors, borders, scroll bars, and size.

Tip Tables can be nested within the cells of other tables. However, for optimal workspace performance, we recommend limiting the number of nested tables as these can increase workspace processing time.

To add a table to the design space

1 From the open workspace or script, click the Insert Control tab and click the Table button.

2 Click the location on the design space where you want the table. The table contains two rows and columns by default.

3 To add columns or rows to the table, select the table on the design space, click the Design tab, and click the Add Column or Add Row button. The table updates to show the new columns and rows.

Tip If you find it difficult to select the table by clicking on its outer border, it may be easier to select it using the Current Selection drop-down menu. Refer to Selecting fields and controls using the ribbon.

4 To edit table properties, such as borders and background color, refer to Layout properties.

Working with tab controls

You can add, move, and delete individual tabs and tab sets, or groups of tabs. Tabs are moved and deleted with the same methods used to move and delete fields and controls on the upper section of the workspace.

To add tabs to the design space

1 From the open workspace or script, click the Insert Control tab on the ribbon, click the Tab Set button, and click the location on the design space where you want the tab set.

Tip You can nest tab sets within other tab sets.

2 To add tabs, right-click next to an existing tab and select Add Tab.

Or

Right-click an existing tab and select Add Tab Before or Add Tab After.

3 Rename the tab.

a Select the new tab.

b Click the Design tab on the ribbon.

c Click the Text button on the ribbon's Label group and type the name you want for the tab.

To move a tab

Note Staff members have the option of dragging the tabs to rearrange them on the workspace. If they do this, the tabs' positions are stored in their local settings. Your changes to the tab positions will not affect staff members who have customized their tab positions on the workspace. For an overview of account settings that can be customized by staff members, refer to Changing your personal settings.

Right-click the tab and select Move Left or Move Right.

Or

Click the tab's **action arrow** and select Move Left or Move Right. Refer to Accessing design properties from the actions list for a description of action arrows.

To delete a tab or tab set

1 Right-click the tab or tab set and select Delete.

2 Click the Yes button on the Delete Confirmation message.

Working with browser controls

By adding a browser control to a workspace or script, you can display a web browser inline with your records. You can specify the URL you want, and you can include variables in the URL to link Oracle Service Cloud data—such as record IDs, custom field values, or custom object field values—with the web page you open or through Oracle RightNow Connect APIs. Refer to Answer ID 2429 on our customer support site.

Also, the page loaded in the browser can contain RightNow Connect JavaScript code to view and edit information about the record being edited. Refer to the *Connect Desktop Integration (Javascript) API* documentation.

Best practices for adding browser controls

Browser controls use components of Microsoft Internet Explorer installed on the workstation. For this reason, your workspace load time may increase due to such factors as the complexity and size of page content, the connection to the site host, as well as the browser's version, settings, and memory usage. Any page that loads slowly or incorrectly in Internet Explorer will likely experience similar problems when loaded in a browser control on the same workstation.

However, there are a few practices you can follow to help reduce the impact of these effects.

- Keep the Delay Page Load property enabled for all browser controls to ensure its contents do not load until the control is visible.
- When loading pages developed by your organization, manage browser memory wisely by reducing the complexity of the pages you are loading. Be sure to thoroughly test and minimize the use of web development libraries to guard against memory leaks. Also, make sure that the connection to the page server is reliable.
- If agents often need to open specific web pages—especially those that take awhile to load—consider adding those pages as links for the workspace's Links button. Refer to Adding URL links to the Links button.
- Minimize the number of browser controls to reduce memory usage and performance. You can use workspace rules to change the URL of a browser control dynamically. Or you can combine multiple pages into a single control using an HTML frame set or create a single launch page with links to the other pages.

To add a browser to a workspace or script

1. Click the Insert Control tab and click the Browser button.
2. Click the location on the design space where you want the browser. The browser is added to the workspace.
3. Select the browser control and click the Design tab.

4 Click the URL button and type the URL you want the browser control to open when the workspace is opened.

Tip You can also set the URL of a browser control using a workspace rule. Refer to Adding and editing actions.

5 To delay the loading of the browser in a tab until the tab is active, select the Delay Page Load check box. The Delay Page Load check box is selected by default.

Note If you place a browser control on a tab that is not the active (or top) tab when the workspace opens, we recommend that you keep the control's Delay Page Load property set to its default enabled state. If this property is not enabled, the browser control will be activated when the workspace is opened, which may prevent other controls on the workspace from functioning as expected.

6 To change the size of the browser control, click the Design tab and select the Set Fixed Height check box.

   a Click the Size button to type a size for the control.

7 To open pop-up windows from the browser content in child browser controls, select the Open Pop-ups in New Browser Control check box.

Note If this check box is not selected, pop-ups will open in a full Internet Explorer browser, which can cause session variables to be lost. To ensure session variables are maintained, select the check box.

8 To suppress any warning prompts (such as script errors and authentication requests) that may occur in the browser control when a URL is loaded, select the Suppress Errors and Authentication Dialogs check box.

Field and control properties

Fields and controls (including relationship items and script questions) have attributes you can configure using the options on the Design tab of the designer ribbon. Many of these attributes are shared by numerous items such as size, label position, and read-only attributes. When you change the properties of a field or control, the design space is updated to reflect your changes.

The properties you can edit depend on the field or control you are editing. The following properties are explained in greater detail in this section.

- Using the Default Value property
- Custom field properties
- Setting hidden, required, and read-only properties
- Setting hidden and read-only properties for required fields

For a full list of all properties and their descriptions, refer to Design property descriptions.

❖ Editing workspaces

❖ Editing agent scripts

❖ Desktop Overview

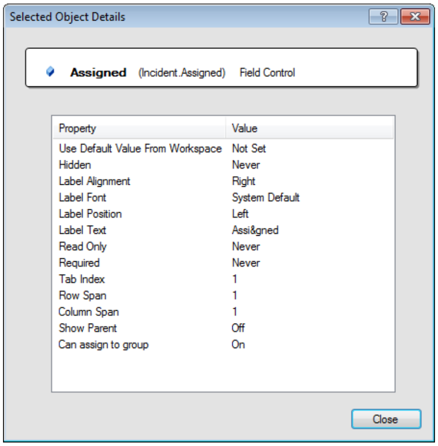
Viewing design item properties

You can quickly view all the properties for a field or control from the ribbon's Design and Rules tabs. This helps you see what properties are already applied to an item before you edit the item.

To view item properties

1 From an open workspace or script, select an item on the design space.

2 Click the Show Details button on the Design tab to open the Selected Object Details window.



The information that displays depends on the item you select and the properties that are applied to it. Any property applied to the item will be shown on the window, including the item's positioning on the workspace and any visibility, hidden, or read-only attributes. Refer to Field and control properties for descriptions of the properties that can be applied to items on workspaces.

3 Click the Close button.

Editing design item properties

When you select a field or control on the design space, the Design and Rules tabs are displayed on the ribbon with buttons appropriate for the selected item. To select an item, you can click it on the design space or you can select it from the Current Selection drop-down menu on the Design tab (refer to Selecting fields and controls using the ribbon). If you want to edit properties shared by a number of fields and controls, you can select them and then edit them simultaneously.

To edit a field or control

1 From an open workspace or script, select a field or control on the design space and click the Design tab. The options displayed on the tab vary depending on the item you select.

Tip You can also double-click an object on the design space to select the Design tab and access properties related to the object.

2 Click a button on the Design tab to adjust the property you want to change. Refer to Design property descriptions. The object is updated on the design space to reflect the change.

3 Click the Save and Close button to save your changes.

Selecting multiple fields and controls

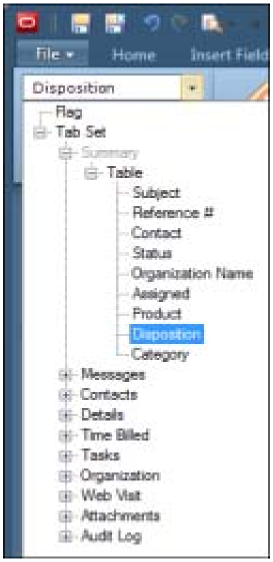
You can select multiple fields and controls on the design space to edit properties they share or remove them from your design space. When you select multiple fields and controls, the Delete button on the ribbon's Design tab will be available on the ribbon, along with buttons to edit common attributes of the selected fields and controls. For example, if you select two fields and a title bar, you will be able to click the Read Only button on the Design tab, since both fields and controls have this attribute.

To multi-select fields and controls

Press **Ctrl** while selecting the fields and controls on the design space that you want to edit or delete.

Selecting fields and controls using the ribbon

The Current Selection drop-down menu displays a tree structure showing all the fields and controls on the design space. You can use this menu to select items on the design space to view or edit. The figure to the right shows the expanded tree when the Disposition field is selected on an incident workspace.



When you navigate the tree structure and click a field or control, it is highlighted on the design space and the options on the Design tab are updated to reflect the actions you can take on the item. This allows you to quickly find and select a specific field or control on the design space and access its properties without having to locate it on the design space.

To access design space items using the ribbon

1. From an open workspace or script, click an item on the design space to activate the Design and Rules tabs on the ribbon.
2. Click the Design or Rules tab.
3. Click the Current Selection drop-down menu on the ribbon's Selected Object group. The tree opens listing the fields and controls on the design space. The item you selected in step 1 is automatically selected in the tree.
4. Expand or collapse the tree to navigate to the field or control you want to view.
5. Click the item in the tree to select it on the design space.

Accessing design properties from the actions list

In addition to using the buttons on the Design tab to edit fields and controls on the design space, you can open an actions list that is unique for each item. The actions list contains some of the same options accessed from the Design tab. Using the actions list can be helpful when the designer ribbon is collapsed.

You can access the actions list either by right-clicking an item on the design space or by selecting the item and clicking the action arrow. The action arrow appears on the upper right side of each selected item on the design space.

The list of action options for a tab control is shown in the following figure. To select an action, click it in the list.

Custom field properties

You can add custom fields to workspaces and scripts just like a standard database field. However, since you can modify certain properties of custom fields when you create them on the Custom Fields editor, there are some considerations to be aware of when editing custom fields you add to a workspace.

- If a default value was defined for the custom field when it was created, that default value will appear when you place the field onto the design space. To override the field's original default and set a different default value from the design space, you must enable the Default Value > From Workspace or From Script property. Refer to Using the Default Value property.
- If a mask was specified for the custom field when it was created, you can view the mask by clicking the RNT Mask button on the field's Design tab on the ribbon. You cannot specify masks for custom fields when you place them on the design space. Refer to Input masks.

- If you add a custom field that was configured to be required when it was created, the field's required property will be enabled on the design space by default. However, you can disable the field's required property if you do not want to require the field. Refer to Setting hidden, required, and read-only properties.

Note Custom field properties defined on the editor affect field behavior only on the workspace or script you are editing. Properties affecting the behavior of custom fields on the **customer portal** are defined on the Custom Fields editor and are not affected by field properties set in a workspace or script.

Using the Default Value property

When you edit a workspace or script, you can set a default value for some fields on the workspace. When a staff member creates a new record using the workspace or script, the field is automatically populated with the default value that you select.

Note The default value is applied only to new records created in the workspace or script. Records created from other channels, such as the **Ask a Question page**, are not impacted.

In addition to the Default Value property, there are a few other methods by which values can be set. When configuring your business processes in Oracle Service Cloud, carefully consider the following order in which these defaults are applied.

1. Values defined by Oracle Service Cloud itself, as described by the Data Dictionary.
2. Values applied by the workspace Default Value property.
3. Values applied when creating a record for a contact selected in a report.
4. Values applied from entering information in a search filter, such as when searching for a contact that is not found, then creating a new contact.
5. Values applied by rules triggered when the editor loads.

Staff members with appropriate permission can change a field's default value. For example, if you have a group of agents that generally handles incidents for a certain product, you can create an incident workspace that has a default product specified for the Product field. As a result, all incidents that the group creates will initially be set to the default product. However, if they need to associate a different product (and they have appropriate permissions), they can change the field to a different value.

When you add a field to the design space that can have a default value, the field's Default Value From Workspace property is initially disabled and must be enabled before you can define a default value.

To enable the Default Value property and set a default value for a field

1 From the open workspace or script, select a field on the design space.

2 Click the Design tab and click the Default Value button.

Note You will see the Default Value button only if the selected field accepts default values from the workspace.

3 Select From Workspace or From Script to enable the Default Value property. A check displays next to the property that you have enabled.

4 Click the field you want to add the default value to. Editing options are displayed according to the field type. For example, you can type text directly into a text field on the design space or select from a drop-down menu on a menu field.

5 Click the Save and Close button to save your changes.

Setting hidden, required, and read-only properties

You can apply the following properties to many of the items you add to a workspace or script.

- **Read Only**—Read Only items are displayed to agents, but agents cannot change the values in the fields or controls. This property is not available for multi-edit workspaces.
- **Required**—Required items are displayed to agents. When agents use the workspace or script to edit a record, they are required to enter a value for the field in order to save the record.
- **Hidden**—Hidden items are not displayed to agents.

When you set any of these properties, you can choose when the property should be applied to the item. You can choose to apply the property only when the workspace or script is used to create a record, only when it is used to open an existing record, or both.

Note Multi-edit workspaces do not include the option to apply the Required or Hidden properties when creating new records, since these workspaces are not used when creating records.

You can also apply these properties to the item on a per-profile basis, allowing you to use the same workspace or script for several profiles if you want different profiles to have different settings for these properties. For example, you can create a workspace that includes fields showing contacts' phone numbers and addresses. You can then set the fields' Hidden properties by profile so the fields are shown to staff members with one profile, but are not visible to staff members with a different profile.

To set the Read Only property

Important This procedure uses the Read Only property as an example, but applies to the Hidden and Required properties as well.

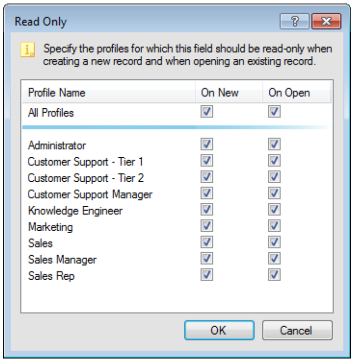
1 From the open workspace, select the item you want to make read-only.

2 Click the Design tab and click the Read Only button.

3 To make the item read-only for all profiles when creating a new record, select On New.

4 To make the item read-only for all profiles when opening an existing record, select On Open.

5 To make the item read-only on a per-profile basis, select Profile Based. The profile selection window opens.



a Select the check boxes in the On New column next to the profiles you want to apply the property to. Profiles you select will have read-only access to the item when staff members with the profile use the workspace or script to create a new record.

b Select the check boxes in the On Open column next to the profiles you want to apply the property to. Profiles you select will have read-only access to the item when staff members with the profile use the workspace or script to open an existing record.

6 Click the OK button to close the profile selection window.

7 Click the Save and Close button to save your changes.

Setting hidden and read-only properties for required fields

You can set the Hidden and Read Only properties for required fields when the combination of properties does not prevent a required field from being set. However, attempting to set certain combinations of the Hidden and Read Only properties on required items is not allowed. When setting these properties for required fields, you should consider the following limitations.

- Standard fields that are required for a workspace, such as the Contact field on incident workspaces, cannot have their Required properties disabled or Read Only properties enabled for new records.
- If you set a field's property to Read Only for new records, you cannot also enable the field's Required property for new records.
- If you set a field to be hidden when creating a record, you cannot also enable the field's Required property when creating a record.
- If you set a field to be required when opening a record, you can set the Hidden property for that field to any value.

- If you set a field to be required when creating a record, you can enable the Hidden property when opening an existing record.
- If you set a field to always be required, you can enable the Hidden property when opening an existing record.
- If you set a field to always be required, you can enable the Hidden property when creating a record if you also set a default value for the field on the design space. Refer to Using the Default Value property.

Design property descriptions

When editing fields or controls that you add to a workspace or script, you can adjust different properties depending on the element you select. When you add one of these items to the design space, you can select it and then edit its properties using the options available on the ribbon's Design tab.

The options on the Design tab are organized by groups and described in the following sections. Not all groups are available for all elements on workspaces or scripts.

Note For the sake of simplicity, descriptions that refer to fields may also apply to controls and relationship items.

Selected Object properties

The following table describes the properties on the Selected Object group. The options in this group let you select the element to edit and delete. Options for tab controls are also available here.

Table 167: Selected Object Properties Descriptions

Property	Description
Current Selection	This field shows the name of the item currently selected on the design space. Click this drop-down menu to view a tree listing the fields and controls currently on the design space. You can select items from the tree to edit them using the options on the Design tab.
Show Details	Click this button to display a list of the selected item's properties and corresponding values.
Delete	Click this button to delete the item currently selected on the design space.

Table 167: Selected Object Properties Descriptions (Continued)

Property	Description
Add Tab	Click this button to add a tab. This button displays only when a tab set is selected.
Add Tab After	Click this button to add a new tab after the tab that is currently selected.
Add Tab Before	Click this button to add a new tab before the tab that is currently selected.
Move Left	Click this button to move the tab that is currently selected one position to the left.
Move Right	Click this button to move the tab that is currently selected one position to the right.
Tab Indexes	Click this button to define the order in which the fields and controls on the currently selected tab can be tabbed through using the keyboard's Tab key.
Set Child Tab Indexes from Top to Bottom	Select this option to start the tabbing sequence with the upper left item on the selected tab, proceed down to the end of the column, continue at the top of the next column, and so on, ending with the item at the lower right.
Set Child Tab Indexes from Left to Right	Select this option to start the tabbing sequence with the upper left item on the selected tab, proceed across to the end of the row, continue at the left of the next row, and so on, ending with the item at the lower right.

Behavior properties

The following table describes the properties on the Behavior group. The options in this group let you modify read-only, required, and hidden properties for the selected element. You can also change the tab order of the selected element.

Table 168: Behavior Properties Descriptions

Property	Description
Read Only	Click this button to specify when this property should be applied to the selected element. • On New—The item will be read-only when the workspace or script is used to create a new record. Multi-edit workspaces do not have this option. • On Open—The item will be read-only when the workspace or script is used to open an existing record. • Profile Based—The item will be read-only for staff accounts using selected profiles. Each profile can have different On New and On Open options applied. Refer to Setting hidden, required, and read-only properties. **Note:** The Read Only property cannot be set to On New if the object's Required property is also set to On New for any or all profiles, and a default value is not set for the object.
Required	Click this button to specify when this property should be applied to the selected element. • On New—The item will be required when the workspace or script is used to create a new record. Multi-edit workspaces do not have this option. • On Open—The item will be required when the workspace or script is used to open an existing record. • Profile Based—The item will be required for staff accounts using selected profiles. Each profile can have different On New and On Open options applied. Refer to Setting hidden, required, and read-only properties. Oracle Service Cloud requires certain fields for certain record types. These fields are automatically set to On New and On Edit, and the property is disabled so that you cannot change it.

Table 168: Behavior Properties Descriptions (Continued)

Property	Description
Hidden	Click this button to specify when this property should be applied to the selected element. • On New—The item will be hidden when the workspace or script is used to create a new record. Multi-edit workspaces do not have this option. • On Open—The item will be hidden when the workspace or script is used to open an existing record. • Profile Based—The item will be hidden for staff accounts using selected profiles. Each profile can have different On New and On Open options applied. Refer to Setting hidden, required, and read-only properties. **Note:** Required fields cannot be hidden when creating records.
Tab Order	Click this button to define the order in which the fields and controls can be tabbed through on the parent table of the workspace or script, using the keyboard's Tab key. You can manually specify the tab order value for each item or you can assign the tab order automatically.
Set Parent Table's Tab Indexes from Top to Bottom	Select this option to automatically assign tab order values for all items. When you select this option, the tab ordering will start with the upper left item on the parent table, proceed down the column, then continue at the top of the next column, ending with the item at the lower right. **Note:** This selection will reset any numerical ordering that has been defined using the Value property.
Set Parent Table's Tab Indexes from Left to Right	Select this option to automatically assign tab order values for all items. When you select this option, the tab ordering will start with the upper left item on the parent table, proceed across the row, then continue at the left of the next row, ending with the item at the lower right. **Note:** This selection will reset any numerical ordering that has been defined using the Value property.

Table 168: Behavior Properties Descriptions (Continued)

Property	Description
Value	Type a value in the property to customize the order in which fields and controls can be tabbed through on the workspace or script. The first field or control is 0, and each subsequent press of the Tab key steps through the items in numerical order. **Note:** By specifying a numerical order, you can define whatever tab sequence you want. However, for ease of use, it is usually best to follow the order of the fields and controls as they are arranged on the design space.

Label properties

The following table describes the properties on the Label group. The options in this group let you adjust the fonts and placement of labels for fields you add to your workspace or script.

Table 169: Label Properties Descriptions

Property	Description
Font	Select the font you want to use for the label from this drop-down menu.
Font Size	Select the font size you want to use for the label from this drop-down menu.
Bold/Underline/Italic/Strikethrough	Click these buttons to toggle font style attributes for the label.
Font Color	Select the font color you want to use from this drop-down menu.
Background Color	Select the background color you want to use from this drop-down menu. **Note:** This option is enabled when editing an element that has a background, such as the panel control.
Align Text Left/Center/Right	Click these buttons to move the label to the leftmost, center, or rightmost side of the available space for the label.
Label Position	Click this drop-down menu to select the label's position in respect to the field. You can position the label at the right, left, top, or bottom of the field. The default label position is to the left of the field.

Table 169: Label Properties Descriptions (Continued)

Property	Description
Text	Click this button to change the text for the label of a field or control. When changing the label for a control, such as a tab, a text box will display. Type the text you want for the label in the text box and press **Enter**. When changing the label for a field, the label will be highlighted when you click the Text button and you can edit the label on the design space. You can also click the label on the design space without clicking the Text button. To allow the use of shortcut keys (Alt + <selected character>), type an ampersand (&) in front of the character you want to be the shortcut key. For example, to allow staff members to move the focus to a control with the label "Details" by pressing **Alt+t**, type `De&tails`. **Note:** Text fields used in scripts are limited to 1,000 characters.

Layout properties

The following table describes the properties on the Layout group. The options in this group let you change the padding, margins, and height of workspace or script elements. You can also increase or decrease the number of rows or columns used by the selected element.

Table 170: Layout Properties Descriptions

Property	Description
Table Cell	Click this button to change the number of rows or columns used by the field or control on the design space.
Increase/Decrease Row Span	Select these options to increase or decrease the number of table rows used by the selected field or control. The number of rows used is increased or decreased by one each time this option is selected.
Increase/Decrease Column Span	Select these options to increase or decrease the number of table columns used by the selected field or control. The number of columns used is increased or decreased by one each time this option is selected.

Table 170: Layout Properties Descriptions (Continued)

Property	Description
Position	Click this button to select the position of the selected object on the table cell that contains it. You can also select options to stretch the object on the table cell.
Padding	Click this button to define the amount of space between the boundaries of the selected control and its contents on the left, top, right, and bottom. For example, you can specify that the text in a panel will begin 50 pixels below the top of the panel. The available options are None, Narrow, Medium, Wide, and Custom. Select Custom to define a specific number of pixels to use for the top, bottom, left, and right padding.
Margin	Click this button to define the amount of space between the selected control and other fields and controls on the left, top, right, and bottom. The available options are None, Narrow, Medium, Wide, and Custom. Select Custom to define a specific number of pixels to use for the top, bottom, left, and right margins.
Size	Click this button to specify the size of the selected control. For some controls, you can select Enable Auto Sizing to automatically adjust the control's height and width to its natural size. If you disable auto sizing, you can type the height and width (in pixels) of the field or control on the workspace. **Note:** On some fields and controls, the MultiLine or Set Fixed Height properties on the Design tab's Options group must be enabled before you can edit the Height property.

Options properties

The following table describes the buttons available on the Options group. The properties you can edit depend on the element you select. This table lists all properties in alphabetical order so you can easily find specific properties.

Table 171: Options Properties Descriptions

Property	Description
Accepts Return	Select this check box if you want staff members to be able to press Enter in a multi-line field.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Accepts Tab	Select this check box if you want staff members to be able to tab to the field.
Activity Position	Click this button to set the position of the activity status indicator on the Chat Transcript Control relationship item.
Allow Delete	Select this check box to allow agents to delete files that have been attached and saved to a record. If this check box is not selected, attached files can be deleted only if the Save button has not yet been clicked.
Allow Multiple Selections	Select this check box to allow agents to select more than one item in a list box control.
Allow Tab Reordering	Select this check box to allow staff members to drag and reorder the tabs of the selected tab set. If this check box is not selected, the tabs cannot be reordered by staff members.
Always Show Parent with Visible Child	Select this check box for a hierarchal menu to display parent items in cases where the parent is hidden but one or more of its children are visible. A parent displayed in this manner cannot be selected.
Anonymous	Select this check box to permit survey responses to be entered when a valid contact is not associated with the record being viewed. This option is available only if the survey allows anony-mous responses.
Answer ID	Click this button and type an answer ID for an Answer Display control.
Auto Ellipsis	Select this check box if you want an ellipsis (…) automatically added when the text of the title bar exceeds the space allocated to it.
Auto Scroll Control Position	Click this button to set the position of the auto scroll control on the Chat Transcript Control relationship item.
Border Style	Click this button to select a border style for the selected table con-trol. The available options are None, Fixed Single, and Fixed 3D.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Can Assign to Group	Select this check box to permit staff members to assign the record to a group rather than a specific staff member. If this check box is not selected, staff members must assign the record to a staff member within a group.
Cell Border Style	Click this button to select a border style for the cells in the selected table control. The available options are None, Single, Inset, Inset Double, Outset, Outset Double, and Outset Partial.
Control Context	Click this drop-down menu and select an option that controls how names in the Assigned field for tasks are grouped. The options are: • Default—Names are displayed in a flat alphabetical list. • Sales—Names are displayed by Manager hierarchy. • Incident—Names are displayed by Group hierarchy. • Answer—Names are displayed by Group hierarchy. • Organization—Names are displayed by Manager hierarchy. • Campaign—Names are displayed by Group hierarchy. • Document—Names are displayed by Group hierarchy. • Mailing—Names are displayed by Group hierarchy. • Survey—Names are displayed by Group hierarchy.
Default Channel	Click this button to define the default channels for customer entries and notes.
Default Channel for Customer Entry	Select the default channel to use for the customer's entry on a record from this list. Options include No Default, Phone (the default value), Fax, Post, Web, and Email.
Default Channel for Note	Select the default channel to use for the note on an incident, contact, organization, or opportunity from this list. Options include No Default, Phone, Fax, Post, Web, and Email.
Default Font	Click a drop-down menu from this button group to select a default font and font size for the Rich Text Incident Thread control.
Default Notification Action	Click this button to specify when to notify subscribers when an answer is updated. Options include No Change, Do Not Notify, Hourly, Daily, Weekly, and Monthly.
Default Phone Type	Click this button to select the default phone type that should be displayed on the workspace. For example, you can choose Office Phone or Mobile Phone.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Default Thread	Click this button to define the default thread type for new incidents or incidents being edited.
Default Thread on Edit	Click this drop-down menu and select an option to define the default thread for an incident being edited. Options include No Default, Private Note, Response (the default value), and Customer Entry.
Default Thread on New	Click this drop-down menu and select an option to define the default thread for a new incident. Options include No Default, Private Note, Response, and Customer Entry (the default value).
Default Value	Click this button and select From Workspace or From Script if you want to specify a field's default value. When this option is enabled, you can edit the field on the design space to specify the default value that will be used when the workspace or script is used to create a record. The value can be changed by staff members who have permission to edit the field. Refer to Using the Default Value property. **Note:** The default value is applied only to new records created in the workspace or script. Records that were created from other channels, such as the **Ask a Question** page, are not impacted.
Delay Page Load	Select this check box to prevent the web page specified in the browser control from loading until the tab the control is on is selected. When this option is disabled, the web page will load as soon as the workspace or script opens, even if the browser control is not initially displayed. **Note:** If the browser is visible when the workspace or script page is opened (for example, it appears on the top tab), it will always open immediately even if this property is enabled.
Disable Email Icon	Select this check box to disable the Send Email envelope button that appears next to the Email Addresses field. When this check box is cleared, clicking the Send Email button opens the contact email address in a new message in the workstation's default mail client, outside of Oracle Service Cloud.
Display Options	Click this button to select toolbar options for the Chat Control relationship item.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Show Toolbar	Select this option to display the Chat Control toolbar.
SmartAssistant	Select this option to display the SmartAssistant button on the Chat Control toolbar.
Search Knowledgebase	Select this option to display the Search Knowledgebase button on the Chat Control toolbar.
Standard Text	Select this option to display the Standard Text button on the Chat Control toolbar.
Filter Type	Click this button to select filter options for custom object or system attribute menus that are populated by the Accounts by Group or Accounts by Manager menu. The option you select will be used to filter the accounts listed in the menu based on account status. Available options include All Accounts, Enabled Accounts, or Accounts Enabled for Assignment.
Hide Report Commands	Select this check box to hide and disable the report commands (New, Open, Copy, Delete, Print, Forward, Assign, and Propose) on the workspace.
Image	Click this button to select the image you want to place on button or image controls. Refer to Working with button and image controls.
Image Align	Click this button to position an image added to a button in relation to the button text. Refer to Working with button and image controls.
Image Layout	Click this button to select how you want the button or image control sized. Refer to Working with button and image controls.
Increment	Type a number that defines the value an integer field is increased or decreased when the up or down arrow is clicked. The default value is 1.
Layout	Click this button to select whether the items in a radio button control are displayed vertically or horizontally.
Legacy Status Mode	Click this button to enable the legacy status indicator on the Chat Transcript Control relationship item.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Limit By Profile Interface(s)	Click this button to limit products and categories displayed on the Products and Categories relationship item to those that have administration visibility on the interfaces to which the staff member's profile has access.
Locale	Click this button to select a locale for the Policy Automation control. For information about Oracle Policy Automation, refer to Oracle Policy Automation Cloud Service. **Note:** To enable Oracle Policy Automation with Oracle Service Cloud, contact your Oracle account manager.
Max Length	Click this button and type the maximum number of characters the field can contain. You can enter values from 1 to 4,000.
Minimum Level	Click this button and type the minimum number of levels of products, categories, or dispositions that staff members must enter when working on incidents. The acceptable range is between 0 and 6.
Multiline	Select this check box to allow multiple lines in the field. If this option is not enabled, the field will be restricted to a single line.
No Time Portion	Select this check box to hide the time portion of date/time fields, such as the Date Created field. **Note:** If this option is selected for fields that can be edited, staff members will not be able to enter exact times. You may want exact times for reporting purposes.
Open Pop-ups in New Browser Control	Select this check box to open pop-up windows from the browser content in child browser controls. When this option is not selected, the control will fill the maximum allowed space. **Note:** If this check box is not selected, pop-ups will open in a full Internet Explorer browser, which can cause session variables to be lost. To ensure session variables are maintained, select the check box.
Password Cover	Type the character you want to use to hide the password when it is typed on the workspace. The default is an asterisk (*). **Note:** This option is available for use with the organization password field. You cannot add the contact password field to workspaces.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Permissions	Click this button to manage individual options available on the Rich Text Incident Thread control. Refer to Responding to incidents. **Note:** All permissions—except Always Default to Plain Text and Always Use Plain Text—are selected by default. Also, these permissions are enforced only for staff members using the workspace, and do not affect actions performed by workflow or script rules.
Follow Links	Select this option to allow agents to navigate to a linked URL in a web browser when they click the link in a committed thread. When this option is not selected, the function is not available and an error message is displayed when the agent clicks a link in a committed thread.
Follow Incident Reference # Links	Select this option to allow agents to open an incident when they click the incident reference number in a committed thread. When this option is not selected, the function is not available.
Allow Using Send On Save	Select this option to display the Send On Save check box on the Messages tab toolbar on an incident thread. When this option is not selected, the check box is hidden.
Allow Using SmartAssistant	Select this option to display the SmartAssistant button on the Messages tab toolbar on an incident thread. When this option is not selected, the button is hidden.
Allow Using Search Knowledgebase	Select this option to display the Search Knowledgebase button on the Messages tab toolbar on an incident thread. When this option is not selected, the button is hidden.
Allow Adding Standard Text	Select this option to display the Standard Text button on the Messages tab toolbar on an incident thread. When this option is not selected, the button is hidden.
Allow Toggling Thread Content to Plain Text	Select this option to allow an agent to toggle between using Plain Text and Rich Text format modes in incident thread entries. **Note:** When this option is selected, the Always Use Plain Text option is cleared.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Always Default to Plain Text	Select this option to use Plain Text format mode for a new incident thread entry. **Note:** When this option is selected, agents will be able to switch to Rich Text format mode if the Allow Toggling Thread Context to Plain Text option is also selected.
Always Use Plain Text	Select this option to allow only Plain Text format mode in incident thread entries. The Rich Text format mode will not be available to agents. **Note:** When this option is selected, the Allow Toggling Thread Content to Plain Text option is cleared and the Always Default to Plain Text option is selected.
Allow Adding Responses	Select this option to enable the Response item in the Add button drop-down menu on the Messages tab toolbar. When this option is not selected, the Response item is not displayed. **Note:** At least one of Allow Adding Responses, Allow Adding Customer Entries, or Allow Adding Notes options must be selected for the Add button to display on the Messages tab toolbar.
Allow Adding Customer Entries	Select this option to enable the Customer Entry item in the Add button drop-down menu on the Messages tab toolbar. When this option is not selected, the Customer Entry item is not displayed. **Note:** At least one of Allow Adding Responses, Allow Adding Customer Entries, or Allow Adding Notes options must be selected for the Add button to display on the Messages tab toolbar.
Allow Adding Notes	Select this option to enable the Private Note item in the Add button drop-down menu on the Messages tab toolbar. When this option is not selected, the Private Note item is not displayed. **Note:** At least one of Allow Adding Responses, Allow Adding Customer Entries, or Allow Adding Notes options must be selected for the Add button to display on the Messages tab toolbar.
Allow Adding CC Recipients	Select this option to allow display of the CC field in the Response title bar when the Send on Save check box is selected by an agent. The agent can show or hide the CC field by clicking the Options button on the Messages tab toolbar and selecting or clearing the Show CC check box.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Allow Adding BCC Recipients	Select this option to allow display of the BCC field in the Response title bar when the Send on Save check box is selected by an agent. The agent can show or hide the BCC field by clicking the Options button on the Messages tab toolbar and selecting or clearing the Show BCC check box.
Policy Model	Click this button to select a policy model to display on the Policy Automation control. For information about Oracle Policy Automation, refer to Oracle Policy Automation Cloud Service. **Note:** To enable Oracle Policy Automation with Oracle Service Cloud, contact your Oracle account manager.
Report	Click this button to open the Select Report window to select a report for the control. Refer to Adding reports and relationship items to custom workspaces and scripts. **Caution:** The Select Report window displays all reports, not just those that apply to the selected workspace. Be sure to select a report that applies to the workspace. For example, do not select an opportunity search report to appear in the Organization field of a contact record.
Report Behavior	Click this button to configure report behavior properties. Refer to Report properties.
Required for Solved/Waiting	Select this check box if staff members must select a value for the item before they can set a record's status to Solved or Waiting.
Response Options	Click this button to select options for the Rich Text Incident Thread control on incident workspaces or the Chat Control control on chat workspaces.
Allow Encoding Choice	Select this option to allow agents to choose between rendering chat comments as HTML or plain text.
Always Leave as Plain Text	Select this option to always render chat comments as plain text.
Always Send as HTML	Select this option to always render chat comments as HTML.
Confirm Response When Saving and Send On Save is Selected	Select this option if you want the staff member to confirm that the incident response should be sent.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Commit Response When Incident is Saved	Select this option if you want the staff response to be committed to the incident thread when the response is saved.
Add a Response When Selecting Send On Save if No Response Already Exists	Select this option to automatically display the response options panel when you select the Send on Save check box on the Rich Text Incident Thread control. Clearing the check box closes the response options. Additionally, when this property is enabled, clicking the slider on the Messages tab to open the response options panel automatically selects the Send on Save check box, and closing the response options clears the check box. If this option is disabled, then expanding the response options panel enables the Send on Save box, but clicking the Send on Save box does not automatically expand the panel. Clearing the Send on Save check box automatically collapses the panel, but collapsing the panel does not automatically clear the Send on Save check box.
Reassign the Incident When Send On Save is Selected	Click this drop-down menu and select one of the following options for reassigning an incident when a response is sent. • No Change—The incident's Assigned field does not change. • To Current Agent—The Assigned field changes to the staff member working the incident. • To Unassigned—The Assigned field is set to No Value.
Automatically Select Send On Save When Opening an Incident	Click this drop-down menu and select an option that indicates when an incident response should be sent automatically. The options are: • Never—A response is never sent automatically. • On New—A response is sent for a new incident. • On Edit—A response is sent when an incident is edited. • On New and Edit—A response is sent whenever an incident is added or edited. **Note:** To automatically select the Send on Save check box only when sending a response, an agent can click the slider bar at the left of the incident thread and enter the response using the response options section. Refer to Sending responses.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Change the Incident's Status when Send On Save is Selected	Click this drop-down menu and select an option for changing an incident's status when a response is sent. The options are: • No Change—The incident's status does not change when a response is sent. • To Waiting—The incident's status changes to Waiting when a response is sent. • To Solved—The incident's status changes to Solved when a response is sent.
RNT Mask	Click this button to view the mask for the selected custom field. Standard fields do not have mask properties. Refer to Adding and editing custom fields for information about specifying masks for custom fields.
Script	Click this button to open the Select a Script window to change the script used in a script control. Refer to Working with script controls.
Search Report	Click this button to open the Select Report window to select a search report. Refer to Adding reports and relationship items to custom workspaces and scripts. **Note:** This property is used for items that include a search report, such as the Contacts, Tasks, Guided Assistance, and Custom Object View relationship items.
Secondary Search Report	Click this button to open the Select Report window to select a secondary search report. Refer to Adding reports and relationship items to custom workspaces and scripts. **Note:** This property is used for relationship items that can include a secondary search report, such as the Contacts and Tasks relationship items.
Set Fixed Height	Select this check box to enable the Height layout property. When this option is not selected, the control will fill the maximum allowed space.
Show Categories	Click this button to show or hide the categories tree on the Products and Categories relationship item. The categories tree is visible by default.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Show Image	Select this check box to display the paper clip icon for file attachment and quote controls when files are attached to the record.
Show Navigation	Select this check box if you want the workspace to display the navigation controls for the selected guide.
Show Parent	Select this check box if you want the workspace to display the parent of the selected item (for example, a staff account's group in the Assigned field or the main product for a sub-product).
Show Products	Click this button to show or hide the products tree on the Products and Categories relationship item. The products tree is visible by default.
Show Row Count	Select this check box to display the number of records in a report. The number is displayed in parentheses next to the tab title.
Show Search Button	Select this check box to add the Search for a Guide button on the Guided Assistance relationship item. Clicking this button on a workspace opens a window where you can enter search criteria to find the guide you want. Refer to Adding guided assistance to workspaces. **Note:** If this check box is not selected on the workspace designer, the Search window can still be opened from a ribbon button on the workspace.
Show Search Inline	Select this check box to display search fields on the workspace to search for a guided assistance guide. Refer to Adding guided assistance to workspaces. **Note:** Selecting this check box prevents the Search for a Guide and Select a Guide buttons from displaying on the workspace, though these can still be accessed from a ribbon button.
Show Select Button	Select this check box to add the Select a Guide button on the Guided Assistance relationship item. Clicking this button on a workspace opens a window where you can select the guide you want from a list of available guides. Refer to Adding guided assistance to workspaces. **Note:** If this check box is not selected on the workspace designer, the Search window can still be opened from a ribbon button.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Siblings Visible	Click this drop-down menu and select True if you want the File Attachments controls to display information for the answer and all the answer's siblings. Select False if you want to display only the information for the answer.
Sort Provinces Alphabetically	Select this check box if you want the State/Province field to display in alphabetical order on the Address control. Clear this check box to display states and provinces in the sequence specified on the Countries editor. Refer to Adding and editing countries and provinces.
Spell Check	Select this check box to enable spell checking for the field or object when the workspace is spell checked.
Spell Check (for the Rich Text Incident Thread control)	Click this drop-down menu and select a spell check option from the following list. • True—The field's spelling is checked when a staff member clicks the Spell Check button on the ribbon. • False—The field's spelling is never checked. • As You Type—The field's spelling is checked automatically as the staff member types information in the field.
Summary Panel Height	Click this button to type the height of the summary panel in pixels. **Note:** This button is available only when the workspace's base tab set is selected.
Suppress Errors and Authentication Dialogs	Select this check box to suppress any warning prompts (such as script errors and authentication requests) that may occur in the browser control when a URL is loaded.
Survey	Click this button to select a survey for the Survey by Proxy control.
Tab Alignment	Click this button to select where you want tab sets placed on the dashboard. The available options are Left, Right, Top, and Bottom.
Thousands Separator	Select this check box to add a thousands separator to an integer when the value is typed on a workspace (for example, "10000" becomes "10,000").

Table 171: Options Properties Descriptions (Continued)

Property	Description
Thread Orientation	Click this drop-down menu to select a thread orientation for the Rich Text Incident Thread control. The available options are Vertical, Horizontal, or Horizontal with Splitter. By default, a vertical thread orientation is used. Refer to Responding to incidents.
Threshold Height	Click this button to type the threshold height for the summary panel in pixels. If the space available for the summary panel is less than this value, the summary panel becomes the first tab on the tab set. **Note:** The minimum value of the threshold height is 100 pixels greater than the value specified in the Summary Panel Height control.
Time Limit	Click this button to select the maximum amount of time that the report specified in the report control should take to generate. You can select a value up to 240 seconds. Specifying a time limit can improve performance since workspaces are unavailable until reports on the workspace generate. Reports that take longer than the specified time limit to generate will not be displayed on the workspace. Refer to Specifying report time limits.
Time Required	Click this button to select time requirements. This property is used with the Time Billed control.
Time Required for Edit	Select Time Required for Edit if you want staff members to be required to add a time billed entry each time they edit an incident. **Note:** An entry will not be required if the Time Billed relationship item is hidden on the workspace.
Time Required for Solved	Select Time Required for Solved if you want staff members to be required to add a time billed entry each time they solve an incident. **Note:** An entry will not be required if the Time Billed relationship item is hidden on the workspace.
Timer Position	Click this button to set the position of the timer status indicator on the Chat Transcript Control relationship item.
Trim Whitespace	Select this check box to trim leading and trailing white space on text fields.

Table 171: Options Properties Descriptions (Continued)

Property	Description
Up Down Align	Click this drop-down menu and select Left to position the up/ down arrows (for incrementing an integer field) on the left side of the field. Select Right to place the arrows on the right.
URL	Type the URL that should be accessed when the browser control is accessed on the workspace. You can also open files on your workstation or network by specifying a format of `file://<file path>`. **Note:** For information about passing variables through this URL, refer to Working with browser controls.
Visible	Select this check box if you do not want the flag control on the workspace to be visible.
Wrap Tabs	Select this check box if you want tabs in a tab group to wrap across multiple lines when there is insufficient space to display them all on a single line. Clear this check box if you want the tabs to be on a single line, requiring tab scrolling.
Wrap Text	Select this check box to wrap the text of the item's label if needed to fit the label in the space provided.

Customizing ribbons and Quick Access toolbars

When designing a workspace, or a script that will be used in a **workflow**, you can select which buttons to place on the ribbon and the Quick Access toolbar. Most of the buttons you can place on the ribbon can also be placed on the Quick Access toolbar. Staff members see only the buttons you select, which vary by the type of workspace or script you are creating.

Note Ribbon and Quick Access toolbar configuration options are available for scripts only when desktop workflows are enabled for your site. Contact your Oracle account manager to enable desktop workflows.

The following table lists the ribbon buttons available for each type of workspace. Buttons available to each script type are the same as those available to the corresponding workspace type, with the exception of the Expand button, which is not supported by scripts.

Button \ Workspace Type	Answer	Assets	Chat	Contact	Custom Object	Incident	Opportunity	Organization	Quote	Quote Product	Task	Multi Edit Workspaces

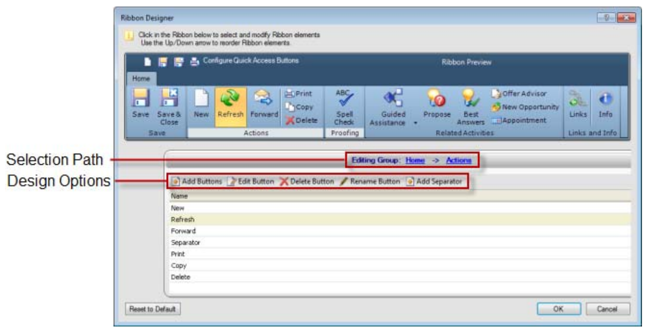
Working with ribbon and Quick Access toolbar buttons

Buttons are added and removed from the ribbon and Quick Access toolbar using the ribbon designer. You can add tabs and tab groups to your ribbon to organize the buttons on the ribbon, and you can arrange tabs, groups, and buttons in any order you want. You can also change buttons' display options to help optimize the ribbon's display. Certain ribbon buttons include special features you can use to access record information and links to web pages.

Note By default, the ribbon and Quick Access toolbar for a new workspace or script contain the same buttons as the standard workspace for the corresponding workspace type. Therefore, it is not necessary to edit the ribbon or Quick Access toolbar if the standard buttons are adequate. Also, if you have made changes, you can restore the default content at any time by clicking the Reset to Default button on the ribbon designer window.

To open the ribbon designer

From the open workspace or script, click the Home tab and click the Ribbon button.



The top of the ribbon designer features a ribbon preview that shows the tabs, button groups, and buttons currently on the ribbon as well as the buttons on the Quick Access toolbar. The bottom part of the ribbon designer includes a clickable path to the ribbon item currently selected on the preview, design options for customizing the selected item, and a list of ribbon items editable from the same path. The path, design options, and list change dynamically as different items are selected on the ribbon preview.

For instance, when you select the Save button group on the default Home tab, the ribbon designer displays the path of the selected group (Editing Tab: Home), a list of the button groups currently defined at that location, and design options for customizing the button groups. Clicking a group or a button on the ribbon preview changes the design options and list to reflect the item you have selected.

Customizing ribbon content

Ribbon tabs contain button groups, which contain buttons. You can easily add, remove, or rename any of these items using the ribbon designer. You can also add vertical separators to organize buttons within a group for clarity. To select an item you want to edit, simply click it on the preview ribbon shown on the designer.

Tip You can right-click items on the ribbon designer to access a list of actions you can take on each item. This gives you a shortcut to many of the same functions described in the following procedures.

To customize the ribbon

1 To add a tab to the ribbon, click the Add Tab button on the bottom of the ribbon designer.

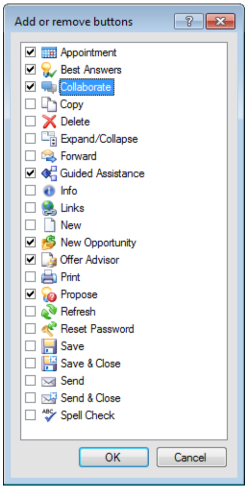
- **a** Type a name for the new tab in the Ribbon Tab Name field.
- **b** Click the OK button.

2 To add a button group to a tab, click the tab you want to add the group to (either on the ribbon preview or in the item list).

- **a** Click the Edit Tab button.
- **b** Click the Add Group button.
- **c** Type a name for the new group in the Group Name field.
- **d** Click the OK button.

3 To add a button to a button group, click the button group you want to add the button to (either on the ribbon preview or in the item list).

- **a** Click the Edit Group button.
- **b** Click the Add Buttons button to open the Add or Remove Buttons window.



c Select the check boxes next to the buttons you want to add to the button group.
d Click the OK button.

When adding buttons to the ribbon, be sure to include only buttons that agents actually need to use. If a button group contains numerous buttons, you can either create another group to make the ribbon easier to navigate, or you can edit the group and click the Add Separator button to add a vertical line to the group to break up buttons in the group.

4 Click the OK button on the ribbon designer to save the changes to the ribbon.

To rename a tab, group, or button

1 To rename a tab, click the tab you want to rename (either on the ribbon preview or in the item list).

Note The Home tab cannot be renamed.

a Click the Rename Tab button. The Rename Tab window opens.
b Type a new name for the tab in the Tab Name field.
c Click the OK button to save the new name.

2 To rename a button group, click the button group you want to rename.

a Click the Rename Group button. The Rename Group window opens.
b Type a new name for the group in the Group Name field.
c Click the OK button to save the new name.

3 To rename a button, click the button you want to rename.
a Click the Rename Button button. The Rename Button window opens.
b Type a new name for the button in the Button Name field.
c Click the OK button to save the new name.

4 Click the OK button to close the ribbon designer.

To move tabs, groups, buttons, and separators

1 Click the tab, group, button, or separator you want to move.

2 Click the up or down arrow at the right of the item list to move the item where you want it.

3 Click the OK button to close the ribbon designer.

To delete tabs, groups, buttons, and separators

Caution If you delete a tab, all the groups and buttons on the tab are also deleted. If you delete a button group, all the buttons in the group are deleted. The Home tab cannot be deleted.

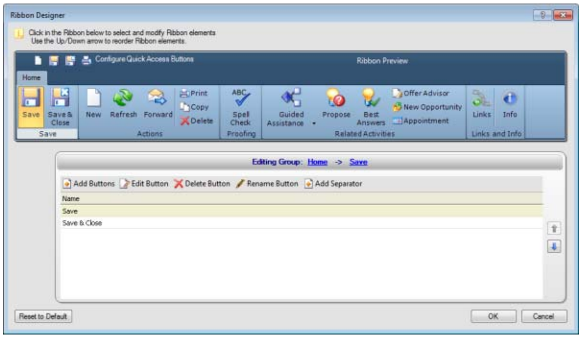
1 Click the tab, group, button, or separator you want to delete.

2 Click the Delete Tab, Delete Group, or Delete Button button.

3 Click the Yes button to confirm the deletion.

Editing ribbon button display options

You can edit buttons on the ribbon to change their size and to specify if text should be included with the icons. The following figure shows a ribbon with the available button display options.

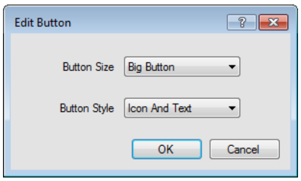


To edit ribbon buttons

Tip You can also right-click tabs, groups, and buttons on the ribbon preview to access Edit, Delete, and Rename options.

1 On the ribbon preview, select the button you want to edit.

2 Click the Edit Button button to open the Edit Button window.



3 To select a different size for the button, select Big Button or Small Button from the Button Size drop-down menu.

4 To select a different style for the button, select Icon and Text or Icon Only from the Button Style drop-down menu.

5 Click the OK button to close the Edit Button window.

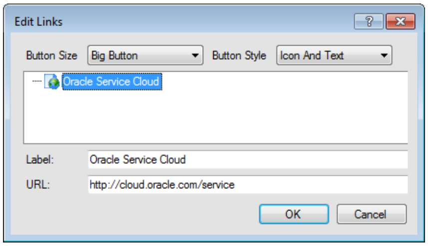
Adding URL links to the Links button

The Links button is added to the ribbon in the same manner as other ribbon buttons. However, this button has unique functionality. You can edit the Links button to create a menu of links to URLs. When staff members click the Links button drop-down menu, they will see the list of links you defined. Selecting one of the links takes them to the specified URL.

To set a link to a URL on the Links button

1 Click the Links button (either on the ribbon preview or in the item list). Refer to Customizing ribbon content for the procedure to add buttons to the ribbon.

2 Click the Edit Button button to open the Edit Links window.



3 Select the size of the Links button from the Button Size drop-down menu.

4 Select whether to display the button with an icon and text or only an icon from the Button Style drop-down menu.

5 Right-click the link browse tree and select Add Link.

6 Type the name of the link (what staff members will see on the menu) in the Label field.

7 Type the URL in the URL field that will open when staff members click the link.

8 To remove a link, right-click the link you want to remove and select Remove Link.

9 To add a folder, right-click the link browse tree and select Add Folder.

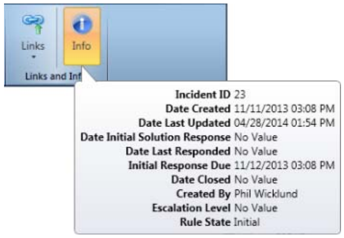
   a Type the name of the folder in the Label field.

10 To add a separator, right-click the link browse tree and select Add Separator.

11 Click the OK button to save the changes to the Links button.

Adding information to the Info button

The Info button is added to the ribbon in the same manner as other ribbon buttons. However, the Info button has unique functionality. You can edit this button to add information about the record being edited on the workspace or script. When staff members hover over the button or click it, they can view the information you want to display. An example of the information displayed on the Info button follows.

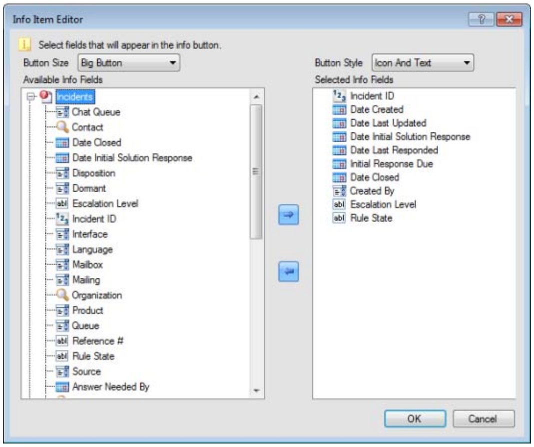


To reduce clutter on your workspace, consider configuring the Info ribbon button to show fields that are always read only, such as an incident's Date Created and Date Updated fields.

To set information options on the Info button

1 Click the Info button, either on the ribbon preview or on the bottom of the designer. Refer to Customizing ribbon content for the procedure to add buttons to the ribbon.

2 Click the Edit Button button to open the Info Item Editor.



3 Select the size of the Info button from the Button Size drop-down menu.

4 Select whether to display the button with an icon and text or only an icon from the Button Style drop-down menu.

5 Expand the field tree in the Available Info Fields column and select the fields you want to add to the Info button.

6 Click the right arrow to place the fields in the Selected Info Fields column.

Note Fields are displayed on the Info button in the order they are added.

7 To remove fields from the Info button, select the fields in the Selected Info Fields column and click the left arrow to remove the fields.

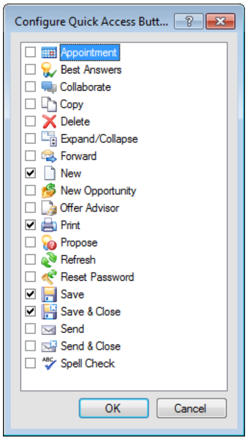
8 Click the OK button to save the changes to the Info button.

Customizing the Quick Access toolbar

In addition to the tabs, button groups, and buttons on the ribbon, you can customize the Quick Access toolbar to add buttons that are commonly used by your staff members. For example, the Save button is often added to the Quick Access toolbar so records can quickly be saved without having to select a tab on the ribbon to access the Save button.

To add or remove Quick Access toolbar buttons

1 Click Configure Quick Access Buttons on the ribbon preview's Quick Access toolbar. The Configure Quick Access Buttons window opens.



2 Select the check boxes next to the buttons you want to add to the Quick Access toolbar.

Tip Buttons will appear on the Quick Access toolbar in the order you select them.

3 Clear the check boxes next to the buttons you do not want.

4 Click the OK button to close the window. The buttons on the Quick Access toolbar shown on the ribbon designer are updated to reflect the changes you made.

Restoring default content

After you edit a ribbon, you may decide you want to restore the ribbon's default content. The ribbon's defaults can be restored at any time. When you restore the defaults, the content on the ribbon's Quick Access toolbar is also reset. In addition, buttons on the ribbon will be reset to use their default size and style.

To restore default content on the ribbon and Quick Access toolbar

1 On the lower left corner of the ribbon designer, click the Reset to Default button.

2 Click the Yes button to reset the ribbon's default content.

30

Desktop Workflows

When following elaborate business processes, staff members must often evaluate critical information and perform a variety of actions across multiple **records**. To help promote efficiency and reduce the chances for human error, Oracle Service Cloud lets you create highly customized desktop workflows that guide agents through complex customer interactions and data updates.

A desktop workflow is a sequence of **workspaces**, **scripts**, **decisions**, and **actions**—even other embedded workflows—that supports a business process. Using an intuitive design interface, you define a workflow by assembling a set of elements into a logical order to form a **flow diagram**, then adding decision logic to advance the flow.

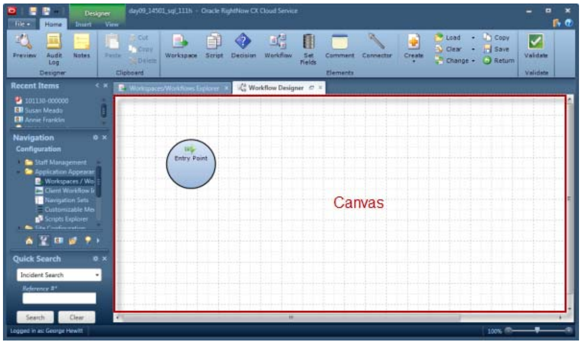
Once you have designed a workflow, you can provide staff members access to it by selecting it in place of a workspace for an editor within their **profile**. When a record is opened into that editor (an incident, for example), the staff member is guided dynamically through the workflow, starting at the entry point. **Events** and **conditions** are evaluated and executed in the sequence you have specified. (For instance, when a staff member updates the value of a field, the workflow can evaluate the update and open a related record in a different workspace.)

In this way, you can provide your staff with an environment tailored to their skills and responsibilities. When their activities are supported by an optimized workflow, staff members can worry less about remembering the details of your complex business processes and focus more on completing them accurately.

Note Before designing desktop workflows, it is important to first become familiar with workspaces, **workspace rules**, **guides**, agent scripts, and **script rules**—and the strengths and benefits of each—to better understand how workflows are used to integrate them. Refer to Desktop Overview.

Desktop workflow design canvas and ribbon

When editing a desktop workflow, you perform most tasks using the ribbon and canvas. These resources provide all of the tools and elements you need to design any workflow, simple or complex.



The workflow design ribbon includes three standard tabs (Home, Insert, and View) as well as two contextual tabs (Element Tools and Path Tools) that become visible when an element or connector is selected. Each tab has one or more groups containing buttons you can use to modify the desktop workflow or its elements on the canvas.

Home tab

The Home tab gives you access to options that impact the entire desktop workflow. For example, you can select workflow elements, perform basic editing functions, add notes, and validate and preview the workflow.

The groups and buttons on the Home tab are described in the following table.

Table 172: Home Tab Description

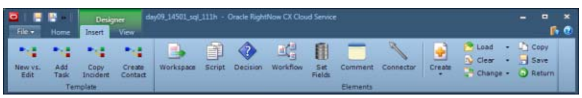
Group/Button	Description
Designer	The buttons in this group provide access to basic design functions.

Table 172: Home Tab Description (Continued)

Group/Button	Description
Preview	Click this button to preview the desktop workflow. Refer to Previewing workflows.
Audit Log	Click this button to view a history of all actions taken on the desktop workflow, such as when it was created and edited and by whom.
Notes	Click this button to add notes about the desktop workflow.
Clipboard	The buttons in this group provide access to basic editing commands when working with components on the canvas. **Note:** Clipboard functions are restricted to the open workspace. They cannot be used to copy elements from one workflow to another.
Paste	Click this button to paste the contents of the clipboard.
Cut	Click this button to cut selected elements from the canvas to the clipboard.
Copy	Click this button to copy selected elements from the canvas to the clipboard.
Delete	Click this button to delete selected elements from the canvas.
Elements	The buttons in this group allow you to add elements to your flow diagram. For a description of available elements, refer to Designing a flow diagram. **Note:** Elements can also be accessed from the Insert tab.
Validate	Click this button to check the flow diagram for errors. Refer to Workflow validation.

Insert tab

The Insert tab allows you to add components to your flow diagram, either one at a time or in predefined workflow templates.



The groups and buttons on the Insert tab are described in the following table.

Table 173: Insert Tab Description

Group/Button	Description
Template	The buttons in this group allow you to select a predefined flow template to apply to your desktop workflow. Refer to Workflow templates. **Caution:** When you add a template, any content you previously added is deleted from the canvas.
New vs. Edit	Hover over this button to see a preview of the New vs. Edit workflow template. Click the button to add the template to the canvas. Refer to New vs. Edit.
Add Task	Hover over this button to see a preview of the Add Task workflow template. Click the button to add the template to the canvas. Refer to Add Task.
Copy Incident	Hover over this button to see a preview of the Copy Incident workflow template. Click the button to add the template to the canvas. Refer to Copy Incident.
Create Contact	Hover over this button to see a preview of the Create Contact workflow template. Click the button to add the template to the canvas. Refer to Create Contact.
Elements	The buttons in this group allow you to select elements to add to your flow diagram. For a description of available elements, refer to Designing a flow diagram. **Note:** Elements can also be accessed from the Home tab.

View tab

The View tab provides options for changing your view of the design canvas.

The groups and buttons on the View tab are described in the following table.

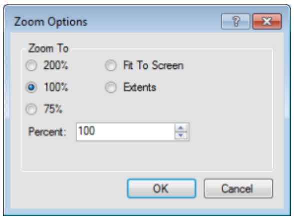
Table 174: View Tab Description

Group/Button	Description
Canvas	The settings in this group allow you to select canvas options. **Note:** Oracle Service Cloud remembers any changes you make to these settings to give you a consistent, personalized design experience.
Element Labels	Select this check box to display labels for elements in the diagram. Name labels are displayed by default.
Connector Labels	Select this check box to display labels for connectors in the diagram. Labels are displayed by default.
Validation Results	Select this check box to display validation icons in the diagram. Validation results are hidden by default. Refer to Workflow validation.
Working Record	Select this check box to display **working record** labels for elements in the diagram. Labels are displayed by default.
Grid	Select this check box to display the design grid. The grid is displayed by default.
Grid Size	Click this drop-down menu to select the size of the canvas grid.
Zoom	The buttons in this group allow you to select a zoom level for the canvas.
Zoom	Click this button to access the Zoom Options window. Refer to To select zoom options.
100 percent	Click this button to view the canvas at its normal size.
Fit To Screen	Click this button to adjust the zoom level to show all elements.
Extents	Click this button to show the entire canvas.

As described in the previous table, you can change the view of the design canvas from the View tab to more easily review and edit your flow diagram. Included in these controls is the ability to adjust the zoom level.

To select zoom options

1 From an open workflow, click the Zoom button on the View tab. The Zoom Options window opens.



2 To specify a desired zoom level, select a radio button in the Zoom To section.

  a To adjust the zoom level to show all components, select the Fit to Screen radio button.

  b To show the entire canvas, select the Extents radio button.

3 Type a zoom percentage in the Percent field. Click the up or down arrow to increase or decrease the value.

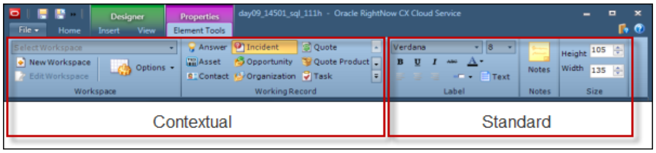
Tip You can also change the magnification of the canvas using the zoom slider located on the bottom right corner.

4 Click the OK button to close the window.

Contextual tabs

When you select an element or connector on the canvas, the ribbon displays a fourth contextual tab. When an element is selected, the Element Tools tab appears. This tab is divided into two sections. On the left are contextual groups and buttons, meaning they change depending on the element selected. On the right are standard groups and buttons, meaning they display no matter what element is selected.

The following figure displays the Element Tools tab and shows the contextual group of buttons for the Workspace element on the left and the standard group of buttons on the right.

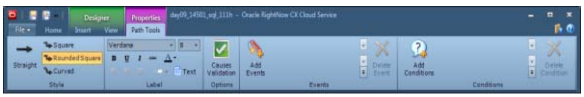


The contextual groups and buttons are described in procedures later in this document. The standard groups and buttons on the Element Tools tab are described in the following table.

Table 175: Element Tools Tab Description

Group/Button	Description
Label	The buttons in this group let you change the font style, size, and color of the element labels. You can select font attributes, such as bold and italic, and change the text's alignment.
(Label Position)	Click this button to select the position of the label relative to the element. The default label position of a new element is Inside.
Text	Click this button to type the text of the element label.
Notes	Click this button to type notes about the element.
Size	The buttons in this group allow you to change the height and width of the element.

Another contextual tab that will display on the ribbon is the Path Tools tab. This tab displays when you select a connector. The buttons on this tab allow you to format the connector and change the connector type.



The standard groups and buttons on the Path Tools tab are described in the following table. Refer also to Linking elements with connectors.

Table 176: Path Tools Tab Description

Group/Button	Description
Style	The buttons in this group allow you to change the line style of the selected connector. Available styles include straight, square, rounded square, and curved. Rounded square is the default connector style.
Label	The buttons in this group let you change the font style, size, and color of the connector label. You can select font attributes, such as bold and italic, and change the text's alignment.
 (Label Position)	Click this button to select the position of the label relative to the element. The default label position of a new element is Inside.
	Click this button to type the text of the element label.
Options	The button in this group lets you enable or disable forced validation for preceding script or workspace elements.
Causes Validation	Click this button to force a preceding script or workspace to be validated before the path is followed.
Events	The buttons in this group allow you to add and delete events that cause the path to be followed. Refer to Defining connector events and conditions. **Note:** At least one event must be defined when connecting from a workspace, script, or workflow element.
Add Events	Click this button to add events to the connector.
Events List	This list displays events that have been added to the connector.
Delete Event	Click this button to delete an event selected in the list.
Conditions	The buttons in this group allow you to add and delete conditions associated with the connector.
Add Conditions	Click this button to add conditions to the connector. Refer to Defining connector events and conditions.
Conditions List	This list displays conditions that have been added to the connector.

Table 176: Path Tools Tab Description (Continued)

Group/Button	Description
Delete Condition	Click this button to delete a condition selected in the list.

Creating workflows

Oracle Service Cloud provides an intuitive graphical interface for creating and editing desktop workflows. When designing a workflow, you can drag elements from the Home or Insert tab and order them on the canvas.

To create a desktop workflow

1 Click the Configuration button on the navigation pane.

2 Double-click Workspaces/Workflows under Application Appearance. The Workspaces/Workflows explorer opens on the content pane.

Note If the Desktop Workflow feature is not enabled on your site, you will see only Workspaces listed under Application Appearance. To enable desktop workflows, contact your Oracle account manager.

3 Click the New Workflow button on the ribbon to open a new desktop workflow with a blank design canvas.

4 To design the flow diagram, refer to Designing a flow diagram.

5 Click the Save and Close button on the Quick Access toolbar to save the desktop workflow. The Save As window opens.

Note You can also click the Save button to save the workflow without closing it.

Before saving, Oracle Service Cloud automatically validates your flow diagram and reports any errors. Click the Cancel button to correct errors before saving or click the Continue button to save the flow in its current state. However, the workflow will not function properly until all validation errors are corrected.

6 Select the folder you want to save the desktop workflow in and type the name of the desktop workflow in the Name field.

7 Click the Save button to save the desktop workflow.

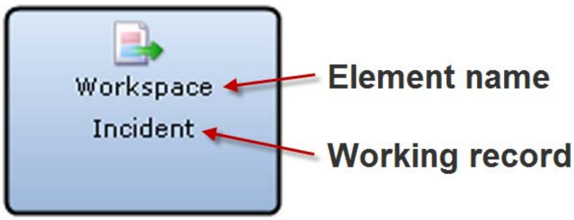
Designing a flow diagram

A desktop workflow is defined by dragging elements to the canvas, ordering them, and connecting them to form a flow diagram. The flow diagram is a graphical representation of the actions and decisions your workflow will perform and the order in which it will perform them. Your flow diagram can be as simple as a single path connecting a few workspaces or it can be complex, routing your staff members through dozens of workspaces, scripts, actions, and decisions. The intuitive graphical interface accommodates most business processes, extending access to advanced features and functions found throughout the application.

When an element is selected on the canvas, an Element Tools ribbon tab appears, allowing you to define its attributes, which vary by element type. For example, Workspace elements are used in workflows to display records using a designated workspace. Therefore, when adding a Workspace element, you must specify the workspace you want to use and the record you want to display.

When a record is opened in a staff member's workflow session, it is loaded into a memory space called the record pool, along with all of its associated records (such as contact and organization). As additional records are opened in the same workflow session, those records are added to the same record pool. Because many records are often open in the record pool at once, the term "working record" is used to describe the record being acted on by a specific element.

Each element on the canvas displays an icon and two labels that help to identify its function. The top label contains the element's name. The bottom label identifies the element's working record. The icon varies by element type as well as the working record's record type.



When an element is selected on the canvas, you can select a working record from the Working Record button group on the Element Tools tab. If multiple records of the same record type are open in the record pool, the Working Record button group will expand with additional buttons so you can select the specific record you want the element to act on. For example, if several incidents are open in the record pool, you can set a Workspace element to display the incident that was opened to initiate the workflow (the initial record), the most recent incident opened in the workflow (the last record), or an incident that has been named elsewhere in the workflow (a named record).

For a menu of available working records, select an element on the workspace, click the Element Tools tab, and then click the Expand Working Records button below the scroll bar in the Working Record button group.

Important If a workflow is unable to locate an open record that matches the designated working record, Oracle Service Cloud will display a workflow execution error and end the workflow session.

The function of the working record varies by element type, as described in the table in the following procedure.

To create a flow diagram

1 From the open workflow, drag and drop an element from the ribbon onto the canvas. Refer to the following table for a description of the available elements.

Table 177: Desktop Workflow Elements

Element/Menu	Description
Workspace	Drag and drop this element to open the working record in a workspace. Refer to Editing Workspace attributes.
Script	Drag and drop this element to initiate a script. Refer to Editing Script attributes. **Note:** Script elements are only available when scripting is enabled. For information about enabling scripts, contact your Oracle account manager.
Decision	Drag and drop this element to branch the workflow based on conditions that you define. The working record defines the record and fields available for conditions. Refer to Editing Decision attributes.
Workflow	Drag and drop this element to nest another workflow into the open workflow. The working record defines the record that opens in the embedded workflow. Refer to Editing Workflow element attributes.

Table 177: Desktop Workflow Elements (Continued)

Element/Menu	Description
Set Fields	Drag and drop this element to set values for one or more fields in the working record. Refer to Editing Set Fields attributes.
Comment	Drag and drop this element to add comments or notes to the workflow. Refer to Adding comments to a workflow.
Connector	Drag and drop this element to add a connector to the workflow. Refer to Linking elements with connectors.
Create	Click this drop-down menu and drag and drop a record type to create a new record in your workflow. You can choose to create an answer, contact, incident, opportunity, organization, quote, quote product, or task. Refer to Editing Create attributes.
Load	Click this drop-down menu and drag and drop a record type to load a record into your workflow based on a report query. You can choose to load an answer, contact, incident, opportunity, organization, quote, quote product, or task. Refer to Editing Load attributes.
Clear	Click this drop-down menu and drag and drop a record type to clear the association between the working record and an organization, contact, answer, incident, or opportunity. Refer to Editing Clear attributes.
Change	Click this drop-down menu and drag and drop a record type to associate the working record to a different organization, contact, answer, incident, or opportunity. Refer to Editing Change attributes.
Copy	Drag and drop this element to copy the working record and give it a name that can be referenced later in the workflow. Refer to Editing Copy attributes.
Save	Drag and drop this element to save all records open in the workflow. To close the records after saving, click the Close After Save button on the ribbon. Refer to Editing Save attributes. **Note:** Business rules will be run on all open records at the time the Save element is triggered.

Table 177: Desktop Workflow Elements (Continued)

Element/Menu	Description
Return	Drag and drop this element to return to a parent workflow from a nested workflow. Edit the element label text to define a return event name that can be referenced in the subsequent connector in the parent workflow. Refer to Editing Return attributes.

Important A quote product created and saved by automation elements cannot be edited afterward in the same workflow. If need arises, the Save element should be moved to occur after the edit in the sequence, or the Save element should be omitted and staff should be directed to click the Save button instead.

2 To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second. Refer to Linking elements with connectors.

3 To change the formatting of an element, select the element and refer to the following table.

Table 178: Element Tools Tab Description

Group/Button	Description
Label	The buttons in this group let you change the font style, size, and color of the element labels. You can select font attributes, such as bold and italic, and change the text's alignment.
(Label Position)	Click this button to select the position of the label relative to the element. The default label position of a new element is Inside.
Text	Click this button to type the text of the element label.
Notes	Click this button to type notes about the element.
Size	The buttons in this group allow you to change the height and width of the element.

4 To cut, copy, or paste one or more elements, click the appropriate button on the Clipboard group of the Home tab.

5 To undo an action on the canvas, click the Undo button on the Quick Access toolbar.

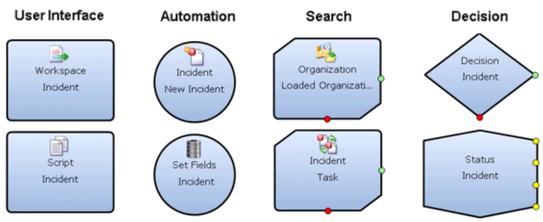
6 To redo an action on the canvas, click the Redo button on the Quick Access toolbar.

Editing element attributes

Once you have added an element to the canvas, you must edit its attributes to make it functional. You can hover over any element on the canvas to see its type, name, and other information.

Important You must define attributes for each element added or a validation error will occur when attempting to save the workflow. Refer to Workflow validation.

Elements vary by shape according to their functions.



- **User Interface**—Rectangular elements used to denote items that display to staff members, such as workspaces, scripts, and other embedded workflows.
- **Automation**—Circular elements used to denote automated events that run in the background, such as setting field values and creating and saving records.
- **Search**—Polygonal elements that require staff members to perform a search, such as loading a record or associating a record with another record.
- **Decision**—Diamond-shaped and polygonal elements that denote logical evaluations that are used to branch the flow across two or more paths based on conditions that you define.

Editing Workspace attributes

The Workspace element is used to display the **working record** in a workspace. Once you add this element to your flow diagram, you must edit its attributes to associate it with a new or existing workspace. You must also select the working record that the workspace will display.

Note Multi-edit and chat workspaces cannot be associated to a Workspaces element.

To edit Workspace attributes

1 From your open workflow, select a Workspace element on the canvas. The Element Tools tab displays on the ribbon.

2 Click a button in the Workspace button group described in the following table. The element's name label is updated with the name of the selected workspace.

Table 179: Workspace Attributes Description

Button	Description
Select Workspace	Click this drop-down menu to select a workspace to use in the workflow.
New Workspace	Click this button to select a new workspace type or import a workspace definition. For information about creating a new workspace, refer to Editing workspaces. For information about importing a workspace, refer to Exporting and importing workflows.
Edit Workspace	Click this button to edit the selected workspace. Refer to Editing workspaces.
Options	Click this drop-down menu to access workspace attribute options.
Enable Save	Select this option to include the Save button group when displaying a record with the workspace. To hide the Save button group, clear this option. This button is enabled by default.

3 Click a button in the Working Record button group to select the record you want to display using the workspace. The element's working record label is updated with the name of the selected working record.

4 If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to display using the workspace.

Tip For a menu of available records, click the Expand Working Records button below the scroll bar in the Working Record button group.

Editing Script attributes

The Script element is used to open the **working record** in a **script**. Once you add this element to your flow diagram, you must edit its attributes to associate it with a new or existing script. You must also select the working record that will be passed to the script.

Note When a script is included in a workflow, be sure it includes a field, an exit script event, a finish script event, or a rule containing a named event so that the flow can be advanced. Field changes, exit script events, and finish script events can be used to advance the flow, as can a script rule that fires a named event. Refer to Using events in workspace and script rules.

To edit Script attributes

1 From your open workflow, select a Script element on the canvas. The Element Tools tab displays on the ribbon.

2 Click a button in the Script button group described in the following table. The element's name label is updated with the name of the selected script.

Table 180: Script Attributes Description

Button	Description
Select Script	Click this drop-down menu to select a script to use in the workflow.
New Script	Click this button to select a new script type or import a script definition. For information about creating a new script, refer to Creating agent scripts. For information about importing a script, refer to Exporting and importing scripts.
Edit Script	Click this button to edit the selected script. Refer to Editing agent scripts.
Options	Click this drop-down menu to access workspace attribute options.
Enable Save	Select this option to include the Save button group when displaying a record in the script. To hide the Save button group, clear this option. This button is enabled by default.

3 Click a button in the Working Record button group to select the record you want to pass to the script. The element's working record label is updated with the name of the selected working record.

Note Because quotes and quote products have no corresponding script type, they are not available as working records for Script elements.

4 If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to pass to the script.

Tip For a menu of available records, click the Expand Working Records button below the scroll bar in the Working Record button group.

Editing Decision attributes

The Decision element is used to branch your workflow based on conditions that you define. Once you add this element to your flow diagram, you can edit its attributes to branch your flow to different paths based on whether certain conditions are met.

The decision can be based on a simple "yes/no" evaluation of one or more conditions, such as the identity and profile of the logged-in account, the **working record's** creation state, and the value of a specified field. If all conditions are met, the Yes path is followed. If any conditions are not met, the No path is followed.

Alternately, you can base a decision on a single field that has multiple possible values, with each selected value having its own outgoing path. For example, by basing a decision on the incident Status field, you can route incidents down different paths based on their status.

Note The fields available for evaluation in a condition will vary based on the working record type selected for the decision.

To define Decision attributes

1 From your open workflow, select a Decision element on the canvas.

2 From the Working Record button group on the Element Tools tab, select a working record to associate to the decision. The element's working record label is updated with the name of the selected working record.

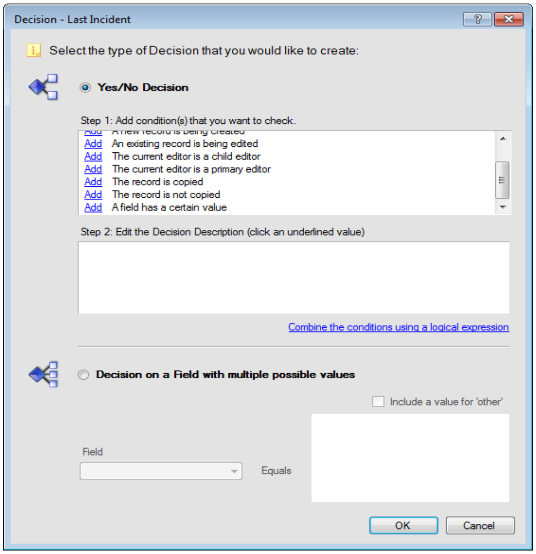
3 If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to associate to the decision.

Tip For a menu of available records, click the Expand Working Records button below the scroll bar in the Working Record button group.

4 Click the Edit button on the ribbon. The Decision window opens.

Or

Double-click the Decision element.



5 To define conditions for a yes/no decision, refer to [To define conditions for a Yes/No decision](#).

6 To define conditions based on a field with multiple possible values, refer to [To define conditions based on a field with multiple possible values](#).

7 Click the OK button to save the decision attributes.

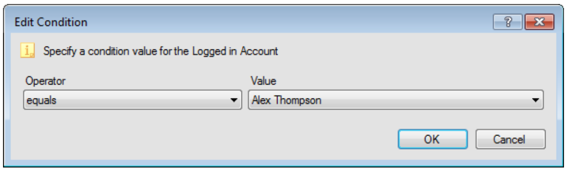
To define conditions for a Yes/No decision

1 On the Decision window, click Add next to the condition you want to add to the decision description. Available conditions are described in the following table.

Table 181: Decision Conditions Description

Condition	Description
The logged in account has a certain value	Add this condition to verify the identity of the logged-in account.
The logged in account's profile has a certain value	Add this condition to verify the profile of the logged-in account.
A new record is being created	Add this condition to verify that the working record is being created.
An existing record is being edited	Add this condition to verify that the existing record is being edited.
The current editor is a child editor	Add this condition to verify that the working record is displayed in a child editor.
The current editor is a primary editor	Add this condition to verify that the working record is displayed in a parent editor.
The record is copied	Add this condition to verify that the working record is being copied from another record.
The record is not copied	Add this condition to verify that the working record is not being copied from another record.
A field has a certain value	Add this condition to verify the value of a certain field.

2 If the condition you have added to the decision description contains an underlined link, click the link to edit the condition.



3 If specifying a condition value for a field, click the Field drop-down menu and select a field.

4 Click the Operator drop-down menu and select an operator.

5 Enter a value in the Value field.

6 Click the OK button.

7 To edit the logical expression used to evaluate two or more conditions, click Combine the Conditions Using a Logical Expression and refer to Defining logical expressions for workspace rule conditions.

8 Click the OK button to close the window.

To define conditions based on a field with multiple possible values

1 On the Decision window, select the Decision on a Field with Multiple Possible Values radio button.

2 Click the Field drop-down menu and select a field to evaluate.

3 To verify a value in a menu field, select the check box next to the value you want to use in the decision.

4 To remove a menu field value from the decision, clear its check box.

5 To verify a value in a date field, click the Add Choice button and then click the calendar button in the Choice column to select a date.

6 To verify a value in a text field, click the Add Choice button and type the value in the Choice column.

7 To remove a date or text value you have added, click Remove in the Action column.

8 To include an option for all other values, select the Include a Value for Other check box.

9 Click the OK button to close the window. An outgoing anchor is added to the element for each value selected.

Editing Workflow element attributes

The Workflow element is used to open the **working record** in an embedded workflow. Once you add this element to your flow diagram, you must edit its attributes to associate it with a new or existing workflow. You must also select the working record that will be opened in the embedded workflow.

Important If you want an embedded workflow to return to the primary flow, it must contain at least one Return element. Refer to Editing Return attributes.

To edit Workflow attributes

1. From your open workflow, select a Workflow element on the canvas. The Element Tools tab displays on the ribbon.
2. Click a button in the Workflow button group described in the following table. The element's name label is updated with the name of the selected workflow.

Table 182: Workflow Attributes Description

Button	Description
Select Workflow	Click this drop-down menu to select a workflow to embed in the current workflow.
New Workflow	Click this button to create a new workflow.
Edit Workflow	Click this button to edit the selected workflow.

3. Click a button in the Working Record button group to select the record you want to open in the workflow. The element's working record label is updated with the name of the selected working record.
4. If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to open in the workflow.

Tip For a menu of available records, click the Expand Working Records button below the scroll bar in the Working Record button group.

Editing Set Fields attributes

The Set Fields element is used to set values for one or more fields in the **working record**. Once you add this element to your flow diagram, you must edit its attributes to select the working record containing the field you want to update and the value you want to set it to.

Best practices for avoiding field conflicts

When setting multiple field values, pay close attention to the order in which you are setting them. Remember that some fields in the record you are updating may also change dynamically due to rule configuration or a functional dependency on other fields.

This consideration is particularly important when updating certain key fields in Oracle RightNow Opportunity Tracking Cloud Service. The following fields should be set in this specific order based on how the values are related to one another.

1. Schedule
2. Quote Total
3. Grand Total
4. Discount
5. Forecast

For example, quote totals often vary based on the schedule that has been selected. If you change the value of the Schedule field, the Quote Total field value will be reset. So, if you are setting values for these two fields, be sure to apply the schedule before setting the quote total. Also, the discount value and the forecast should be specified after the grand total has been set. By setting these fields in the correct order, you can avoid setting fields incorrectly due to overriding functional dependency.

To edit Set Fields attributes

1. From your open workflow, select a Set Fields element on the canvas. The Element Tools tab displays on the ribbon.

2 Click a button in the Working Record button group to select the record containing the field you want to set. The element's working record label is updated with the name of the selected working record.

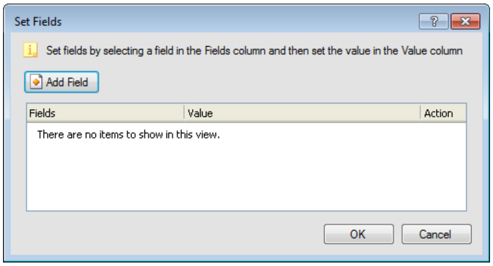
3 If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record containing the field you want to set.

Tip For a menu of available records, click the Expand Working Records button below the scroll bar in the Working Record button group.

4 Click the Edit button. The Set Fields window opens.

Or

Double-click the Set Fields element.



5 Click the Add Field button to add a field to the element.

6 In the Fields column, click the Select a Field drop-down menu, expand the appropriate table, and select the field you want to set.

7 In the Value column, enter the value that you want to set the field to.

Note In addition to setting explicit (absolute) values, you can set relative values for some field types by adding or subtracting (or appending or prepending) a value to the field's previous value. Refer to Setting relative field values.

8 To remove a field you have added, click Remove in the Action column.

9 Click the OK button. The field and value you selected are displayed in the text box next to the Edit button.

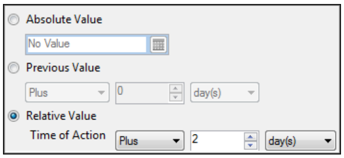
10 To display a confirmation message when the field is set, click the Confirmation Message button and type the message.

a Click the OK button to close the Confirmation Message window.

Setting relative field values

In addition to setting absolute field values for date, date/time, integer, text, and text area fields, you can set relative values. When setting a value for one of these field types, clicking the Value drop-down menu presents additional options for adding or subtracting (or appending or prepending) a value to the field's previous value. For example, you can increment the value of an integer field by 1 or prepend text to an incident's subject line.

For date and date/time fields, you can also set a value relative to the time of action, such as adding two days to the current date and time, shown here.



Options for setting relative field values vary by field type and are described in the following table.

Table 183: Relative Field Value Options

Field Type	Value Options
Date	Add or subtract a number of days or weeks to or from the previous value or the current date.
Date/Time	Add or subtract a number of minutes, hours, days, or weeks to or from the previous value or the current date and time.
Integer	Add or subtract an integer value to or from the current value. **Note:** The resulting value cannot be greater than the maximum value defined for the field or less than the minimum. Therefore, the maximum value you can add or subtract is the field's maximum value minus the field's minimum value. For example, if the field maximum is 8 and the field minimum is -8, the maximum value you can add or subtract from the current value is 16.
Text Field	Prepend or append a text value to the current text value.

Table 183: Relative Field Value Options (Continued)

Field Type	Value Options
Text Area	Prepend or append a text value to the current text value.

Editing Create attributes

The Create element is used to create a new record in the workflow. Once you add this element to your flow diagram, you can edit its attributes to specify the field values, a confirmation message, and a name for the record you are creating.

Important Workflows that contain Create elements can create records even when used by staff members who do not have permission in their profile to create records of the same type. For example, a staff member who does not have permission to create an incident can still be associated with a workflow that results in the creation of an incident, and the incident's **audit log** will show the staff member as the creator of the incident.

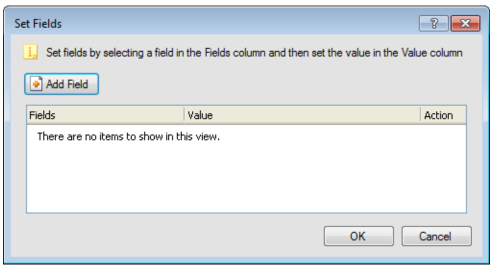
To edit Create attributes

1 From your open workflow, select a Create element on the canvas. The Element Tools tab displays on the ribbon.

2 Click the Set Fields button. The Set Fields window opens.

Or

Double-click the Set Fields element.



3 Click the Add Field button to add a field to the element.

4 In the Fields column, click the Select a Field drop-down menu and select the field you want to set.

5 In the Value column, enter the value that you want to set the field to.

Note In addition to setting explicit (absolute) values, you can set relative values for some field types by adding or subtracting (or appending or prepending) a value to the field's previous value. Refer to Setting relative field values.

6 To remove a field you have added, click Remove in the Action column.

7 Click the OK button. The field and value you selected are displayed in the text box next to the Set Fields button.

8 To display a confirmation message when the field is set, click the Confirmation Message button and type the message.

   a Click the OK button to close the Confirmation Message window.

9 To name the record, click the New Record Name button and type the name in the element's working record label. The new record name appears in the Working Record button group for elements of the same record type.

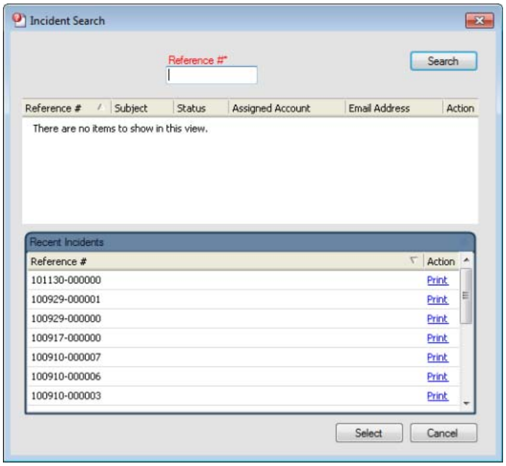
Important When a new record is created with the Create element, it is not yet saved to the database. To ensure the record is saved, be sure to open the working record in a workspace that has the Save button enabled or follow the Create element with a Save element. Refer to Editing Save attributes.

Editing Load attributes

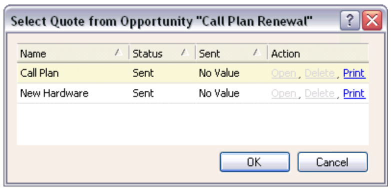
The Load element is used to find and load an existing record into the record pool. Once you add this element to your flow diagram, you can use it to prompt the agent to search for a record, or you can select a specific record to load every time.

Note The option to load a specific record is not available when loading quotes or quote products.

If you want to prompt agents to perform a search, you must select the primary search report that will be used to find the record to be loaded. You may also select an optional secondary search report. The Load element can have two outgoing connectors to branch the flow based on the button clicked by staff on the search window (OK/Select or Cancel). In most cases, the Load element will prompt staff members to search for a record using a primary and secondary search report.



However, when using the Load element to open a quote, quote product, or task, the Secondary Search Report button is replaced on the ribbon with a Parent Record button group. When you select a parent record for these record types, the Load element will prompt staff members to select from a list of records associated to the parent. For example, to load a quote, staff members select from a list of quotes associated with the specified parent opportunity, as shown here.



Important Records opened with the Load element are simply loaded into memory and are not automatically displayed in workspaces. To display a loaded record to your staff members, you will need to follow the Load element with a workspace or workflow associated with the appropriate **working record**.

To prompt agents to search for a record to load

1 From your open workflow, select a Load element on the canvas. The Element Tools tab displays on the ribbon.

2 Click the Search Report button. The Select Report window opens.

   By default, the system's standard report for searching the designated record type is selected. For example, if you are loading an incident, the Incident Search report is selected by default.

3 Select a primary report to display in the search window.

4 Click the OK button to close the window.

5 To select a secondary search report to display in the search window, click the Secondary Search Report button. The Select Report window opens.

   a Select a secondary report.

   b Click the OK button to close the window.

   c Select a secondary search record from the Secondary Search Record button group.

6 To load a quote, quote product, or task, click a button in the Parent Record button group to select the parent of the record you want to load.

7 To name the record, click the New Record Name button and type the name in the element's working record label. The new record name appears in the Working Record button group for elements of the same record type.

To load a specific record

1 From your open workflow, select a Load element on the canvas. The Element Tools tab displays on the ribbon.

2 Click the Load Type button and select Constant Record. The Load element changes to a circular automation element and the ribbon buttons refresh to display the attributes for this load type.

3 Click the Record button.

4 Search for and select the record you want the element to load.

5 Click the Select button.

6 Click the OK button to close the window.

7 To rename the record, click the New Record Name button and type the new name in the element's working record label. The new record name appears in the Working Record button group for elements of the same record type.

Editing Clear attributes

The Clear element is used to clear the **working record's** association with any organization, contact, answer, incident, or opportunity. Once you add a Clear element to your flow diagram, you must edit its attributes to select the working record you want to disassociate.

Tip You can also clear a record association by using a Set Fields element to set the value to No Value, but using the Clear element can make the flow diagram easier to understand.

To edit Clear attributes

1 From your open workflow, select a Clear element on the canvas. The Element Tools tab displays on the ribbon.

2 Click a button in the Working Record button group to select the record you want to clear the association from. The element's working record label is updated with the name of the selected working record.

3 If more than one record of the selected type is open in the record pool, click a button on the right of the Working Record button group to select the record you want to clear the association from.

Tip For a menu of available records, click the Expand Working Records button below the scroll bar in the Working Record button group.

4 To display a confirmation message when the record association is cleared, click the Confirmation Message button and type the message.

a Click the OK button to close the Confirmation Message window.

Important When an association is cleared by a Clear element, the update is not automatically saved in the database. To save the change made by the Clear element, be sure to open the working record in a workspace that has the Save button enabled or follow the Clear element with a Save element. Refer to Editing Save attributes.

Editing Change attributes

The Change element is used to find and load an existing record to associate with the **working record**. Once you add this element to your flow diagram, you must edit its attributes to select the primary and secondary search reports that will be used to find the record to be associated. The Load element can have two outgoing connectors to branch the flow based on the button clicked by staff on the search window (OK or Cancel).

Note When using a Change element to change the contact associated with an incident, the behavior is the same as when you click the Search button on the Contact field in an incident workspace. If the new primary contact is not already associated to the incident (as a secondary contact, for example), the previous primary contact becomes disassociated from the incident. If the new primary contact is already associated to the incident as a secondary contact, the previous primary contact becomes a secondary contact. The same behavior applies to contacts associated with opportunities.

To edit Change attributes

1 From your open workflow, select a Change element on the canvas. The Element Tools tab displays on the ribbon.

2 Click the Search Report button. The Select Report window opens.

By default, the system's standard report for searching the designated record type is selected. For example, if you are associating an incident, the Incident Search report is selected by default.

3 Select a primary report to display in the search window.

4 Click the OK button to close the window.

5 To select a secondary search report to display in the search window, click the Secondary Search Report. The Select Report window opens where you can select a secondary report.

a To select no secondary search report, select the No Value check box.

6 Click the OK button to close the window.

Important When you associate records with the Change element, neither record is automatically saved or displayed to staff members. To save the change made by the Change element, be sure to open the working record in a workspace that has the Save button enabled or follow the Change element with a Save element. Refer to Editing Save attributes.

To display the working record or associated record to staff members, you will also need to follow the Change element with a workspace or workflow of the same record type and specify the record you want to display.

Editing Copy attributes

The Copy element is used to create a new record in the workflow. Once you add this element to your flow diagram, you can edit its attributes to specify the field values, a confirmation message, and a name for the record you are creating.

Important When a new record is created with the Copy element, it is not automatically saved to the database or displayed to staff members. To ensure the new record is saved, be sure to open the **working record** in a workspace that has the Save button enabled or follow the Copy element with a Save element. Refer to Editing Save attributes.

To display the copied record to staff members, you will need to follow the Copy element with a workspace or workflow of the same record type and specify the copy as the working record you want to display.

To edit Copy attributes

1 From your open workflow, select a Copy element on the canvas. The Element Tools tab displays on the ribbon.

2 Click a button on the left of the Working Record button group to select the type of record you want to copy. The last record of that type is selected by default and the element's working record label is updated with the name of the selected working record.

3 To select a different record of the selected type, click a button on the right of the Working Record button group to select the record you want to copy.

Tip For a menu of available records, click the Expand Working Records button below the scroll bar in the Working Record button group.

4 To select the parts of the original record to include in the record copy, click the Copy Details drop-down menu and select the parts you want to copy. Available options vary by record type.

Table 184: Copy Detail Options by Record Type

Record Type	Copyable Details
Incident	Threads, incident contacts, and file attachments.
Contact	Contact lists, file attachments, and notes.
Answer	Sibling relationships, file attachments, and notes.
Opportunity	Opportunity contacts, opportunity competitors, quotes, quote products, file attachments, and notes.
Organization	Organization addresses, file attachments, and notes.
Task	File attachments and notes.

Note Quotes and quote products can be copied but have no copy detail options.

5 To display a confirmation message when the record is copied, click the Confirmation Message button and type the message.

a Click the OK button to close the Confirmation Message window.

6 To name the copied record, click the New Record Name button and type the name in the element's new record label. The new record name appears in the Working Record button group for elements of the same record type.

Editing Save attributes

The Save element is used to save all records that are open in the record pool. To close the records after saving, click to highlight the Close After Save button on the ribbon.

Once you add a Save element to your flow diagram, you can edit its attributes to change its appearance.

Important When the record pool is saved with a Save element, each record update triggers business rules immediately in the background. Because business rules introduce another layer of complexity, it is important to use the Save element only when necessary and to keep your business rule processes separate and distinct from your desktop workflows.

Editing Return attributes

The Return element is used to return an embedded workflow to the primary workflow to resume the flow of action. Refer to Editing Workflow element attributes.

Once you add a Return element to your flow diagram, you can change its label name to define an event name that can be used in the primary workflow. By ending different branches of an embedded workflow with Return elements having unique names, you can advance the primary flow in different directions based on the route that was followed. If you create multiple Return elements with the same label name, any one of them will fire that named event.

Note A Return element added to a workflow that is not embedded in another workflow will have no effect.

Linking elements with connectors

Connectors are used to link elements and indicate flow direction. Some connectors are followed immediately upon performing an action in the originating element. Others are triggered only by events and conditions that you define. Connectors leading from Decision elements are followed only if the decision's conditions are met.

To connect an element

To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second.

Other ways to connect elements include:

- Hover over the first element and click a blue arrow to link to an adjoining element.
- Drag one element over another, hover over its blue arrow until it turns dark blue, and then drop to automatically connect the elements.

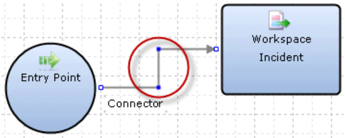
- Click an element from the ribbon, and then hover over an element on the canvas and click its blue arrow to drop and auto-link the new element.
- Drag and drop a connector from the ribbon to the canvas, and then drag the ends of the connector to the elements you want to link.

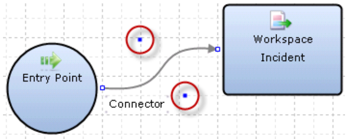
To connect to a different element

From your open workflow, click a midpoint on the connector to select it and drag one of its ends to an anchor on a different element to create a different connection.

To edit a square or curved connector

From your open workflow, click a midpoint on a square or curved connector to select it and drag the calibration points to adjust the shape of the connection. The following figures show the calibration points on square and curved connectors.





To delete a connector

From your open workflow, click a midpoint on the connector to select it and press **Delete**.

Defining connector events and conditions

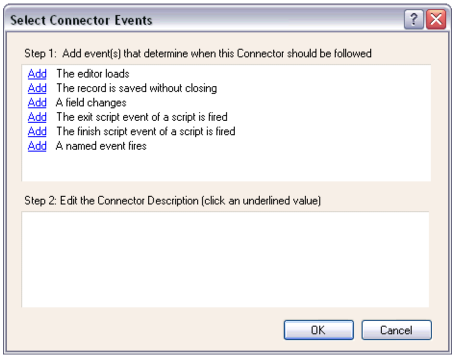
When a record or script is displayed to a staff member, it must remain open long enough for your staff members to complete their work before advancing to the next element in the workflow. Therefore, when connecting from a Workspace, Script, or Workflow element, you must define one or more triggering events (such as a field value change) that will cause the path to be followed. You can also specify conditions under which the event will cause the path to be followed.

In addition, Workspace elements can have more than one outgoing connection, each triggered by a different set of events and conditions. In this way, a single workspace can route staff members through different sequences of actions and decisions based on the event that was triggered.

Note If a connector is triggered by an event in a workspace rule or script rule, the flow will advance without running any subsequent rules in that workspace or script.

To add a connector event

1. From your open workflow, select the connector on the canvas. The Path Tools tab displays on the ribbon.
2. Click the Add Events button. The Select Connector Events window opens.



3. Click Add next to the event you want to add to the connector. Available events are described in the following table, but vary based on the type of element you are connecting from.

Table 185: Connector Events Description

Event	Description
The editor loads	Add this event to follow the path when a record is loaded using the workspace. **Note:** When using this event, the connector conditions are evaluated at the time a record is opened. If any of the conditions require that items be changed after the record is opened, the path will not be followed.

Table 185: Connector Events Description (Continued)

Event	Description
The record is saved without closing	Add this event to follow the path when an open record is saved without closing. **Note:** This event is not triggered if records are closed when saved, or closed without being saved. This includes records opened in child editor windows that do not feature Save buttons.
A field changes	Add this event to follow the path when the value of a field is changed. Once added, click the event's underlined text to select a field that will trigger the event. Available fields vary depending on the type of workspace you are connecting from. For example, when connecting from an incident workspace, you can select fields from the *incidents, contacts,* and *organizations* tables. However, not every field in these tables is available for use in connector events. **Note:** When using this event, connector conditions are evaluated at the time any change is made to the selected field. If the selected field is a text field, the conditions will be evaluated the moment any character in the field is changed.
An input control value changes	Add this event to follow the path when the value of an input control is changed to another value or to no value. Once added, click the event's underlined text to select an input control that will trigger the path. Available input controls include any menus, radio buttons, list boxes, and text boxes that are not used to trigger other paths. **Note:** This event is available only when an input control has been added to the workspace. When using this trigger, conditions are evaluated at the time any change is made to the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.
An input control value is selected	Add this event to follow the path when an input control value is selected. Once added, click the event's underlined text to select an input control that will trigger the path. Available input controls include any menus, radio buttons, and list boxes that are not used to trigger other paths. **Note:** This event is available only when an input control has been added to the script. When using this trigger, conditions are evaluated at the time a value is selected from the input control. If you want to verify that a specific value was selected, add An Input Control Has a Certain Value as a condition.

Table 185: Connector Events Description (Continued)

Event	Description
A button is clicked	Add this event to follow the path when a specified button is clicked. Once added, click the event's underlined text to select a button from the workspace that will trigger the event.
An image is clicked	Add this event to follow the path when an image is clicked. Once added, click the underlined text to select an image from the workspace that will trigger the event. **Note:** This trigger is available only when an image has been added to the workspace.
A hyperlink control is clicked	Add this event to follow the path when a hyperlink is clicked. Once added, click the underlined text to select a link from the workspace that will trigger the event. **Note:** This trigger is available only when a hyperlink has been added to the workspace.
The exit script event fires	Add this event to follow the path when the Exit button is clicked, an exit script event is fired by a rule from a script called in a workflow, or from a script placed on a workspace called in a workflow. Connector conditions are evaluated at the time that the event is fired. Refer to Using events in workspace and script rules.
The finish script event fires	Add this event to follow the path when the Finish button is clicked, a finish script event is fired by a rule from a script called in a workflow, or from a script placed on a workspace called in a workflow. Connector conditions are evaluated at the time that the event is fired. Refer to Using events in workspace and script rules.
A named event fires	Add this event to follow the path when a specified named event fires from a workspace rule or from a rule in a script that has been placed on the workspace. Click the underlined text to type the name of the event that will be used to trigger the connector event. Connector conditions are evaluated at the time that the event is fired. Refer to Using events in workspace and script rules. **Note:** When a connector is triggered from a workspace or script rule by a named event, the rule will stop running and any actions that follow the event in the rule will not be performed.

4 Click any underlined text in the Edit the Connector Description section to open a window where you can specify the source of the event action (such as the field, control, or event name).

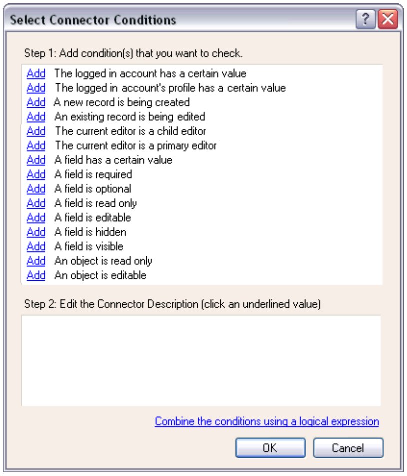
5 To remove an event from the connector description, hover over the event and click Remove.

6 Click the OK button to add the event to the connector.

To add a connector condition

1 From your open workflow, select the connector on the canvas. The Path Tools tab displays on the ribbon.

2 Click the Add Conditions button. The Select Connector Conditions window opens.



3 Click Add next to the conditions you want to add to the connector. Available conditions are described in the following table, but vary based on the type of element you are connecting from.

Table 186: Connector Conditions Description

Condition	Description
The logged in account has a certain value	Add this condition to follow the path if the logged-in account has a certain value. Click the underlined text to select the account to be evaluated.
The logged in account's profile has a certain value	Add this condition to follow the path if the logged-in account's profile has a certain value. Click the underlined text to select the profile to be evaluated.
A new record is being created	Add this condition to follow the path if a new record is being created by the originating workspace.
An existing record is being edited	Add this condition to follow the path if an existing record is being edited in the originating workspace.
The current editor is a child editor	Add this condition to follow the path if the record is open in a child editor.
The current editor is a primary editor	Add this condition to follow the path if the record is open in a primary (non-child) editor.
The record is copied	Add this condition to follow the path if the record is being copied from another record. **Tip:** This condition can be useful if you want to automatically set field values when records are copied.
The record is not copied	Add this condition to follow the path if the record is not being copied from another record.
A field has a certain value	Add this condition to follow the path if a field has been set to a specified value in the originating workspace. Click the underlined text to select the field to be evaluated.
A field is required	Add this condition to follow the path if a field is required in the originating workspace. Click the underlined text to select the field to be evaluated.

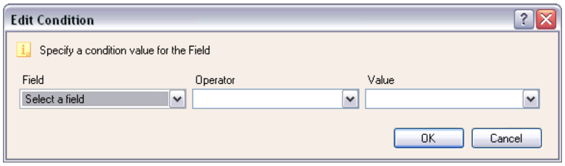
Table 186: Connector Conditions Description (Continued)

Condition	Description
A field is optional	Add this condition to follow the path if a field is optional (not required) in the originating workspace. Click the underlined text to select the field to be evaluated.
A field is read only	Add this condition to follow the path if a field is read-only in the originating workspace. Click the underlined text to select the field to be evaluated.
A field is editable	Add this condition to follow the path if a field is editable in the originating workspace. Click the underlined text to select the field to be evaluated.
A field is hidden	Add this condition to follow the path if a field is hidden in the originating workspace. Click the underlined text to select the field to be evaluated.
A field is visible	Add this condition to follow the path if a field is visible in the originating workspace. Click the underlined text to select the field to be evaluated.
An object is read only	Add this condition to follow the path if a control is read-only in the originating workspace. Click the underlined text to select the control to be evaluated.
An object is editable	Add this condition to follow the path if a control is editable in the originating workspace. Click the underlined text to select the control to be evaluated.
An object is hidden	Add this condition to follow the path if a control is hidden in the originating workspace. Click the underlined text to select the control to be evaluated.
An object is visible	Add this condition to follow the path if a control is visible in the originating workspace. Click the underlined text to select the control to be evaluated.
An input control has a certain value	Add this condition to follow the path if a specified question control value has been selected in the originating script element. Click the underlined text to select the control to be evaluated.

Table 186: Connector Conditions Description (Continued)

Condition	Description
An add-in control condition returns a certain value	Add this condition to follow the path based on whether an add-in control returns a certain value. Click the underlined text to select the add-in control and the parameters to be evaluated. Refer to Add-ins in scripts and workspaces.

4 If a condition you have added to the description contains underlined text, click the underlined text to open the Edit Condition window. The following figure shows the Edit Condition window as it appears when defining a condition based on a field value.



a If defining a condition based on a value for a field, select the Field drop-down menu and select a field.
b Click the Operator drop-down menu and select an operator.
c Enter a value in the Value field.
d Click the OK button to close the window.

5 To remove a condition from the connector description, hover over the condition and click Remove.

6 To evaluate the conditions using a logical expression, click Combine the Events Using a Logical Expression.

7 Click the OK button to add the condition to the connector.

Adding comments to a workflow

The Elements button group provides a Comment element that allows you to add comments to your diagram without impeding the flow of action. Comment elements can be connected to other elements but they do not accept incoming connections. Used to convey information only, comments have no impact on the actions or events that comprise the workflow.

To add a comment

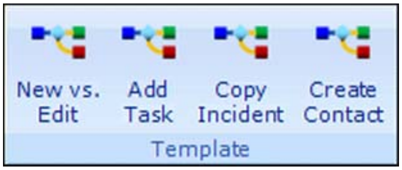
1 From your open workflow, drag and drop a Comment element from the ribbon onto the canvas.

2 Click the element to type your comments.

3 To connect the Comment element to another element, click an anchor on the Comment element and drag to the element. The element is highlighted when the connector is able to link to it.

Note Connectors from Comment elements are dashed lines, indicating that they do not impact the flow of action.

Workflow templates



The Template button group on the Insert tab of the workflow designer provides several predefined templates as a starting point for creating your workflow's flow diagram. When you choose a template, the elements and connectors associated with that template are added to your diagram. You can add and remove elements to further customize your workflow, then edit each element's attributes to meet your business needs.

To apply a workflow template

1 From the Template group of the Insert tab, hover over a template button to see it previewed on the canvas.

- **New vs. Edit**—This template directs staff members to one workspace if they are creating a new incident and to a different workspace if they are opening an existing incident. Refer to New vs. Edit.
- **Add Task**—This template displays an incident in a workspace and then automatically creates a new task for the incident. Refer to Add Task.
- **Copy Incident**—This template displays an incident in a workspace, and then copies the incident, sets fields in the copy, and displays the copy in another workspace. Refer to Copy Incident.

- **Create Contact**—This template checks whether an open incident is associated with a contact record. If no contact is associated, it automatically creates a new contact for the incident and sets contact fields before displaying the incident in a workspace. Refer to Create Contact.

2 Click a template button to add the template to the canvas. A message opens warning you that selecting a template will overwrite the existing content on the canvas.

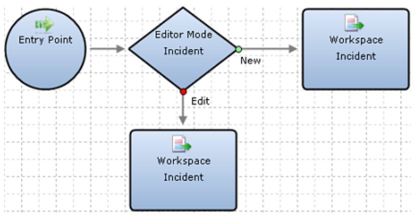
3 Click the OK button. The template is inserted in the diagram.

4 Select each element and edit its attributes. Refer to Designing a flow diagram.

5 Click the Save button to save the workflow.

New vs. Edit

This template uses a decision element to determine if the staff member is creating a new incident or opening an existing incident. Based on the decision, the staff member is either directed to a workspace designed for new incident creation or a workspace designed for editing existing incidents.



Each element in the template is described in the following table.

Table 187: New vs. Edit Description

Element	Description
Entry Point	This element indicates the starting point of the workflow.
Editor Mode Incident	This Decision element checks whether the incident open in the workflow is a new incident or an existing incident. The **working record** is set to Incident, referring to the incident being created or opened.

Table 187: New vs. Edit Description (Continued)

Element	Description
Workspace Incident (New Path)	This Workspace element displays a new incident in a workspace. The working record is set to Incident, referring to the incident being created.
Workspace Incident (Edit Path)	This Workspace element displays an existing incident in a workspace. The working record is set to Incident, referring to the incident being opened.

Add Task

This template opens an incident in a workspace. Then, based on an event you define in the outgoing connector, a task is automatically added to the incident.

Each element in the template is described in the following table.

Table 188: Add Task Description

Element	Description
Entry Point	This element indicates the starting point of the workflow.
Workspace Incident	This Workspace element displays the opening incident in a workspace. The **working record** is set to Incident, referring to the incident that is being opened in the workspace.
Task New Task	This Create element automatically creates a new task associated with the incident and names the task “New Task.”

Copy Incident

This template opens an incident in a workspace. Then, based on an event you define in the outgoing connector, the incident is copied, fields are set in the copy, and the copy is displayed in another workspace.

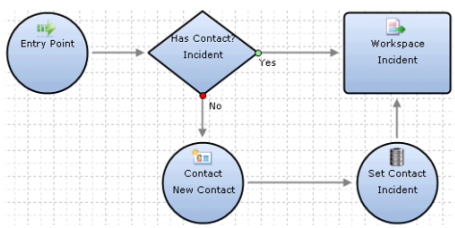
Each element in the template is described in the following table.

Table 189: Copy Incident Description

Element	Description
Entry Point	This element indicates the starting point of the workflow.
Workspace Initial Incident	This Workspace element displays the opening incident in a workspace. The **working record** is set to Initial Incident, or the incident that is initiating the workflow.
Copy Last Incident The Copy	This Copy element copies the incident to a new incident and names the copy “The Copy.” The working record is set to Last Incident so the element will copy the incident last opened in the workflow.
Set Fields The Copy	This Set Fields element updates incident fields. The working record is set to The Copy so the element will update fields in the incident copy.
Workspace The Copy	This Workspace element displays an incident in a workspace. The working record is set to The Copy so the element will display the incident copy.

Create Contact

This template uses a Decision element to determine if the incident being opened is associated with a contact record. If no contact is associated, it automatically creates a new contact for the incident and sets contact fields before displaying the incident in a workspace.



Each element in the template is described in the following table.

Table 190: Create Contact Description

Element	Description
Entry Point	This element indicates the starting point of the workflow.
Has Contact? Incident	This Decision element checks whether the incident being opened is associated with a contact record. If so, the flow is forwarded to the Workspace element. If not, the flow is directed to the Create element. The **working record** is set to Incident, referring to the incident being opened in the workflow.
Contact New Contact	This Create element automatically creates a new contact and names the contact "New Contact."
Set Contact Incident	This Set Fields element updates the incident's Contact field to the new contact, associating the two records. The working record is set to Incident so the element will make the update to the incident opened earlier in the workflow.
Workspace Incident	This Workspace element displays the opening incident in a workspace. The working record is set to Incident so the element displays the incident opened earlier in the workflow.

Testing workflows

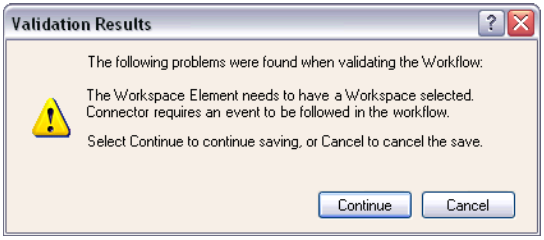
Because even basic workflows can contain many components that must be configured correctly in order to function properly, it is important to test your workflows thoroughly before you take them to production. For this reason, Oracle Service Cloud provides features to help you validate and preview workflows as you create them.

Workflow validation

As you create a flow diagram for your workflow, Oracle Service Cloud validates all flow elements to ensure all required attributes have been specified. Although validation occurs in real time as you add and update elements, you can review validation errors manually at any time by clicking the Validate button on the Home tab.

You can also choose to display validation flags to help quickly identify invalid elements. When you select the Validation Results check box on the View tab, valid elements are flagged with a green check mark, while those found to be invalid are flagged with a red exclamation point and a small button you can click to view the validation error.

If you attempt to save a workflow without first addressing its validation errors, you will receive a message summarizing the errors.



Important You can save a workflow without first correcting validation errors by clicking the Continue button on the Validation Results window. However, the workflow will not function properly until all validation errors have been corrected.

Previewing workflows

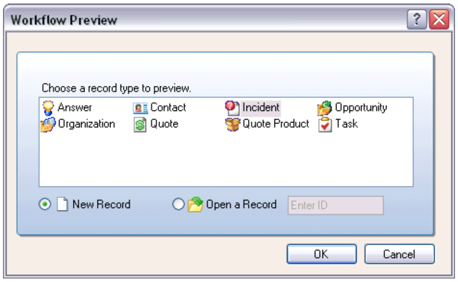
In order to thoroughly test the workflows you create, the Preview feature simulate the effects of the workflow you are editing, without altering your own profile settings or updating your production data.

Once you select a record type and choose a new or existing record, a preview window opens to display the Service Console as it would appear to a staff member opening the same record in the live workflow. Except for saving records (which is disabled), the full functionality of your workflow is available for you to test in a read-only environment.

Note Because record saving is disabled, you will not be able to test "The record is saved without closing" events in preview mode. To test subsequent elements in the flow, you must temporarily select a different event.

To preview a workflow

1 From the open workflow, click the Preview button on the ribbon's Home tab. The Workflow Preview window opens.



2 Select the type of record you want to preview in the workflow.

3 To simulate the workflow using a new record, select the New Record radio button.

4 To simulate the workflow using an existing record, select the Open a Record radio button and type the record ID in the Enter ID field.

5 Click the OK button. A preview window opens where you can test the workflow.

Tip Elements such as Create, Clear, Copy, and Set Fields perform automated actions in the background that advance the flow without visual indication. To verify these elements during testing, you can use the Confirmation Message button to add a visual indicator that an action has been performed.

Exporting and importing workflows

If you have a workflow that you want to copy to another interface, you can export the workflow and then import it on the other interface. Exported workflows contain all included workspaces (with all elements, fields, controls, layout, and rules), decisions, actions, and other embedded workflows. Alternately, you can export the contents of your canvas as an image file for use as a visual reference.

To export a workflow

1 On the Workspaces/Workflows explorer, right-click the workflow you want to export and select Open. The workflow opens.

2 Click File and select Export > Export Definition. The Export Workflow window opens.

Note You can also export an image of the canvas to your workstation by selecting Export > Export Image.

3 If the workflow contains embedded workspaces, scripts, or nested workflows, select the Export Workflow Definition Only radio button to export the workflow definition only. By default, the workflow definition will be exported along with any contained workspaces, scripts, and workflows.

4 Click the OK button. The Save As window opens.

5 Select the location where you want to save the workflow definition file and type the file name.

6 Click the Save button to save the file.

Note Workflow definition files are saved with a hash value that is used when the file is imported to determine if the file has been modified externally. If the file has been modified, it will not be available for importing and an error message will notify you that the file is invalid.

To import a workflow

1 On the Home tab of the Workspaces/Workflows explorer, click New Workflow. A new workflow opens.

2 Click File and select Import Definition. A message appears indicating that the import process will overwrite the current open workflow.

3 Click the Yes button to allow the import to overwrite the current open workflow. The Import Workflow wizard opens.

4 Click the Next button.

5 Type the path and name of the workflow definition file you want to import.

Or

Click the Browse button to find the file on your workstation and click the Open button.

If the workflow contains workspaces, scripts, or nested workflows, you will be prompted to select whether to include them in your import.

6 To import the workflow definition along with any contained workspaces, scripts, and workflows, click the Next button.

  a Select the folder you want to save the workspaces and workflows in and click the Next button.

  b Click the Map To Type drop-down menu to select a record type for each workspace and script you are importing.

  c If a contained workspace includes records from a custom object, click the Map To Record Type drop-down menu and select the record type you want to map the records to. If Oracle Service Cloud detects a record type of the same name already in the site, it is selected by default.

  d Click the Next button.

7 To import only the workflow definition, select the Import Workflow Definition Only radio button and click the Next button.

8 If the workflow contains fields that do not exist in the database, they are listed in the wizard as invalid. To remove invalid field references from the workflow, click the Next button.

9 Click the Finish button. The desktop workflow canvas opens with the imported workflow.

Best practices for desktop workflows

Desktop workflows can meet a broad range of needs, some simple and some complex. Complex workflows can be challenging to manage, but keeping your flow diagram elements grouped intuitively on your canvas can help make it easier to understand, in case the workflow needs to be revised later. To view an example of a well organized, complex desktop workflow, click the tutorial link to the right.

The following practices can also be helpful when creating and updating workflows.

- **Apply logic prudently**—Desktop workflows contain many points where logic may be used, such as script elements, workspace elements, decision elements, and connectors. The best places to incorporate logic will depend on your use case, but be sure to consider the full impact and scalability of the workflow when adding these functions. Creating logic that is simple and distinct with minimal overlap is much easier to maintain and modify over time.

- **Track and advance your flows**—Record updates made by workflows are tracked in record audit logs, but sometimes tracking the path a record has taken through a complex flow can be challenging. To make this easier, you can add a custom field to manage the workflow "state." For example, if an agent completes a key step in a workflow, consider running a rule action to update an easily reviewed custom field signifying that the step was completed. With this information tracked by a field, you could even check its value in an initial decision point to bypass steps completed in previous edits of the record.

For more best practices for using the various features that comprise the dynamic agent desktop, refer to Desktop Overview.

Analytics

The following sections are intended for administrators and staff members. They contain information and procedures for configuring and using Oracle RightNow Analytics Cloud Service.

- Management Reports
- Analytics Explorers
- Creating Basic Reports
- Custom Reports
- Report Management
- Dashboards
- Data Dictionary
- Analytics Configuration Settings
- Transaction Descriptions

31

Analytics Explorers

The reporting features in Oracle Service Cloud are accessed through the Oracle RightNow Analytics Cloud Service (Analytics) explorers. From these explorers, you can create **custom reports** and **dashboards**, view **standard** and custom reports, and edit **report styles**, **chart styles**, **color schemes**, images, and **text fields** to use with reports and dashboards. Refer to Explorers.

Working with explorers

The Analytics explorers are accessed from the Analytics button on the navigation pane. Your access to Analytics explorers is determined by your navigation set and profile permissions.

- Overview of navigation sets
- Customizing profiles
- Explorers

You can search from all Analytics explorers to quickly locate items you want to view or edit. You can also copy and save items you create in custom folders.

To display Analytics explorers

Click the Analytics button on the navigation pane. The explorers you have access to display.

Searching in explorers

You can search for reports, **styles**, images, or other types of items specific to the explorer you are working in. For instance, you can search for reports and dashboards from the Reports explorer and **text fields** from the Text Fields explorer.

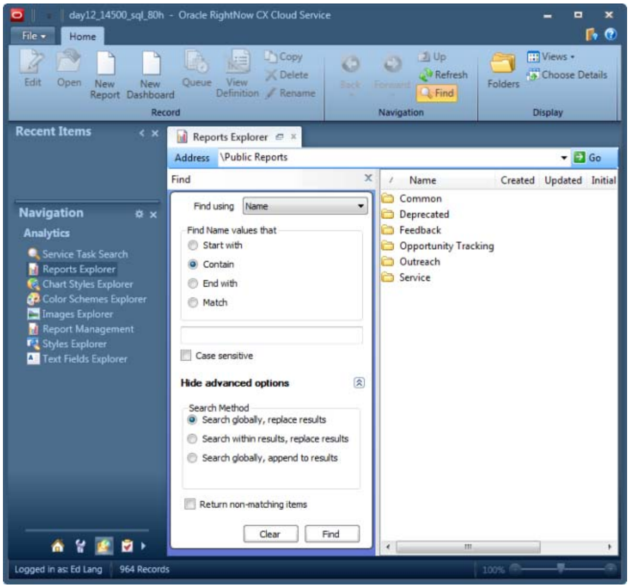
Note A separate Quick Search feature is available that enables you to search for a specific file or record no matter where you are in the product. Refer to Searching for records with Quick Search.

The following procedure describes how to search for reports from the Reports explorer. However, the basic procedure is the same for all explorers—only the columns available for searching change between explorers.

To search for a report

1. Click the Analytics button on the navigation pane and then double-click Reports Explorer.
2. Click the Find button on the ribbon. The left side of the content pane displays a Find menu, hiding the folders tree.

Note All of the Analytics explorers include a **ribbon** for working with items shown in the explorers.



3 Enter the following field information.

Table 191: Reports Explorer Find Menu Description

Field	Description
Find Using	Click this drop down menu to select a column in the reports list to search on. You can search by the report's name, ID number, dates created or updated, the report's initial run (opening report without prompting for search parameters) status, or the refresh on edit status. Each column is associated with one of three data types which determine the available search options: • Strings—Search for strings that start with, contain, end with, or match the value you enter in the text box. • Dates—Search for dates before, on, or after today's date. You can also click the calendar to display the current month's calendar and select another day, or click the arrows at the top of the calendar to change months. • Integers—Search for values that are less than, equal to, or greater than a number.
Search text box	Type your search text in this field.

Table 191: Reports Explorer Find Menu Description (Continued)

Field	Description
Case Sensitive	When searching a string column, select this check box if you want to match the case.
Show Advanced Options	Click Show Advanced Options to display additional search options.
Search globally, replace results	Select this radio button to remove the results from the previous search and replace them with results from this search. **Note:** This is the default option.
Search globally, append to results	Select this radio button to keep results from the previous search and add results to them from this search.
Search within results, replace results	Select this radio button to search the current search results and keep only those results that match the new search.
Return Non-matching Items	Select this check box to return all reports that do *not* match your search criteria.

4 Click the Find button. The search results display on the right pane. A message displays if no results are found.

5 To remove the text entered for the previous search, click the Clear button on the bottom of the Find menu.

6 To replace the search results with the original reports list, click the Refresh button on the ribbon.

7 To remove the Find menu and display the folders list, click the Folders button on the ribbon.

Creating custom folders

You can create custom folders in any explorer to store new or copied reports, **styles**, **chart styles**, **color schemes**, images, and **text fields**. You can also rename custom folders and files.

To create a custom folder

1 Open the appropriate explorer.

2 Right-click the parent folder you want to add the custom folder to.

Note Not all standard folders accept custom folders.

3 Select New Folder.

4 Type a name for the folder.

5 Click outside the folder name, or press **Enter**, to save the folder.

To rename a custom folder

1 Open the appropriate explorer.

2 Right-click the custom folder.

3 Select Rename.

4 Type a new name for the folder.

5 Click outside the folder name, or press **Enter**, to save the name.

Tip You can also use right-click functionality to rename custom folders when you are saving or copying items.

Copying items

The **standard reports**, **styles**, **chart styles**, and **color schemes** in the Analytics explorers cannot be edited, renamed, or deleted. However, you can copy any of these predefined items and use the copy as a starting point when you want to create a customized version. You can also use the same method to copy custom items that were created in any of the Analytics explorers.

To copy an item

1 Open the appropriate explorer.

2 Right-click the item you want to copy.

3 Select Copy to open the Copy <name> As window.

4 To store the new item in a custom folder, navigate to the folder.

Note Custom files cannot be stored in the Reports explorer's or Images explorer's standard folders.

5 Type a name for the new item in the Name field.

6 Click the OK button to save the new item.

Saving items

The procedure to save **custom reports**, **report styles**, **chart styles**, **color schemes**, images, and **text fields** is similar, no matter what type of item you are saving.

To save an item

1 After editing the item, select the appropriate save option on the ribbon's Home tab:
   - **a** To save changes to the item without closing it, select Save.
   - **b** To save a new item, or to save a copy of the item you are editing with a different name, select Save As.
   - **c** To save changes to the item and close it, select Save and Close. This option is faster than saving a change and then manually closing the window.

Note Options for saving a custom report are accessed by clicking the arrow on the Save button on the report design center's **Quick Access toolbar**.

When you select Save As, or attempt to save a new item for the first time, the Save As window opens to name the item.

2 To store the new item in a custom folder, navigate to the folder.

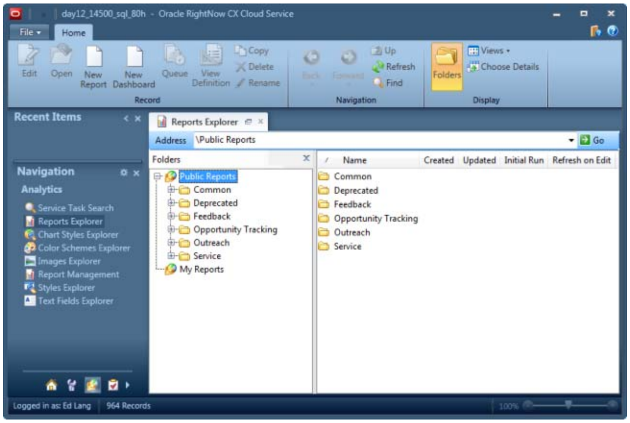
Note Custom files cannot be stored in the Reports explorer's or Images explorer's standard folders.

3 Type a name for the new item in the Name field.

4 Click the OK button to save the item.

Reports explorer

The Reports explorer provides you with one location to view and organize reports, and edit and create **custom reports** and **dashboards**. The content created in the other Analytics explorers is applied to reports using the Reports explorer.



Reports are contained in folders in the Reports explorer. These folders are in a tree structure and can be expanded or collapsed to hide or display their contents. Reports that are accessible by multiple staff members are contained in the Public Reports folder, and private reports that are accessible only to the staff member who created them are stored in the My Reports folder.

Note Other staff members' My Reports folders are not displayed in the Reports explorer. However, **administrators** can log in with the **administrator account** to access every account's folders. This ensures that private reports can be edited, moved, and deleted if necessary.

Clicking a folder in the Reports explorer's tree displays the folder's contents in the list on the right. A folder's contents can include reports, dashboards, and subfolders. Reports and dashboards contained in the same folder are automatically sorted in alphabetical order and cannot be reordered. However, you can drag items from one folder to another.

Right-clicking a folder or report displays a list of actions you can take on the item, such as opening a report for editing or queuing a report.

❖ Report Management

- ❖ Custom Reports
- ❖ Dashboards

Styles explorer

Report styles allow you to quickly apply custom display settings to your reports without editing the underlying report. Styles can also help staff members use the same display settings for their reports so that all reports generated by your staff share the same appearance. For information about applying a style to a report, refer to Changing report displays with styles.

A number of default styles are available, which may be all you need. However, you can easily create and edit styles to define the specific fonts, colors, borders, and margins which are most appropriate for your target audience. You can then apply your custom styles to reports just as you would the default styles.

You can edit style options for various components used in reports, such as **text fields**, column headers, **exceptions** descriptions, or entire report sections. You can also associate a custom chart style with your report style that will be applied to charts added to reports.

The style options vary depending on the type of component you are editing. For example, the options for a text component include a Font tab, whereas the options for a non-text component do not, since font settings do not apply. Refer to Report elements for descriptions of the various components that can be added to reports.

Using the style editor

The style editor displays examples of the various report components that you can create custom styles for. This helps you identify the component you want to modify. You can also select the component you want to modify from a list if you know its name.

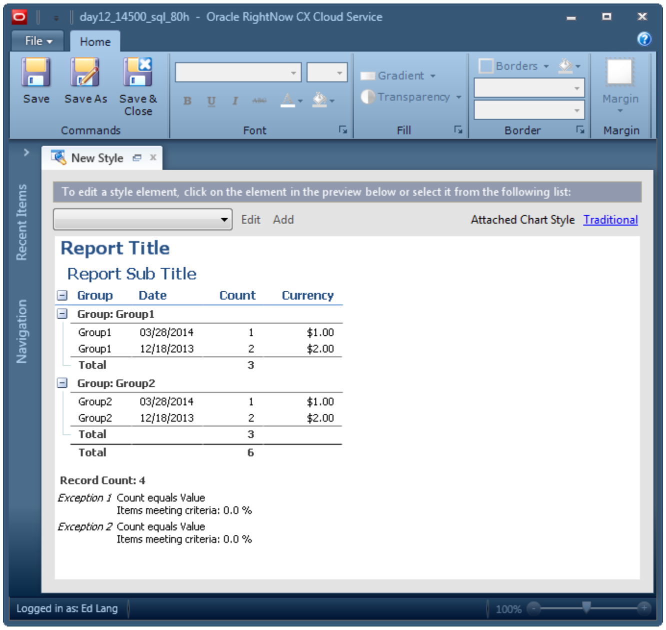
To create a style

1. Click the Analytics button on the navigation pane.
2. Double-click Styles Explorer. The Styles explorer opens, displaying the current styles.
3. To create a style, click the New button on the ribbon.

   Or

   To edit an existing custom style, right-click the style and select Edit.

   The style editor opens.



4 Select the component whose style you want to modify from the drop-down menu at the top of the editor and click Edit.

Or

Double-click the component on the style editor. A window opens for selecting style options.

5 Select the style options you want for the selected component. Refer to [Selecting style options](#).

6 To associate a custom chart style with the report style, click the name of the **chart style** that is currently associated with the report style, shown next to Attached Chart Style. The Select Chart Style window opens.

a Select the chart style you want to associate with the report style.

b Click the OK button.

Note The associated chart style is used by default for charts added to reports that use the report style. However, different chart styles can be selected when creating charts. Refer to Chart Styles explorer for information about chart style options. For information about adding charts to reports, refer to Adding and editing charts.

7 Click the Save and Close button on the ribbon to save the style.

Selecting style options

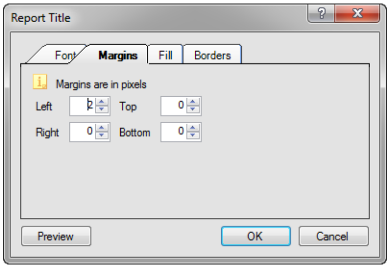
Once you select the component you want to modify from the style editor, you can define options for the component's font, margins, background colors, and borders.

Note You can access all the style options for the selected component from the window that displays when you select a component and click Edit. However, you can also select common style options for the selected component using the buttons on the explorer's **ribbon**, which provide shortcuts to many of the same options available on the window. In this procedure, we show you how to change options from the window.

To select style options

1 Open the style editor window for the component you have selected. By default, the window opens on the Font tab if the selected component includes text. Refer to Choosing font attributes for information about this tab.

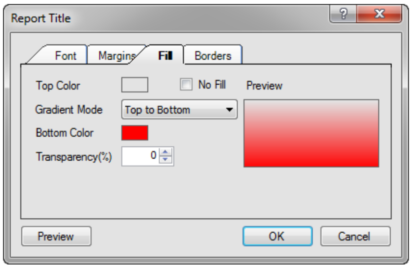
2 Click the Margins tab to define the amount of space surrounding the component when used in reports.



3 Enter the number of pixels between the text and the left, right, top, and bottom margins.

4 If you are editing a style for a report section, such as the report header, enter the number of pixels you want between the section's contents in the Spacing field.

5 Click the Fill tab to modify the background fill colors for the selected component.



6 Enter the following field information.

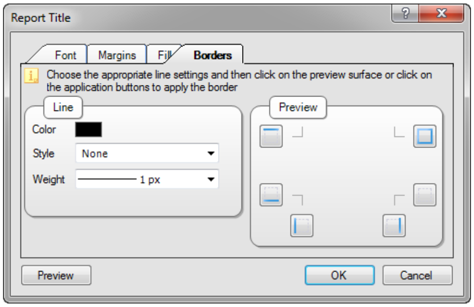
Table 192: Fill Tab Description

Field	Description
Color/Top Color/Left Color	Click this box to select a primary color as the background. The text description for this option varies depending on the Gradient Mode you select. Refer to Choosing colors.
No Fill	Select this check box to clear any fill colors previously selected. If this check box is selected, the other options on the Fill tab are disabled, except Color. Selecting a color automatically clears the No Fill check box, enabling the other options.
Gradient Mode	Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available. • **None**—Select this option to use only the primary color as the fill color. If you select None, the Gradient Color field is disabled. • **Top to Bottom**—Select this option to merge the colors from the top of the background to the bottom. • **Left to Right**—Select this option to merge the colors from the left of the background to the right.

Table 192: Fill Tab Description (Continued)

Field	Description
Gradient Color/Bottom Color/Right Color	Click this box to select a secondary color to merge with the primary color. The fill colors then merge using the method defined in the Gradient Mode menu. The text description for this option varies depending on the gradient mode you select. Refer to Choosing colors.
Transparency (%)	Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview field, so you can easily scroll through the transparency percentages to find a value that best suits your needs.
Preview	This area provides a sample of how the fill colors you select will appear on the report background.

7 Click the Borders tab to modify the borders of a component.



8 Enter the following field information.

Table 193: Borders Tab Description

Field	Description
Color	Click this box to select a color for the border. Refer to Choosing colors.

Table 193: Borders Tab Description (Continued)

Field	Description
Style	Click this drop-down menu to select one of the following border styles: Solid, Dashed, Dotted, Inset, Outset, Double, Groove, Ridge, Rounded, or Separator. The Separator option lets you add space around the component.
Weight	Click this drop-down menu to select the pixel size of the border. You can choose a number between 1 and 10 pixels.
Preview	Use this area to define the placement of the borders. Select any of the following buttons to place the borders, or click the area in the Preview white space where you want the border.
 Borders	Click a button to add the selected border attributes to the top, bottom, left, right, or all sides of the component. You can also add or remove borders from all sides of the component.

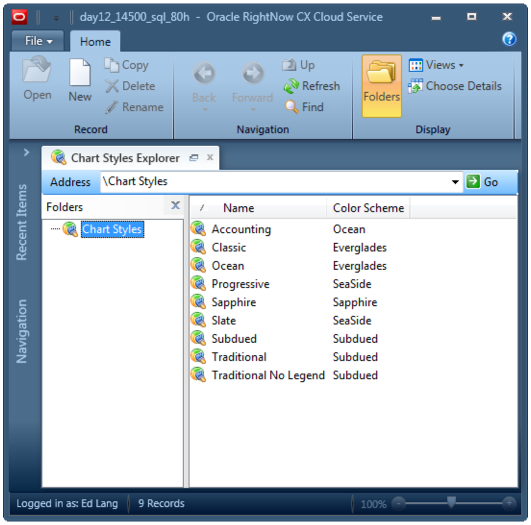
9 Click the Preview button to preview the style with the changes you have made to fonts, margins, fill, and borders.

10 Click the OK button to save your changes to the selected component.

11 Select other components on the style editor and repeat steps 1 through 10 to edit the style options for the selected component.

Chart Styles explorer

You can create chart styles to define the appearance of charts shown on reports. By applying a chart style, you can immediately change a chart's fonts, colors, scales, gridlines, backgrounds, and other display attributes. The Chart Styles explorer includes several predefined chart styles, which you can apply to charts, and allows you to create custom chart styles. You can then apply the same chart style to charts in different reports to ensure that all the charts have a similar appearance.



The attributes defined in chart styles vary depending on the type of chart used in a report. Likewise, the chart style options vary depending on the type of chart the style should be applied to. The chart types available are described in the following table.

Table 194: Chart Types Description

Chart Type	Description
 Vertical Bar	Vertical bar charts display data as a series of vertical bars. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.
 Horizontal Bar	Horizontal bar charts display data as a series of horizontal bars. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.
 Pie	Pie charts display data as a percentage of a whole. Subtype options can display two- or three-dimensional pie charts or doughnut charts.
 Line	Line charts display data as a series of points connected by a line. Subtype options can display the chart as two- or three-dimensional.

Table 194: Chart Types Description (Continued)

Chart Type	Description
 Line/Bar Combo	Line/bar combo charts display both a line chart and a vertical bar chart. Subtype options can display the chart with single or stacked bars and as two- or three-dimensional.
 Area	Area charts display data as areas on an x- and y-axis. Subtype options can display the chart as two- or three-dimensional.
 X-Y	X-Y charts display data as a series of plotted points. Subtype options can display the plotted points as points, lines, or bubbles and as two- or three-dimensional.
 Radar	Radar charts display data in a radar format. Numeric values are plotted at markers on the perimeter.
 Stock	Stock charts display the minimum and maximum values for data. Subtype options can display the chart using squares or lines to represent the high and low points of each plot.
 Pareto	Pareto charts display data in descending order with an ascending plot line for cumulative percentage. Subtype options can display the chart as two- or three-dimensional.
 Gauge	Gauge charts display a numeric value as a percentage of a whole. Subtype options can display the chart as a gradation bar or a simple color meter. **Note:** Gauge charts cannot be used in reports that contain non-aggregate columns.
 Funnel	Funnel charts display data as areas shown in ascending or descending order. Subtype options can display two- or three-dimensional funnel or pyramid charts.
 Gantt	Gantt charts display time lines for completion of scheduled tasks. Subtype options can display the chart as two- or three-dimensional.

For procedures on applying a chart style to a chart, refer to Adding and editing charts.

Creating and editing chart styles

Chart styles are customized using options available on the chart styles editor's **ribbon**. When you edit a chart style and select a chart type, different buttons are enabled based on the new chart type. For example, the Bar Settings button is enabled on the ribbon when editing a style for a vertical bar chart, whereas it is not enabled when creating a style for a pie chart. The chart subtype, such as two- or three-dimensional and stacked or not stacked, also impacts options enabled on the ribbon.

Tip The same ribbon options available on the chart styles editor are also available when you add a chart to a custom report. This allows you to customize the display of an individual chart used in a report without creating or modifying a chart style.

When creating a chart style, a sample of the currently selected chart type and subtype is shown on the content pane. The sample chart's display changes depending on the options you select so you can quickly see how a chart that uses the selected settings will appear.

Note Once you select a chart type and subtype, you can follow the steps in this procedure in any order you want. The steps in this procedure are listed according to the order of their associated buttons on the ribbon.

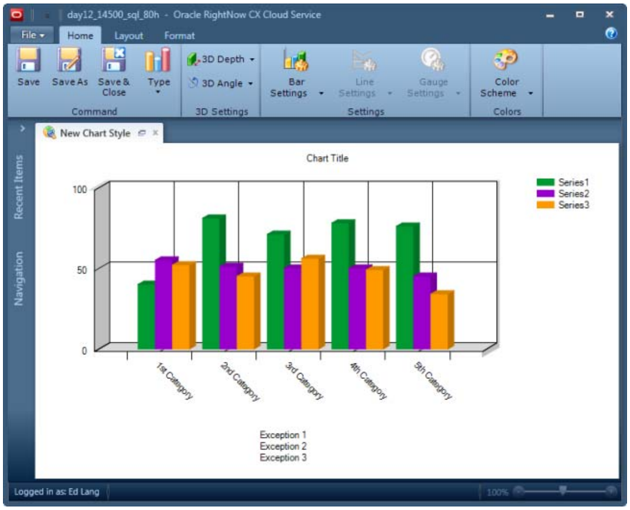
To create or edit a chart style

1 Click the Analytics button on the navigation pane and then double-click Chart Styles Explorer.

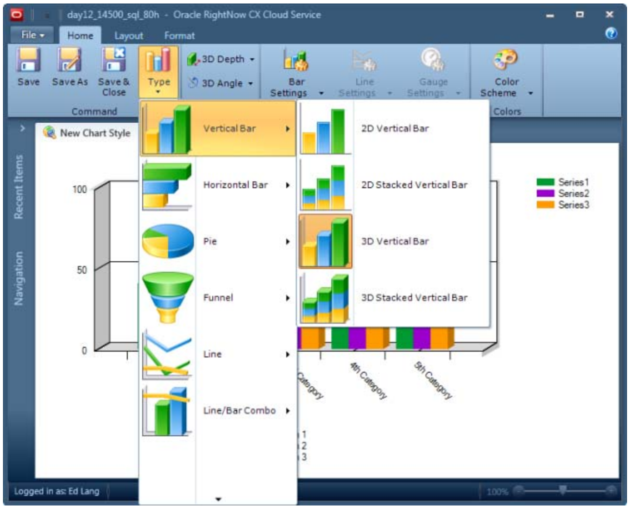
2 To create a new chart style, click the New button on the ribbon.

Or

To edit a chart style, right-click the chart style and select Edit. The chart styles editor displays a default chart type.



3 Click the Type button on the Home tab to display the chart type menu.



4 Select the chart and chart subtype you want to configure for the chart style.

Note Once you configure your chart style for the selected chart type and subtype, you can select other types to configure your chart style for use with those types. This allows you to use the same chart style regardless of the types of charts you add to reports, while ensuring the charts' colors, fonts, and other attributes are consistent.

5 To configure three-dimensional settings for a chart style with a 3D subtype, click the 3D Depth and 3D Angle buttons on the Home tab to enter values that impact how three-dimensional charts display.

Tip You can modify the three-dimensional settings for charts with 3D subtypes by right-clicking the chart on the content pane and selecting Rotate. When you do so, your cursor changes and you can move your mouse or other pointing device horizontally and vertically to change the chart's three-dimensional values. Click the left mouse button to quit rotating the chart. The right-click menu also gives you options to convert three-dimensional charts to two-dimensional charts, or two-dimensional charts to three-dimensional charts, as long as the chart type includes 3D subtypes. This right-click menu is also available when creating or viewing reports.

The following table describes the settings you can access from these buttons.

Table 195: Three-Dimensional Chart Subtype Settings Description

Button	Description
3D Depth	Click this button and enter a number for the extent of the chart's three-dimensional effect. A value of 0 removes the 3D appearance from the chart, where as a setting of 125 maximizes the effect.
3D Angle	Click this button to enter values for the chart's horizontal and vertical angles.
X Angle	Enter a value from 0 to 180 degrees in this field. This value determines the vertical rotation of the chart.
Y Angle	Enter a value from 0 to 180 degrees in this field. This value determines the horizontal rotation of the chart.

6 To configure colors, styles, borders, and other settings for the bar, line, or gauge elements in charts, click the Home tab and click the Bar Settings, Line Settings, or Gauge Settings button.

The following table describes the settings you can access from these buttons.

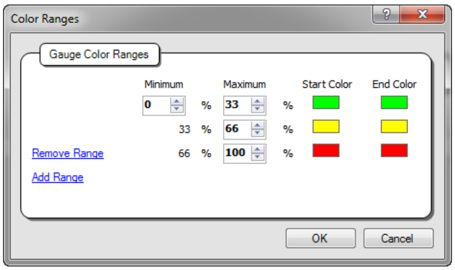
Table 196: Bar, Line, and Gauge Settings Buttons Description

Button	Description
Bar Settings	Click this button to customize the display of the bar elements for chart types that include bars.
Bar Outline	Select this option and then select the type of outline you want around the individual bars in the chart. You can choose from the following options: • None—The bars have no outline. • Lighter—The bar outline is a lighter shade of the bar's color. • Darker—The bar outline is a darker shade of the bar's color. • Color—The bar outline is a specified color. Choosing Color enables the Outline Color option. Select this to open the color menu where you can select a color for the outline. Refer to Choosing colors.
Bar Style	Select this option and then select the style you want for the bars in the chart. You can choose Block, Cylinder, Wedge, Emboss, or Light to Dark.
Multicolor Series	Select this option to make the bars in different series use different colors. When this option is not enabled, the bars in different series are shown using the same set of colors.
Line Settings	Click this button to customize the display of the line elements for chart types and subtypes that include lines.
Line Width	Select this option and then select the number of pixels you want for the line's width. Options include widths from one to ten pixels.
Symbols	Select this option and then select the symbol you want to place on the line to mark data points. You can choose None, Square, Circle, or Triangle.

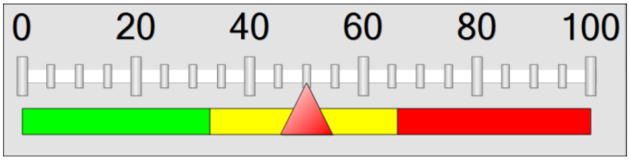
Table 196: Bar, Line, and Gauge Settings Buttons Description (Continued)

Button	Description
Gauge Settings	Click this button to customize the display of the gauge for gauge chart types.
Gauge Color	Select this option to open the color menu to select a color for the gauge. Refer to Choosing colors. You can also select No Value from the menu to use the default color.
Border Color	Select this option to open the color menu to select a color for the gauge's outline. Refer to Choosing colors. You can also select No Value from the menu to use the default color.
Show Numeric Identifier	Select this option to display a numeric indicator on the gauge which shows the actual value represented on the gauge.
Color Ranges	Select this option to open the Color Range window where you can define different colors to use for different value ranges on the gauge. Refer to step 7 for information on defining color ranges for gauge charts.

7 To define color ranges for a gauge chart, click the Gauge Settings button on the Home tab and select Color Ranges. Sample ranges are shown in the Color Ranges window here.



Color ranges are unique to gauge charts and let you show ranges of different values on the chart in different colors. The following figure shows a gauge chart with three color ranges.



a Click Add Range to add a color range.
b Enter the following field information

Table 197: Color Ranges Window Description

Field	Description
Add Range	Click this text to add a range. Before you add a range, the Color Ranges window does not show any ranges and Add Range is the only option available.
Minimum	Enter the percentage value the range should begin at. For example, a gauge with three color ranges could have a range that begins at 34%.
Maximum	Enter the percentage value the range should end at. For example, a gauge with three color ranges could have a range that ends at 66%.
Start Color	Click this box to open the Color window and select a color for the beginning of the range. Refer to Choosing colors.
End Color	Click this box to open the Color window and select a color for the end of the range. Refer to Choosing colors.
Remove Range	Click this text to remove the range shown next to the text.

c Click the OK button to save the color ranges.

8 To select a color scheme for the chart style, click the Color Scheme button on the Home tab and select the item you want from the color scheme menu.

Customizable color schemes are available for all chart types except gauge charts. Color schemes can be used to define the colors used for the chart. Refer to Color Schemes explorer.

9 To define the placement of labels, such as titles and legends, click the Layout tab and click the button on the ribbon's Labels group that corresponds to the label you want to configure.

The following table describes the labels you can configure from these buttons.

Table 198: Labels Buttons Description

Label	Description
Title	Click this button to select options for the chart's title. This label displays the chart's title defined when you add a chart to a report. You can choose not to show this label, or you can show it at the left, right, top, or bottom of the chart.
Legend	Click this button to select options for the chart's legend. This label displays a legend to identify the chart's contents. You can choose not to show this label, or you can show it at the left, right, top, or bottom of the chart.
Category Axis Title	Click this button to select options for the chart's category axis title. This label identifies the chart's category axis. You can choose to show it or not show it.

Table 198: Labels Buttons Description (Continued)

Label	Description
Value Axis Title	Click this button to select options for the chart's value axis title. This label identifies the chart's value axis. You can choose to show it or not show it.
Data Labels	Click this button to select options for the chart's data labels. Data labels can be displayed on the chart's bars, lines, and other display components to show the actual values represented in the chart. You can choose to show data labels or not show them.
Exception Box	Click this button to select options for the chart's exception box. This label describes the exceptions shown in the chart if the chart's data includes exceptions and the report is configured to show exceptions on the chart. You can choose to show this label at the left, right, top, or bottom of the chart.

10 To configure scale options for the chart style, click the Value Scale button on the Layout tab and select from the options described in the following table.

Table 199: Value Scale Button Description

Option	Description
Primary Scale	The options in this section let you show the primary scale, rotate the scale's labels, and choose whether to configure the scale's range manually. You can also choose to have these options configured automatically.
Show	Select this option to display the primary scale on the chart. By default, the primary scale is displayed.
Automatic	Select this option to automatically determine the range of the scale based on the range of values in the data shown on the chart.
Manual	Select this option to manually configure the range shown on the primary scale. When you select this option and hover over it, Scale Start and Scale End fields appear. Enter the minimum value you want for the scale in the Scale Start field and the maximum value you want in the Scale End field.
Rotate Labels	Select this option and then select a degree to rotate the label text. Your choices are None, 15, 30, 45, 0, -15, -30, and -45 degrees (clockwise).

Table 199: Value Scale Button Description (Continued)

Option	Description
Secondary Scale	The options in this section let you configure the secondary scale for the line values shown on line/bar chart types.
Show	Select this option to display the secondary scale on the chart. By default, the secondary scale is not displayed.
Automatic	Select this option to automatically determine the range of the scale based on the range of values in the data shown on the chart.
Manual	Select this option to manually configure the range shown on the secondary scale. When you select this option, Scale Start and Scale End fields appear. Enter the minimum value you want for the scale in the Scale Start field and the maximum value you want in the Scale End field.
Rotate Labels	Select this option and then select a degree to rotate the label text. Your choices are None, 15, 30, 45, 0, -15, -30, and -45 degrees (clockwise).
Position	The options in this section let you choose where to place the primary scale on the chart.
Primary Scale Right Primary Scale Left	Select one of these options to place the primary scale on the right or left side of the chart. By default, the primary scale is displayed to the left of the chart. **Note:** These options are enabled only for chart types that display data vertically.
Primary Scale Top Primary Scale Bottom	Select one of these options to place the primary scale at the top or bottom of the chart. By default, the primary scale is displayed at the bottom of the chart. **Note:** These options are enabled only for chart types that display data horizontally.
Use Logarithmic Scale	Select this check box to use a logarithmic scale based on your report data.

11 To configure category and value grid lines shown on the chart, click the Category Grid Lines or Value Grid Lines button on the Layout tab. The following table describes the options you can configure from these buttons.

Table 200: Category Grid Lines and Value Grid Lines Buttons Description

Option	**Description**
Scale	The options in this section let you choose whether to use automatic or manual offsets for the major and minor grid lines shown on the chart. The offsets determine the spacing between the grid lines.
Automatic	Select this option if you want the offsets between the major and minor grid lines shown on the chart to be configured automatically.
Manual	Select this option to manually specify the offsets for the chart's grid lines. When you select this option, Major Offset and Minor Offset fields are displayed. Enter the numeric offset value you want for the major grid lines in the Major Offset field, and the offset you want for the minor grid lines in the Minor Offset field.
Display	The options in this section let you show or hide major and minor grid lines on the chart. Grid lines can make it easier to identify values on the chart.
Show Major	Select this option to display major grid lines on the chart.
Major Color	Select this option to open the color menu where you can choose the color you want for the major grid lines. Refer to Choosing colors.
Show Minor	Select this option to display minor grid lines on the chart.
Minor Color	Select this option to open the color menu where you can choose the color you want for the minor grid lines. Refer to Choosing colors.
Show Left	Select this option to show grid lines along the left side of the chart. **Note:** This option is not available on the Value Grid Lines button.
Left Color	Select this option to open the color menu where you can choose the color you want for the grid line along the left side of the chart. Refer to Choosing colors. **Note:** This option is not available on the Value Grid Lines button.

Table 200: Category Grid Lines and Value Grid Lines Buttons Description (Continued)

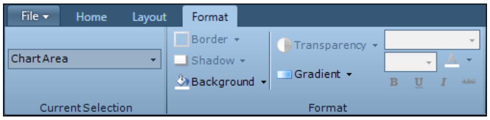
Option	Description
Bottom Color	Select this option to open the color menu where you can choose the color you want for the grid line along the bottom of the chart. Refer to Choosing colors. **Note:** This option is not available on the Category Grid Lines button.

12 To configure options for tick marks shown on the chart's scale, click the Tick Marks button on the Layout tab. The following table describes the options available on this button.

Table 201: Tick Marks Button Description

Option	Description
Scale	The options in this section let you choose whether to use automatic or manual offsets for the major and minor tick marks shown on the chart's scale. The offsets determine the spacing between the tick marks.
Automatic	Select this option if you want the offsets for the scale's major and minor tick marks to be configured automatically.
Manual	Select this option to manually specify the offsets for the scale's major and minor tick marks. When you select this option, Major Offset and Minor Offset fields are displayed. Enter the numeric offset value you want for the major tick marks in the Major Offset field, and the offset you want for the minor tick marks in the Minor Offset field.
Display	The options in this section let you show or hide major and minor tick marks on the chart's scale.
Major Tick Marks	Select this option to show the major tick marks on the chart.
Minor Tick Marks	Select this option to show minor tick marks on the chart.

13 To customize the fonts, borders, and backgrounds of different sections of the chart, click the Format tab.



a Click the section of the chart you want to configure on the content pane.

Or

If you know the name of the chart section you want to configure, select it from the Current Selection drop-down menu on the ribbon. The following chart sections are available, though not all sections are available for all chart types.

- ▷ Chart Area
- ▷ Grid Area
- ▷ Title
- ▷ Legend
- ▷ Category Axis Labels
- ▷ Category Axis Title
- ▷ Value Axis Title
- ▷ Primary Scale Labels
- ▷ Secondary Scale Labels
- ▷ Data Labels
- ▷ Exception Box

b Select from the buttons on the Format tab's Format group described in the following table.

Table 202: Format Tab Buttons Description

Button	**Description**
Border	Click this button to select a border style for the selected section. The available options are: • None • Thin • Medium • Thick • Dashed To select a color for the border, select Border Color from the menu to open the color menu. Refer to Choosing colors.

Table 202: Format Tab Buttons Description (Continued)

Button	Description
Shadow	Click this button to select a shadow style for the selected section's border. The available options are: • None • Thin • Medium • Thick To select a color for the shadow, select Shadow Color from the menu to open the color menu. Refer to Choosing colors.
Background	Click the arrow on this button to open the color menu where you can select a background color for the selected section of the chart. Refer to Choosing colors.
Transparency	Click this button to enter a percentage to define how intense the background color is for the chart's grid area. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected on the sample chart, so you can easily scroll through the transparency percentages to find a value that best suits your needs.
Gradient	Click this button to select the type of gradient you want for the background of the chart area section. You can use gradient color to customize a background by blending two colors. Your options are: • None • Left to Right • Top to Bottom To select a gradient color to blend into the background color, select Gradient Color to open the color menu. Refer to Choosing colors.
Font buttons	Select the font, font size, and other attributes from these buttons. Refer to Choosing font attributes.

14 To configure settings for a different chart type or subtype, repeat steps 3 through 13.

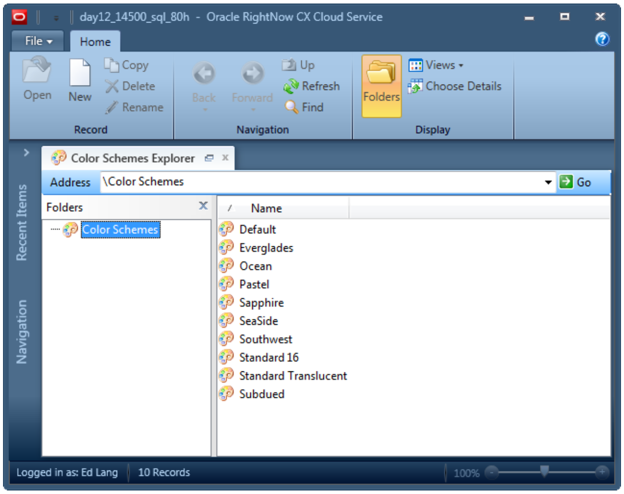
15 Click the Save and Close button on the ribbon to save the new chart style.

Color Schemes explorer

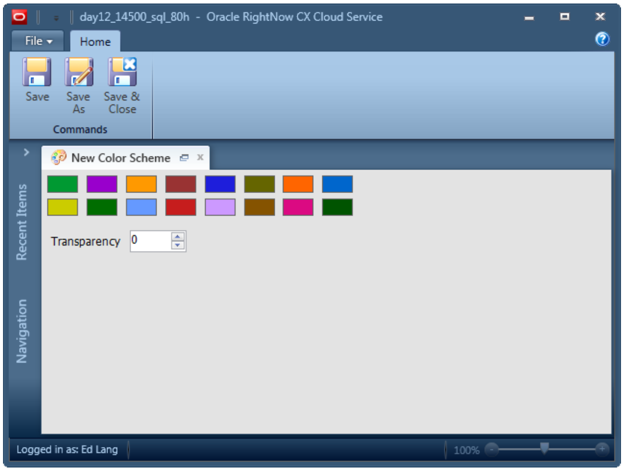
The Color Schemes explorer lets you view standard color schemes used in conjunction with chart styles. You can also copy standard color schemes and edit the copies, or you can create your own custom color schemes. Color schemes you create can be copied, renamed, edited, and deleted using right-click functionality.

To create a color scheme

1 Click the Analytics button on the navigation pane and then double-click Color Schemes Explorer. The Color Schemes explorer opens, displaying the current color schemes.



2 Click the New button on the ribbon to open the New Color Scheme window. The window populates with default colors.



3 To change a particular color, click the box with the color to open the Color window. Refer to Choosing colors.

4 Enter the transparency value for the color scheme in the Transparency field. A transparency value of 0 displays a solid color, and a value of 255 is completely transparent with no color.

5 Click the Save and Close button on the ribbon to save the new color scheme.

Images explorer

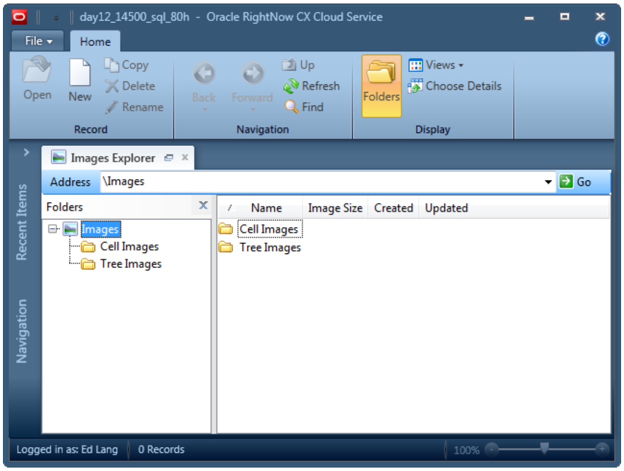
Photos and other images can be uploaded to use in reports and **dashboards**. For example, your organization's logo can be added as an image and then added to custom reports. Refer to Adding images to reports for information about adding images to reports area backgrounds or Adding images for information about adding images to dashboards.

The images used with reports and dashboards can be added and replaced using the Images explorer. The ability to replace images is helpful when an image, such as a corporate logo, is modified. Once the image file is replaced, the reports and dashboards with the old image automatically use the new image.

Note Images can also be copied, renamed, or deleted using right-click functionality.

To add an image

1 Click the Analytics button on the navigation pane and then double-click Images Explorer.



2 Click the New button on the ribbon.

3 Click Select One or More Images to open a window where you can select the images you want to add. You can add *.bmp*, *.jpg*, *.gif*, and *.png* file types.

4 Select the image you want to upload. You can select multiple images by pressing **Ctrl** when selecting them.

5 Click the Open button.

6 Click the Save and Close button on the ribbon to save the image. When saving a single image, you can specify a new name for the image. When saving multiple images, the original image names are retained.

To replace an image

1 In the Images explorer, right-click the image you want to replace and select Open.

2 Click Select a Different Image. A window opens where you can select the new image.

3 Select the image you want to replace the existing image with.

4 Click the Open button.

5 Click the Save and Close button on the ribbon to save the new image.

Text Fields explorer

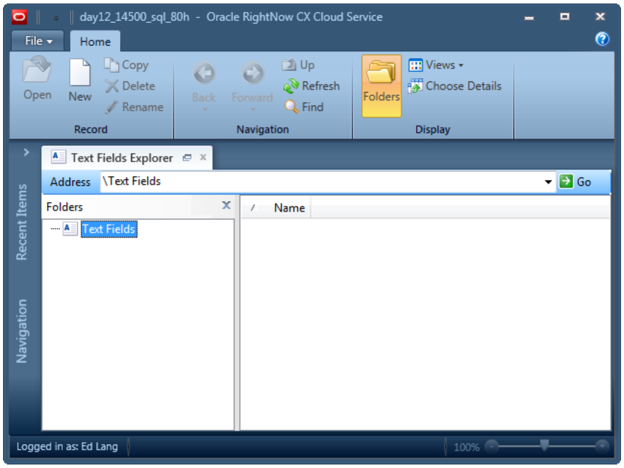
The Text Fields explorer lets you create text fields you can add to **custom reports** and **dashboards**. When you create a text field, you can specify the field's text, fonts, borders, colors, and margins. You can also adjust these settings after you add the field to a report or dashboard. Refer to Adding text fields to reports or Adding images and text fields to dashboards.

For example, you could create a text field with your organization's name, using your organization's preferred fonts and colors, which you could add to your reports' titles. Since the text fields can be edited once they are added to reports, you can also create a template text field with your customized settings and change the wording in the field as necessary.

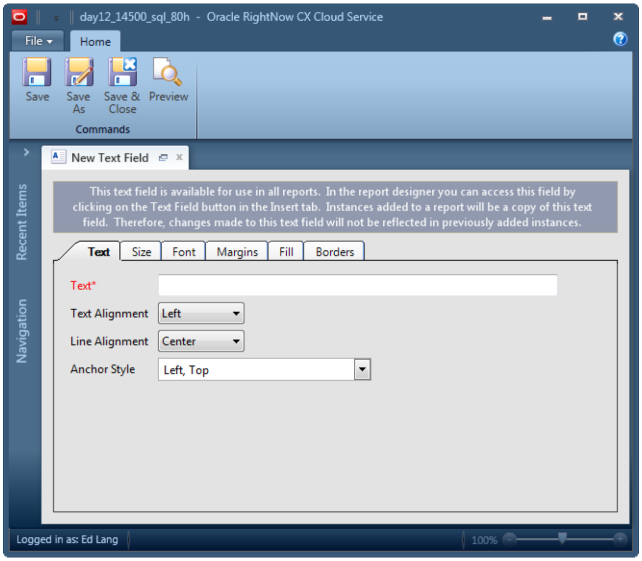
Using the Text Fields explorer, you can edit, copy, delete, and rename text fields using right-click functionality. You can also create new text fields.

To create a text field

1 Click the Analytics button on the navigation pane and then double-click Text Fields Explorer.



2 Click the New button on the ribbon. A new text field opens on the content pane.

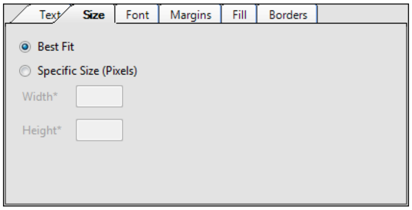


3 Enter the following field information.

Table 203: Text Tab Description

Field	Description
Text*	Type the text you want to display in this field. This text also serves as the text field name.
Text Alignment	Click this drop-down menu to select the horizontal alignment for the text in the text field. Options are Left, Center, and Right.
Line Alignment	Click this drop-down menu to select the vertical alignment for the text in the text field. Options are Top, Center, and Bottom.
Anchor Style	Click this drop-down menu to select the anchor style for the field. Refer to Defining anchor styles.

4 Click the Size tab.



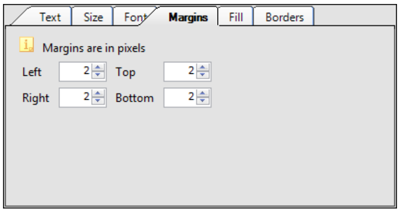
5 Enter the following field information.

Table 204: Size Tab Description

Field	Description
Best Fit	Select this radio button to have the size of the text field automatically adjusted to best fit the available space in the report.
Specific Size (Pixels)	Select this radio button to manually enter the specific width and height settings for the text field. Any text in the field boundaries that exceeds the size of the field is clipped.

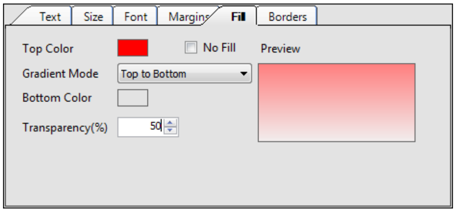
6 Click the Font tab to select the font settings for the text field. Refer to Choosing font attributes.

7 Click the Margins tab to define the amount of space surrounding the text in the text field.



8 Select the number of pixels between the text and each of the four text field margins.

9 Click the Fill tab to define the background fill colors for the text field.



10 Enter the following field information.

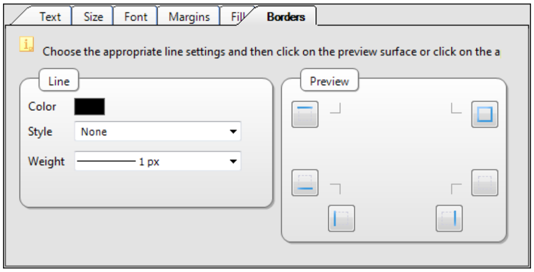
Table 205: Fill Tab Description

Field	Description
Color/Top Color/Left Color	The text description for this option varies depending on the gradient mode you select. Click this box to select a primary color as the background. Refer to Choosing colors.
No Fill	Select this check box to clear any fill colors previously selected. If this box is selected, the other options on the Fill tab are disabled except Color. Selecting a color automatically clears the No Fill check box, enabling the other options.
Gradient Mode	Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available. • **None**—Select this option to use only the primary color as the fill color. If you select None, the Gradient Color field is disabled. • **Top to Bottom**—Select this option to merge the colors from the top of the background to the bottom. • **Left to Right**—Select this option to merge the colors from the left of the background to the right.
Gradient Color/Bottom Color/Right Color	The text description for this option varies depending on the gradient mode you select. Click this box to select a secondary color to merge with the primary color. The fill colors then merge using the method defined in the Gradient Mode menu. Refer to Choosing colors.

Table 205: Fill Tab Description (Continued)

Field	Description
Transparency (%)	Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview area, so you can easily scroll through the transparency percentages to find a value that best suits your needs.
Preview	This area provides a sample of how the fill colors you select will appear on the text field's background.

11 Click the Borders tab to define the borders for the text field.



12 Enter the following field information.

Table 206: Borders Tab Description

Field	Description
Color	Click the color box to select a color for the border. Refer to Choosing colors.
Style	Click this drop-down menu to select one of the following border styles: Solid, Dashed, Dotted, Double, Inset, Outset, Groove, Ridge, Rounded, or Separator. The Separator option lets you add empty space around the text field.
Weight	Click this drop-down menu to select the pixel size of the border. The border weight can be from 1 to 10 pixels.

Table 206: Borders Tab Description (Continued)

Field	Description
Preview	This area defines the placement of the borders you define. Select any of the following buttons to place the borders or click the area in the Preview white space where you want the border.
 Borders	Click a button to add the selected border attributes to the top, bottom, left, right, or all sides of the component. You can also add or remove borders from all sides of the component.

13 To preview the text field, click the Preview button on the ribbon.

14 Click the Close button to close the preview window.

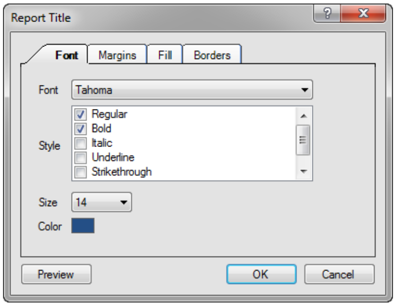
15 Click the Save and Close button on the ribbon to save the text field.

Selecting fonts and colors

Certain items you edit in explorers include options to change font attributes or add colors. The methods to define fonts and colors are generally the same, regardless of the item you are editing or the explorer you are working in.

Choosing font attributes

When customizing text elements in Analytics, you can specify font attributes to change the display of the text. Font attributes can be selected from the **ribbon** in certain editors, such as the chart styles editor, or from a Font tab on a window in other areas. The same options are available from the ribbon or the tab. Some editors give you access to font attributes from both the ribbon and the tab, allowing you to change font attributes from either location. The following figure shows font options on the style editor's Font tab.



This procedure describes the options available on the Font tab. However, you can also set these options from the ribbons of most editors in Analytics, such as the Chart Styles editor.

To select font attributes from the Font tab

1 Click the Font tab.

2 Enter the following field information.

Table 207: Font Options Description

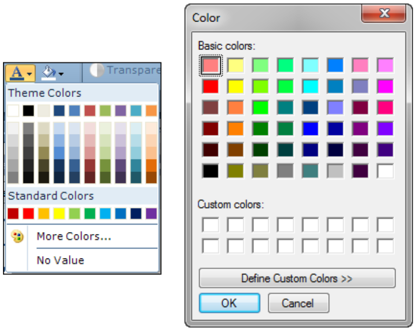
Field	Description
Font	Click this drop-down menu to select a font.
Style	Select the check boxes for the style attributes you want. You can select multiple attributes to apply to the font: Regular, Bold, Italic, Underline, Strikethrough, and All Caps.
Size	Click this drop-down menu to select the point size of the font.
Color	Click the color box to select a color for the font. Refer to Choosing colors.
Preview	Click this button to preview the font using the options you select. **Note:** This button is not available on all Font tabs.

3 Click the OK button to save your changes.

Choosing colors

You can select colors for many objects in Analytics, such as text labels and report backgrounds. When selecting colors from a tabbed window, the Color window displays. When selecting colors from a **ribbon**, the color menu is displayed. Both give you the same options, though they present them in slightly different ways.

This procedure explains how to select colors and define custom colors using both the color menu and Color window. The following shows the color menu on the left and the Color window on the right.

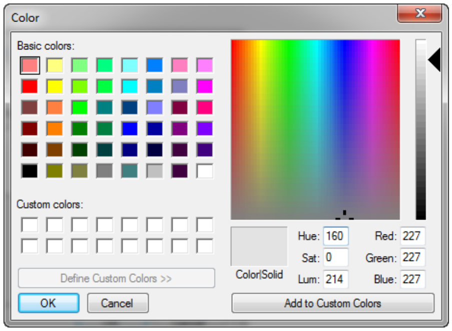


To select a color

1 To select a color using the menu, click the color you want. The color is applied to the object you are editing.

2 To select a color using the window, click the color you want and then click the OK button. The color is applied to the object you are editing.

3 To define a custom color from the window, click the Define Custom Colors button. The window expands to show custom color options.



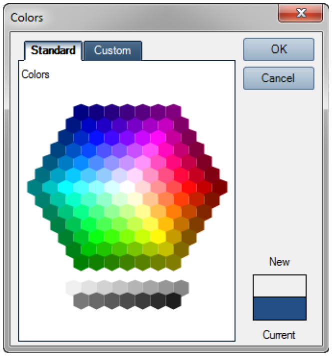
a Click anywhere in the color palette or type the HSL (hue, saturation, lumination) or RGB (red, green, blue) components in the appropriate text boxes to define your custom color.

- The HSL color model defines the hue, saturation, and lumination of the color.
  - ▷ **Hue**—The hue is the pigment of the color and has a value between 0 to 359 degrees.
  - ▷ **Saturation**—The saturation is measured as a percent from 0 to 100 and specifies the vividness of a color.
  - ▷ **Lumination**—Lumination is the amount of white in the color and is a value from 0 to 100 percent.
- The RGB color model defines the amount of red, green, and blue light the color contains. RGB values can be between 0 and 255. For example, when all components are set to 255, the color is white, and when all are set to 0, the color is black.

b Click the Add to Custom Colors button. The color is added to your custom colors.

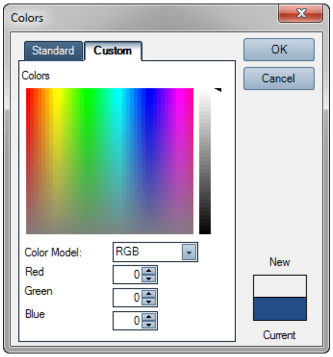
c Click the OK button to apply the color you selected or created to the component you are defining.

4 To view additional standard colors or to create a custom color from the color menu, click More Colors.



a To choose a standard color from the window, click the color you want and click the OK button to apply the color to the object you are editing.

b To define a custom color, click the Custom tab.



Custom colors are defined on the Custom tab in the same way they are defined on the Color window, as described in step 3.

c Click the OK button to apply the custom color to the object you are editing.

32

Dashboards

When viewing standard or custom reports, you generally open reports one at a time, and search for data in only the report that is active. However, you can view and search for data in several reports simultaneously by adding them to a dashboard. Each report in a dashboard retains the same functionality as if you opened the report separately, allowing you to access and work with a variety of data from one dashboard.

Dashboards are particularly useful for managers who need to view a wide range of data from different reports. Using dashboards eliminates the need to open a large number of reports individually.

Creating dashboards

Dashboards are created and edited on the dashboard design center by dragging reports to the dashboard, adding optional descriptions, images, text, and controls, and configuring display options. If you do not want to create a new dashboard, you can copy an existing custom or standard dashboard in the Reports explorer and then edit the copy using the dashboard design center.

Important Customizations made to report displays in existing dashboards are not carried over when copying dashboards. This can result in a copied dashboard displaying somewhat differently than the original.

Opening the dashboard design center

The dashboard design center provides the tools you need to create and edit dashboards, and lets you access optional items such as text fields and images to enhance your dashboards. The dashboard design center can be opened from the Reports explorer or by right-clicking a dashboard on the navigation pane and selecting Edit Report Definition. The following procedure describes opening the design center from the Reports explorer.

To open the dashboard design center

1 If your navigation set is configured to add dashboards from the **file menu**, click File and select Dashboard. See To configure the file menu.

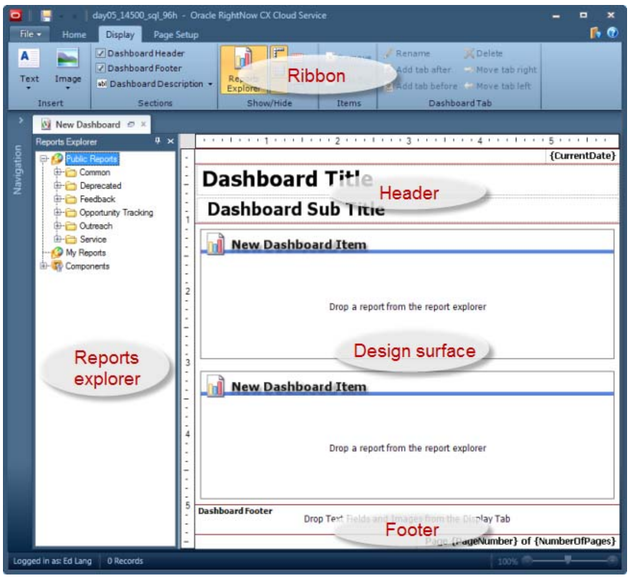
Or

Click the Analytics button on the navigation pane and then double-click Reports Explorer.

a To create a dashboard, click the New Dashboard button.

b To edit an existing dashboard, right-click the dashboard and select Edit.

The following image shows the dashboard design center. The design center's main components you use to create dashboards are indicated.



For descriptions of the ribbon and main components, refer to Dashboard design center ribbon and Dashboard design center components.

Dashboard design center ribbon

When you open the dashboard design center, the ribbon includes the Home, Display, and Page Setup tabs from which you can access tools to edit the dashboard. Each tab has one or more groups containing buttons you can use to modify the dashboard or items on the dashboard.

Note To minimize the ribbon when editing a dashboard, double-click a tab. Click the tab to temporarily display the buttons and click the tab again to hide them. To permanently restore the tab buttons, double-click the tab again.

Home tab

The options available on the Home tab let you preview the dashboard you are editing and configure options that apply to the entire dashboard. For example, you can select a dashboard layout and specify when the dashboard's contents should be refreshed.

The groups and buttons on the Home tab are described in the following table.

Table 208: Home Tab Description

Group/Button	Description
Views	This button lets you choose whether to view the dashboard using the report view or design view. Refer to Previewing dashboards.
Properties	The buttons in this group let you modify properties that apply to the entire dashboard.
Options	Click this button to select different options that impact how the dashboard runs. For example, you can edit the dashboard description and specify when the dashboard's contents should be refreshed. Refer to Changing dashboard options.

Table 208: Home Tab Description (Continued)

Group/Button	Description
Scheduling	Click this button to schedule the dashboard to be sent to other individuals. A dashboard can be scheduled and sent just as a report can. However, since **data exceptions** cannot be applied to dashboards, alerts cannot be added to the dashboard's schedule. Refer to Scheduling dashboards. **Note:** This button appears only when scheduled reports are enabled. For information about enabling scheduled reports, contact your Oracle account manager.
Permissions	Click this button to define which profiles should have access to run and edit the dashboard. Refer to Specifying permissions.
Audit Log	Click this button to open the audit log for the dashboard, which shows you when the dashboard was created, edited, run, and **published**, and which staff members performed these actions. Refer to Viewing the audit log.
References	Click this button to access predefined reports that show you the **workspaces**, **navigation sets**, and **report links** that use the dashboard you are editing. Viewing these items before editing a dashboard ensures that you are aware of other items that might be impacted by changes you make. If you decide the impact would be too great, you can create a copy of the dashboard and edit the copy instead. **Note:** If you have the Analytics Administrator profile permission, you can access versions of these reports that include search options using the Report Management component. Refer to Management Reports.
Display	The buttons in this group let you modify how the dashboard is displayed. For example, you can apply a style to all the reports on the dashboard to give them a similar appearance.
Screen	Click this button to display all the dashboard's reports on the screen when the dashboard is run. Each report can have separate scroll bars to view the report contents.

Table 208: Home Tab Description (Continued)

Group/Button	Description
Scrollable	Click this button to display all the contents of each report on the dashboard. When this option is selected, each report displays in its preferred size and the height and width of the items in each report are fixed. Separate reports do not have separate scroll bars, but vertical and horizontal scroll bars are added to the dashboard if needed to display the entire dashboard. **Note:** If the entire size of the dashboard exceeds 32767 x 32767 pixels, dashboard contents are clipped when using this option.
Display Options	Click this button to change the dashboard's width, add report title bars, and select which report sections you want to display. Refer to Changing dashboard display options.
Auto Format	Click this button to apply a **style** to all the reports in a dashboard. This overrides styles applied to the individual reports. Refer to Applying a style to a dashboard.
Layouts	Click this button to load a predefined dashboard layout. Layouts let you quickly select how many reports are shown on the dashboard and their position. When you select a layout, the design surface is automatically adjusted to conform to the layout you selected. Refer to Selecting dashboard layouts.
Parameter Values	Click this button to open the Set Filter Values window where you can specify defaults for searching reports in the dashboard. Refer to Specifying search defaults.
Add Tab	Click this button to add a tab to the dashboard. Tabs let you create multiple pages for the same dashboard, and you can select the reports that display on each tab.

Display tab

The options available on the Display tab let you add images and text fields, show the dashboard header and footer, and hide portions of the design center so you can see only the components you need.

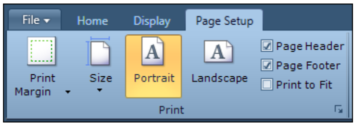
The groups and buttons on the Display tab are described in the following table.

Table 209: Display Tab Description

Group	Description
Insert	The buttons in this group let you add images and text fields to your dashboard. Refer to Adding images and text fields to dashboards.
Sections	The check boxes and button in this group let you show or hide the Dashboard Header and Dashboard Footer sections, and choose how you want to display the dashboard's description. Refer to Adding dashboard descriptions.
Show/Hide	The buttons in this group let you show or hide different parts of the dashboard design center. Showing the reports explorer lets you select reports to add to the dashboard. You can also add rulers, rule lines, field outlines, section headers, and a grid to the design surface to help you create your dashboard. Refer to Dashboard design center components.
Items	The buttons in this group let you remove a selected report or a report placeholder from the dashboard, and let you show or hide the title of the selected report when the dashboard is generated. **Note:** The Remove button is disabled when the only report on a dashboard is selected.
Dashboard Tab	The buttons in this group let you add, delete, rename, and move dashboard tabs. Refer to Adding tabs to the dashboard.

Page Setup tab

The options on the Page Setup tab let you configure printing options for the dashboard. These options are applied only when printing.



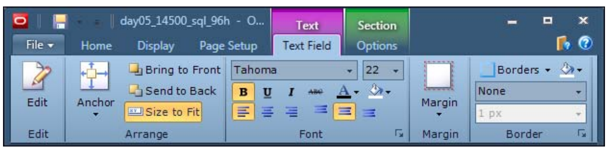
The groups and buttons on the Page Setup tab are described in the following table.

Table 210: Page Setup Tab Description

Group/Button	Description
Print	The buttons in this group let you configure the dashboard for printing and add the Page Header and Page Footer sections.
Print Margin	Click this button to select the size of the margins used when printing the dashboard. The available options are Normal, Narrow, Medium, and Wide.
Size	Click this button to select the size of the paper used when printing the dashboard. The available options are Letter, Legal, Executive, A3, A4, and A5.
Portrait/Landscape	Click these buttons to print the dashboard in portrait or landscape mode.
Page Header/Page Footer	Select these check boxes to include a page header and page footer when printing the dashboard.
Print to Fit	Select this check box to scale the dashboard to your printer's default page width and send the dashboard to the printer.

Text Field tab

The Text Field tab is shown on the ribbon when you select a text field on the dashboard design center. You can use the buttons on the tab to edit the text field's fonts, margins, and borders.



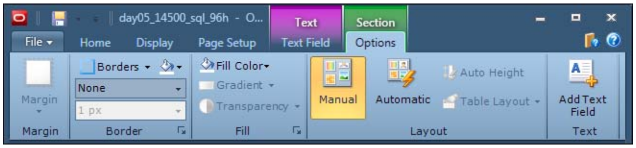
The groups and buttons on the Text Field tab are described in the following table.

Table 211: Text Field Tab Description

Group/Button	Description
Edit	Click this button to open the Edit Text Field window, where you can select fonts, margins, fill colors, and borders for the text. Many of the buttons on the Text Field tab let you customize the same options available on the Edit Text Field window.
Arrange	The buttons in this group let you position and size the selected text field.
Anchor	Click this button to define an anchor style for the image or text field. Anchor styles determine how an image or text field moves in relation to the borders of the dashboard section. Refer to Defining anchor styles.
Bring to Front/Send to Back	Click these buttons to place the selected item on top of or beneath other overlapping items.
Size to Fit	Click this button to automatically shrink or expand the element containing the image or text field to fit the selected item. **Note:** Manually resizing the selected element disables this option.
Font	The buttons in this group let you change the font style, size, and color. You can also select font attributes, such as bold and italic, and change the text's alignment within the text field. In addition, you can add a background color for the text field.
Margin	Click this button to select the width of the margins around the item. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Border	The buttons in this group let you add borders to the text field and change the borders' display options. You can identify which borders you want and choose the borders' color, size, and style.

Options tab

The Options tab is shown on the ribbon when you select an item on the dashboard design center. The buttons on the tab vary depending on the item you select and let you customize the item. For example, if you select a report on the dashboard, you can use the buttons on the Options tab to add a border around the report and choose background colors.



The groups and buttons on the Options tab are described in the following table.

Table 212: Options Tab Description

Group/Button	Description
Margin	Click this button to select the width of the margins around the item. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Border	The buttons in this group let you add borders to the text field and change the borders' display options. You can identify which borders you want and choose the borders' color, size, and style.
Fill	The buttons in this group let you add a background color to the selected item. You can select the background color and add a gradient color to blend into the primary color. You can also choose how intense the colors should be with the Transparency setting.
Layout	The buttons in this group let you define how the content of the selected dashboard section should be arranged and how the height of the dashboard section should be managed. Refer to Selecting dashboard section layout options.
Add Text Field	Click this button to add a new text field to the dashboard.

Dashboard design center components

The tasks you perform when creating or editing a dashboard are done through the ribbon, design surface, and reports explorer components of the dashboard design center. These components provide access to the reports, dashboard sections, and other items you use to create and edit dashboards. The dashboard sections are described in following table.

Table 213: Dashboard Sections Description

Dashboard Section	Description
Page Header	This section accepts images and text fields and is displayed at the top of dashboards when you print them.
Dashboard Header	Contains text fields and images that display at the top of the dashboard. By default, the header contains text fields you can modify for the dashboard's title and sub-title.
Dashboard Description	Contains text that you can modify to provide general information about the dashboard. You can display dashboard descriptions inline to show the description on the dashboard or as text on a separate tab on the dashboard. Refer to Adding dashboard descriptions.
Dashboard Items	Contains the reports and components you add to the dashboard. **Note:** If you add tabs to the dashboard, the name of this section changes to Tabs, and a tree is added from which you can add content to each tab. Refer to Adding tabs to the dashboard.
Dashboard Footer	This section contains text fields and images that display at the bottom of the dashboard.
Page Footer	The page footer is similar to the page header section. The text fields and images added to this section display at the bottom of printed dashboards.

Design surface

The design surface displays the dashboard sections you want to include in the dashboard. Once a dashboard section is displayed on the design surface, you can add, edit, and remove content in the section. For example, you can drag reports to the Dashboard Items section, insert text fields into the Dashboard Header, and change the background of the Dashboard Footer.

You can add rulers, lines, and headings to help you identify sections and fields shown on the design surface. These options are accessed from the Show/Hide group on the ribbon's Display tab. The options are described in the following table.

Table 214: Design Surface Display Options Description

Option	Description
Show Rulers	Click this button to display horizontal and vertical rulers when designing the dashboard to provide a perspective on the size of the dashboard.
Show Rule Lines	Click this button to display horizontal lines separating the dashboard sections displayed on the design surface.
Show Field Outlines	Click this button to display borders around the fields you add to the dashboard.
Show Section Headers	Click this button to display a heading above each dashboard section.
Show Grid	Click this button to display a grid in the dashboard's header and footer sections to help you align items you add to the sections. You can also click the arrow on the button to select the grid size you want to use.

Reports explorer

The dashboard design center's reports explorer lists the reports, notifications, and a web browser component that can be added to a dashboard. You add these by dragging them from the reports explorer to the dashboard's design surface.

Note If your site is configured to use custom add-in components, they are available on the reports explorer's Components tree. Custom add-ins can be dragged to dashboards and positioned just like reports. For information about custom add-ins, contact your Oracle account manager.

You can also hide the reports explorer to add more room to the design surface if you do not need to add reports. To hide the reports explorer, click the Display tab and then click the Reports Explorer button. You can click the button again to show the reports explorer.

Tip You can drag the reports explorer and reposition it on the dashboard design center or open it in a new window just as you can move the data dictionary on the report design center. Refer to Moving the data dictionary.

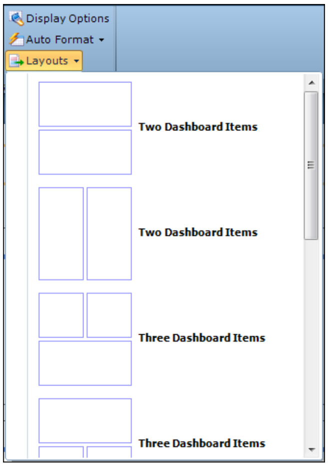
Selecting dashboard layouts

When creating a dashboard, you can use dashboard layouts to add predefined regions to the design surface. You can then drag reports and other content to the regions. The use of layouts is optional, but they offer a helpful starting point when creating dashboards.

To apply a layout to a dashboard

1 Click the Home tab.

2 Click the Layouts button to open the layouts menu.



3 Select the layout you want to apply to the dashboard. The design surface is updated to reflect the layout you selected.

4 To modify the spacing of the dashboard layout you selected, hover over the spaces between the report areas until the cursor changes to show direction arrows. You can then drag the borders to the position you want.

Placing content on the dashboard

You add reports and other items to a dashboard by dragging them from the dashboard design center's reports explorer to the design surface. You decide where to place each item and how much content you want on the dashboard. You can also add tabs to the dashboard to place additional reports and other content that may not fit on the dashboard's main page.

There are four types of items you can add to dashboards from the dashboard design center's reports explorer.

Note Each dashboard can have a maximum of fifty items placed on it.

- **Reports**—Most items you add to dashboards will likely be reports, though there are considerations to keep in mind before you add them.
  - ▷ Private reports on a dashboard can be viewed by staff members with permission to open the dashboard, even if the staff members do not have permission to view the individual reports. This may result in staff members seeing information they should not have access to.
  - ▷ If a report used on a dashboard is deleted, the report is automatically removed from the dashboard and a placeholder for the report displays when the dashboard is viewed or edited.
  - ▷ If you want to use the same report on a dashboard more than once with different default filter values to show different data, you need to create a copy of the report and add the copy along with the original report since only one set of filter values can be stored for each unique report on a dashboard.
- **Add-ins**—If you have installed add-ins that are designed to be accessible in dashboards, you can access them in the Components > Add-ins folder. You can drag add-ins to the dashboard just as you would drag a report. Refer to Add-Ins.
- **Notifications**—You can drag the Notifications component, located in the Components > Common folder, to the dashboard to allow your staff to receive notices on the dashboard when particular events happen, such as an incident being assigned. Refer to Opening your notifications.
- **Web browser**—A web browser can be added to a dashboard as well, allowing staff members to navigate to a web page displayed in the dashboard. To add the browser to a dashboard, drag the Web Browser–Component report from the Public Reports > Com-

mon report folder to the dashboard. Once the browser is added to the dashboard, you can specify a default URL in the dashboard's parameters. Refer to Specifying search defaults.

The following procedure describes adding reports to the dashboard, but the same process is used to add any of the other items listed in the dashboard's reports explorer.

To add reports to a dashboard

1 In the dashboard design center's reports explorer, navigate to the report you want to add to the dashboard.

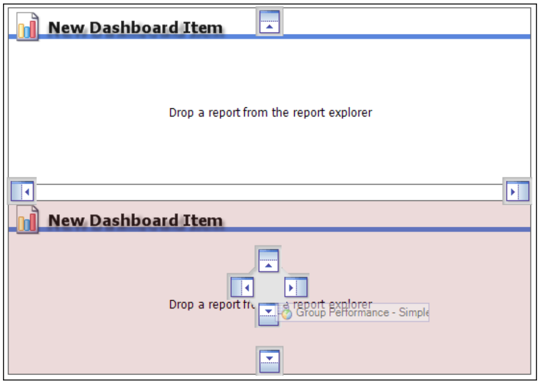
Tip You can quickly locate reports by right-clicking a report folder in the reports explorer and selecting the Search option.

2 Select the report and drag it to the dashboard.

3 Drop the report on the design surface where you want the report to display.

When you drag the report to the design surface, positioning images appear. Hovering over the various images highlights portions of the design surface. Once the section where you want the report is highlighted, drop the report. The design surface refreshes to show the updated dashboard layout.

In the example shown below, the Group Performance report being dragged would be added to the highlighted portion of the bottom section of the dashboard.



The positioning icons that display on the design surface when dragging a report are described in the following table.

Table 215: Dashboard Reports Positioning Icons

Icon	Description
 Entire Area	This icon group appears over the predefined dashboard section you are hovering over when dragging a report. Hovering over the various icons in the group highlights different portions of the dashboard section where you can drop the report. You can hover over the center of the icon group to drop the report in the full dashboard section. You can also place the report in the top, bottom, left, or right portions of the dashboard section by hovering over the individual icons in the group. If you break up a predefined dashboard section when dropping your report onto the dashboard section, the dashboard's layout is split into smaller areas.
 Area Buttons	Drop a report over one of these icons to place the report in the top, right, bottom, or left areas of the dashboard.

4 To modify the size of the area where you placed the report, hover over the area's borders until the cursor changes to show direction arrows. You can then drag the borders to the position you want.

5 Repeat steps 1 through 3 to add additional reports to the dashboard.

6 Click the Save button on the Quick Access toolbar to save the dashboard.

Removing, replacing, and editing dashboard reports

If you want to change the reports that are on a dashboard, you can remove the reports from the dashboard or replace them with new reports. If you need to make a change to a report on the dashboard, you can also open the report for editing.

Note If your dashboard has only one report, you cannot remove it, but you can replace it with another report.

To remove a report from the dashboard

Right-click the report on the design surface and select Remove.

Or

Click the item on the dashboard, click the Display tab, and click the Remove button.

To replace a report on the dashboard

Drag the new report you want on the dashboard from the reports explorer and place it on top of an existing report on the dashboard. The existing report is replaced with the new report.

To open a report for editing from the dashboard

Right-click the report on the design surface and select Edit Report Definition. The report opens on the report design center where you can edit it. Refer to Opening the report design center for information about editing reports.

Adding tabs to the dashboard

When creating a dashboard, you may find that you want more reports than can easily be viewed or that you want to group similar reports together. By adding tabs to the dashboard, you can create multiple pages for the same dashboard, and you can select the reports that display on each tab. Each tab acts as a distinct page of the dashboard. Reports are added to the pages just as they would be if the dashboard had only one page.

Tip Each dashboard can have a maximum of fifty tabs.

To add a tab to a dashboard

1. Click the Home tab.
2. Click the Add Tab button.

Once you add a tab, the dashboard design center is updated to show the tabs on the design surface. The tab names will likely not be what you want, but you can change them.

To change the name of a tab

1. Right-click the tab on the design surface and select Rename.

   Or

   Click the tab, click the Display tab, and click the Rename button.
2. Type the new name for the tab.
3. Click the OK button to save the tab's name.

Adding dashboard descriptions

If you create a dashboard that will be used by other people, you can add a description to explain the purpose of the dashboard or to relay other information concerning the dashboard. The description text can display **inline** on the dashboard or as text accessed from a separate tab.

To add a dashboard description

1. Click the Home tab on the dashboard design center's ribbon.
2. Click the Options button and select Edit Dashboard Description. The Edit Dashboard Description window opens.
3. Type the text for the description.
4. Click the OK button to save the description.

To define the description location

1. Click the Display tab and then click the Dashboard Description button.
2. To display the dashboard description on the dashboard, select Display Dashboard Description Inline.
3. To display the dashboard description on a separate Description tab, select Display Dashboard Description on Separate Tab.

Adding images and text fields to dashboards

You can add images and text fields to your dashboard's header and footer sections to clarify the dashboard's purpose or to make it more presentable to your target audience. When you place an image or text field on the dashboard, you can either manually position the item or it can be positioned automatically depending on the section's layout properties. Once you add an image or text field to a dashboard section, you can reposition it if needed, and you can edit any text fields you have added directly from the dashboard.

Selecting dashboard section layout options

When you add images or text fields to a dashboard section, you can manually position the item if the section has a manual layout. If the section has an automatic layout, the text field or image is positioned automatically, and the dashboard section's height is adjusted to best fit the image or text field. You can also set table layout options to change how the items in the section are sized. By default, dashboard sections have manual layout enabled.

To enable automatic layout of a dashboard section

1 Add the dashboard section you want to your dashboard.

- **a** To add the dashboard header or footer sections, click the Display tab and select the Dashboard Header or Dashboard Footer check box.
- **b** To add the page header or footer sections, click the Page Setup tab and select the Page Header or Page Footer check box.

2 Click the dashboard section you want to modify on the design surface.

3 Click the Options tab and click the Automatic button.

4 To prevent the section's height from being automatically adjusted to fit the items you add to the section, click the Auto Height button to disable the feature.

Tip When Auto Height is disabled, you can manually change the height of the dashboard section by dragging the section's horizontal borders up or down, just as you would if the section had a manual layout.

If a dashboard section has an automatic layout, the images and text fields you add to it are arranged in an invisible table structure with the items placed in rows and columns. You can adjust the sizing of the rows and columns to arrange the images and text fields as you want them.

To change a dashboard section's table layout options

1 Add images and text fields to the dashboard section.

2 Select the dashboard section you want to modify on the design surface.

3 If the section has a manual layout, click the Automatic button on the Options tab to change to an automatic layout.

4 Click the Table Layout button on the Options tab.

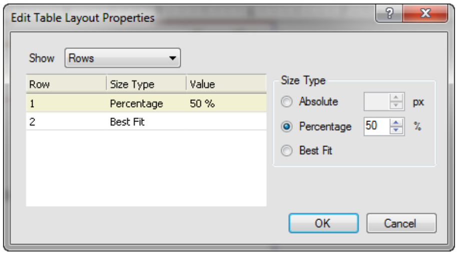
5 To give each column in the section's table the same amount of width, select Size All Columns Equally.

6 To give each row in the section's table the same amount of height, select Size All Rows Equally.

7 To size each column to best show the column's contents, select Auto Size All Columns.

8 To size each row to best show the row's contents, select Auto Size All Rows.

9 To manually configure the table's layout, select More Options. The Edit Table Layout Properties window opens.



10 Enter the following field information.

Table 216: Edit Table Layout Properties Window Description

Field	Description
Show	Select the row column you want to configure and then click this drop-down menu to select whether you are configuring rows or columns.
Size Type	Specify how the size of the report section is determined in this section.
Absolute	Select this radio button to specify a certain size for the selected row or column in pixels.
Percentage	Select this radio button to specify a certain percentage of the total available space in the section to allocate to the selected row or column.

Table 216: Edit Table Layout Properties Window Description (Continued)

Field	Description
Best Fit	Select this radio button to have the size of the selected row or column automatically adjusted to best fit the row's or column's contents.

11 Click the OK button to save your changes.

Adding text fields

You can add predefined text fields to your dashboard, or you can add custom text fields you create in the Text Fields explorer. You can also add new text fields you create from the dashboard design center. The dashboard's page header, dashboard header, page footer, and dashboard footer sections all accept text fields. Refer to Text Fields explorer for information about creating custom text fields.

Once you add a text field to a dashboard, you can modify its text, fonts, colors, and borders to tailor the text field to the dashboard's audience. These edits to the text field are specific to the dashboard and do not affect the original text field. This lets you customize the same text fields for different dashboards.

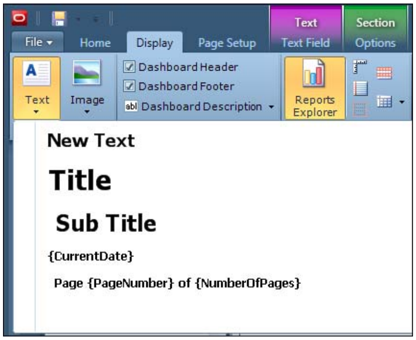
To add a text field to a dashboard

1 Add the dashboard section to the design surface that you want to add the text field to.

- **a** To add the dashboard header or footer sections, click the Display tab and select the Dashboard Header or Dashboard Footer check box.
- **b** To add the page header or footer sections, click the Page Setup tab and select the Page Header or Page Footer check box.

2 If you want the text field to be automatically positioned on the dashboard, click the dashboard section, click the Options tab, and click the Automatic button. Refer to Selecting dashboard section layout options.

3 To add a preconfigured text field to the dashboard, click the Display tab and then click the Text button. The Insert Text Field window opens.



The window displays standard text fields and custom text fields that you have added in the Text Fields explorer. The text fields' default fonts, colors, and other attributes are reflected in the display.

4 Click the text field you want to add to the dashboard. The Insert Text Field window closes, and the cursor displays the name of the text field you are adding when you hover over dashboard sections that accept text fields, such as the dashboard header.

5 Click the dashboard section on the design surface where you want to add the text field. The text field is added to your dashboard.

6 To add a new text field that is not in the Text Fields explorer, click the Options tab and click the Add Text Field button. The text field is added to the dashboard section with default text and text attributes which you can then edit. Refer to Editing text fields.

7 Click the Save button to save the changes to the dashboard.

Editing text fields

Once you add a text field to your dashboard, you can edit it to change the fonts, colors, text, and other attributes. These edits apply to the text in the dashboard, but the original text field is not affected.

Note Certain standard text fields, such as Current Date, include values that are dynamically updated when the report is run. While these fields can be edited, you cannot edit their dynamic value placeholders.

To edit a text field on a dashboard

Right-click the text field and select Edit Text Field.

Or

Click the text field and then click the Edit button on the Text Field tab.

The Edit Text Field window opens. For the procedure to use the options available on this window, refer to Editing text fields.

You can also edit the text field using the buttons in the Font, Margin, and Border groups on the Text Field tab. These buttons provide shortcuts to many of the same options available on the Edit Text Field window.

Adding images

You can insert images you have added to your dashboard's page header, dashboard header, dashboard footer, and page footer. Images can act as backgrounds or header images in these sections. Refer to Images explorer for information about adding images you can use on reports and dashboards.

To add an image to a dashboard

1 Add the dashboard section to the design surface that you want to add the image to.

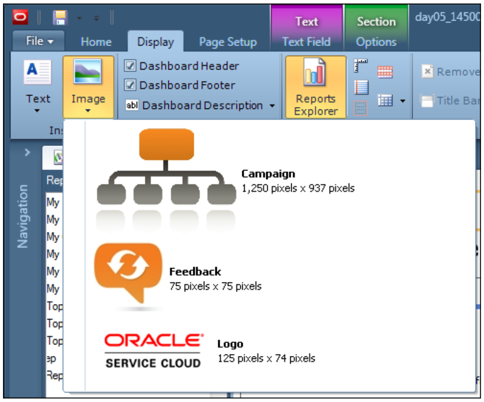
  a To add the dashboard header or footer sections, click the Display tab and select the Dashboard Header or Dashboard Footer check box.

  b To add the page header or footer sections, click the Page Setup tab and select the Page Header or Page Footer check box.

2 If you want the image to be automatically positioned on the dashboard, click the dashboard section, click the Options tab, and click the Automatic button. Refer to Selecting dashboard section layout options.

3 Click the Display tab on the ribbon.

4 Click the Image button to open the list of images added in the Images explorer.



5 Click the image you want to add.

6 Hover over the section where you want to add the image. The cursor displays the name of the image you selected when it is over a section that can accept an image.

7 Click to place the image in the dashboard section you select.

8 Click the Save button to save the changes to the dashboard.

Moving images and text fields

Once you add an image or text field to a dashboard section, you can move the field by dragging it to the appropriate place in the section. This may require dragging other text fields in the dashboard section to prevent the fields from overlapping.

If the dashboard section has a manual layout, you can move the item to any location in the section you want. If the dashboard section has an automatic layout, you can still move the item, but blue lines display when you drag the item, showing you where the item can be placed in relation to any other images or text fields in the section.

When you click an image or text field that has been added to a dashboard section, handles appear on the field's borders. To increase or decrease the size of the field, click the appropriate handle and drag it to a new position. When dragging a text field, the font size remains unchanged, but the text field's area is altered. However, when dragging an image, the image itself is resized.

Changing dashboard properties

Many of the buttons on the ribbon's Home tab let you specify a number of options that impact how the dashboard can be used. For example, you can select who owns the dashboard, specify dashboard permissions, and set the time zone the dashboard uses when it is opened. You can also schedule the dashboard to be sent in an email, view an audit log to see who has viewed or edited the dashboard, and modify how the dashboard's reports are searched.

Changing dashboard options

Dashboard options let you select the time zone that should be used for the reports in the dashboard, change the dashboard owner, and modify settings that impact how the dashboard functions when it is opened for viewing. You can also configure automatic refresh of the data shown in the dashboard's reports, select data source options, add notes to the dashboard, and change the image displayed for the dashboard in report lists.

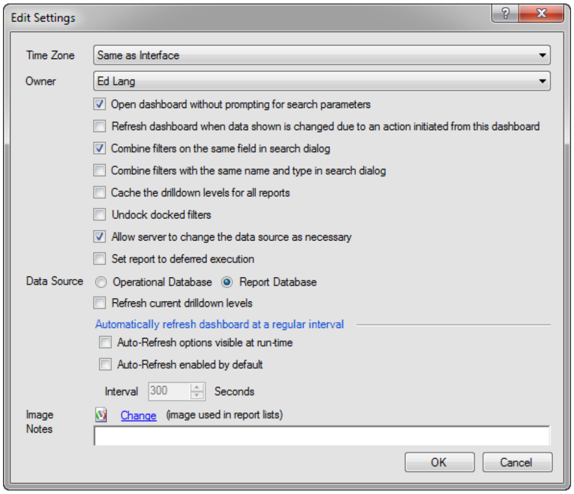
Several of the dashboard options you select play an important role in how the dashboard's reports are searched. These options are described in the following procedure and are also addressed in Searching dashboard reports.

To edit dashboard options

1 Click the Home tab on the ribbon.

2 Click the Options button and select More Options to open the Edit Settings window.

Note Most dashboard options can also be selected from the Options button without opening the Edit Settings window.



3 Enter the following field information.

Table 217: Edit Settings Window Description

Field	Description
Time Zone	Click this drop-down menu to select the time zone to be used with the dashboard's reports. The dates and times listed in the report output, filters, and parameters are adjusted according to the time zone that is specified. The available options are: • Same as Interface—The time zone is the same as that set for the interface. This is the default setting. • Same as Account—The time zone is the same as that of the staff member who is using the dashboard. Refer to Adding and editing staff accounts. • A specific time zone you can select from a list of standard time zones.
Owner	Click this drop-down menu to select a dashboard owner. Only the dashboard's owner can view or edit the dashboard, unless the owner makes the dashboard public and grants permissions to other profiles. Refer to Specifying permissions. **Note:** Changing the owner of a private dashboard makes the dashboard unavailable to the previous owner.

Table 217: Edit Settings Window Description (Continued)

Field	Description
Open dashboard without prompting for search parameters	Select this check box to open the dashboard using the default **run-time filters** for the reports. If this check box is not selected, the Search window opens for the dashboard's reports before the dashboard is displayed. Selecting this check box does not prevent the Search window from opening if a report has a required run-time filter. Refer to Searching dashboard reports.
Refresh dashboard when data shown is changed due to an action initiated from this dashboard	Select this check box to automatically refresh the dashboard's reports when you initiate an edit from one of the reports in such a way that the reports' contents would change. The dashboard is refreshed only if a record is edited in such a way that the record no longer matches the dashboard reports' search criteria.
Combine filters on the same field in search dialog	Select this check box to combine filters on the same field used in multiple reports on the dashboard. For example, multiple reports on the same dashboard might all have filters to search by contact email address. If this check box is selected, the dashboard's Search window joins these into one common filter for this field. All the reports that have this filter are filtered on the search value entered for the common filter.
Combine filters with the same name and type in search dialog	Select this check box to combine filters that have the same name and filter on different fields with the same data type. For example, if there are two filters both named Contact, and one filter searches a text field for first name, and the other searches a text field for last name, these filters can be joined into one common filter. The search value entered for the common filter is checked against both the first name and last name fields.

Table 217: Edit Settings Window Description (Continued)

Field	Description
Cache the drilldown levels for all reports	Select this check box to automatically cache the data in report levels when they are displayed. When you open a dashboard with this option enabled, the data shown on the reports' initial output levels is stored on your workstation. When you drill down on a report to view another output level and then return to the report's top level, it loads quickly since the data you are viewing is cached on your workstation. The cache is cleared when you close the dashboard. If this option is not selected, the database is queried every time you view an output level to ensure the most recent data is displayed even if you have already viewed the level. This default functionality can result in longer page load times than necessary when viewing reports with data that does not change frequently. **Note:** This option is also available for individual reports. When using a dashboard that has this option enabled, the dashboard's setting overrides the settings in the dashboard's report.
Undock docked filters	Select this check box to not dock filters on the dashboard that are docked in the dashboard's reports. If this check box is not selected and a report on the dashboard includes **docked filters**, the filters are displayed in the dashboard's Search window, and are also docked above the reports in the dashboard.
Allow server to change the data source as necessary	Select this check box to allow the data source to automatically change if necessary to allow the dashboard to run. For example, if a dashboard is configured to run on the operational database but is unable to do so due to data constraints, selecting this check box allows the dashboard to run on the report database (also referred to as the replication database). Clearing this check box forces dashboards to run on the data source that is selected. **Note:** This check box is cleared automatically any time the data source is changed on the Edit Settings window.
Set report to deferred execution	Select this check box to automatically queue the dashboard when it runs. **Note:** If the dashboard is automatically queued the next time it is run due to meeting queuing criteria, this option is selected automatically. To prevent the dashboard from being queued when it is next run, edit the dashboard and clear this check box.

Table 217: Edit Settings Window Description (Continued)

Field	Description
Data Source	Select which database you want the dashboard to run on. You can choose the operational or the report database. Refer to Report databases for information about these data sources. **Note:** This option is available only if your site has a report database. If your site does not have a report database, contact your Oracle account manager for more information.
Operational Database	Select this radio button if you want the dashboard to run on your operational database. This option is helpful if you need the dashboard to return the most current data available.
Report Database	Select this radio button if you want the dashboard to run on your report database. This option is helpful if your dashboard queries a large amount of data since the query size restrictions on report databases are more relaxed than those on operational databases.
Refresh current drilldown levels	Select this check box to automatically refresh the data shown on drill-down levels when the dashboard's display is refreshed without returning to the top levels of the dashboard's reports. When this option is not enabled and the dashboard is refreshed, drill-down levels shown on the dashboard automatically return to the top level of the dashboard's reports.
Automatically refresh dashboard at a regular interval	Options in this section let you configure automatic refresh of the data shown in the dashboard's reports to ensure the most recent data is displayed.
Auto-refresh options visible at run-time	Select this check box to add an arrow on the Home tab's Refresh button. Clicking the arrow displays options to let staff members enable or disable automatic refresh and change the interval time. **Note:** When this check box is not selected, the Refresh button refreshes the dashboard's data only when the button is clicked.
Auto-refresh enabled by default	Select this check box to enable automatic refresh of the data shown in the dashboard's reports.
Interval	Enter the number of seconds after which the data shown on the dashboard is automatically refreshed.

Table 217: Edit Settings Window Description (Continued)

Field	Description
Image	Click Change to select a different image to display next to the dashboard in lists such as navigation lists. When selecting the new image, you can choose from a list of standard images or from custom images that have been added in the Images explorer. Refer to Images explorer.
Notes	Type any text you want to add as a note to the dashboard. The note displays on the Edit Settings window, but cannot be seen by individuals viewing the dashboard.

4 Click the OK button to save the dashboard options.

Scheduling dashboards

You can schedule a dashboard to be sent to recipients or to be published in the same manner that reports can be scheduled. When a scheduled dashboard is sent, the recipients receive an email containing the dashboard in the format you select when creating the schedule.

Note Dashboard schedules cannot have alerts applied as report schedules can, since dashboards do not have **data exceptions** associated with them. In addition, dashboards cannot be sent to comma-separated values (CSV) files.

To open a dashboard's Schedules window, select the Scheduling button on the Properties tab. Refer to Scheduling reports.

Specifying permissions

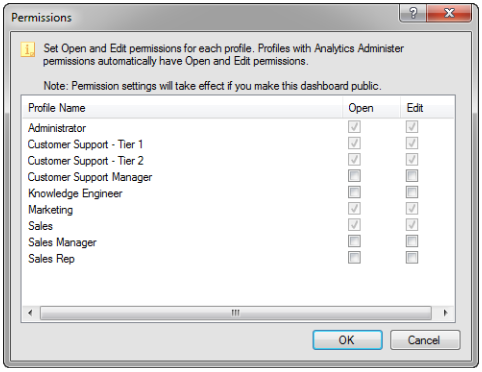
A dashboard's permissions specify the profiles whose staff accounts can open or edit the dashboard. You can select Open and Edit permissions for each profile defined in your system.

Note Permissions applied to a private dashboard take effect only when the dashboard is made public.

To specify dashboard permissions

1 Edit a dashboard and click the Home tab.

2 Click the Permissions button.



3 Enter the following field information.

Table 218: Permissions Window Description

Field	Description
Open	Select this check box next to a profile to allow staff members assigned to that profile permission to open the dashboard. You can select multiple profiles.
Edit	Select this check box next to a profile to allow staff members assigned to that profile permission to edit the dashboard. You can select multiple profiles.

4 Click the OK button to save the permissions.

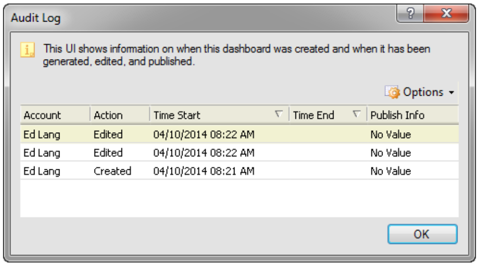
Viewing the audit log

You can open an audit log for a dashboard to see when the dashboard was created, edited, run, and **published**, and which staff members performed these actions. Since the audit log is a report, you can perform common report actions on the audit log, such as printing, forwarding, or **slicing**.

To view the audit log

1 Edit a dashboard and click the Home tab.

2 Click the Audit Log button.



3 To access a list of actions that can be taken on the audit log report, click the Options button. Many of the actions available when viewing other reports are available on the Options button. Refer to Ribbon options when viewing reports for descriptions of these actions.

4 To close the audit log, click the OK button.

Specifying search defaults

When opening a dashboard, the dashboard's reports automatically display with their default filter values, comparison date offsets, and output variables. However, you can select different defaults for the reports when they are opened from the dashboard by changing the dashboard's parameter values. If your dashboard includes the Web Browser–Component report, you can also specify a default URL for the web browser displayed in the dashboard.

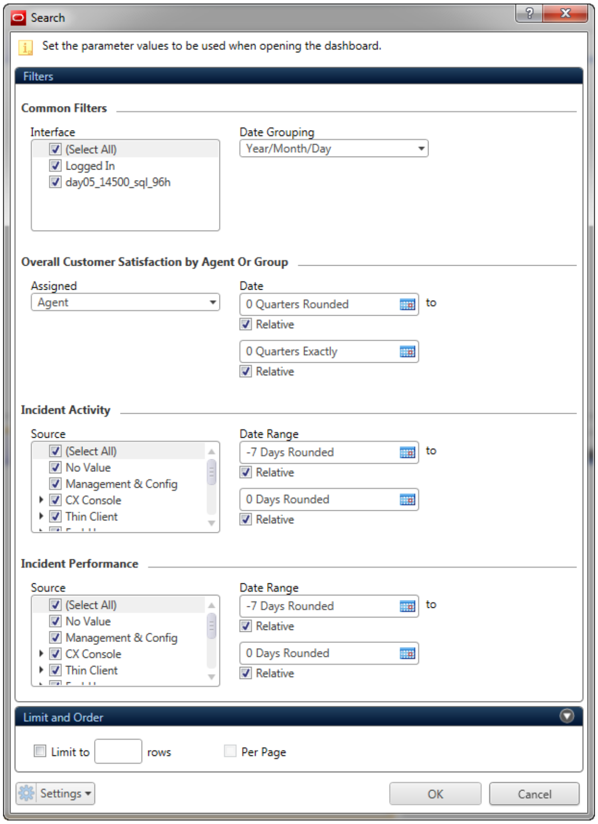
You also have the option to set limits on the total number of rows returned in each report or the number of rows returned on each page of the reports. In addition, you can enter Search Design Mode to modify the layout of the filters on the dashboard's Search window. For more information about searching for information in the reports shown in a dashboard, refer to Searching dashboard reports.

To set dashboard reports' search defaults

1 Edit a dashboard.

2 Click the Home tab.

3 Click the Parameter Values button to open the Set Filter Values window.



The window displays the **run-time selectable filters**, **comparison periods**, and variables that are in the dashboard's reports. If any of the reports have identical filters, comparison date offsets, or output variables, these are grouped together. You can also set limits on the number of rows returned on each page of the reports or the total number of rows the reports can return.

4 Select the default values you want for the reports' variables and filters.

5 To set record or page limits on the reports, select options in the Limit section of the Set Filter Values window.

   a Select the Limit To check box.

   b Type the number of rows to return.

c Select the Per Page check box to apply the entered row limit to each page of the report.

Note If the Per Page check box is not selected, the row limit you enter restricts the total number of rows returned in the reports.

6 To clear the customized default search parameters specified for the dashboard, click Settings and select Reset Values. When you do so, the dashboard's default search parameters are reset to use the reports' default search parameters.

7 To modify the sizes and placement of the filters on the Search window, click Settings and select Enter Search Design Mode. Refer to Customizing the Search window.

8 Click the OK button to save the dashboard parameters.

Customizing dashboard output

The appearance of the dashboard can be customized by applying a **style** to the dashboard, by changing fonts, by changing the dashboard's width, and by specifying how the reports on the dashboard should be scrolled. You can also add titles to the dashboard's reports and choose which report sections to display.

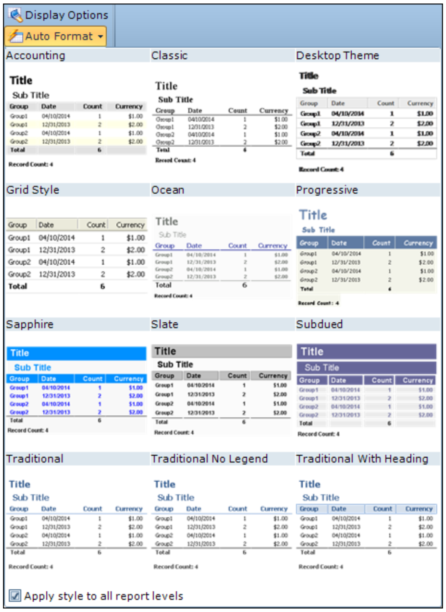
Applying a style to a dashboard

Dashboards can have report styles applied to them, just as individual reports can. When you apply a style to a dashboard, all reports on the dashboard use the same style when viewed from the dashboard. If a new report is added to the dashboard, the dashboard style needs to be applied again for the style to be applied to the new report. Refer to Changing report displays with styles for information about applying a style to a report. For procedures on editing and creating styles, refer to Styles explorer.

To apply a style to a dashboard

1 Click the Home tab.

2 Click the Auto Format button to open the Auto Format window.



3 To prevent the style from being applied to all levels in the reports shown on the dashboard, clear the Apply Style to All Report Levels check box.

4 Click the style you want to apply to the dashboard.

The report style is automatically applied to all the reports in your dashboard.

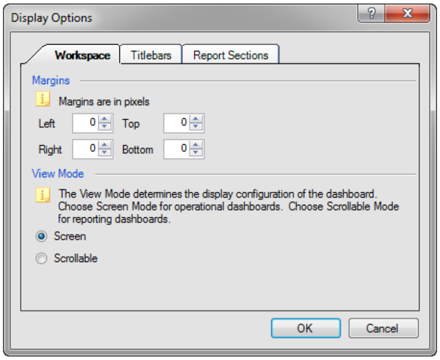
Changing dashboard display options

You can adjust the dashboard's display options to add margins and titles to the reports in the dashboard. You can also specify which report sections should display in the dashboard's reports.

To change display options

1 Click the Home tab.

2 Click the Display Options button to open the Display Options window.

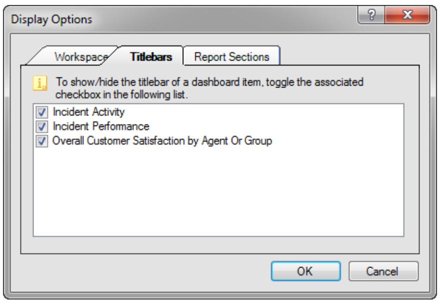


3 In the Margins area, enter the number of pixels between the text and the left, right, top, and bottom margins.

4 In the View Mode area, select a radio button to specify how you want the dashboard's reports to scroll.

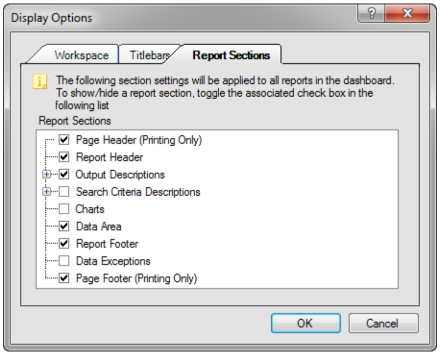
- **Screen**—Select this radio button to add scroll bars to the individual reports in the dashboard.
- **Scrollable**—Select this radio button to permit each report to display in its preferred size, with the height and width of the items in each report fixed. When this option is selected, a single set of scroll bars is added to the dashboard so you can view the entire dashboard surface. However, if the entire size of the dashboard exceeds 32767 x 32767 pixels, the dashboard's reports may be clipped.

5 Click the Titlebars tab.



6 To display a report's title above the report in the dashboard, select the check box next to the report.

7 Click the Report Sections tab.



This tab displays the common report sections included in the dashboard's reports. Sections common to all reports in the dashboard have a black check mark, sections that are not shared by all reports have a gray check, and sections that are not in any of the reports have no check.

8 Select the check box next to each report section you want to display on the dashboard. To remove a section you have already selected, clear the check box next to the section.

9 Click the OK button to save your display options.

Previewing dashboards

When creating and editing dashboards on the dashboard design center, you generally use the design view. This is the default view used to edit the dashboard's properties, and add reports, images, and text fields to the dashboard.

Once you modify your dashboard, you can switch to the report view to preview what the dashboard will look like when it is used by staff. When viewing a dashboard using the report view, the dashboard is presented to you just as your staff members see it, though certain items, such as action links displayed in reports, are disabled. When you want to edit the dashboard again, you can switch back to the design view.

To select the report or design views

1 Edit or create a new dashboard. By default, the dashboard is shown in the design view.

2 Click the ribbon's Home tab.

3 Click the arrow on the Views button and select Report View to change the view.

4 To view the dashboard with the design view, click the arrow on the Views button and select Design View.

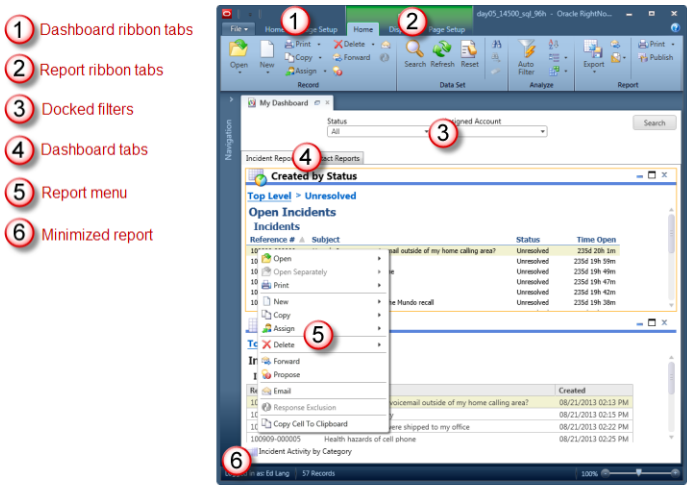
Using dashboards

You open dashboards just as you would open a regular report from the Reports explorer or one of your navigation lists. Dashboards can also be opened from links you add to reports. When you open a dashboard, it loads with current report data. You can also queue dashboards to view them at a later time.

The dashboard includes options similar to those accessed from the Report tab when viewing a report. The dashboard also includes **docked filters** that are common to the reports in the dashboard and may include tabs to access reports on other dashboard pages.

Since every report in a dashboard is fully functional, you can access the standard options available when viewing a report to sort columns, show or hide columns, and add column calculations. If the report and the permissions allow it, you can also access records listed in the reports or edit them inline.

Here's a sample dashboard highlighting dashboard features.

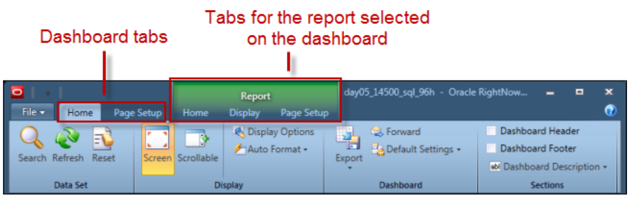


Dashboard ribbon

When you open a dashboard, the dashboard's ribbon includes Home and Page Setup tabs. You can use the options on these tabs to print the dashboard and adjust the dashboard's display and output. When you select an individual report on the dashboard, the ribbon is updated to include additional tabs containing options for modifying the selected report.

Note When viewing a published dashboard or a dashboard that is run after being queued, some options on the ribbon are not available.

A ribbon with dashboard and report-specific tabs is shown here.



Dashboard tabs

The buttons available on the Home and Page Setup dashboard tabs let you open the Search window, refresh the display, select display options, forward the dashboard, configure print options, and perform other actions that impact the entire dashboard. Refer to Page Setup tab for descriptions of the buttons on the Page Setup tab.

Important Permission to export, print, and forward reports must be selected in your profile for the Page Setup tab and the Export and Forward buttons on the Home tab to display. Refer to Customizing profiles.

The groups and buttons on the dashboard Home tab are described in the following table.

Table 219: Dashboard Home Tab Description

Group/Button	Description
Data Set	The buttons in this group let you search for data in all the dashboard's reports, refresh the display, and reset the search criteria to the dashboard's defaults.
Search	Click this button to open the dashboard's Search window. Refer to Searching dashboard reports.
Refresh	Click this button to refresh the dashboard's data using the current search criteria. **Note:** If the auto-refresh feature is enabled, an arrow displays on the button. Clicking the arrow displays options to let staff members enable or disable automatic refresh and change the interval time for automatic refresh of data. Refer to Changing dashboard options.
Reset	Click this button to reset the dashboard's search criteria to the defaults and regenerate the dashboard using the default search criteria.
Display	The buttons in this group let you modify how the dashboard is displayed. For example, you can apply a style to all the reports on the dashboard to give them a similar appearance.
Screen	Click this button to display all the dashboard's reports on the screen when the dashboard is run. Each report can have separate scroll bars to view the report contents.
Scrollable	Click this button to display all the contents of each report on the dashboard. When this option is selected, each report displays in its preferred size and the height and width of the items in each report are fixed. Separate reports do not have separate scroll bars, but vertical and horizontal scroll bars are added to the dashboard if needed to display the entire dashboard. **Note:** If the entire size of the dashboard exceeds 32767 x 32767 pixels, dashboard contents are clipped when using this option.
Display Options	Click this button to change the dashboard's width, add report title bars, and select which report sections you want to display. Refer to Changing dashboard display options.

Table 219: Dashboard Home Tab Description (Continued)

Group/Button	Description
Auto Format	Click this button to apply a **style** to all the reports in a dashboard. This overrides styles applied to the individual reports. Refer to Applying a style to a dashboard.
Dashboard	The buttons in this group let you export the dashboard, forward the dashboard in an email, and save and restore default settings. **Note:** Permission to export, print, and forward reports must be selected in your profile for the Export and Forward buttons to display. Refer to Customizing profiles.
Export	Click this button to export the data from the dashboard's reports to a file for use with third-party applications. You can export the dashboard in HTML, PDF, Excel, XML, Image, Clipboard, and Delimited formats. Reformatting of report layouts will occur when exporting dashboards in certain formats. • Dashboards exported in the Excel format are laid out vertically, and the reports' row and column spacing are reset so the data displays sequentially. • Dashboards exported in XML and delimited formats do not retain their report layouts, and the data is displayed sequentially. • Dashboards exported in HTML, Image, and PDF formats retain their report layouts. However, dashboards that span multiple pages are arranged vertically when viewed in PDF format. Dashboards and reports are exported using the same method and can be exported in the same formats. Refer to Exporting report output for more information about these formats.
Forward	Click this button to send the dashboard to individuals or distribution lists in an email. Dashboards and reports are forwarded using the same method. Refer to Forwarding reports.
Default Settings	Click this button and select Save as Default to save your personalized display and data settings for a dashboard for later use. Select Restore to remove personalized display and data settings from a dashboard and restore the settings to those defined in the dashboard. Refer to Resetting display and data settings.
Sections	The options in this group let you select whether to show the dashboard's header, footer, and description.

Table 219: Dashboard Home Tab Description (Continued)

Group/Button	Description
Dashboard Header	Select this check box to show the dashboard's header.
Dashboard Footer	Select this check box to show the dashboard's footer.
Dashboard Description	Click this button and select how the dashboard description should be displayed. You can choose to not display a description, display the description inline, or display the description on a separate tab.

Report tabs

When you click a report on the dashboard to select it, the ribbon is updated to include the report's Home, Display, and Page Setup tabs. You can use the buttons on these tabs to perform the same actions you could if viewing the report outside of a dashboard. For example, you can add calculations, select fields to show in the report, sort the report output, and edit records. For descriptions of the buttons on these tabs, refer to Ribbon options when viewing reports.

Queuing dashboards

Dashboards can be queued to run at a later time just as reports can. Dashboards can be manually queued or automatically queued. Once a queued dashboard generates, you can view the dashboard using a standard report or a notification just as you can with queued reports. Refer to Queuing reports.

Note Unlike queued reports, you cannot send queued dashboards to comma-separated values (CSV) files.

Manually queuing dashboards

You can queue dashboards containing reports that you think may query or return large amounts of data. This is also helpful if you want to view a number of dashboards but do not want to wait for each to generate.

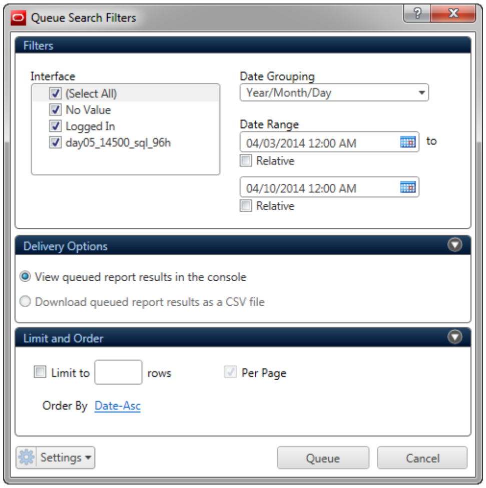
To manually queue a dashboard

1 Select the dashboard on the Reports explorer and click the ribbon's Queue button.

Or

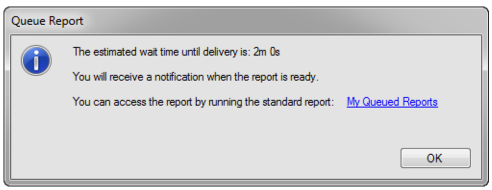
Right-click the dashboard, either on the Reports explorer or the navigation list, and select Queue.

The Queue Search Filters window opens where you specify the search parameters you want to use for the queued dashboard.



2 Enter the search parameters you want to use. Refer to Searching dashboard reports.

3 Click the Queue button. A window displays an approximation of when the dashboard will be available to view.



4 Click the OK button to close the window.

Automatic queuing

When you attempt to open a dashboard, the queries that are required to run each of the dashboard's reports are examined. If the system determines that one or more of the reports will take too long to process, a message displays the reports in the dashboard that are causing the problem and asks if you want to queue the dashboard. If you choose to queue the dashboard, it is queued to run at a later time using the search parameters you entered and a message shows you the estimated time when the dashboard will be ready for viewing. If you choose not to queue the dashboard, you can try to run it again using more restrictive search parameters.

Tip You can force dashboards to be queued automatically by enabling the Set Report to Deferred Execution option on the Edit Settings window. Refer to Changing dashboard options.

Viewing queued dashboards

After you queue a dashboard, you can use standard reports located in the Reports explorer's Public Reports > Common > Site Administration > Reports folder to see the dashboard's status in the queue. Once the dashboard runs and is ready to view, you are notified and you can open it from several locations. Most of the standard options are available on the dashboard's ribbon, though there are some exceptions.

It is possible that some of the reports in the dashboard will not queue successfully, for the reasons described in Queuing failures. If a report in a dashboard cannot be queued, the queued dashboard cannot be processed.

The methods to view and open dashboards that have been queued are identical to those used with queued reports. Refer to Viewing queued reports.

Displaying and hiding reports in a dashboard

When viewing a dashboard, you can use buttons displayed in each report's title bar to minimize, maximize, or close each report. This allows you to simplify the dashboard display when you want to focus on certain reports in the dashboard.

Note The minimize, maximize, and close buttons are not available when the dashboard is displayed with a scrollable view mode. Refer to Changing dashboard display options for information about view modes.

The buttons in each report's title bar are described in the following table.

Table 220: Dashboard Reports Display Buttons Description

Button	Description
Minimize	Click this button to minimize the report. When a report is minimized, the report name and icon display in the lower left corner of the dashboard. To restore the report, right-click the minimized option and select Restore.
Maximize	Click this button to maximize the report. When a report is maximized, the other reports in the dashboard are hidden.
Restore	Click this button in the maximized report's title bar to return the report to its previous size.
Close	Click this button to close the report and temporarily remove it from the dashboard. The report displays the next time you load the dashboard.

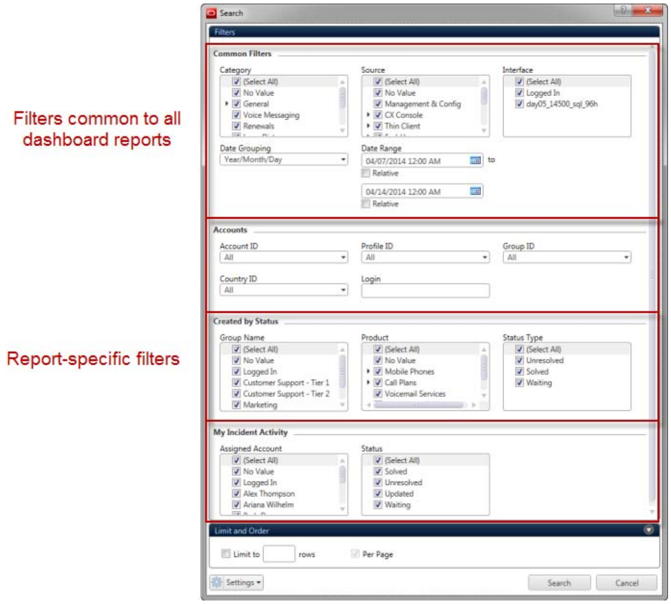
Searching dashboard reports

Searching for information in reports in a dashboard is similar to searching the reports when they are generated on their own. However, there are some differences that you need to be aware of.

- **Docked filters**—When a report that includes docked **run-time filters** is run outside of a dashboard, the docked filters display at the top of the report. However, when the report is opened in a dashboard, the report's docked filters are displayed at the top of the dashboard.

If multiple reports in the same dashboard include docked filters, all the reports' docked filters are displayed at the top of the dashboard. If two or more reports in the dashboard have the same docked filters, these can be merged so only one docked filter displays. Values you set in the merged filter are applied to all reports with that filter. Refer to Changing dashboard options for information about combining filters for dashboard reports.

- **Search window**—When reports are displayed together on a dashboard, you can search for information in all the reports simultaneously. Searching for information in a dashboard is similar to searching for information in a report, though a dashboard's Search window displays filters common to multiple reports, followed by report-specific filters. These common and report-specific filters are separated by headers on the Search window, as shown in the following figure. Refer to Searching in reports.



To search for information in all reports on a dashboard

1 Open the dashboard and click the Home tab.

2 Click the Search button to open the dashboard's Search window.

3 Select the filters, variables, and limits you want.

4 Click the OK button to apply the search criteria to all the reports on the dashboard.

Note Certain options you select when creating dashboards impact the behavior of the Search window. For example, if you select the Open Dashboard Without Prompting for Search Parameters option on the Edit Settings window, the Search window automatically opens when you open the dashboard. Refer to Changing dashboard options for information about these options.

If you want to search a specific report on the dashboard without searching the dashboard's other reports, select the report on the dashboard, click the report's Home tab on the ribbon, and then click the Search button.

To search for information in only one report on a dashboard

1. Open the dashboard.
2. Select the report on the dashboard you want to search. When you select a single report on the dashboard, additional report tabs display on the ribbon. (Refer to Report tabs.)
3. Click the Home tab beneath the ribbon's Report heading and then click the Search button to open the report's Search window.

The search you perform from the report's Search window applies only to the selected report.

Tip You can use the Find feature to locate specific text in the highlighted report. Refer to Finding content in reports.

33

Creating Basic Reports

Oracle RightNow Analytics Cloud Service (Analytics) provides tools to create custom reports that include advanced features such as multiple **output levels**, **linked reports**, calculations, **data exceptions**, **variables**, **computed fields**, and custom scripts. These reports can take time to plan or may require input from several people. However, you can quickly create reports that fulfill most of your reporting needs.

Note This section provides an overview of planning and creating basic custom reports. For information about all the tools available to create and edit reports, refer to Custom Reports.

Planning reports

No matter how simple or complex a custom report is, there are certain guidelines to follow to help you create the report you want. Since each custom report you create can output different data and include different components, you may want to design your report before you start to create it. This helps determine what steps you need to take to create the report you want.

We recommend considering the following questions before you create your report.

- What audience will view or use the report? This determines which report layout you use since some layouts include charts, titles, and other information. Refer to Applying report layouts.
- What information do you want the report to return? This determines the fields to include in the report's output. Refer to Managing output columns.
- What fields do you want to be able to search on when running the report, and what information should be excluded? This determines the report's **fixed** and **run-time selectable filters**. Refer to Specifying filters.
- Do you want to be able to **drill down** on any fields to view additional information? This determines if multiple output levels or linked reports need to be configured. Refer to Adding additional output levels and Linking reports.

- How do you want the information that is returned to be ordered? This determines the sorting options that you apply to the report. Refer to Changing sort options.
- Who should have access to run or edit the report? This determines if the report should be made public and what permissions are applied to the report. Refer to Specifying permissions.

Tip Before creating a report, we recommend reviewing the reports already on your site to see if any of them are similar to the report you want. If so, you can copy the existing report and then edit the copy to meet your reporting needs.

To view descriptions of existing reports, you can generate a catalog of reports. Refer to Producing a catalog of reports. For information about finding and copying reports, refer to Working with explorers. For information about viewing the contents of a report, refer to Viewing and exporting report definitions.

Creating reports

Once you have an understanding of what your report should contain, you create it on the report design center. The procedures listed here demonstrate the basic steps that are required to create most reports. While the sample report might not be useful to your organization, knowing how to create a report such as this will help you create reports your organization needs.

In this sample report, you will see the number of unresolved and updated incidents in each incident queue. You will also be able to drill down on the information in the first level to open a second output level to view details about the incidents in each queue.

To create the report, you will follow a number of basic steps.

- Open the report design center. Refer to Opening the report design center.
- Add columns to the report. Refer to Adding columns.
- Add another output level to the report. Refer to Adding drill-down levels.
- Add filters to the report. Refer to Adding filters.
- Save the report. Refer to Saving reports.

Opening the report design center

The report design center gives you access to all the tools you need to create basic or more complex reports.

To open the report design center

1 Click the Analytics button on the navigation pane, double-click Reports Explorer, and then click New Report on the ribbon.

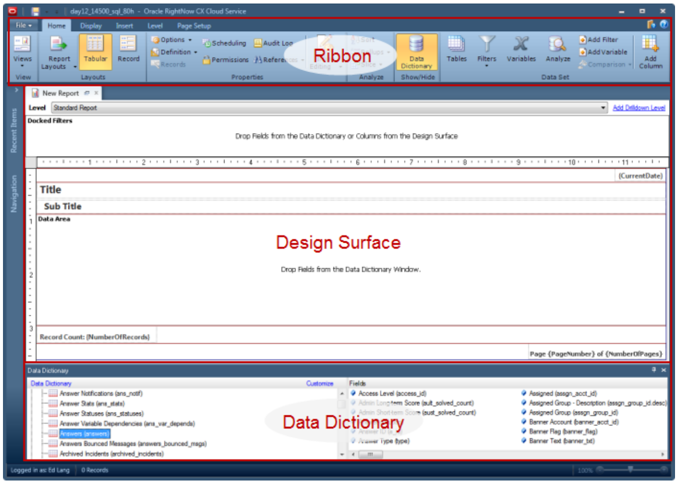
Or

If your navigation set is configured to add new reports from the **file menu**, click File and then select Report. Refer to File menu.

2 Select the type of report you want to build: Grid report, Standard report, or Standard report with Chart. Since the sample report will primarily be used internally by staff members to work with records, select Grid report.

Note Grid reports are most commonly used on the **Service Console** to list records that staff members can open for editing. The other report types are generally used to present summaries of data inside or outside of your organization. If you decide you want a different report type after you start creating a report, you can change it from the Report Layouts button on the ribbon's Home tab.

After selecting the report type, the report design center opens where you create your report. The report design center is shown in the following figure and the main areas of the design center are indicated.



For detailed information about the design center, refer to Opening the report design center.

Adding columns

We will add two columns to the report's first output level, displaying incident queues and the number of incidents in each queue.

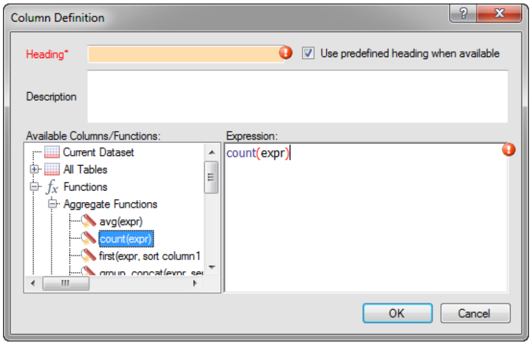
To add output columns

1 Expand the All Tables tree on the data dictionary and then select Incidents.

2 Select Queue (queue_id) on the right side of the data dictionary and drag it to the design surface. The field is added to the report as a column and is automatically named Queue, but you can right-click the column to change the name and customize other options.

3 On the data dictionary, scroll down to the Functions tree and expand it.

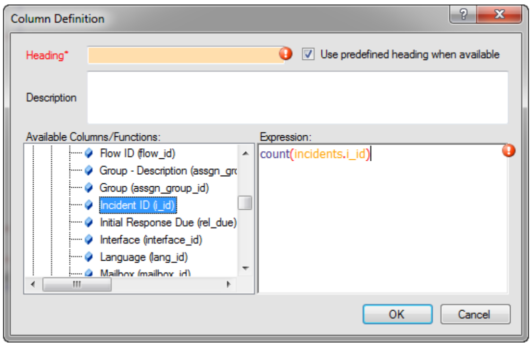
4 Select Aggregate Functions and then drag count(expr) onto the design surface. The Column Definition window opens where you select the field you want counted.



We will edit the column’s expression to specify what records we want counted. In this example, we want to count the incidents in each queue.

5 On the left side of the window, expand Current Dataset and Incidents.

6 Scroll down to Incident ID (i_id) and drag it to the text between the parentheses on the right side of the window. After you do this, the column’s expression will be *count(incidents.i_id)*.



We want to count the records using this field since it is a unique identifier for incidents as no two incidents share the same ID number.

7 To change the name of the column you are adding, type the name you want in the Heading field. For our example, you can type Number of Incidents.

8 Click the OK button to save the changes and add the column to the report. The new column automatically displays a count of all incidents in each incident queue.

The first output level of the sample report now has two columns displaying incident queues and the number of incidents in each queue. For more information about adding output columns to reports and the types of columns you can add, refer to Managing output columns.

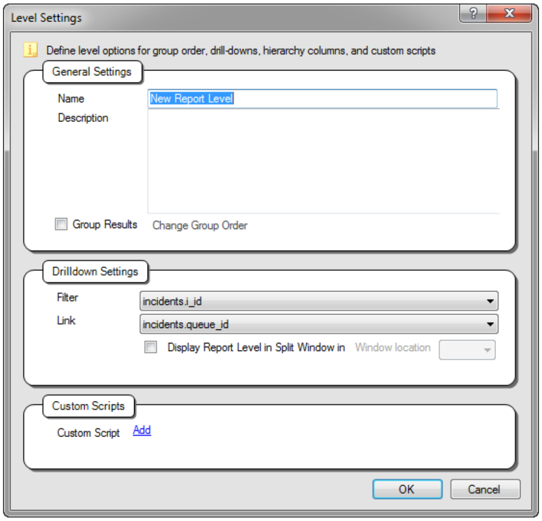
Adding drill-down levels

Now we will add a second level to the report that you can drill down into to view details about the incidents in the queues. Refer to Adding additional output levels.

Tip If you already have a report that returns the information you want to see in the drill-down level, you can link the reports together instead of adding another output level. Refer to Linking reports.

To add another output level

1 Click the Level tab on the ribbon and then click the Add Drilldown button. The Level Settings window opens, displaying information about the new output level.



You can type a different name for the new output level in the Name field, add notes about the level in the Description field, and change other options that are described in Adding additional output levels.

As you review the options in the Drilldown Settings area of the window, notice that the drill-down filter is automatically set to *incidents.queue_id*. When you use the report and click a drill-down link on the first level of the report, the second output level knows to display only information related to the queue in the row you clicked. For more complex reports, the drill-down filter can be changed, but it is not necessary to do so here.

The link you click when using the report is also automatically set to *incidents.queue_id*. However, for our sample report, we will make the incident count column the link we click to drill down.

2 Click the Link drop-down menu and select count(incidents.i_id).

3 Click the OK button to save the new output level.

You can now drag fields from the data dictionary onto the design surface to add columns to the second level of the report. Since this output level is intended to display details about the incidents, you could add fields from the *incidents* table such as Reference #, Subject, Assigned Account, and Date Created. You can also add fields from the *contacts* table to view information about the contacts who submitted the incidents. Refer to Adding columns to reports.

Tip If you want to change the output level you are editing, click the Level drop-down menu at the top of the design surface and select the level you want.

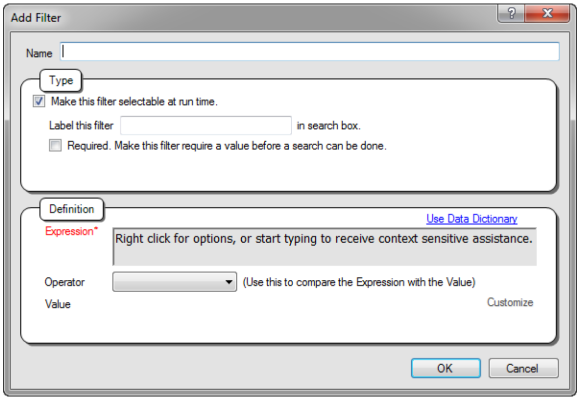
Adding filters

Next, we will add a fixed filter to return only unresolved and updated incidents in the report. Fixed filters prevent reports from querying more information than you need in the report.

You could also add run-time selectable filters to the report to return only incidents created in a certain time period, assigned to particular staff accounts, or that match other criteria you specify. Unlike fixed filters, run-time selectable filters allow you to select the values you want when you run the report. For detailed information about filters, refer to Specifying filters.

To add a filter to the report

1 Click the Home tab on the ribbon and then click the Add Filter button.



2 If you want to specify a name for the filter, type a name in the Name field. This name is used only on the report design center. If you do not specify a name, the filter's database field is used instead.

3 Clear the Make this Filter Selectable at Run Time check box.

Note If we were creating a run-time selectable filter, we would leave this check box selected and type a filter name in the Label this Filter field that staff members see when running the report. We could also select the Required check box for run-time selectable filters to force the report's users to specify a filter value before they can run the report.

4 In the Definition section, right-click in the Expression field and select Incidents followed by Status (status_id). This is the database field we are using to filter the report's output by.

5 Click the Operator drop-down menu and select In List.

6 When you use the In List operator, all items are selected by default. Clear the check box next to each item you do not want to include in the initial search or clear the Select All check box and select the check box next to each item you want to include. For our example, select Unresolved and Updated. The report will include only incidents with one of these statuses. Since the filter is selectable at run-time, you can change the search options when you run the report.

   a To prevent menu options that are irrelevant to the report's audience from being available in searches, click Customize and clear the check boxes next to the options you do not want to display. Refer to [Hiding menu options](#).

7 Click the OK button to save the filter.

Saving reports

The final step in creating the report is to save it to a location where the report's audience can access it. Once you save the report, your staff members can open it, assuming they have permission to do so. Refer to Specifying permissions.

To save the report

1. Click the arrow next to the Save button on the **Quick Access toolbar** and select Save and Close. The Save As window opens where you specify the name of the report and where you want it saved.

2. Select Public Reports or a custom subfolder beneath Public Reports. Reports that are saved in the My Reports folder are accessible only by you.

   a. To create a custom subfolder, right-click Public Reports, select New Folder, and type the name you want for the folder.

3. Type the name for the report in the Name field. The name can be up to eighty characters.

4. Click the OK button to save the report and close the report design center.

Your staff members can now access the report from the Reports explorer or you can add the report to their navigation sets (refer to Creating navigation sets). You can edit the report whenever you want to add more columns, filters, or output levels. You can also add advanced functionality such as column calculations, variables, inline editing, and other options. If you want to show the information in the report to a wider audience, you can also change the report's layout and add charts, text fields, and images. For information about these and other options, refer to Custom Reports.

If you encounter problems when you try to run a custom report, you can examine it using the report analyzer. This will help you determine the cause of the problem, such as the report querying tables that it does not need, or lacking filters to reduce the amount of data being read. Refer to Reviewing report performance.

34

Custom Reports

Creating custom reports gives you the flexibility to output the information you need in the format you want. Custom reports can be simple, pulling data from one table and returning data from the same table, or they can be complex, pulling data from several tables, filtering it, and returning tabular and chart information in multiple output levels or linked reports.

When creating a custom report, you can select the database fields you want, add calculations and **functions** to the fields, and create **fixed** and **run-time selectable filters** to find the exact records you want. You can also add charts and text to your report, and specify the display and data options used when your report is opened. This ensures the information presented in your report is clear and accessible to your audience.

Note For step-by-step instructions for creating a basic custom report, refer to Creating Basic Reports.

Using the report design center

You create and edit custom reports from the report design center. All the tools you need to create a report are available from one location. You can also access optional items, such as **chart styles** and **color schemes** you have configured in the other Oracle RightNow Analytics Cloud Service (Analytics) explorers, from the report design center to enhance your reports. Refer to Analytics Explorers.

You can customize reports based on your organization's needs using the report design center's ribbon, data dictionary, and design surface components.

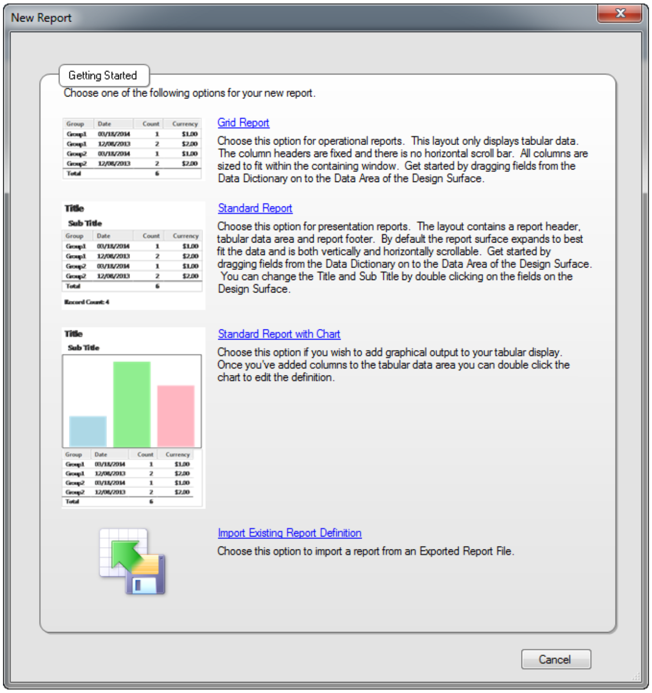
Opening the report design center

The report design center is generally opened from the Reports explorer. However, if you want to create a new report and your navigation set is configured to add reports from the **file menu**, you can click File and select Report. See To configure the file menu.

Once you open the report design center, you can increase the amount of space on the design surface by hiding the data dictionary or elements on the design surface. When you need an item that is hidden, you can display it again.

To open and configure the report design center

1. Click the Analytics button on the navigation pane.
2. Double-click Reports Explorer. Refer to Reports explorer for an overview of this explorer.
3. To edit an existing custom report, right-click the report and select Edit. The report design center opens. Refer to Report design center components.
4. To create a report, click the New Report button. When creating a report, a window opens where you select the report's initial layout.



5 Click the name of the layout you want to use for the report. The options are Grid Report, Standard Report, and Standard Report with Chart. When you select a layout, the report design center opens with the selected layout. Refer to Applying report layouts.

6 To create a copy of a report from another **interface** by importing a report definition, click Import Existing Report Definition. Refer to Importing reports.

Importing reports

If you have multiple **interfaces**, you can use report definitions saved in XML files to create reports on other interfaces. This allows you to create duplicates of complex custom reports from other interfaces without manually re-creating the reports. If you have previously exported **segments**, you can also import these to create custom reports. Refer to Exporting and importing segments.

Important Since reports are not shared between interfaces, you must export a report from one interface and import it into another to have the same report available in multiple interfaces.

When importing a report, the permissions from the imported report are not changed. However, the owner of the report is changed to the staff member who imports the report.

The following procedure explains how to import report definitions from XML files created from another interface. For information about exporting report definitions, refer to Exporting report definitions.

To import a report definition

1 Click the New Report button on the Report explorer's ribbon to select the report layout.

2 Click Import Existing Report Definition and select the XML file containing the report definition.

3 Select the XML file you want and click the Open button.

Note If you import a report that includes custom object record commands into a site that has custom objects with different names or ID numbers, a window opens where you can match the custom objects referred to in the imported report to the custom objects on the site. Refer to Custom Objects.

The imported report opens on the report design center where you can modify it.

Important When you import a report definition to create a report on a different Oracle Service Cloud site, items in the report definition that do not exist in the database where you import the report, such as custom fields, will display in the new report but will not display data. You must edit the new report to modify or delete items that do not correspond to existing fields in the database.

4 Save the new report.

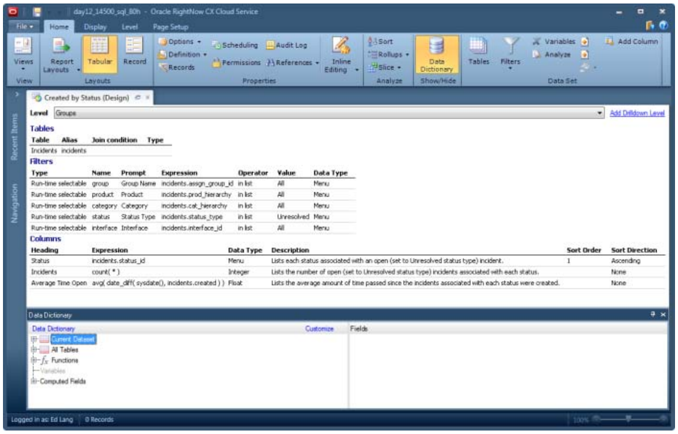
Selecting a view

When you open the report design center, you can choose to use one of four views to look at your report. Each view presents your report in a different way and gives you access to different tabs on the ribbon. The following views are available when editing a report.

- **Report View**—This view shows you the report just as your staff members will see it when they open it. The report presents real data and is particularly useful when you want to preview a report you are editing. This view does not let you add column calculations, adjust column formatting options, or use action links.
- **Layout View**—This view is similar to the report view and is also useful for previewing reports. However, unlike the report view, this view lets you select individual columns in the report and apply formatting options to the columns. For example, if you want to add **conditional formatting** to a column to highlight data that meets certain criteria in the column, you could select the layout view, select the column, and configure conditional formatting for the column.

Note When you select the report or layout view, a message appears if your report queries too much data. You can save reports such as this, but we recommend that you add fixed filters or reduce the number of tables in the report to ensure that the report runs efficiently.

- **Design View**—This is the default view when you open the report design center. This view gives you access to the tools you need to create and edit your report on the design surface.
- **Data Set View**—This view shows your report in a textual design space. You can add columns, filters, and variables using this view, just as you can when using the design view, but you cannot add graphic elements, such as charts, images, or text fields. The data set view is particularly helpful if you want to view text descriptions of your report's contents, and access different report components to edit them. The following figure shows a report displayed using the data set view.



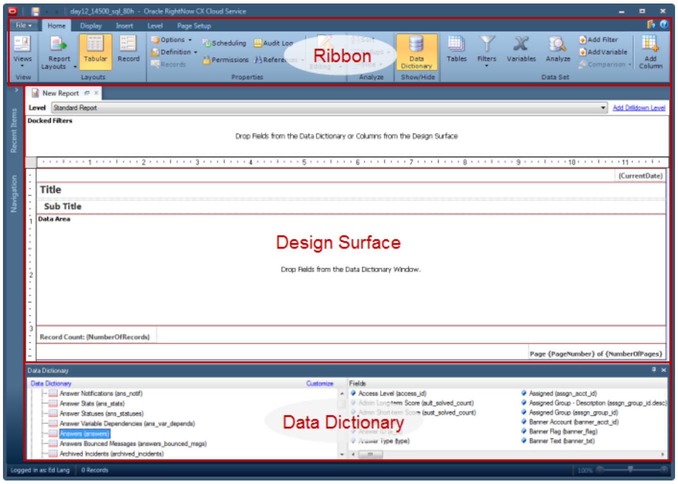
To select views

1 Edit a report. By default, the report opens in the design view.

2 Click the arrow on the Views button on the ribbon's Home tab and select the view you want. The report display is updated to use the view you select.

Report design center components

The majority of the tasks you perform when creating or editing a custom report are done through the ribbon, design surface, and data dictionary components of the report design center. These components provide access to the data, report sections, parameters, and other items you use to create and edit custom reports. The following figure shows the report design center's main components and includes the grid, rulers, rule lines, field outlines, and section headers design tools you can enable from the ribbon's Display tab.

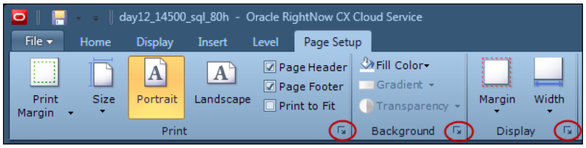


Report design center ribbon

The report design center's ribbon includes eight tabs from which you can access options to create or edit a report. The tabs on the ribbon change depending on which view you use and what is selected on the design surface. When editing a report using the design view, you can select the Home, Display, Insert, Level, and Page Setup tabs to add filters and report levels, insert charts, and modify the report's display. The Design, Format, and Options tabs are displayed when you select objects on the report, giving you options to edit the selected object. The data set view gives you similar options, though the Insert tab is not available. Fewer tabs are available when using the report and layout views. For descriptions of the tabs available in the report and layout views, refer to Ribbon options when viewing reports.

Tip You can minimize the ribbon when editing a report by double-clicking the active tab. Click the tab to temporarily display the buttons on the tab or double-click the tab again to maximize the ribbon.

Each tab on the ribbon has one or more groups containing buttons you can use to modify the report or items on the report. Some groups have buttons to the right of their names that you can click to open a window. For example, the Page Setup tab has groups for Print, Background, and Display options, and you can click the Background group's button to open the Display Options window.

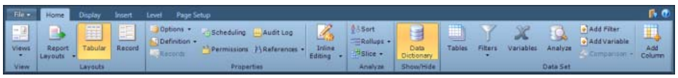


Windows give you access to the same features you can access from the ribbon, though the windows group the options differently, and sometimes contain additional options not available from the ribbon.

Important When explaining features that can be accessed from a window or the ribbon, we describe the feature using the window, but keep in mind that the ribbon's buttons provide shortcuts to most of the same features available on windows.

Home tab

The report design center's Home tab gives you access to options that impact the entire report. For example, you can select report layouts, view or export a definition of the report, schedule the report to be sent out in an email, adjust permissions, view an audit log, and enable inline editing for the report. You can also sort the data in the report or view it differently using rollups or slicing. Buttons on the tab's Data Set group give you access to the report's tables, filters, variables, and columns.



The groups and buttons on the Home tab are described in the following table.

Table 221: Home Tab Description

Group/Button	Description
Views	This button lets you choose whether to view the report using the report, layout, design, or data set view. Refer to Selecting a view.
Layouts	The buttons in this group let you select a style and layout for the report.

Table 221: Home Tab Description (Continued)

Group/Button	Description
Report Layouts	Click this button to load a predefined report layout. The available layouts are Grid Report, Standard Report, Chart, and Standard Report with Chart. When you select a layout, the report sections needed for the type of report you select are automatically displayed. Refer to Applying report layouts.
Tabular	Click this button to edit the report in a tabular layout. This is the default layout used when creating a report. Refer to Selecting record or tabular layouts.
Record	Click this button to edit the report in a record layout. Refer to Selecting record or tabular layouts.
Properties	The buttons in this group let you modify properties that apply to the entire report.
Options	Click this button to select how the time zone used in the report is determined, who the owner of the report is, set Auto Refresh and other options, and add notes to the report. Refer to Changing report properties.
Definition	Click this button and select View to view the report definition, showing descriptions of the report's tables, columns, filters, and other information describing the report's structure. Refer to Viewing and exporting report definitions. Click this button and select Export to export the definition to a file which you can import into another **interface** to copy the report. Refer to Exporting report definitions.
Records	Click this button to select the record commands buttons you want to display on the report's Home tab. Refer to Customizing record commands.
Scheduling	Click this button to schedule the report to be sent to other individuals. Refer to Scheduling reports. **Note:** This button appears only when scheduled reports are enabled. For information about enabling scheduled reports, contact your Oracle account manager.
Permissions	Click this button to define which profiles should have access to run and edit the report. Refer to Specifying permissions.

Table 221: Home Tab Description (Continued)

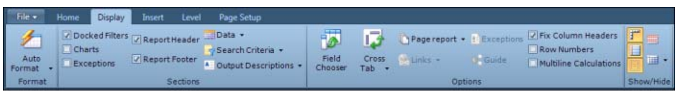
Group/Button	Description
Audit Log	Click this button to open the audit log for the report, which shows you when the report was created, edited, run, and **published**, and which staff members performed these actions. Refer to Viewing the audit log.
References	Click this button to access pre-defined reports that show you the **workspaces**, **navigation sets**, **dashboards**, and **report links** that use the report you are editing. Viewing these items before editing a report ensures that you are aware of other items that might be impacted by changes you make. If you decide the impact would be too great, you can create a copy of the report and edit the copy instead. **Note:** If you have the Analytics Administrator profile permission, you can access versions of these reports that include search options in the Report Management component. Refer to Management Reports.
Inline Editing	Click this button to select options for **inline editing**, which allows staff members to edit data directly from a report. Refer to Enabling inline editing. **Note:** This button does not display if the staff member's profile lacks inline editing permission.
Analyze	The buttons in this group let you sort the data shown on the report and apply rollups and slicing to the data.
Sort	Click this button to open the Sort window and select which output columns to sort by and the sort method. Refer to Changing sort options.
Rollups	Click this button to select rollup options and open the Rollups window. Refer to Displaying rollup levels.
Slice	Click this button to slice the data in the report. Slicing lets you group tabular data that shares common values in fields included in the report. Refer to Slicing report data.
Data Dictionary	Click this button to hide or display the data dictionary at the bottom of the report design center. You can select fields from the database to use in the report from the data dictionary. Refer to Data dictionary.

Table 221: Home Tab Description (Continued)

Group/Button	Description
Data Set	The buttons in this group let you add or edit columns, tables, filters, variables, and edit comparison date offsets.
Tables	Click this button to view the tables used in the report, change the joins used between the tables, add and delete tables from the report, and add join filters. Refer to Managing table relationships.
Filters	Click this button to view, add, edit, or delete report filters. Refer to Creating report filters.
Variables	Click this button to view, add, edit, or delete variables. Refer to Variables.
Analyze	Click this button to preview the report's database query. Refer to Reviewing report performance.
Add Filter	Click this button to add a report filter. Refer to Creating report filters.
Add Variable	Click this button to add a variable to the report. Refer to Variables.
Comparison	Click this button to add comparison date offsets for comparison columns. Refer to Adding comparison columns to reports.
Add Column	Click this button to add a column to the report. Refer to Adding columns to reports. **Note:** You can also add columns by dragging them from the data dictionary onto the design surface.

Display tab

The Display tab on the report design center ribbon is similar to the Display tab available when viewing a report. Each gives you options to apply report styles, add report sections, page the report, fix column headers, and display data using cross tabs. The report design center's Display tab also includes a Show/Hide button group that lets you add rulers, lines, and headings to help you identify sections and fields shown on the design surface.



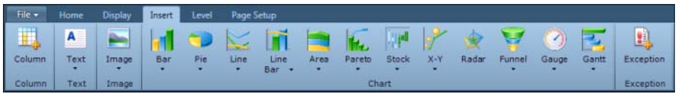
For descriptions of the buttons on the tab's Format, Sections, and Options button groups, refer to Display tab. The buttons on the Display tab's Show/Hide group are described in the following table.

Table 222: Display Tab Show/Hide Group Description

Button	Description
Show Rulers	Click this button to display horizontal and vertical rulers when designing the report to provide a perspective on the report's size.
Show Rule Lines	Click this button to display horizontal lines separating the report sections displayed on the design surface.
Show Field Outlines	Click this button to display borders around the fields you add to the report.
Show Section Headers	Click this button to display a heading above each report section.
Show Grid	Click this button to display a grid in the report's header and footer sections to help you align items you add to the sections. You can also select the grid size you want to use.

Insert tab

The Insert tab allows you to add columns, charts, and **data exceptions** to your report. You can also add standard text fields or custom text fields created from the Text Fields explorer and images added in the Images explorer. This Refer to Text Fields explorer and Images explorer.



The groups and buttons on the Insert tab are described in the following table.

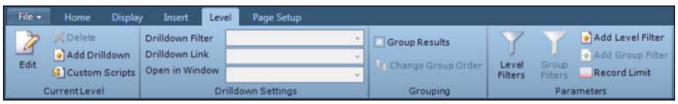
Table 223: Insert Tab Description

Group/Button	Description
Column	Click this button to open the Column Definition window to add a column to the report. Refer to Adding columns to reports. **Note:** You can also add columns by dragging them from the data dictionary onto the design surface.
Text	Click this button to insert a text field into a report section that accepts text fields. Refer to Adding text fields to reports.
Image	Click this button to add an image to your report. Refer to Adding images to reports.
Chart	The buttons in this group let you select a chart to add to the Charts section of your report. You can select different chart types and subtypes. Refer to Adding and editing charts.
Exception	Click this button to add data exceptions to the report. Refer to Creating data exceptions.

Level tab

The report design center's Level tab gives you access to options you can apply to report levels. You can also create reports with drill-down levels from this tab. If your report already has multiple output levels, you can select the level you want to edit from the Level drop-down menu located on the design surface.

You can apply level filters and group filters from this tab and add custom scripts to the report level you are viewing. You can also click the Edit button to add output descriptions to the report level.



The groups and buttons on the Level tab are described in the following table.

Table 224: Level Tab Description

Group/Button	Description
Current Level	The buttons in this group let you edit the report level that is currently selected on the Level drop-down menu at the top of the design surface. You can also delete the selected level, or add custom scripts or drill-down levels to the level.
Edit	Click this button to open the Level Settings window where you can configure all level options for the selected level. Refer to Adding additional output levels.
Delete	Click this button to delete the selected level. This option is not available for the top level of a report. **Note:** When you delete a level, all the columns and other items added to the level are also deleted.
Add Drilldown	Click this button to add a drill-down level to the selected level. Refer to Adding additional output levels.
Custom Scripts	Click this button to add a custom script to the selected level. Refer to Adding custom scripts to output levels.
Drilldown Settings	The options in this group let you select the drill-down filter and link for the level. Refer to Configuring recursive drill-down levels.
Drilldown Filter	Click this drop-down menu to select the output column or columns to use as the filter for the new level. The drill-down filter determines the data set displayed in the drill-down level.
Drilldown Link	Click this drop-down menu to select the output column you click to open the drill-down level. You can also select Entire Row to open the drill-down level by clicking anywhere on a row in the parent output level. **Note:** If you want to drill down into another report level instead of opening a specific record when a value from the record is double-clicked on a report, select Entire Row as the drill-down link. When configuring record commands for the report, select None from the Default Record drop-down menu. Refer to Customizing record commands.

Table 224: Level Tab Description (Continued)

Group/Button	Description
Open in Window	Click this drop-down menu to specify how you want to open the drill-down output level. To replace the current output level, select None. To open the output level in a new window, select the location on the screen where you want the window to open by default. You can choose Top, Bottom, Left, or Right.
Grouping	The buttons in this group let you configure result grouping for the drill-down level.
Group Results	Select this check box to group data on the selected level. Refer to Result grouping.
Change Group Order	Click this button to change the order of the grouped output columns. Refer to Changing group ordering.
Parameters	The buttons in this group let you manage level and group filters, and add record limits to the selected level.
Level Filters	Click this button to view, add, edit, or delete level filters. Refer to Creating level filters.
Group Filters	Click this button to view, add, edit, or delete group filters. Refer to Creating group filters.
Add Level Filter	Click this button to add a level filter. Refer to Creating level filters.
Add Group Filter	Click this button to add a group filter. Refer to Creating group filters.
Record Limit	Click this button to limit the number of records that can be returned on the selected level. Refer to Adding row limits and page breaks.

Page Setup tab

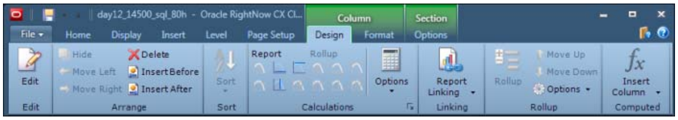
The options on the Page Setup tab allow you to configure default printing options for the report. You can also change the report's background, margins, and width. This tab is also available when staff members view reports. Refer to Page Setup tab for a description of the options on this tab.

Design tab

The report design center's Design tab is available when you click a column, text field, exception, or chart. The Design tab also displays when you select a filter, variable, or table when using the data set view.

Note The Design tab is renamed to Text Field when a text field is selected.

Different buttons are shown on the tab depending on the item you select. For example, when working with a column, buttons are available to add calculations, configure data rollups, and add comparison values. When working with text fields, you can change fonts, margins, and borders. The following figure shows the options on the Design tab when a column is selected.



The groups and buttons on the Design tab are described in the following tables, with the options for columns, text fields, data exceptions, charts, tables, and filters or variables described in separate tables.

Note The groups and buttons available on the Design tab depend on the type of object you select. In addition, when editing a column, the options on the tab depend on the type of data the column returns.

The groups and buttons available on the Design tab when editing a column are described in the following table.

Table 225: Design Tab Column Options Description

Group/Button	Description
Edit	Click this button to open the Column Definition window, from which you can edit the column's definition. Refer to Adding columns to reports.
Arrange	The buttons in this group let you hide, remove, and order the position of the selected column.

Table 225: Design Tab Column Options Description (Continued)

Group/Button	Description
Hide	Click this button to hide the selected column. **Note:** To show hidden columns, right-click the header for a visible column, select Insert Hidden Column, and select the column you want to show. The column will be displayed in the column's default location.
Move Left/Move Right	Click these buttons to move the selected column one column to the left or right.
Delete	Click this button to remove the selected item from the report.
Insert Before/Insert After	Click these buttons to open the Column Definition window, from which you can create a new column inserted before or after the selected column.
Sort	Click this button and select Sort Ascending or Sort Descending to sort the data in the report by the values in the selected column. Refer to Changing sort options. **Note:** Columns with a text area data type cannot be sorted.
Calculations	The buttons in this group let you add calculations to the selected column. You can hover over each button to view a description of the calculation. You can also choose to show multiple calculations on a single row or on separate rows. Refer to Adding column calculations.
Calculation buttons	Click the button for the calculation that you want to add to the selected column.
Options	Click this button and select Display Calculations on Single Row to show all the selected calculations on one row beneath the column. Select Display Calculations on Separate Rows to show each calculation on a separate row below the column.
Report Linking	Click this button to add, edit, and remove links to other reports. You can add conditional or unconditional links to columns. Refer to Linking reports.

Table 225: Design Tab Column Options Description (Continued)

Group/Button	Description
Rollup	The buttons in this group let you group the information in the report by the selected column. You can also change the ordering if your report has multiple rolled-up columns. Refer to Displaying rollup levels.
Rollup	Click this button to roll up the report's data by the selected column. Click the button again to remove the rollup.
Move Up/Move Down	If your report's data is rolled up by more than one column, click these buttons to move the selected column up or down one rollup level.
Options	Click this button to select rollup options. The available options are Display Group Counts, Display Rollup Headings, Display Column Headings, and Repeat Column Headings.
Insert Column	Click this button in the Computed group to add a computed column to the report. The types of computed columns available depend on the values in the selected column. You can also add computed columns from the data dictionary. Refer to Computed fields for information about computed columns.
Trend Options	The buttons in this group let you edit trend options for the selected trend column. Refer to Specifying trend value duration.
Perform Forecast	Select this check box to enable forecasting in the trend value column.
Forecast Units	Enter the number of time units to forecast forward. For example, if the trended column groups data by week, trending forward three units displays data trended three weeks in the future.

Table 225: Design Tab Column Options Description (Continued)

Group/Button	Description
% Change	The buttons in this group let you edit comparison percentage and trend percentage column options for the selected comparison percentage or trend percentage column. Refer to Adding comparison percentage columns and Adding trend percentage columns.
Comparison Direction	Click this button and select how the percentage value shown in the comparison or trend percentage column should be derived. The value can be derived from the difference between the value in the original column being compared/trended versus the value in the comparison or trend column. The value can also be derived from the difference between the value in the comparison or trend column versus the value in the original column being compared/trended.
Show Icon	Select this check box to display icons next to the percentage values returned in the column. The icons indicate whether there is a positive change, negative change, or no change.
Icon Colors	Click this button to change the colors used for the icons to indicate a positive change, negative change, or no change.

The groups and buttons available on the tab when editing a text field are described in the following table.

Table 226: Text Field Tab Options Description

Group/Button	Description
Edit	Click this button to open the Edit Text Field window, from which you can edit the selected text field. Refer to To create a text field.
Arrange	The buttons in this group let you position the selected text field on the design surface.
Anchor	Click this button to define an anchor style for the text field. Anchor styles determine how a text field moves in relation to the borders of the report section. Refer to Defining anchor styles.
Bring to Front/Send to Back	Click these buttons to place the selected item on top of or beneath overlapping items.

Table 226: Text Field Tab Options Description (Continued)

Group/Button	Description
Size to Fit	Click this button to automatically shrink or expand the element containing the text field to fit the selected item. **Note:** Manually resizing the selected element disables this option.
Font	The buttons in this group let you change the selected text field's font style, size, and color. You can also select font attributes, such as bold and italic, and change the text's alignment within the text field. In addition, you can add a background color for the text field.
Margin	Click this button to select the width of the margins around the item. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Border	The buttons in this group let you add borders to the text field and change the borders' display options. You can identify which borders you want and choose the borders' color, size, and style.

The groups and buttons available on the Design tab when editing a **data exception** are described in the following table.

Table 227: Design Tab Data Exception Options Description

Group/Button	Description
Edit	Click this button to open the Exception Editor, from which you can edit the selected data exception. Refer to Creating data exceptions.
Display Reference	The drop-down menu in this group lets you select the field you want to highlight to indicate which rows meet the selected data exception.
Arrange	The buttons in this group let you add, remove, and position the selected data exception.
Add	Click this button to add a new data exception. Refer to Creating data exceptions.
Delete	Click this button to remove the selected exception from the report.

Table 227: Design Tab Data Exception Options Description (Continued)

Group/Button	Description
Move Up/Move Down	Click these buttons to move the selected exception up or down in the list of exceptions. Refer to Ordering data exceptions.
Insert Before/ Insert After	Click these buttons to add a new data exception before or after the selected exception. Refer to Ordering data exceptions.
Tabular Display	The options in this group let you configure the tabular display for the selected data exception. Refer to Creating data exceptions.
Show Notifications	Click this button to show the selected exception at the bottom of the report's tabular data.
Show Criteria	Select this check box to display the exception criteria. For example, if the data exception marks opportunities that are still active, the criteria would display *opportunities.status_id = Active.*
% Meeting Criteria	Select this check box to show the percentage of data in the report that meets the specified exception criteria. This information displays at the bottom of the report in the Data Exceptions report section.
% Not Meeting Criteria	Select this check box to show the percentage of data in the report that does not meet the specified exception criteria. This information displays at the bottom of the report in the Data Exceptions report section.
Graphical Display	The options in this group let you configure the graphical display for the selected data exception. Refer to Creating data exceptions.
Show Notifications	Click this button to show the selected exception in charts shown on the same report output level as the data exception.
Show Criteria	Select this check box to display the exception criteria in the chart. For example, if the data exception marks opportunities that are still active, the criteria would display *opportunities.status_id = Active.*
% Meeting Criteria % Not Meeting Criteria	Select these check boxes to display data on the chart showing the percentage of data that meets or that does not meet the specified exception criteria.
Color	Click this button to select a color to use for the indicator on the chart that shows the amount of data meeting the exception criteria.

The groups and buttons available on the Design tab when editing a chart are described in the following table.

Table 228: Design Tab Chart Options Description

Group/Button	Description
Define Data Source	Click this button to open the Chart Wizard where you can select data options for your chart. Refer to Using the Chart Wizard.
Arrange	The buttons in this group let you position the selected chart on the design surface and remove it from the report.
Delete	Click this button to remove the selected chart from the report.
Bring to Front/Send to Back	Click these buttons to place the selected chart on top of or beneath overlapping charts.
Type	Click this button to change the type and subtype of the selected report. If the data options in the new chart type differ from those in the old chart type, the Chart Wizard opens, allowing you to select new data options. Click here for descriptions of the available chart types.
Chart Style	Click this button to select a chart style for the selected chart. Refer to Chart Styles explorer.
Labels	Click in the text fields in this group to type text for the chart's title, category, and value labels.
3D Settings	Click the buttons in this group to specify angle and depth settings for a three-dimensional chart. Refer to Chart Styles explorer. **Note:** The buttons in this group are active only if a three-dimensional chart is selected.
Settings	Click the buttons in this group to modify settings specific to charts that include bars, lines, or gauges. Refer to Chart Styles explorer. **Note:** The buttons in this group are active only if a chart with bar, line, or gauge properties is selected.
Colors	Click the button in this group to select a color scheme for the chart. Refer to Chart Styles explorer.

The buttons available on the Design tab when editing a table from the data set view are described in the following table.

Table 229: Design Tab Table Options Description

Group/Button	Description
Tables	Click this button to open the Data Set window, where you can edit the tables used in the report. Refer to Managing table relationships.
Outer Join	Click these buttons to join the selected table with the parent table using an outer or an inner join. Refer to Types of table joins.
Inner Join	
Join Condition Menu	Select the fields used to link the selected table with the parent table from this drop-down menu.

The groups and buttons available on the Design tab when editing a filter or variable from the data set view are described in the following table.

Table 230: Design Tab Filters and Variables Options Description

Group/Button	Description
Edit	The buttons in this group let you modify filter properties and the logical expression combining filters.
Edit	Click this button to open the Edit Filter window, from which you can edit the filter's properties. Refer to Specifying filters.
Logical Expression	Click this button to open the Edit Logical Expression window, where you can modify the logical expression combining the report filters, level filters, or group filters. The type of filter you select determines which logical expression you can edit. Refer to Defining logical expressions.
Arrange	The buttons in this group let you add, remove, and order filters and variables.
Add	Click this button to open the Add Filter or Add Variable window to add a new filter or variable. Refer to Specifying filters and Creating variables. **Note:** The type of filter you select determines whether you add a report, level, or group filter.

Table 230: Design Tab Filters and Variables Options Description (Continued)

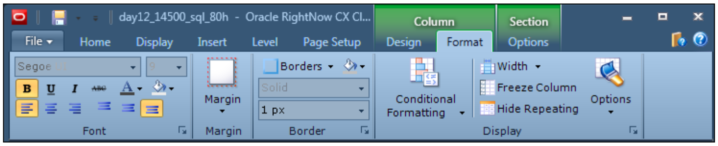
Group/Button	Description
Delete	Click this button to remove the selected item from the report.
Move Up/Move Down	Click these buttons to move the selected run-time selectable filter or variable up or down in the list of filters or variables on the data set view. **Note:** Moving filters and variables can help you organize them for easier management when using the data set view. However, their positions do not change their placement on the Search window or the filters' logical expression.
Insert Before/ Insert After	Click these buttons to open the Add Filter window to add a new filter or variable before or after the selected filter or variable.
Filter/Variable Options	The check boxes in this group let you modify options for the selected filter or variable.
Display in Docked Filters	Select this check box to display the selected variable or run-time selectable filter on the docked filters section of the report. Refer to Docking variables and run-time selectable filters.
Display in Search Criteria	Select this check box to include descriptions of the selected variable or filter in the search criteria description. Refer to Search criteria descriptions.
Run-Time Selectable	Select this check box to make the selected filter available on the Search window when the report is run. Refer to Creating report filters.
Required	Select this check box to make the selected run-time selectable filter required. Staff members must specify values for required filters when they run the report.

Layout tab

The report design center's Layout tab is available when you click a chart. The buttons on this tab let you apply chart style options to individual charts in your report. This allows you to create a custom look for a chart without creating or modifying a chart style. This tab is identical to the Layout tab on the Chart Styles designer. Refer to Chart Styles explorer for information about options available on this tab.

Format tab

The report design center's Format tab is available when you click a column, **data exception**, or chart. This tab provides access to general display options, such as fonts, margins, borders, and width. Some buttons on the tab vary depending on the type of item you select. For example, when working with a column, you can apply **conditional formatting** to flag data in the column that meets certain criteria. Here is the Format tab for a column.



The groups and buttons on the Format tab are described in the following table.

Table 231: Format Tab Description

Group/Button	Description
Font	The buttons in this group let you change the font style, size, and color. You can also select font attributes, such as bold and italic, and change the text's alignment. In addition, you can also add a background color. **Note:** This group does not display when editing a chart.
Margin	Click this button to select the width of the margins around the selected column. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins. **Note:** This button displays when editing a column.
Border	The buttons in this group let you add borders to the column and change the borders' display options. You can identify which borders you want and choose the borders' color, size, and style. **Note:** This group does not display when editing a chart.

Table 231: Format Tab Description (Continued)

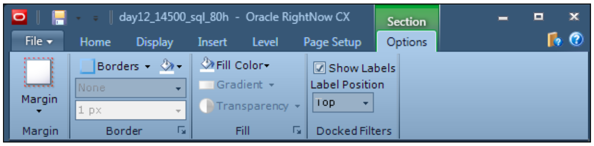
Group/Button	Description
Display	The buttons in this group let you apply conditional formatting to the column, change the column's width, freeze the column, and hide repeating values in the column. You can also select other display options for the column. **Note:** This group displays when editing a column.
Conditional Formatting	Click this button to apply conditional formatting to the column's data. Refer to Editing column format options.
Width	Click this button to select a width for the column. Select Best Fit to automatically set the width based on the amount of space needed to display the column's contents. Best Fit also takes into account the width needed by other columns in the report. Select Percentage to specify a percentage of the total report width for the column.
Freeze Column	Click this button to fix the selected column in place so it does not move when you horizontally scroll the report. This can be helpful if you want to continue to view the first column in the report while scrolling the report to see the columns on the right of the report. **Note:** When you fix a column, all columns to the left of the column are also fixed. You can still scroll the columns to the right of the fixed column.
Hide Repeating	Click this button to hide consecutive repeating values in the column. For example, if the name of a staff member is shown in the column in five consecutive rows, you can hide repeating values to show the name in only the first column. **Note:** You can also hide repeating values from the Column Format window, described in Editing column format options. This window has an option to exclude hidden repeating values from consideration in column calculations and column auto-filter options. When you hide repeating values from the ribbon, they are still included in column calculations and auto-filtering.
Options	Click this button to select display options for the column. Refer to Editing column format options.

Table 231: Format Tab Description (Continued)

Group/Button	Description
Number	The options in this group let you display numeric values as a gauge and select numeric formats. Refer to Editing column format options. **Note:** This group displays when selecting a column containing numeric values.
Date	The options in this group let you select a date format for the column and view the format. Refer to Editing column format options. **Note:** This group displays when selecting a column containing date/time data.
Image	The options in this group let you configure the image used to indicate columns that meet **data exception** criteria. These options are also available when creating data exceptions. Refer to Creating data exceptions. **Note:** This group displays when editing a data exception.
Current Selection	The options in this group let you select the area of the chart you want to edit and reset the style options. **Note:** This group displays when editing a chart.
Area Menu	Select the area of the chart you want to edit from this drop-down menu. You can also select the area by clicking it on the chart on the design surface.
Reset to Match Style	Click this button to reset customized display and formatting of the selected chart area to match the default settings specified in the chart style that is applied to the chart.
Format	The buttons in this group let you select border, background, and font characteristics for the selected chart area. These same options are available when creating chart styles. Refer to Creating and editing chart styles. **Note:** This group displays when editing a chart.

Options tab

The report design center's Options tab is available when you click a report section, column, table, or other item. The tab displays options appropriate for the report item you have selected. The type of item you select is displayed above the Options tab. For example, the following figure shows the tab after selecting a report section. In this example, you could edit the section's margins, borders, fill colors, and layout options from the tab.



The groups and buttons on the Options tab are described in the following table.

Table 232: Options Tab Description

Group/Button	Description
Margin	Click this button to select the width of the margins around the item. The available options are None, Narrow, Medium, Wide, and Custom. Selecting Custom lets you specify the number of pixels for the top, bottom, left, and right margins.
Border	The buttons in this group let you add borders to the selected item and change the borders' display options. You can identify which borders you want and choose the borders' color, size, and style.
Fill	The buttons in this group let you add a background color to the selected item. You can select the background color and add a gradient color to blend into the primary color. You can also choose how intense the colors should be with the Transparency setting.
Layout	The buttons in this group let you define how the content of the selected report section should be arranged and how the height of the section should be managed. Refer to Editing section layout properties. **Note:** This group is not shown when a column is selected.
Manual	Click this button to manually size the report section and manually position text fields and images you add to the section. When a section is configured with manual layout, you control the placement of items on the section and the section's height.

Table 232: Options Tab Description (Continued)

Group/Button	Description
Automatic	Click this button to automatically size the report section and automatically position text fields and images you add to the section. When a section is configured with automatic layout, you do not need to specify the placement of items on the section or the section's height.
Layouts	Click the down arrow on this button to select a layout for the chart section. Refer to Adding charts with chart table layouts. **Note:** This button is shown when a chart is selected on the report.
Auto Height	If Automatic layout is selected, you can click this button to prevent the height of the section from being automatically set.
Table Layout	If Automatic layout is selected, you can click this button to configure the layout of the table that underlies each report section. For example, you can specify that all columns in the table have the same width, giving any images or text fields in those columns the same amount of horizontal space. Refer to To change a report section's table layout options.
Add Text Field	Click this button to add a new text field to the report. **Note:** This button is shown when a text field, image, or report section is selected on the report.
Add Chart	Click this button to add a new chart to the report. **Note:** This button is shown when a chart is selected on the report.
Add Column	Click this button to add a new output column to the report. **Note:** This button is shown when a column is selected on the report.

Design surface

The design surface displays all of the sections you add to your report from the ribbon. Only report sections displayed on the design surface are included in a report when it runs. Once you add a section to the design surface, you can add, edit, and remove content in the section or modify the display of the section itself. For example, you can drag database fields to the data area, insert charts into the Charts section, and edit the report's title in the report header.

When working on the report design center, you can add rulers, lines, and headings to help you identify sections and fields shown on the design surface. These options are accessed from the Show/Hide group on the ribbon's Display tab.

Data dictionary

The data dictionary is shown on the report design center when you use the design or data set views, and lists the standard tables and fields from the database that can be used in custom reports. **Functions**, **variables**, **computed fields**, and tables created for **custom objects** can also be selected from the data dictionary. Any item listed in the data dictionary can be dragged to the Data Area section to add the field as an output column, dragged to Docked Filters to create a filter based off the field, or dragged to the Data Exceptions section to create an **exception** based on the field.

You can view detailed information about the tables and fields shown in the data dictionary and customize the data dictionary to show only the fields and tables you regularly use. You can also reposition the data dictionary if you want a different location for it.

Viewing table and field information

Before you add database fields to a report from the data dictionary, you may need to view information about the field's contents. You can view brief descriptions of tables and fields in the data dictionary by hovering over their names, and you can view more detailed information by right-clicking tables or fields and selecting View Data Definition.

If you want to view the entire data dictionary that describes all the standard tables and fields in the database, you can right-click any table name and select View Full Data Dictionary. The data dictionary opens in a separate window. You can also open the full data dictionary from Configuration > Database > Data Dictionary.

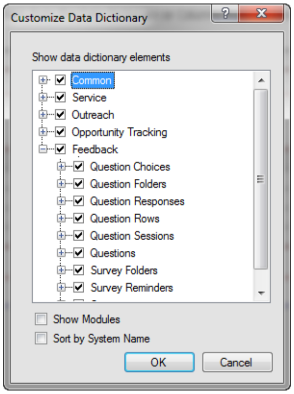
Customizing the data dictionary

The list of available tables and fields in the data dictionary can be customized to hide the tables and fields that you do not use in your reports. This is helpful if you use only certain tables and fields in your reports and want to simplify the data dictionary to make it easier to select the tables and fields you use.

Note Tables and fields created for **custom objects** can be viewed only in the All Tables list in the report design center's data dictionary. This prevents customizing the data dictionary to display only custom object tables. Refer to Custom Objects.

To customize the data dictionary

1 Click Customize at the top of the data dictionary to open the Customize Data Dictionary window.



2 Expand the modules, tables, and fields that you want to see.

3 Clear the check boxes for those tables, fields, or modules, such as Feedback or Sales, that you do not want to see in the data dictionary.

4 To group the database tables by the module they are most frequently used with, select the Show Modules check box.

5 To sort the lists of tables displayed in the data dictionary by their database names instead of the tables' aliases, select the Sort by System Name check box.

6 Click the OK button to save your customizations to the data dictionary.

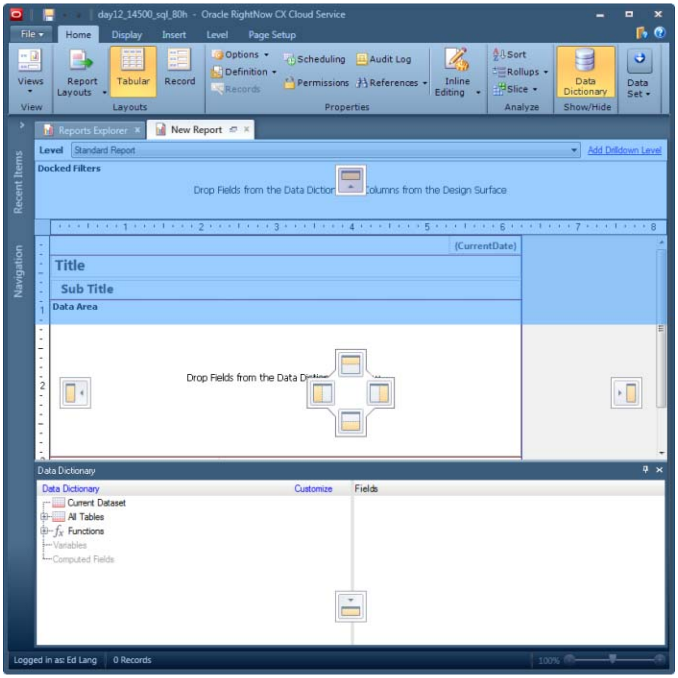
Moving the data dictionary

By default, the data dictionary is located at the bottom of the report design center, but you can reposition it on the content pane.

Note The following procedure is the same as that used to move the report explorer on the dashboard design center. Refer to Dashboards for information about the dashboard design center.

To move the data dictionary

1 Click the data dictionary's title bar and drag it. When you drag the data dictionary, positioning images appear. Hovering over the various images highlights portions of the report design center.



2 Drop the data dictionary once the section where you want it is highlighted.

The design center is updated to show the data dictionary in the new location.

Note Since the location of the data dictionary is stored in your personal settings, it remains where you placed it until you move it again.

Report elements

Every report consists of items added to the report and configured using the ribbon, design surface, and data dictionary. Reports can have one or more output levels that contain report sections, and each section can contain text fields, images, charts, and output columns. The data shown in charts and output columns in each output level is impacted by the filters, variables, and comparison date offsets you add to the report.

Output levels

Each custom report has at least one output level, and each output level contains one or more report sections and can have unique filters, variables, and comparison date offsets. If your report has drill-down levels, a separate output level is added for each drill-down level. Refer to Drilling down in reports and Adding additional output levels.

Important The output level you are currently viewing on the design surface is shown in the Level drop-down menu at the top of the design surface. If your report has multiple output levels, you select the level you want to view from the drop-down menu.

Output columns

The output columns you add to the report levels' data sections determine the information your staff members can see about the records returned in the report. There are different types of output columns, including database fields, **functions**, and **computed fields**. You can apply formatting to the columns in your report and also add calculations to tally data shown in each column. Columns can be added from the Column Definition window or by dragging fields from the data dictionary. Refer to Managing output columns.

Charts

Charts offer a graphical display of the data returned in your report. You can add multiple charts to the charts report section in each output level. Different types of charts are available so you can present the data in different ways, and you can modify the display for each chart, selecting different colors, fonts, scales, and other attributes. Refer to Adding and editing charts.

Text fields and images

You can add text fields and images to your report to enhance the report's appearance and to clarify the report's purpose. Refer to Adding images to reports.

Data exceptions

Data exceptions let you highlight data displayed in charts and output columns that meet certain requirements. Each output level can have multiple exceptions to highlight data for different reasons. For example, in an incidents report, you could display unresolved incidents in red text and overdue incidents in bold text. The exceptions' criteria and percentage of data meeting or not meeting the exceptions can be shown in the report level's charts and exceptions report section. Refer to Creating data exceptions.

Tip If you want to highlight data in a single column, you can apply conditional formatting to the column instead of using data exceptions. Refer to Editing column format options.

Report sections

Report sections store the content you add to the output level, such as docked filters, headers, footers, descriptions, charts, tabular data, and **data exceptions**. Some sections are designed to contain **text fields**, such as the report's title, and others are designed to display non-tabular data, such as charts. The sections you should include in each output level are primarily determined by the report's audience and the output level's purpose. For example, a custom report that only you will use may not need a report header, report footer, or similar report sections that clarify the report's purpose and make it more presentable. However, these report sections are useful if the report will be sent to other staff members. If a section is added to the design surface, but has no content, the section does not display when the report is run. For procedures on adding and editing report sections, refer to Managing report sections.

Note When creating a report, you can select a layout to have the appropriate report sections automatically included in the report. Refer to Applying report layouts.

The sections you can add to your output levels are described in the following table, along with the type of contents each section can contain.

Table 233: Report Sections Description

Report Section	Description
Docked Filters	This section is used to display run-time selectable filters at the top of the report for easy changes to the report's search parameters. Refer to Docking variables and run-time selectable filters. **Note:** This section can be added to or removed from the design surface using the Docked Filters check box on the ribbon's Display tab.
Page Header	This report section is displayed only on printed reports. By default, this section contains the Current Date text field, which is a variable that outputs the date when the report is run. **Note:** This section can be added to or removed from the design surface using the Page Header check box on the ribbon's Page Setup tab.
Report Header	This section contains text fields that display at the top of each page of the report. By default, this section contains the Title and Sub Title text fields. **Note:** This section can be added to or removed from the design surface using the Report Header check box on the ribbon's Display tab.
Output Descriptions	This section contains text that you can modify to provide general information about the report. Output descriptions can display **inline**, as text on a separate tab, or by rolling over the columns in the report. Refer to Output descriptions. **Note:** This section is shown on the design surface by selecting Display Descriptions Inline from the Output Descriptions button on the ribbon's Display tab.
Search Criteria Descriptions	This section contains text explaining the filters that are added to the report. Search criteria descriptions can be displayed inline or as text on a separate tab in the report. Refer to Search criteria descriptions. **Note:** This section is shown on the design surface by selecting Display Search Criteria Inline from the Search Criteria button on the ribbon's Display tab.

Table 233: Report Sections Description (Continued)

Report Section	Description
Charts	This section contains charts that you insert into the report. Charts provide a graphic representation of data and are most useful for quickly comparing groups of data. **Note:** This section can be added to or removed from the design surface using the Charts check box on the ribbon's Display tab.
Data Area	This section contains database fields you add to the report, which outputs tabular data. This report section is used in almost all reports, as it provides text with specific details about specific records or specific numbers summarizing groups of records. **Note:** This section can be removed from the design surface by selecting Do Not Display Data from the Data button on the ribbon's Display tab.
Report Footer	The report footer is similar to the report header, though the text fields in the footer display on the bottom of each page of the report. By default, the report footer contains the Record Count text field. This is a variable which displays the number of records returned on the page. **Note:** This section can be added to or removed from the design surface using the Report Footer check box on the ribbon's Display tab.
Data Exceptions	This section contains information summarizing the data exceptions that are indicated in the data area. Data exceptions are used to highlight specific information in the report that meets certain criteria you define. **Note:** This section can be added to or removed from the design surface using the Exceptions check box on the ribbon's Display tab.
Page Footer	The page footer is similar to the page header section. The text fields added to this section display at the bottom of printed reports. By default, this section contains the page number text field. This is a variable which outputs the current page number and the total number of pages in the report. **Note:** This section can be added to or removed from the design surface using the Page Footer check box on the ribbon's Page Setup tab.

Search parameters

You can add search parameters to your report to define the data shown in the report's columns, charts, and exceptions. Search parameters include filters, variables, and comparison date offsets. These are shown on the report's Search window when staff members run the report, allowing them to modify the data that is returned, or you can hide filters so their values cannot be changed by staff members.

The types of parameters available on the Search window are described in the following table.

Table 234: Search Parameters Description

Parameter	Description
Filters	Filters limit the data returned in your report by selecting a subset of information from the database. Different types of filters are available, and each serves a different purpose.
Report Filters	Report filters limit the data accessible to any of the report's output levels and can be fixed or run-time selectable. Fixed filters cannot be changed when the report is run, but run-time selectable filters can be changed by staff members. Run-time selectable filters can also be required if you want to force staff members to select filter values. Refer to Creating report filters.
Level Filters	Level filters are similar to report filters and can be fixed or run-time selectable. However, unlike report filters, level filters limit the data accessible at individual output levels rather than the entire report. Refer to Creating level filters.
Group Filters	Group filters can be fixed or run-time selectable and are applied to data that is grouped to prevent information about certain groups from being returned. For example, a report that shows the number of unresolved incidents for each staff member could have a group filter to display information only for staff members with more than ten unresolved incidents. Refer to Creating group filters.
Variables	Variables can be used to return different data, or the same data in different formats, in one column. For example, you could create a single report that displays the number of incidents by staff member, group, queue, or status. You select the information you want when you run the report. Refer to Variables.

Table 234: Search Parameters Description (Continued)

Parameter	Description
Comparison Date Offset	Staff members can select comparison date offsets when they run a report with comparison columns. Comparison columns are used to display related information from different time periods. For example, comparison columns can be used to see how many opportunities were created in two different quarters. Refer to Adding comparison columns to reports.

Managing report sections

Report sections are added to the design surface by using a **layout** or by selecting the sections on the ribbon. When a section is displayed on the design surface, you can resize the section and add content such as **text fields**, database fields, and charts. You can also change section colors, margins, and borders using the options on the ribbon, and adjust layout properties for certain sections.

Applying report layouts

You can apply a predefined layout to quickly modify the report's display to make it appropriate for the report's audience. For example, the Grid layout can be applied to operational reports that are used by staff members who work with incidents, contacts, or other types of records. This layout is ideal for such reports since it does not include titles, headers, or other report sections that are not needed when working with records. If your report is to be emailed or printed, you could use the Standard Report layout, which includes titles, headers, and other report sections that help explain the report's context and purpose. The other layouts available are Standard Report with Chart and Chart Report.

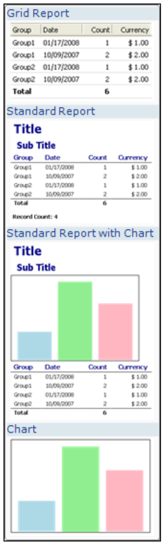
Layouts can be selected on the Getting Started window when creating reports or from the report design center's ribbon. Layouts selected from the Getting Started window are applied to all the output levels added to the report, and layouts selected from the ribbon are applied to individual output levels. Refer to Opening the report design center for more information about adding layouts from the Getting Started window. The following procedure describes how to apply a layout to individual output levels.

To apply a layout to an output level

1 If your report includes more than one output level, select the output level the layout should be applied to from the Level drop-down menu at the top of the design surface.

2 Click the Home tab.

3 Click the Report Layouts button to open the report layouts menu.



4 Click one of the layouts to apply it to the current output level. The predefined layouts are described in the following table.

Table 235: Report Layout Options

Layout	Description
Grid Report	Select this layout for an output level with the Docked Filters, Page Header, Data Area, and Page Footer report sections.
Standard Report	Select this layout for an output level with the Docked Filters, Page Header, Report Header, Data Area, Report Footer, and Page Footer report sections.

Table 235: Report Layout Options (Continued)

Layout	Description
Standard Report with Chart	Select this layout for an output level with the Docked Filters, Page Header, Report Header, Charts, Data Area, and Page Footer report sections.
Chart	Select this layout for an output level with the Page Header, Charts, and Page Footer report sections. This layout is not available on the Getting Started window. **Note:** When a report output level includes a chart but not tabular data, you can add data for the chart directly from the Chart Wizard. Refer to Using the Chart Wizard.

Manually adding sections to the design surface

While layouts automatically add certain report sections to the design surface, you may want to customize the sections displayed once the layout is applied. Manually adding report sections to the design surface is simple using the ribbon. You can add different sections to each output level in a report. For example, the primary output level in your report might include a header and chart, and the other output levels in the report might include only the data area section.

To display and hide report sections on the design surface

1. If your report includes more than one output level, select the level you want from the Level drop-down menu at the top of the design surface.
2. Click the Display tab on the ribbon.
3. Select the check box next to the section you want to display from the tab's Section group. The design surface changes to include the report section you select.
4. To display the Page Header or Page Footer section when the report is printed, click the Page Setup tab and select the Page Header or Page Footer check box on the tab's Print group.
5. To remove a report section from the design surface, clear the section's check box on the ribbon. The design surface changes to remove the report section.

Resizing sections

When a report section is added to the design surface, it is displayed with a default size. You may want to resize a section to allow more room for images or **text fields** or to reduce the size of the section to allow more room for other sections.

To resize report sections

1 Move your cursor over the section border that you want to move on the design surface. The cursor changes to display directional arrows when it is over a border.

2 Drag the border to the position you want.

Editing section styles

Sections that are included in a report can be customized, allowing you to further tailor your report to your audience. The available style options for each section vary. You can change the fill colors and borders of all the sections, and you can also change the margins in the output descriptions, search criteria descriptions, data area, and data exceptions sections.

Section styles can also be changed by applying **report styles** with the Auto Format feature. If the style selected using auto format is applied after you manually modify a section style, your edits to the section style are overwritten. Editing a section style after an auto-format style is applied overwrites the auto-format style. Refer to Changing report displays with styles for more information about the Auto Format feature.

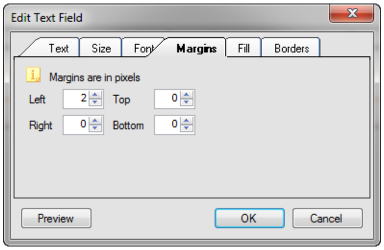
Tip The following procedure describes editing section styles from the Edit Style window. However, you can also adjust style options by selecting the report section and using the buttons on the ribbon's Options tab.

To edit section styles

1 Right-click the section on the design surface that you want to edit and select Edit Style.

Note The Edit Style window for some report sections includes an Options tab that allows you to set layout options. Refer to Editing section layout properties.

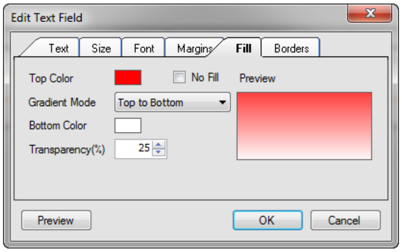
2 Click the Margins tab to modify the amount of space surrounding the contents in the section.



3 Enter the number of pixels between the text and the left, right, top, and bottom margins.

4 If you are editing a style for a report section, such as the report header, enter the number of pixels you want between the section's content in the Spacing field.

5 Click the Fill tab to modify the background fill colors for the selected section. When editing styles for report sections that do not have margins, the Fill tab is the active tab when you edit the style.



6 Enter the following field information.

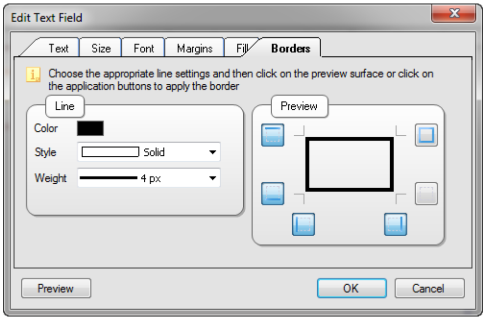
Table 236: Fill Tab Description

Field	Description
Color/Top Color/Left Color	The text description for this option varies depending on the gradient mode you select. Click this box to select a primary color as the background. Refer to Choosing colors.
No Fill	Select this check box to clear any fill colors previously selected. If this box is selected, the other options on the Fill window are disabled except Color. Selecting a color automatically clears the No Fill check box and enables the other options.

Table 236: Fill Tab Description (Continued)

Field	Description
Gradient Mode	Select the positioning of the primary and secondary colors for the background from the Gradient Mode drop-down menu. Using gradient coloring lets you merge two colors. The following options are available. • **None**—Select this option to use only the primary color as the fill color. If you select None, the Gradient Color field is disabled. • **Top to Bottom**—Select this option to merge the colors from the top of the background to the bottom. • **Left to Right**—Select this option to merge the colors from the left of the background to the right.
Gradient Color/Bottom Color/Right Color	The text description for this option varies depending on the gradient mode you select. Click this box to select a secondary color to merge with the primary color. When you do so, the fill colors merge using the method defined in the Gradient Mode menu. Refer to Choosing colors.
Transparency(%)	Select a percentage to define how intense the fill colors are. A setting of 100% is completely transparent, which prevents the fill colors from displaying. A setting of 0% has no transparency, resulting in intense background colors. The selected percentage is immediately reflected in the Preview field, so you can scroll through the transparency percentages to find a value that best suits your needs.
Preview	This area provides a sample of how the fill colors you select will appear on the report background.

7 Click the Borders tab to modify the borders of a report section.



8 Enter the following field information.

Table 237: Borders Tab Description

Field	Description
Color	Click this box to select a color for the border. Refer to Choosing colors.
Style	Click this drop-down menu to select one of the following border styles: Solid, Dashed, Dotted, Inset, Outset, Double, Groove, Ridge, Rounded, or Separator. The separator option lets you add empty space around the report section.
Weight	Click this drop-down menu to select the pixel size of the border. You can choose a number between 1 and 10 pixels.
Preview	This area defines the placement of the borders you define. Select any of the following buttons to place the borders, or click the area in the Preview white space where you want the border.
 Borders	Click a button to add or remove the selected border attributes from the top, bottom, left, or right sides of the component. Alternatively, you can click the appropriate location in the Preview area to add or remove borders.

9 Click the OK button to save the section’s style changes.

Editing section layout properties

Section layout properties determine how the charts, images, and text fields you add are positioned on the section. A manual layout lets you manually position items you add. If the section has an automatic layout, the item is positioned automatically, and the section's height is adjusted to best fit the item. You can also set table layout options to change how the items in the section are sized. By default, report sections have manual layout enabled.

To enable automatic layout of a report section

1. Add the report section you want to the report output level.
2. To add the report header or footer sections, click the Display tab and select the Report Header or Report Footer check box.
3. To add the page header or footer sections, click the Page Setup tab and select the Page Header or Page Footer check box.
4. Click the report section on the design surface to select it.
5. Click the Options tab and click the Automatic button.
6. To prevent the section's height from being automatically adjusted to fit the items you add to the section, click the Auto Height button to disable it.

Tip When Auto Height is disabled, you can manually change the height of the section by dragging the section's horizontal borders up or down, just as you would if the section had a manual layout.

If a report section has an automatic layout, the charts, images, and text fields you add to it are arranged in an invisible table structure, with the items placed in rows and columns. You can adjust the sizing of the rows and columns to arrange the images and text fields exactly like you want them.

To change a report section's table layout options

1. Add images and text fields to the report section.
2. Click the report section on the design surface and then click the Options tab.
3. If the section has a manual layout, click the Automatic button to change to an automatic layout.

4 Click the Table Layout button.

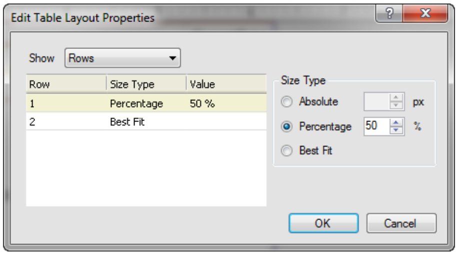
5 To give each column in the section's table the same amount of width, select Size All Columns Equally.

6 To give each row in the section's table the same amount of height, select Size All Rows Equally.

7 To size each column to best show the column's contents, select Auto Size All Columns.

8 To size each row to best show the row's contents, select Auto Size All Rows.

9 To manually configure the table's layout, select More Options.



10 Enter the following field information.

Table 238: Edit Table Layout Properties Window Description

Field	Description
Show	Click this drop-down menu and then select whether you want to configure rows or columns.
Size Type	Specify how the size of the report section is determined in this section.
Absolute	Select this radio button to specify a certain size for the selected row or column in pixels.
Percentage	Select this radio button to specify a certain percentage of the total available space in the section to allocate to the selected row or column.

Table 238: Edit Table Layout Properties Window Description (Continued)

Field	Description
Best Fit	Select this radio button to have the size of the selected row or column automatically adjusted to best fit the row's or column's contents.

11 Click the OK button to save your changes.

Adding images, text fields, and descriptions

You can add optional content to make your reports more presentable, or to explain the purpose or functionality of a report. You can add images and text fields to a report's headers and footers, and you can add output and search criteria descriptions to describe a report's purpose to your staff members.

Adding images to reports

When presenting a report, you may want the report to include images, such as a logo, to enhance the report's appearance or to customize it for your audience. You can add images you have created in the Images explorer to the Page Header, Report Header, Report Footer, and Page Footer sections. Images can act as backgrounds or header images in these sections. You can also use images as links to open URLs that you specify. Refer to Images explorer.

To add an image to a report section

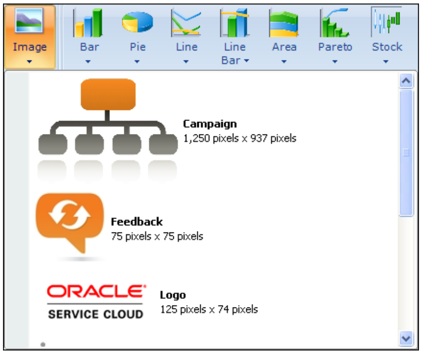
1 Click the Analytics button on the navigation pane.

2 Double-click Reports Explorer.

3 Right-click the report you want to add the image to and select Edit.

4 Click the Insert tab on the report design center's ribbon.

5 Click the Image button to open the list of images available in the Images explorer.



6 Click the image you want to add. The images list closes.

7 Hover over the report section where you want to add the image. The image name displays when the cursor is over a section that can accept an image.

8 Click to place the image in the report section you select.

9 To move an image you have added to a report section, drag the image to the position where you want to place it in the section.

Note To move an image from one report section to another, both sections must have Automatic layout enabled. Refer to Editing section layout properties.

10 To resize an image you have added to a report section, click the image to activate it, and then drag one of the handles displayed on the image's borders. The image is resized as you drag the handle.

11 To define how the image should move in relation to the report section's border, you can specify an anchor style for the image. Refer to Defining anchor styles.

To use an image as a link

You can associate URLs with images to use the images as links. When you view a report and click an image that is configured as a link, the web page the URL points to opens on the workstation's default browser. You can also associate a filter or variable you create to open a different web page depending on the value selected for the filter or variable.

To associate a URL with an image

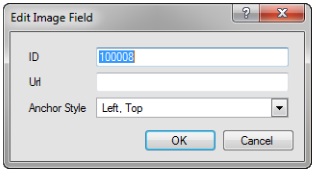
1 Click the Analytics button on the navigation pane.

2 Double-click Reports Explorer.

3 Right-click the report you want to add the image to and select Edit.

4 Add an image to the report. Refer to To add an image to a report section.

5 Right-click the image and select Edit Image Field. The Edit Image Field window opens.



6 Type the URL you want the image to link to in the URL field.

7 Click the OK button to save the change and close the window.

8 Click the Save and Close button on the ribbon to save the change to the report and close the report design center.

When you run the report and click the image, the web page the image links to opens in a web browser.

To use a filter or variable in the URL field

1 Click the Analytics button on the navigation pane.

2 Double-click Reports Explorer.

3 Right-click the report you want to add the image to and select Edit.

4 Add an image to the report. Refer to To add an image to a report section.

5 Create the filter or variable you will use to populate the image's URL field. For example, you could create a variable named *$webpages* with a User Defined List type and add menu values such as `www.google.com` and `www.yahoo.com`. Refer to Specifying filters or Variables.

6 Right-click the image on the report design center and select Edit Image Field to open the Edit Image Field window.

7 Type the name of the filter or variable you created in step 5 in the URL field. Surround the name in braces. For example, if the variable's name is *$webpages*, type {*$webpages*} in the URL field (filter names do not begin with the dollar sign).

8 Click the OK button to save the change and close the window.

9 Click the Save and Close button on the ribbon to save the change to the report.

After you open the report, click the report's Search button and enter the URL you want in the filter or variable you created. When you click the image, the web page you selected opens in your workstation's default browser.

Adding text fields to reports

You can add standard text fields or custom text fields you have created in the Text Fields explorer to the Page Header, Report Header, Report Footer, and Page Footer report sections. You can also insert values from a report's filters and variables into the text fields on the report. Refer to Text Fields explorer for information about creating and editing custom text fields in the Text Fields explorer.

To add a text field to a report

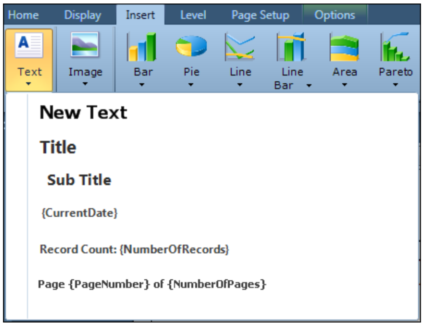
1 Click the Analytics button on the navigation pane.

2 Double-click Reports Explorer.

3 Right-click the report you want to add the text field to and select Edit.

4 Click the Insert tab on the report design center's ribbon.

5 Click the Text Field button to open the list of text fields. The window displays standard text fields, such as "Title," and custom text fields you can add using the Text Fields explorer. The text fields' default fonts, colors, and other attributes are reflected in the display.



6 Click the text field you want to add to the report. The text fields list closes, and the cursor displays with a small version of the text field when you hover over report sections that accept text fields.

7 Click the report section where you want to add the text field. The text field is added to your report.

8 To move the text field, drag it to the position you want.

Note To move a text field from one report section to another, both sections must have Automatic layout enabled. Refer to Editing section layout properties.

9 To resize a text field in a report section, click the text field to activate it and then drag one of the handles displayed on the text field's borders. The text field is resized as you drag the handle.

10 Click the Save and Close button on the ribbon to save the change to the report.

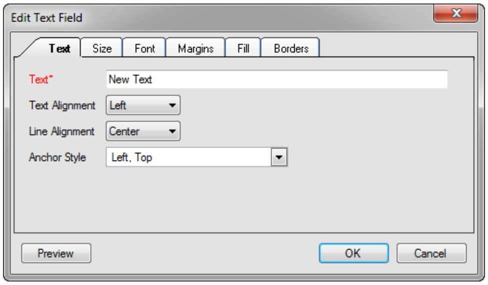
Editing text fields

Once you add a text field to a report section, you can edit it to change the fonts, colors, text, and other attributes. This allows you to have one generic text field that can be added to several reports, which can then be modified for each individual report.

Note Certain standard text fields, such as Record Count or Rows per Page, include values that are dynamically updated when the report is run. While these fields can be edited, you cannot edit their dynamic value placeholders.

To edit a text field in a report

1. Right-click the text field in the report section on the design surface and select Edit Text Field. The Edit Text Field window opens.



Tip If you know the specific options you want, it can be faster to select them from the ribbon. Opening the window gives you an overview of all the available options.

2. Edit the text field on the Edit Text Field window. Refer to Text Fields explorer.

3. Click the OK button on the Edit Text Field window to save your changes.

Populating text fields with filter and variable values

You can insert the values currently selected in a report's filters and variables into text fields on the report. For example, a text field can display the value selected in a filter that filters on the staff member assigned to a group of incidents. The following procedure describes how to use a value from a filter in a text field, but a similar process is used to display the value from a variable.

To display a filter's value in a text field

1. Click the Analytics button on the navigation pane.

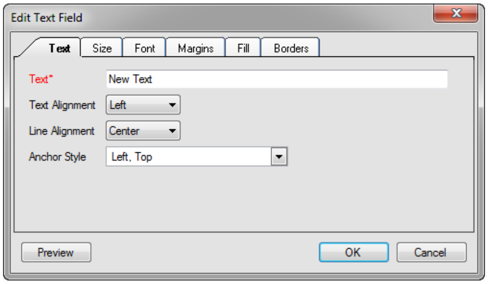
2. Double-click Reports Explorer.

3. Right-click the report you want to add the text field to and select Edit.

4. Create a filter that includes the values you want to display in the text field. For example, you can add a filter to an incidents report that filters on the staff accounts that incidents are assigned to. Refer to Specifying filters.

5 Add a text field to your report. Refer to To add a text field to a report.

6 Right-click the text field and select Edit Text Field. The Edit Text Field window opens.



7 Type the text you want to display in the Text field on the window's Text tab. Type the name of the filter, putting braces around it ({}), where you want the filter value to display in the field.

For example, if the report has a filter named *Assigned* that filters on the staff member assigned to incidents, you can type "Assigned to {Assigned}" in the window's Text field.

8 Click the OK button to save the change and close the window.

9 Click the Save and Close button on the ribbon to save the change to the report.

When the report runs, the text field will display the static text entered in the field along with the filter or variable value that is currently selected. For example, if the filter value is currently Tina Smith, the text field will read "Assigned to Tina Smith."

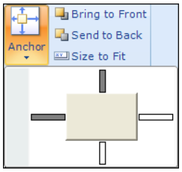
Defining anchor styles

Once you add an image or text field to a report section, you can define how the item should move in relation to the report section's border by specifying an anchor style. By default, when a report section is resized, images and text fields in the section maintain the same distance between the top and left side of the report section. However, you can change the default anchor style so the item instead moves with the bottom or right side of the report section when the section's borders are changed. The following procedures describe how to select anchor styles for text fields and images.

To select an anchor style for a text field

1 Click a text field on the design surface to select it. Refer to Adding text fields to reports.

2 Click the Anchor button on the Text Field tab to view anchor style options. The text field's current anchor style displays. The gray bars identify which sides of the report section the text field is anchored to.



3 To clear an anchor, click the gray bar indicating an active anchor.

4 To add an anchor, click the appropriate clear bar. For example, to anchor a text field to the bottom and right side of the report section, clear the gray bars at the top and left side, and click the clear bars at the bottom and right side of the anchor style selection control.

To select an anchor style for an image

1 Right-click an image on the design surface and select Edit Image Field. Refer to Adding images to reports.

2 Click the Anchor Style drop-down menu to display the anchor style options. The image's current anchor style displays when you click the drop-down menu.

3 To clear an anchor, click the gray bar indicating an active anchor.

4 To add an anchor, click the appropriate clear bar. For example, to anchor an image to the bottom and right side of the report section, clear the gray bars at the top and left side, and click the clear bars at the bottom and right side of the anchor style selection control.

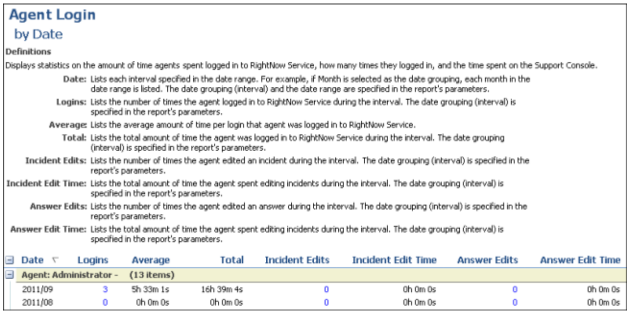
5 Click the OK button to save the change to the anchor style and close the window.

Adding output and search criteria descriptions

You can add descriptions to your reports to provide additional information about the report's output levels, columns, and filters. The information is customizable, so you can add information you think would be helpful to the report's audience. You can add output descriptions and search criteria descriptions.

Output descriptions

The Output Descriptions report section displays text you enter to describe output levels and columns in the output level. The output descriptions you add can be displayed **inline**, on a separate tab in the report, or when rolling over the columns in the report that have definitions defined. You can select the placement of the output descriptions from the ribbon. The following figure shows a report with output descriptions displayed inline.



To add text to output descriptions

1 Open the report you want to edit.

2 To add a description to an output level, select the output level you want from the Level drop-down menu at the top of the design surface.

  a Click the Level tab and click the Edit button to open the Level Settings window.

  b Type the text you want to describe the output level in the Description field.

  c Click the OK button to save the output level's description.

3 To add an output description to a column, click the column on the design surface to select it.

   a Click the Design tab.
   b Click the Edit button to open the Column Definition window.
   c Type the text you want to describe the column in the Description field.
   d Click the OK button to save the column description.

To display output descriptions on reports

1 Click the Display tab.

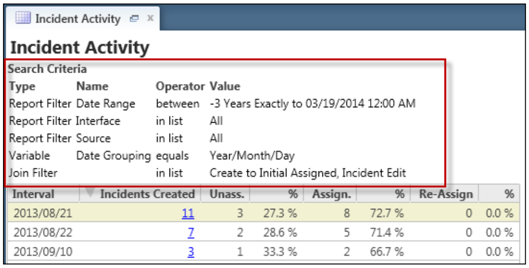
2 Click the Output Descriptions button and select the display option you want from the list. The options are described in the following table.

Table 239: Output Descriptions Display Options

Option	Description
Do Not Display Descriptions	Select this option to remove output descriptions from the report.
Display Descriptions on Column Rollover	Select this option to show the output descriptions when rolling over the report columns that have definitions defined.
Display Descriptions Inline	Select this option to show the output descriptions in the output level, below the page header and report header sections.
Display Descriptions on Separate Tab	Select this option to show the output descriptions on a separate Description tab. The tab is automatically added to the report when you choose this option.

Search criteria descriptions

By default, the Search Criteria Descriptions report section includes information about the filters in your report, along with descriptions of the report's variables, record limits, and comparison date offsets. However, you may not want to display descriptions of all report components, so you can specify which descriptions you want to display. Search criteria descriptions can be displayed **inline** or on a tab in the report. You select where to place the descriptions from the Search Criteria button on the ribbon's Display tab. The following figure shows search criteria descriptions displayed inline.



To display search criteria descriptions on reports

1 Click the Display tab.

2 Click the Search Criteria button and select the display option you want from the list. The options are described in the following table.

Table 240: Search Criteria Descriptions Display Options

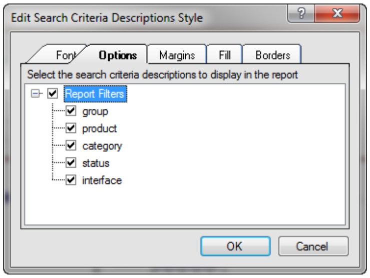
Option	Description
Do Not Display Search Criteria	Select this option to remove search criteria descriptions from the report.
Display Search Criteria Inline	Select this option to show the search criteria descriptions in the output level's output, below the page header and report header text fields.
Display Search Criteria on Separate Tab	Select this option to show the search criteria descriptions on a separate Description tab.

To specify which search criteria descriptions to display

1 Click the Search Criteria Descriptions tab or report section on the design surface.

2 Click the Options tab.

3 Click the Search Criteria button.



4 Clear the check boxes next to the descriptions you do not want to display.

5 Click the OK button to save your changes.

Managing output columns

The output columns you add to a report display tabular information about your data. Output columns are added to the data area of each output level. Once an output column is added to the output level, you can move the column, change the column headers, add notes to the column, change the column's display, and add calculations to tally the values shown in the column. You can also create data exceptions to highlight data returned in the columns. For example, if you want to highlight all incidents in a report that are unresolved and overdue, you could create data exceptions to display these records in bold red text.

Output columns can be fields from the database, **functions**, **variables**, or **computed fields**. All of these items can be added from the ribbon or by dragging the field from the data dictionary to the design surface.

Database fields

Generally, most of the columns added to reports are fields from the database, which contain the data you see throughout Oracle Service Cloud. Fields from tables that are created for **custom objects** are also available (refer to Custom Objects). The database fields that can be used in reports are listed in the report design center's data dictionary.

Tip To view descriptions of the tables and fields in the data dictionary, right-click the table or field and select View Data Definition. A new window opens with a description of the table or field.

Adding suffixes to database fields

When certain database fields are used in report columns, the output is automatically modified to display the data in an easily readable format. For example, the *incidents.assgn_acct_id* field stores the ID numbers of the agents who have incidents assigned to them. Since report users generally prefer to see agent names instead of ID numbers, the names are returned instead of the ID numbers.

However, there are occasions when you may want the report to return the agents' ID numbers instead of their names. In such cases, the suffix *.id* can be added to *incidents.assgn_acct_id*, changing the column's expression to *incidents.assgn_acct_id.id*. This suffix prevents the name associated with the record from being returned automatically and forces the report to instead return the ID number from the database field.

There are several suffixes that can be added to name lookup fields, such as *incidents.assgn_acct_id*, or currency fields, such as *opportunities.mgr_value*. Other types of database fields do not accept suffixes. Each suffix has a different purpose, as described in the following table.

Table 241: Database Field Suffixes

Suffix	Description
Name lookup field suffixes	These suffixes can be used with database fields that trigger an automatic name lookup when used in reports.
.id	This suffix prevents Analytics from performing a name lookup and returns the ID number stored in the field. For example, *answers.assgn_acct_id.id* would return the account ID number of the staff member an answer is assigned to.
.desc	This suffix can be used only with name lookup fields that have a description field. The suffix returns the text from the field's description rather than the field's ID number or name. For example, *incidents.prod_lvl1_id.desc* would return the text description of the parent product an incident is associated with.
.name	This suffix returns the name that is associated with the database field. For example, *answers.map_cat_lvl1_id.name* would return the name of the parent category an answer is associated with. **Note:** This suffix is rarely used since the name lookup is usually performed by default.
Currency field suffixes	These suffixes can be used with database fields that store currency values.

Table 241: Database Field Suffixes (Continued)

Suffix	Description
.curr_id	This suffix returns the type of currency the value was stored in, rather than the currency value. For example, *opportunities.mgr_value.curr_id* could return *USD*, *GBP*, or another currency type.
.rate_id	This suffix returns the exchange rate that is used to calculate the field's currency value when returning the value in a different currency format. For example, *opportunities.rep_value.rate_id* could return 1.45000 or another exchange rate.
.native	This suffix returns the field's value in its original currency instead of the currency determined by staff account or interface settings. For example, *opportunities.mgr_value.native* used in a report on a British interface would return the manager forecast value in USD if that value was originally entered on a U.S. interface.

Variables

You can create variables to use in report output columns, filters, images, text fields, and data exceptions. Using a variable in an output column lets you return different data, or data in different formats, in the same column. For example, you could create a single report that displays the number of incidents by staff member, group, queue, or status. You select which of the four variable values to use in the report from the Search window or from a menu at the top of the report if the variable is docked.

The following figures show a report with a variable used as an output column.
