Developer Overview

This overview is intended for web developers who need to produce custom code for the Oracle RightNow Customer Portal Cloud Service (Customer Portal).

The overview includes:

- A summary of the features of the Customer Portal framework, including its architecture, the APIs provided, and the tools used with the framework.
- A description of the components of the reference implementation of Customer Portal.
- Conceptual information, procedures, and examples for producing custom code, including the models, controllers, and widgets used in Customer Portal.

It is assumed that you have an understanding of web application development, PHP, software design and development methodologies, object-oriented programming, and also a basic understanding of WebDAV, HTML, CSS, and JavaScript.

Note The sample code in this document or accessed through this document is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the License Agreement.

Customer Portal framework overview

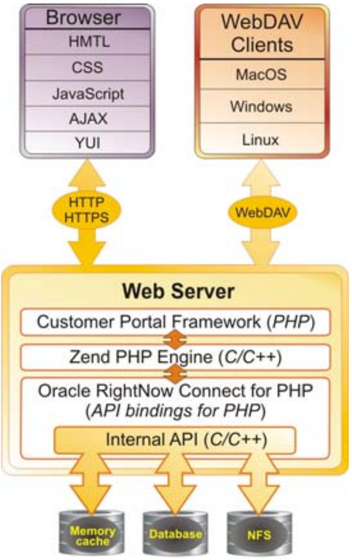
The Customer Portal is a web application framework based on the Model-View-Controller (MVC) design pattern. It includes:

- Client-side scripting framework—The Yahoo! User Interface Library (YUI) for JavaScript coding.
- Server-side libraries and frameworks—The libraries and APIs for PHP coding and for accessing the Oracle Service Cloud knowledge base.

The files that are developed with or associated with the Customer Portal framework include:

- **Pages**—The files containing the HTML code for the customer portal.
- **Templates**—The wrapper of HTML and CSS around the pages and widgets.
- **Assets**—CSS files, images, and themes.
- **Models**—PHP classes that include functions to access the knowledge base.
- **Controller**—PHP classes that handle requests from the client and coordinate access to the knowledge base and the display of data to the user.
- **Widgets**—Collections of files containing HTML, CSS, JavaScript, and PHP code that provides specific functionality. The page files contain the code to call widgets.
- **Hooks**—Custom code that allows you to extend Customer Portal functionality. You specify hooks that execute before and after important Customer Portal events.
- **Helpers**—PHP files containing utility functions.
- **Libraries**—PHP classes containing a set of utility functions.

Refer to The customer folder for information about where these different types of files are located.



The main directory of Customer Portal Framework Version 3.0 is named *cp*, and within this file system there are four sets of Customer Portal files.

- **Development files**—The files you work with when you want to make changes to the customer portal. They cannot be seen by your customers until you stage and promote them. Development files are contained in the */cp/customer* folder.
- **Staging files**—The files located in */cp/generated/staging*. When your development pages are ready, you can stage them. Staged files are compiled and optimized to look and perform as they will on the production site. They are not editable, nor are they visible to your customers.
- **Production files**—The files, located in */cp/generated/production*, that have been promoted from the staging site and are visible to your customers.
- **Reference implementation files**—The default, read-only files that make up the original Customer Portal reference implementation before you make any changes. The original pages are located in */cp/core/framework/views*, the reference assets are located in */cp/core/assets* and the standard widgets are located in */cp/core/widgets*. If you want to revert to an original file, you can copy it from the reference folder and paste it over the file you no longer need.

Refer to The customer folder for more information about the files you'll be working with.

The Customer Portal framework is supported by tools that help in your code development and file administration. See Tools for working with the Customer Portal framework. Additional documentation is provided in API reference documentation and on the Customer Portal Web Administration site, for example, under the Framework and Widgets menus. There is also a Customer Portal Discussion Forum.

API reference documentation

API reference information is not provided in this overview, but the purpose and use of each API is discussed. Material that is available elsewhere includes:

- Oracle RightNow Connect PHP API Cloud Service (Connect PHP API) reference documentation
- Customer Portal API Documentation for PHP and JavaScript
- YUI reference documentation
- PHP language reference documentation

Tools for working with the Customer Portal framework

The support tools and software for working with the framework include:

- **Version control system**—You can use any version control system, for example, Apache Subversion (SVN), Git, or Mercurial, to provide revision control for your custom code.
- **Code editor**—You can use any software development application, for example, Eclipse, Vim, or Adobe Dreamweaver, to develop your custom code.
- **A WebDAV client**—You need a client that supports WebDAV, the standard protocol for managing and updating files on a web server. A WebDAV client allows you to map the *cp* directory to a local drive letter. Although you can use any WebDAV client, the use of Cyberduck is recommended.
- **Customer Portal Web Administration site**—You can use this site to:
  - ▷ View the development, staging, and production areas.
  - ▷ View information about framework versions.
  - ▷ Review widget information and access the widget builder.
  - ▷ Review page tag and business object documentation.
  - ▷ Stage and promote your development pages.
  - ▷ Access further documentation, resources, and developer community pages.
  - ▷ View log files.
- **Widget builder**—You can use this tool, which is available from the Customer Portal Web Administration site, for developing custom widgets rapidly. You can create a completely new widget or extend the functionality of an existing widget.

Refer to System requirements for information about the operating systems and browsers supported by Oracle Service Cloud and the Customer Portal.

Model-View-Controller design pattern

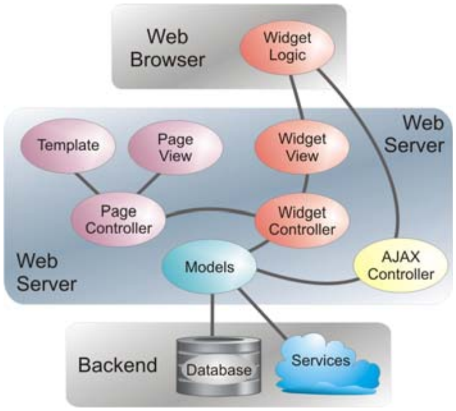
One of the most important aspects of the Customer Portal framework is the Model-View-Controller (MVC) design pattern, which allows the separation of logic and presentation so that each can vary independently. In other words, you can change the logic without affecting the presentation and vice versa.

The *model* represents your data structures. Typically, model classes contain functions that help you create, read, update and delete information in your database (in other words, perform CRUD operations).

The *view* is the information that is presented to a customer, usually a web page, although it can be a page fragment such as a header or a sidebar.

The *controller* is the intermediary between the model, the view, and any other resources needed to process the HTTP request and generate a web page. The controller is responsible for receiving the request, calling the appropriate models, and passing data to the view.

Widgets have their own view and controller files and can also make calls to models. For information, see Widgets and MVC.



Model

Models are PHP classes that are designed to work with information in your Oracle Service Cloud database. Models encapsulate database API calls. For example, the Answer model exposes a get() function that populates an Answer object, and the get() function of the Contact model populates a Contact object. These functions are available to any controllers that load the model.

Instead of making direct SQL calls to the database, custom models can make calls to Oracle RightNow Connect PHP API Cloud Service (Connect PHP API) and use the data objects from that API. Models can also use the Oracle RightNow Object Query Language (ROQL) to access the database.

Standard models call the native abuse detection methods. However, in some circumstances, such as when your custom code makes direct Connect PHP calls, or when it overrides standard controllers, your custom code must contain abuse detection calls. For information, refer to Abuse detection in custom code.

View

In Oracle Service Cloud, views are the page, template, and widget content combined with the CSS, images, and other assets that comprise the presentation part of the architecture.

Views are not called directly, but instead must be loaded by a controller. Any YUI components and other scripts are invoked from within the finalized view. The customer's experience is therefore controlled from the client side by HTML and JavaScript.

Controller

Controllers are PHP classes that are accessible through URI (Uniform Resource Identifier) requests. They call models, libraries, and helpers as required, and pass data to the view for display.

RightNow provides a set of application controllers that handle the URI requests. Examples include:

- *Page*—Processes the page requests and loads the appropriate page or template.
- *AjaxRequest*—Processes all of the AJAX requests made from client-side widget logic files.
- *Fattach*—Processes any file attachment requests.

The *index.php* file is called the front controller. It is distinct from the application controllers like *Page.php* and *AjaxRequest.php* and is specific to the Oracle web hosting environment.

The front controller receives the request URI, inspects the request, and then determines what modifications are necessary for the query string. The following table describes how the front controller handles various requests.

Table 385: How the Front Controller Handles Request URIs

When the request URI contains…	The front controller…
/app	Presets the Page controller and the render function (page/render).
/dav	Presets the WebDAV controller's index function (webdav/index).
/ci	Does not preset any controller or function. Instead, the next two URI segments specify what to load and execute. For example, when the front controller sees ci/ajaxRequest/sendForm, it loads the ajaxRequest controller and executes the sendForm() function. URIs containing /ci are used only for standard controllers.
/cc	Calls a custom controller. The format is: cc/class_name/function_name.

Widgets and MVC

It is useful to illustrate the MVC pattern through the sequence of events when a user interacts with a widget on a customer portal page.

When a user accesses a customer portal page, the view file for each widget presents the HTML for that widget, and the user can then interact with the widget. If the user clicks a button or link on the widget to submit the page to the server, the submission request goes to the controller. If part of the request requires data, the controller calls a model function to interact with the database and return the data to the controller. The controller then passes any updates back to the view, which refreshes the widget and displays it on the web page.

A model is not always necessary, because data from the database is not required for every widget.

Client-side scripting framework

The Customer Portal takes advantage of the YUI library, an open source JavaScript and CSS library for building richly interactive web applications using techniques such as DOM scripting, DHTML, and AJAX. Customer Portal Framework Version 3.2 uses YUI Version 3.13. For information about YUI 3, refer to the YUI Library.

Some YUI features used by Customer Portal include:

- Yahoo Global Object
- DOM collection
- Event utility
- Utilities, for example, the browser history manager
- Widgets such as auto complete and button control

The entire YUI library set is included with the Customer Portal. Although the reference implementation does not use the entire YUI framework, you can use these additional libraries for your customer portal implementation.

The Customer Portal Framework Version 3.2 has extended the YUI libraries for integration with the server-side scripting framework. This integration of technology makes it easy to create reusable functionality without having to handle variables and visit information. Typically, these libraries are associated with the specific widget functionality you are trying to create. Refer to the standard widgets located in */cp/core/widgets* in the reference implementation for examples of this integration.

For information about referencing the available objects and functions, refer to the Customer Portal Framework Version 3.2 JavaScript API reference documentation.

Server-side libraries and frameworks

On the server side, the following APIs and frameworks are available:

- **Connect PHP API**—Provides methods for interaction with the Connect Common Object Model (CCOM), and therefore entities in the database.
- **ROQL**—Allows the use of SQL-like calls to interact with entities in the database.

Connect PHP API

The Connect PHP API provides a set of classes that you can use to interact with the CCOM.

Queries in a custom model can use three built-in static methods.

- **The fetch() method**—Returns a single object based on its ID.
- **The first() method**—Returns the first record that matches a query string.
- **The find() method**—Returns an array of all matches for that string.

Refer to the [Oracle RightNow Connect PHP API Cloud Service Developer Guide.]()

The following is an example of a function in a model that includes calls to the Connect PHP API.

```
<?php

namespace RightNow\Models;

use RightNow\Utils\Url,
...
    RightNow\Connect\v1_2 as Connect,
...
public function get($contactID = null){
    static $contactCache = array();
    if($contactID === null){
        if(Framework::isLoggedIn()){
            $contactID = $this->CI->session-
            >getProfileData('contactID');
            }
        else{
            return $this->getResponseObject(null, null, "No contact
            ID specified and no contact is logged in.");
            }
        }
        if(!Framework::isValidID($contactID)){
```

```
            return $this->getResponseObject(null, null, "Invalid
            Contact ID: $contactID");
        }
        if($cachedContact = $contactCache[$contactID]){
             return $cachedContact;
        }
        try{
            $contact = Connect\Contact::fetch($contactID);
        }
        catch(Connect\ConnectAPIErrorBase $e){
            return $this->getResponseObject(null, null, $e-
            >getMessage());
        }
        $contactCache[$contactID] = $this-
        >getResponseObject($contact);
        return $contactCache[$contactID];
    }
```

Connect Common Object Model

The CCOM defines a set of objects representing entities in the Oracle Service Cloud knowledge base that can be displayed on the Customer Portal. CCOM includes the following types of objects:

- **Primary object**—Primary objects have a unique key and can be created, read, updated, or deleted directly. They can contain either data fields that hold primitive date types or sub-objects. Primary objects represent entities in the knowledge base such as answers, contacts, and incidents.
- **Sub-object**—Sub-objects may also contain primitive data types or other sub-objects. Sub-objects do not have a separate existence and are manipulated through their parent primary object. An example of a sub-object is PersonName, which is contained in the Contact primary object.
- **Array object**—An array object is a collection of sub-objects.

Use dot notation to identify objects in CCOM. For example, to access the first name of a contact, use `Contact.Name.First`.

For more information about CCOM, refer to the Oracle RightNow Connect PHP API Cloud Service Developer Guide.

Oracle RightNow Object Query Language

ROQL provides an alternative to the Connect PHP API for accessing data in the knowledge base. A ROQL query is similar to a SQL query, but there are some exceptions, including:

- FROM is followed by the singular name of a RightNow object.
- You can retrieve either a whole object or individual fields.
- Not all SQL functions are supported.
- Traditional joins and nested queries are not supported.

There are two types of ROQL query. Tabular queries are similar to SQL queries and return rows of comma-separated values.

```
function lookupByLastName($search_string)     {
initConnectAPI();
$query ="SELECT Contact.Name.Last, Contact.Name.First FROM
    Contact WHERE Contact.Name.Last = "'".$search_string."'";
$roql_result=RNCPHP\ROQL::query($query)->next();
$row = $roql_result->next();
$name = $row[firstname]." ".$row[lastname];
echo $name;
}
```

Object queries return complete objects rather than individual field names.

```
function lookupByLastName($search_string)     {
initConnectAPI();
$query ="SELECT Contact FROM Contact WHERE
    Contact.Name.Last =  "'".$search_string."'";
$roql_result=RNCPHP\ROQL::queryObject($query)->next();
while($contact = $roql_result->next())   {
    $rows[] = array("last" => $contact->Name->Last);
    }
     echo $rows;
}
```

See the Oracle RightNow Connect PHP API Cloud Service Developer Guide for more information about ROQL.

Namespacing

Namespaces prevent naming conflicts in Customer Portal reference implementation code and your custom code. The following sections discuss the namespaces that are used in PHP and JavaScript code and the use of widget namespaces in the reference implementation and in custom code.

PHP namespacing

The two core namespaces are `Rightnow` and `Custom`, and they are designated using a backslash (\) notation.

Customer Portal reference implementation code uses the `RightNow\*` namespaces, but custom code that you develop must use `Custom\*` namespaces.

Declaring and referencing namespaces

The following example comes from the */cp/core/framework/Models/Contact.php* file:

```
<?php /* Originating Release: August 2014 */
namespace RightNow\Models;
use RightNow\Utils\Url,
    RightNow\Utils\Framework,
    RightNow\Utils\Config,
    RightNow\Api,
    RightNow\Connect\v1_2 as Connect,
    RightNow\Internal\Sql\Contact as Sql,
    RightNow\Utils\Connect as ConnectUtil,
    RightNow\ActionCapture,
require_once(CORE_FILES . 'compatibility/Internal/Sql/Contact.php');
class Contact extends PrimaryObjectBase {
. . .
}
```

This example includes a namespace declaration (`namespace RightNow\Models`), which shows that the *Contact.php* file belongs in the `RightNow\Models` namespace. So to refer to the class file you must use `RightNow\Models\Contact.` In this case, the reference reflects the folder where the example is located. The example also includes a number of namespace aliases.

The following is an example of using the `Custom` namespace in */cp/customer/development/models/custom/Sample.php*:

```
<?php
namespace Custom\Models;

class Sample extends \RightNow\Models\Base
. . .
}
```

This example contains the namespace declaration, `namespace Custom\Models`, and a reference to the Base class in the `\RightNow\Models` namespace.

The following is an example of how you can use namespace aliases in your custom code.

```
use RightNow\Connect\v1_2 as Connect;
```

This offers a shorthand way of referencing namespaces within a file. In this case, you can use the alias Connect:

```
Connect\NamedIDLabel();
```

instead of the following when referencing the namespace:

```
RightNow\Connect\v1_2\NamedIDLabel();
```

Keep in mind the following requirements for PHP namespaces in your customer portal code.

- When you refer to global objects, such as classes, interfaces, functions, or constants, from within a namespaced class, you must prepend the object with a backslash as shown in the following example.
  ```
  throw new \Exception('Invalid state')
  ```
- When you refer to a namespace in a string, you must escape each backslash as shown in the following example.
  ```
  $controller="\\RightNow\\Controllers\\$library";
  ```
- You must place the `namespace` declaration at the top of the file before any other code, with the exception of a `declare` statement.

Primary namespaces

The table shows the primary PHP namespaces and how they relate to the Customer Portal file system.

Table 386: Primary Customer Portal Namespaces in PHP

Namespace	Directory
RightNow\Controllers	/cp/core/framework/Controllers
RightNow\Hooks	/cp/core/framework/Hooks
RightNow\Libraries	/cp/core/framework/Libraries
RightNow\Libraries\Widget	/cp/core/framework/Libraries/Widget
RightNow\Models	/cp/core/framework/Models
RightNow\Utils	/cp/core/framework/Utils
RightNow\Widgets	/cp/core/widgets/standard

Table 386: Primary Customer Portal Namespaces in PHP (Continued)

Namespace	Directory
Custom\Models	/cp/customer/development/models
Custom\Widgets	/cp/customer/development/widgets/custom

Widget namespaces

Standard widgets are in the `RightNow\Widgets` namespace, as shown in this example from the DateInput widget's *controller.php* file in the */cp/core/widgets/standard/input/DateInput* folder:

```
<?php /* Originating Release: August 2014 */
namespace RightNow\Widgets;
use RightNow\Utils\Config,
    RightNow\Connect\v1_2 as Connect;
class DateInput extends \RightNow\Libraries\Widget\Input {
. . .
}
```

Custom widget namespaces must start with `Custom\Widgets`, and the remaining namespace segments must reflect the name of the parent directory of the directory that contains the widget files.

Library namespaces

Custom libraries are in the `Custom\Libraries` namespace as shown in this example from the library *Sample.php* in */cp/customer/development/libraries*:

```
<?php
namespace Custom\Libraries;
class Sample
{
. . .
}
```

Custom libraries are not required to extend from anything. Also they are not allowed to be in a subfolder, which means the namespace does not have to match the file system path required for custom widgets and models. All libraries appear under the `Custom\Libraries` namespace. Additionally, namespace requirements apply only when using the framework functions (for example, using `$this->load->library('Sample')`) to load and instantiate the library. If you include the library manually using include/require, the Customer Portal cannot enforce the naming conventions.

JavaScript namespacing

All JavaScript code must be namespaced. There must not be any JavaScript variables or functions that are not contained within a namespace.

JavaScript namespaces are designated with dot notation, for example, `RightNow.Widgets` and `Custom.Widgets.` Customer Portal reference implementation code uses the `RightNow.*` namespaces, but the custom code you develop must use `Custom.*` namespaces.

Note If a namespace segment contains only two characters, both need to be capitalized, for example, `Custom.UI`. If the namespace segment has three or more characters, Pascalcase must be used, for example, `Custom.Urnl`).

Widget namespaces

Standard widgets are in the `RightNow.Widgets` namespace, as shown in this example from the DateInput widget's *logic.js* file in */cp/core/widgets/standard/input/DateInput*:

```
/* Originating Release: August 2014 */
RightNow.Widgets.DateInput = RightNow.Field.extend({
    overrides: {
        constructor: function() {
            this.parent();
            . . .
            }
        . . .
});
```

In the example, the namespace for the DateInput widget is declared as `RightNow.Widgets.DateInput`, and it extends from `RightNow.Field.`

Custom widget namespaces must use `Custom.Widgets` as the first two namespace segments, and the remaining segment must reflect the widget's subfolder. For example, a custom widget in */cp/customer/development/widgets/custom/input* must declare its namespace as `Custom.Widgets.input.`

Function namespaces in the reference implementation

There are a number of JavaScript namespaces for common functions in the reference implementation, including:

- **RightNow.Ajax**—Functions that pertain to AJAX requests or AJAX request handling.

- **RightNow.Event**—Event logic for Customer Portal, including the functions used to create, fire, and subscribe to events, as well as process this information.
- **RightNow.Interface**—Message base and configuration base values that are transferred into JavaScript and message base and configuration base functions.
- **RightNow.JSON**—Functions to encode and decode JSON.
- **Rightnow.Profile**—Variables for the logged-in user's profile and functions that deal with the profile.
- **RightNow.Text**—Functions that apply to string manipulation. This also contains an Encoding subclass that is used for encoding and decoding.
- **RightNow.UI**—Functions that interact with the DOM. This class also contains a Dialog subclass that is used for any dialog functions and a Form subclass for form submission functions and variables.
- **RightNow.Url**—Functions that pertain to URL retrieval, addition, modification, deletion, and redirection.
- **RightNow.Widgets**—All widget JavaScript instances on the page and functions to interact with these instances.

Note These are internal namespaces and must not contain custom code. Refer to the Customer Portal Framework Version 3.2 JavaScript API reference documentation.

Access to customer profile data

You can access a customer's profile information using JavaScript so you don't need to gather that information in a widget *controller.php* file and pass it to JavaScript manually. The available profile data includes whether the customer is logged in, email, first name, last name, full name, contact ID, and previously seen email. The following widgets should use RightNow.Profile in the *logic.js file* for their profile data:

- chat/ChatLaunchButton/controller.php
- notifications/AnswerNotificationIcon/controller.php
- social/CommunityPostDisplay/controller.php

The following methods are available:

- RightNow.Profile.isLoggedIn()
- RightNow.Profile.previouslySeeEmail()
- RightNow.Profile.firstName()
- RightNow.Profile.lastName()

- RightNow.Profile.fullName()
- RightNow.Profile.contactID()
- RightNow.Profile.emailAddress()

Note This API does not automatically add the Japanese name suffix label when retrieving the fullName property. If you need this label, you can manually append the call to:

```
RightNow.Interface.getMessage("NAME_SUFFIX_LBL"):
```

Basic development

The elements of your customer portal that can be customized without PHP or JavaScript coding are not included in this developer overview section. Instead they are described in the primary customer portal documentation and include the following basic procedures.

- **Editing themes**—You can edit themes to change the look and feel of your pages. For example, you can edit a *site.css* file to change the background color or the color of controls and text. Refer to Defining themes.
- **Editing templates**—You can edit templates to change page layout, for example, to configure sidebars, headers, and footers, and change labels on navigation tabs. Refer to Configuring the template.
- **Editing pages**—You can control page functionality using page tags and page meta tags. Page tags control specific sections of the page, for example, to let you display or hide page content based on specific conditions. Page meta tags control page options, such as which template is used and whether customers need to be logged in to access the page. Refer to Page tags and Page meta tags.
- **Customizing widgets**—You can add attributes and edit attribute values used in the widget tags on pages to customize the behavior of the widget. The widget's look and feel is customizable by simply editing its presentation CSS file. Refer to Widget attributes.

Refer to the Customer Portal documentation beginning at Getting Started with the Customer Portal for details of procedures and supporting conceptual information.

Site CSS and styling rules

Each theme contains a single *site.css* file that provides all of the basic styling rules for the site. This file contains generic element rules and rules for page layout classes. No widget class or element CSS selectors are contained within this file.

However, any style setting in a theme at the site level can be overridden by code in the template, which affects all pages using that template. On an individual page, style attributes can be added to tags to override settings in the template or theme. In addition, widgets have individual styles settings of their own. Refer to Widget CSS.

Overview of creating customer portal custom code

You can customize the code for your customer portal by:

- Creating custom widgets
- Creating custom models
- Creating custom controllers
- Adding hooks
- Creating custom libraries
- Creating custom helpers
- Loading JavaScript content on every page
- Customizing the error pages

Of course, simple customization may be all that is required. You can perform various types of customization without having to write custom PHP or JavaScript code, as described in Basic development.

Before you start coding, you should plan your customization. Refer to Getting started with custom code for information about why you would perform the various types of code customization.

Samples for various type of customization are provided in Code samples.

When you develop code, be aware that Abuse detection in custom code may be required. There is also a list of Disabled and banned PHP functions.

Getting started with custom code

This section helps you get started with developing custom code. It provides an overview of the types of development you can do, explains why you might need to perform particular customizations, and provides references to further information. It also describes creating a custom model and controller as well as additional customizations you can implement.

Creating a custom widget

To plan for and create a custom widget, follow these steps.

1. Determine whether there is an existing standard or custom widget that provides similar functionality to what you want, and make a note of its name and location. Refer to Standard widgets for information about the available widgets.
   - If there is an existing widget with similar functionality, you can extend it. Work through the Deciding What You Need for a Custom Widget That Extends an Existing Widget table to determine the components and functionality you require for the widget and supporting code.
   - If there is no suitable existing widget, work through the Deciding What You Need for a Brand New Custom Widget table to determine the components and functionality you require for the brand new widget.
2. Use the widget builder to create your widget. This creates all the widget files, which include skeleton code you can use as a starting point for customization. Refer to Widget builder.
3. Add the custom code you require to the files produced by the widget builder. Refer to Creating custom widgets.
4. Customize the CSS file as required.
5. Create any additional code you require to support your custom widget. For example, you may have determined that you need a new custom model, or a custom controller, or that you need to add some hooks.

Note Remember that you can change the look and feel of a widget simply by modifying the CSS, and this may be all the customization you require.

Extending an existing widget

Use the following table to determine which components and functionality you require for a custom widget that extends from another (parent) widget.

Table 387: Deciding What You Need for a Custom Widget That Extends an Existing Widget

Planning decision	Why you might need this...	Refer to...
Does your custom widget need its own controller or can it use the parent's controller?	You might want to override functions from the parent widget, or you might need to add new functions.	Extending a widget's controller
If your widget has its own controller, does it need its own AJAX handling capability, or can it use that of the parent widget?	If you need to get data from the server and the parent widget does not get the data you require, you can add AJAX handling to your custom widget. However, if you have multiple widgets making the same AJAX request, you should use the AJAX handling capabilities of a custom controller.	Making AJAX requests to the server Creating custom controllers
Does your custom widget need its own view or can it use the parent's view?	You might want to customize the view by adding additional HTML within <rn:block> elements in the *view.php* or *view.ejs* file generated by the widget builder.	Extending a widget's view
If the new widget has its own view, will the parent widget's view be extended or overridden? Overriding means that the view *and* JavaScript of the parent are ignored and those of the new widget are used instead.	You might want to override if you need a view and logic file that are very different from those of the parent widget. If the parent widget's view is extended, the new custom widget is automatically updated when nano changes are made to the parent widget. This is the recommended option. If the parent widget's view is overridden, you must manually update the custom widget to take advantage of any future changes to the parent widget.	Overriding the view and JavaScript

Table 387: Deciding What You Need for a Custom Widget That Extends an Existing Widget

Planning decision	Why you might need this…	Refer to…
Do you want to include the parent's CSS in your custom widget's CSS file.	If the parent's CSS is included, your custom widget automatically inherits all of the default styling. However, you can still specify style changes that apply only to the new widget without affecting the parent widget.	Extending a widget's CSS
Does your custom widget need its own JavaScript (*logic.js* file) or can it just use the parent's JavaScript?	You might want to override properties and functions from the parent widget, or you might need to add new functions. You might want to subscribe to form field events, report events, or other events. Remember that if you override the parent's view, the parent's JavaScript is overridden as well.	Extending a widget's logic file Subscribing to form field events Subscribing to report events
Which YUI modules do you need for the widget?	A number of default YUI modules are loaded automatically, but you may want to specify additional modules.	Using YUI components
Do you need JavaScript templates (in a *view.ejs* file)?	You might use EJS templates if you need to dynamically render views. You can customize the view by adding additional code within <rn:block> elements in the new widget's *view.ejs* file.	Using JavaScript templates
Do you need to add additional attributes or remove attributes? What are the names, types, and default values of any additional attributes, and are they required?	Attributes are inherited from the parent widget, but you may want to add additional attributes or remove inherited attributes. You may also want to override attributes to set different default values. For example, some widgets have a *source_id* attribute and you can change its default value to specify a different search source. If your widget is to have its own AJAX handling capability, you need an AJAX endpoint attribute, and this is added by the widget builder.	Widget info files Defining attributes Using additional search sources with report widgets

Table 387: Deciding What You Need for a Custom Widget That Extends an Existing Widget

Planning decision	Why you might need this…	Refer to…
What is the description of the widget?	You add a description of the widget's purpose when you use widget builder and this is added to the *info.yml* file for the widget.	Widget info files Adding a description and URL parameters
Do you need to specify any additional URL parameters?	URL parameters are inherited from the parent widget, but you may want to add additional parameters. You must supply a name, description, and example for each parameter when using the widget builder.	Adding a description and URL parameters
Which JavaScript modules will your widget use?	Your widget may have a dependency for standard or mobile JavaScript libraries.	Specifying framework dependency
Will your custom widget contain other widgets?	Your widget may need to contain other widgets within its view, as long as there is PHP logic within the view. **Note:** You must add this information manually to the *info.yml* file.	Listing the included widgets
Where will you add your custom widget, that is, on which pages and where on the page?	You must determine which pages require the new widget, and where exactly the widget is added on the page. There may be constraints on where you can add the widget. For example, a widget that extends RightNow.Field must be placed inside an HTML <form> element on the page that includes the widget.	
Do you need to develop a new custom model?	You might need to create a custom model if you require data from the server that you cannot obtain from existing model function calls. This may be necessary, for example, if you are adding new custom objects. Consider whether adding a hook to an existing custom model would be sufficient for your needs.	Creating custom models Creating a custom model

Table 387: Deciding What You Need for a Custom Widget That Extends an Existing Widget

Planning decision	Why you might need this…	Refer to…
Do you need to add any hooks?	You can use hooks, for example, to modify data, perform custom validation, and return customized error messages to display to the user.	Adding hooks
Do you need to develop a new custom controller?	You might need to create a custom controller if you have multiple widgets making the same AJAX request. You might also need a custom controller if you are creating a new custom model.	Creating custom controllers Creating a custom controller

Creating a brand new widget

Use the following table to determine which components and functionality you require for a new custom widget that does not extend from another widget.

Note You need at least one of the controller, view, and logic components in a widget.

Table 388: Deciding What You Need for a Brand New Custom Widget

Planning decision	Why you might need this…	Refer to…
Does your custom widget need a controller?	You will need a controller: • If you need to get data from the database and pass it back to the view. • If you want the widget to do its own AJAX handling, as the controller contains the AJAX endpoint.	Widgets and MVC
If your new widget has a controller, does it need its own AJAX handling capability?	You might need AJAX handling if you want to customize date sent in the request or received in the response from the server.	Making AJAX requests to the server

Table 388: Deciding What You Need for a Brand New Custom Widget (Continued)

Planning decision	**Why you might need this…**	**Refer to…**
Does your custom widget need a view?	You will usually require a view, as the view provides the HTML for the widget and displays content including data from the server. In some cases, however, widgets can display all their content within a dialog that does not appear when the widget is loaded. In this case, the view is dynamically added purely through JavaScript.	Widgets and MVC
Does your custom widget need JavaScript (*logic.js* file)?	You will need JavaScript if: • You need to include display logic. • You need to subscribe to and fire events, for example, form field events and report events. • Your widget is doing its own AJAX handling, as AJAX requests are made from the JavaScript.	Widgets and MVC Subscribing to form field events Subscribing to report events Making AJAX requests to the server
Which YUI modules do you need for the widget?	A number of default YUI modules are loaded automatically, but you may want to specify additional modules.	Using YUI components
Do you need JavaScript templates (in a *view.ejs* file)?	You might use EJS templates if you need to dynamically render views.	Using JavaScript templates
Do you need a base CSS file for the widget.	You need a base CSS file if you require CSS rules to structure the widget or so that it functions correctly. A base CSS file and presentation CSS file are created automatically when you use the widget builder, but neither of these files are required.	Base CSS
Do you need a presentation CSS file for the widget?	You need a presentation CSS file if you want to add specific styling rules for the widget that are not covered within the site CSS file.	Site CSS and styling rules Presentation CSS

Table 388: Deciding What You Need for a Brand New Custom Widget (Continued)

Planning decision	**Why you might need this…**	**Refer to…**
Which attributes do you need to specify for your widget? What are the names, types, and default values, and are they required?	If your widget is to have its own AJAX handling capability, you need an AJAX endpoint attribute, and this is added by the widget builder.	Widget info files Defining attributes
What is the description of the widget?	You add a description of the widget's purpose when you use widget builder. This description is added to the *info.yml* file for the widget.	Widget info files Adding a description and URL parameters
Do you need to specify any URL parameters?	Your new widget may require URL parameters. If so, you must supply a name, description, and example for each parameter when using the widget builder.	Adding a description and URL parameters
Which JavaScript modules will your widget use?	Your widget may have a dependency for standard or mobile JavaScript libraries, or it may have no JavaScript requirements.	Specifying framework dependency
Will your custom widget contain other widgets?	Your widget may need to contain other widgets within its view, as long as there is PHP logic within the view. **Note:** You must add this information manually to the *info.yml* file.	Listing the included widgets
Where will you add your custom widget, that is, on which pages and where on the page?	You must determine which pages require the widget, and where exactly the widget is added on the page. There may be constraints on where you can add the widget. For example, a widget that extends RightNow.Field must be placed inside an HTML <form> element on the page that contains the widget.	

Table 388: Deciding What You Need for a Brand New Custom Widget (Continued)

Planning decision	Why you might need this…	Refer to…
Do you need to develop a new custom model?	You might need to create a custom model if you require data from the server that you cannot obtain from existing model function calls. This may be necessary, for example, if you are adding new custom objects. Consider whether adding a hook to an existing custom model would be sufficient for your needs.	Creating custom models Creating a custom model
Do you need to add any hooks?	You can use hooks, for example, to modify data, perform custom validation, and return customized error messages to display to the user.	Adding hooks
Do you need to develop a new custom controller?	You might need a custom controller if you have multiple widgets making the same AJAX request. You might also need a custom controller if you are creating a new custom model.	Creating custom controllers Creating a custom controller

Creating a custom model

You can customize a standard model's functionality by creating a custom model that extends from a standard model. Refer to Extending from a standard model.

Customizing a model can be useful for modifying the behavior of all the widgets that make calls to that particular model.

You may find that adding a hook is sufficient for your customization purposes. Hooks provide custom code associated with particular events that allow you to extend Customer Portal functionality by calling a function in a custom model. You can use hooks, for example, to modify data, perform custom validation, and return customized error messages to display to the user. Refer to Adding hooks.

You might create a brand new custom model if you need to access custom data, for example, a custom object or data that is not kept in the knowledge base. In this case, the custom model extends directly from the Base model. Refer to Extending from the Base model.

Creating a custom controller

You can create custom controllers that extend from the \RightNow\Controllers\Base class. You cannot extend from any other controller class.

Custom controllers are mostly required to create a new AJAX endpoint, either to pre-process data before it goes to a standard model, or to allow the sending of the data to a custom model.

Performing other customizations

In addition to creating custom widgets, custom models, and custom controllers, there are some other types of customization available for the Customer Portal:

- **Custom libraries**—If you use the same custom code in multiple places, you may want to avoid duplication of the code in a number of models or controllers and therefore use custom libraries to organize the code. Refer to Creating custom libraries.
- **Custom helpers**—Although it is unlikely that you will use custom helpers, you can add them to the folder */cp/customer/development/helpers*. Refer to Creating custom helpers.
- **The autoload.js file**—You can put common functions and event declarations in this file so they get loaded on every page. Refer to Loading JavaScript content on every page.
- **Error pages**—You can customize error pages that are displayed when your site is undergoing an upgrade. Refer to Customizing the error pages.

Abuse detection in custom code

The code in your custom models or custom controllers may be susceptible to abuse, such as SQL injections and other attacks under certain circumstances. Standard models and standard controllers call the native abuse detection methods, so if you use standard controllers with standard models, you do not need to customize your code with abuse detection calls. However, if your custom code performs any direct API calls for database updates or back-end actions, for example, to create or update incidents or contacts, log in a user, or perform answer retrieval, it must contain abuse detection code. Customer portal code generally calls check() in most places, including from controllers. However, custom models should call the \RightNow\Libraries\AbuseDetection::isAbuse() function instead of check() to prevent the model from exiting with JavaScript code for invoking a CAPTCHA. The isAbuse() function returns a ResponseObject error that can be handled appropriately.

In models, use isAbuse() to prevent the model call from exiting with JavaScript code. From other sources, including controllers, use check() to ensure that the CAPTCHA is invoked. If your custom models are being called only from custom controllers, the check() needs to be called once in the request, so it can reside only in the controller.

```
if (AbuseDetection::isAbuse($formToken)) {
    return false;
}

OR

if (!AbuseDetection::isAbuse($formToken)) {
    // Code to create an incident
}
```

If abuse is detected, a CAPTCHA screen is displayed for the user to fill out. Failing to call the check() function can result in Connect PHP calls throwing an exception.

Security configuration is an important part of your Oracle Service Cloud application and we realize that your organization may have unique security needs. For an in-depth discussion about security practices in Oracle Service Cloud and how to protect your data, see Security Practices.

Simulating abuse situations

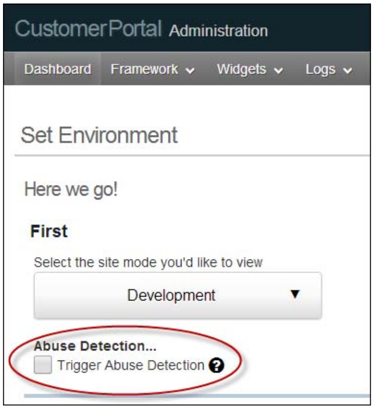
The Customer Portal uses web form security on the FormSubmit widget to automatically require human validation through the use of a CAPTCHA when abuse is suspected, for example, when a standard action is performed repeatedly in a short amount of time, such as when a spammer automatically submits repeated incidents. See Web form security. If your custom code performs database calls, you must call the \RightNow\Libraries\AbuseDetection::isAbuse( ) function to detect abuse.

An abuse scenario is hard to create deliberately for testing purposes, so the Customer Portal includes a cookie that makes your site behave as if it is under abuse when the cookie is set. It works only in development mode for testing purposes, so it does not affect customers on your production site.

To set the abuse detection cookie from the Customer Portal Administration site

1. Go to your Customer Portal Administration site at https://<your_site>/ci/admin.
2. Click the Set Environment shortcut.

3 Select the Trigger Abuse Detection check box.

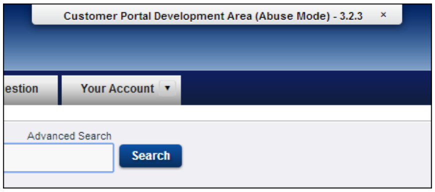


To set the abuse detection cookie from the development header

1 On your development site, click the header to display the main headings.

2 Click Links and Resources to expand the list of options.

3 Click Toggle Abuse Detection. The header indicates that your development site is now in abuse mode.



4 To turn off abuse detection, click the development header, expand Links and Resources, and click Toggle Abuse Detection again.

Other security features

In addition to the abuse detection cookie, the following security enhancements are included in Customer Portal Framework Version 3.2.

- **PTA encryption**—The encryption scheme for pass-through authentication supports the use of a salt and IV (initialization vector), which allow more secure encryption of PTA strings. Two configuration settings let you specify the salt or IV values to use during decryption: PTA_ENCRYPTION_SALT and PTA_ENCRYPTION_IV.
- **File attachment whitelisting**—The Customer Portal hooks *pre_attachment_upload* and *pre_attachment_download* let you indicate the mime types you want to support and allowing you to prevent automatic execution of certain types of downloaded files.
- **HTTP Strict Transport Security (HSTS) support**—If your customer portal uses SSL only (that is, if SEC_END_USER_HTTPS is enabled), your customers will always access the site using HTTPS even if they type `http` in the browser address bar. This security feature is supported in Google Chrome, Mozilla Firefox 4, and the NoScript Firefox extension.

Disabled and banned PHP functions

You cannot use the following functions because they are disabled for custom code in the Customer Portal framework. If you include calls to these functions in custom code, fatal errors are generated:

- chgrp()
- chmod()
- chown()

- dl()
- exec()
- ini_set()
- lchgrp()
- lchown()
- link()
- passthru()
- proc_open()
- shell_exec()
- symlink()
- system()
- yaml_emit()
- yaml_emit_file()
- yaml_parse()
- yaml_parse_file()
- yaml_parse_url()

The following functions are not disabled, but you must not use them in custom code:

- **htmlenties()**—Do not use this function because it is not UTF-8 safe. Use the htmlspecialchars() function instead.
- **delete()**—Do not use this function because it is deprecated. Use the unlink() or unset() functions instead.
- **Any of the** alias functions described within the PHP documentation. Always use the master function because use of alias functions is discouraged.

Creating custom widgets

You can create custom widgets either by extending an existing standard or custom widget, or by writing a new widget.

You can use the widget builder to create the files you require for a new or extending widget, and then add code as required to complete your custom widgets. Refer to Widget builder.

A custom widget can contain the files described in the following table:

Table 389: Widget Files

File	Purpose
info.yml	Provides information about a widget, its attributes, and its dependencies. Refer to Widget info files.
controller.php	Contains code to coordinate the widget, including calls to models to access the database and code to pass data to the view. A custom widget can have its own controller or simply use the controller of its parent widget. A custom widget controller can include its own AJAX request handling capability or inherit the capability from its parent widget. Refer to Extending a widget's controller.
view.php	Contains the HTML required to display the widget. A custom widget can have its own view, or simply use the view of its parent widget. Refer to Extending a widget's view.
view.ejs	Contains JavaScript templates used by the widget to render dynamic views. Refer to Using JavaScript templates.
logic.js	Contains display logic, event-handling, and other logic. A custom widget can have its own logic file, or simply use the logic file of its parent widget. A custom widget logic file can override properties and functions of its parent widget. Refer to Extending a widget's logic file.
base.css	Contains base CSS to structure the widget. Refer to Extending a widget's CSS.
WidgetName.css	Contains presentation CSS, which controls the appearance of the widget. Refer to Extending a widget's CSS.
preview/ preview.png	Displays an example of what the widget will look like when you add it to a page.

While a new custom widget is not required to have its own controller, view, and logic components, your custom widgets will need at least one of these components.

Widget info files

Every widget must have an *info.yml* file, written in the YAML format, in its directory. This file specifies all of the widget's important details, for example, its version, its attributes, and other widgets that it extends.

When you use the widget builder to create a new widget, an *info.yml* file for the new widget is automatically created. You may need to edit this file as you make further customizations to the widget.

The *info.yml* file has the following functionality. Required entries are identified.

Defining the version

The `version:` entry in the *info.yml* file is required and contains a string consisting of the major and minor version number of the widget. For example:

```
version: "1.0"
```

Refer to Widget version management.

Specifying framework dependency

The `requires:` section in the *info.yml* file lists the Customer Portal framework and technology dependencies for the widget:

- **framework**—The Customer Portal framework versions applicable for the widget, given as major and minor version numbers. Standard widgets have a nano version, but that level is not required for custom widgets. For information about versioning, refer to Framework versioning and Widget version management.

Note The framework information is applicable only for standard widgets. The *info.yml* file for custom widgets do not specify a framework dependency unless you add it manually.

- **jsModule**—The JavaScript modules that the widget uses. You are required to select an option for this section. Valid options include:
  - ▷ **standard**—The widget uses the default set of YUI and Oracle Service Cloud libraries.
  - ▷ **mobile**—The widget uses the default set of YUI and Oracle Service Cloud libraries that are optimized for usage on a mobile device.
  - ▷ **none**—The widget relies on none of the default YUI and Oracle Service Cloud libraries.
- **yui**—The YUI modules that the widget uses. By default, a number of modules are included on every page and do not need to be specified.
  - ▷ anim-base
  - ▷ anim-easing
  - ▷ escape

- ▷ event-base
- ▷ history
- ▷ node-core
- ▷ node-event-delegate
- ▷ node-screen
- ▷ node-style

The following example shows a `requires:` section.

```
requires:
    framework: "3.0"
    jsModule: [standard, mobile]
    yui: [panel, autocomplete, autocomplete-highlighters]
```

You can also list the YUI requirements for a particular jsModule entry.

```
    yui:
        standard: [overlay]
```

Refer to Using YUI components.

Defining attributes

The `attributes:` section in the *info.yml* file lists attributes for the widget. Attributes inherited from a parent widget are included in the *info.yml* file only if they have been modified.

- **name**—The name of the attribute, which is required.
- **description**—A description of the attribute.
- **type**—The data type of the attribute. The following options are available:
  - ▷ string—Alphanumeric string.
  - ▷ boolean—True or false option.
  - ▷ int—Integer value.
  - ▷ option—List of menu options.
  - ▷ ajax—Path to a controller endpoint (for example, */cc/myCustomController/action*)
  - ▷ filepath—Path to an asset.
- **default**—The default value for the attribute, if you don't specify a value for the widget in page code. The default values for each data type are:
  - ▷ string—An empty string " ".
  - ▷ boolean—False.
  - ▷ int—Null.

  - ▷ option—After you enter the menu options, you can select one of the options as the default value, or you can leave it null.
  - ▷ ajax—Null.
  - ▷ filepath—Null.
- **required**—If selected, the attribute must have a non-null value when the widget is used on a page.
- **options**—A list of option names. Applies only to attributes with the option data type.
- **min**—The minimum value. Applies only for attributes with the integer data type.
- **max**—The maximum value. Applies only for attributes with the integer data type.

The following example shows an `attributes:` section.

```
attributes:
    label_heading:
        name: Heading label
        description: Label for the heading
        type: string
        default: Welcome back!
    display_option:
        name: Display option
        description: How to display the widget
        options: [subtle, bold, obnoxious]
        default: subtle
```

Attributes can be accessed anywhere in the *controller.php* and *view.php* files as:

```
$this->data['attrs']['attr_name']
```

or in the *logic.js* file as:

```
this.data.attrs.attr_name
```

In each case, *attr_name* is the name of the attribute as specified in the *info.yml* file.

Identifying the parent widget

The `extends:` section in the *info.yml* file specifies the parent widget of the custom widget.

- **widget**—The directory path of a widget to extend. Must begin with `standard/` or `custom/`.
- **components**—The list of widget components to extend. Options include the following:
  - ▷ **php**—The widget controller.
  - ▷ **view**—The widget view file.

  - ▷ **js**—The widget logic file.
  - ▷ **css**—The widget CSS file.
- **overrideViewAndLogic**—The value `true` or `false`. Specify `true` to completely override the specified widget's own view and JavaScript. The js and view components must not be specified in this case.

The following example shows an `extends:` section.

```
extends:
    widget: "standard/utils/SocialBookmarkLink"
    components: [php, css]
    overrideViewAndLogic: true
```

For more information, refer to:

- [Extending a widget's view]
- [Extending a widget's controller]
- [Extending a widget's logic file]
- [Extending a widget's CSS]

Adding a description and URL parameters

The `info:` section in the *info.yml* file contains an associative array containing information about the widget:

- **description**—An explanation of the widget's purpose.
- **urlParameters**—An associative array consisting of URL parameter keys that the widget reads from; each key is the name of the URL parameter.
  - ▷ **name**—The human-readable name of the parameter.
  - ▷ **description**—A description of the parameter's purpose.
  - ▷ **example**—An example of the parameter's key and value.

The following example shows an `info:` section.

```
info:
    description: This widget provides a Contact Us form for users to
    submit complaints and feature requests.
    urlParameters:
        a_id:
            name: Answer ID
            description: ID of the answer to display
            example: a_id/123
```

Listing the included widgets

The `contains:` section in the *info.yml* file is an optional section used when the widget contains one or more other widgets within its view.

- **widget**—The relative path to the contained widget.
- **versions**—The versions of the contained widget that are compatible with the containing widget. If more than one version is specified, the value must be a comma-separated list. Specifying versions is optional.

The following example shows a `contains:` section.

```
contains:
    - widget: standard/input/SelectionInput
        versions: ["1.0"]
    - widget: standard/input/DateInput
        versions: ["1.0"]
    - widget: standard/input/TextInput
        versions: ["1.0", "1.1"]
```

You must add this section manually because the widget builder does not generate it. The view must contain PHP logic in order for a widget to contain other widgets.

Widget CSS

There are two types of cascading style sheet (CSS) files for widgets:

- A base CSS file, which controls the widget's functionality
- A presentation CSS file, which controls the appearance of a widget

These files allow you to control the appearance of one widget without impacting the appearance of any other widgets.

All widget styling must exist in one of the CSS files because widget code cannot contain any inline CSS rules.

Best practices for widget CSS files include using as few classes as possible, using the top-level widget CSS class attribute to style elements within the widget, and creating styling rules only if a site CSS rule must be overridden.

Base CSS

If a widget requires CSS rules to function correctly, it must have a *base.css* file located in the widget folder along with the *view.php*, *controller. php* and *logic.js files*.

All of the CSS rules in the *base.css* file should start with the class name in the top-level `<div>` element in the view.

The *base.css* file should contain rules that structure the widget or make it function correctly, with very few or no styling rules in the file. The file should not include generic functionality rules. This makes it easier and more manageable for multiple developers to edit the presentation CSS and keep *base.css* changes to a minimum.

If no CSS is necessary to ensure that a widget works, the *base.css* file can be omitted.

Presentation CSS

If a widget requires specific styling rules that are not included in the site CSS file, it uses a presentation CSS file to define these rules. The file must be located in the */cp/customer/assets/themes/standard/widgetCss* folder, and must have the same name as the widget (for example, *SampleReport.css*).

Similar to the widget's base CSS, all rules in the presentation CSS file should start with the class name in the top-level `<div>` element in the view.

```
<div id="rn_<?=$this->instanceID;?>" class="rn_DisplayChartReport">
    <div class="rn_ChartHeaderText">
```

So, in the presentation CSS file:

```
.rn_DisplayChartReport .rn_ChartHeaderText {
    font-weight: bold;
}
```

The file should contain no generic styling rules, so that widget CSS rules are not likely to impact styling of elements outside of the widget.

Extending existing widgets

A widget can extend an existing standard or custom widget. A widget can have only one parent widget.

Instead of copying standard or custom widget code, which is a tedious and error-prone process, use the widget builder to create a custom widget that extends from another widget. You specify the components (controller, view, JavaScript, and CSS) to extend, and you can also specify the following:

- For the controller, you can specify whether it does any AJAX handling.
- For the view, you can specify whether the parent widget's view is to be extended or overridden, and whether the parent widget's CSS is to be included.
- For the JavaScript, you can specify the YUI modules you want to have loaded on any page that contains the widget and then passed to the widget's constructor.

- For the JavaScript, you can specify whether you require a template, which allows you to dynamically render content within the parent's JavaScript view file.
- You can specify any new attributes for the widget and change the values of any attributes inherited from the parent widget.
- You can specify additional information including a description, the URL parameters for the widget, and the JavaScript compatibility information.

The widget builder generates custom code with defaults and placeholders that you can then tailor to your requirements.

Note Remember that you may be able to modify standard widgets by simply editing their attributes in page code.

The following procedure summarizes how to extend a widget using the widget builder. Refer to Widget builder for more details.

To extend an existing widget

1. In the widget builder, select **Extend the functionality of an existing widget**.
2. Specify the name of the new widget and the widget it is extending from.
3. Specify the widget components to be used.
4. If the widget has its own controller, specify whether it will do any AJAX handling.
5. If the widget has its own view, specify whether the parent widget's view is to be extended or overridden and whether the parent widget's CSS is to be included.
6. If the widget has its own JavaScript, specify the YUI modules to be used with the widget.
7. If the widget has its own JavaScript, specify whether templates are required.
8. Add any new attributes that are required in addition to the attributes inherited from the parent widget.
9. Add additional details as required, including a description of the widget, any URL parameters, and JavaScript framework compatibility. If the parent widget of your new widget contains URL parameters, they are listed as inherited parameters for the new widget.

Files are generated for the new custom widget. You can then add code to the files as required.

The following sections discuss how you can extend each of the components in a custom widget.

- Extending a widget's view
- Extending a widget's controller
- Extending a widget's logic file
- Extending a widget's CSS

Customizing the YAML file

When you extend a widget using the widget builder, an *info.yml* file is created. You then need to customize the file according to your requirements. For example, you might want to edit the `attributes:` section to remove or modify attribute values, or you might need to add a `contains:` section. Refer to Widget info files.

Extending a widget's view

A widget's view file may contain `<rn:block>` elements as shown in this example.

```
<rn:block id="postFeedbackInput"/>
```

Every `<rn:block>` element within a widget has a unique ID that describes its context. These blocks are customization hook points for extending the widget.

When a widget extends another widget, the parent widget's *view.php* file is used for rendering. If the new widget has a *view.php* file of its own, then the blocks that are defined in the new view are added to the parent widget's view.

For example if the parent *view.php* file contains:

```
<rn:block id="main"/>
<div><?= $this->data['js']['moreresults'] ?></div>
```

and the extending view contains:

```
<rn:block id="ParentWidgetName-main">
    <span><?= $this->data['js']['results'] ?></span>
</rn:block>
```

the resulting view is:

```
<span><?= $this->data['js']['results'] ?></span>
<div><?= $this->data['js']['moreresults'] ?></div>
```

If the extending widget does not have a *view.php* file, then the parent widget's *view.php* file is used.

In a similar way, blocks of content within the parent JavaScript view file (*view.ejs*) can be modified.

Refer to the following sections for code samples of extending a widget's view.

- Editing the view.php and view.ejs files

- The ExtendedAnswerFeedback sample widget

Overriding the view and JavaScript

In most cases, extending the parent widget's view and customizing the new widget's view with the `<rn:block>` element is sufficient, and this is the recommended best practice. However, if a custom widget extends a widget's controller, but has a completely different view and corresponding logic file, you can specify the `overrideViewAndLogic` value in the custom widget's *info.yml* file. This is also an option in the widget builder. The parent widget's *view.php* and *logic.js* files are then ignored, and instead these files from the custom widget are used. Specifying an override of just the view or just the logic file is not supported, because the DOM and JavaScript are tightly coupled.

In the following example from the `extends` section of an *info.yml* file, the php component of the DataDisplay widget is being used, but view and logic files will be referenced solely from the extending widget.

```
extends:
    widget: standard/output/DataDisplay
    components: php
    overrideViewAndLogic: true
```

Note that when `overrideViewAndLogic` is specified, the component values `view` and `js` must not be present in the `components:` key in *info.yml*, otherwise an error is thrown when attempting to use the widget. For information about the `components:` key, see Identifying the parent widget.

Extending a widget's controller

A custom widget that extends another widget can have its own *controller.php* file that extends the other widget's controller, or it may simply use the parent widget's controller, which will be loaded and ready to use. If the new widget does not have its own controller, its view and logic files will use the default properties and data defined in the parent's controller.

The new widget can override methods (other than private methods) from the parent widget. When you use the widget builder to create a widget that extends from another widget, the *controller.php* file that is generated lists the methods that can be overridden.

An example of a new *controller.php* file is as follows.

```
<?php
namespace Custom\Widgets\sample;

class MySocialBookmarkLink extends
\RightNow\Widgets\SocialBookmarkLink {
    function __construct($attrs) {
```

```
            parent::__construct($attrs);
        }
        function getData() {
            // Add preprocessing code here...
            parent::getData();
            // Add postprocessing code here...
        }
    }
```

As shown in the example, custom widgets must use the Custom\Widgets*widgetParentFolder* namespace, for example, Custom\Widgets\sample or Custom\Widgets\feedback.

The widget's class name must be the same as the widget's folder name.

Widgets extending standard widgets must have a constructor and must call the parent's constructor. The custom extender can add, modify, or remove data before or after the parent widget controller's getData() method is called. However, widget controllers are not required to call the parent's getData() methods.

The widget automatically inherits any AJAX-handling functionality of its parent. However, the extending widget can also have its own AJAX handler. Refer to Handling AJAX requests in the widget controller.

Refer to the following for examples of extending a widget's controller.

- The AdditionalResults sample widget
- The ExtendedAnswerFeedback sample widget

Extending a widget's logic file

A custom widget that extends another widget can have its own *logic.js* file that extends from the parent widget's logic file, or it can use the parent widget's logic file, which will be loaded and ready to use.

If the new custom widget has its own *logic.js* file, the code must indicate that it is extending from another widget, for example:

```
RightNow.namespace('Custom.Widgets.MySocialBookmarkLink');
Custom.Widgets.MySocialBookmarkLink =
    RightNow.Widgets.SocialBookmarkLink.extend({
```

Refer to the following for examples of extending a widget's logic file.

- The AdditionalResults sample widget
- The ExtendedAnswerFeedback sample widget

The constructor function in logic.js files

This section discusses using the constructor function to extend *logic.js* files. As an example, consider the SocialBookmarkLink widget, which extends from RightNow.Widgets.

```
})
RightNow.Widgets.SocialBookmarkLink = RightNow.Widgets.extend({
    constructor: function() {
        // Do things on page load here (constructor)
    },
    sbl: function() {
    }
});
```

The first function defined in the object passed to RightNow.Widgets.extend() is named constructor. This function is run immediately when the widget is instantiated (during onDomReady event). Three parameters are passed to the constructor method.

- The `data` parameter:
  - ▷ `attrs`—Widget attributes.
  - ▷ `js`—Members set in the widget's controller.
  - ▷ `info`—Name and path, for example.
- The `instanceID` parameter.
- The `Y` parameter, which is an instance of YUI. Refer to Using YUI components.

Before the constructor is called, several helpful actions are performed. The RightNow.Widget that all widgets extend from has already called a base function that's called before the extending widget's constructor is called.

This base function performs the following actions:

```
function helper(data, instanceID, Y) {
    this.data = data;
    this.instanceID = instanceID;
    this.Y = Y;
    this.baseDomID = "rn_" + this.instanceID;
    this.baseSelector = "#" + this.baseDomID;
    this.getStatic = function(){ return
    _getObject(this.data.info.class_name);};
}?
```

This means that every widget that extends from RightNow.Widget does not need to set instance variables to what was passed in, because that action has already been performed. All standard RightNow widgets use `rn_ + widgetInstanceID` as a convention for IDs in

HTML elements, therefore setting the baseDomID and baseSelector provides helpful instance variables so that you do not need to duplicate `rn_ + this.instanceID + _SomethingElse` multiple times in widget JavaScript code.

You can define all other widget methods or instance variables within the object passed to RightNow.Widgets.extend() using the standard key: value paradigm. When code is executing inside a widget method, it can reference other methods and instance variables as it normally does (for example, `this.someOtherMethod`, `this.instanceID`.)

Static properties

As shown in the previous section, RightNow.Widgets.extend() accepts two parameters, the constructor function and an optional second parameter, which also must be an object. However, with this second parameter, all key-value properties declared are added as static properties of the widget. For example:

```
RightNow.Widgets.SocialBookmarkLink = RightNow.Widgets.extend({
    constructor: function(data, instanceID, Y) {

    },
    sbl: function() {
    }
}, /** End of the first parameter **/
{
    aStaticProperty: "sbl",
    aStaticFunction: function() { … }
});
RightNow.Widgets.SocialBookmarkLink.aStaticProperty; // "sbl"
RightNow.Widgets.SocialBookmarkLink.aStaticFunction();
```

All static properties are then available on the widget's static class, `RightNow.Widgets.WidgetName.`

If a widget extends another widget then any static properties defined for the parent can be overridden by the child.

Overriding parent properties in logic.js files

An extending widget automatically gains access to all of its parent's properties and methods, and the extending widget can change the behavior of any of these methods.

In the object passed to *parent*.extend() there is a special key, `overrides,` which allows the overriding of properties and methods defined in the parent.

```
parent.extend({
    overrides: {
```

```
            constructor: function(){...},
            aMethod: function(){...},
            aProperty: 23
        },
        anotherMethod: function(){...}
    })
```

Any property defined in the object denoted by the `overrides` key overrides the property of the same name in the parent.

Every function defined inside `overrides` that has a parent function of the same name automatically gets a this.parent() member that allows the function to call the parent function that it is overriding.

Every property that is defined inside `overrides` is essentially "flattened out", meaning that other widget methods still reference them normally using this.*propertyName*. So from the example above, aMethod is able to call anotherMethod as expected using `this.anotherMethod()`, and anotherMethod is able to call aMethod as expected using `this.aMethod()`.

As an example, in the parent:

```
    RightNow.Widgets.SocialBookmarkLink = RightNow.Widgets.extend({
        constructor: function() { ... },
        _onClick: function() { ... },
    });
```

And in the extending widget:

```
    Custom.Widgets.Bookmark =
    RightNow.Widgets.SocialBookmarkLink.extend({
        overrides: {
            constructor: function() {
                this.parent(); // Calls constructor above
            // Do something else...
                this.showDialog();
            },
            _onClick: function() {
                this.parent(); // Calls _onClick above
                // Do something else...
                this.hideDialog();
            }
        },
        showDialog: function() {
            // Do something...
```

```
            this._onClick();
        },
        hideDialog: function() {
            // Do something...
        }
    });
```

If a property is defined within `overrides` that does not have the same name as any parent property, then the property simply exists as any other widget property.

```
    parent.extend({
        overrides: {
            constructor: function() {...}
            // overrides parent's constructor
            doesntExistOnParent: true
        },
        heyNow: function() {
            this.doesntExistOnParent; // true
        }
    });
```

If a property with the same name as a parent property is specified outside of the overrides structure, the property is still accessible to the rest of the widget itself, as normal, but the property does *not* override the parent property of the same name.

```
    parent = RightNow.Widget.Extend({
        constructor: function() {
            ...
            something.on('click', this.onClick, this);
        },
        onClick: function() {
            alert('parent');
        }
    });
    child = parent.extend({
        overrides: {
            constructor() {
            ...
            this.parent();
            this.onClick(); // 'child' alerts
            }
        },
        onClick: function() {
```

```
            typeof this.parent === 'undefined'; // true
            alert('child');
        }
    });
```

In the example, the extending widget accesses its own onClick() method normally, but when the domElement subscribed to in the parent is clicked, the parent's onClick method is still called, because it was not overridden by the extending widget.

Again, to override and call into a parent method, the overriding method must be contained within the `overrides` structure.

```
    child = parent.extend({
        overrides: {
            constructor() {
            ...
            this.parent();
            this.onClick(); // 'child' alert is followed by a 'parent'
            alert

            }
        },
        onClick: function() {
            typeof this.parent === 'function'; // true
            alert('child');
            this.parent();

        }
    });
```

Using YUI components

As mentioned in The constructor function in logic.js files, an instance of YUI is passed as the third parameter to the constructor function in *logic.js* files, and widgets can use this YUI instance to interact with YUI.

```
    this.Y.one(this.baseSelector);
    (this.Y.UA.ie > 9);
```

YUI 3 is intended to be used in discrete, compartmentalized, modularized components within applications. This is exactly how widgets can be described, so YUI is ideal to use with them.

Including the YUI 3 script tag on a page creates a minimal YUI() function that returns an object with a few functions and properties. YUI 3 expects callers to list out any sub-module dependencies that you intend to use with your code. The code that uses the sub-modules is a callback function that YUI executes when it has created a new YUI instance with all of those modules as part of that instance. It provides that instance as the first parameter to the callback function.

By default, each YUI instance has several components available as first-level modules, including:

- DOM
- Node
- Anim
- Event
- History
- IO

Widgets declare any YUI module dependencies by listing the modules in the Specifying framework dependency of their *info.yml* file.

```
...
requires:
    ...
    yui: [slider, autocomplete, autocomplete-highlighters]
...
```

Any standard YUI 3 modules are accessible to widgets that declare such module dependencies.

```
RightNow.Widgets.sbl = RightNow.Widgets.extend({
    constructor: function(data, instanceID, Y) {
        Y.Slider(); Y.Plugin.Autocomplete;
    }

});
```

In some cases, a widget might be used in both mobile and desktop environments, but for each of those environments there might be different requirements. Also, as additional JavaScript on a page incurs a greater performance impact on a mobile device, you may decide not to include certain components for mobile (as long as the widget code appropriately handles the omission of certain YUI components). In this case, in the *info.yml* file you can specify YUI requirements for each jsModule entry.

```
...
requires:
    yui:
        standard: [panel, autocomplete]
```

```
            mobile: [overlay]
    ...
```

In this example, if the widget is used on a page where `standard` is the jsModule value (the default), the widget instance receives a YUI instance including the Panel and Autocomplete YUI components. If the same widget is used on a page where `mobile` is the jsModule value, then it receives a YUI instance including just the Overlay component. This allows you to use the same widget for both environments without having to build an almost identical mobile widget. However, requiring very different YUI components for standard and mobile environments is not recommended because it can lead to convoluted code and bugs.

A more common scenario is to simply omit certain requirements for a mobile environment from the *info.yml* file.

```
    ...
    requires:
        yui:
            standard: [overlay]
    ...
```

In this case, rather than the widget checking for a particular browser user-agent, it can then simply not provide a feature or provide the feature in a different way. For example in the widget's *logic.js*:

```
    if (this.Y.Overlay) {
        // Do something with an overlay
    }
    else {
        // Do something without an overlay
    }
```

Extending a widget's CSS

If there is a *base.css* file within a widget's directory, then it is used. If there is a presentation CSS file with the same name as the widget directory under */cp/customer/assets/themes/standard/widgetCss,* then it is used.

If a widget extends another widget and you want the CSS for the parent widget to also be included, you can specify it as another component in the *info.yml* file.

```
    extends:
        widget: "standard/utils/SocialBookmarkLink"
        versions: "3.1"
        components: ["php", "css"]
```

The resulting CSS included on the page is ordered with the parent CSS first, followed by the extending child CSS.

```
<style>
    /* Parent base.css */
    /* Parent presentation CSS (SocialBookmarkLink.css) */
    /* MyWidget base.css */
    /* MyWidget presentation CSS (MyWidget.css) */
</style>
```

When a widget extends another widget, the names of both widgets are used for the top-most containing element's class name. In this example, MyWidget extends from the SocialBookMarkLink widget.

```
<div class="rn_SocialBookmarkLink rn_MyWidget" id="...">
    Widget contents
</div>
```

If the parent's CSS is included, the widget automatically inherits all of the default styling. However, you can specify style changes that apply only to the new extending widget without affecting the standard widget.

```
.rn_SocialBookmarkLink {
    /* Styles written here will affect the standard SocialBookmarkLink
    widget as well as any widgets that extend from it*/
}

.rn_SocialBookmarkLink.rn_MyWidget {
    /* Styles written here only affect the extending widget */
}
```

For more information, see Base CSS and Presentation CSS.

Refer to the following for code samples of extending a widget's CSS.

- The AdditionalResults sample widget
- The ExtendedAnswerFeedback sample widget

Creating a new widget from scratch

Instead of copying standard or custom widget code, which is a tedious and error-prone process, use the widget builder to create new widgets. You specify the components (controller, view, JavaScript) that the new widget has. A new widget must have at least one of the components.

- For the controller, you can specify whether it does any AJAX handling.

- For the JavaScript, you can specify the YUI modules you want to have loaded on the page that contains the widget and then passed to the widget's constructor.
- For the JavaScript, you can specify whether you require a template, in other words, a *view.ejs* file.
- You can specify the attributes required for the new widget.
- You can also specify additional information including a description, the URL parameters for the widget, and the JavaScript compatibility information.

The widget builder generates custom code with defaults and placeholders that you can then tailor to your requirements. The widget's *view.php* file contains the following top level div tag to simplify your coding work:

```
<div id="rn_<?= $this->instanceID ?>" class="<?= $this->classList ?>">

</div>
```

The following procedure summarizes how to create a new widget using the widget builder. Refer to Widget builder for more details.

To create a new widget

1 In the widget builder, select **Create a brand new widget from scratch**.

2 Specify the widget components that will be used.

3 If the widget has a controller, specify whether it will do any AJAX handling.

4 If the widget has its own JavaScript, specify the YUI modules to be used with the widget.

5 If the widget has JavaScript, specify whether templates are required.

6 Add attributes as required.

7 Add additional details as required, including a description of the widget, any URL parameters, and JavaScript framework compatibility information.

Files are generated for the new custom widget. You can then add code to the files as required.

Refer to The DisplayChartReport sample widget for an example of a new widget created from scratch.

Making AJAX requests to the server

Widgets can make their own AJAX requests to the server, which works as follows.

- You specify the location of a handler for an AJAX request (the endpoint URL) through a widget attribute.
- Before a widget makes a request, the *logic.js* file fires an event, and subscribers to the event can customize the data to be sent in the request.
- The widget's *logic.js* file makes the AJAX request and calls a handler method in the widget's controller, passing the necessary data for the request.
- The handler method in the controller can access any parameters passed in the request and calls model functions as required to return the output and results.
- The widget's *logic.js* file has a callback method for the response from the server.
- After a widget receives a response, the *logic.js* file fires an event, and subscribers to the event can customize behavior, for example, to modify any of the data in the response.

Firing an event before submitting the request

Before a widget makes an AJAX request, it fires an event. Subscribers to that event can:

- Add, remove, or modify any data to be sent in the request.
- Cancel the AJAX request.

The following code from a *logic.js* file shows an example of such an event.

```
var eventObject = new RightNow.Event.EventObject(this, {data: {
    w_id: this.data.info.w_id,
    a_id: this.data.js.answerID,
    rate: this._rate,
    email: this.data.js.email || this._emailField.value,
    message: this._feedbackField.value,
    threshold: this.data.attrs.dialog_threshold,
    options_count: this.data.attrs.options_count,
    submitfeedback: true,
    handler: this.data.ajaxHandlers.submit_rating_ajax
}});
if(RightNow.Event.fire("evt_answerFeedbackRequest", eventObject)){
RightNow.Ajax.makeRequest(this.data.attrs.submit_feedback_ajax,
eventObject.data, {successHandler: this._onResponseReceived, scope:
this, data: eventObject, json: true});
}
```

In this example, all of the data sent to the server is passed in the evt_answerFeedbackRequest event. Subscribers to that event can modify any of that data. If a subscriber returns false, then the event is cancelled and the line containing RightNow.Ajax.makeRequest is never reached.

Making AJAX requests in the widget JavaScript

Using the AnswerFeedback widget as an example, when customers rate an answer, the AnswerFeedback widget's *logic.js* file calls one of its JavaScript functions.

```
/**
* Submit data to the server.
*/
_submitFeedback: function() {
    var eventObject = new RightNow.Event.EventObject(this, {data: {
        w_id: this.data.info.w_id,
        a_id: this.data.js.answerID,
        rate: this._rate,
        email: this.data.js.email || this._emailField.value,
        message: this._feedbackField.value,
        threshold: this.data.attrs.dialog_threshold,
        options_count: this.data.attrs.options_count,
        submitfeedback: true,
        }});
        if(RightNow.Event.fire("evt_answerFeedbackRequest",
        eventObject)){

RightNow.Ajax.makeRequest(this.data.attrs.submit_feedback_ajax,
eventObject.data, {successHandler: this._onResponseReceived, scope:
this, data: eventObject, json: true});
    }
},
```

In addition to the normal POST variables, there is also the instance number of the current widget (`w_id`).

The endpoint for the request (the value for the *submit_feedback_ajax* attribute) is specified by `this.data.attrs.submit_feedback_ajax`. When the widget controller calls `$this->setAjaxHandlers`, the attribute value is changed to *attribute* value + *widget path* + *name of handler method*. So, for our example.

```
this.data.attrs.submit_feedback_ajax == "/ci/ajax/widget/standard/
feedback/AnswerFeedback/submitAnswerFeedback"
```

And therefore the request ultimately made is:

```
POST /ci/ajax/widget/standard/feedback/AnswerFeedback/
submitAnswerFeedback
Data:
w_id=12&a_id=57&rate=4&email=red@dog.com&threshold=2&options_count=4&
submitfeedback=true
```

The widget path and handler name are appended onto the path on any value specified for AJAX-type attributes. So, if the widget's AJAX endpoint is changed, for example:

```
<rn:widget path="feedback/AnswerFeedback" submit_feedback_ajax="/cc/
feedback">
```

The URL for the request that's made is:

```
POST /cc/feedback/standard/feedback/AnswerFeedback/
submitAnswerFeedback
```

As already discussed, before the AJAX request is actually made, a synchronous event is fired, along with the actual contents of everything to be sent to the server. This means that any subscriber to the event is able to modify what is sent to the server.

The widget specifies its own callback function for the server response. In the example, _onResponseReceived() specifies that the results are to be JSON-parsed before the callback method is called.

Everything needed to route the AJAX request to the specific widget instance is in the AJAX request:

- The path to the widget (added implicitly by the framework).
- The name of the widget's AJAX handling method (added implicitly by the framework).
- The Instance ID of the widget.
- The page containing the widget (captured as the http_referer in the request).

With this information, the proper widget method can be called and instance-specific attributes can also be called, all as part of handling the AJAX request.

There are a number of ways to customize the AJAX request.

- **Changing the endpoint of the request**—You can change the attribute value in the widget declaration on the containing page.
- **Changing how the request data is handled on the server**—You can extend the widget controller and either change the ajaxHandlers member to a uniquely named method, or modify the incoming and outgoing data by implementing and wrapping the same method as the parent.
- **Modifying the data sent in the AJAX request**—You can subscribe to the event that is fired before the AJAX request is sent and modify the event object data. Refer to Firing an event before submitting the request

Handling AJAX requests in the widget controller

Any widget can define an AJAX request handler method within its controller file. All standard widgets behave in this manner. This can be illustrated using the standard widget AnswerFeedback as an example. AnswerFeedback performs two AJAX requests: one to record the answer rating that the user has given, and one to submit the user's feedback message.

AnswerFeedback has an attribute for each AJAX request, and each attribute specifies the location of the handler function for the AJAX request (the endpoint). Each instance of a widget can specify a unique AJAX endpoint, if required. However, the attributes have a default path for the endpoint (*/ci/ajax/widget*), as shown in this excerpt from the *info.yml* file.

```
submit_rating_ajax:
    name: Submit Rating AJAX
    type: ajax
    description: Endpoint to make the answer rating AJAX request to
    default: /ci/ajax/widget
submit_feedback_ajax:
    name: Submit Feedback AJAX
    type: ajax
    description: Endpoint to make the answer feedback AJAX request to
    default: /ci/ajax/widget
```

The default endpoint, *ci/ajax/widget*, means that the handler function in the widget's controller is used for the AJAX request.

The following illustrates the *controller.php* of AnswerFeedback.

```
namespace RightNow\Widgets;

class AnswerFeedback extends \RightNow\Libraries\Widget\Base {
    function __construct($attrs) {
        parent::__construct($attrs);

            $this->setAjaxHandlers(array(
                'submit_rating_ajax' => 'submitAnswerRating',
                'submit_feedback_ajax' => array(
                    'handler' => 'submitAnswerFeedback',
                    'clickstream' => 'submitFeedback',
                )
            ));
    }
    function getData() {
        ...
```

```
        }
        static function submitAnswerRating($postData) {
            // record clickstreams interaction
            // echo out response
        }
        function submitAnswerFeedback($postData) {
            // pass thru to incident model
            // echo out response
        }
    }
```

The widget has a setAjaxHandlers() method inherited from the widget Base class. The keys in the array passed to setAjaxHandlers() are the names of the attributes relevant to the AJAX requests, which are used within the widget's JavaScript to make the request.

The values in the array are either:

- The string name of the widget's method that will handle the AJAX request (submitAnswerRating() in the example), or,
- An array with key values of:
  - **handler**—The string name of the widget's method that will handle the AJAX request (submitAnswerFeedback() in the example).
  - **clickstream**—The clickstream action to insert when this AJAX request occurs and the handler is called.

AJAX handling methods receive a single parameter that is an associative array of the GET/POST variables. The methods can pull out parameters and route them through to models and then output the results.

The AJAX handling methods can be static or non-static. If an AJAX handling method is static, it cannot access any instance properties of the widget, The method is in turn called as part of the AJAX request, therefore the widget is not instantiated and the method is called statically. For example:

```
AnswerFeedback::submitAnswerRating($_POST);
```

If an AJAX handling method is non-static, then as the widget method is called on the AJAX request, the method is able to access widget attributes that are specific to that instance of the widget.

Refer to The AdditionalResults sample widget for an example of a sample widget that does its own AJAX handling.

Firing an event after getting a response

After a widget receives a response from the server, it immediately fires an event. Subscribers to that event can:

- Modify any of the data in the response.
- Perform any additional functionality, integration, or business logic based on the response.
- Cancel the event (so that the source widget ignores the server response).

The following code shows an example of such an event.

```
_onResponseReceived: function(response, originalEventObj){
    if(RightNow.Event.fire("evt_answerFeedbackResponse", {data:
    originalEventObj, response: response})) {
    // handle the server response

    }
}
```

Using JavaScript templates

You can use embedded JavaScript (EJS) in template files to dynamically render views. The following is an example of code from a *view.ejs* file.

```
<rn:block id="preList"/>
<ul id="<%= listID %>">
<% for (var i = 0; i < links.length; i++) { %>
    <rn:block id="listItem">
        <li><a href="<%= links[i].href %>"/><%= links[i].label %></
        a></li>
    </rn:block>
<% } %>
</ul>
<rn:block id="postList"/>
```

The highlighted code shows the JavaScript that is dynamically rendered when the widget logic file loads the *view.ejs* file and the view is rendered.

Essentially JavaScript views allow separation of code and HTML for cleaner, dynamic widgets, and this can be particularly important when you have a lot of HTML in the widget.

EJS is well suited for AJAX handlers in widgets. For example, if you have a widget that uses AJAX to fetch data from the server, it can use EJS to dynamically update the UI on the page with the returned data.

As another example of how you can leverage EJS, you can put the following in a *view.ejs* file (or assign it to a variable in JavaScript):

```
<h1><%= text %></h1>,
```

You then use this code in the *logic.js* file to render the view:

```
// using inline template or JS variable
this.Y.one('#myTitle').set('innerHTML', new EJS({text:
RightNow.Widget[this.data.info.class_name].templates.view}).render(re
sponse);
```

Form widgets

Form widgets are those standard input widgets (for example, CustomAllInput, FormInput, and TextInput) or custom widgets that extend from RightNow.Field that allow your customers to enter and update form information that gets stored in incidents and contact records. Refer to Input widgets.

The RightNow.Field widget helper provides several useful functions that make processing form requests easier. For example, the this.parentForm() function allows your custom code to subscribe to form field events, to perform validation of form input, check whether the form should be submitted, and perform error handling as required.

Subscribing to form field events

All standard input widgets extend from RightNow.Field, and as your custom widgets can extend from those standard widgets, they have access to the this.parentForm() function. Your custom widgets can therefore subscribe to a form's events.

The events for this.parentForm() are:

- **submit**—Fired when the submit button on the form is clicked. Subscribing code must perform validation during this event.
  - ▷ If a widget fails validation, it must report the error in the common error <div> element (whose id value is provided in the EventObject passed to submit event subscribers). It must also return false from the subscriber to the submit event (this notifies the parent form that validation failed and the form must therefore not be submitted).
  - ▷ If a widget passes validation, it must return a valid EventObject whose data is the value to be submitted to the server.
- **send**—Fired just before the form data is sent to the server. If a subscriber needs to cancel the event (and prevent the form from being sent to the server), false must be returned.

- **response**—Fired as soon as a response is received from the server.

The following example from a *logic.js* file shows how events can be subscribed to.

```
RightNow.Widgets.sbl = RightNow.Field.extend({
overrides: {

    constructor: function() {
        this.parent();
        ...

        this.parentForm().on("submit", this.validate, this)
        .on("send", this.seeIfFormShouldBeSubmitted, this)
        .on("response", this.lookAtResponse, this);
},
...
```

A widget that extends RightNow.Field must be placed inside an HTML `<form>` element on a containing page, otherwise a JavaScript error is thrown. There is no parent form, therefore placing an input field outside of a form is invalid HTML.

Form widgets must contain only one FormSubmit widget inside the form. This is because the FormSubmit widget extends from RightNow.Form, which is what sets the this.parentForm() for each Form widget.

Native form submissions

There are cases when you may want a form to be submitted natively (using either a POST or GET request) rather than submitted through an AJAX request.

If a declared HTML `<form>` element on a page has *action* and *method* attributes defined, and if the FormSubmit widget does not have the *on_success_url* attribute defined (by default, it is not set), then the form's *action* and *method* attributes are honored. When the form passes validation (that is, all submit subscribers return successful EventObjects), the form is submitted natively.

```
<form action="/cc/myCustomSubmit" method="post">
    <rn:widget path="input/TextInput" name="Incident.Subject"/>
    ...
    <rn:widget path="input/FormSubmit"/>
</form>
```

Search widgets

Search widgets are those standard report-filtering or report-displaying widgets and custom widgets that extend from RightNow.SearchFilter or RightNow.ResultsDisplay. Search widgets allow your customers to filter reports generated from their searches or display those reports.

RightNow.SearchFilter and RightNow.ResultsDisplay provide access to the this.search-Source() function, which allows your custom code to subscribe to search events.

Subscribing to report events

All of the following standard report-filtering widgets extend from RightNow.SearchFilter.

- KeywordText
- SearchButton
- SortList
- Paginator
- SearchTypeList
- OrgList
- ProductCategorySearchFilter
- DisplaySearchFilters

The following standard report-displaying widgets extend from RightNow.ResultsDisplay.

- Multiline
- MobileMultiline
- Grid
- CombinedSearchResults
- CommunitySearchResults

Widgets, including your custom widgets, that extend SearchFilter or ResultsDisplay inherit this.searchSource(), which is the interface to subscribe to events for searching. The following describes the events.

- **search**—Fired when the search button is clicked (fired by the SearchButton widget: `this.searchSource().fire("search", eo))`.
  - ▷ All subscribers must return an event object with the filters property properly set to the current state of the filter.
- **send**—Fired just before performing the search (making the AJAX request or doing the page flip search).
  - ▷ If a subscriber returns false, then any other subscribers are still notified about the event, but the search is cancelled when the event completes.

- **response**—Fired when a response is returned from the server. The event object contains the server's response.
- **reset**—Fired to indicate that certain filters (that subscribe to this event) must reset their states to their initial state.
- **keywordChanged**—Fired to indicate that the keyword changed.
- **appendFilter**—Fired when the event-firing code adds a filter to the group of the filters sent to the server.
- **setInitialfilters**—Fired from ResultsDisplay widgets when the page is loaded. The event object sent contains an allFilters-keyed object containing the initial state of all of the search filters on the page.

How filter widgets respond to multiple reports

A single keyword field can be used for multiple reports on the same page. For report-filtering widgets, the *report_id* attribute accepts a comma-separated string of report IDs. These report IDs are the ones that the search filter is applied to when a search is triggered.

```
<rn:widget path="search/KeywordText" report_id="176,197"/>
<rn:widget path="search/SearchButton" report_id="176,197"/>
<rn:widget path="reports/Multiline" report_id="176"/>
<rn:widget path="reports/Multiline" report_id="197"/>
```

So in the above example, the SearchButton widget triggers a search on reports 176 and 197. The KeywordText widget responds to that search event by passing back the user-entered search term. A search is then completed for both reports 176 and 197 using the same keyword.

Report-displaying widgets are limited to a single *report_id* value.

Using the inherited searchSource() function, widgets with multiple report IDs can respond to search events either for individually reports or multiple reports. For example, for a widget with `report_id="176,197"`:

```
...
/* When a search is triggered for either report 176 or report 197 then
myHandlerFunction is called */
this.searchSource().on("search", this.myHandlerFunction, this);
...
/* When a response comes back for report 176 then myResponder is
called */
this.searchSource(176).on("response", this.myResponder, this);
...
/* When a response comes back for report 197 then myOtherResponder is
called */
```

```
this.searchSource(197).on("response", this.myOtherResponder, this);
```

Using additional search sources with report widgets

You can include additional search sources in report events, allowing you to add to report results.

Search filter and report widgets have a *source_id* attribute. An example of a default value for the *source_id* attribute is `social` for the CommunitySearchResults widget.

Setting *source_id* to this value means that the widget's filter values are applied to searches for social.

```
<rn:widget path="search/KeywordText" report_id="176"
source_id="social"/>
<rn:widget path="search/SearchButton" report_id="176"
source_id="social"/>
<rn:widget path="reports/Multiline" report_id="176"/>
```

In the above example, the KeywordText and SearchButton widgets are used to simultaneously search report 176 as well as social results.

By extending from SearchFilter, widgets inherit the searchSource() method. The searchSource() method can be called without any parameters. In this case, the caller gets back a handle to all reports and search sources that the widget has declared in its *report_id* and *source_id* attributes. Subscribing to or firing on that handle happens for all of those reports and search sources.

```
this.searchSource().on("search", sbl, this)
```

You can use the searchSource() function to respond to search events for additional sources. For example, for a widget with the attributes *report_id* with the value `176` and the *source_id* attribute with the value `social`:

```
...
/* When a search is triggered for either report 176 or social then
myHandlerFunction is called */
this.searchSource().on("search", this.myHandlerFunction, this);
...
/* When a search is triggered for the social source then
myHandlerFunction is called */
this.searchSource(this.data.attrs.source_id).on("search",
this.myHandlerFunction, this);
...
/* When a response comes back for report 176 then myResponder is
called */
this.searchSource(176).on("response", this.myResponder, this);
```

```
...
/* When a response comes back for social then myOtherResponder is
called */
this.searchSource(“social").on("response", this.myOtherResponder,
this);
```

In addition to the built-in external search source social, you can use any other search services that may be plugged-in. You can set the *source_id* attribute to an arbitrary name or number, and widgets can specify what data is sent to the server and where the data is to be sent.

The searchSource() method can also be called with a named subset of reports and search sources. In this case, the caller gets back a handle to all named reports and search sources that the widget has declared in its *report_id* and *source_id* attributes. Subscribing to or firing on that handle happens for only those named reports and search sources. For example:

```
this.searchSource(176).on("search", sbl, this)
this.searchSource("social").on("search", sbl, this)
```

Finally, the searchSource() method can be called with a named subset, as above, and additionally specify the following options.

- **reportIDorNamedSearchSource**—A report ID or source ID.
- **endpoint**—A string specifying where the AJAX request is handled.
- **filters**—An array specifying what report filter values are to be sent (only applies to non-report search sources).
- **params**—The key-value parameters to be sent to the server in the POST data.

For example, for a widget with `source_id="sbl"`:

```
this.searchSource({
    /* name of the search source */
    "sbl": {
    "endpoint": "/cc/myCustomController/search",
    "filters": [ "keyword", "sort" ]
    "params": {
        "banana": 0
    }
}).on("search", function() {
    return new RightNow.Event.EventObject(this, {data: {
        resource: "123",
        numOfResults: 20
    }});
});
```

The AJAX request when a search is triggered for `source_id="sbl"` (where the user searched on iphone and sort is set to 2 is therefore:

```
POST /ci/myCustomController/search
FORM DATA keyword=iphone&sort=2&banana=0&resource=123&numOfResults=20
```

Refer to The AdditionalResults sample widget for a sample widget that uses an additional search source with report widgets.

Creating custom models

You can create custom models that extend directly from the RightNow\Models\Base class. You can also create custom models that extend from and override standard models, which themselves extend from Base.

Customizing models can be useful for modifying the behavior of all the widgets that make calls to a particular model.

In your custom models, you can include Connect PHP API calls as well as ROQL calls. Refer to the Oracle RightNow Connect PHP API Cloud Service Developer Guide.

You must create a custom model when you need to create access to data that is not available through the standard models, which include the following:

- **Account**—Retrieves details about agent accounts based on its ID value.
- **Answer**—Retrieves and manipulates knowledge base answers and also retrieves related and previous answers.
- **AsyncBase**—Makes asynchronous HTTP requests to external servers when you need to make several external requests simultaneously without blocking execution.0
- **Base**—Serves as the base class for all models and provides a number of boilerplate methods and a built in cache.
- **Chat**—Initiates chat requests, sends content between the customer and agent, and checks on current chat availability.
- **Clickstream**—Inserts entries into the clickstream table.
- **Contact**—Creates and updates contacts and retrieves contact data.
- **Country**—Returns a country from the Connect PHP API based on its ID value.
- **Field**—Marshals contact and incident form data and directs it to the correct model to create and update records.
- **FileAttachment**—Retrieves file attachments from sources such as answers, incidents, and guides.

- **Guidedassistance**—Returns a GuidedAssistance object from the database based on the ID value of the guide.
- **Incident**—Creates and updates incidents and retrieves incident data.
- **Notification**—Returns an array of specified product, category, and answer notifications associated with the interface and formats the answer summary.
- **Polling**—Retrieves questions for displaying polling data, submits poll questions, and retrieves poll results.
- **PrimaryObjectBase**—Serves as the base class for models that are used to retrieve, create, and update objects within the Customer Portal.
- **Prodcat**—Retrieves product and category information from the database, works with product/category linking, and gets partial hierarchies of the data.
- **ProductCatalog**—Retrieves product data from the database.
- **Report**—Retrieves and manipulates analytics reports.
- **Social**—Interacts with the Social API to create social posts and comments and memcaches the results for performance benefits.
- **Survey**—Accesses specified surveys.
- **Topicbrowse**—Retrieves topic browse trees.

Model coding standards

Apply the following standards when preparing custom models.

- **File names**—File names must be singular and in Pascalcase format.
- **Class names**—Class names should be the same as the file name.
- **Content**—All calls to access the database (Connect PHP API and ROQL calls) must be contained within a model and not in any other part of the code.
- **Data caching**—If applicable, cache the results of database calls within the model. The two functions setCache() and getCache() use keys to store data over the course of a request. Connecting to the database consumes more resources and caching improves performance.

Standard models

Standard models are contained within the RightNow\Models namespace, and are located in the */cp/core/framework/Models* folder. Standard models include the Answer, Contact, and Incident models that provide access to objects in the knowledge base. All standard models extend from the Base model class.

Refer to the Customer Portal Framework Version 3.2 PHP API reference documentation.

About the ResponseObject object

For consistency, all functions in models should return a \RightNow\Libraries\ResponseObject object (all standard models return this object). This is recommended because it enables the caller to determine how to handle any errors or warnings, rather than requiring the called function to determine how to format and return the errors and warnings.

The only exception to returning the ResponseObject object is when a return type of the method is boolean. So, for example, \RightNow\Models\Answer::exists() just returns true or false.

The ResponseObject object contains five fields.

Table 390: ResponseObject Fields

Field Name	Type	Description
result	mixed	Whatever the function returns.
errors	ResponseError array	See Creating a ResponseObject object for information about the ResponseError object.
error	ResponseError	First ResponseError in errors field.
warnings	string array	Array of warning strings (for example, “Contact is not logged in.” while retrieving an incident).
warning	string	First string in warnings field.

The following example, which makes a call to a standard model function to get notifications for a contact, shows how a returned ResponseObject is used.

```
$notifications = $this->CI->model('Notification')->get('all',
$contactID);
if($notifications->error) {
    echo "Error about getting all notifications " . $notifications-
    >error->externalMessage;
    \RightNow\Utils\Framework::logMessage("Warning about getting all
    notifications " . $notifications->error->externalMessage);
    return;
}
else if($notifications->warning) {
    // warnings are usually for developer consumption only
```

```
        \RightNow\Utils\Framework::logMessage("Warning about getting all
        notifications " . $notifications->warning);
        return;
    }

    // now get the actual list of notification objects
    $notifications = $notifications->result;
    ...
```

The following example throws an exception if a contact cannot be retrieved.

```
    if(!$contact = $this->CI->model('Contact')->get($contactID)->return)
        throw new \Exception("What happened here?");
```

Creating a ResponseObject object

Within a model, the easiest way to create a ResponseObject object is to use the getResponse-Object() function, which is defined in the Base model class.

The getResponseObject() function has four parameters, but only the $return parameter is required.

Table 391: Parameters for getResponseObject() function

Parameter	Type	Description
$return	mixed	Whatever the function returns such as an object, array, Boolean, or string.
$validationFunction	function	A callable function that takes the return value as its only argument and returns true upon success. If specified as null, no validation is performed. The default value is is_-object.
$errors	mixed	A ResponseError object, ResponseError array, error string, or error string array.
$warnings	mixed	A warning string or warning string array.

The ResponseError array contains five fields.

Table 392: Fields for ResponseError

Field Name	Type	Description
externalMessage	string	Error message to display to end users and customers.

Table 392: Fields for ResponseError (Continued)

Field Name	Type	Description
errorcode	string	An error code that can be used by the caller to determine how to handle the error.
source	string	Defines where the error came from (for example, models/standard/report).
internalMessage	string	Error message for internal use.
extraDetails	mixed	Any extra details to attach to the error (for example, a stack trace).

The constructor of the ResponseError object has the same fields as shown in the above table and in the same order. The only field that is required is externalMessage.

The following is an example of using the getResponseObject() function in a standard model.

```
public function get($countryID)
    {
        if(!Framework::isValidID($countryID)){
            return $this->getResponseObject(null, null, "Invalid
            Country ID: $countryID");
        }
        try{
            $response = Connect\Country::fetch($countryID);
        }
        catch(Connect\ConnectAPIErrorBase $e)
        {
            return $this->getResponseObject(null, null, $e-
            >getMessage());
        }
        return $this->getResponseObject($response);
```

Extending from the Base model

You can create a custom model that extends directly from the Base model. The custom model must extend from the Base model class and call the parent constructor within its constructor as shown in this example.

```
<?php
namespace Custom\Models;
```

```
class Sample extends \RightNow\Models\Base
{
    function __construct()
    {
        parent::__construct();
    }

    function get($sampleID)
    {
        if(!\RightNow\Utils\Framework::isValidID($sampleID)){
            return $this->getResponseObject(null, null, "Invalid
            Sample ID: $sampleID");
        }
        return $this->getResponseObject(array('SampleID' =>
        $sampleID, 'SampleName' => "Sample $sampleID"), 'is_array');
    }
}
```

This example shows how you might use the custom model in a widget.

```
$sampleObject = $this->CI->model('custom/Sample')->get($sampleID);
if($sampleObject->error) {
    echo "Error in retrieving sample object " . $sampleObject->error-
    >externalMessage;
    return;
}

echo "Sample Name: " . $sampleObject->result['SampleName'];
```

Refer to Creating the CustomIncidentModel.php file for a sample custom model that extends from the Base model class.

Extending from a standard model

You can create a custom model that extends a standard model. The custom model is then automatically used in place of calls to the parent standard model. All functions of the parent model that are not marked as private can be called from the custom model.

The file *extensions.yml* file is a configuration file in which you must specify the standard models that you wish to override and the custom model that extends each standard model. The file consists of `modelExtensions` entries that name the standard model to override, and the custom model to use as a replacement.

To override the standard Answer model with a model at *development/models/custom/ExtendedSample.php:*

```
modelExtensions:
    Answer: ExtendedSample
```

To override the standard Contact model with a model at *development/models/custom/contacts/ContactCreation.php:*

```
modelExtensions:
    Contact: contacts/ContactCreation
```

In the custom model, the class declaration must extend from the standard model as shown in the following example, otherwise an error is thrown at runtime.

```
class ContactCreation extends \RightNow\Models\Contact
```

To extend a standard model

1 Open the */cp/customer/development/config/extensions.yml* file and edit it so that it contains an entry with the following format.

```
modelExtensions:
    Answer: ExtendedSample
```

2 Make sure that the custom model file contains code as in the following example, where the ExtendedSample custom model extends from the Answer standard model.

```
<?php
namespace Custom\Models;

class ExtendedSample extends \RightNow\Models\Answer
{
    function __construct()
    {
        parent::__construct();
```

3 Add code to override functions from the parent model or add new functions.

Refer to Custom model sample code for an example of a model that extends a standard model.

Calling custom model functions

The code to call a model function varies depending on where the model is called from. For example, to call the sampleFunction() function of the Sample model from a widget or another model:

```
$this->CI->model('custom/Sample')->sampleFunction();
```

To call the function from a custom controller:

```
$this->model('custom/Sample')->sampleFunction();
```

To call the function from anywhere else:

```
$CI = get_instance();
$CI->model('custom/Sample')->sampleFunction();
```

In each case, the model is automatically loaded.

When using the model() function to call a custom model's functions, you must specify the path to the custom model, as shown in the following example:

```
$sampleData = $this->CI->model('custom/input/SiteInfoCustomObject')-
>sampleFunction()->return;
```

However, in calls to standard models, you need to pass only the name of the model:

```
$chatHours = $this->CI->model('Chat')->getChatHours()->return;
```

Creating custom controllers

You can create custom controllers that extend from the \RightNow\Controllers\Base class. You cannot extend from any other controller class. All functions of the parent controller that are not marked as private can be called from the custom controller and additional code can be added as required.

Functions in custom controllers are called by sending a request to a URL with the following format:

```
cc/class_name/function_name
```

For example, to call the myHandler() function in the *MyController.php* controller, the URL is:

```
/cc/myController/myHandler
```

Controller coding standards

Within controllers, group public functions that are callable from URLs at the top of the file. All functions that are not intended to be callable with a URL should be labeled as private or protected, and their names should begin with an underscore (_). This is the only location where you can start your function names with a non-alphabetic character. Also, locate these private or protected functions toward the bottom of the file. This organizes the code better and makes it obvious which functions can be called with a URL and which ones cannot. For example:

```
function viewPage()
......
private function _addParms()
```

Only define an index() function within your controller when you need to be able to call the controller without defining a method. If you want to require a method to be defined to use the controller, omit the index() function.

Controller function content

For controller functions that interact with models and are called by using AJAX requests, the content of the function should harvest POST variables, call the model, and return JSON encoded data (plain text must not be returned from the server). Any business logic required for the AJAX call should be performed in the model. This allows model functions to be easily reused. For example:

```
function doSearch()
{
    $searchTerm = $this->input->post('term');
    $this->load->model('custom/Search');
    $results = $this->model('custom/Search')->query($searchTerm);
    echo json_encode($results);
}
```

Adding hooks

Hooks are sections of code in custom models that allow you to extend Customer Portal functionality. You specify hooks that you wish to execute before and after important events that occur within Customer Portal. You can use hooks, for example, to modify data, perform custom validation, and return customized error messages to display to the user.

You define hooks in the */cp/customer/development/config/hooks.php* file with `$rnhooks`. You specify the hook location that is, the event associated with the hook, as the array index and set that index to an array of three items.

- **`class`**—The name of the custom model you wish to use. The class name must match the name of the custom model, including case sensitivity.

Tip A best practice is to name the file the same as the class name. For example, the class MyCustomIncident would be in the *models/custom/MyCustomIncident.php* file, not *mycustomincident.php*.

- **`function`**—The name of the function within the class to call.
- **`filepath`**—The location of the model, which is automatically prefixed with models/custom/. The `filepath` item needs a value only if your model is contained within a subfolder.

For example, assume you want to call the sendFeedback() function immediately after an incident is created, and you will use the Immediateincidentfeedback model, which you created and placed in *models/custom/Immediateincidentfeedback.php*.

```
$rnHooks['post_incident_create'] = array(
    'class' => 'Immediateincidentfeedback',
    'function' => 'sendFeedback',
    'filepath' => ''
    );
```

For a list of events and more examples of hooks, refer to the comments in the *hooks.php* file. Also, refer to The ExtendedAnswerFeedback sample widget, for a sample where a hook is used with a custom widget.

Creating custom libraries

You can add custom libraries containing sets of utility functions in the folder */cp/customer/development/libraries*. A custom library must be a class file and have a structure as in the following example for a *Sample.php* library.

```
namespace Custom\Libraries;

class Sample
{
    function __construct(){
```

```
        }

        function sampleFunction()
        {

        }
    }
```

Loading a library

You can load a library in different ways depending on where it's being called. For example, to load a library called Sample from a widget or model:

```
$this->CI->load->library('Sample');
```

To load the library from a custom controller:

```
$this->load->library('Sample');
```

To load the library from anywhere else, including other libraries:

```
$CI = get_instance();
$CI->load->library('Sample');
```

Calling a library function

Once a library is loaded, you can call a library function in different ways, depending on where it's being called. For example to call the sampleFunction() function in the Sample library from a widget or model:

```
$this->CI->sample->sampleFunction();
```

To call the function from a custom controller:

```
$this->sample->sampleFunction();
```

To call the function from anywhere else, including other libraries:

```
$CI = get_instance();
$CI->sample->sampleFunction();
```

Creating custom helpers

You can add custom helpers in the folder */cp/customer/development/helpers*. You can load a helper in different ways depending on where it's being called. For example, to load a *sample_helper.php* file containing a helper function from a widget or model:

```
$this->CI->load->helper('sample')
```

From a custom controller:

```
$this->load->helper('sample')
```

To load multiple helpers at once, you can pass an array that loads each helper file, using the format shown in this example.

```
$this->load->helper(array ('sample1','sample2','sample3'))
```

Once a helper is loaded you can call all functions in the helper by simply using the name of the function, for example, *helperFunction()*.

Loading JavaScript content on every page

The */cp/customer/development/javascript/autoload.js* file is automatically loaded on every page so you can put common functions and event declarations in a single location without having to ensure they get loaded on every page.

As an example of how you can use this page, you might add code like the following to override the default failure handler to not display the error dialog if a particular request fails.

```
RightNow.Event.subscribe("on_before_ajax_request", function(name,
data){
    data = data[0];
    if(data.url === '/ci/ajaxRequestMin/getHierValues'){
        data.failureHandler = function(response){};
    }
});
```

This code subscribes to an event that is fired before making an AJAX request. In this case, if the request is made to a specific URL, the failure handler function is set to not do anything, and the request can be modified as required.

Customizing the error pages

The */cp/customer/development/errors* folder contains two PHP scripts used to display customized error pages. These are *error_general.php* and *error_php.php*. Besides customizing the appearance of these pages, you can also display information provided by the customer portal if an error occurs. This information includes severity, message, file name, and line number where the error occurred. By customizing these pages, you can provide your customers with more specific information than they will receive from a standard 404 error page delivered by the web server. You can edit these files but you cannot add any files to this folder.

Additionally, the */cp/customer/error* folder contains the following static HTML pages that you can customize to provide additional information when the following error types are returned. The default message is "There has been an error with your request."

- *error404.html*—Displayed when an **HTTP 404 Not found** error code is returned.
- *error413.html*—Displayed when an **HTTP 413 Request entity too large** error code is returned.
- *error500.html*—Displayed when an **HTTP 500 Internal server** error code is returned.

The *splash.html* page is displayed when your site is being upgraded. For information, refer to Splash page for maintenance mode.

Dynamic forms

A dynamic form is a form with fields that change depending on selections in other fields. For example, when a customer selects a certain product, you may want to ask for additional information that would not be relevant if the customer had selected a different product. A dynamic form identifies the customer-selected product and displays the additional fields for that product selection.

Because creating dynamic forms can be a complex coding task, the Customer Portal includes a change handler for the Field.js module (used by input widgets) in the Customer Portal JavaScript API. Input widgets subscribe to this change handler, which is called anytime the widget changes. When you want a widget for a dynamic form, you extend the corresponding standard input and override the onChange function. All input widgets have a *hide_on_load* attribute to let you hide forms that should appear only when the input value of another widget matches the condition you define.

Although product selection is a primary use case for dynamic forms, the change handler is triggered by changes to any form field, not just products or categories. In addition to changing a field's visibility, you can also change whether it is required based on a previous field. The setConstraints method indicates whether customers must add a value to the field.

The general steps for creating a dynamic form include the following.

1 Create a new widget by extending one of the following standard input widgets (DateInput, FileAttachmentUpload, MobileProductCategoryInput, PasswordInput, ProductCategory-Input, SelectionInput, or TextInput).

Note This is the widget that triggers the change when its value is changed rather than the widget that changes as a result of a value change. For example, if you want to make the Incident.Product field required when the Incident.Subject field equals "test," extend the TextInput widget so you can use it with the Incident.Subject field.

2 Edit the widget you created so it subscribes to the change event handler.

3 Use the findField method to retrieve the field that should change (the Incident.Product field in this example).

4 Call the setContraints method with a JavaScript object (for example, `constraint = {required:true}`) to change the field.

Dynamic forms code sample

Dynamic forms can be configured in a countless number of ways. We have created a code sample that introduces you to the functionality available in dynamic forms so that you can configure the forms you need.

Illustrated concepts

The dynamic forms code sample illustrates the following concepts.

- Extension of the *logic.js* file
- Implementation of a change event handler
- Overriding of show and hide methods to produce a dynamic form with multiple levels of nesting
- Making fields required or not required based on selections for other fields.

Steps for using the sample code

The following procedure describes the necessary steps for using the dynamic forms sample code.

To use the dynamic forms sample code

1. Download DynamicForm.zip from http://documentation.custhelp.com/euf/assets/docs/may2015/cp_resources/samples/DynamicForm.zip and extract the files.

2. Copy the downloaded *dynamic_ask.php* file from the *Dynamic Form/customer/development/views/pages* folder and paste into your development pages at */cp/customer/development/views/pages*.

3. Copy the downloaded *input* folder from *Dynamic Form/customer/development/widgets/custom* and paste into your development pages at */cp/customer/development/widgets/custom*.

4. Activate the downloaded widget.
   - **a** Go to the Customer Portal Administration site at https://[your_site]/ci/admin/versions/manage.
   - **b** Locate the DynamicProductCategoryInput widget in the left column. (Custom widgets are listed alphabetically before the standard widgets.)
   - **c** Select the widget and click Activate this Version in the upper right of the screen.

5. Create a new custom object. The following steps provide a brief overview of the process. For more detail, see [To import custom objects](#).
   - **a** Log in to Oracle Service Cloud.
   - **b** Double-click Object Designer in the navigation pane.
   - **c** Click in Import button on the ribbon, browse to *Dynamic Form/exports/CP CustomObject.zip*, and click Open.
   - **d** Click Next, and then click Next again. A message notifies you that the import was successful.
   - **e** Click Save on the ribbon.
   - **f** Click Deploy on the ribbon.

6. On the Service Console, click the Service button and then double-click Products/Categories/Dispositions.

7. Mouse over the products and categories for the ID values of the products and categories you want to use in the sample code. You will replace the product and category ID values used in the sample code with IDs that are relevant to your customer portal.

8. Edit the *dynamic_ask.php* page to use your organization's product and category IDs. These IDs are referenced in lines 33, 43, and 44.

When you go to your development site and select various products and categories, you will notice that the displayed fields vary with your selections. Notice that the sample code in the *dynamic_ask.php* page first displays the Category field only for selected products (those products associated with ID 1 and ID 2 in the sample code). Then it displays selected fields based on the category ID.

For example, using the code sample, select product ID 2 and category ID 68 will display the custom Serial Number field. The following table shows the dynamic fields that are displayed and/or required for selected product and category IDs called out in the code sample. You can substitute your product and category IDs to create a similar matrix for testing your custom code.

Table 393: Dynamic Fields in Sample *dynamic_ask* Page

Product ID	**Category ID**	**Displayed/Required Dynamic Fields**
1 or 2	68	Serial Number
1 or 2	78	Serial Number Purchase Date Request Callback
1 or 2	All	Email Address Subject Question Attach Documents
1 or 2	77	Required: Attach Documents
1 or 2	78	Required: Serial Number Required: Attach Documents
1 or 2	79	Required: Attach Documents

Creating the DynamicProductCategoryInput widget yourself

Here are the steps for creating the DynamicProductCategoryInput widget. By understanding the steps involved, you can use this procedure as an example of creating other dynamic input fields.

To create the DynamicProductCategoryInput widget

1 Open the widget builder on your Customer Portal Administration site by going to https://<your_site>/ci/admin/tools/widgetBuilder.

2 Click **Extend the functionality of an existing widget.**

3 The custom DynamicProductCategoryInput widget extends the standard ProductCategoryInput widget, so enter `ProductCategoryInput` in the field **Which widget shall it extend from?** and select input/ProductCategoryInput.

4 Type `DynamicProductCategoryInput` in **What is its name?** and `input` in **And its parent folder?**

5 Click Continue. The Components section opens to let you specify the files you require.

6 Select Yes for **Does this widget have its own controller?** and No for **Will it be doing any of its own AJAX handing?**

7 Select No for **Does this widget modify the parent widget's view?** and Yes for **Include the parent widget's CSS?**

8 Select Yes for **Does this widget have its own JavaScript?** and No for **JavaScript templates too?**

9 Click Continue. The Attributes section opens.The DynamicProductCategoryInput widget uses all of the standard ProductCategoryInput widget's attributes, and you will add two more attributes.

10 Scroll to the bottom of the Attributes section, click **Add an attribute,** and type `show_fields_for_ids` in the field.

a Select String from the Type drop-down menu.

b Add this description:
A list of IDs for the given data type and the fields that are associated with it. For instance:

```
2:Incident.Subject,Incident.Threads |
5:Incident.Subject,Incident.Threads, Incident.FileAttachments
```

c Leave the Default Value field blank.

d Leave the check box for **This attribute is required** cleared.

11 Scroll to the bottom of the Attributes section, click **Add an attribute,** and type `fields_required_for_ids` in the field.

a Select String from the Type drop-down menu.

b Add this description:
A list of IDs for the given data type and the fields that are associated with it that should be required. For instance:

```
2:Incident.FileAttachments | 5:Incident.FileAttachments,
Incidents.CustomFields.CP.SerialNumber
```

c Leave the Default Value field blank.

d Leave the check box for **This attribute is required** cleared.

12 Click Continue, and then click Create Widget. The code for the custom widget is generated automatically.

Important Although the widget builder generated the files you need and used the information you provided, you must now edit the files to complete the changes necessary for the functionality of the DynamicProductCategoryInput widget.

Editing the logic.js file

The *logic.js* file generated by the widget builder does not include a change event handler, so you must edit the file to add it. Review the code of the *logic.js* file you downloaded in To use the dynamic forms sample code to get an understanding of the various methods that form input widgets include. The following methods extend from RightNow.Field.

- hide( )—To hide a form input widget.
- show( )—To display a form input widget.
- getValue( )—To return the current value of a form input widget.
- getFieldName( )—To return the field name, for example, Incident.Product.
- isVisible( )—To return a boolean value that indicates whether the widget is visible.
- setConstraints( )—To indicate whether a field is required.
- parentForm( )—To locate the parent form. You can use this with findField( ), as this example shows.

  ```
  this.parentForm().findField('Incident.Subject').show()
  ```
- findField( )—To specify any read/write field, including custom fields and attributes, found in the Business Objects section of the Customer Portal Administration site (Framework > Business Objects).

You must also override the show and hide methods to support multiple levels in a dynamic form.

Editing the controller.php file

Add code to the *controller.php* file to parse the widget attributes and pass them to the *logic.js* file using the following as an example.

```
$this->data['js']['fieldMapping'] =
```

Editing the dynamic_ask.php page

Edit the DynamicProductCategoryInput widget on the sample *dynamic_ask.php* page to reflect the product and category IDs on your site.

Code samples

This section contains code samples for the widgets, models, controllers and other custom code that you can create for Customer Portal.

Note The sample code in this document or accessed through this document is not certified or supported by Oracle. It is intended for educational or testing purposes only. Use of this sample code implies acceptance of the License Agreement.

Custom widget sample code

This section contains the code for a number of custom widgets. For each widget, the following is included:

- A summary of the widget's purpose.
- The concepts illustrated by the sample widget.
- Any prerequisite tasks you must perform before using the widget.
- The steps required for installing and using the sample widget.
- The steps required if you were creating the sample widget yourself. This includes creating the widget with the widget builder and then customizing the code as necessary to match the sample widget's functionality.

Note If you want to use the custom widget exactly as it is, all you need to do is install the widget following "Steps for using the sample widget" under the widget's main heading. If, however, you want to customize the widget or understand the steps that went into creating it, refer to "Creating the widget yourself" under the widget's main heading.

- The *info.yml* file for the sample widget.
- For each of the other widget files and supporting files:
  - ▷ Code samples as generated by widget builder or as provided in model or controller template files.
  - ▷ Code samples for the custom widgets with a description of their purpose and showing the changes that you would need to make to the generated files or template files.

This section also contains cross-references to the topics that explain the ways in which widgets can be customized.

The order of the samples reflects a progression from more basic customization where a widget is extended, through customization of a parent widget, to the most complex customization where a new widget is created from scratch.

- The AdditionalResults sample widget
- The ExtendedAnswerFeedback sample widget
- The DisplayChartReport sample widget
- The PollingSlider widget

The zip files for these samples and additional samples are available at:

http://documentation.custhelp.com/euf/assets/docs/may2015/cp_resources/samples

Each sample zip includes a README file with information on how to build the sample using the widget builder and perform any further customization.

In addition to the samples described in this section, the following samples are also available:

- ClickCounterWithAjax sample widget—This widget provides a simple example of an AJAX request being processed by a widget's controller and the returned data being rendered within the widget. It illustrates widget creation, widget controller AJAX handling, and widget JavaScript views.
- FilteredTopAnswers sample widget—This widget provides an example of how to display results from a report that are filtered at runtime by the product and category ID, provided by widget attributes. It illustrates widget creation and report data interaction and display.

The AdditionalResults sample widget

The AdditionalResults sample widget queries a third-party search API when searching the Oracle Service Cloud knowledge base and appends the results onto the end of report results. It extends from the standard Multiline widget.

Duck Duck Go is the third-party search engine used as the source for search results. Simple phrases and keywords will return results, but Duck Duck Go's search API does not return results for complex queries or questions.

This sample widget assumes that the default Multiline report (ID 176) is being used.

Click to view

Illustrated concepts

The sample illustrates the following:

- Widget extension:
  - ▷ Extending a widget's controller
  - ▷ Extending a widget's logic file
  - ▷ Extending a widget's view (using <rn:block> elements in the PHP widget view and EJS widget view)
  - ▷ Including and inheriting CSS from the parent widget. See Extending a widget's CSS.
- Widget controller AJAX handler. See Handling AJAX requests in the widget controller.
- Using the widget's *source_id* attribute to trigger searches on an additional search end-point. See Using additional search sources with report widgets.
- Making a simple HTTP request to a third-party API and using the PersistentRead-ThroughCache class to cache responses.

Steps for using the sample code

To install the sample widget, follow this procedure.

To install the widget

1 Create a *search* folder in */cp/customer/development/widgets/custom*.

2 Download *Additional Results.zip* from http://documentation.custhelp.com/euf/assets/docs/may2015/cp_resources/samples/AdditionalResults.zip and extract the files.

3 Move or copy the *AdditionalResults.css* file from the unzipped *Additional Results/customer/assets/themes/standard/widgetCss* folder into your */cp/customer/assets/themes/standard/widgetCss* folder.

4 Move or copy the unzipped *Additional Results/customer/development/widgets/custom/search/AdditionalResults* folder into your */cp/customer/development/widgets/custom/search* folder that you created in step 1.

5 Activate the AdditionalResults widget.

  a Go to https://<your_site>/ci/admin/versions/manage.

  b In the left column, locate and select the AdditionalResults widget. Custom widgets are listed at the top, and it is grayed out to indicate that it is not yet active.

  c Click Start Using This Version in the upper right corner of the page.

6 Place the widget on a search results page and add the *source_id* attribute to widgets that are to trigger and provide filter values for the search. See The list.php page for information about which widgets require the *source_id* attribute.

See how to use the widget builder to create the AdditionalResults widget.

Creating the widget yourself

Here are the steps that let you create the AdditionalResults widget yourself by using the widget builder to extend an existing standard widget.

To create the widget

1 Open the widget builder on your Customer Portal Administration site by going to https://<your_site>/ci/admin/tools/widgetBuilder.

2 Click Extend the functionality of an existing widget.

3 The custom AdditionalResults widget extends the standard Multiline widget, so enter `Multiline` in the field **Which widget shall it extend from?** and select reports/Multiline. Type `AdditionalResults` in **What is its name?** and `search` in **And its parent folder?**

4 Click Continue. The Components section opens to let you specify which of the controller, view, and JavaScript files you require.

5 Select Yes for **Does this widget have a controller of its own?** and Yes for **Will it be doing any of its own AJAX handling?**

6 Select Yes for **Does this widget modify the parent widget's view?** and select the Extend the view radio button.

7 Select Yes for **Include the parent widget's CSS?**

8 Select Yes for **Does this widget have its own JavaScript?** and Yes for **JavaScript templates too?**

9 Click Continue. The Attributes section opens. The AdditionalResults custom widget example uses all of the standard Multiline widget's attributes.

10 Click Add attribute and add a *source_id* attribute.

- **Type**—string
- **Description**—ID for an additional search source
- **Default value**—ddg

11 Add a *search_endpoint* attribute.

- **Type**—ajax
- **Description**—Endpoint for searches
- **Default value**—/ci/ajax/widget

12 Add a *label_heading* attribute.

- **Type**—string
- **Description**—Heading for additional results
- **Default value**—Additional results

13 Click Continue.

14 Click Add additional details and type the following in the Widget description field: `This widget extends standard Multiline functionality in order to append additional search results from a third-party source onto standard knowledgebase report results.`

15 Click Create Widget at the bottom of the page. The code for the custom widget is generated automatically.

Important Although the widget builder generated the files you need and used the information you provided, you must now edit the files to complete the changes necessary for the functionality of the AdditionalResults widget.

The info.yml file

The YAML file shows that the sample widget extends from the Multiline widget and has its own extending controller, view, logic, and CSS files. Apart from the ten attributes inherited from the Multiline widget, the widget has three additional attributes: *source_id*, *search_endpoint*, and *label_heading*. The inherited attributes are not included in the *info.yml* file because their default values remain the same.

For more information, see Widget info files.

The YAML code generated by the widget builder

```
version: "1.0"
requires:
    jsModule:
    - standard
attributes:
    source_id:
        name: source_id
        type: string
        description: ID for an additional search source
        default: ddg
        required: false
    search_endpoint:
        name: search_endpoint
        type: ajax
        description: Endpoint for searches
        default: /ci/ajax/widget
        required: false
```

```
        label_heading:
            name: label_heading
            type: string
            description: Heading for additional results
            default: Additional results
            required: false
info:
    description: This widget extends standard Multiline functionality
    in order to append additional search results from a third-party
    source onto standard knowledgebase report results.
    urlParameters:
        kw:
            name: Keyword
            description: The current search term
            example: kw/search
        r_id:
            name: Report ID
            description: The report ID to apply filters to
            example: r_id/176
        st:
            name: Search Type
            description: Sets the search type to the URL parameter
            value
            example: st/6
        org:
            name: Organization Type
            description: Sets the organization type to the URL
            parameter value
            example: org/2
        page:
            name: Page
            description: Sets the select to the page number in the URL
            parameter
            example: page/2
        search:
            name: Search
            description: Key denoting if search should be performed
            example: search/0
        sort:
            name: Sort By
            description: Sets the sort column to value and direction.
```

```
                Use column number
                and 1 for ascending, 2 for descending
                example: sort/3,1
extends:
    widget: standard/reports/Multiline
    components:
    - php
    - view
    - js
    - css
```

The changes required for AdditionalResults

```
# File: info.yml
# Abstract: Definition of AdditionalResults widget
# Version: 1.0

version: "1.0"
requires:
framework: ["3.0", "3.1"]
    jsModule:
    - standard
attributes:
    source_id:
        name: source_id
        type: string
        description: ID for an additional search source
        default: ddg
    search_endpoint:
        name: search_ajax
        type: ajax
        description: Endpoint for searches
        default: /ci/ajax/widget
    label_heading:
        name: label_heading
        type: string
        description: Heading for additional results
        default: Additional results
extends:
```

```
        widget: standard/reports/Multiline
        includeParentCss: true
        components:
        - php
        - view
        - css
        - js
    info:
        description: This widget extends standard Multiline functionality
        in order to append additional search results from a third-party
        source onto standard knowledgebase report results.
        urlParameters:
            kw:
                name: rn:msg:KEYWORD_LBL
                description: rn:msg:THE_CURRENT_SEARCH_TERM_LBL
                example: kw/search
```

The list.php page

The containing page for the AdditionalResults widget, *list.php*, also includes a number of other widgets that must share the same *source_id* attribute value as the AdditionalResults widget.

- **KeywordText**—Provides the search term.
- **SearchButton**—Triggers the search.

Report and search widgets such as Paginator and ResultInfo will not include the Duck Duck Go search source's results. Even if their widget declarations are updated to share the same *source_id* value, their *controller.php* and *logic.js* code needs to be updated to look at the specific return structure of the results (specifically the RelatedTopics array in the returned object), for example, to properly calculate pagination, and number of results returned. You can extend these widgets' standard functionality in a similar manner as for AdditionalResults to properly handle results returned from Duck Duck Go.

Code for the list.php page

```
<rn:meta title="#rn:msg:FIND_ANS_HDG#" template="standard.php"
clickstream="answer_list"/>

<rn:widget path="knowledgebase/RssIcon"/>
<rn:container report_id="176">
<div id="rn_PageTitle" class="rn_AnswerList">
```

```
        <div id="rn_SearchControls">
            <h1 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_CMD#</h1>
            <form onsubmit="return false;">
                <div class="rn_SearchInput">
                    <rn:widget path="search/AdvancedSearchDialog"/>
                    <rn:widget path="search/KeywordText"
                    label_text="#rn:msg:FIND_THE_ANSWER_TO_YOUR_QUESTION_
                    CMD#" initial_focus="true" source_id="ddg"/>
                </div>
                    <rn:widget path="search/SearchButton"
                    source_id="ddg"/>
            </form>
            <rn:widget path="search/DisplaySearchFilters"/>
        </div>
    </div>
    <div id="rn_PageContent" class="rn_AnswerList">
        <div class="rn_Padding">
            <h2 class="rn_ScreenReaderOnly">#rn:msg:SEARCH_RESULTS_CMD#</
            h2>
            <rn:widget path="reports/ResultInfo"/>
            <rn:widget path="knowledgebase/TopicWords"/>
            <rn:widget path="search/AdditionalResults" source_id="ddg"/>
            <rn:widget path="reports/Paginator"/>
        </div>
    </div>
</rn:container>
```

Editing the logic.js file

The widget builder creates the basic template you need for your custom widget's JavaScript functionality, which is shown in the first code sample. The second sample shows the changes you must make for the AdditionalResults custom widget.

The logic file for AdditionalResults sets the AJAX endpoint for the custom search source, oversees the report and additional results responses, and calls the parent widget's method to render the combined results.

The endpoint for the custom search source is specified in the constructor function. For every *source_id* used on the page, an endpoint must be specified. The endpoint is the route to a controller and handler method for the AJAX request. In this case, the widget's controller itself processes the AJAX request, so the widget's *search_endpoint* attribute value defaults to */ci/*

ajax/widget, which is the generic controller route to specify when the widget's controller method is handling the request. However, the *search_endpoint* attribute could specify a custom controller route (for example, */cc/myController/myMethod)* to process the request.

The parent functions _searchInProgress() and _onReportChanged() are overridden.

For more information, refer to Extending a widget's logic file.

The JavaScript code generated by the widget builder

```
RightNow.namespace('Custom.Widgets.search.AdditionalResults');
Custom.Widgets.search.AdditionalResults =
RightNow.Widgets.Multiline.extend({
    /**
    * Place all properties that intend to
    * override those of the same name in
    * the parent inside `overrides`.
    */
overrides: {
        /**
        * Overrides RightNow.Widgets.Multiline#constructor.
        */
        constructor: function() {
            // Call into parent's constructor
            this.parent();
        }

        /**
        * Overridable methods from Multiline:
        *
        * Call `this.parent()` inside of function bodies
        * (with expected parameters) to call the parent
        * method being overridden.
        */
        // _setFilter: function()
        // _searchInProgress: function(evt, args)
        // _setLoading: function(loading)
        // _onReportChanged: function(type, args)
        // _displayDialogIfError: function(error)
        // _updateAriaAlert: function(text)
    },
```

```
        /**
        * Sample widget method.
        */
        methodName: function() {

        },

        /**
        * Makes an AJAX request for `search_endpoint`.
        */
        getSearch_endpoint: function() {
            // Make AJAX request:
            var eventObj = new RightNow.Event.EventObject(this, {data:{
                w_id: this.data.info.w_id,
                // Parameters to send
            }});
            RightNow.Ajax.makeRequest(this.data.attrs.search_endpoint,
            eventObj.data, {
                successHandler: this.search_endpointCallback,
                scope:          this,
                data:           eventObj,
                json:           true
            });
    },

        /**
        * Handles the AJAX response for `search_endpoint`.
        * @param {object} response JSON-parsed response from the server
        * @param {object} originalEventObj `eventObj` from
        * #getSearch_endpoint
        */
        search_endpointCallback: function(response, originalEventObj) {
            // Handle response
        },

        /**
        * Renders the `view.ejs` JavaScript template.
        */
        renderView: function() {
```

```
            // JS view:
            var content = new EJS({text:
            this.getStatic().templates.view}).render({
                // Variables to pass to the view
                // display: this.data.attrs.display
            });
        }
    });
```

The changes required for AdditionalResults

```
    /**
    * File: logic.js
    * Abstract: Extending logic for AdditionalResults widget
    * Version: 1.0
    */
    RightNow.namespace('Custom.Widgets.search.AdditionalResults');
    Custom.Widgets.search.AdditionalResults =
    RightNow.Widgets.Multiline.extend({
    overrides: {
            /**
            * Overrides RightNow.Widgets.Multiline#constructor.
            */
            constructor: function() {
                //Call into parent's constructor
                this.parent();

                this.Y.one(this.baseSelector).delegate('click',
                this.onResultClick, '.result');

                // The endpoint for searches for this source_id is
                specified here.
                var options = {};
                options[this.data.attrs.source_id] = { endpoint:
                this.data.attrs.search_endpoint };
                // Any searches that are triggered with this source_id
                will automatically POST the
                // search term (kw) to the endpoint.
                // Additional options can also be specified such as...
                // Additional search filters to include (if they're on the
                page) and POST values to the endpoint.
```

```
        // options[this.data.attrs.source_id].filters = [ 'p',
        'c', 'sort' ];
        // Additional parameters to POST to the endpoint.
        // options[this.data.attrs.source_id].params = { 'key':
        'value' };

        this.searchSource(options)
            .on('search', this.onSearch, this)
            .on('response', this.onAdditionalResultsResponse,
            this);
    },

    /**
    * Overrides RightNow.Widgets.Multiline#_searchInProgress.
    * Resets the _reportResults member on a new search before
    calling its parent.
    * @param {string} evt Event name
    * @param {array} args Event object
    */
    _searchInProgress: function(evt, args) {
        this._reportResults = null;
        this.parent(evt, args);
    },

    /**
    * Overrides RightNow.Widgets.Multiline#_onReportChanged.
    * Sets the _reportResults member to the given results. If both
    the
    * report results and additional results have returned then the
    additional
    * results are added to data so that they're applied toward the
    rendered view
    * in the parent method.
    * @param {string} evt Event name
    * @param {array} args Event object
    */
    _onReportChanged: function(type, args) {
        this._reportResults || (this._reportResults = args);

        if (this._reportResults) {
            this._reportResults[0].data.heading =
```

```
                this.data.attrs.label_heading;
                this._reportResults[0].data.results =
                this._additionalResults  || [];
                this.parent('response', this._reportResults);
            }
        }
    },

    * Click handler for result div.
    * Makes the result href easier to click
    * by making the entire result div clickable.
    * @param {object} e Click event
    */
    onResultClick: function(e) {
        e.halt();

        RightNow.Url.navigate(e.currentTarget.one('.content
        a').get('href'), true);
    },

    /**
    * Called when a new search is triggered by a widget with the same
    source_id attribute.
    * Resets the member keeping track of additional results and
    responds with an event object
    * containing the widget's id.
    * @return {object} EventObject
    */
    onSearch: function() {
        this._additionalResults = null;

        return new RightNow.Event.EventObject(this, { data: {
            // Since the keyword being searched on is automatically
            included
            // (see the constructor comments above),
            // the only thing we need to send to the server is the
            widget's id
            // which is used to sort out which widget instance's
            method should
            // be used to handle the AJAX request.
```

```
            w_id: this.data.info.w_id
        }});
    },

    /**
    * Called when results for the AJAX request for additional results
    are returned from the server.
    * @param {string} evt Event name
    * @param {array} args Event arguments; the event object that we
    want will be at index 0
    */
    onAdditionalResultsResponse: function(evt, args) {
        this._additionalResults = args[0].data.RelatedTopics;
        this._onReportChanged();
    }
});
```

Editing the controller.php file

The widget builder creates the basic template you need for your custom widget's controller, which is shown in the first code sample. The second sample shows the changes you must make for the AdditionalResults custom widget.

The controller for AdditionalResults processes the widget's search AJAX request and retrieves and caches search results from the third-party API. The controller does its own AJAX handling, therefore the controller contains code to register the AJAX handler method, getSearchResults(), for the widget.

The HTTP request is made through the getResults() function using PersistentReadThrough-Cache. For more information, refer to Extending a widget's controller and Handling AJAX requests in the widget controller.

The controller code generated by the widget builder

```
<?php
namespace Custom\Widgets\search;

class AdditionalResults extends \RightNow\Widgets\Multiline {
    function __construct($attrs) {
        parent::__construct($attrs);
```

```
        $this->setAjaxHandlers(array(
            'search_endpoint' => array(
                'method'      => 'handle_search_endpoint',
                'clickstream' => 'custom_action',
            ),
        ));
    }

    function getData() {

        return parent::getData();

    }

    /**
    * Handles the search_endpoint AJAX request
    * @param array $params Get / Post parameters
    */
    function handle_search_endpoint($params) {
        // Perform AJAX-handling here...
        // echo response
    }
}
```

[The changes required by AdditionalResults]()

```
<?php
/**
* File: controller.php
* Abstract: Extending controller for AdditionalResults widget
* Version: 1.0
*/

namespace Custom\Widgets\search;

use RightNow\Libraries\Cache;

/**
* AdditionalResults
* @uses RightNow\Widgets\Multiline
```

```
*/
class AdditionalResults extends \RightNow\Widgets\Multiline {
    const CACHE_TIME = 1800; // Amount of time to cache results from
    the third-party API (in seconds)
    const API_URL = 'http://api.duckduckgo.com/?q=%s&format=json';

    function __construct($attrs) {
        parent::__construct($attrs);

        // Register the AJAX-handler method for this widget.
        // The key is the name of the widget's AJAX-type attribute.
        // The value can either be a String name of the method that
        // will handle the AJAX request OR an associative array with
        // two keys:
        // * method: String name of the method that will handle the
        AJAX request
        // * clickstream: String name of a clickstream entry to record
        for the AJAX request
        $this->setAjaxHandlers(array(
            'search_endpoint' => array(
                'method'      => 'getSearchResults',
                'clickstream' => 'custom_search',
            ),
        ));
    }

    function getData() {
        if ($kw = \RightNow\Utils\Url::getParameter('kw')) {
            $this->data['additionalResults'] = json_decode($this-
            >getResults($kw));
        }

        return parent::getData();
    }

    /**
     * Produces search results as an AJAX endpoint.
     * @param array $params POST params
     * @return string JSON results
     */
    function getSearchResults($params) {
```

```
        $response = $this->getResults($params['keyword']);

        header('Content-Length: ' . strlen($response));
        header('Content-type: application/json');
        echo $response;
    }

    /**
    * Makes the HTTP request thru the PersistentReadThroughCache
    * caching mechanism to the third-party API.
    * @param string $kw search query
    * @return string response from third-party; if no search query
    * is supplied, an object consisting of a "RelatedTopics" property
    * with an empty array is returned
    * @see http://api.duckduckgo.com/ Format of what's returned
    */
    protected function getResults($kw) {
        // If no query is supplied, the API doesn't return anything.
        // Our code expects that, at the very least,
        // this minimal object is returned.
        if ($kw === '' || $kw === null) return '{"RelatedTopics":[]}';

        $cache = new
        Cache\PersistentReadThroughCache(self::CACHE_TIME,
        function($kw, $url) {
            \RightNow\Utils\Framework::logMessage(sprintf($url,
            $kw));
            return @file_get_contents(sprintf($url, $kw));
        });

        return $cache->get($kw, self::API_URL);
    }
}
```

Editing the view.php and view.ejs files

The widget builder creates the basic template you need for your custom widget's *view.php* and *view.ejs* files, which are shown in the first set of code samples. The second set of samples shows the changes required for the AdditionalResults custom widget.

The PHP and EJS view files of AdditionalResults use an `<rn:block>` element as an insertion point to append additional results after the standard report results. Compared to the templates generated by widget builder, most of the `<rn:block>` elements and all of the comments are deleted.

For more information, refer to Extending a widget's view.

The view.php code generated by the widget builder

```
<!--
<rn:block id='Multiline-top'>

</rn:block>
-->

<!--
<rn:block id='Multiline-preLoadingIndicator'>

</rn:block>
-->

<!--
<rn:block id='Multiline-postLoadingIndicator'>

</rn:block>
-->

<!--
<rn:block id='Multiline-topContent'>

</rn:block>
-->

<!--
<rn:block id='Multiline-preResultList'>

</rn:block>
-->

<!--
```

```
<rn:block id='Multiline-topResultList'>

</rn:block>
-->

<!--
<rn:block id='Multiline-resultListItem'>

</rn:block>
-->

<!--
<rn:block id='Multiline-bottomResultList'>

</rn:block>
-->

<!--
<rn:block id='Multiline-postResultList'>

</rn:block>
-->

<!--
<rn:block id='Multiline-bottomContent'>

</rn:block>
-->

<!--
<rn:block id='Multiline-bottom'>

</rn:block>
-->
```

The view.ejs code generated by the widget builder

```
<!--
<rn:block id='preResultList'>
```

```
</rn:block>
-->

<!--
<rn:block id='topResultList'>

</rn:block>
-->

<!--
<rn:block id='resultListItem'>

</rn:block>
-->

<!--
<rn:block id='bottomResultList'>

</rn:block>
-->

<!--
<rn:block id='postResultList'>

</rn:block>
-->
```

The changes to view.php required by AdditionalResults

```
<?php
/**
* File: view.php
* Abstract: Extending PHP view for AdditionalResults widget
* Version: 1.0
*/
?>
<rn:block id='Multiline-postResultList'>
<? if ($this->data['additionalResults']->RelatedTopics): ?>
<div class="additionalresults">
```

```
<? if ($this->data['attrs']['label_heading']): ?>
    <h3><?= $this->data['attrs']['label_heading'] ?></h3>
<? endif; ?>
    <div id="rn_<?= $this->instanceID ?>" class="results">
    <? foreach ($this->data['additionalResults']->RelatedTopics as
    $topic): ?>
        <? if (!$topic->Result) continue; ?>
        <div class="result">
            <div class="icon">
                <img src="<?= $topic->Icon->URL ?>"/>
            </div>
            <div class="content">
                <?= $topic->Result ?>
            </div>
        </div>
    <? endforeach; ?>
    </div>
</div>
<? endif; ?>
</rn:block>
```

The changes to view.ejs required by AdditionalResults

```
<%
/**
* File: view.ejs
* Abstract: Extending JS view for AdditionalResults widget
* Version: 1.0
*/
%>
<rn:block id='Multiline-postResultList'>
<% if (results.length) { %>
<div class="additionalresults">
<% if (heading) { %>
    <h3><%= heading %></h3>
<% } %>
<% for (var i = 0; i < results.length; i++) { %>
    <% if (!results[i].Result) continue; %>
    <div class="result">
```

```
            <% if(results[i].Icon && results[i].Icon.URL) { %>
            <div class="icon">
                <img src="<%= results[i].Icon.URL %>"/>
            </div>
            <% } %>
            <div class="content">
                <%= results[i].Result %>
            </div>
        </div>
    <% } %>
    </div>
    <% } %>
    </rn:block>
```

Editing the presentation CSS file

The first CSS code shows the basic container for the CSS code as it was generated by the widget builder. The second set of CSS code is used to display the AdditionalResults as it appears in the example. You can also modify CSS characteristics to match whatever presentation you want for the custom widget.

The CSS for the Multiline widget is included. The AdditionalResults.css file simply adds styling for the custom widget.

The AdditionalResults.css code generated by the widget builder

```
/**
* AdditionalResults.css: Presentation CSS
*/
.rn_AdditionalResults.rn_Multiline {

}
```

The changes required by AdditionalResults

```
/**
* File: AdditionalResults.css
* Abstract: Provides styling for AdditionalResults widget
* Version: 1.0
*/
```

```
.rn_AdditionalResults.rn_Multiline .additionalresults {
    background: #FAF8F8;
    border: 1px solid #CCC;
    border-radius: 4px;
    box-shadow: 0 0 7px rgba(0, 0, 0, .3);
    margin: 2em;
    padding: 10px;
}

.rn_AdditionalResults.rn_Multiline h3 {
    border-bottom: 1px dashed #CCC;
    margin-bottom: 1em;
}
.rn_AdditionalResults.rn_Multiline .result {
    border-radius: 4px;
    border: 1px solid #CCC;
    box-shadow: 0 0 1px rgba(0, 0, 0, .2);
    clear: both;
    cursor: pointer;
    margin-bottom: 1.6em;
    overflow: hidden;
    padding: 1em;
}
.rn_AdditionalResults.rn_Multiline .result:hover {
    background: #F8F5F5;
}
.rn_AdditionalResults.rn_Multiline .icon {
    float: right;
    margin-left: 3em;
}
```

The ExtendedAnswerFeedback sample widget

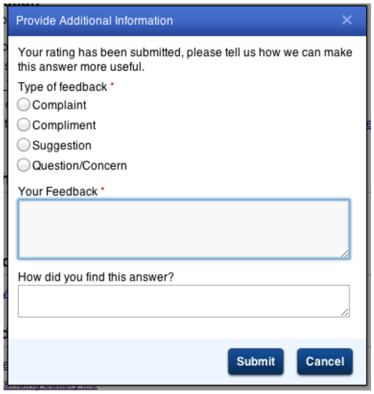
The ExtendedAnswerFeedback sample widget extends the standard AnswerFeedback widget to display and submit custom Incident fields in the feedback form.

This sample is one of the possible solutions to this common customization scenario. A different implementation could, for example, send the AJAX request to a custom endpoint that then sends the POST parameters to a custom model that either extends the standard Incident model or re-implements its own feedback creation logic. That implementation is a more classical approach to the problem, but it involves more code.

The approach that this sample takes—allowing the standard controller endpoint and model to process the feedback submittal normally, but using a hook model to add POST parameter values to the incident—is probably not the cleanest approach. However, it has the advantage of leaving the standard controller and Incident model processing intact, so that features like auto abuse-detection and enhancements and bug fixes in future framework updates will continue to happen automatically.

The sample widget requires two Incident custom fields. As the two incident custom fields are editable by the user, they will appear anywhere that the standard CustomAllInput widget is used, including on the Ask page. When the fields are not null, they will also appear where the standard CustomAllDisplay widget is used, for example, on the *questions/detail* page.

Click to view



Illustrated concepts

The sample illustrates the following:

- Widget extension:
  - ▷ Extending a widget's controller
  - ▷ Extending a widget's logic file
  - ▷ Extending a widget's view (using <rn:block> elements in the PHP widget view)
  - ▷ Including and inheriting CSS from the parent widget. See Extending a widget's CSS.
  - ▷ Overriding attributes to set different default values
  - ▷ Using a hook to add data to an incident before it is saved. See Adding hooks.

Prerequisites

You must complete the following tasks before you can use the sample code.

1 Create a menu-only custom object, TypeOfFeedbackMenu, with settings as follows:
   - **Type**—Menu Only Object
   - **Package**—CO
   - **Menu Items**—Complaint, Compliment, Suggestion, Question/Concern.

2 Add a custom field, type, for Incident, with settings as follows.
   - **Name**—type
   - **Label**—Type of feedback
   - **Package**—CO
   - **Data Type**— Menu
   - **Menu**—CO.TypeOfFeedback.

(Refer to Adding and editing custom fields for information about adding custom fields through the administration interface.)

3 Add a custom field, source, for Incident, with settings as follows.
   - **Name**—source
   - **Package**—CO
   - **Label**—How did you find this answer?
   - **Field Usage**—Long text.

Steps for using the sample code

To install the sample widget, follow this procedure.

To install the widget

1 Create a *feedback* folder in */cp/customer/development/widgets/custom*.

2 Download *ExtendedAnswerFeedback.zip* from http://documentation.custhelp.com/euf/assets/docs/may2015/cp_resources/samples/ExtendedAnswerFeedback.zip and extract the files.

3 Move or copy the *ExtendedAnswerFeedback.css* file from the unzipped *Extended AnswerFeedback/customer/assets/themes/standard/widgetCss* folder into your */cp/customer/assets/themes/standard/widgetCss* customer portal file folder.

4 Move or copy the unzipped *Extended AnswerFeedback/customer/development/widgets/custom/feedback/ExtendedAnswerFeedback* folder into your */cp/customer/development/widgets/custom/feedback* folder that you created in step 1.

5 Activate the ExtendedAnswerFeedback widget.
   - a Go to https://<your_site>/ci/admin/versions/manage.
   - b In the left column, locate and select the ExtendedAnswerFeedback widget. Custom widgets are listed at the top, and it is grayed out to indicate that it is not yet active.
   - c Click Start Using This Version in the upper right corner of the page.

6 Replace the AnswerFeedback widget on the standard *answers/detail.php* page with ExtendedAnswerFeedback.

7 Move or copy the *CustomIncidentModel.php* file from the unzipped *Extended AnswerFeedback/customer/development/models/custom* folder into your */cp/customer/development/models/custom* folder.

8 Register the hook by adding the following to */cp/customer/development/config/hooks.php*.

```
$rnHooks['pre_feedback_submit'] = array(
    'class'    => 'CustomIncidentModel',
    'function' => 'preFeedbackSubmit',
);
```

9 To view the new custom field values on newly-created Answer feedback incidents, add the new Incident.Co.type and Incident.CO.source fields to the Incident workspace that's currently in use.

See how to use the widget builder to create the ExtendedAnswerFeedback widget.

Creating the widget yourself

Here are the steps that let you create the ExtendedAnswerFeedback widget yourself by using the widget builder to extend an existing standard widget.

To create the widget

1 Open the widget builder on your Customer Portal Administration site by going to https://<your_site>/ci/admin/tools/widgetBuilder.

2 Click **Extend the functionality of an existing widget.**

3 The custom ExtendedAnswerFeedback widget extends the standard AnswerFeedback widget, so enter `AnswerFeedback` in the field **Which widget shall it extend from?** and select feedback/AnswerFeedback.

4 Type `ExtendedAnswerFeedback` in **What is its name?** and `feedback` in **And its parent folder?**

5 Click Continue. The Components section opens to let you specify which of the controller, view, and JavaScript files you require.

6 Select Yes for **Does this widget have a controller of its own?** and No for **Will it be doing any of its own AJAX handling?**

7 Select Yes for **Does this widget modify the parent widget's view?** and select the Extend the view radio button.

8 Select Yes for **Include the parent widget's CSS?**

9 Select Yes for **Does this widget have its own JavaScript?** and No for **JavaScript templates too?**

10 Click Continue. The Attributes section opens. The ExtendedAnswerFeedback custom widget example uses all of the standard AnswerFeedback widget's attributes.

11 For the *dialog_threshold* attribute, change the value for default to 3.

12 For the *options_count* attribute, change the value for default to 5.

13 Click Continue.

14 Click Add additional details and type the following in the Widget description field: `This widget extends standard AnswerFeedback functionality in order to save additional custom fields on the created Incident.`

15 Click Create Widget at the bottom of the page. The code for the custom widget is generated automatically.

Important Although the widget builder generated the files you need and used the information you provided, you must now edit the files to complete the changes necessary for the functionality of the ExtendedAnswerFeedback widget. You would also need to create the custom model as described in Creating the CustomIncidentModel.php file.

The info.yml file

The *info.yml* file shows that the sample widget extends from the AnswerFeedback widget and has its own extending controller, view, logic, and CSS files. Apart from the attributes inherited from the AnswerFeedback widget, the widget has two inherited attributes with modified values: *dialog_threshold*, and *options_count*.

For more information, see [Widget info files](#).

The YAML code generated by the widget builder

```
version: "1.0"
requires:
    jsModule:
    - standard
attributes:
    dialog_threshold:
        name: dialog_threshold
        type: int
        description: Rating level at which an additional form displays
        to allow additional comments to be submitted
        default: 3
        required: false
    options_count:
        name: options_count
        type: int
        description: Number of options to display
        default: 5
        required: false
info:
        description: This widget extends standard AnswerFeedback
        functionality in order to save additional custom fields on the
        created Incident.
        urlParameters:
            a_id:
                name: Answer ID
                description: Answer ID from which to associate
                feedback
                example: a_id/3
extends:
    widget: standard/feedback/AnswerFeedback
        components:
```

```
        - php
        - view
        - js
        - css
```

The changes required for ExtendedAnswerFeedback

```
version: "1.0"
requires:
    framework: ["3.0", "3.1"]
    jsModule:
    - standard
attributes:
    dialog_threshold:
        name: dialog_threshold
        type: int
        description: Rating level at which an additional form displays
        to allow additional comments to be submitted
        default: 3
        required: false
    options_count:
        name: options_count
        type: int
        description: Number of options to display
        default: 5
        required: false
extends:
    widget: standard/feedback/AnswerFeedback
        components:
        - view
        - js
        - css
```

Editing the logic.js file

The widget builder creates the basic template you need for your custom widget's JavaScript functionality, which is shown in the first code sample. The second sample shows the changes required for the ExtendedAnswerFeedback custom widget.

The logic file of ExtendedAnswerFeedback validates that a value is supplied for the type custom field, because it is required, and subscribes to an event (evt_answerFeedbackRequest) to add the two custom fields to the data sent to the server in the AJAX request. (The actual request is made through the parent widget.) The function that subscribes to the evt_answerFeedbackRequest event is the onAnswerFeedbackRequest() function.

For more information, refer to Extending a widget's logic file.

The JavaScript code generated by the widget builder

```
RightNow.namespace('Custom.Widgets.feedback.ExtendedAnswerFeedback');
Custom.Widgets.feedback.ExtendedAnswerFeedback =
RightNow.Widgets.AnswerFeedback.extend({
    /**
    * Place all properties that intend to
    * override those of the same name in
    * the parent inside `overrides`.
    */
    overrides: {
        /**
        * Overrides RightNow.Widgets.AnswerFeedback#constructor.
        */
        constructor: function() {
            // Call into parent's constructor
            this.parent();
        }

/**
* Overridable methods from AnswerFeedback:
*
* Call `this.parent()` inside of function bodies
* (with expected parameters) to call the parent
* method being overridden.
*/
// _onClick: function(event, rating)
// _showDialog: function()
// _onSubmit: function(type, args)
// _onCancel: function()
// _validateDialogData: function()
// _closeDialog: function(cancelled)
// _submitFeedback: function()
```

```
// _onResponseReceived: function(response, originalEventObj)
// _submitAnswerRating: function()
// _onRatingResponseReceived: function(response, originalEventObj)
// _addErrorMessage: function(message, focusElement)
// _onCellOver: function(event, chosenRating)
// _updateCellClass: function(minBound, maxBound, removeOrAddClass)
// _onCellOut: function(event, args)
// _onFormTokenUpdate: function(type, args)
},

    /**
    * Sample widget method.
    */
    methodName: function() {

    }
});
```

The changes required by ExtendedAnswerFeedback

```
/**
* File: logic.js
* Abstract: Extending logic for ExtendedAnswerFeedback widget.
* Version: 1.0
*/
RightNow.namespace('Custom.Widgets.feedback.ExtendedAnswerFeedback');
Custom.Widgets.feedback.ExtendedAnswerFeedback =
RightNow.Widgets.AnswerFeedback.extend({
        /**
        * Place all properties that intend to
        * override those of the same name in
        * the parent inside `overrides`.
        */
    overrides: {
        /**
        * Overrides RightNow.Widgets.AnswerFeedback#constructor.
        */
        constructor: function() {
            // Call into parent's constructor
            this.parent();
```

```
        // Overriding the parent's _submitFeedback method in order
        to add the custom field values
        // to the AJAX request's data would require duplicating a
        lot of code.
        // Rather, by subscribing to this event, which fires just
        prior to the AJAX request, we can
        // then just add to the data that'll be sent in the
        request.
        RightNow.Event.subscribe('evt_answerFeedbackRequest',
        this.onAnswerFeedbackRequest, this);
    },

    /**
    * Overrides RightNow.Widgets.AnswerFeedback#_showDialog.
    */
    _showDialog: function() {
        this.parent();

        // If there's not an email field present (user is logged-
        in) or it has an
        // autofilled value (saved email from the session) then
        the feedback textarea
        // is autofocused when the dialog is shown. But that's
        below our new type
        // custom field, so we'll refocus on the first type radio
        input instead
        if (document.activeElement ===
        this.Y.Node.getDOMNode(this._feedbackField)) {
            this.Y.one(this.baseSelector +
            '_FeedbackType').one('input').focus();
        }
    },

    /**
    * Calls the parent's _validateDialogData method before
    validating
    * that a feedback type option has been selected.
    * @return {boolean} True if the parent validation passed and a
    feedback type
    *       option has been selected; False if parent validation
    failed or a feedback
    *       type option hasn't been selected
```

```
    */
    _validateDialogData: function() {
        var parentReturnValue = this.parent();

        this.Y.all(this.baseSelector + '_FeedbackType
        input').some(function(input) {
            if (input.get('checked')) {
                this._selectedFeedbackType = input.get('value');
                return true;
            }
        }, this);

        if (!this._selectedFeedbackType) {
            this._addErrorMessage(
                // Use the label for the fieldset for the '{field
                name} is required' error message.
            RightNow.Text.sprintf(RightNow.Interface.getMessage("
            PCT_S_IS_REQUIRED_MSG"), this.data.js.typeLabel),
                // This is the DOM element ID of the first radio
                // input to focus on when the error message's link
                // is clicked.
                this.Y.one(this.baseSelector +
                '_FeedbackType').one('input').get('id')
            );
            return false;
        }

        return parentReturnValue;
    }
},

/**
* The value of the selected radio input for the type field.
* Set during validation and retrieved to send the value along
* in the AJAX request.
* @type {null|string}
*/
_selectedFeedbackType: null,

/**
* Called when the 'evt_answerFeedbackRequest' event is fired
```

```
        * by the parent just prior to making the AJAX request that posts
        * the supplied EventObject data to the server. Since objects in
        JavaScript
        * are passed by reference, modifying the EventObject's data will
        * add these additional fields to the data that's posted.
        * @param {string} evt Event name
        * @param {array} args Event data; in this case, the EventObject
        * that's supplied is in only element in the array
        */
        onAnswerFeedbackRequest: function(evt, args) {
            args[0].data.type = this._selectedFeedbackType;
            args[0].data.source = this.Y.one(this.baseSelector +
            '_Source').get('value');
        }
    });
```

Editing the controller.php file

The widget builder creates the basic template you need for your custom widget's controller, which is shown in the first code sample. The second sample shows the changes required for the ExtendedAnswerFeedback custom widget.

The controller of ExtendedAnswerFeedback retrieves metadata for the two Incident custom fields, source and type, to retrieve their labels. (The metadata is retrieved through the Connect utility, which in turn calls a function in the Incident model to get the metadata).

For more information, refer to Extending a widget's controller.

The controller code generated by the widget builder

```
<?php
namespace Custom\Widgets\feedback;

class ExtendedAnswerFeedback extends \RightNow\Widgets\AnswerFeedback
{
    function __construct($attrs) {
        parent::__construct($attrs);
    }

    function getData() {

        return parent::getData();
```

```
        }

        /**
        * Overridable methods from AnswerFeedback:
        */
        // protected function getRateLabels()
    }
```

[The changes required by ExtendedAnswerFeedback]()

```

    * File: controller.php
    * Abstract: Extending controller for ExtendingAnswerFeedback widget
    * Version: 1.0
    */

namespace Custom\Widgets\feedback;

use RightNow\Utils\Connect;

/**
    * ExtendingAnswerFeedback
    * @uses RightNow\Widgets\AnswerFeedback
    */
class ExtendedAnswerFeedback extends \RightNow\Widgets\AnswerFeedback {
    function __construct($attrs) {
        parent::__construct($attrs);
    }
```

```
function getData() {
    // If a widget's getData method returns false then the widget
    isn't rendered.
    // This check ensures that we won't do additional work if the
    parent indicates
    // that the widget shouldn't be rendered.
    if (parent::getData() === false) return false;

    // Retrieve an empty Incident object and get the metadata for
    // its CustomFields.
    $incident = $this->CI->model('Incident')->getBlank()->result;
    $customFields = $incident->CustomFields;
    $customFieldsMeta = $customFields::getMetadata();

    if ($customFieldsMeta->CO) {
        $co = new $customFieldsMeta->CO->type_name;
        $meta = $co::getMetadata();

        // Check the existence and type of the two fields.
        if ($meta->type && $meta->type->named_values) {
            $this->data['js']['typeLabel'] = $meta->type->label;
            $this->data['feedbackTypes'] = $meta->type->named_values;
        }
        else {
            echo $this->reportError("Expecting a Menu field named type
            on Incident.CustomFields.CO");
            return false;
        }

        if ($meta->source && $meta->source->type_name === 'string') {
            $this->data['js']['sourceLabel'] = $meta->source->label;
        }
        else {
            echo $this->reportError("Expecting a String field named
            source on Incident.CustomFields.CO");
            return false;
        }
    }
    else {
        echo $this->reportError("Expecting a CO package to exist on
        the Incident object");
```

```
            return false;
        }
    }
}
```

Editing the view.php file

The widget builder creates the basic template you need for your custom widget's view, which is shown in the first code sample. The second sample shows the changes required for the ExtendedAnswerFeedback custom widget.

The PHP view file of ExtendedAnswerFeedback uses two <rn:block> elements to insert the Incident custom fields into the widget's feedback form. The view also specifies that the type custom field is required to fill out the form.

For more information, refer to Extending a widget's view.

The view.php code generated by the widget builder

```
<!--
<rn:block id='AnswerFeedback-top'>

</rn:block>
-->

<!--
<rn:block id='AnswerFeedback-preRatingButtonsLoop'>

</rn:block>
-->

<!--
<rn:block id='AnswerFeedback-topRatingButtonsLoop'>

</rn:block>
-->

<!--
<rn:block id='AnswerFeedback-bottomRatingButtonsLoop'>

<!--
<rn:block id='AnswerFeedback-bottom'>

</rn:block>
-->
```

The changes required by ExtendedAnswerFeedback

```
<?php
/**
* File: view.php
* Abstract: Extending PHP view for ExtendedAnswerFeedback widget
* Version: 1.0
*/
?>
<rn:block id='AnswerFeedback-preFeedbackInput'>
    <fieldset id="rn_<?= $this->instanceID ?>_FeedbackType" aria-
    describedby="rn_<?= $this->instanceID ?>_FeedbackTypeLabel"
    class="rn_FeedbackType">
        <div id="rn_<?= $this->instanceID ?>_FeedbackTypeLabel">
            <span class="rn_LabelText"><?= $this-
            >data['js']['typeLabel'] ?></span>
            <span class="rn_Required" >
            <?=\RightNow\Utils\Config::getMessage(FIELD_REQUIRED_MARK
            _LBL);?></span><span
            class="rn_ScreenReaderOnly"><?=\RightNow\Utils\Config::ge
            tMessage(REQUIRED_LBL)?></span>
        </div>
        <? foreach ($this->data['feedbackTypes'] as $namedValue): ?>
        <label>
            <input type="radio" name="rn_<?= $this->instanceID
            ?>_FeedbackTypeChoice" value="<?= $namedValue->ID ?>"/>
```

```
<?= $namedValue->LookupName ?>
        </label>
        <? endforeach; ?>
    </fieldset>
</rn:block>

<rn:block id='AnswerFeedback-bottomForm'>
    <label for="rn_<?= $this->instanceID ?>_Source"><?= $this-
    >data['js']['sourceLabel'] ?></label>
    <textarea id="rn_<?= $this->instanceID ?>_Source" cols="60"
    rows="2" class="rn_Textarea"></textarea>
</rn:block>
```

Editing the presentation CSS file

The first CSS code shows the basic container for the CSS code as generated by the widget builder. The second set of CSS code is used to display the ExtendedAnswerFeedback widget as it appears in the example. You can also modify CSS characteristics to match whatever presentation you want for the custom widget.

The ExtendedAnswerFeedback.css code generated by the widget builder

```
/**
* ExtendedAnswerFeedback.css: Presentation CSS
*/
.rn_ExtendedAnswerFeedback.rn_AnswerFeedback {

}
```

The changes required by ExtendedAnswerFeedback

```
/**
* File: ExtendedAnswerFeedback.css
* Abstract: Provides styling for ExtendedAnswerFeedback widget
* Version: 1.0
*/
.rn_AnswerFeedbackForm .rn_FeedbackType {
margin-bottom: 10px;
padding: 0;
}
```

```
.rn_AnswerFeedbackForm .rn_FeedbackType input[type="radio"] {
margin: 4px 0 4px 0;
}
```

Creating the CustomIncidentModel.php file

The *CustomIncidentModel.php* custom model has a preFeedbackSubmit() function that receives the incident about to be created for the feedback submission, and sets the two custom field values to what was submitted to the server.

For information about custom models, see Creating custom models.

The custom model required by ExtendedAnswerFeedback

```
<?php
/**
* File: CustomIncidentModel.php
* Abstract: Saves values on several custom fields for the incident
* supplied by the pre_feedback_submit hook.
* Version: 1.0
*/

namespace Custom\Models;

use RightNow\Connect\v1_2 as Connect;

class CustomIncidentModel extends \RightNow\Models\Base {
    function __construct() {
        parent::__construct();
    }

    /**
    * This method is triggered via a hook that fires prior
    * to site or answer feedback (incident creation via
    * the Incident Model's submitFeedback method).
    * @param Array $hookInfo Array containing key whose value is
    * the incident that's about to be saved
    */
    function preFeedbackSubmit(&$hookInfo) {
```

```
        if ($this->CI->input->post('a_id')) {
        // Answer feedback was submitted (as opposed to site
        // feedback).
        $incident = $hookInfo['data'];

        $typeOfFeedback = $this->CI->input->post('type');
        $sourceOfFeedback = $this->CI->input->post('source');

        if (ctype_digit($typeOfFeedback)) {
            // Since type is a Menu field that uses a Menu Only
            // Custom Object (TypeOfFeedback),
            // we expect an int and fetch a TypeOfFeedback custom
            // object instance corresponding to that ID value.
            $incident->CustomFields->CO->type =
            Connect\CO\TypeOfFeedback::fetch((int)
            $typeOfFeedback);
         }

        if ($sourceOfFeedback) {
            // source is a Text Area field.
            $incident->CustomFields->CO->source =
            $sourceOfFeedback;
        }
    }
}
```

The DisplayChartReport sample widget

The DisplayChartReport sample widget is an example of how to use the YUI charting library, a custom widget AJAX endpoint, and a custom report to create a chart display widget for two-dimensional data.

The widget retrieves the data from a report and sends it to the client side to be displayed. When the data arrives at the client side, it is extracted from the data array and transformed into the appropriate format for the YUI charting library. This transformed data can be used to render any two-dimensional YUI chart including bar, column, line, and pie charts. These charts are displayed using Scalable Vector Graphics (SVG) to create a simple interactive chart.

The widget also contains a button to update the displayed results. The button makes an AJAX request to the server to get the modified results (in this case, simple random data), which is then displayed to the user. The widget expects the first two columns of the report data to be the first two dimensions of the rendered chart. If you plan to use the widget as more than a sample, it is worth modifying the controller to more intelligently handle different formats of report data.

The XML file for this sample (*report_def.xml*) is not described in the following pages, but it is available in the zip file for the sample.

Illustrated concepts

The sample illustrates the following:

- Widget creation. See Creating a new widget from scratch.
- Widget controller AJAX handler. See Making AJAX requests to the server.
- Additional YUI library dependency. See Using YUI components.
- Report data interaction and display.

Steps for using the sample code

To install the sample widget, follow this procedure.

To install the widget

1 Create a *samples* folder in */cp/customer/development/widgets/custom*.

2 Download *DisplayChartReport.zip* from http://documentation.custhelp.com/euf/assets/docs/may2015/cp_resources/samples/DisplayChartReport.zip and extract the files.

3 Move or copy the *DisplayChartReport.css* file from the unzipped *DisplayChartReport/customer/assets/themes/standard/widgetCss* folder into your */cp/customer/assets/themes/standard/widgetCss* customer portal file folder.

4 Move or copy the unzipped *DisplayChartReport/customer/development/widgets/custom/sample/DisplayChartReport* folder into your */cp/customer/development/widgets/custom/sample* folder that you created in step 1.

5 Import the *DisplayChartReport/exports/report_def.xml* file into the Reports Explorer and note the report ID.

6 In the *info.yml* file, change the default value for the *report_id* attribute from -1 to the report ID from step 5.

7 Activate the DisplayChartReport widget.

a Go to https://<your_site>/ci/admin/versions/manage.

b In the left column, locate and select the DisplayChartReport widget. Custom widgets are listed at the top, and it is grayed out to indicate that it is not yet active.

c Click Start Using This Version in the upper right corner of the page.

8 Place the widget on a page, for example.

```
<rn:widget path="sample/DisplayChartReport"/>
```

See how to use the widget builder to create the DisplayChartReport widget.

Creating the widget yourself

Here are the steps that let you create the DisplayChartReport widget yourself by using the widget builder to create a new widget.

To create the widget

1 Open the widget builder on your Customer Portal Administration site by going to https://<your_site>/ci/admin/tools/widgetBuilder.

2 Click **Create a brand new widget from scratch.**

3 Type `DisplayChartReport` in **What is its name?** and `sample` in **And its parent folder?**

4 Click Continue. The Components section opens to let you specify which of the controller, view, and JavaScript files you require.

5 Select Yes for **Does this widget have a controller?** and Yes for **Will it be doing any AJAX handling?**

6 Select Yes for **Does this widget have a view?**.

7 Select Yes for **Does this widget have JavaScript?** and No for **JavaScript templates too?**

8 Under **YUI Modules**, click Add Module and type `charts`.

9 Click Continue. The Attributes section opens.

10 Rename the provided *default_ajax_endpoint* attribute to *get_chart_data_ajax*.

11 Add seven attributes:

- A *label_loading* attribute:
  - ▷ **Type**—String
  - ▷ **Description**—The label that appears while new results are loading into the display

  - ▷ **Default value**—Loading.
- A *label_result_link* attribute:
  - ▷ **Type**—String
  - ▷ **Description**—The label that appears on the button for loading updated results
  - ▷ **Default value**—Get Latest Results.
- A *chart_type* attribute:
  - ▷ **Type**—Option
  - ▷ **Options**—bar, column, line
  - ▷ **Description**—The type of chart to be displayed
  - ▷ **Default value**—column
- A *chart_header* attribute:
  - ▷ **Type**—String
  - ▷ **Description**—The title to display at the top of the chart
  - ▷ **Default value**—Number of page hits by Answer ID.
- A *report_id* attribute:
  - ▷ **Type**—String
  - ▷ **Description**—ID number of the report that contains charting data
  - ▷ **Default value**— –1 (minus 1).
- A *category_axis_label* attribute:
  - ▷ **Type**—String
  - ▷ **Description**—The label to display on the category axis. Uses the report header by default.
- A *value_axis_label* attribute:
  - ▷ **Type**—String
  - ▷ **Description**—The label to display on the value axis. Uses the report header by default.

12 Click Continue.

13 Click Add additional details and type the following in the Widget description field: `This widget provides an example of how to use the YUI charting library, a custom widget AJAX endpoint and a custom report to create a chart display widget for two dimensional data.`

14 Click Create Widget at the bottom of the page. The code for the custom widget is generated automatically.

Important Although the widget builder generated the files you need and used the information you provided, you must now edit the files to complete the changes necessary for the functionality of the DisplayChartReport widget.

The info.yml file

The *info.yml* file shows that the sample widget requires the Charts YUI module. The provided attribute *default_ajax_endpoint* is renamed to *get_chart_data_ajax*.

For more information, see Widget info files.

```

Editing the logic.js file

The widget builder creates the basic template you need for your custom widget's JavaScript functionality, which is shown in the first code sample. The second sample shows the changes you must make for the DisplayChartReport custom widget.

The logic file for DisplayChartReport contains code in the constructor to inserts the initial data set into the chart, and also has the following functions.

- **getUpdatedResults()**—Makes an AJAX request for the latest chart data.
- **onSuccessfulUpdate()**—Takes the results from the AJAX response and renders them in the chart.
- **onFailedUpdate()**—Displays a warning dialog if an update has failed.
- **setLoading()**—Prevents simultaneous requests to the server.
- **transformReportResults()**—Takes the report results returned from the server and transforms them into a data structure that can be fed directly into the YUI charting library.

[The JavaScript code generated by the widget builder]

```
RightNow.namespace('Custom.Widgets.sample.DisplayChartReport');
```

```
Custom.Widgets.sample.DisplayChartReport = RightNow.Widgets.extend({
    /**
    * Widget constructor.
    */
    constructor: function() {

    },

    /**
    * Sample widget method.
    */
    methodName: function() {

    },

    /**
    * Makes an AJAX request for `get_chart_data_ajax`.
    */
    getGet_chart_data_ajax: function() {
        // Make AJAX request:
        var eventObj = new RightNow.Event.EventObject(this, {data:{
            w_id: this.data.info.w_id,
            // Parameters to send
        }});

    RightNow.Ajax.makeRequest(this.data.attrs.get_chart_data_ajax,
    eventObj.data, {
        successHandler: this.get_chart_data_ajaxCallback,
        scope:          this,
        data:           eventObj,
        json:           true
        });
    },

    /**
    * Handles the AJAX response for `get_chart_data_ajax`.
    * @param {object} response JSON-parsed response from the server
    * @param {object} originalEventObj `eventObj` from
    #getGet_chart_data_ajax
    */
```

```
    get_chart_data_ajaxCallback: function(response, originalEventObj)
    {
        // Handle response
    }
});
```

The changes required for DisplayChartReport

```
/**
* File: logic.js
* Abstract: Logic file for the DisplayChartReport widget
* Version: 1.0
*/
RightNow.namespace('Custom.Widgets.sample.DisplayChartReport');
Custom.Widgets.sample.DisplayChartReport = RightNow.Widgets.extend({

    constructor: function() {
        // Insert the initial data set into the chart. Notice how the
        // this.data.js.reportData corresponds to the equivalent
        // field in the controller getData function. Additionally,
        // notice that the this.data.attrs.chart_type field
        // corresponds to the same attribute in the info.yml file.
        this._chart = new this.Y.Chart({
            dataProvider:
            this.transformReportResults(this.data.js.reportData),
            render: this.baseSelector + '_Container',
            type: this.data.attrs.chart_type,
            axes: {
                category: {

    * clear the load indicator.
    */
    onFailedUpdate: function() {
        this.setLoading(false);
        RightNow.UI.Dialog.messageDialog('There was an error with the
        request. Please try again.', {'icon': 'ALARM'});
        },
    /**
    * Add a little bit of flair to the loading indicator while also
    * preventing simultaneous requests to the server. This function
```

```
* acts like a locking mechanism, toggling on and off with each
* successful request to the server.
* @param {Boolean} isLoading true or false to enable or disable
* loading
*/
setLoading: function(isLoading) {
    var resultLink = this._resultsLink,
        scope = this;
    if(isLoading) {
        resultLink.detach('click', this.getUpdatedResults);
        resultLink.set('innerHTML',
        this.data.attrs.label_loading);
        this._ticker = setInterval(function() {
            var currentContent = resultLink.get('innerHTML');
            if(currentContent.indexOf('...') !== -1) {
                resultLink.set('innerHTML',
                scope.data.attrs.label_loading);
            }
            else {
            resultLink.set('innerHTML', currentContent +
                '.');
            }
        }, 200);
    }
    else {
        clearInterval(this._ticker);
        resultLink.set('innerHTML',
        this.data.attrs.label_result_link);
        resultLink.on('click', this.getUpdatedResults, this);
    }
},

/**
* Take the report results returned from the server and transform
* them into a data structure that can be fed directly into the
* YUI  charting library. Charts use two keys 'category' and
* 'value' to represent the two different dimensions of data
* in a bar, line, column or pie chart.
*/
transformReportResults: function(results) {
```

```
            var chartData = [];
            this.Y.Object.each(results, function(element, key) {

                chartData.push({
                    category: element[0], /* Grab the column label from
                    the data */
                    value: element[1] /* And the associated value */
                });
            });

            return chartData;
        }
    });
```

Editing the controller.php file

The widget builder creates the basic template you need for your custom widget's controller, which is shown in the first code sample. The second sample shows the changes you must make for the DisplayChartReport custom widget.

The controller for DisplayChartReport has methods to handle the widget's AJAX request and retrieve chart data.

The controller does its own AJAX handling, therefore the controller contains code to register the AJAX handler method, getChartData(), for the widget.

In this case, the widget's controller handles the AJAX request, so the widget's *get_chart_data_ajax* attribute value defaults to /ci/ajax/widget, which is the generic controller route to specify when the widget's controller method is handling the request.

The controller also has a addRandomizedData() function, which can be used if the report doesn't have much interesting data. If your site has a report with appropriate data, you can remove this function and its calls.

Refer to Handling AJAX requests in the widget controller.

The controller code generated by the widget builder

```
<?php
namespace Custom\Widgets\Sample;
```

```
class DisplayChartReport extends \RightNow\Libraries\Widget\Base {
    function __construct($attrs) {
        parent::__construct($attrs);

        $this->setAjaxHandlers(array(
            'get_chart_data_ajax' => array(
                'method' => 'handle_get_chart_data_ajax',
                'clickstream' => 'custom_action',
            ),
        ));
    }

    function getData() {

        return parent::getData();

    }

    /**
    * Handles the get_chart_data_ajax AJAX request
    * @param array $params Get / Post parameters
    */
    function handle_get_chart_data_ajax($params) {
         // Perform AJAX-handling here...
         // echo response
    }
}
```

[The changes required by DisplayChartReport]()

```
<?php
namespace Custom\Widgets\Sample;

class DisplayChartReport extends \RightNow\Libraries\Widget\Base {
    function __construct($attrs) {
        parent::__construct($attrs);

        //This function registers the AJAX handler getChartData so
        //that subsequent requests for data are correctly routed to
```

```
    //this controller instance.
    $this->setAjaxHandlers(array(
        'get_chart_data_ajax' => array(
            'method' => 'getChartData'
            'clickstream' => 'custom_action'
        )
    ));
}
/**
* This function is executed during the widget creation process
* when a new page request is made to the server. The results are
* used when rendering the view and executing the JavaScript on the
* client side.
*/
function getData() {
    if($this->data['attrs']['report_id'] === -1) {
    echo $this->reportError('The report_id is unset. Please check
    the readme document to determine how to setup the report.');
        return false;
        }
    //Retrieve our initial set of data results
    $reportToken = \RightNow\Utils\Framework::createToken($this-
    >data['attrs']['report_id']);
    $results = $this->CI->model('Report')->getDataHTML($this-
    >data['attrs']['report_id'], $reportToken, array(), array())-
    >result;

    if($results['error'] !== null) {
        echo $this->reportError($results['error']);
        return false;
        }

    //Make sure that the report has two columns with valid headers
    if(count($results['headers']) !== 2) {
        echo $this->reportError(sprintf("The report '%s' does not
        use exactly two columns and cannot be displayed with this
        widget.", $this->data['attrs']['report_id']));
        return false;
    }

    //Add the results to the data sent to the client so that
```

```
    //they can be rendered
    $this->data['js'] = array(
        'reportData' => $this->addRandomizedData($results, true),
        'categoryLabel' => ($this-
        >data['attrs']['category_axis_label']) ?:
        $results['headers'][0]['heading'],
        'valueLabel' => ($this-
        >data['attrs']['value_axis_label']) ?:
        $results['headers'][1]['heading'],
        'r_tok' => $reportToken
    );
}
/**
* This function is used as an AJAX endpoint for requests for newly
* updated chart data.
* @param $parameters
*/
function getChartData($parameters) {
    //Look up the new results
    $results = $this->CI->model('Report')-
    >getDataHTML($parameters['report_id'], $parameters['r_tok'],
    array(), array())->result;
    if($results['error'] !== null) {

        echo
        json_encode(getMessage(ERROR_REQUEST_ACTION_COMPLETED_MSG
        ));
        return;
    }

    //Seed in some random data so the chart looks different
    //with each refresh
    echo json_encode($this->addRandomizedData($results));
    }

/**
* Used in case the report doesn't have much interesting data. It
* will add randomized results so that it is easy to see how
* the charts will display different data sets.
* If your site has a report with appropriate data, this
* function and its calls can be removed.
```

```
        */
        function addRandomizedData($results, $isInitialRequest = false) {
            //If the report data is empty, just add in some random data so
            //a chart can be displayed
            $data = (empty($results['data'])) ? array(array(6, 4),
            array(7, 3), array(8, 16), array(9, 10), array(10, 5)) :
            $results['data'];

            //Only randomize the data on requests after the initial
            if(!$isInitialRequest) {
                foreach($data as &$item) {
                    $randomOffset = rand(0, 20);
                    if($randomOffset % 5) {
                        $item[1] -= $randomOffset;
                    }
                    else {
                        $item[1] += $randomOffset;
                    }
                    if($item[1] < 0) {
                        $item[1] = abs($item[1]);

                    }
                }
            }
            return $data;
        }
    }
```

The view.php file

The widget builder generates a blank *view.php* file when you create a widget from scratch. The following is the *view.php* file for DisplayChartReport.

```
<?php
/**
* File: view.php
* Abstract: View file for the DisplayChartReport widget
* Version: 1.0
*/
?>
<div id="rn_<?=$this->instanceID;?>" class="rn_DisplayChartReport">
```

```
        <div class="rn_ChartHeaderText">
            <?= $this->data['attrs']['chart_header'];?>
            <a id="rn_<?=$this->instanceID;?>_ResultsLink"
            class="rn_UpdateButton"><?=$this-
            >data['attrs']['label_result_link'];?></a>
        </div>
        <div id="rn_<?=$this->instanceID;?>_Container"
        class="rn_ChartContainer"></div>
    </div>
```

Editing the presentation CSS file

The first CSS code shows the basic container for the CSS code as generated by the widget builder. The second set of CSS code is used to display the DisplayChartReport as it appears in the example. You can also modify CSS characteristics to match whatever presentation you want for the custom widget.

The DisplayChartReport.css code generated by the widget builder

```
/**
* DisplayChartReport.css: Presentation CSS
*/
.rn_DisplayChartReport {

}
```

The changes required by DisplayChartReport

```
/**
*
* File: DisplayChartReport.css
* Abstract: Provides styling for the DisplayChartReport widget
* Version: 1.0
*/
.rn_DisplayChartReport .rn_ChartContainer {
    width: 750px;
    height: 600px;
    padding-top: 12px;
}

.rn_DisplayChartReport .rn_ChartHeaderText {
```

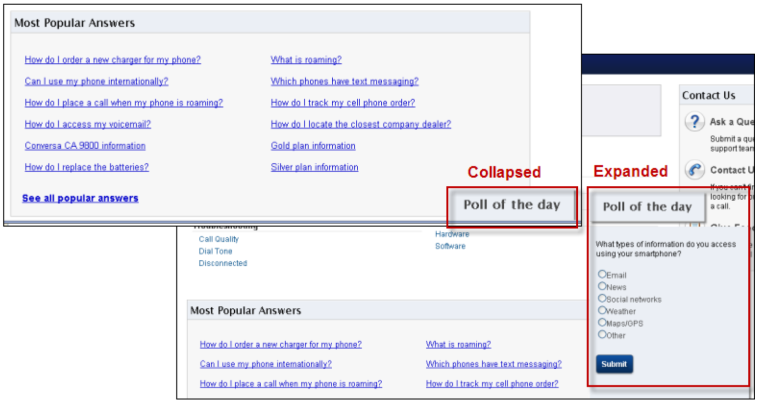
```
    font-weight: bold;
}
.rn_DisplayChartReport .rn_UpdateButton {
    float: right;
    background:#0E53A7 url('../images/buttonGradientCombo.png') 0px
    0px repeat-x;
    -webkit-border-radius: 4px;
    border-radius: 4px;
    -webkit-box-shadow: 0 1px 3px rgba(0,0,0,0.5);
    box-shadow: 0 1px 3px rgba(0,0,0,0.5);
    color:#FFF;
    cursor:pointer;
    font-weight:bold;
    padding: 4px;
    margin-right: 10px;
    min-width: 54px;
}

.rn_DisplayChartReport .rn_UpdateButton:hover {
    background-position: 0px -40px;
```

The PollingSlider widget

The custom PollingSlider widget extends the standard Polling widget to create a slider drawer at the bottom of the page that opens a polling survey when it is clicked.

Click to view

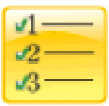


Illustrated concepts

The sample illustrates the following:

- Extending the JavaScript of a standard widget
- Including and inheriting the CSS of a standard widget

Prerequisites



You must complete the following tasks before you can use the sample code.

- Create a choice question for the survey you want to add to the page. For best results, use the radio button or check box display types.
- Create a polling survey.
- Determine the survey ID value.

Steps for using the sample code

To install the sample widget, follow this procedure.

To install the widget

1 Create a *surveys* folder in */cp/customer/development/widgets/custom*.

2 Download *Polling Slider.zip* from http://documentation.custhelp.com/euf/assets/docs/may2015/cp_resources/samples/PollingSlider.zip and extract the files to a temporary location.

3 Move or copy the *PollingSlider.css* file from the unzipped *Polling Slider/customer/assets/themes/standard/widgetCss* folder into your */cp/customer/assets/themes/standard/widgetCss* customer portal file folder.

4 Move or copy the unzipped *Polling Slider/customer/development/widgets/custom/surveys/Polling-Slider* folder into your */cp/customer/development/widgets/custom/surveys* folder that you created in step 1.

5 Activate the PollingSlider widget.

  a Go to https://<your_site>/ci/admin/versions/manage.

  b In the left column, locate and select the PollingSlider widget. Custom widgets are listed at the top, and it is grayed out to indicate that it is not yet active.

  c Click Start Using This Version in the upper right corner of the page.

6 Open the page where you want to add the widget and add the following code, substituting the survey ID for "12" in this example:

```
<rn:widget path="surveys/PollingSlider" survey_id="12" />
```

Note It doesn't matter where you add the code because the widget CSS places it at the bottom of the page automatically.

Also, if you want to test the survey on your development page, add `cookie_duration="0"` to the widget code. This prevents a cookie from being set so you can take the survey repeatedly. (Your customers will not be offered a survey again. Instead, they will simply see the results of the survey until the cookie on their browser expires.)

See how to use the widget builder to create the PollingSlider widget.

Creating the widget yourself

Here are the steps that let you create the PollingSlider widget yourself by using the widget builder to extend an existing standard widget.

1 Open the widget builder on your Customer Portal Administration site by going to https://<your_site>/ci/admin/tools/widgetBuilder.

2 Click Extend the Functionality of an Existing Widget.

3 The custom PollingSlider extends the standard Polling widget, so enter `Polling` in the field **Which widget shall it extend from?** and select surveys/Polling.

4 Type `PollingSlider` in **What is its name?** and `surveys` in **And its parent folder?**

5 Click Continue. The Components section opens to let you specify which of the controller, view, and JavaScript files you require.

6 Select No to answer **Does this widget have a controller of its own?**

7 Select No to answer **Does this widget modify the parent widget's view?**

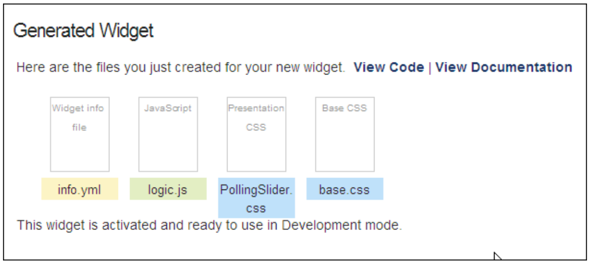
8 Select Yes for **Does this widget have its own JavaScript?** and No for **JavaScript templates too?**

9 Under **YUI Modules**, click Add Module and type `transition`.

10 Click Continue. The Attributes section opens. The PollingSlider custom widget example uses all of the standard Polling widget's attributes except *modal, poll_logic,* and *seconds*, so click the X to the right of those three attributes (above **This attribute is inherited**) to remove them.

11 Click continue.

12 Click Create Widget at the bottom of the page. The code for the custom widget is generated automatically.



Important Although the widget builder generated the files you need and used the information you provided, you must now edit the files to complete the changes necessary for the functionality of the PollingSlider widget.

The info.yml file

You'll need to edit the generated *info.yml* file slightly. The second sample shows the code to add.

The YAML code generated by the widget builder

```
version: "1.0"
requires:
    jsModule:
    - standard
    - mobile
    yui:
    - charts
    - transition
attributes:
    modal: unset
    seconds: unset
    poll_logic: unset
info:
    description: Placeholder description of the PollingSlider widget
extends:
    widget: standard/surveys/Polling
    components:
    - js
```

The changes required for PollingSlider

```
version: "1.0"
requires:
    framework: ["3.0", "3.1"]
    jsModule:
    - standard
    yui:
    - charts
    - transition
attributes:
    survey_id:
        name: survey_id
        type: int
```

```
        description: The ID of the polling survey to be used
        default: ~
        required: false
    modal: unset
    seconds: unset
    poll_logic: unset
extends:
    widget: standard/surveys/Polling
    components:
    - js
    - css
info:
    description: This widget extends the standard Polling widget in order
    to have the Polling dialog slide in from the bottom with a drawer
    effect.
```

Editing the logic.js file

The widget builder creates the basic template you need to extend your custom widget's JavaScript functionality, which is shown in the first code sample. The second sample shows the changes you must make for the PollingSlider custom widget.

Note These file changes are for demonstration purposes only. If you are using the PollingSlider custom widget without modification, we suggest you use the procedure described in Steps for using the sample code.

The *logic.js* file of the PollingSlider widget:

- Uses the constructor of the parent Polling widget `(this.parent())` and adds code to perform the following tasks:
  - ▷ Calculate the slider drawer offset.
  - ▷ Close the drawer on page load.
  - ▷ Hide the survey if your customer has already taken it.
- Overrides the way the standard Polling widget displays the survey results if you're showing the results chart inside the slider drawer so that clicking the poll title permanently closes the drawer.
- Uses the YUI Transition module to add a click handler function that toggles the polling slider open and closed

[The JavaScript code generated by the widget builder]

```
RightNow.namespace('Custom.Widgets.surveys.PollingSlider');
Custom.Widgets.surveys.PollingSlider =
RightNow.Widgets.Polling.extend({
    /**
    * Place all properties that intend to
    * override those of the same name in
    * the parent inside `overrides`.
    */
    overrides: {
        /**
        * Overrides RightNow.Widgets.Polling#constructor.
        */
        constructor: function() {
                // Call into parent's constructor
                this.parent();
        }

        /**
        * Overridable methods from Polling:
        *
        * Call `this.parent()` inside of function bodies
        * (with expected parameters) to call the parent
        * method being overridden.
        */
        // _showDialog: function()
        // _actionDialogButtonClicked: function()
        // _submitButtonClicked: function(e)
        // _viewResultsLinkClicked: function()
        // _getPollResults: function(flow_id, question_id)
        // _onSubmit: function()
        // _setCookie: function()
        // _validate: function(formElement)
        // _getFieldData: function()
        // _getSurveyFieldObjectList: function(formElement)
        // _onShowPoll: function()
        // _onResponseReceived: function(response, originalEventObj)
        // _showThankYou: function()
        // _showChart: function(jsonString, totalVotes)
```

```
            // _buildSimpleChart: function(chartData, flipAreaElement)
            // _buildChart: function(data, flipAreaElement)
            // markerLabelFunction: function(categoryItem, valueItem,
            itemIndex, series, seriesIndex)
            // _getChartAltText: function (chartType, chartData)
            // _showTotalVotes: function(totalVotes)
        },

        /**
        * Sample widget method.
        */
        methodName: function() {

        }
    });
```

The changes required by PollingSlider

```
    /**
    * File: logic.js
    * Abstract: Extending logic for PollingSlider widget
    * Version: 1.0
    */
    RightNow.namespace('Custom.Widgets.surveys.PollingSlider');
    Custom.Widgets.surveys.PollingSlider =
    RightNow.Widgets.Polling.extend({
        overrides: {
            /**
                * Overrides RightNow.Widgets.Polling#constructor
                */
            constructor: function() {
                // Call into parent's constructor
                this.parent();

                this._sliderNode = this.Y.one(this.baseSelector);
                this._pollTitleNode = this.Y.one(this.baseSelector +
                "_PollTitle");
                // Calculate the offset to use for the slider drawer in
                the closed position
                this._closedDrawerOffset =
                this._pollTitleNode.get('offsetHeight') -
```

```
            this._sliderNode.get('offsetHeight') - 1;

            // Start with the drawer closed
            this._sliderNode.setStyle('bottom',
            this._closedDrawerOffset + "px");
            this._drawerOpen = false;

            this._pollTitleNode.on('click', this._toggleDrawer,
            this);

            // If the user has already taken the survey, hide the
            slider entirely
            if(this.data.js.cookied_questionID > 0) {
            this._sliderNode.hide();
            }
    },

    /**
        * Overrides RightNow.Widgets.Polling#_showChart
        */
    _showChart: function(jsonString, totalVotes) {
            // Call parent's _showChart
            this.parent(jsonString, totalVotes);

            // If we have a poll title and we are attempting to show
            the chart inside the slider drawer
            if(this._pollTitleNode) {
                // Change the title click to permenantly close the
                drawer
                this._pollTitleNode.detach('click',
                this._toggleDrawer);
                this._pollTitleNode.on('click',
                this._closeDrawerPermenantly, this);
            }
        }
    },

    // Opens and closes the slider drawer
    _toggleDrawer: function() {
        this._sliderNode.transition({
            duration: 1,
```

```
                bottom: (this._drawerOpen) ? this._closedDrawerOffset +
                "px" : "0px"
            });
            // Toggle the drawer open flag
            this._drawerOpen = !this._drawerOpen;
        },

        // Closes the drawer permenantly (all the way off the screen)
        _closeDrawerPermenantly: function() {
            this._sliderNode.transition({
                duration: 1,
                bottom: this._sliderNode.get('offsetHeight') * -1 + "px"
                });
                this._drawerOpen = false;
        }

    });
```

Editing the presentation CSS file

The widget builder generates the PollingSlider.css file and places it in the */cp/customer/assets/themes/standard/widgetCss* folder. You can customize the CSS if you want, but no customization is necessary if you want to use the code that has been generated.

The PollingSlider.css code generated by the widget builder

```
/**
* PollingSlider.css: Presentation CSS
*/
.rn_PollingSlider.rn_Polling {
    position: fixed;
    bottom: 0px;
    width: 250px;
    right: 250px;
    border-left: 1px solid #fff;
}
.rn_PollTitle {
    text-decoration: none;
    background: none;
}
.rn_PollTitle h2 {
```

```
    font-weight: bold;
    font-size: 1.5em;
    padding: 10px;
    cursor: pointer;
    width: 160px;
    background: #EBEFF5;
    color: #464646;
    text-align: center;
    border-top: 1px solid #fff;
    -moz-box-shadow: 3px 3px 3px #888;
    -webkit-box-shadow: 3px 3px 3px #888;
    box-shadow: 3px 3px 3px #888;
}
.rn_PollingSlider form {
    padding: 20px 10px 40px 10px;
    background: #EBEFF5;
    color: #464646;
    -moz-box-shadow: 3px 3px 3px #888;
    -webkit-box-shadow: 3px 3px 3px #888;
    box-shadow: 3px 3px 3px #888;
}
.rn_PollAnswerArea {
    min-height:40px;
}
.rn_PollSubmit {
    margin-top: 20px;
}
```

Custom model sample code

The following sample custom model extends from the standard Answer model. It provides am emailToFriend() function that overrides the parent function so that the From field is modified with a company email address.

```
<?php
namespace Custom\Models;

class ExtendedSample extends \RightNow\Models\Answer
{
    function __construct()
    {
```

```
            parent::__construct();
        }

        function emailToFriend($sendTo, $name, $from, $answerID){
        // Modify from field to company email and add user specified
        // email to name
            $name .= "(Email: $from)";
            $from = "support@companyName.com";
            $response = parent::emailToFriend($sendTo, $name, $from,
            $answerID);
            // Remember that $response is an instance of a
            // ResponseObject, so we need to check the return property
            // for success
            if($response->result){
                return $response;
            }
            // Add an additional error to the return which might be
            // potentially handled by a custom widget
            $response->error = "Unable to send email, please try again
            later.";
            return $response;
        }
    }
```

For more information, refer to Creating custom models.

Custom controller sample code

The following sample code illustrates the required structure of a custom controller.

```
<?php

namespace Custom\Controllers;

class AjaxCustom extends \RightNow\Controllers\Base
{
    // This is the constructor for the custom controller.
    // Do not modify anything within this function.
    function __construct()
    {
        parent::__construct();
    }
```

```
        /**
        * Sample function for ajaxCustom controller. This function
        * can be called by sending a request to:
        * /ci/ajaxCustom/ajaxFunctionHandler.
        */
        function ajaxFunctionHandler()
        {
            $postData = $this->input->post('post_data_name');
            //Perform logic on post data here
            echo $returnedInformation;
        }
    }
```

For more information, see Creating custom controllers.

Chat

The following sections are intended for administrators and staff members. They contain information and procedures for configuring and using areas specific to Oracle RightNow Chat Cloud Service and Co-Browse.

- Chat Configuration
- Chat
- Co-Browse Configuration

65

Chat Configuration

Though self-service and email response management can solve the majority of customer issues, one-on-one interaction remains the best venue and value for certain queries. With Oracle RightNow Chat Cloud Service (Chat), you can provide access to agents for customer questions and issues that merit human interaction through real-time chat sessions.

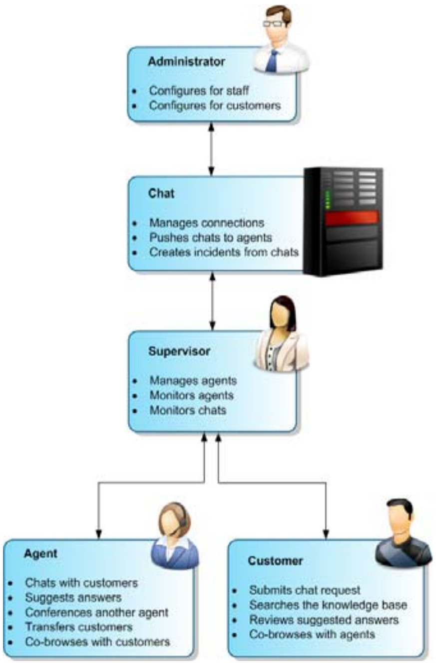
Once you implement Chat for your application, you can measure its effectiveness using powerful analytics. Refer to Real-time reports and Chat Audit report.

Best Practices for Implementing Chat

Effective chat implementations are simple when best practices are followed. The Best Practices Guide for Implementing Chat provides best practices that should be considered before implementing Chat. By following the recommendations in the guide, you are ensuring a great chat experience for your customers. Refer to *Top 12 Best Practices for Implementing Chat*.

Chat overview

Chat is a component of Oracle Service Cloud that can be used to provide one-on-one interaction between your supervisors and agents and agents and customers. You must configure Chat for supervisors, agents, and customers to take advantage of these functions. To get started, become familiar with the interactions illustrated in the following figure.



Configuring Chat for supervisors and agents

When configuring Chat, it is important that you set certain configuration options before others. For example, chat session queues must be added to Oracle Service Cloud before they will display in profiles, and profiles must be added or updated before they can be assigned to agents. For this reason, we recommend that you configure Chat options in the following order.

- Add **chat session queues**. Refer to Adding and editing chat session queues.
- Add **chat agent statuses**. Refer to Adding and editing chat agent statuses.
- Add chat reports to **navigation sets**. Refer to Adding chat reports to navigation sets.
- Add or update **profiles** to include Chat permissions. Refer to Adding Chat permissions to profiles.

- Add or update **staff accounts** to use profiles that include Chat permissions. Refer to Adding and editing staff accounts.

Note Configuration options will not be visible until Chat is enabled. To enable Chat, contact your Oracle account manager.

❖ Adding chat reports to navigation sets
❖ Adding Chat permissions to profiles
❖ Adding and editing staff accounts

Adding and editing chat session queues

Chat session queues, when used with **profiles** and **business rules**, enable automatic sorting of incoming chats based on contact, organization, product, category, and custom field information.

For example, a wireless communications organization might have agents that specialize in different types of sales products or services. You could add chat session queues such as cell phones and wireless service. You would then create profiles that allow agents to access the different queues and assign the appropriate profile to your agents based on their area of expertise.

Tip The following chat configuration settings are not interface specific, the setting in the primary interface takes precedence: AVERAGE_WAIT_TIME_SAMPLES, ESTIMATED_WAIT_TIME_SAMPLES, IDLE_QUEUE_WAIT_-TIME_RESET_SECONDS, and MIN_WAIT_INFO_UPDATE_SECONDS. Setting each configuration setting in additional interfaces to the same value as the primary interface avoids confusion. Refer to Multiple Interfaces.

Business rules, which perform actions on incoming chat requests based on specific conditions, can be used to automatically assign incoming chat requests to specified chat session queues. This ensures that chat requests are routed to the appropriate agent based on the agent's skill set. Refer to Business rules overview.

To add or edit a chat session queue

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree opens on the **content pane**.

3 Click the arrow next to the System Menus folder to expand the list.

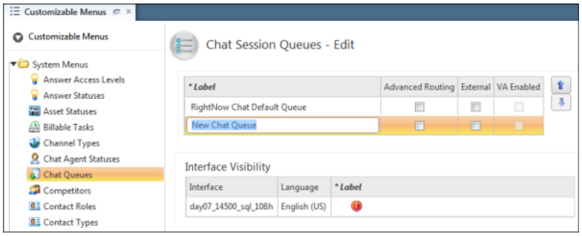
4 Click Chat Queues to display the editor.

Note Chat has one default chat session queue named Default Chat Queue. The name of the default queue can be changed, but the queue cannot be deleted. All incoming chat requests are routed to the Default Chat Queue unless new queues are added and **business rules** are implemented to route chats to the new queues.

5 To add a chat session queue, click the New button on the **ribbon** to display the editor.

Or

To edit a chat session queue, click it in the tree.



6 Type the name of the chat session queue in the Label field. The same name is added to the Label field in the Interface Visibility section.

Note When using multiple-language **interfaces**, you must type the name in the Label field in the language of the interface.

7 To designate the queue for use with advanced routing of chat requests, select the Advanced Routing check box. Refer to [Configuring advanced routing](#).

a Enter a value for Skill Requirement Relaxation for each skill.

b Enter a value for the Overflow Timer.

Note Smart Interaction Hub (SIH) must be enabled. To enable, contact your Oracle account manager.

8 To designate the queue for use with third-party-initiated chat requests, select the External check box.

Note The read-only VA Enabled check box is used to designate the queue for use with virtual assistant initiated chat requests. Refer to Configuring virtual assistant.

9 To change the order in which chat session queues display on the editor, select the queue and click the Move Up or Move Down button.

10 Click the Save and Close button on the ribbon.

Important If you try to delete a chat session queue that is used in a business rule, a message displays the rules that depend on the queue. Before you can delete the chat session queue, you must first edit the rules so they no longer use the queue.

❖ Business rules overview

Adding and editing chat agent statuses

An agent's status describes his or her availability to chat with customers as well as assist supervisors and other agents with their chats. Although Chat contains default chat agent statuses, you can create custom agent statuses and associate them with either the Available or Unavailable status type. While working in Chat, agents can change their status as necessary.

By default, Chat has five chat agent statuses that are assigned to three chat status types.

- **Available**—The Available status type signifies that the agent is available to chat. The following chat status is associated with the Available status type.
  - ▷ Unrestricted—The Unrestricted status indicates that there are no restrictions to an agent's availability to chat.
- **Unavailable**—The Unavailable status type signifies that the agent is not available to chat. The following chat statuses are associated with the Unavailable status type.
  - ▷ Unqualified—The Unqualified status indicates that the agent did not specify a reason for being unavailable to chat.
  - ▷ In Meeting—The In Meeting status indicates that the agent is in a meeting and is not available to chat.
  - ▷ On Break—The On Break status indicates that the agent is on a break and is not available to chat.

- **Logged Out**—The Logged Out status type is restricted to the Unspecified chat agent status type and cannot be modified.
  - ▷ Unspecified—The Unspecified status indicates that the agent is logged out of Chat. This chat status does not display to staff on the Agent Status drop-down menu.

The default chat agent statuses may be enough for your organization. However, if additional chat agent statuses will help you more accurately determine the status of agents, you can add them. When you add a chat agent status, you must assign it to one of the default status types and then make it available through the Chat Agent Statuses section in profiles. Refer to Adding Chat permissions to profiles.

To add or edit a chat agent status

1 Click the Configuration button on the **navigation pane**.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree displays on the **content pane**.

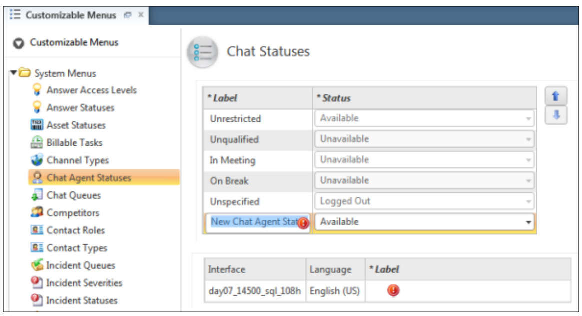
3 Click the arrow next to the System Menus folder to expand the list.

4 Click Chat Agent Statuses to display the editor.

5 To add a chat agent status, click the New button on the **ribbon** to display the editor.

Or

To edit a chat agent status, click it in the tree.



6 Type the name of the chat agent status in the Label field. The same label is added to the Label field in the Interface Visibility section.

7 Click the Status drop-down menu and select a status type. The options include Available, Unavailable, and Logged Out.

Note Once you save a chat agent status, you can change its label but not its status.

8 To change the order in which chat agent statuses display on the editor, select the status and click the Move Up or Move Down button.

9 Click the Save and Close button on the ribbon.

Tip The In Meeting and On Break default chat agent statuses and custom chat agent statuses can be deleted.

❖ Adding Chat permissions to profiles
❖ Live Media bar

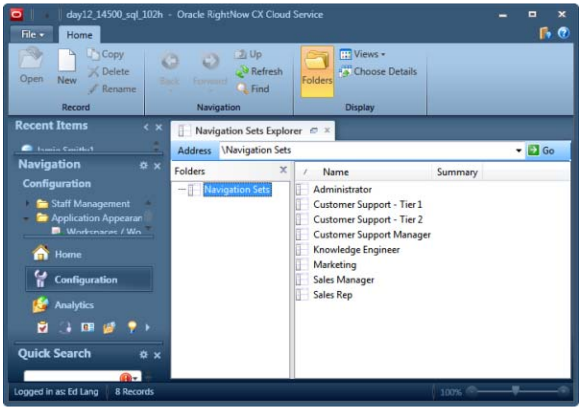
Adding chat reports to navigation sets

Before staff members chat with customers, we recommend that you add the applicable real-time chat reports to their **navigation sets** so they can view a dashboard of their chat activity. Refer to Real-time reports. For complete information about modifying navigation sets, refer to Modifying navigation sets.

To add a real-time chat report to a navigation set

1 Click the Configuration button on the **navigation pane**.

2 Double-click Navigation Sets under Application Appearance. The Navigation Sets explorer opens on the **content pane**.



3 Double-click the navigation set used by your agents. The content pane displays the Navigation Sets editor.

4 On the right side of the content pane, select the Communication Center check box. All Communication Center items display in the lower portion.

5 On the left side of the content pane, click the plus signs next to Public Reports > Service > Chat Reports > Real-Time Reports.

6 To configure the navigation set for agents, drag Chat Agent Home–Real Time from the left column and drop it in the lower portion of the right column.

7 To configure the navigation set for supervisors, drag Chat Supervisor Home–Real Time from the left column and drop it in the lower portion of the right column.

8 Click the Save and Close button on the **ribbon**.

Note The navigation set containing Chat Agent Home or Chat Supervisor Home must be selected in the Interfaces section on the Profile editor. Refer to Adding Chat permissions to profiles.

❖ Modifying navigation sets
❖ Adding Chat permissions to profiles

Real-time reports

Real-time reports and dashboards are available at Public Reports > Service > Chat Reports > Real-Time Reports. All of the reports include a default refresh rate of fifteen seconds or less. The following table describes the real-time reports and dashboards available for Chat.

Table 394: Real-Time Chat Reports Description

Report	Description
Active Chat List Per Agent	This report displays information about active chats that are assigned to agents.
Active Chat List Per Queue	This report displays information about active chats in queues.
Chat Agent Home–Real Time	This dashboard is a real-time alternative to the Chat Agent Home dashboard located at \Public Reports\Service\Chat Reports.
Chat Agent List Per Queue	This report displays information about agents and their assignment to queues.
Chat Agent Queue Snapshot	This report displays information about an agent's current chats.
Chat Supervisor Home–Real Time	This dashboard is a real-time alternative to the Chat Supervisor Home dashboard located at \Public Reports\Service\Chat Reports.
Chat Supervisor Queue Snapshot	This report displays information about each engagement in a queue.
Current Chat Agent Statistics	This report displays statistics for individual agents. **Note:** The Chats in Last Hour column is non-functional, displays 0, for the virtual assistant. Refer to Configuring virtual assistant.
Current Chat Group Statistics	This report displays statistics for agent groups.
Current Chat Queue Statistics	This report displays statistics for chat queues.
My Chat Agent Statistics	This report displays basic statistics for the current agent.
Waiting Chat List Per Queue	This report displays information about waiting chats in queues.

Chat Audit report

The Chat Audit report is a top-level report that provides a 360-degree view of chat data during a selected time period. The report includes drill-down links into associated audit detail reports and is available at Public Reports > Service > Chat Reports > Audit Reports.

Tip To view column definitions in the Chat Audit report, hover over the column headings.

Adding Chat permissions to profiles

Chat is not fully functional until staff members have been assigned as agents. Once you create or edit a **profile** containing Chat permissions, you can then assign the profile to individual staff members. This lets you designate which staff members have access to Chat. You can assign Chat permissions to one or more profiles based on your organization's needs.

To add Chat permissions to a profile

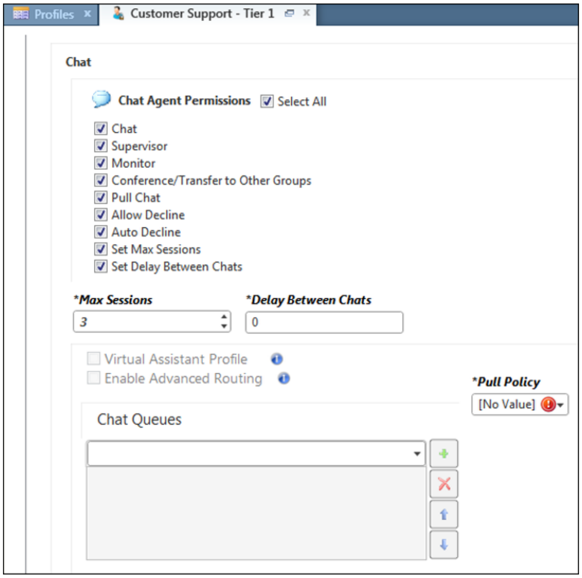
1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management. The report opens on the **content pane**.

3 Double-click the profile you want to edit. The Profiles editor opens.

4 Click the Permissions button on the **ribbon**.

5 Click the Service tab and scroll down to Chat permissions.



6 Enter the following field information.

Table 395: Chat Profile Settings Description

Field	Description
Chat Agent Permissions	Select the Select All check box to select all options in the Chat section. **Note:** If you do not want agents having full chat permissions in their profile, you must clear the check boxes next to the functions you do not want agents to have access to.
Chat	Select this check box to allow staff members with this profile to chat with customers.
Supervisor	Select this check box to allow staff members with this profile supervisory permissions in Chat.
Monitor	Select this check box to allow supervisors with this profile to monitor other agents. **Note:** This check box cannot be selected unless the Supervisor check box is selected, as monitoring can be performed only by supervisors.

Table 395: Chat Profile Settings Description (Continued)

Field	Description
Conference/Transfer to Other Groups	Select this check box to allow staff members to conference with agents in other groups and transfer customers to agents in other groups. **Note:** Agents can always conference with agents in their own group and transfer customers to agents within their own group.
Pull Chat	Select this check box to allow agents to pull chats from the wait queue. **Note:** By default, the chat server automatically pushes chat requests to agents. If the Pull Chat check box is selected, a corresponding pull policy must be selected so that chat requests are offered to agents when they click the Request Chat button on the Live Media bar.
Allow Decline	Select this check box to allow agents with this profile to manually decline chat requests. **Note:** If Allow Decline is selected, but Auto Decline is not, chats will automatically be assigned to agents if they click X on the top of toast invitations. To decline chats, agents must click Decline on toast invitations.
Auto Decline	Select this check box to allow the system to automatically decline chat requests when the toast notification expires. **Note:** The chat toast expiration timeout can be configured through the CHAT_ALERTFORM_AUTOCLOSE_TIMEOUT configuration setting.
Set Max Sessions	Select this check box and enter in the associated Max Sessions field the maximum number of chat sessions that a staff member can be engaged in. **Note:** The value set in this field also determines the value that displays in the Maximum Chat Sessions field on the Oracle Service Cloud Options window. Refer to Changing chat options.
Set Delay Between Chats	Select this check box and enter in the associated Delay Between Chats field the number of seconds that elapse before a new chat is presented to an agent. **Note:** The value set in this field determines the value that displays in the Stagger Incoming Chats field on the Oracle Service Cloud Options window. Refer to Changing chat options.

Table 395: Chat Profile Settings Description (Continued)

Field	Description
***Max Sessions**	Type the maximum number of chat sessions that a staff member can be engaged in.
***Delay Between Chats**	Type the number of seconds that elapse before a new chat is presented to an agent.
Virtual Assistant Profile	This read-only check box is used to designate the profile for use with virtual assistant initiated chat requests. Refer to Configuring virtual assistant.
Enable Advanced Routing	Select this check box to designate the profile for use with advanced routing. Refer to Configuring advanced routing.
Chat Queues	Click this drop-down menu and select the chat queue you want to be available for this profile. After selecting a queue, the queue can be moved up or down in the queue list. If needed, you can then select additional chat queues to associate with this profile. Refer to Adding and editing chat session queues. **Note:** An agent must be assigned to a chat queue to log in to Chat and accept chat requests from customers.
Pull Policy	Click this drop-down menu to select a pull policy that determines the queues that chat requests are retrieved from and their order. • **Strict priority**—Uses the priority ranking of the available queues to determine which queue to pull chats from, starting with the highest ranking queue. Chats are pulled from this queue until the staff member's active session limit is met or the queue is empty. If the queue is empty before the staff member's limit is met, then chats are pulled from the queue with the next highest priority ranking. • **First due**—Uses the order that chats were requested to determine which chats are sent to staff members. The first chat requested is the first chat pulled from a queue. Chats are pulled from all the staff member's available queues in the order the chats were requested until the staff member's maximum session limit is met or all queues are empty. Queue ranking will not affect the pull order.

Table 395: Chat Profile Settings Description (Continued)

Field	Description
Advanced Routing - Chat Queues	Click this drop-down menu and select the advanced routing chat queue you want to be available for this profile. After selecting a queue, the queue can be moved up or down in the queue list. If needed, you can then select additional chat queues to associate with this profile. Refer to Configuring advanced routing.
Chat Agent Statuses	This section contains panels for moving chat agent statuses between the Available and Assigned lists. Chat agent statuses are added through the Chat Agent Statuses editor. Refer to Adding and editing chat agent statuses.
Available	The Available list displays chat agent statuses that are not available to agents on the Agent Status drop-down menu located on the Live Media bar. Select a status and click the Add button to move the status to the Assigned list.
Assigned	The Assigned list displays chat agent statuses that are available to agents on the Agent Status drop-down menu located on the Live Media bar. Select a status and click the Remove button to move the status to the Available list. **Note:** By default, the Logged Out–Unspecified radio button is selected so agents are not automatically logged in to Chat when they log in to Oracle Service Cloud. Select the Available–Unrestricted radio button to automatically log agents in to Chat (and make them available) when they log in to Oracle Service Cloud.

7 Click the Save and Close button on the ribbon.

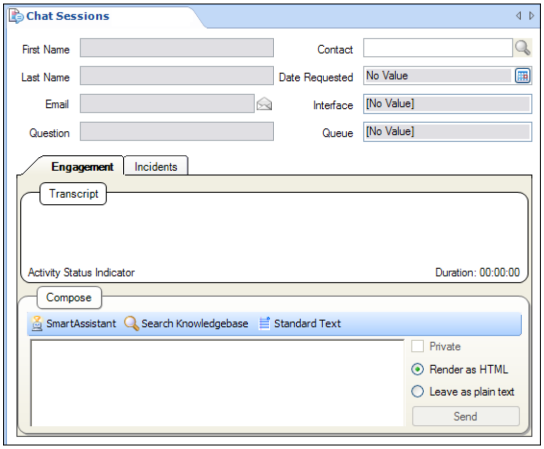
Important Before agents can use Chat, you must assign a profile containing chat permissions to their staff account. Refer to Adding and editing staff accounts.

Chat workspaces

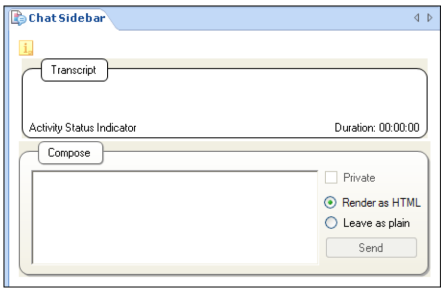
Chat contains two standard **workspaces** that are used by supervisors and agents. Workspaces determine what staff members see when they chat with customers or among themselves.

You can use the standard workspaces or create custom workspaces by copying one to use as a starting point. You assign a workspace in the profile used by agents. If you do not assign a workspace, the system uses the default.

- **Chat sessions**—The chat sessions workspace displays when an agent accepts a chat from a customer or when a supervisor monitors a chat. It consists of information about the customer plus an Engagement tab and an Incidents tab. The Engagement tab consists of a Transcript section (where the chat session is recorded to) and a Compose section (where you type your responses to customers). The Incidents tab contains a list of incidents previously submitted by customers, so you can review any correspondence that customers had with other agents prior to the chat session.



- **Chat sidebar**—The chat sidebar workspace displays as a new tab and is used when transferring chats to other agents or conferencing agents into chat sessions.



Additional chat configuration options

Powerful configuration options are available for Chat. For instance, you can set service level requirements to ensure agents respond to customers in a timely manner and set up **standard text** to increase agent efficiency when responding to contacts. Chat can be integrated with guided assistance so agents can present **guides** to contacts when they are chatting with them. Chat can also be integrated with **Oracle RightNow Feedback Cloud Service (Feedback)** so that contacts are presented with a **survey** at the conclusion of a chat session.

Configuring service level requirements

Chat has configurable service level requirements that allow you to set realistic service goals for your agents and reasonable expectations for your customers. For instance, you can define the amount of time that elapses before a customer tab changes from green to yellow, indicating to the agent that the customer is waiting for a response. The Chat service level configuration settings are located at Chat > General > Service Level. Refer to Customizing configuration settings and Chatting with customers.

Configuring agent and system service level statistics

From the Chat Agent Home dashboard, agents can view chat statistics, such as the available chat queues, the number of current chat sessions, active chats, waiting customers, average wait time, and average chat duration. By default, all cumulative statistics are a representation of system activity for the last thirty minutes and are updated each minute. By configuring agent service level statistics, you can configure both the reporting, or "lookback" period, and the frequency of updates to meet your requirements. The agent service level statistics configuration settings are located at Chat > General > Service Level.

- Customizing configuration settings
- Chatting with customers

Configuring standard responses and URLs for chat sessions

Agents can send chat responses to customers from predefined **standard text** responses. By creating standard responses and URLs for agents to use during chat sessions, your agents can save valuable time by not having to type answers for commonly asked questions or URLs.

A Shortcut field allows agents to quickly insert standard text responses and URLs during a chat session. To view the shortcut ID code, agents can hover over the response or URL entry to see the shortcut ID. Typing the shortcut ID in the Shortcut field and pressing **Enter** automatically sends the response or URL to the customer. For additional information about configuring standard text and URLs, refer to Adding standard text.

Tip If your organization uses **variables** in standard text, such as *contacts.first_name*, agents can type (or copy and paste) the variable inline when responding to a customer. The variable is then replaced with the appropriate data before the response is sent to the customer. For additional information about configuring variables, refer to Adding variables.

- ❖ Adding standard text
- ❖ Adding variables

Pulling chats from the wait queue

By default, chats are automatically pushed to agents, but this functionality is configurable. If you select the Pull Chat check box in an agent profile, agents can manually pull chat requests from the wait queue. If the Pull Chat check box is not selected, the Request Chat and Cancel Request buttons are disabled on the Live Media bar and chats are pushed to agents by the system.

Important If the Pull Chat check box is selected, you must also select a **pull policy**. Refer to Adding Chat permissions to profiles.

By clicking the Request Chat button, the agent is requesting to pull a chat from the wait queue. If there is a chat in the wait queue, the agent will receive a toast notification that the agent can either accept or decline. If the wait queue is empty, the Request Chat button remains active, letting the chat server know that the agent is attempting to request the next chat that enters the wait queue.

- ❖ Adding Chat permissions to profiles

Creating incidents from chat sessions

Chat can capture chat sessions as incidents, allowing you to track all chat correspondence. By default, agents are prompted to create an incident when a chat sessions ends, but this functionality is configurable so that an incident can be created when a chat session begins. In addition, incident fields can be added to the chat session workspace for viewing and editing purposes. By configuring the chat sessions **workspace**, you can customize this functionality to meet your organization's needs.

Important To create an incident when a chat session begins, you must copy the standard chat sessions workspace. The copied workspace will contain an Options button on the ribbon, which you can use to customize incident creation and editing at the beginning of a chat. If you do not copy the chat sessions workspace, incident creation is dictated by the default behavior. Contact your Oracle account manager for more information.

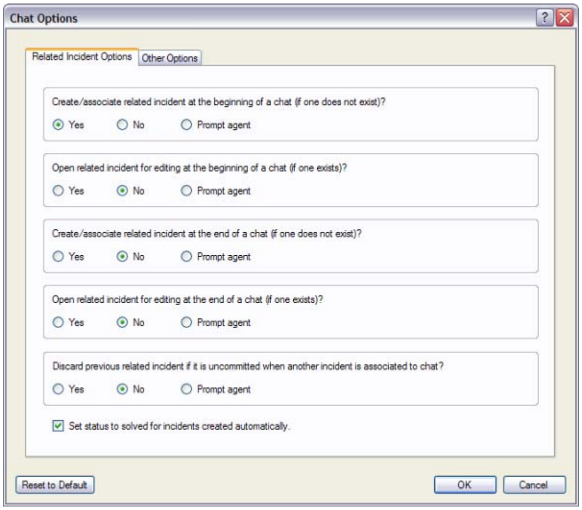
The following default actions are performed at the conclusion of the chat session.

- The agent is prompted to create an incident.

- The agent is prompted to enter wrap-up mode. Wrap-up mode allows agents to complete any post-chat tasks before automatically receiving the next chat request.
- If a customer account does not exist for the customer, a new customer account is created and a contact record is added to the knowledge base. If the email address field is not enabled on the Live Help page, the field is set to a generic email address (chat@nodomain.com).
- The Assigned field is set to the agent who participated in the chat session.
- The incident custom fields you have made visible on the Live Help page are updated.
- The chat conversation appears as a chat transcript on the Messages tab of the incident.
- The Subject field is populated with Chat Session.
- The status of the incident is set to Solved.

To configure incident creation and editing for chat

1. Click the Configuration button on the **navigation pane**.
2. Double-click Workspaces under Application Appearance. The Workspaces explorer opens on the **content pane**.
3. Click the Standard folder in the tree under Workspaces.
4. Right-click the Chat Sessions workspace and select Copy.
   - **a** Select the folder you want to add the copied workspace to.
   - **b** Type a name for the copied workspace in the Name field.
   - **c** Click the OK button. The workspace displays on the explorer in the folder that you selected.
5. Double-click the new workspace. The workspace opens on the content pane.
6. Click the Options button on the ribbon. The Chat Options window opens and the Related Incident Options tab displays by default.



7 Select from the options described in the following table.

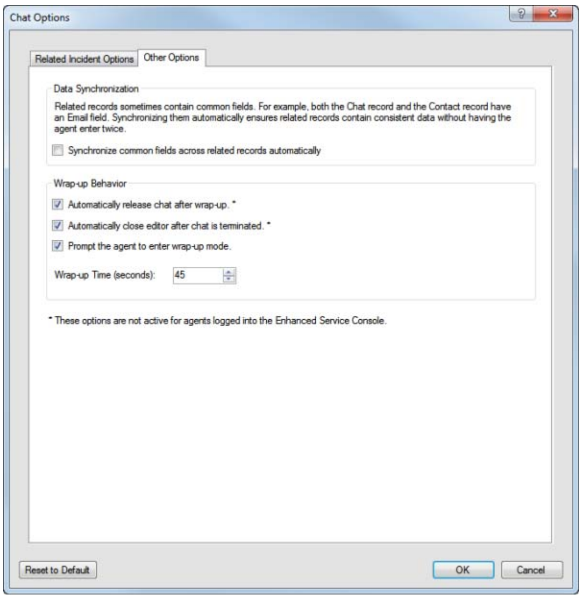
Table 396: Related Incident Options Tab Description

Option	Description
Create/associate related incident at the beginning of a chat (if one does not exist)?	Select from the following radio buttons. • Yes • No • Prompt agent **Note:** This option is set to Yes by default.
Open related incident for editing at the beginning of a chat (if one exists)?	Select from the following radio buttons. • Yes • No • Prompt agent **Note:** This option is set to No by default.
Create/associate related incident at the end of a chat (if one does not exist)?	Select from the following radio buttons. • Yes • No • Prompt agent **Note:** This option is set to No by default.

Table 396: Related Incident Options Tab Description

Option	Description
Open related incident for editing at the end of a chat (if one exists)?	Select from the following radio buttons. • Yes • No • Prompt agent **Note:** This option is set to No by default. Incident opens only when Wrap-up is selected to end a chat.
Discard previous related incident if it is uncommitted when another incident is associated to chat?	Select from the following radio buttons. • Yes • No • Prompt agent **Note:** This option is set to No by default.
Set status to solved for incidents created automatically.	Select this check box to set the incident's status to Solved if it is not automatically opened by Oracle Service Cloud. **Note:** This check box is selected by default.

8 Click the Other Options tab.



9 Select from the options described in the following table.

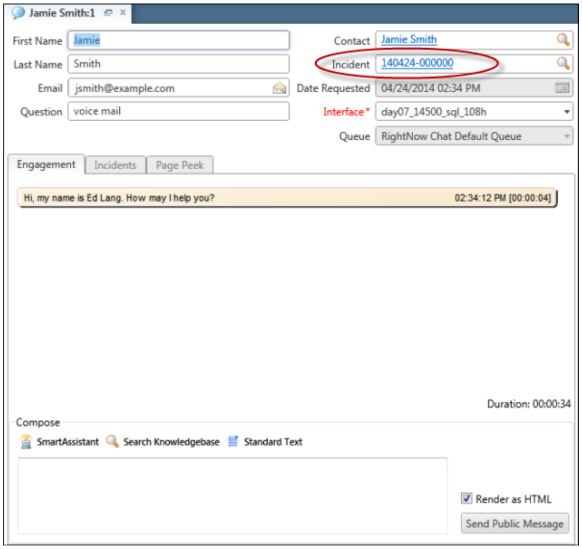
Table 397: Other Options Tab Description

Option	Description
Data Synchronization	This section contains an option to synchronize common fields across related records. For example, both the chat sessions and contact workspaces include an Email field that is synchronized for data consistency purposes.
Synchronize common fields across related records automatically	Select this check box to enable data synchronization between the following fields. • *chats.email* and *contacts.email* • *chats.first_name* and *contacts.first_name* • *chats.last_name* and *contacts.last_name* • *chats.c_id* and *incidents.c_id* **Note:** This feature is disabled by default.
Wrap-up Behavior	This section contains options for configuring wrap-up mode, which allows agents to complete any post-chat tasks before automatically receiving the next chat request.
Automatically release chat after wrap-up	Select this check box to automatically release a chat after wrap-up mode has ended. **Note:** This feature is enabled by default. This feature is not available for the enhanced Service Console.
Automatically close editor after chat is terminated	Select this check box to close the incident workspace after the chat has ended. **Note:** This feature is enabled by default. This feature is not available for the enhanced Service Console.
Prompt the agent to enter wrap-up mode	Select this check box to prompt agents to enter wrap-up mode. **Note:** This feature is enabled by default.
Wrap-up time (seconds)	Type the number of seconds to specify the maximum time allowed for chat sessions to wrap up. **Note:** This option is set to 45 seconds by default. If it is set to zero, agents will not be prompted to enter wrap-up mode.

10 Click the Save and Close button on the **ribbon** to save and close the custom workspace.

After configuring the custom workspace, it must be assigned to one or more profiles. Refer to Customizing profiles.

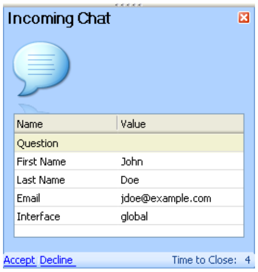
If you have configured Oracle Service Cloud to create an incident at the beginning of a chat session, the chat sessions workspace includes an Incident field that displays the reference number of the incident. To view or edit the incident while chatting with the customer, right-click the reference number and select Open. Refer to Editing incidents.



❖ Adding incidents
❖ Editing incidents

Configuring preliminary screen pop

Preliminary screen pop functionality enhances toast notifications that agents view before accepting chats. The preliminary screen pop displays as a two-column table that allows agents to view additional information about chat requests.



The information that displays on the preliminary screen pop table can be specified using the CHAT_ALERTFORM_DISPLAY configuration setting. You can also disable the preliminary screen pop using the CHAT_ALERTFORM_ENABLED configuration setting. Both settings are located at Chat > General > Agent. Refer to Customizing configuration settings.

- Chatting with customers
- Customizing configuration settings

Feedback for chat

Both website link and transactional surveys can be distributed to customers to gather feedback during or after a chat session. This includes the ability to either send an invitation message to the customer containing a link to the survey during the chat session (website link survey) or popping a browser window containing a survey at the end of the chat session (transactional survey). Customer responses to the surveys are linked back to the chat session to facilitate reporting. Refer to Creating surveys.

If you are creating a transactional survey, you must also create a **business rule** to trigger the survey upon completion of the chat session. Refer to Creating rule bases and Actions for chat rules.

- Creating surveys
- Creating rule bases
- Actions for chat rules

Guided assistance for chat

Guided assistance **guides** can be added to custom chat sessions workspaces to assist agents as they chat with customers. For information about adding the Guided Assistance control to a custom chat sessions workspace, refer to Adding fields to workspaces and scripts. For information about how agents use guides while chatting with customers, refer to Accessing guided assistance guides.

- Adding fields to workspaces and scripts
- Accessing guided assistance guides

Chat presence management

Presence management ensures that chat participants are notified when either the agent or the customer experiences communication difficulties with the chat service. By default, if the chat service does not receive signals from an agent or customer within two minutes, the chat service begins the process of disconnecting the agent or customer and handling any active chats in which either party is a participant. Presence management is available on a per-site basis.

Because agents and customers are recognized by the chat service as existing in an active, absent, or disconnected state, three configuration settings are available for modifying the intervals in which agents and customers are recognized by the chat service. The chat presence management configuration settings are located at Chat > General > Chat Session.

Proactive chat

With the proactive chat widget, you can offer a chat invitation to customers while they are using your website. The proactive chat widget is accessed from the **customer portal**. You can configure the chat widget to select when the chat invitation is displayed to the customer based on the time the customer has spent on the page and the number of searches conducted as well as chat agent availability and estimated wait time. Refer to Offering customers a chat session.

❖ Offering customers a chat session

Chat data purging

Because chat data can potentially build up quickly, it can be purged according to configuration settings located at Agedatabase Utility > Chat Purging.

Caution Be cautious when configuring chat data purging, as chat data is permanently deleted from the database. If you need assistance with chat data purging, submit an incident to our support site.

Configuring advanced routing

You can route incoming chats to agents with specific language or product skills. Routing chats to agents with a specific skill set ensures that customers' questions are answered accurately and efficiently.

Products and categories selected by the customer and the language of the customer portal page from which the chat was initiated determine which agent skills are required. If your customer is viewing the English version of the customer portal when they initiate the chat, connecting them to a chat agent fluent in English is going to provide the best experience. If your customer is looking for information about your newest product, connecting them to a chat agent who is an expert with that product is going to provide the quickest resolution.

Additionally, you can track the performance of advanced routing of chat sessions using standard reports available at Public Reports > Service > Advanced Routing.

Note Advanced routing reports and configuration options will not be visible until Chat and Smart Interaction Hub are enabled. To enable, contact your Oracle account manager.

You will need to complete the following tasks before you can configure and use advanced routing for incoming chats.

- Define products and categories. Refer to Adding and editing products, categories, and dispositions.
- Add product and category fields to the Live Help page of the customer portal. Refer to Live Help page.
- Create an advanced routing chat queue. Refer to Adding and editing chat session queues.
- Create and activate a rule to route chats to the advanced routing chat queue. Refer to Adding rules.
- Assign advanced routing permissions to a profile. Refer to Adding Chat permissions to profiles.

Additionally, you will need to configure skills and staff account skill scores to finish the configuration and begin using advanced routing for incoming chats.

To assign the Skill Edit permission in profiles

1. Click the Configuration button on the navigation pane.
2. Double-click Profiles under Staff Management. The report opens on the content pane.
3. Double-click the profile you want to edit. The Profiles editor opens.
4. Click the Permissions button on the ribbon. The Permissions page opens.
5. Select the Skill Edit check box in the Administration section on the Administration tab.
6. Click the Save and Close button on the ribbon.

Note Next, you need to add Product Skills and Language Skills to the navigation set. Refer to Modifying navigation sets.

To add skills

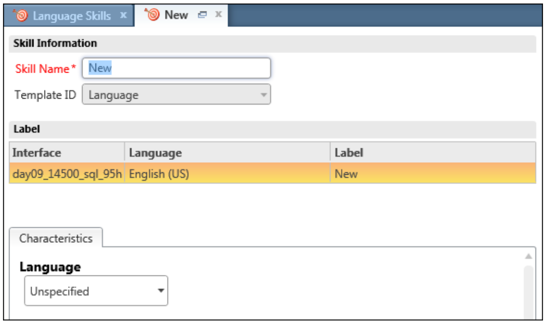
1 Click the Configuration button on the navigation pane.

2 Double-click Language Skills or Product Skills under Service. The Skills editor displays on the content pane.

3 To add a skill, click the New button on the ribbon to display the editor.

Or

To edit a skill, click it in the tree.



Caution You can delete a skill at any time by selecting the skill entry in the tree and clicking the Delete button on the ribbon. However, when you delete a skill, all instances of the skill will also be deleted.

4 Enter the following field information.

Table 398: Skills Editor Description

Field	Description
Skill Information	This section defines the name and type of the skill.
*Skill Name	Type the name of the skill.
Template ID	This read-only field identifies the type of skill.
Label	Select the interface.

Table 398: Skills Editor Description (Continued)

Field	Description
Characteristics	This section specifies the language, product, or category for the skill.
Language	Select a language from the drop-down menu. **Note:** This field is available only on the Language Skills editor.
Product	Select a product from the drop-down menu. **Note:** This field is available only on the Product Skills editor.
Category	Select a category from the drop-down menu. **Note:** This field is available only on the Product Skills editor.

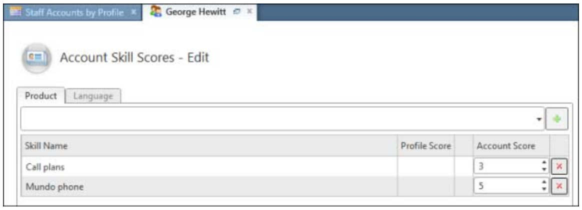
5 Click the Save and Close button on the ribbon.

To assign skill scores to a staff account

1 Click the Configuration button on the navigation pane.

2 Double-click Profiles under Staff Management and double-click the profile you want to edit. The Profiles editor opens.

3 Click the Skills button on the **ribbon**. The Account Skill Scores page opens.



4 Select the Product or Language tab.

5 Select a product or language from the drop-down menu.

6 Click the green plus sign to add it to the profile.

7 Assign the skill an account score from the drop-down menu.

8 Click the Save and Close button on the ribbon.

Configuring engagement engine rules

Engagement engine rules give you greater control over when, where, and how proactive and reactive chats are provided to your customers. A robust set of built-in rule conditions regarding customer behavior and page data determine the initiation of a chat offer.

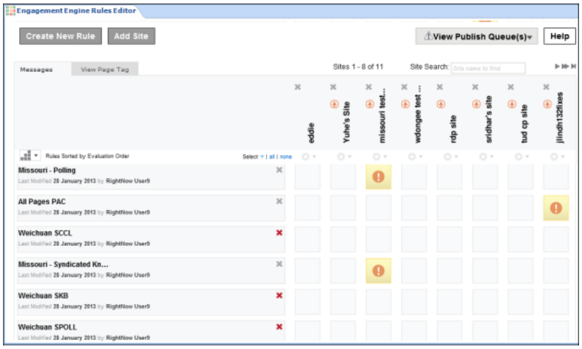
Note Engagement engine rules must be enabled. Contact your Oracle account manager.

To assign engagement engine rules permissions in profiles

1. Click the Configuration button on the **navigation pane**.
2. Double-click Profiles under Staff Management. The report opens on the **content pane**.
3. Double-click the profile you want to edit. The Profile editor opens.
4. Click the Permissions button on the **ribbon**. The Permissions page opens.
5. Select the Engagement Engine Rules check box on the Administration tab.
6. Click the Save and Close button on the ribbon.
7. Add the Engagement Engine Rules item to your **configuration list** for the Configuration button. Refer to Creating a navigation set for the administrator.

To access the Engagement Engine Rules editor

1. Double-click Engagement Engine Rules in the configuration list. The Engagement Engine Rules editor login screen opens on the content pane.
2. Enter your user ID, password, and account ID, provided by your Oracle account manager.
3. Click the Log In button. The Engagement Engine Rules editor opens on the content pane.



For detailed procedures about creating and editing engagement engine rules, click the Help button.

Configuring visitor browser history

Visitor browser history gives you more information about what your customers were viewing prior to initiating a chat. A list of up to fifteen URLs tracking the pages of your organization's website displays on the visitor browser history tab of the chat workspace. Visitor browser history provides agents with valuable information about what customers were viewing before requesting a chat.

Note Engagement engine must be enabled and all pages of your organization's website that you want to track must contain the engagement engine tag. Contact your Oracle account manager. Refer to Oracle Engagement Engine documentation for more information about tagging your pages.

Configuring Chat for customers

Many options are available for customizing Chat to match your business requirements. Because the chat pages are integrated with the **customer portal**, they are highly configurable.

Note Chat must be enabled in order for your customers to chat with agents. Contact your Oracle account manager.

Configuring the Live Help page

The Live Help page on the customer portal is your customers' entry point for submitting chat requests. Within each section you can place incident custom fields to gather additional information before customers can engage in chat. Refer to Live Help page.

Setting chat hours

You can set chat hours for Chat availability to control when customers can submit chat requests. Outside of those chat hours, customers cannot request assistance. Additionally, your chat hours are displayed on the Live Help page.

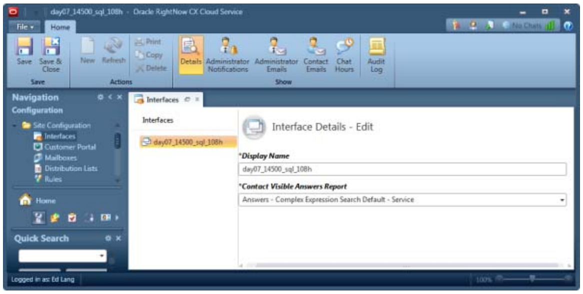
You can also specify more than one set of chat hours per day to allow for multiple time periods in a single day (for example, if you wanted to offer chat during peak traffic times only, such as 8:00 A.M. to 12:00 P.M. and 1:00 P.M. to 5:00 P.M.).

To set chat hours

1 Click the Configuration button on the **navigation pane**.

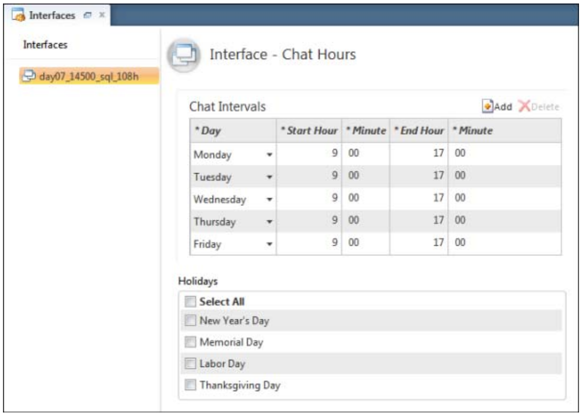
2 Double-click Interfaces under Site Configuration. The Interfaces tree displays on the **content pane**.

3 Click the **interface** to add chat hours to. The Interfaces editor displays on the content pane.



4 Click the Chat Hours button on the **ribbon**. The Chat Hours page opens.

Note Chat hour intervals will always be entered at the bottom of the list, but when you save your changes, the intervals are arranged in chronological order.



5 Enter field information described in the following table.

Table 399: Chat Hours Editor Description

Field	Description
Chat Intervals	Edit the following fields to set chat hour intervals.
Day	Click in this field and select the day of the week from the drop-down menu. **Note:** Use this functionality to specify more than one set of chat hours per day to allow for multiple time periods in a single day.
*Start Hour	Type the hour of the day that you want the service interval to begin. This field uses the 24-hour clock. For example, type 8 for 8:00 A.M and type 17 for 5:00 P.M.
*Minute	Type the minute of the hour that you want the service interval to begin.
*End Hour	**Note:** Type the hour of the day that you want the service interval to end. This field uses the 24-hour clock. For example, type 8 for 8:00 A.M and type 17 for 5:00 P.M.
*Minute	Type the minute of the hour that you want the service interval to end.

Table 399: Chat Hours Editor Description (Continued)

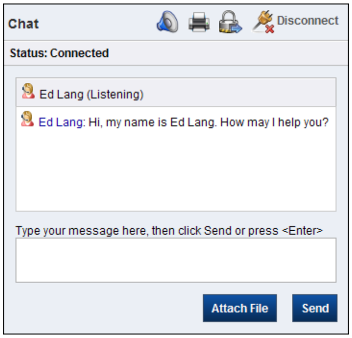
Field	Description
Holidays	Select the holidays that will affect your chat hours. Chat hours will not be available during selected holidays. **Note:** If you have not defined any holidays, this field is blank. Refer to Adding and editing holidays.

6 Click the Save and Close button on the ribbon.

The chat hours will now appear on the Live Help page of the customer portal. Refer to Live Help page.

Configuring the Chat page

The Chat page opens after customers submit chat requests from the Live Help page. From this page, customers can chat with agents, send file attachments, and print chat correspondence. Because your organization has its own image and web presence, you may want to customize the Chat page to match the look and feel your customers have come to expect. Refer to Chat page.



To learn more about Chat and how agents interact with customers while chatting, refer to Chat for agents.

Configuring virtual assistant

If your site is integrated with Oracle RightNow Virtual Assistant Cloud Service (Virtual Assistant), you can route incoming chats to a virtual assistant. For complete information about Virtual Assistant, refer to the Virtual Assistant documentation.

Using virtual assistant chats, you can ease the volume of chats requiring an agent. Many customer questions can quickly be answered with existing information in the knowledge base. Agent chats and virtual assistant chats can be initiated, routed, and tracked through the Service Console.

Note The virtual assistant component must be enabled in both Oracle Service Cloud and Virtual Assistant. Contact your Oracle account manager.

Once virtual assistant is enabled, you need to perform the following steps so incoming chats can be routed to the virtual assistant.

- Assign the Virtual Assistant Edit permission to your profile—You will need this permission in order to configure the virtual assistant for your application. Refer to Administration permissions.
- Add the Virtual Assistant editor to a navigation set—All configuration takes place on this editor. Refer to Creating a navigation set for the administrator.
- Create the virtual assistant profile, account, and chat queue—In this step, you will define the virtual assistant name that will display to customers during a chat and the chat queue that will handle incoming chats and escalation. Once you fill in this information and save it to the database, the virtual assistant profile is created automatically. Refer to Adding and editing chat session queues.
- Create chat rules to route virtual assistant chats and escalate virtual assistant chats to agents when necessary. Upon escalation, you can view a complete transcript of the virtual assistant chat leading to a smooth transition from virtual assistant to agent. Refer to Configuring engagement engine rules for steps to create rules.

To add virtual assistant edit permissions to a profile

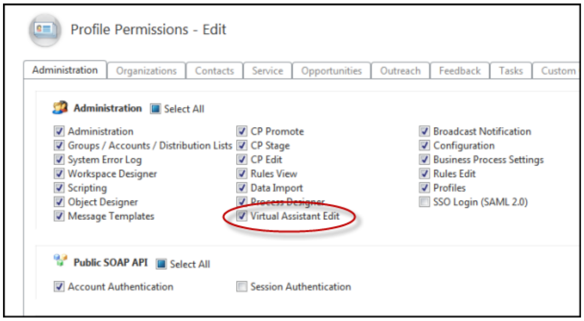
1 Click the Configuration button on the **navigation pane**.

2 Double-click Profiles under Staff Management. The report opens on the **content pane**.

3 Double-click the profile you want to edit. The Profiles editor opens.

4 Click the Permissions button on the **ribbon**.

5 Select the Virtual Assistant Edit check box in the Administration section on the Administration tab.



6 Click the Save and Close button on the ribbon.

To add the virtual assistant editor to a navigation set

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. The Navigation Sets explorer opens.

3 Right-click the navigation set you want to edit and select Open. The navigation set opens on the content pane.

4 Click Configuration on the right side of the content pane. The folders and configuration items associated with this button display in the lower portion of the right column.

5 Expand the Components list and Common folder in the left column.

6 Click the Virtual Assistant Editor item and click the Add button.

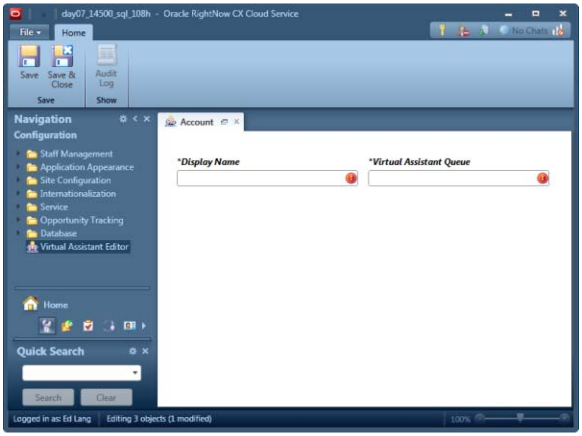
7 Click the Save and Close button on the ribbon to save the modified navigation set.

To create a virtual assistant profile, virtual assistant account, and virtual assistant queue

Note You can have only one virtual assistant account and one virtual assistant queue. Once created, the virtual assistant profile, account, and queue cannot be deleted. However, you can change the names of the virtual assistant account and queue using the Virtual Assistant editor.

1 Click the Configuration button on the navigation pane.

2 Double click Virtual Assistant Editor in the list.



3 Type the name for the virtual assistant in the Display Name field. This is the account name that will be displayed to customers during a chat.

4 Type the name for the virtual assistant chat queue in the Virtual Assistant Queue field. This is the name of the chat queue that you will use to configure rules to handle incoming chats and escalation.

5 Click the Save and Close button on the ribbon to save the information and create the virtual assistant profile (automatically labeled VA_Accounts_Profile), virtual assistant account, and virtual assistant queue.

Important In order to complete the configuration and begin routing incoming chats to the virtual assistant, you must create chat rules. Refer to Configuring engagement engine rules.

66

Chat

While self-service and email response management can solve the majority of customer issues, Oracle RightNow Chat Cloud Service (Chat) offers the best venue for certain queries, such as helping customers finalize purchases.

Chat for agents

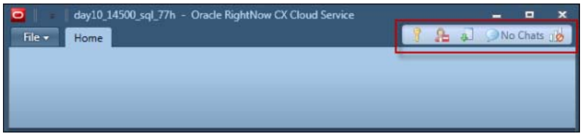
As a chat agent, you can serve customers in real time through typed conversation. While chatting, you can send predefined responses and URLs to customers, offering a faster response time. When you need assistance with a chat session, you can **conference** another agent into a chat or **transfer** a chat to another agent. Both the conference and transfer features can be useful if another agent is more knowledgeable in a particular area.

By default, when you are finished chatting with a customer, Chat creates an **incident** from a chat session, which results in all correspondence being recorded to the **knowledge base** for resolution and reporting purposes.

- Inserting standard text
- Chat for supervisors
- Chat for customers

Logging in to Chat

Once Chat is enabled and your **profile** includes chat permissions, you can log in as an agent from the **Live Media bar**. The Live Media bar appears on the **content pane** regardless of which **navigation list** is selected or what is displayed on the content pane. Refer to Adding Chat permissions to profiles.



Live Media bar

With the Live Media bar, you can log in, log out, and set your status in Chat. In addition, you can request and cancel chat requests, manage active chat sessions, and view the status of your connection with the chat server.

The following table describes the options available on the Live Media bar.

Table 400: Live Media Bar Description

Button	Description
Login Chat	Click this button to log in to Chat. The Agent Status drop-down menu (located next to the Login button) is enabled. **Note:** This button appears only when you are logged out.
Logout Chat	Click this button to log out of Chat. The Agent Status drop-down menu (located next to the Logout button) is disabled. **Note:** This button appears only when you are logged in.
Agent Status	Click the drop-down menu on this button to select an agent status type and status. **Note:** Chat contains default agent status types of Unavailable and Available. By default, the Unavailable status type is selected, but your administrator can select Available as your default status type. In addition, your administrator can add custom statuses and select any of them as the default. Refer to Adding and editing chat agent statuses.
Available	The Available status type signifies that you are available to chat.
Unavailable	The Unavailable status type signifies that you are not available to chat.
In Meeting	The In Meeting status indicates that you are in a meeting and unavailable to chat. **Note:** By default, this status does not display on the Agent Status drop-down menu.

Table 400: Live Media Bar Description (Continued)

Button	Description
On Break	The On Break status indicates that you are on a break and unavailable to chat. **Note:** By default, this status does not display on the Agent Status drop-down menu.
Request Chat	Click this button to request (pull) a chat from the queue. **Note:** By default, chats are pushed to you by the system. This button is enabled only if Pull Chat permission is set in your profile and you are available to chat.
Cancel Request	Click this button to cancel a chat request after it has been pulled from the queue. **Note:** By default, chats are pushed to you by the system. This button is enabled only if Pull Chat permission is set in your profile, you are available to chat, and the Request Chat button is not active.
Active Chats	If you are chatting with multiple customers, click this drop-down menu and select a chat session to participate in. When you are not chatting with customers, the drop-down menu is disabled and displays No Chats. When you are engaged in a chat session, the name of the customer you are chatting with displays in the menu. **Note:** The color of the selections in the Active Chats drop-down menu correspond to the customer tab colors. Refer to Chatting with customers.
Connectivity	A symbol with all green bars signifies that your connection to the Oracle server is excellent. A symbol with yellow bars signifies that your connection to the Oracle server is intermediate, but could be better. A symbol with a small red bar signifies that your connection to the Oracle server is poor. A symbol with white bars covered by a red circle signifies that you are logged out of Chat.

To log in to Chat

1 Click the Communication Center button on the **navigation pane**.

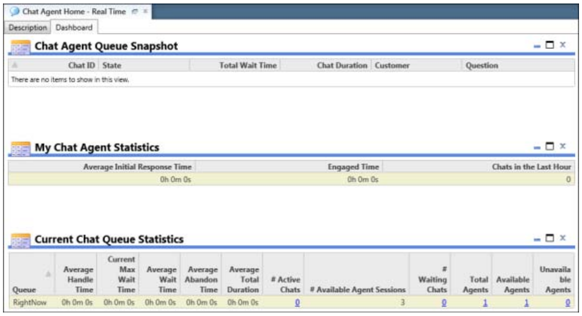
2 Double-click Chat Agent Home–Real Time or Chat Supervisor Home–Real Time in the **navigation list**. The dashboard opens on the **content pane**.

Note If the Chat Agent Home–Real Time or Chat Supervisor Home–Real Time reports do not display in your navigation list, you can add them if you have the correct profile permission. Refer to Customizing navigation and configuration lists.

3 Click the Login Chat button on the Live Media bar.

4 Click the Agent Status drop-down menu and select Available.

Tip Your administrator can configure your profile so that you are automatically logged in and available to chat after logging in to Oracle Service Cloud.



The following reports display on the Chat Agent Home dashboard.

- **Chat Agent Queue Snapshot**—Shows the service statistics for each chat queue that the logged-in agent is assigned to.
- **My Chat Agent Statistics**—Shows chat agents their basic chat statistics, including average response time, engaged time, and chats completed.
- **Current Chat Queue Statistics**—Shows the service statistics for all of the chat queues.

Tip The Chat Agent Home–Real Time dashboard refreshes every fifteen seconds or less, depending on server load.

❖ Customizing navigation and configuration lists

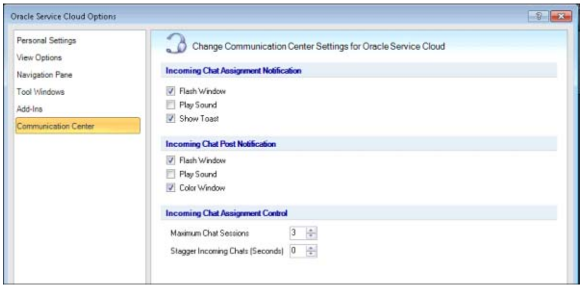
❖ Real-time reports

Changing chat options

Visual and audible alerts are available to notify you when customers request to chat or when they update existing chat sessions. You can change certain settings to provide the most effective assistance possible.

To change your chat options

1 Click **File** and select Options > Communication Center to view chat options.



2 Select from the options described in the following table.

Table 401: Chat Notification Settings Description

Field	Description
Incoming Chat Assignment Notification	Incoming Chat Notification options apply only to new chat requests.
Flash Window	Select this check box to flash the minimized window on the Windows task bar whenever a new chat arrives. **Note:** This option is selected by default.
Play Sound	Select this check box to enable an incoming sound alert whenever a new chat arrives.
Show Toast	Select this check box to display a toast notification whenever a new chat request arrives. **Note:** This option is selected by default.

Table 401: Chat Notification Settings Description (Continued)

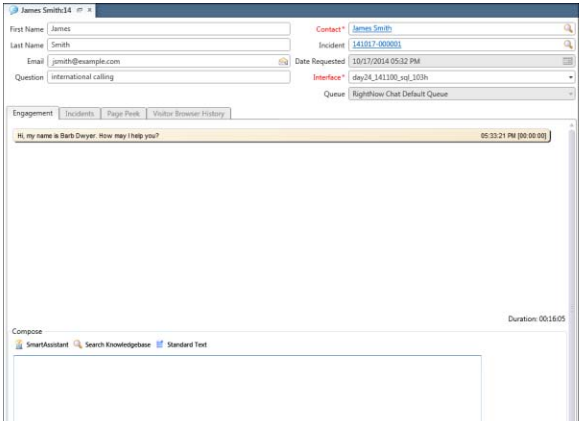
Field	Description
Incoming Chat Post Notification	Incoming Chat Post Notification options apply only to existing chats that are updated by the customer.
Flash Window	Select this check box to flash the minimized window on the Windows task bar whenever a chat is updated by the customer. **Note:** This option is selected by default.
Play Sound	Select this check box to enable sound alerts whenever the chat is updated by the customer.
Color Window	Select this check box to change colors on the customer tab as time passes to alert you that you need to respond to the customer. **Note:** This option is selected by default. If this option is not selected, a colored icon will display on the customer tab whenever the customer updates the chat session.
Incoming Chat Assignment Control	Incoming Chat Assignment Control options apply only to new chat requests.
Maximum Chat Sessions	This number represents the maximum number of chat sessions that you can have open at one time. Click the up arrow to increase sessions and click the down arrow to decrease sessions. **Note:** The maximum number is set by your administrator in your profile.
Stagger Incoming Chats (Seconds)	This number represents the amount of time that elapses before you are offered another chat. Click the up arrow to increase seconds and click the down arrow to decrease seconds.

3 Click the OK button to save your chat notification settings.

Chat sessions workspace overview

Your main role is to chat with customers and access tools to answer their questions. This is accomplished through the chat sessions **workspace**. It is important to familiarize yourself with the chat sessions workspace before chatting with customers.

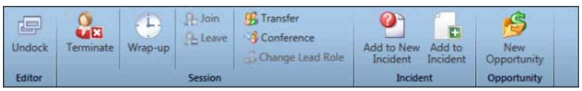
Note The following figure shows the standard chat sessions workspace for an agent after accepting a chat request from a customer. Keep in mind that what you see may be different if your administrator has created a custom chat sessions workspace and assigned it to your **profile**.



Notice in the previous figure the customer's name on the content pane tab. Additional tabs will display when you are engaged in multiple chat sessions.

Chat ribbon

While chatting with customers, multiple chat agent tools are available on the chat **ribbon**.



The following table describes the buttons on the chat ribbon.

Table 402: Chat Ribbon Description

Group/Button	Description
Editor	
Undock	Click this button to undock the chat workspace editor from the console and display it in a separate window.
Session	
Terminate	Click this button to terminate the chat session.
Wrap-up	Click this button to conclude the chat and enter wrap-up mode. Wrap-up mode allows you to do any post-chat tasks before automatically receiving the next chat request. Tasks can include creating an incident from the chat, adding the chat to an existing incident, or creating an opportunity from the chat.
Join	Click this button to join a chat session while monitoring a chat. Refer to Monitoring chats. **Note:** This button is disabled until you begin monitoring a chat session.
Leave	Click this button to leave a chat session during a conference. Refer to Conferencing another agent into your chat. **Note:** For this button to be enabled, you must be the agent who was conferenced into the chat.
Transfer	Click this button to transfer the customer to another agent. Refer to Transferring chats.
Conference	Click this button to conference another agent into your chat. Refer to Conferencing another agent into your chat.
Change Lead Role	Click this button to select the lead chat agent. **Note:** You must be involved in a conference session for this button to be enabled.

Table 402: Chat Ribbon Description (Continued)

Group/Button	Description
Incident	
Add to New Incident	Click this button to create an incident from the chat session while the chat is in progress or after you have entered wrap-up mode. Refer to Creating incidents from chat sessions. **Note:** Chat correspondence that is added to an incident is read-only and cannot be edited.
Add to Incident	Click this button to add the chat correspondence to an existing incident. Refer to Adding incidents. **Note:** Chat correspondence that is added to an incident is read-only and cannot be edited.
Opportunity	
New Opportunity	Click this button to create an opportunity from the chat session while the chat is in progress or after you have entered wrap-up mode. Refer to Adding opportunities.
Offer Advisor	Click this button to present an offer to the customer. Refer to Presenting offers. **Note:** Offer Advisor must be enabled. Contact your Oracle account manager.

❖ Working with the ribbon

Chat contact fields

After you accept a chat request, read-only customer fields display at the top of the content pane. Refer to Viewing customer information.

Tip Much of the information listed on the **content pane** is also provided in the toast invitation you see before accepting the chat request.

❖ Viewing customer information

Chat session workspace tabs

Below the information about the customer is a tab set containing information about the chat session and the customer's existing incidents.

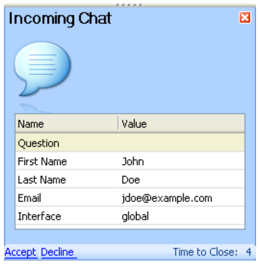
- **Engagement**—The Engagement tab is where you chat with customers.
  - ▷ **Transcript**—The Transcript section contains all chat correspondence between you and the customer. As text is sent from the customer, it appears in the Transcript section with a time stamp. After you send text to the customer from the Compose section, it is added to the Transcript section with a time stamp. Refer to Chatting with customers.
  - ▷ **Compose**—The Compose section is where you respond to a customer during a chat session. You can use **SmartAssistant** to request answers from the **knowledge base**, manually search for answers in the knowledge base, and send predefined text and URLs to the customer. Refer to Using agent chat tools.
- **Incidents**—The Incidents tab is where you view incident that the customer has submitted prior to requesting the chat.
- **Page Peek**—The Page Peek tab is where you view a snapshot of the web page that the customer was viewing when the chat was initiated.
- **Visitor Browser History**—The Visitor Browser History tab is where you view a list of up to fifteen URLs tracking the pages of your organization's website that the customer was viewing prior to initiating the chat. The amount of time browser history is retained is configured using the VS_PURGE_NON_PAGELOAD_EVENT_DAYS configuration setting (Agedatabase > Batch Processing > Visitor Service).

Note Engagement engine must be enabled in order to configure and use page peek and visitor browser history. Contact your Oracle account manager. We recommend creating a custom chat workspace and removing these tabs if you are not using page peek or visitor browser history.

Chatting with customers

If you are the agent selected for a chat request, you will receive a toast notification. Through chat notification settings, you can also enable sound notification. Refer to Changing chat options.

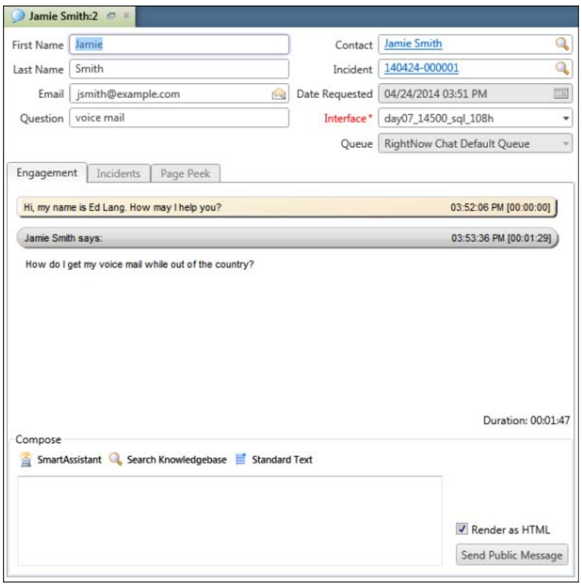
By default, the toast notification contains customer information, including the customer's first and last names, email address, and any incident custom fields that have been configured by your administrator.



To chat with a customer

1 Click Accept on the toast invitation to accept the chat request and activate the chat session. An automatic greeting is sent to the customer and displays in the Transcript section.

Note By default, you have fifteen seconds to manually accept or decline an incoming chat request. After fifteen seconds, the toast notification closes and the chat request is returned to the **chat queue** from which it originated.



The customer tab is gray until the customer asks a question. After the customer asks a question, the customer tab turns green to notify you that it is your turn to respond.

Important By default, the customer tab will change from green to yellow when a customer has been waiting for a response for thirty seconds. When the tab changes to red, it signifies that a customer has been waiting for sixty seconds. After you respond to the customer, the tab color changes back to gray. The timing of the changes in tab color can be configured by your administrator. Refer to Configuring service level requirements.

Additional customer tabs will display if you are engaged in multiple chat sessions. To manage the individual chat sessions, simply click the appropriate tab when the color changes from gray to green. You can also move between active chat sessions using the Active Chats drop-down menu on the Live Media bar. The colors of the selections in the drop-down menu correspond to the colors of the customer tabs. Refer to Live Media bar.

2 Type your reply in the message text box in the Compose section.

As you type, an inline spell checker recognizes misspelled words and marks them with a red zigzag underline. Right-clicking the misspelled word presents a list of substitute words from which you can choose. You can also choose to add words to your spell check dictionary. Refer to Inline spell checking.

Tip To copy and paste text, press **Ctrl+c** and **Ctrl+v**. To start a new paragraph, press **Shift+Enter**.

By default, the Render As radio button is selected when responding to customers. To send XML, HTML, or any other type of markup language to the customer without the tags being rendered, you can select the Leave As Plain radio button and all of the markup tags will display in the response to the customer.

3 Click the Send button or press **Enter** to send your response. Your response is added to the Transcript section and the customer's tab color changes back to gray, signifying it is the customer's turn to respond.

For information about terminating chats and creating incidents from chat sessions, refer to Creating incidents from chat sessions.

- Changing chat options
- Configuring preliminary screen pop

Email address sharing in Chat

Email address sharing lets you associate a single email address with multiple contact records. By default, email address sharing is disabled, but when it is enabled and a contact submits a chat request, the Email field on the chat sessions workspace displays a yellow icon with a black exclamation point if a duplicate email address is detected by the system. Although contact-matching logic is used to determine which contact to associate the chat session with, you can manually change the contact association by clicking the Contact field and selecting Change. Refer to [Email address sharing](#).

Using agent chat tools

Agent chat tools give you access to customer information, **SmartAssistant** suggested answers, answers in the Oracle Service Cloud **knowledge base**, and **standard text**. In addition, you can transfer chats to other agents, conference other agents into your chat sessions, access guided assistance **guides**, and **co-browse** with customers.

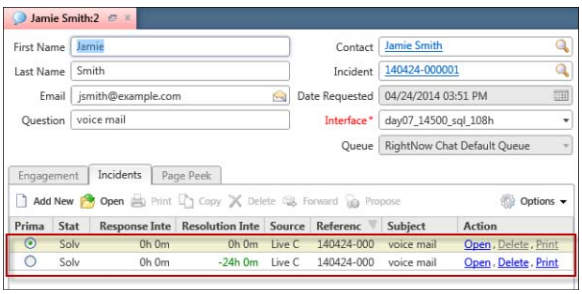
Note Agent chat tools are available only when chatting with customers.

Viewing customer information

You can tailor your assistance to customers if you know what issues they are experiencing. For example, if a customer has an open **incident** in Oracle RightNow Cloud Service (Service), you can view the contents of the incident while chatting with the customer.

To view incidents submitted by a customer

1 While chatting with a customer, click the Incidents tab.



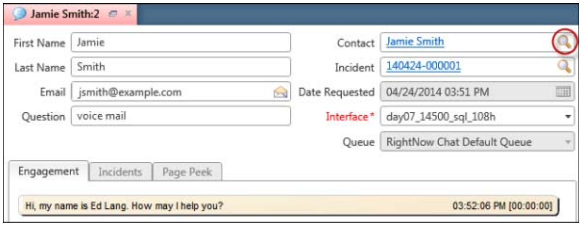
2 Double-click an incident to open it. Refer to [Working with incidents](#).

3 After reviewing the customer's current incidents, click the Engagement tab to return to the chat.

❖ Working with incidents

Searching for contact records

You can also access additional information about the customer using the Contact Search feature. For example, if the customer has a contact record in the **knowledge base**, you can see any **organization association** and where the customer is located.

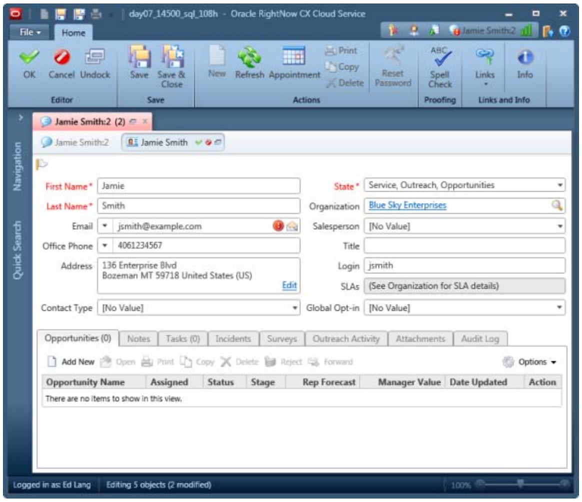


To search for a contact record

1 If a contact record exists, the customer's name appears in the Contact field. Click the customer's name and select Open to open the contact record. Depending on your profile permissions, other options (Change, Add New, Print, and Clear) will also be available. Refer to Contacts.

Or

If a contact record does not exist for the customer, the Contact field is blank. Click the Search button to the right of the Contact field to open the Contact Search window. Refer to Searching for records.



2 After viewing or editing the contact record, click the OK button on the **ribbon** to return to the chat session.

❖ [Contacts]()

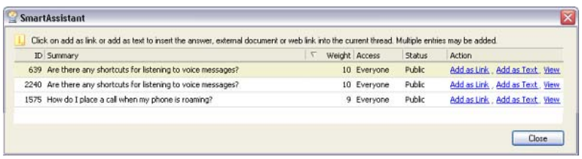
❖ [Searching for records]()

Accessing SmartAssistant suggested answers

While chatting with a customer, you can use **SmartAssistant** to suggest answers for a customer's question. SmartAssistant searches the knowledge base and returns possible answers related to the chat history text. A new window opens containing links to the suggested answers. If an answer is pertinent, you can add the answer text or the answer link to the Compose section and send it to the customer.

To access SmartAssistant suggested answers

1 Click the SmartAssistant button on the Compose section. The SmartAssistant window opens.



2 To add the answer link to your response, click Add as Link.

3 To add the answer text to your response, click Add as Text.

4 Click the Close button to close the SmartAssistant window.

Searching the knowledge base

As you respond to a customer's question, you might remember answers that address similar issues. Rather than conducting a time-consuming hunt of the **knowledge base** to find the relevant answers, Service lets you search for specific answers. Using any of four text searching techniques, you can quickly identify answers to resolve a customer's question. Refer to Appending answer content.

Inserting standard text

Frequently used responses and URLs can be prepared in advance so that you can quickly send them to customers. These tools not only help you assist customers more quickly, but they also eliminate typographical errors.

Your administrator can also define shortcut IDs for standard responses and URLs. Then, you can type an ID in the Shortcut field and press **Enter** to automatically insert the response or URL in the message text box in the Compose section.

To insert standard text

1 Click the Standard Text button on the Compose section. The Standard Text window opens.

Tip To search for standard text, click Find in List above the left column.

2 Click a standard text item to add it to the Preview section of the Standard Text window.

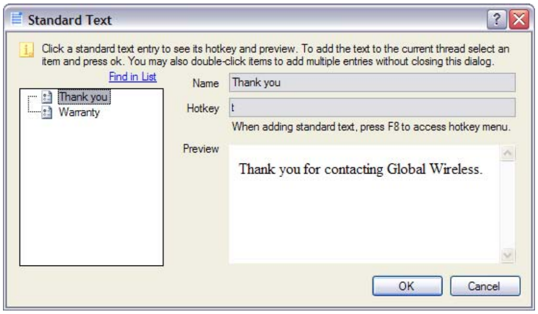
Or

Drag the standard text item from the left column into the Compose section of the response.

Or

Copy the text in the Preview section and paste it into the response.

Tip If an HTML version of the standard text item is available, it displays by default in the Preview section of the window. Otherwise, the plain text version displays.



3 Click the OK button or press **Enter** to add the standard text to your response. The standard text is now ready to send to the customer.

Tip If you send a URL to the customer, it will display as an active link on the Chat page.

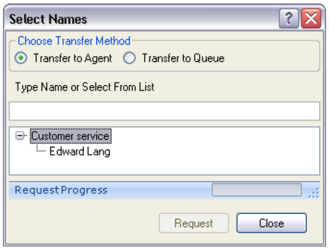
Also, if your organization uses variables in standard text, such as *contacts.first_name*, you can type (or copy and paste) the variable inline when responding to a customer. The variable is then replaced with the appropriate data before you send your response to the customer. If a variable entry does not have a value associated with it, you must type the value before sending your response to the customer.

Transferring chats

When necessary, you can transfer a chat to another agent during a chat session. This feature is helpful when another agent has more experience with a specific topic than you do.

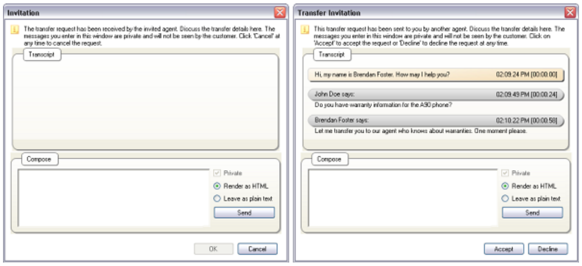
To transfer a chat to another agent

1 At any point during your chat session, click the Transfer button on the **ribbon**. The Select Names window opens.



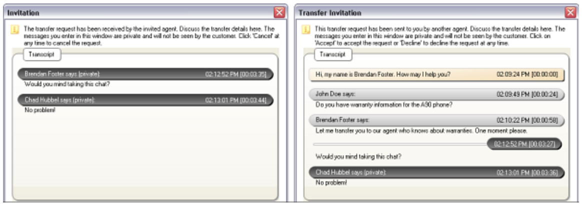
Tip Select the Transfer to Queue radio button if you are not aware of a specific agent who can accept the transfer. Chat will then route the chat to an agent in the queue.

2 When you see the agent you want to transfer the chat to, select the agent's name and click the Request button. The agent receives a toast notification to view or decline the transfer request. When the agent clicks View, the toast invitation closes, the Invitation window opens on your workstation, and the Transfer Invitation window opens on the agent's workstation.



You and the agent can chat before the other agent accepts or declines the transfer request. The customer cannot view text on the Invitation and Transfer Invitation windows because the Private check box is selected by default.

Caution If you clear the Private check box, all internal chat correspondence is displayed to the customer.



The agent clicks the Accept button to accept the transfer. A message notifies you that the transfer has been accepted. Both windows close, the associated contact and incident are automatically saved, and the chat is transferred to the agent. Once the transfer is made, the customer is notified of the transfer and the new agent's name appears in the chat transcript instead of your name.

Tip If the agent declines the transfer, the chat remains with you.

3 Click the OK button to complete the transfer, which removes the active chat from the **content pane**.

❖ Conferencing another agent into your chat

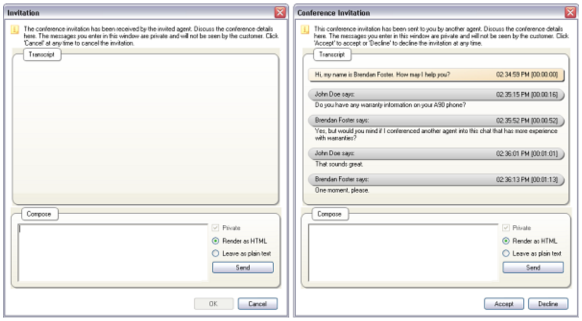
Conferencing another agent into your chat

Agent conferencing is another way Service helps you provide superior service to your customers. Conferencing can be useful when you want to include another agent in your chat session to help you solve a customer's problem.

To conference another agent into your chat

1 At any point during your chat session, click the Conference button on the **ribbon**. The Select Names window opens.

2 When you see the agent you want to conference into the chat, select the agent's name and click the Request button. The agent receives a toast notification to view or decline the conference request. When the agent clicks View, the toast invitation closes, the Invitation window opens on your workstation, and the Conference Invitation window opens on the agent's workstation.



You and the agent can chat before the other agent accepts or declines the conference request. The customer cannot view text on the Invitation and Conference Invitation windows because the Private check box is selected by default.

Caution If you clear the Private check box, all internal chat correspondence is displayed to the customer.

The agent clicks the Accept button to accept the conference. A message notifies you that the conference has been accepted. Both windows close, the associated contact and incident are automatically saved, and the new agent is conferenced into the chat session. If the agent declines the conference, the chat remains with you.

3 Click the OK button to complete the conference request.

Once the conference starts, you and the customer are notified. Each person can send text and all those in the conference can see the message text and the name of the person who sent it.

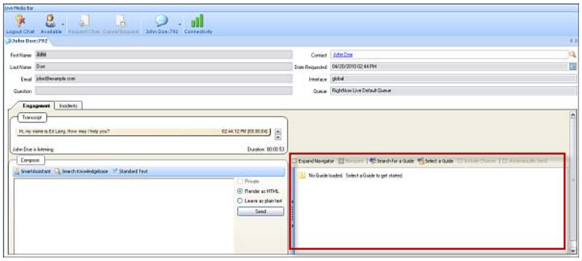
Tip The Leave button is disabled on the ribbon because you initiated the conference. The agent you conferenced in must click the Leave button on the ribbon to exit the conference. Refer to Chat ribbon.

❖ Transferring chats

Accessing guided assistance guides

The Guided Assistance **control** can be added to custom chat sessions workspaces so **guides** are available when you chat with customers. At any point during a chat session, you can search for a guide or select a guide to resolve difficult questions.

Note Guided assistance must be enabled before you can access guides on the chat sessions workspace. Contact your Oracle account manager.

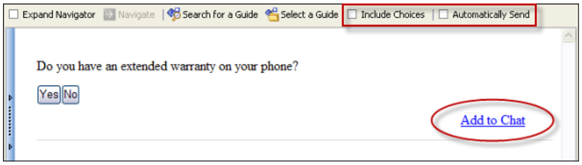


To access a guide during a chat session

1 While chatting with a customer, click the Search for a Guide or Select a Guide button on the Guided Assistance control. The Search for a Guide or the Select a Guide window opens. Refer to Finding answers using guided assistance.

2 To insert a question into the guide, click Add to Chat. Add to Chat is available for all questions and text explanations in guides.

Important If the Leave as Plain Text option is selected, all HTML tags and other code that is entered in the reply (including the code in guides) will display as unrendered.



Note The Include Choices check box controls how chat message text is formed from questions when you click Add to Chat. When the Include Choices check box is selected, the chat message text that is added to the Compose section includes both the question and its choices. When it is not selected, it includes only the question.

The Automatically Send check box controls what happens to the chat message text when you click Add to Chat. When this check box is selected, the chat message text is automatically sent to the customer. When it is not selected, it is added to the Compose section of the chat and is not sent to the customer until you click the Send button.

Co-browsing with customers

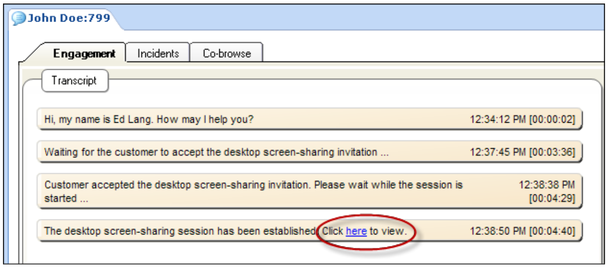
With co-browse, you can guide a customer through a web page using your mouse or other pointing device to demonstrate actions. In effect, you take control of the customer's web browser to show the customer how to complete an action. Co-browse helps eliminate the confusion that can arise when giving instructions to customers through dialog or text. Co-browse is also effective for assisting customers in filling out forms or completing a sale.

Note Co-browse must be enabled before you can begin a session with a customer. In addition, you can engage in only one co-browse session at a time.

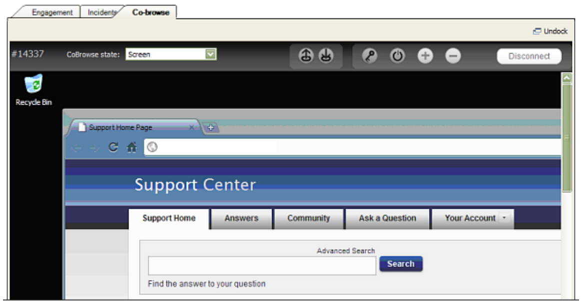
To co-browse with a customer

1 While chatting with a customer, click the Screen Sharing button on the **ribbon**. A message informs you that an invitation is being sent to the customer to start a co-browse session.

After the customer accepts the co-browse request, the chat transcript is updated with a link so you can view the customer's desktop. (Co-browse is also available for customers using mobile devices.)



2 Click the link to view the customer's desktop. Focus shifts from the Engagement tab to the Co-browse tab, where the customer's desktop displays.



The co-browse toolbar allows you to control the co-browse session. The following table describes the buttons and fields on the co-browse toolbar.

Table 403: Co-Browse Toolbar Description

Button/Field	Description
CoBrowse State	Click this drop-down menu to select a co-browse state, which specifies how much control you have over the customer's desktop.
Screen	Select this option to view the customer's desktop. **Note:** This option is selected by default.
+ Pointer	Select this option to view the customer's desktop and control the movement of the mouse or other pointing device. **Note:** With this option selected, mouse-click functionality does not work on the customer's desktop.

Table 403: Co-Browse Toolbar Description (Continued)

Button/Field	Description
+ Full Mouse	Select this option to view the customer's desktop, control the movement of the mouse or other pointing device, and control mouse-click functionality.
+ Full Mouse/Keyboard	Select this option to view the customer's desktop, control all mouse or other pointing device functions (pointer and mouse clicks), and use your keyboard to enter information on the customer's desktop (for instance, to help the customer fill out a form).
Send File	Click this button to send a file to the customer's desktop.
Receive File	Click this button to receive a file from the customer's desktop.
Credentials	Click this button to open a window on the customer's desktop that requests their Windows user name and password. **Note:** If a contact provides credentials for you, you can reboot the contact's workstation without knowing their user name and password.
Reboot	Click this button to reboot the customer's workstation.
Zoom In	Click this button to zoom in on the customer's desktop.
Zoom Out	Click this button to zoom out on the customer's desktop.

3 Click the Disconnect button to disconnect from the co-browse session. Both you and the customer are notified when the co-browse session has ended.

Note The customer can also disconnect from the co-browse session at any time. Although co-browse information is not recorded to the chat transcript, it is recorded to the knowledge base and can be viewed using standard co-browse reports. Refer to Co-browse session reporting.

❖ Configuring co-browse on chat workspaces
❖ Co-browse session reporting

Creating incidents from chat sessions

By default, when you terminate a chat session, you are prompted to save the chat as an **incident** for tracking and reporting purposes. If you choose to create an incident, it is assigned to you with a **status** and **status type** set by your administrator. The dialog from the chat session is inserted as a response thread. Refer to Adding incidents.

Note If your administrator configured chat to create an incident at the beginning of a chat session, an Incident field displays as a key field and contains the incident's reference number. To edit the incident while chatting with a customer, right-click the reference number and select Open.

To create an incident from a chat session

1 When the customer ends the chat session, a message asks if you want to create an incident from the chat session. Click the Yes button to open the incident on the content pane.

The Subject field populates with "Chat Session" and the chat transcript is inserted as a response thread on the Messages tab. The party that initially disconnected from the chat (customer or agent) is also identified in the response thread.

Note In the event the chat transcript is converted to an incident and emailed to the customer, private chat messages that took place between you and other agents during the chat are hidden to prevent customers from seeing them.

You can edit this incident in the same manner as any other incident, including changing the incident subject. Refer to Editing incidents.

2 Click the Save and Close button to save and close the incident.

- ❖ Adding incidents
- ❖ Editing incidents

Chat for supervisors

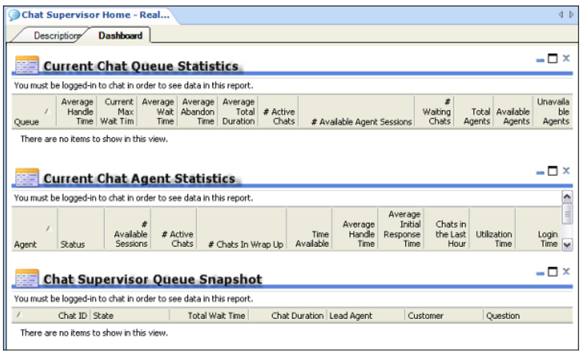
Through real-time reporting, Chat makes it easy to manage a group of agents. From the Chat Supervisor Queue Snapshot **dashboard**, you can view all agents and their active chat sessions, the number of customers waiting to chat, the average wait time, and the average time duration of chats. If you think it is necessary to intervene in a chat session, you can do so at any time by joining the chat and **monitoring** it.

- Chat for agents
- Chat for customers

Chat supervisor overview

As a chat supervisor, your main role is to **monitor** agents who are involved in active chat sessions. It is important to familiarize yourself with the Chat Supervisor Home–Real Time dashboard before monitoring agents.

Note For information about agents and the standard workspace they work in, refer to Chat sessions workspace overview. What you see may be different if your administrator has created a custom workspace.



The following reports display on the Chat Supervisor Home–Real Time dashboard.

- **Current Chat Queue Statistics**—Shows the service statistics for each chat queue.
- **Current Chat Agent Statistics**—Shows the service statistics for each chat agent.

- **Chat Supervisor Queue Snapshot**—Shows all current chat engagements, which includes customers who are waiting to chat with agents. From this report, you can monitor chats. Refer to Monitoring chats.

Tip The Chat Supervisor Home–Real Time dashboard refreshes every fifteen seconds or less, depending on server load.

❖ Monitoring chats

Monitoring chats

If you notice a chat duration that is unusually long, you can monitor the chat to see if there are any problems. By making sure chats flow through the system without interruption, you are increasing customer satisfaction.

When you monitor a chat session, the chat automatically opens on the Engagement tab. The look and feel of the Engagement tab is the same for both supervisors and agents. Refer to Chat sessions workspace overview.

Note When monitoring a chat, you might want to disable auto scrolling on the chat sessions workspace so the Transcript window does not automatically scroll to the newest thread every time an agent or customer updates the chat session. For information about the Auto Scroll Control Position property, refer to Options properties.

To monitor a chat session

1 Click the Login Chat button to log in to Chat. Refer to Logging in to Chat.

2 From the Chat Supervisor Queue Snapshot report, right-click the chat you want to monitor. The chat session opens on the Engagements tab and you can view all correspondence between the agent and customer. At this point, the agent does not know the chat is being monitored.

3 To join the chat you are monitoring, click the Join button on the ribbon. The Compose section is activated and the agent is notified that you joined the chat.

4 To send a message to the agent, type your message in the Compose section.

Important The Private check box is selected by default to ensure that the customer does not see your message to the agent and does not know you are monitoring the chat. If you want the customer to see your message to the agent and to be notified that you are participating in the chat session, clear the Private check box.

5 Click the Send button to send your message to the agent.

6 To leave the chat you are monitoring, click the Leave button on the ribbon. You are disconnected from the chat and the monitoring session ends. The agent is notified that you left the chat. If you cleared the Private check box during the monitoring session, the customer is also notified that you left the chat.

Chat for customers

The Chat page is the customer interface where customers chat with agents. Because the Chat page is integrated with the **customer portal**, it can be customized to suit your customers' needs.

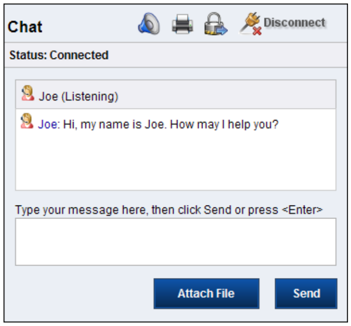
❖ Chat for agents

❖ Chat for supervisors

Chatting with an agent

After customers submit a chat from the Live Help page on the customer portal, the Chat page opens. This page displays a wait time and queue position when customers are waiting to chat. In addition, customers can search the **knowledge base** for answers to their questions while they are waiting to chat with an agent.

The following figure shows the Chat page after an agent accepts a customer's request to chat. What your customers see may be different if your administrator has customized this page.



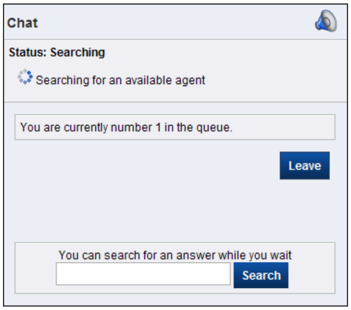
The following table describes the options available on the Chat page.

Table 404: Chat Page Description

Button	Description
Mute	Customers click this button to mute incoming sound notifications.
Print	Customers click this button to print the chat correspondence at any time.
Send an Off the Record Message	Customers click this button to send unrecorded messages during the chat session. **Note:** This button appears only during a chat session. Agents cannot send unrecorded messages to customers. If the chat session is saved as an incident, the unrecorded message displays as "<username>: Message Removed."
Disconnect	Customers click this button to disconnect from the chat session. **Note:** This button appears only during a chat session.
Close	Customers click this button to close the Chat page. **Note:** This button appears only after a chat session is disconnected.
Attach File	Customers click this button to send file attachments during the chat session. **Note:** This button appears only during a chat session.
Send	Customers click this button to send messages to an agent. **Note:** This button appears only during a chat session. Customers can also press **Enter** to send messages.

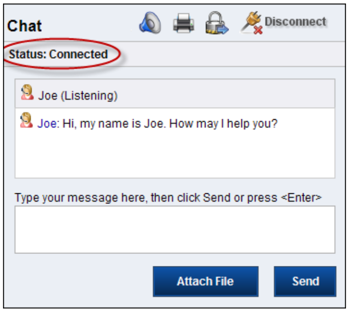
To chat with an agent

1 From the Live Help page, the customer fills in the required information and clicks the Submit Request button. The Chat page opens.



While Chat searches for an available agent, the customer is placed in the wait queue and is provided with the estimated wait time and position in the queue.

After an agent accepts the chat request, the status section changes from Searching to Connected, and the Chat Dialog section opens with a greeting from the agent.



2 The customer types a question and presses **Enter** or clicks the Send button. The customer's question is added to the Chat Dialog section.

3 The agent responds to the customer. The agent's response is added to the Chat Dialog section.

4 After receiving an answer to the question, the customer clicks the Disconnect button to terminate the chat session. The agent is notified that the customer has disconnected.

5 The customer clicks the Close button to close the Chat page and return to the Live Help page.

Chat customer reconnect

In the case of a crashed browser or otherwise improperly terminated chat session, the chat reconnect feature allows customers to reconnect to their previous chat session. When customers are unintentionally disconnected from a chat and attempt to chat again, they receive a message stating that an existing chat session was found and are given the option of resuming that session. Upon reconnecting to the chat session, the Chat page is populated with all chat correspondence that was present before the chat became disconnected, and customers can resume the chat session where they left off without having to wait in a **chat queue**.

Outreach and Feedback

The following sections are intended for administrators and staff members and contain information and procedures for configuring and using areas specific to Oracle RightNow Outreach Cloud Service and Oracle RightNow Feedback Cloud Service.

- Explorers
- Audiences
- Content Library
- External Suppression List
- Outreach Mailings
- Outreach Campaigns
- Feedback Questions
- Feedback Surveys

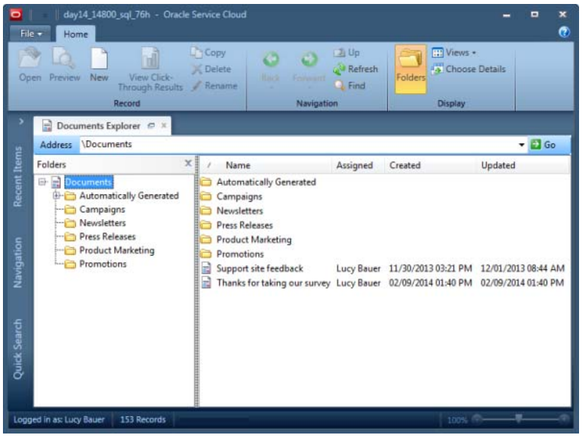
67

Explorers

Explorers are used to access and manage **mailings**, **campaigns**, **questions**, **surveys**, **audiences**, and **content library** items that have been created in Oracle RightNow Outreach Cloud Service (Outreach) and Oracle RightNow Feedback Cloud Service (Feedback). With these explorers, you can browse, search, and organize items in hierarchical folders on the content pane using functions similar to Windows Explorer.

Opening explorers

Like Windows Explorer, each Oracle Service Cloud explorer consists of a set of hierarchal folders and a detailed list of available items. Explorers display items of their associated type. For instance, documents are listed in the Documents explorer.



While each explorer generally resides in its associated **navigation list**, it is important to remember that explorers can be added to (or removed from) any navigation list, just like a report. For example, the Mailings explorer can be added to the Mailings navigation list or to a different navigation list. If you are unable to locate a specific explorer in any of your navigation lists, contact your administrator.

The following table describes how to open each Outreach and Feedback explorer from its most common location on the navigation pane. For more detailed information about using explorers, refer to Explorers.

Table 405: Outreach and Feedback Explorers

Explorer	Description
Outreach Explorers	These explorers are used to manage mailings and campaigns.
Mailings	Click the Mailings button on the navigation pane and double-click Mailings Explorer. Refer to Outreach Mailings.
Campaigns	Click the Campaigns button on the navigation pane and double-click Campaigns Explorer. Refer to Outreach Campaigns.
Feedback Explorers	These explorers are used to manage questions and surveys in Feedback.
Questions	Click the Questions button on the navigation pane and double-click Questions Explorer. Refer to Feedback Questions.
Surveys	Click the Surveys button on the navigation pane and double-click Surveys Explorer. Refer to Feedback Surveys.
Audience Explorers	These explorers are used to manage audiences in both Outreach and Feedback.
Contact Lists	Click the Audiences button on the navigation pane and double-click Contact Lists Explorer. Refer to Adding contact lists.
Segments	Click the Audiences button on the navigation pane and double-click Segments Explorer. Refer to Creating segments.
Content Library Explorers	These explorers are used to manage content library items in both Outreach and Feedback.
Documents	Click the Content Library button on the navigation pane and double-click Documents Explorer. Refer to Creating documents.

Table 405: Outreach and Feedback Explorers (Continued)

Explorer	Description
Tracked Links	Click the Content Library button on the navigation pane and double-click Tracked Links Explorer. Refer to Adding tracked links.
File Attachments	Click the Content Library button on the navigation pane and double-click File Attachments Explorer. Refer to Adding files.
Templates	Click the Content Library button on the navigation pane and double-click Templates Explorer. Refer to Creating templates.
Snippets	Click the Content Library button on the navigation pane and double-click Snippets Explorer. Refer to Creating snippets.

Searching in explorers

Explorers contain a number of search functions to help you find mailings, campaigns, segments, contact lists, documents, tracked links, files, templates, snippets, surveys, and questions. The following procedure describes how to search for a document from the Documents explorer, but the steps are the same for searching for other Outreach and Feedback items.

Note You can also search for mailings, campaigns, surveys, and documents from anywhere in the product using Quick Search. Refer to Searching for records with Quick Search.

To find a document

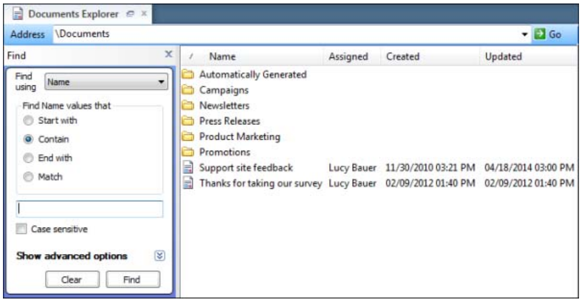
1 Click the Find button on the ribbon. The left side of the content pane displays a Find menu, hiding the folders tree.

2 Enter the following field information.

Table 406: Documents Explorer Search Menu Description

Field	Description
Find Using	This drop-down menu contains the names of all the columns in the documents list. Each column is associated with one of three **data types** that are supported in explorer searches. • Strings—Search for strings that start with, contain, end with, or match the value you enter in the text box. • Dates—Search for dates before, on, or after today's date. You can also click the calendar in the search text box to display the current month's calendar and select another day, or click the arrows at the top of the calendar to change months. • Integers—Search for values that are less than, equal to, or greater than a number. You can also click the up and down arrows in the search text box to increase or decrease the search value. **Note:** The data type of the column you select determines the available search criteria. For example, if you select Created (a date data type), you can search for dates before, on, or after a selected date.
Search text box	Type your search text in this field.
Case Sensitive	When searching a string column, select this check box to match the case.
Show Advanced Options	Click this text or the down arrow to display the following advanced search options.
Search globally, replace results	Select this radio button to remove the results from the previous search and replace with results from this search. This method is selected by default.
Search within results, replace results	Select this radio button to search only the current results and keep only those that match this search.
Search globally, append to results	Select this radio button to keep results from the previous search and add results from this search.
Return Non-matching Items	Select this check box to return all documents that do *not* match your search criteria.

3 Click the Find button. The search results replace the explorer's document list.



4 To clear the value from the search text box, click the Clear button.

5 To replace the search results with the original documents list, click the Refresh button on the ribbon.

For additional information about explorer search functionality, click here.

Editing in explorers

The following procedures describe how you can edit, copy, and delete items from Outreach and Feedback explorers. Items include the following:

- Mailings
- Campaigns
- Contact lists
- Segments
- Documents
- Tracked links
- Files
- Templates
- Snippets
- Surveys
- Questions

To edit an item

1 Select the item you want to edit and click the Open button on the ribbon. The item opens on the content pane.

2 Edit the necessary fields and click the Save button.

To copy an item

1 Select the item you want to copy and click the Copy button on the ribbon. The Copy As window opens.

2 Select the folder you want to save the item in and type the name of the item in the Name field.

3 Click the OK button to save the item.

To delete an item

Select the item you want to delete and click the Delete button on the ribbon.

Caution If you attempt to delete an item that is being used in a document, mailing, survey, or campaign, a **dependency** warning will list each location where the item is used and provide you with an option to cancel the deletion. If you choose to continue deleting the item, all references to the item become invalid and you must manually update each reference appropriately. For example, if you delete a tracked link used in a survey, you must edit the survey and either remove the tracked link or replace it with a valid link.

Automatically generated folders

The Documents explorer contains a folder for content that is automatically created when a document is saved or copied in a mailing or survey. The system creates a copy of each document that is inserted in a mailing message or a survey invitation message, and each page that is added to the questionnaire in a survey. Each copy is stored in the corresponding subfolder in the Automatically Generated folder. You can reuse these documents or use them to track the content you have used in previous mailings or surveys. Additionally, automatically generated copies of each message template can be found in the Automatically Generated folder. However, the message template documents are read-only.

The Tracked Links explorer also contains an Automatically Generated folder that contains all **tracked links** that are created when the tracked link converter runs. Refer to Tracked link conversion.

Important If you modify the content in a mailing or survey, those changes are also made to the automatically generated copy and impact all other instances of that copy. For example, if you create a mailing and insert an existing document on the Message tab, a copy of that document is automatically generated and stored in the Automatically Generated folder. Each time you modify the content in that mailing, the copy is also modified, but the original document is not modified. However, if you share a document with a mailing or survey, every time the content is updated, all occurrences of the document are also updated.

The following table describes each automatically generated folder and its corresponding contents.

Table 407: Automatically Generated Folders Description

Folder	Description
Documents explorer	The Documents explorer contains the following automatically generated folders.
Mailing Messages	This subfolder contains a copy of every document created on the Message tab in a mailing once the mailing is saved. The new document is named "YYMMDDHHMM <mailing name>" where YYMMDDHHMM is the year, month, day, hour, and minute of the first save, and the mailing name corresponds with the name of the original mailing. If more than one message is used (for example, the same document is reused in multiple mailings), the new document is named "YYMMDDHHMM <mailing name>: <message name>" where "message name" corresponds with the message defined on the Message tab of the mailing. **Note:** The document name is limited to 80 characters.
Message Templates	This subfolder contains a copy of every administrator notification, administrator email, and contact email for this interface. The documents are named the same as the corresponding message. **Note:** These documents are read-only.

Table 407: Automatically Generated Folders Description (Continued)

Folder	Description
Survey Invitation Messages	This subfolder contains a copy of every document created on the Invitation Message tab in a survey. The new document is named "YYMMDDHHMM <survey name>" where YYMMDDHHMM is the year, month, day, hour, and minute of the save, and the survey name corresponds with the name of the original survey. **Note:** The document name is limited to 80 characters.
Survey Pages	A subfolder is created for each survey created in basic mode and is named the same as the corresponding survey. These folders contain a document for each page in the questionnaire. When you add, edit, or delete a page in the questionnaire, the corresponding document is also modified. **Note:** Documents are read-only if they are created in basic mode but can be edited if they are converted to **advanced mode**.
Survey Reminders	This subfolder contains a copy of every document created on the Reminders tab in a survey. The copy is named "YYMMDDHHMM <reminder name>" where YYMMDDHHMM is the year, month, day, hour, and minute of the save, and the name corresponds with the name of the original reminder. **Note:** The name is limited to 80 characters. You can edit the reminders in this folder as long as they have not been sent.
Tracked Links explorer	The Automatically Generated folder in this explorer contains all of the tracked links that are created every time the tracked link converter runs. The tracked links are organized in subfolders using the YYYY-MM-DD format, which corresponds to the date the tracked links are generated. Refer to Tracked link conversion. **Note:** You can edit or move the tracked links in this folder.

68

Audiences

Oracle Service Cloud provides two methods for grouping contacts to create audiences for your broadcast mailings and surveys: contact lists and segments. Contact lists are static lists comprised only of contacts that have been explicitly selected, changing only when you manually add or remove contacts. Segments are dynamic lists comprised of contacts that match one or more **fixed filters** that you specify. Because segments are dynamic, their contents change over time as updated contacts fall in and out of alignment with the filters.

When you create a mailing or survey, contact lists and segments can be used alone or included with (or excluded from) other lists and segments to form your audience. You can include and exclude a total of fifty contact lists and segments, each containing a vast number of contacts. This gives you all the flexibility you need to assemble audiences that are specific, optimized, and efficiently maintained.

Note For information about creating and working with contacts, see Contacts. For information about uploading contacts to your knowledge base, see Adding contacts. For information about adding segments and lists to mailings and surveys, see Defining the broadcast mailing audience and Defining the broadcast survey audience.

- Contacts overview
- Importing data
- Defining the broadcast mailing audience
- Defining the transactional mailing audience

Adding contact lists

Contact lists are static sets of contacts you can use to define audiences for broadcast mailings and surveys. They are static in that you add each contact to a list manually. Otherwise, the list does not change, even when a contact record is modified in the database. Every time a contact list is used, it returns the same set of contacts.

You can create as many lists as you want and update them by manually adding or removing contacts as needed. Once a contact list is created, you can update your audiences to include or exclude it.

Note The following procedure assumes that you access the Contact Lists explorer from the Audiences **navigation list**. However, this explorer may reside in a different navigation list.

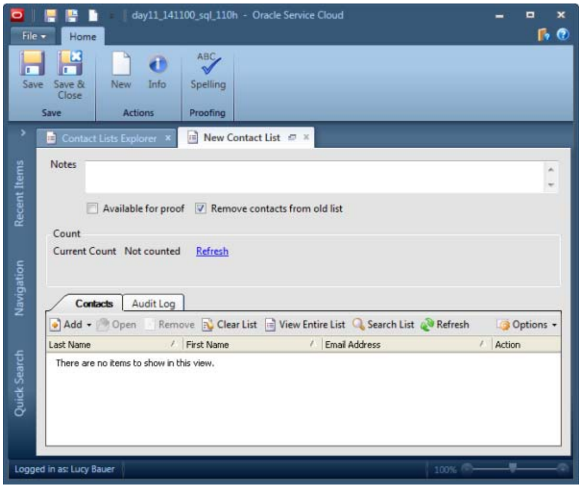
To add a contact list

1 Click the Audiences button on the navigation pane.

2 Double-click Contact Lists Explorer. The Contact Lists explorer opens on the content pane.

3 Click the New button. A new contact list opens on the content pane.

Tip You can also create a contact list from an open contact list by clicking the New button. Additionally, if your navigation set is configured to add contact lists from the file menu, click File and select Audience > Contact List. See To configure the file menu.



4 Enter the following field information.

Table 408: Contact List Description

Element	Description
Notes	Type any notes associated with the contact list in this field.
Available for Proof	Select this check box to let contacts in the list receive **proof** requests. See Sending a proof message.
Remove Contacts from Old List	Clear this check box to let contacts stay in contact lists for longer than the time frame set in the database. When this check box is selected, contact list data is removed according to the value of a database variable that is set, by default, to 400 days. To change this value, submit an incident to our support site. Also see Answer ID 4802 on our support site. **Important:** We recommend leaving this check box selected to ensure your database tables stay at a manageable size.
Count	This field displays the number of contacts in the contact list the last time it was counted and the date and time the count was performed.

Table 408: Contact List Description (Continued)

Element	Description
Details	To view the details of a count, click Details in the Current Count section after the count has been performed. A window opens showing the number of contacts belonging to the contact list, and how many of those contacts have an invalid or duplicate email address or no address. **Note:** A count must be performed before Details are available.
Refresh	To calculate the number of contacts currently in the list, click Refresh. **Note:** The list must be saved before the count is refreshed.

5 To add new and existing contacts to the list on the Contacts tab, see Managing contact lists.

6 To view a list of actions taken on the contact list, click the Audit Log tab. See Audit logs.

7 To check the spelling of any fields that have spell checking enabled, click the Spelling button. See Spell checking.

8 Click the Save and Close button to save the contact list. The Save As window opens.

Note You can click the Save button to save the contact list without closing it.

9 Select the folder you want to save the contact list in and type the name of the contact list in the Name field.

10 Click the Save button to save the contact list.

Managing contact lists

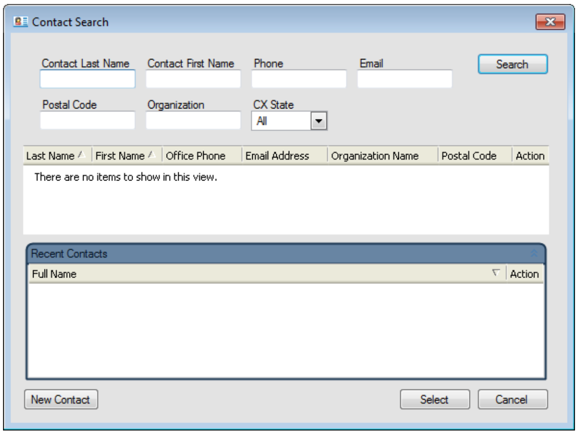
From the Contacts tab of the contact list editor, you can add existing contacts to the list or create new contacts and add them to the list. You can also search your list of contacts, remove contacts from the list, or edit contact records. Refer to Contacts.

Tip Contacts can also be added to lists in large batches using the Data Import Wizard. See Importing data.

Keep in mind that in some cases your contact list may time out before it can show your results. When this happens, a message displays on the Contacts tab of the contact list editor where you have the option to queue your results and then view them in a report. Alternatively, you can refine your search criteria to return less data. See Queuing reports and Viewing queued reports.

To add a contact to the contact list

1 On the Contacts tab of a contact list, click the Add button and select Add Existing. The Contact Search window opens where you can search for the contact you want to add.



2 To search for an existing contact to add to your contact list, enter the search criteria in one or more fields. You can use any of the following fields to define your search criteria.

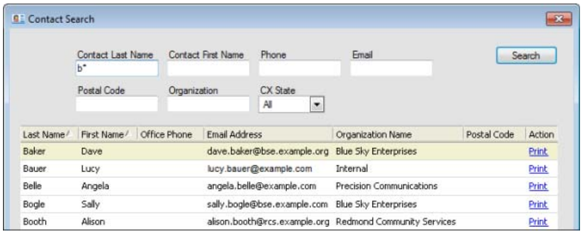
- Contact Last Name
- Contact First Name
- Phone

- Email
- Postal Code
- Organization
- CX State

Tip You can use an asterisk (*) as a wildcard in your search term.

3 To add a new contact, click the New Contact button. See [To create a contact and add it to the contact list](#).

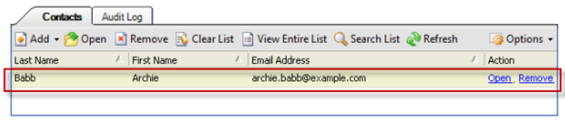
4 Click the Search button. A list of contacts that match the search criteria you entered appears in the grid below the search criteria fields.



5 Click a contact to select it.

Note You can select multiple contacts by pressing **Ctrl** while clicking additional contacts. Selected contacts that are already in the list are not added again.

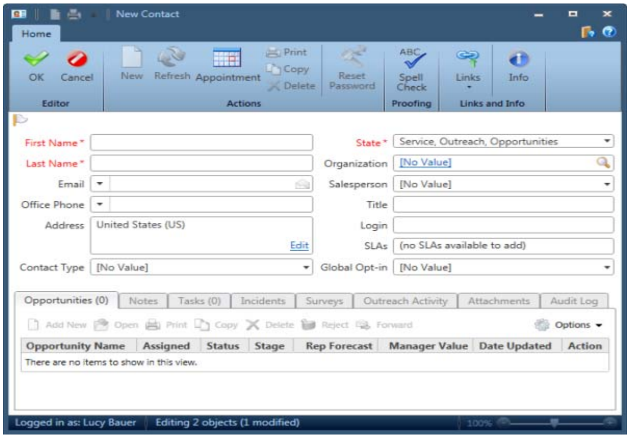
6 Click the Select button to add the selected contact to the list. The contact appears on the Contacts tab with the other contacts in the contact list.



7 Click Save to save the contact list.

To create a contact and add it to the contact list

1 On the Contacts tab of a contact list, click the Add button and select Add New. The New Contact window opens.



2 Enter contact field information. Names of required fields appear in red text and are flagged with asterisks.

3 Click the OK button. The contact appears on the Contacts tab with the other contacts in the contact list.

Important Clicking the OK button on the child window saves the new contact in memory but it is not added to the knowledge base until you save the contact list (the item from which the contact record was created). See Adding contacts from other records.

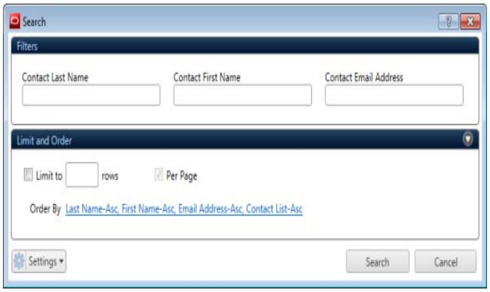
4 Click Save to save the contact list.

Searching the contact list

You can search the list of contacts using several fields and return the results in the grid. Contacts can then be removed from the contact list or a contact record can be edited.

To search the contact list

1 From the open contact list, click the Search List button on the Contacts tab toolbar. The Search window opens.



2 In the Filters section, type the last name, first name, or email address of the contact you are searching for. Partial values can be used.

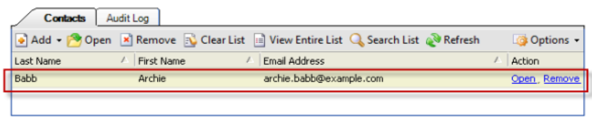
3 In the Limit and Order section, type the maximum number of contact records you want to return.

   a To return all matching contact records, but limit the number of contact records per page, select the Per Page check box.

4 To sort by fields other than last name followed by first name, click the Order By text and select from the available fields.

5 To design your Search window layout and to set, restore, or reset your default filter values, click the Settings drop-down menu. See Settings.

6 Click the Search button. The search results are returned on the Contacts tab.



7 To edit a contact record, click Open next to the contact.

   Or

   Select the contact and click the Open button.

8 To remove a contact from the contact list, click Remove next to the contact.

   Or

Select the contact and click the Remove button.

Note This does not delete the contact from the knowledge base. It only removes the contact from the list.

9 To remove all contacts from the contact list, click the Clear List button.

a Click the Yes button to confirm.

10 To clear the search results and view the entire contact list, click the View Entire List button.

11 To refresh the contact list, click the Refresh button.

12 To access report options, such as sorting and exporting, click the Options button. See Distributing reports and dashboards and Changing output options.

Creating segments

While contact lists are created by manually adding contacts to a static list, segments are dynamic lists of contacts created by defining contact criteria and selecting filters. When you create a segment, you can filter using any field in the Contacts *(contacts)* table, including custom fields, and by joining the Contacts table to other tables.

For example, some segments might include all contacts who live in Montana, all contacts between the ages of 18 and 24, or all contacts who live in Montana *and* are between the ages of 18 and 24. You can also filter contacts by whether they have submitted an incident related to a certain product.

Once you create a segment, it can be used in mailings and surveys and the group of contacts is constantly adjusted and updated as contact data meets or falls outside of the segment's requirements. For example, a segment that selects customers based on their age produces a different result every time it is used for a mailing, assuming that customer contact data changes.

Note The following procedure assumes that you access the Segments explorer from the Audiences **navigation list**. However, this explorer may reside in a different navigation list.

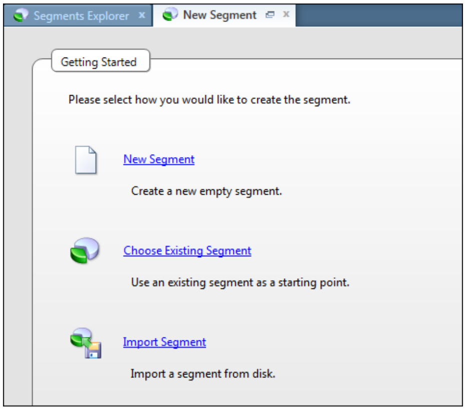
To create a segment

1 Click the Audiences button on the navigation pane.

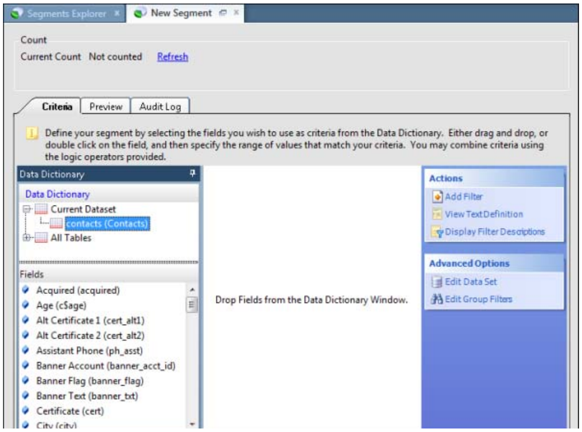
2 Double-click Segments Explorer. The Segments explorer opens on the content pane.

3 Click the New button on the ribbon.

Tip You can also create a segment from an open segment by clicking the New button. Additionally, if your navigation set is configured to add segments from the file menu, click File and select Audience > Segment. See To configure the file menu.



a To create a segment from scratch, click New Segment.



The content pane is divided into sections to group common functions and help make creating the segment easier. At the top is the current count of contacts meeting the segment's criteria. The tabs let you define the segment filters and **data set**, preview a list of contacts belonging to the segment, and view the **audit log**.

b To create a segment by copying an existing segment, click Choose Existing Segment. The Choose Existing Segment window opens where you can select the segment you want to use.

c To import an XML segment, click Import Segment. See To import a segment.

4 Enter field information to define the segment's filters on the Criteria tab. See Adding segment filters.

5 To preview the contacts belonging to the segment, click the Preview tab. See Previewing segments.

6 To refresh the audience count, click Refresh in the Count section.

Note Occasionally, the **replication database** used to process mailings can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current, the audience count is labeled as "Estimated."

7 To view the details of an audience count, click Details in the Count section after the count has been performed. A window opens showing you the number of contacts belonging to the segment, along with how many of those contacts have an invalid or duplicate email address or no address.

8 To view a list of actions taken on the segment, click the Audit Log tab. See Audit logs.

9 Click the Save and Close button to save the segment. The Save As window opens.

Note You can click the Save button to save the segment without closing it.

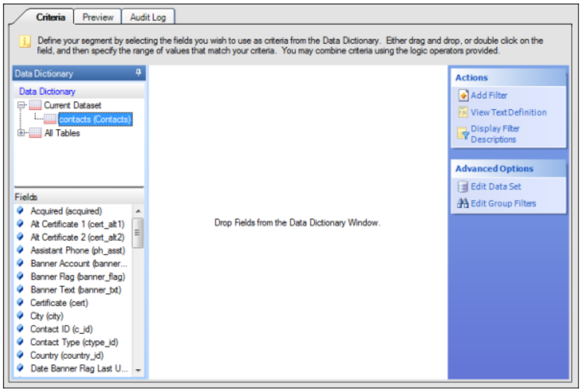
10 Select the folder you want to save the segment in and type the name of the segment in the Name field.

11 Click the Save button to save the segment.

Adding segment filters

Filters determine which contacts are returned when the segment is applied to contact data. You can use expressions and operators to determine a **data set**, and you can also use SQL-type functions (such as aggregate, string, date, logical, and math functions) to define expressions when creating a filter.

From the Criteria tab, you can define the filters used by your segment and the database tables used to create the filters.



The Data Dictionary section lists the database tables that can be accessed by the segment. You can also join tables to columns in other tables, such joining the Contacts *(contacts)* table to the Incidents *(incidents)* table See Editing the data set.

The Fields section shows the fields (database columns) associated with the table selected in the Data Dictionary section. You can drag and drop fields from the Fields section to the Filters section to filter contacts by that field. For example, you could select the Contacts table in the Data Dictionary section and drag and drop the State/Province field from the Fields section to the Filters section to filter contacts by the state in their address. For a description of the available tables and columns, see the Data dictionary.

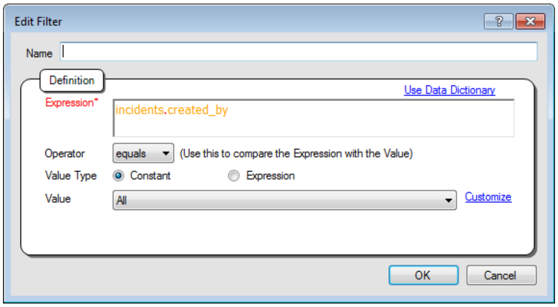
In addition to drag-and-drop functionality, you can click Add Filter in the Actions section to add a filter. Once filters are added, you have additional options in the Actions section to edit and delete filters and change the logical expression used for multiple filters. See Defining logical expressions.

To add filters to a segment

1 Select a table in the Data Dictionary section. The table's columns appear in the Fields section.

2 Drag and drop a column name from the Fields section to the center of the Criteria tab. The Edit Filter window opens.

Note You can also add a filter by clicking Add Filter in the Actions section or double-clicking a column name in the Fields section.



3 Type the name of the filter in the Name field. The name appears in the Filters section of the Criteria tab.

4 Enter the following field information.

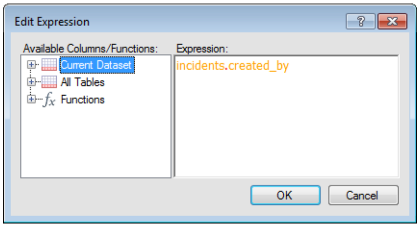
Table 409: Edit Filter Window Description

Field	Description
***Expression**	Type the expression you want to use to limit the data set in this field. The syntax is <table_name>.<column_name>. As you type an entry in the Expression field, a drop-down menu displays a list of database tables that begin with the letters you type. You can type the complete expression or select a table and field from the drop-down menu. You can also select a table and column or function (see Adding functions) by right-clicking in the field. **Note:** If you drag and drop a column name from the Fields section, the field contains the table and column name.
Operator	Select the operator to use in comparing the expression to the value. The available operators vary depending on the expression. See Selecting filter operators.
Value Type	Select the type of value to match with the expression from these radio buttons.
Constant	Select this radio button to type the value to complete the filter or select the value from a drop-down menu or calendar (depending on the expression).
Expression	Select this radio button to type an expression to complete the filter, using the syntax <table_name>.<column_name>.
Value	Type the value that the expression is compared to. The available options in the Value field change depending on the type of field, the operator you select, and the value type. For example, when the field type is menu, you select it from a drop-down menu, but when the field type is date, you select if from a calendar.

5 To customize the list of values that display in the Value field, click Customize.

Note The Customize link is available only when you select equal or list values from the Operator drop-down menu *and* when the Value field displays as a drop-down menu.

6 To select an expression or expression value from a list of database fields and functions, click Use Data Dictionary. The Edit Expression window opens.



a Enter the expression by dragging and dropping columns and functions from the Available Columns/Functions section to the Expression section.

Table 410: Edit Expression Window Description

Expression	Description
Current Dataset	Select a table and column from the tables currently used in the segment. The Contacts table is available by default.
All Tables	Select a table and column from the available tables.
Functions	Select a function to filter contacts in the segment. See Adding functions.

b Click the OK button to save the expression and return to the Edit Filter window.

7 Click the OK button to save the filter.

Note If there is an error in the expression, the Expression field changes to orange and an error exclamation point appears. Hover over the exclamation point for more information about the error. You must either correct the error or click the Cancel button to exit the window.

8 To edit a filter, select the filter and click Edit Filter in the Actions section.

Or

Right-click the filter in the Filters section and select Edit Filter.

9 To display the filter's expression in the Filters section instead of the name you defined, click Display Filter Descriptions. To toggle back to the filter name, click Display Filter Names.

10 To delete a filter, select the filter and click Delete Filter in the Actions section.

Or

Right-click the filter in the Filters section and select Delete Filter.

11 To define the logical expression used when multiple filters are included in the segment, see Defining logical expressions.

12 To define the tables and joins used in the segment, click Edit Data Set in the Advanced Options section. See Editing the data set.

13 To apply group filters to the segment, click Edit Group Filters in the Advanced Options section. See Creating group filters.

Adding functions

Functions let you apply standard mathematical operators to your segment. You can also combine different functions and database fields in an expression. After you drag a function to the expression on the Edit Expression window, you must enter the variables used in the function. You can either type the variables in the Expression field or, if the variable is an item listed in the Available Columns/Functions field, you can drag the item into the function's expression.

Prerequisite

Before you can add a function, you must add a filter. See To add filters to a segment.

The following table describes the functions you can use in segments.

Table 411: Functions Description

Expression	Description
Aggregate Functions	Select from the following to use an aggregate function in the expression. **Note:** Aggregate functions are available only when defining group filters. See Creating group filters.
avg(expr)	This function computes an average value for the data set *expr*.

Table 411: Functions Description (Continued)

Expression	Description
count(expr)	This function returns the number of rows included in the data set *expr*.
first(expr, sort column1[, sort column2][,...])	This function returns the first value of data set *expr* based on the order of the specified sort columns. For example, the expression `first(threads.note, threads.entered, threads.seq)` returns the first thread note in the data set based on time entered and thread sequence.
group_concat(expr, separator[, sort column 1, ASC|DESC][, sort column 2, ASC|DESC][,...])	This function lets you combine multiple values from data set *expr* into a delimited list in a single row. The list is delimited by *separator* and ordered by the specified sort columns. For example, the expression `group_concat(threads.note, ',', threads.entered, ASC)` returns a comma-delimited list of thread notes ordered by time entered ascending.
last(expr, sort column1[, sort column2][,...])	This function returns the last value of data set *expr* based on the order of the specified sort columns. For example, the expression `last(threads.note, threads.entered, threads.seq)` returns the last thread note in the data set based on time entered and thread sequence.
max(expr)	This function returns the largest numerical value, the last string in alphabetical order, or the latest date in the data set *expr*.
min(expr)	This function returns the smallest numerical value, the first string in alphabetical order, or the earliest date in the data set *expr*.
sum(expr)	This function returns the sum of the values in the data set *expr*.
sum_distinct(expr, reference)	This function returns the sum of distinct values in an expression for a particular record (reference) rather than for all records of the same type in a table. For example, if you want to calculate the sum of all quotas for a particular sales person, you could add a function of `sum_distinct(sa_period2accts.quota, sa_period2accts.acct_id)`.
stddev(expr)	This function returns the standard deviation of *expr*. For example, the expression `stddev(answers.solved_count)` returns the standard deviation of all the values in the *solved_count* column of the Answers *(answers)* table.

Table 411: Functions Description (Continued)

Expression	Description
String Functions	Select from the following to use a string function in the expression.
concat(str1,str2)	This function combines input character strings from multiple expressions into a single output string. Two or more expressions can be appended with this function. For example, the expression `concat('www.','global','.com')` returns the value `www.global.com.`
instr(str, substr)	This function returns the numeric position (in characters) of the initial occurrence of string *substr* within string *str*. For example, the expression `instr('globalcellphones.com','cell')` returns the value `7`.
length(str)	This function returns the length (in characters) of the string. For example, the expression `length('cell phones')` returns the value `10`.
lower(str)	This function returns string *str* in all lowercase characters. For example, the expression `lower('Global.COM')` returns the value `global.com.`
ltrim(str)	This function returns the string *str* without leading spaces. For example, the expression `ltrim(' Cell phone')` returns the value `Cell phone.`
lpad(str1, X, str2)	This function returns *str1* padded on the left with *str2* until *str1* is *X* characters long. For example, the expression `lpad('phone', 10, '@')` returns the value `@@@@@phone`.
rpad(str1, X, str2)	This function returns *str1* padded on the right with *str2* until *str1* is *X* characters long. For example, the expression `rpad('phone', 10, '@')` returns the value `phone@@@@@`.
rtrim(str)	This function returns the string *str* without trailing spaces. For example, the expression `rtrim('agarfield@global.com ')` returns the value `agarfield@global.com`.
substr(str, start_pos, [length])	This function returns a portion of the string *str* starting at the character defined by *start_pos* (an integer) and ending at the character defined by *length* (an integer). If *length* is not indicated, it returns the remainder of the string.

Table 411: Functions Description (Continued)

Expression	Description
to_char(expr)	This function converts the numeric *expr* to a character string.
to_number(str)	This function converts the character string *str* to a numeric. If the *str* is not numeric, this function returns zero. If *str* is a combination of numbers and other characters and begins with a number, this function returns only the initial numeric portion. For example, `to_number('123ABC')` returns 123.
upper(str)	This function returns string *str* in all uppercase characters. For example, the expression `upper('global.COM')`returns the value `GLOBAL.COM.`
Date Functions	Select from the following to use a date function in the expression.
date_add(date, units, interval, round)	This function returns the value of *date* plus a specified amount of time where date is a datetime type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. The amount of time to add is specified by *units* and *interval,* where *units* must be an integer specifying the number of intervals to add, and *interval* can be SECONDS, MINUTES, HOURS, DAYS, WEEKS, MONTHS, or YEARS. To round the result to the beginning of the specified interval, set the *round* argument to 1. Otherwise, set *round* to 0 and the result is not rounded. For example, the expression `date_add('2003-11-25 22:35:00', 48, HOURS, 1)` returns the value `2003-11-27 22:00:00`.

Table 411: Functions Description (Continued)

Expression	Description
to_date(str, format)	This function converts the string *str* in the format specified by *format* to a date value. For example, the function `to_date('19981231', 'YYYYMMDD')` returns a date of 12/31/1998. **Note:** Unlike date_format, the to_date function supports only the following date formats. DD MM YYYY HH24:MI:SS DD MM YYYY HH:MI:SS AM DD MON YY DD MON YYYY DD-MM-YY DD-MM-YYYY DD.MM.YY DD.MM.YYYY DD/MM/YY DD/MM/YYYY DD/MM/YYYY HH:MI:SS AM MM-DD-YY MM-DD-YYYY MM/DD/YY MM/DD/YYYY MON DD YY MON DD YYYY MON DD YYYY HH:MI AM MON DD YYYY HH:MI:SS AM YY.MM.DD YY/MM/DD YYMMDD YYYY-MM-DD YYYY-MM-DD HH24:MI:SS YYYY-MM-DDTHHH24:MI:SS YYYY.MM.DD YYYY/MM/DD YYYYMMDD

Table 411: Functions Description (Continued)

Expression	Description
date_format(date, format)	This function converts *date* from a datetime data type to a string and reformats *date* to match the format specified by *format,* where date is a datetime type column or a literal string in the format YYYY-MM-DD or YYYY-MM-DD HH:MI:SS. For example, the expression `date_format('2003-11-25 22:25:00', 'DAY, MONTH DD, YYYY, HH12:MI PM')` returns the value `Tuesday, November 25, 2003 10:25 PM.`
date_diff(date, date)	This function returns the number of seconds occurring between two dates. For example, the expression `date_diff('2009-11-26 22:25:00', '2009-11-25 10:30:00')` returns the value `129300`. Another example is `date_diff(sysdate(),incidents.updated)`. This expression returns the number of seconds between the current time and the time that incidents were last updated. **Note:** To change the format of the output, use the time_format function. For example, `time_format(date_diff('2009-11-26 22:25:00', '2009-11-25 10:30:00'), 'HH24h MIm SSs')` returns the value `35h 55m 00s`.
date_trunc(date, units)	This function truncates *date* to the unit specified by *units*. For example, the expression `date_trunc('2003-11-25 22:25:10', HOURS)` returns the value `2003-11-25 22:00:00`.
sysdate()	This function returns the current system date in the format YYYY-MM-DD HH:MI:SS.
time_format (seconds, format)	This function converts *seconds* to the specified time format. For example, the expression `time_format(86610,'HH24 MI SS')` returns the value `24 03 30.`

Table 411: Functions Description (Continued)

Expression	Description

date_group(expr, format)	This function groups records together according to a date range that you specify, and includes rows for date ranges that have no associated records. If you do not want to return rows for date ranges with no records, you could use date_format instead.
	For example, if you have incidents created in January and March, but none in February, and create a report with the expression for column A set to *date_group(incidents.created, 'YYYY-MM')*, and the expression for Column B set to *count(*)*, the report would output:
	`2006-01 10`
	`2006-02 0`
	`2006-03 15`
	If you changed Column A's expression to *date_format(incidents.created, 'YYYY-MM')* to use the date_format function instead of date_group, the report would output similar data, but would not return a row for February.
	Note: This function can be used only when defining group filters. See Creating group filters.

Logical Functions	Select from the following to use a logical function in the expression.
if(expression, then result, else result)	This function returns the then result if expression is true, or returns the else result if expression is false. For example, the expression `if(incident.c$field=1, 'Yes', 'No')` returns Yes for incidents where the value of c$field is 1. Otherwise, No is returned. **Note:** You can use IS NULL and IS NOT NULL as part of the expression. For example, you could use the expression `if(incident.c$field IS NOT NULL, 'Yes', 'No')`.
decode(expression, test_value_1, result_1[, test_value_2, result_2][, default])	This function compares *expression* to each *test value* in order and returns *result* for the first *test value* that *expression* matches. If *expression* does not match any *test value*, *default* is returned. If *default* is undefined, a null value is returned. **Note:** The decode function can perform table lookups, letting you use text strings as test values rather than requiring coded values. For example, you can use Review as a test value for the expression *faqs.status* even though the table contains code value in the *status* column.

Table 411: Functions Description (Continued)

Expression	Description
nvl(expr1, expr2)	If the value *expr1* is null, this function returns the value *expr2*. However, if the value *expr1* is not null, then the value *expr1* is returned. The value of *expr2* must match the data type of *expr1*.
Math Functions	Select from the following to use a math function in the expression.
bitand(X, Y)	This function returns the bitwise AND of two integers, *X* and *Y*.
ceiling(X)	This function returns the smallest integer value greater than or equal to *X*.
floor(X)	This function returns the largest integer less than or equal to *X*.
power(X, Y)	This function returns the value of *X* to the power of *Y*. For example, `power(2,3)` would return `8`.
rand()	This function returns a random number between 0 and 1, containing up to nine decimal places.
round(X, D)	This function returns the value *X* rounded to the nearest number with *D* decimals. For example, `round(5.55555, 2)` returns the value `5.56`.
truncate(X, D)	This function returns the value *X* truncated to the *D* decimal places. For example, the expression truncate`(5.55555, 2)` returns the value `5.55`.
Currency Functions	Select the following to use a currency function in the expression.
to_currency(expr, str)	This function converts *expr* to a value in *str* currency. The value is returned as an amount in the staff member's default currency. The conversion rate used for this function is the exchange rate defined in the Exchange Rates *(exchange_rates)* table. For example, for a staff member with a default currency of USD, `to_currency(opportunities.mgr_value, 'EUR')` returns an amount in USD that is equal to the number in the `mgr_value` converted to Euros.

Selecting filter operators

The operator you select when creating filters greatly impacts the data that is returned, so it is important to understand the functionality of each operator. Filters can use the following operators

Table 412: Filter Operators Description

Operator	Description
equals	The expression matches the value exactly (including case).
not equals (exclude No Value)	The expression does not match the value exactly (including case), and does not contain a null value.
less than	The expression is less than the value.
less than or equals	The expression is less than or equal to the value.
greater than	The expression is greater than the value.
greater than or equals	The expression is greater than or equal to the value.
between	The expression is between two specified values. The between operator is available to use with date, currency, and numeric (integer and float) expressions. **Note:** When using this operator with a date expression, records matching the beginning value's date and time are returned, but those matching the ending value's date and time are not. This prevents records from being displayed twice on a report that is run once to view records created between 9:00 AM and 10:00 AM, and run again to view records created between 10:00 AM and 11:00 AM, for example.
like	The expression matches any part of the value. When using this operator, you should use the % wildcard symbol to offset your value. For example, to include values containing "all," type `'%all%'` in the Value field.
not like	The expression does not match any part of the value. The % character may be used as a wildcard. For example, to exclude values containing "all," type `'%all%'` in the Value field.

Table 412: Filter Operators Description (Continued)

Operator	Description
in list	The expression values you want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. **Note:** When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes. For example, `'red','green','orange'`. Spaces between entries are ignored.
not in list	The expression values you do not want to search for are specified by selecting check boxes in a menu. The selected options are displayed in a separate Selected Items list to assist you when selecting from menus with a large number of options. This operator is available only with menu field expressions. **Note:** When using this operator with integer fields, the numbers in the Value field must be comma-separated. When using this operator with text fields, the text strings in the Value field must be comma-separated and each text string must be offset by single quotes. For example, `'red','green','orange'`. Spaces between entries are ignored.
is null	The expression contains a null value.
is not null	The expression does not contain a null value.
not equals (include No Value)	The expression does not match the value exactly (including case), or contains a null value.
not like or null	The expression does not match any part of the value, or contains a null value.
Complex Expression	The expression matches any part of the value. This operator allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only. Refer to Using special characters when searching.

Table 412: Filter Operators Description (Continued)

Operator	Description
Not Complex Expression	The expression does not match the complex expression in the value. The Not Complex Expression operator is available only with text field expressions.

Defining logical expressions

When you add multiple filters to a segment, the filters are automatically joined together with a logical expression. This defines how the filters should work together to return data. By default, the logical expression uses Boolean AND logic. For example, if you have a filter of *contacts.prov_id = MT*, and a filter of *contacts.ma_state = Yes*, the logical expression is *contacts.prov_id = MT* AND *contacts.ma_state = Yes*. This expression would result in the report returning only contacts that are from Montana *and* are in the Outreach state.

You can edit logical expressions to limit your data set by using different Boolean operators to connect your filters.

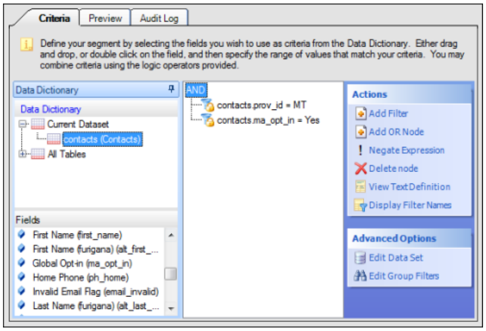
- The AND operator retrieves data matching *all* of the filters.
- The OR operator retrieves data matching *any* of the filters.
- The NOT operator (represented by an exclamation point) excludes matching data.

When you add nodes to the expression, the nodes are displayed in a tree structure, with filters displayed either under an AND node or an OR node. Filters under the same AND node are joined to each other using AND logic, and filters under the same OR node are joined to each other using OR logic.

NOT logic is achieved by negating a filter, which displays in the Filters section preceded by an exclamation point. For instance, if you negate the filter description *contacts.prov_id = MT*, the description appears as *!contacts.prov_id = MT* (equivalent to *NOT contacts.prov_id = MT*).

To edit a logical expression

1 From an open segment, add more than one filter to the Filters section.



The filters you add are automatically joined with AND logic and are displayed in an AND tree.

2 To add a filter joined with OR logic to the logical expression:

a Click Add OR Node in the Actions section. The node is added to the logical expression.

b Click the filter that should be joined with OR logic and drag it to the new OR node.

3 To negate a filter, select the filter and click Negate Filter in the Actions section.

4 To view a text definition of the current filters' logical expression, click View Text Definition.

a Click the OK button to close the Text Definition window.

5 To display the filter description instead of the filter name, click Display Filter Descriptions. The filter description includes the field name, operator, and value. For example, a filter named Contacts in MT could be described as *contacts.prov_id = MT*.

Editing the data set

The data set consists of the database tables the segment is referencing. The Contacts *(contacts)* table is automatically added to the data set when you create a segment. When you add fields from different database tables as filters or add more than one table to the data set, the tables that contain the fields are automatically joined together. This lets you use data from tables related to contacts (for example, incidents).

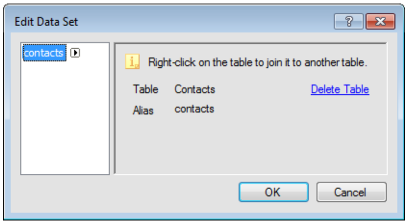
Tables can be joined using two methods, or join types:

- **Inner join**—Inner joins select records from the joined tables on the condition that the value in the specified column of the primary table is equal to the value in the specified column of the secondary table. For example, if the Incidents table is joined to the Contacts table with an inner join, contacts without an associated incident are not included.
- **Outer join**—Outer joins select rows from two tables regardless of whether the specified columns contain corresponding values. An outer join returns all rows from the primary table and any rows from the secondary table where the value in the specified column of the primary table is equal to the value in the specified column of the secondary table. For example, if the Incidents table is joined to the Contacts table with an outer join, contacts without an associated incident are included.

Note Tables are automatically added to the data set when you select columns to filter by in the segment.

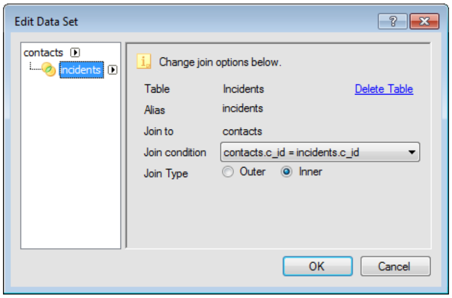
To edit the data set

1 Click Edit Data Set in the Advanced Options section. The Edit Data Set window opens, listing the tables in your segment and their relationships.



2 To add another table, right-click the table you want to join to, select Join To, and select the table and columns you want to join (for example, Incidents >*contact.c_id=incidents.c_id*). Repeat this step for each table you want to add.

3 To edit table join information, click the table that is joined to the parent table.



a Enter the following field information.

Table 413: Edit Data Set Window Description

Field	Description
Table	This field displays the database name of the table you have selected.
Delete Table	Click Delete Table to remove the table you have selected from the segment. If the table acts as a parent to other tables in the segment, the child tables are also removed.
Alias	This field displays the alias name of the table you have selected. The alias allows for multiple instances of the same database table to the same segment. For example, the first instance of the Contacts *(contacts)* table would have an alias of "contacts," and the second instance would have an alias of "contacts2" to distinguish it from the first instance.
Join To	This field displays the table that the selected table is joined to.
Join Condition	If more than one field relationship is available to join the tables, click this drop-down menu to select the fields on which to join. **Note:** If only one field relationship is available, the menu displays only that option.
Join Type	Select the Inner radio button to use an inner join and the Outer radio button to use an outer join. **Note:** To change the join type, you can also right-click the joined table in the Data Set tree and select Toggle Join Type.
Join Filters	If you select the Outer join type, the option to add join filters becomes available. See [Creating outer join filters]().

4 Click the OK button to save changes to the data set.

Creating outer join filters

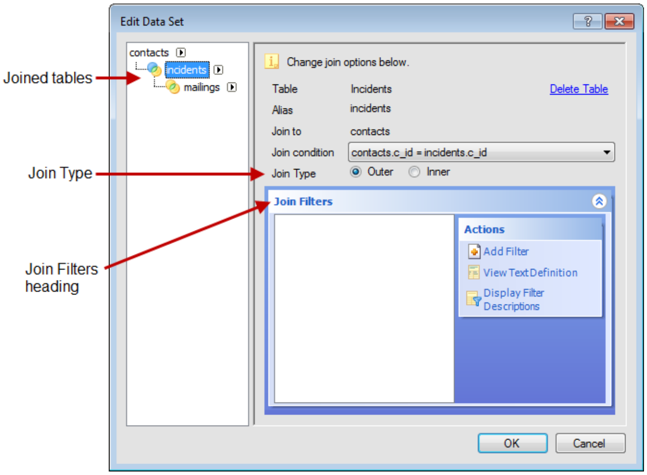
When you create an outer join, you can add join filters to filter the data returned from the secondary table without filtering the data from the primary table. Join filters are similar to segment filters in that they limit the records that can be returned by the report, but they apply to the table join rather than to the data returned by the query on the database.

To create outer join filters

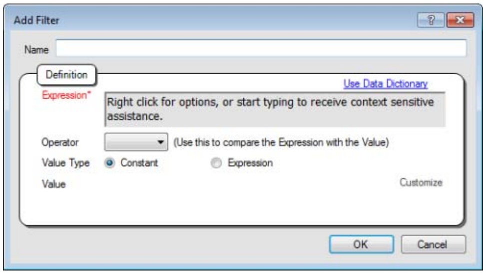
1 Select a joined table in the data set tree.

2 Select the Outer radio button in the Join Type field. The Join Filters heading displays.

3 Click the Join Filters heading on the Edit Data Set window. The Edit Data Set window displays the Join Filters section.



4 Click Add Filter to open the Add Filter window.



5 Enter field information described in the following table.

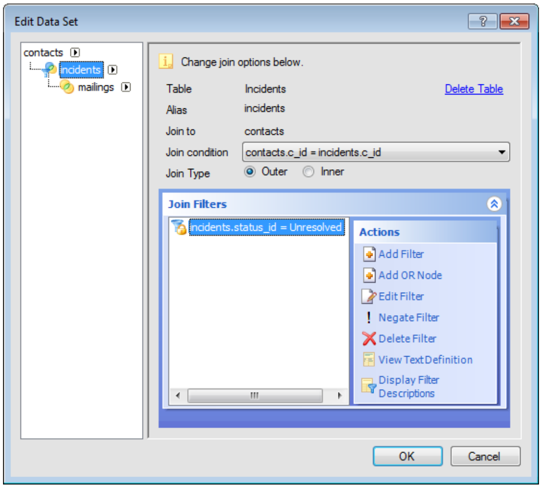
Table 414: Add Filter Window Description

Field	Description
Name	Type the name of the filter. If you leave this field blank, the database name displays.
***Expression**	Type the expression you want to use to limit the data set in this field. The syntax is <table_name>.<column_name>. As you type an entry in the Expression field, a drop-down menu displays a list of database tables that begin with the letters you type. You can type the complete expression or select a table and field from the drop-down menu. You can also select a table and column or function (see Adding functions) by right-clicking in the field. **Note:** If you drag and drop a column name from the Fields section, the field contains the table and column name.
Operator	Select the operator to use in comparing the expression to the value. The available operators vary depending on the expression. See Selecting filter operators.
Value Type	Select the type of value to match with the expression from these radio buttons.
Constant	Select this radio button to type the value to complete the filter or select the value from a drop-down menu or calendar (depending on the expression).
Expression	Select this radio button to type an expression to complete the filter, using the syntax <table_name>.<column_name>.

Table 414: Add Filter Window Description (Continued)

Field	Description
Value	Type the value that the expression is compared to. The available options in the Value field change depending on the type of field, the operator you select, and the value type. For example, when the field type is menu, you select it from a drop-down menu, but when the field type is date, you select if from a calendar.

6 Click the OK button to save the join filter. The Edit Data Set window is updated to display the filter, along with additional actions.



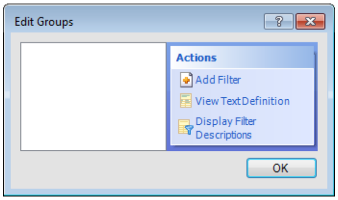
The additional actions that become available are identical to those used when creating logical expressions for segment filters. These actions let you edit your filter, create additional filters, add OR logic to the join filters, negate filters, and view a text definition of the join filters' logical expression. For procedures on using these actions, see Defining logical expressions.

Creating group filters

You can create group filters to specify the filters to use on grouped data. Group filters are applied to the data after the grouping is completed and must be aggregate functions. For example, if you join the Contacts *(contacts)* table to the Marketing Activities *(ma_trans)* table, create a fixed filter for *ma_trans.type* of Email Sent, group by *contacts.c_id*, and use the group filter *count(*) > 10*, then only those contacts that have been sent more than ten emails will be selected in the segment.

To create a group filter

1 From the Criteria tab, click Edit Group Filters. The Edit Groups window opens.



2 Click Add Filter to open the Add Filter window.

3 Enter field information. See Adding segment filters.

4 Click the OK button to save the group filter.

The additional actions that become available are identical to those used when creating logical expressions for segment filters. These actions let you edit your filter, create additional filters, add OR logic to the join filters, negate filters, and view a text definition of the join filters' logical expression. See Defining logical expressions.

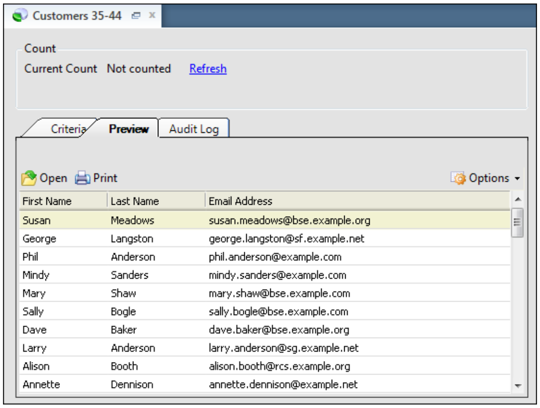
5 Click the OK button to save the filters.

Previewing segments

After defining your filters, you may want to see which contacts meet the segment's criteria. You can preview the segment to see a list of up to 1,000 contacts.

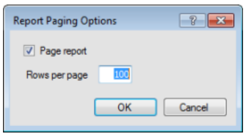
To preview a segment

1 Click the Preview tab.



The contacts' first name, last name, and email address display. If any contact fields are used to filter the segment, they are also included as output columns in the list.

2 To change the number of contacts that display per page, click the Options button and select Paging.



3 Type the number of rows you want to display per page and click the OK button.

4 To edit a contact record, select the contact and click the Open button. See Editing contacts.

5 To print a contact record, select the contact and click the Print button.

6 To access report options, such as sorting and exporting, click the Options button. See Distributing reports and dashboards.

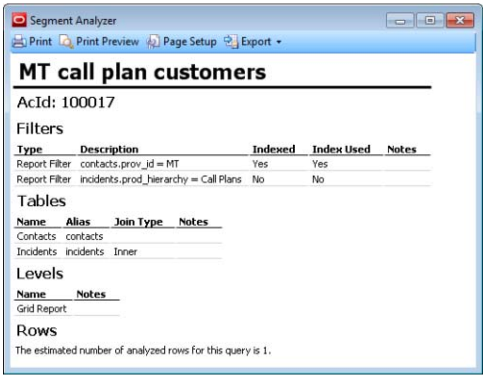
Analyzing segments

After you create or edit a segment, we recommend that you run the segment analyzer to check the segment's database queries. This lets you fine-tune your segments to ensure they run as quickly and efficiently as possible. The segment analyzer examines your segment and provides suggestions as to how you can improve the segment by removing database tables, adding filters, and making other changes. The analyzer also shows you the estimated number of rows the segment's query may need to access so you know if the segment can run without encountering row limits.

To analyze a segment

1 Open the segment you want to analyze.

2 Click the Analyze button on the ribbon's Home tab. The Segment Analyzer window opens.



The segment analyzer lists the segment's filters, tables, output levels, and the estimated number of rows the segment's query will examine when it runs. If the analyzer finds potential issues with the segment's query, it lists the issues in the Notes column next to the applicable segment component.

The following table describes the four segment components included on the Segment Analyzer window and lists the messages you may see in the Notes column when potential issues are found.

Table 415: Segment Analyzer Window Description

Segment Component	Potential Issue
Filters	This section lists the expressions used for each segment and level filter and identifies whether the filters' fields are indexed in the database and whether the index is used. Custom fields can be indexed for faster queries, though too many indexes can slow down queries. Only the following message can be returned in this section. • The filter contains a custom field that does not have an index. To improve the performance of this query, consider adding an index on the custom field.
Tables	This section lists the tables that are used in the segment, along with the types of joins used to link the data in the tables. Two messages can be returned in this section. • This table is in an outer join but there are one or more filters on fields in this table. Make sure this is by design. If not, consider changing the join type to inner or changing these filters to join filters to prevent an implicit inner join. • This table is not used in the report. Consider removing the table from the data set. If you need to filter out rows in the parent table that do not have rows in this table, consider adding a not null filter on the join field in the parent table.
Levels	This section does not apply to segments even though it displays in the report.

Table 415: Segment Analyzer Window Description (Continued)

Segment Component	Potential Issue
Rows	This section lists the estimated number of rows that will be examined by the query. Messages are displayed if the number of rows exceeds the threshold values for the operational and report databases. Three messages can be returned in this section. The messages vary depending on whether your site has a report database in addition to the operational database. • The estimated number of analyzed rows for this query is *X*. This value exceeds the threshold of 2,000,000 for the operational database. Consider using the report database for this report. Otherwise, it is likely this will occur automatically. • The estimated number of analyzed rows for this query is *X*. This value exceeds the threshold of 2,000,000 for the operational database. Since you have specified the operational database for this report, it is unlikely the report will execute. Consider using the report database for this report. • The estimated number of analyzed rows for this query is *X*. This value exceeds the threshold of 5,000,000 for the report database. Consider adding or refining filters to reduce the number of analyzed rows to below this threshold. Otherwise, it is unlikely the report will execute.

3 Click X on the top right to close the Segment Analyzer window.

4 Click X on the top right to close the segment.

Exporting and importing segments

There may be situations when you want to use the same segment in multiple interfaces, websites, or custom reports. Exporting and importing segments saves you time by letting you reuse your segments. You can export your segments as XML files and then import the files to use again. See Importing reports.

To export a segment

1 Open the segment you want to export.

2 Click the Export button on the ribbon's Home tab.

3 Save the new XML file.

To import a segment

1 On the Segments explorer, click the New button on the ribbon.

2 Click Import Segment.

Tip You must have exported an XML segment and saved it to a location where you can access it before it can be imported. See To export a segment.

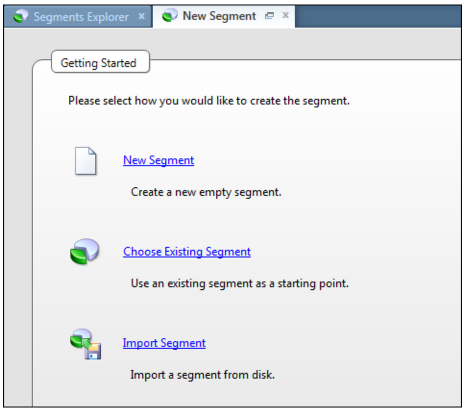
3 Select the XML segment file you want to import and click the Open button. The segment displays on the Data Dictionary window.

Segment example

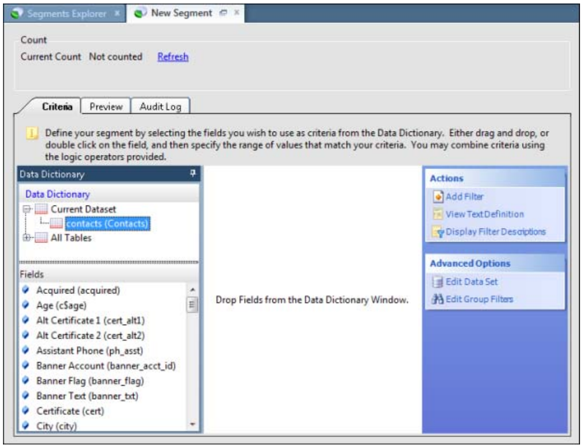
In the following example, a segment is created to return a data set of contacts who live in the state of Montana and have submitted an incident assigned to a certain product. The example works under the premise that there is a product named Call Plans. For information about creating products, see Adding and editing products, categories, and dispositions.

To create the example segment

1 From the Segments explorer, click the New button on the ribbon. A new segment opens on the content pane.

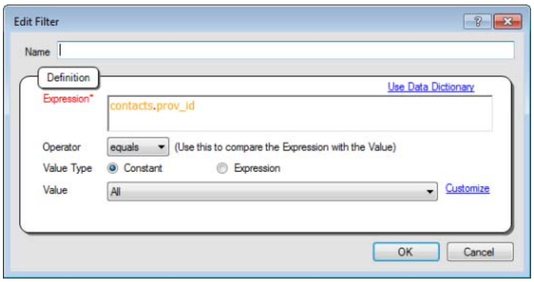


2 Click New Segment.



3 Click Contacts under Current Dataset in the Data Dictionary section on the Criteria tab.

4 In the Fields section, drag State/Province (prov_id) and drop it in the Filters section. The Edit Filter window opens.

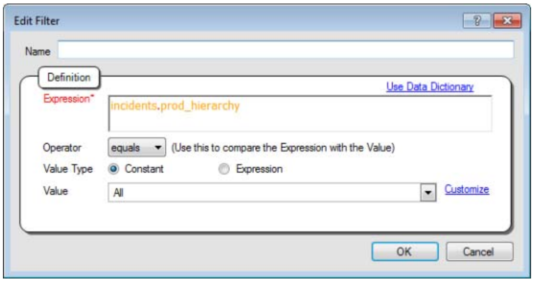


5 Click the Value drop-down menu and select MT.

6 Click the OK button.

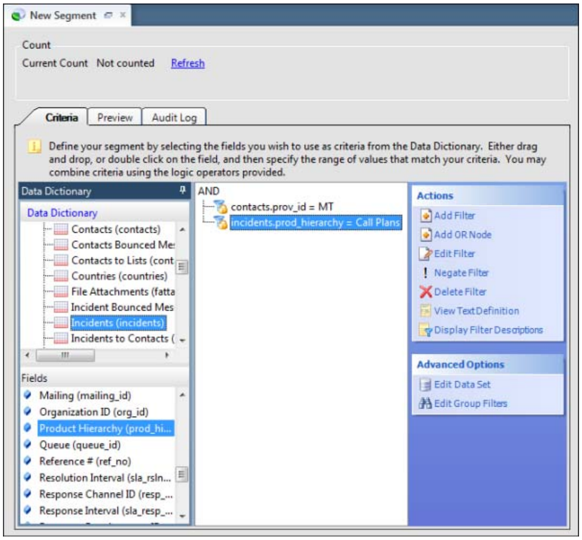
7 Click Incidents under All Tables in the Data Dictionary section.

8 In the Fields section, drag Product Hierarchy (prod_hierarchy) and drop it in the Filters section. The Edit Filter window opens.



9 Click the Value drop-down menu and select Call Plans.

10 Click the OK button.



11 Click the Save button, type the segment name in the Name field of the Save As window, and click the Save button.

The segment can now be used in mailings and surveys to target only those contacts with an address in Montana who have submitted an incident associated with call plans.

Best practices for improving conversion rates

A common myth about sending broadcast email is that—like direct mail—the larger your audience, the more likely your mailing is to be successful. In reality, succeeding with broadcast email depends more on the quality of contacts than the quantity. Sending email to people who have no interest in your product or service not only drags down your conversion rates, it can land you on blacklists and block delivery of future mailings across large swaths of the Internet.

One of the most effective ways to improve conversion rates is to filter your contacts by email viewing history. The system keeps track of each contact's marketing activity in the Marketing Scorecard *(ma_scorecard)* table. When a contact views a mailing, the *ma_scorecard.last_view* field is updated with the date and time that the message was viewed. Knowing whether a contact recently viewed a message provides a reasonable basis for judging contact quality.

There are several reasons a contact might *not* view a message. For example, the message may contain an unfamiliar From address or an ambiguous subject line. It may be filtered as spam, bounced or blocked by the recipient's mail server, or rejected due to the sender's reputation. Whatever the reason, it is safe to assume that a contact who has not viewed a recent mailing is not likely to view one in the future.

Conversely, a contact who recently viewed a message is more likely to view future messages. Therefore, to optimize your conversion rates and protect your reputation, we recommend that you add the following filter to all segments.

> *ma_scorecard.last_view* greater than -90 Days Exactly (Relative)

This filter limits your segment to a list of contacts who have viewed at least one mailing within the past ninety days.

Tip Once you have added this filter to a segment and included the segment in an audience, be sure to perform an audience count. If the segment returns too small an audience, adjust the date value defined by the *ma_scorecard.last_view* filter to be less restrictive. But remember—the longer contacts go without viewing a mailing, the more likely they are to lower your conversion rates.

The contacts in the resulting list will be more likely to view future messages than contacts who are not listed. You can also assume that their email addresses are valid and that they are not marking your messages as spam. Therefore, the quality of these contacts is high.

Another way to improve conversion rates is to track your contacts' engagement score. Based on historical contact interactions within Oracle Service Cloud, the system evaluates each contact and assigns a contact engagement score on a scale from 0 to 100. This statistic is based on each contact's hourly transaction history, such as content viewed, links clicked, web form and survey submittals, marketing emails forwarded, SmartSense ratings, and service transactions. Score value is stored in the *ma_scorecard.score* field, which is available for reports (for example, the Engagement Scorecard report), segments, and campaign decisions.

Important Data older than 400 days is automatically truncated from the following tables: Marketing Activities *(ma_trans)*, Bounced Messages *(bounced_msgs)*, Mailing Exclusions *(exclude_trans),* and RNMD Event Log *(rnmd_event_log)*.

The Marketing Stats *(ma_stats)* table summarizes records in the Marketing Activities *(ma_trans)* table that share a unique combination of *mailing_id, format_id, doc_id, flow_id, flow_web_page_id,* and *type* values. This ensures that summary marketing transaction statistics remain available indefinitely, even after the originating *ma_trans* records have been truncated. All transactions related to unsubscribe, including list-unsubscribe header, feedback loop unsubscribe, and unsubscribe, will remain in the Marketing Activities table.

To ensure optimal conversion rates and protect your reputation, you should adopt a regular contact evaluation process to ensure that all contacts are valid and active. See *Best Practices for Email Marketing*.

Managing contact opt-ins

Although many of your customers may want to be included in your mailings or survey invitations, it is not uncommon for some to decline. In fact, anti-spam legislation in most countries requires that you provide a way for your contacts to easily opt out of all mailings (see CAN-SPAM compliance in mailings). However, an effective opt-in process can also provide numerous benefits, including:

- Affirming contact receptiveness to your messages.
- Targeting the interests of your valued prospects and customers to provide more pertinent information without overwhelming their inboxes.

- Optimizing your contact data to improve conversion rates.
- Protecting your company's reputation among ISPs.

Note For an overview of these topics, see *Best Practices for Email Marketing*.

To help track your customers' messaging preferences, Oracle Service Cloud provides two types of opt-in fields.

- **Global Opt-in** is a contact database field that describes the willingness of your contacts to receive any form of bulk mailing.
- **Custom opt-in fields** are contact custom fields of an opt-in data type that can be used to more precisely describe the willingness of contacts to receive bulk mailings about specific topics or products.

Opt-in fields are often made visible on the Account Settings page of the customer portal so that customers can set their own preferences for accepting bulk email. Opt-in fields are also commonly paired with unsubscribe links in mailings and survey invitations to provide contacts with a simplified means of opting out. See Inserting unsubscribe links.

Contacts that are globally opted in are considered fully active and willing to receive your communications. Alternately, contacts that are globally opted out should be regarded as though they have explicitly stated that they do not want to receive bulk email from your company—they should be excluded from all mailings and surveys. Global exclusions are enabled by default by the Honor Global Opt-in check box on the Audience tab of mailings and surveys. See Defining the broadcast mailing audience.

Exclusions based on custom opt-in fields are manually enabled by adding a filter to your segments, such as *contacts.<opt-in_field_name>* not equals No, or by adding a special segment to your audience as described in the following procedure.

To exclude contacts based on a custom opt-in field

1 Click the Audiences button on the navigation pane. Double-click Segments Explorer. The Segments explorer opens on the content pane.

2 Click the New button on the ribbon. A new segment opens on the content pane.

Tip You can also exclude a segment based on a custom opt-in field from an open segment by clicking the New button. Additionally, if your navigation set is configured to add segments from the file menu, click File and select Audience > Segment. See Configuring the file menu.

a To create a segment from scratch, click New Segment.
b To create a segment by copying an existing segment, click Choose Existing Segment. The Choose Existing Segment window opens where you can select the segment you want to use.
c To import an XML segment, click Import Segment. See To import a segment.

3 Click Add Filter.

4 In the Expression field, type the opt-in field name.

5 In the Value field, select No.

6 Click the OK button and then click the Save and Close button to save the segment.

7 From the Audience tab of an open mailing, click Add Segment in the Excluded section.

8 Select the segment you created and click the OK button.

9 Click the Save button to save your changes.

Contact opt-out tracking

Oracle Service Cloud records transactions for global opt-ins and opt-outs in the contact **audit log**. While global opt-outs are generally performed by contacts themselves, there are many methods by which a contact can be opted out, including the following.

Table 416: Contact Opt-Out Methods

Method	Description
Contact Record	A staff member set the Global Opt-in field to No in the contact record.
Account Settings	The contact set the Global Opt-in field to No on the Account Settings page on the customer portal.
Unsubscribe Link	The contact clicked an unsubscribe link that was included in a served web page or delivered email.
Web Page Link	The contact opted out by form submission.
Data Import	The contact was opted out when the contact record was uploaded by the Data Import Wizard.

Table 416: Contact Opt-Out Methods

Method	Description
List-Unsubscribe Header	The contact clicked an opt-out button in the mail client that appeared as a result of the List-Unsubscribe mail header.
Automatic Feedback Loop	The contact clicked a spam notification feature provided by the contact's email service, which relayed a notification to Oracle Service Cloud, and the contact was opted-out by the system.

In addition to the audit log, the system provides the following reports to help you identify the methods responsible for opting out contacts.

- **Mailing Opt-out Details**—Lists all contacts who opted out as a result of a mailing and the opt-out method used.
- **Contact Opt-out Details**—Lists all contacts currently opted out and (if available) the opt-out method used.
- **Outreach Activity**—Includes information about contacts who opted out using the List-Unsubscribe Header or Automatic Feedback Loop methods.
- **Mailing Response Analysis**—Includes the total number of opt-outs that occurred using the List-Unsubscribe Header or Automatic Feedback Loop methods.

Caution Administrators noticing a large number of global opt-outs may be tempted not to include unsubscribe links in mailings. However, you should be aware that in many countries, including the United States, the inclusion of unsubscribe links in marketing email is required by law. See CAN-SPAM compliance in mailings.

If your site is experiencing higher-than-usual opt-out rates, the recommended best practice is to increase the deliverability of your communications. See *Best Practices for Email Marketing*.

69

External Suppression List

Using the external suppression list, you can define a list of email addresses that are excluded from **mailings** and **surveys**. When a mailing or survey is sent or launched, the **audience** is automatically checked against the external suppression list and email is not sent to contacts with an email address on the list. This can help you ensure that certain addresses are consistently excluded from marketing and survey communications even if those contacts have not explicitly opted out.

Note Although the external suppression list is honored by default, you can configure individual surveys and mailings to ignore the list and send to all audience members instead. Refer to Defining the broadcast mailing audience and Defining the broadcast survey audience.

Creating and editing the external suppression list

You can create the external suppression list by adding email addresses individually or uploading a list of multiple addresses from a file. You can also replace the current list with a new list or remove specific email addresses from the suppression list if you decide you now want to send mailings or surveys to those addresses.

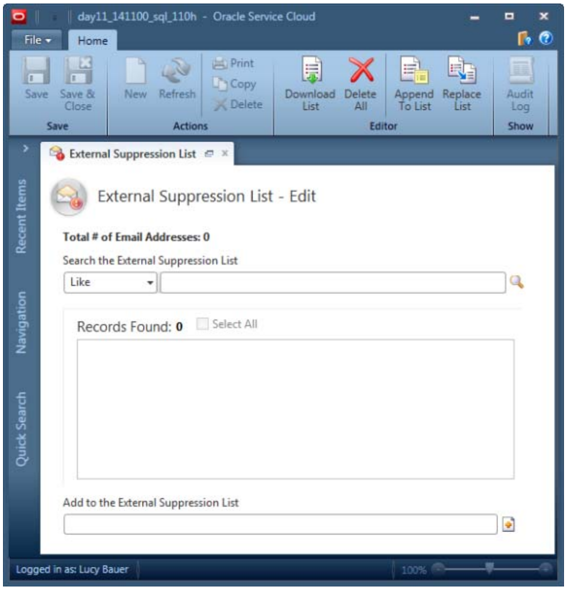
Note The list of email addresses you use to append to the existing external suppression list or to replace it must be a *.txt* document with a separate email address on each line.

The following procedure assumes that the External Suppression List component has been added to your navigation list. See To add items to or remove items from a navigation or configuration list.

To create or edit an external suppression list

1 Click the Configuration button on the navigation pane.

2 Double-click External Suppression List under Outreach. The editor displays on the content pane.



3 To append a list of addresses to the external suppression list, click the Append to List button on the ribbon. A window opens to let you browse to the folder that contains the file you want to append.

a Select the *.txt* file you want to append or type its path and name in the File Name field.
b Click the Open button. A message lets you know that the upload was successful.
c Click the OK button on the message.
d Click the Search button to the right of the Search the External Suppression List field. The email addresses in the file display in the Records Found section.

Note Practical limitations can cause the upload process to time out after five minutes. If you have difficulty uploading a large file, split the data into multiple files and upload them instead. For more about file size limitations, refer to [Answer ID 280](#) on our support site.

4 To add an individual email address to the external suppression list, type the email address in the Add to the External Suppression List field at the bottom of the editor.

   a Click the Add Email button to the right of the field.

   b Click the Search button to the right of the Search the External Suppression List field. The new email address displays in the Records Found section.

5 To replace the existing suppression list with a different list, click the Replace List button on the ribbon. A window opens to let you browse to the folder that contains the file you want to replace the list with.

   a Select the *.txt* file you want to replace the existing list or type its path and name in the File Name field.

   b Click the Open button. A message asks you to confirm that you want to replace the list.

   c Click the Yes button.

   d Click the Search button to the right of the Search the External Suppression List field. The Records Found section now displays only the email addresses in the file you selected.

6 To delete individual email addresses in the external suppression list, search for the addresses you want to delete. Refer to Searching and downloading the external suppression list.

   a Select the check box next to each email address you want to delete.

   b Click the Delete button on the ribbon. A message asks you to confirm that you want to delete the selected addresses.

   c Click the Yes button. The Records Found section is refreshed to remove the addresses you deleted.

7 To delete all email addresses in the external suppression list, click the Delete All button on the ribbon. A message asks you to confirm.

   a Click the Yes button. A message lets you know all email addresses were successfully deleted.

   b Click the OK button to close the message.

Searching and downloading the external suppression list

Before you can remove individual email addresses from the external suppression list, you need to select them, which means you must display them on the editor by searching for them. You might, for example, want to search for and delete all email addresses with a specific domain. You also have the option of downloading your external suppression list and saving it to a text file on your local workstation.

To search the external suppression list

1 Click the Configuration button on the navigation pane.

2 Double-click External Suppression List under Outreach. The editor displays on the content pane.

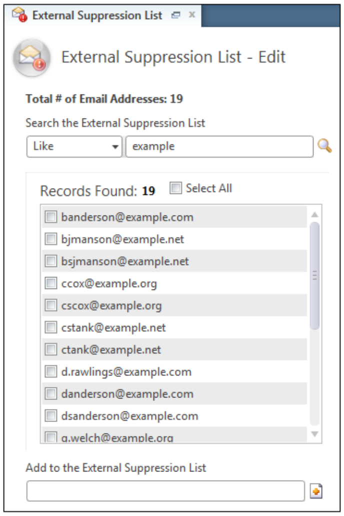
3 Select the type of search you want from the Like drop-down menu. The following options are available.

Table 417: Search Options for the External Suppression List

Search Option	Description
Like	The search returns email addresses that contain the search term you enter. For example, typing and returns the following results: jim.anderson@example.com, sandy_johnson@example.net, and jsmith@example.net.
Ends With	The search returns email addresses that end with the search term you enter. Use this option to find all email addresses at a specific domain, such as example.com.
Exact Match	The search returns email addresses that exactly match the search term you enter.
Starts With	The search returns email addresses that begin with the search term you enter.

4 Type your search term in the text field. Leave this field blank to return all email addresses in the list.

5 Click the Search button. The number of matching records and the returned email addresses display in the Records Found section. In the following figure, the search results include all email addresses that contain “example.”



6 To select one or more email addresses to remove from the external suppression list, select the check box next to each email address. Or select the Select All check box if you want to remove all of the addresses in the Records Found field.

To download the external suppression list

1 Click the Configuration button on the navigation pane.

2 Double-click External Suppression List under Outreach. The editor displays on the content pane.

3 Click the Download List button on the ribbon. A window opens to let you browse to the folder where you want to save the file.

4 Type the file name in the File Name field or select an existing file to overwrite it.

5 Click the Save button. A confirmation message lets you know the download was successful and asks if you want to open the file.

6 Click the Yes or No button to close the download confirmation. If you click Yes, the file opens.

70

Content Library

The Content Library is a resource for creating, storing, and organizing custom content such as **documents**, **templates**, **tracked links**, and **snippets**. Once saved, you can access this content whenever you need to include it in a mailing, campaign, web page, or survey. You can use the content as is, or make minor changes once it has been added. You can also upload file attachments once and include them in your content as many times as you like.

The HTML editor can help you create dynamic documents to send to your customers. You can add graphics, hyperlinks, tables, and apply text formatting without having any knowledge of HTML. Should you need to modify the source code, the editor provides easy access with a technical interface.

You can also add web forms to documents, templates, and snippets to collect customer data from the web or through email. You can add any database contact field or contact custom field to the web form, enabling you to populate a contact record with data from the submitted form.

Creating documents

You can create unique documents to use in mailings, campaigns, and surveys. Documents can be designed in either HTML or as plain text, and are easily previewed while being created. You can also access tasks and notes associated with the document, and an audit log of actions taken on the document.

Once a document is created, it can be served as a web page in a campaign, sent to contacts in a mailing or survey invitation, or used to form a questionnaire in a survey. Documents can contain templates, web forms, snippets, **merge fields**, **merge reports**, and **conditional sections** based on contact filters. However, mailings and surveys using simpler documents send more quickly than those using documents with many merge fields, merge reports, conditional sections, and web forms.

Note The following procedure assumes that you access the Documents explorer from the Content Library **navigation list**. However, this explorer may reside in a different navigation list.

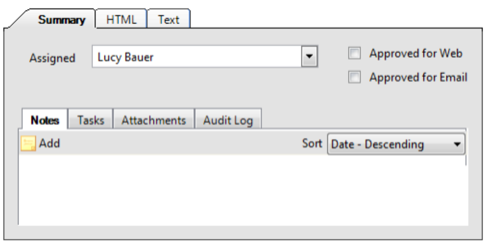
To create a document

1 Click the Content Library button on the navigation pane.

2 Double-click Documents Explorer. The Documents explorer opens on the content pane.

3 Click the New button. A new document opens on the content pane.

Tip You can also create a document from an open document by clicking the New button. Additionally, if your navigation set is configured to add documents from the file menu, click File and select Content Library > Document. See To configure the file menu.



By default, the Summary tab is active when creating a document. From here, you can assign the document to a staff member, as well as manage the document's notes, tasks, and attachments. See Managing documents.

Note The Notes, Tasks, Attachments, and Audit Log tabs are available only when the Summary tab is selected.

4 To assign the document to another staff member (by default, the document is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

a To search for a staff member, type the staff member's name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

5 To allow staff members to serve this document as a web page, select the Approved for Web check box.

6 To allow staff members to use this document in a mailing or survey, select the Approved for Email check box.

7 To create an HTML version of the document, click the HTML tab and refer to Creating HTML documents.

8 To create a plain-text version of the document, click the Text tab and refer to Creating text content in documents.

9 To spell check the document, click the Spelling button on the ribbon and refer to Spell checking.

10 Click the Save and Close button to save the document. The Save As window opens.

Note You can click the Save button to save the document without closing it.

11 Select the folder you want to save the document in and type the name of the document in the Name field.

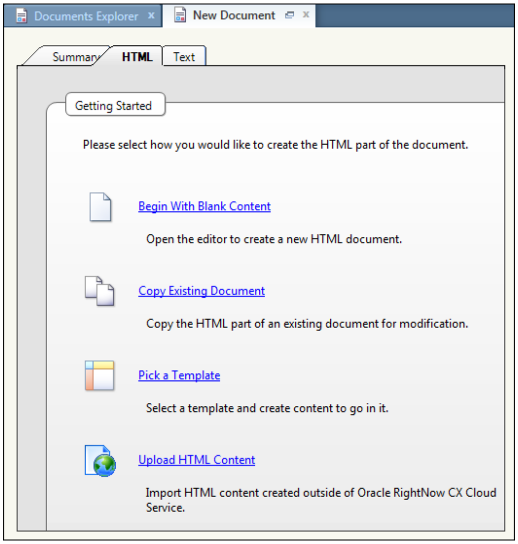
12 Click the OK button to save the document.

Creating HTML documents

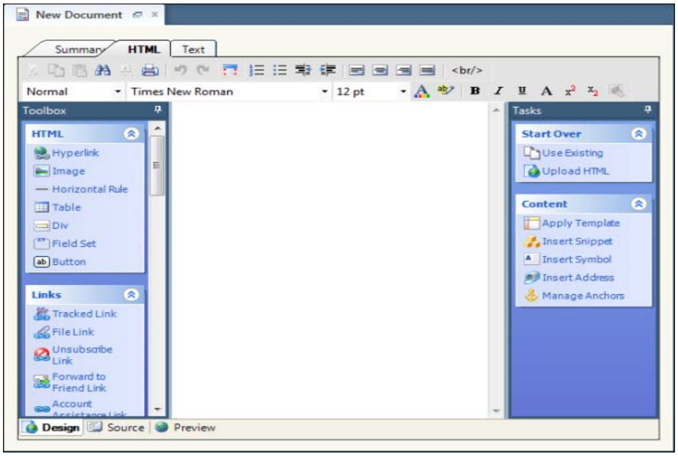
When you create HTML documents, you have the option of starting with a blank document, copying an existing document, using a template (refer to Creating templates), or uploading your own HTML to the document. HTML documents can be modified by editing the source code, or using an HTML editor to add images, formatting or insert special links, such as **tracked links** or links to unsubscribe to mailings. You can also add **conditional sections**, **merge fields**, and **merge reports** to your HTML documents.

To create an HTML document

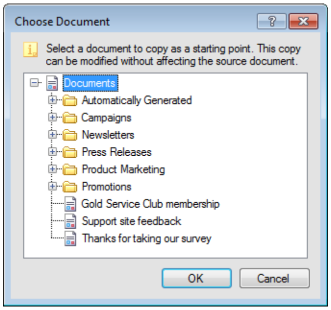
1 Click the HTML tab.



2 To create an HTML document from scratch, click Begin with Blank Content. The HTML editor opens. See [Using the HTML editor](#).



3 To create an HTML document by copying an existing document, click Copy Existing Document. The Choose Document window opens.

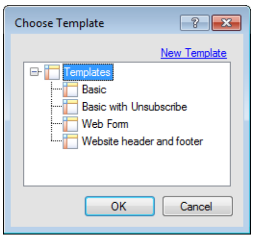


a Select the document you want to copy.

b Click the OK button to add the content to your document.

Note Changes to the document content do not affect the original document.

4 To create an HTML document by uploading a template, click Pick a Template. The Choose Template window opens.



a Select the template you want to use.

b To create a template, click New Template and refer to Creating templates.

c Click the OK button to use the template in your document.

5 To create an HTML document by uploading an HTML file from your workstation, click Upload HTML Content.

a Select the HTML file you want to upload.

b Click the Open button. The HTML is inserted in your document.

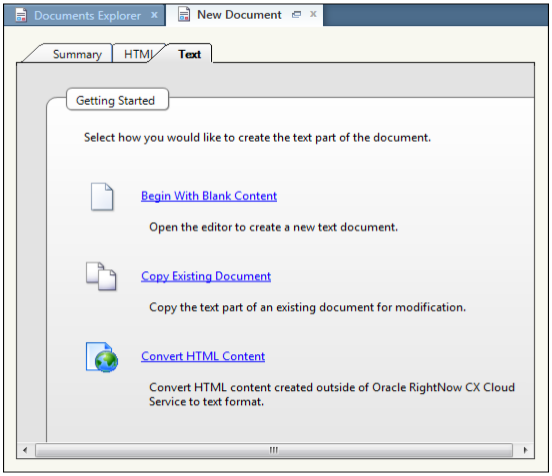
6 Click the Save button on the ribbon to save the document.

Creating text content in documents

You may want to create a text version of your document if certain customers can receive only plain text emails. When you create text documents, you can start with a blank document, upload the text portion of an existing document, or convert an HTML file.

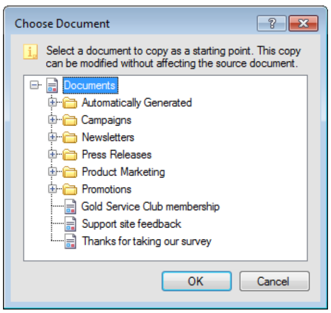
To create text content

1 Click the Text tab.



2 To create text content from scratch, click Begin with Blank Content. The text editor opens. See Creating and editing text.

3 To create text content by copying an existing document, click Copy Existing Document. The Choose Document window opens.

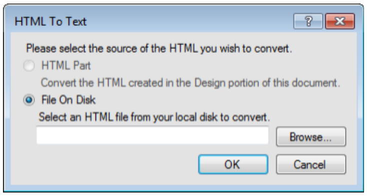


a Select the document you want to copy.

Note Only the text content from the document is copied. The HTML content of the document is not affected.

b Click the OK button to add the content to your document.

4 To create a text document by converting an HTML page to text, click Convert HTML Content.



a To convert the HTML content to text, select the HTML Part radio button. This option is not available if no HTML content exists in the document.

Note You should finalize your HTML content before converting it to text.

b To convert an HTML file to text, select the File On Disk radio button and browse for the file.

c Click the OK button to insert the converted HTML in the text part of your document.

5 Click the Save button on the ribbon to save the document.

Managing documents

You can view click-through results for a document and add notes, tasks, and file attachments to your documents. You can also view the **audit log** to see when a document was created and edited. The following sections describe how to view click-through results and add notes and tasks. To add file attachments and view the audit log, refer to Working with records.

Viewing click-through results

Documents can be viewed with click-through results for **tracked links**, web page links, file links, unsubscribe links, and forward to friend links. Following each link, inline statistics display the number of times the link was clicked, the number of total link clicks in the document, and the percentage of times the link was clicked when compared to total clicks. The links are also color coded so you can immediately see how they are performing. Links that perform well appear in green, underperforming links appear in red, and all other links appear in yellow.

To view click-through results

From the Documents explorer, right-click the document and select View Click-Through Results.

Or

Click the View Click-Through button on the Documents explorer ribbon.

Adding notes

You may want to add notes to a document to provide additional information to staff members as they are working with the document.

To add a note

1 From your open document, click the Summary tab. The Notes tab is selected by default.

2 Click the Add button.

3 Type the text of the note.

4 To sort the notes by either ascending or descending date, click the Sort drop-down menu and select a sort option.

5 To edit an existing note, click Edit next to the note.

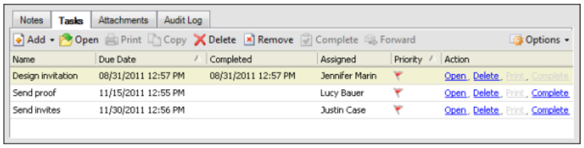
6 To permanently delete a note, click Delete next to the note.

Adding tasks

From the Summary tab, you can assign new or existing tasks to documents and edit, delete, and forward tasks to other staff members. You can also view each task associated with the document. See Adding tasks.

To add a task

1 From your open document, click the Tasks tab.



2 Enter the following field information.

Table 418: Tasks Tab Toolbar Description

Button	Description
Add	Click this button to display a drop-down menu containing the following options.
Add New	Select this option to add a new task. See Adding tasks for the procedure to complete the fields on this window.
Add Existing	Select this option to add an existing task. After finding and selecting a task, the task is added to the task list for the document. See To search for a task from an open record for information about the Task Search window.
Open	Click this button to open the selected task for editing.
Print	Click this button to print the task.

Table 418: Tasks Tab Toolbar Description (Continued)

Button	Description
Copy	Click this button to copy the task.
Delete	Click this button to permanently delete the task.
Remove	Click this button to remove the task from the document (without deleting the task).
Complete	Click this button to set the task status to Completed.
Forward	Click this button to open the Forward Task window and send the task to the selected recipients.
Options	Click this button to select an option for managing the output and display of information on the tab, such as print, forward, or export. See Report Management, Forwarding reports, and Exporting report output. For information about other options, see Changing output options.

Creating templates

Templates are used to standardize the design of the headers and footers of your documents. When you apply a template to a document, the template design appears as part of the document layout. However, the template design cannot be edited from the document editor—you can edit only the contents of the document, indicated by a red outline. To make changes to the template, you must open it in the template editor.

Templates are sometimes referred to as “living” content. When a template is edited and saved, all documents using the template automatically display the updated content. For instance, if you design a template containing a standard header and apply it to multiple documents, any changes made to that template appear automatically in every document that the template was applied to.

Important Templates are best used for applying a common look and feel to a group of documents that will be published to the web (using the Serve Web Page campaign element, for instance). For documents used in a mailing or survey invitation, it is better to add design elements using **snippets**.

For example, if a template is applied to a document used by a mailing, and the template is later edited, the mailing is updated in Oracle Service Cloud to reflect the edits. This occurs even if the mailing has already been sent and the RNM_-MOD_SENT_DOCS setting is set to disable the editing of sent documents. If the template is edited after the mailing is sent, and a staff member views the mailing from the mailing editor or the Outreach Activity tab of a recipient’s contact record, the mailing no longer appears as it did when it was sent. This can cause confusion and ambiguity about the mailing’s effectiveness.

When you insert a snippet, its contents are copied to the layout and can then be edited freely with the rest of the design. You can also edit the snippet at any time without affecting the appearance of layouts to which the snippet was previously applied. See Creating snippets.

Another alternative to using templates is to store your design in an HTML file outside of Oracle Service Cloud and then upload it when you create your mailing or survey. See Uploading HTML content.

If you need to update a template that has been applied to a document, you can click the Info button on the Home tab to display the template ID. You can then search for the template in the Templates explorer by clicking the Find button and selecting ID from the Find Using drop-down menu. See Searching in explorers.

Tip To see a list of documents that are using a template, you can create a report from the Documents *(documents)* table that uses the *live_rc_id* filter. For example, using the Documents table, you could add columns, such as Name, Date Created, Date Updated, and Assigned, and then add the *live_rc_id* filter to the report to see which templates are returned in the list. See Creating reports.

Document templates are not applied when surveys are viewed on mobile devices because templates are not optimized for mobile. However, if you want to create an appropriately sized template to be used for mobile, you could add HTML content with a conditional section for mobile runtime that includes a smaller image. See Customizing surveys for use on mobile devices.

- Creating snippets
- Uploading HTML content

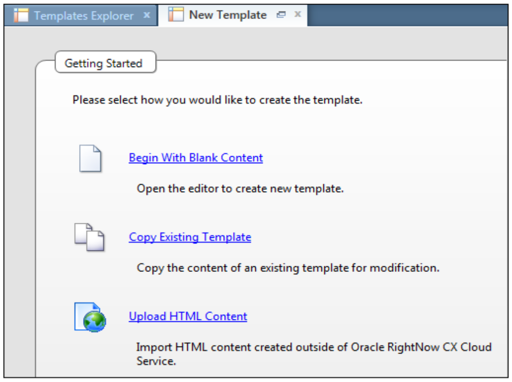
To create a template

1 Click the Content Library button on the navigation pane.

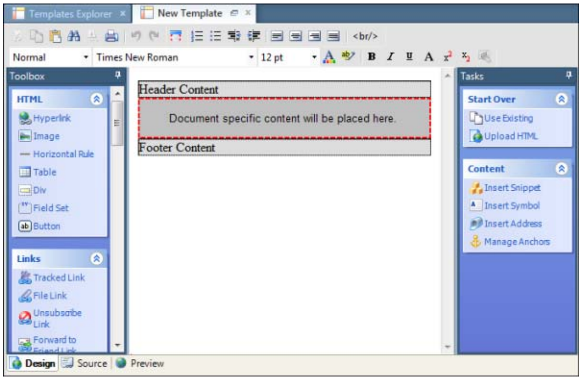
2 Double-click Templates Explorer. The Templates explorer opens on the content pane.

3 Click the New button. A new template opens on the content pane.

Tip You can also create a template from an open template by clicking the New button. Additionally, if your navigation set is configured to add templates from the file menu, click File and select Content Library > Template. See To configure the file menu.



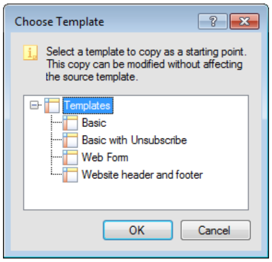
4 To create the template from scratch, click Begin with Blank Content.



In the middle of the HTML editor is a placeholder for document content when the template is used. You can insert HTML above and below the placeholder, including in the header and footer. See Using the HTML editor.

Note The template must include the content placeholder.

5 To create a template by copying an existing template, click Copy Existing Template. The Choose Template window opens.



- **a** Select the template you want to copy.
- **b** Click the OK button to add the content to your template.

6 To create a template by uploading an HTML file from your workstation, click Upload HTML Content.

- **a** Browse to the location of the HTML file you want and select it.
- **b** Click the Open button. The HTML is inserted in your template.

Important After uploading your HTML, you must insert the placeholder by clicking the Content Placeholder button in the toolbox.

7 To spell check the template, click the Spelling button on the ribbon and refer to Spell checking.

8 Click the Save and Close button to save the template. The Save As window opens.

Note You can click the Save button to save the template without closing it.

9 Select the folder you want to save the template in and type the name of the template in the Name field.

10 Click the Save button to save the template.

Creating snippets

Snippets are small pieces of commonly used content that can be inserted into the layout of a document, mailing message, survey, or survey invitation. Creating a snippet is helpful if you want to make certain design elements available to any document, mailing, or survey. Snippets can be accessed easily and reused as many times as needed.

When you insert a snippet, its contents are copied to the layout and can then be edited freely with the rest of the design. Changes made to a snippet in the snippet editor do not alter the appearance of layouts to which the snippet was previously applied.

Tip If you want to apply design elements that can be updated automatically across multiple documents, you might consider using a **template** instead of a snippet. When a template is edited and saved, all documents using the template automatically display its updated content. However, templates are best used when working with groups of documents that will be published to the web (using the Serve Web Page campaign element, for instance). When designing documents that are used for mailings or survey invitations, it is better to use snippets.

You can also store your design in an HTML file outside of Oracle Service Cloud and then upload it when you create your mailing or survey. See Uploading HTML content.

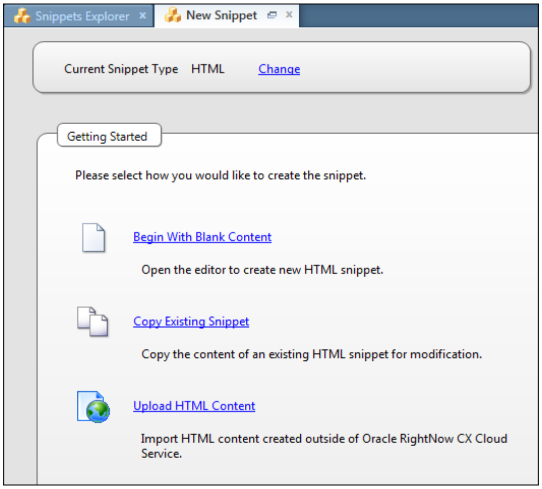
To create a snippet

1 Click the Content Library button on the navigation pane.

2 Double-click Snippets Explorer. The Snippets explorer opens on the content pane.

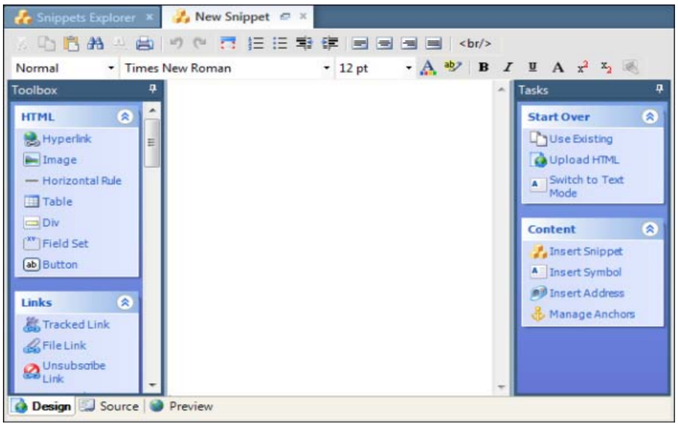
3 Click the New button. A new snippet opens on the content pane.

Tip You can also create a snippet from an open snippet by clicking the New button. Additionally, if your navigation set is configured to add snippets from the file menu, click File and select Content Library > Snippet. See To configure the file menu.

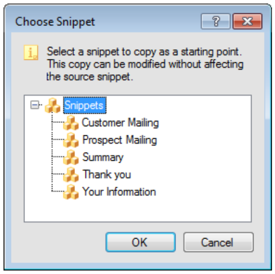


By default, the snippet type is HTML. You can also create plain text snippets. See [Creating text snippets](#).

4 To create an HTML snippet from scratch, click Begin with Blank Content. The HTML editor opens so you can design the HTML in your snippet. See [Using the HTML editor](#).



5 To create an HTML snippet by copying an existing snippet, click Copy Existing Snippet. The Choose Snippet window opens.



- **a** Select the snippet you want to copy.
- **b** Click the OK button to add the content to your snippet.

6 To create an HTML snippet by uploading an HTML file from your workstation, click Upload HTML Content.

- **a** Browse to the location of the HTML file you want and select it.
- **b** Click the Open button. The HTML is inserted in your snippet.

7 To spell check the snippet, click the Spelling button on the ribbon and refer to Spell checking.

8 Click the Save and Close button to save the snippet. The Save As window opens.

Note You can click the Save button to save the snippet without closing it.

9 Select the folder you want to save the snippet in and type the name of the snippet in the Name field.

10 Click the Save button to save the snippet.

Creating text snippets

You may want to create a text version of your snippet to insert in text documents. Text documents are used if certain customers can receive only plain text emails.

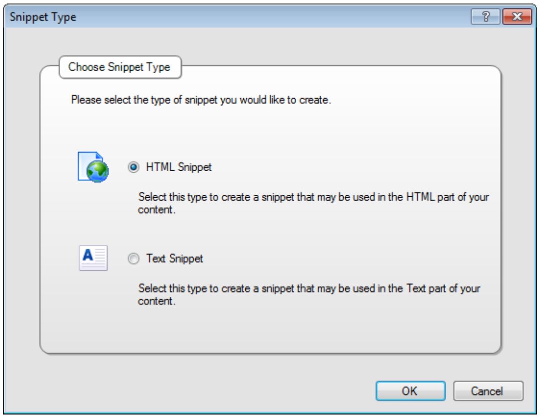
To create a text snippet

1 From the Snippets explorer, click the New button. A new snippet opens on the content pane.

Tip You can also create a snippet from an open snippet by clicking the New button. Additionally, if your navigation set is configured to add snippets from the file menu, click File and select Content Library > Snippet. See To configure the file menu.

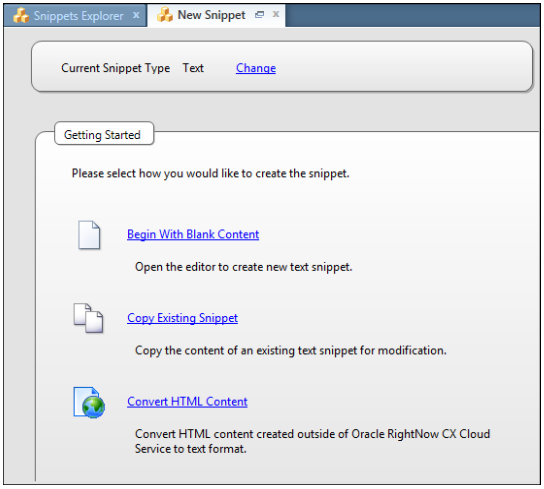
2 Click Change in the Current Snippet Type section.

Note You can also change to a text snippet while creating an HTML snippet by clicking the Switch to Text Mode button.



3 Select the Text Snippet radio button.

4 Click the OK button. The snippet type changes to Text.



5 To create a text snippet from scratch, click Begin with Blank Content. The text editor opens where you can define the plain-text version of your snippet. See Creating and editing text.

6 To create a text snippet by copying an existing snippet, click Copy Existing Snippet. The Choose Snippet window opens.

 a Select the snippet you want to copy.
 b Click the OK button to add the content to your snippet.

7 To create a text snippet by converting an HTML page to text, click Upload HTML Content.

 a Browse to the HTML file you want to convert and select it.
 b Click the Open button to insert the converted HTML in the snippet.

8 Click the Save button to save the snippet.

Adding tracked links

You can add links that are tracked and reported on for statistical purposes. The number of times a link was clicked through is reported when editing the mailing or survey (refer to Viewing mailing results) and through analytics.

After you have added tracked links to your system, they can be inserted in documents, templates, or snippets (refer to Inserting tracked links). Tracked links can also be inserted in several of the standard system-generated contact email messages (refer to Customizing messages). Adding tracked links to your contact emails are especially useful in tracking your customer-facing incident responses. See Incident response tracking.

Important Due to the volume of tracked links that accumulates as new content is created, the **Agedatabase** utility regularly purges the database of orphaned tracked links. That is, links that have been defined but not used in any campaign, document, or mailing. The PURGE_TRACKED_LINK_DAYS configuration setting specifies the number of days after which an orphaned tracked link is purged from the database. The default value is 30 days. Set to 0 to turn off tracked link purging.

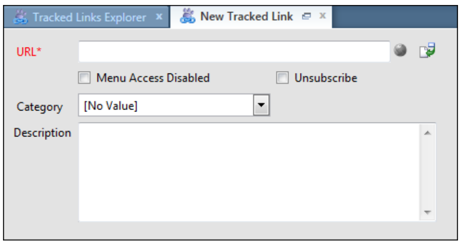
To add a tracked link

1 Click the Content Library button on the navigation pane.

2 Double-click Tracked Links Explorer. The Tracked Links explorer opens on the content pane.

3 Click the New button. A new tracked link opens on the content pane.

Tip You can also create a tracked link from an open tracked link by clicking the New button. Additionally, if your navigation set is configured to add tracked links from the file menu, click File and select Content Library > Tracked Link. See To configure the file menu.

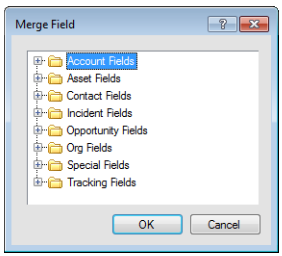


4 Enter the following field information.

Table 419: Tracked Link Description

Field	Description
URL	Type the full URL of the tracked link in this field.
Open URL	Click this button to open the URL.
Merge Field	Click this button to add a contact, incident, opportunity, or tracked link merge field to the URL.
Menu Access Disabled	Select this check box to make the tracked link unavailable. Staff members cannot insert the link in a document.
Unsubscribe	Select this check box to increment the unsubscribed count when this link is clicked in a mailing or survey. **Note:** Clicking the link does not change the contact's opt-in status. Select this check box if you want to manage opt-in information outside of Oracle Service Cloud.
Category	Click this drop-down menu and select a category to associate with the link. See [Tracked link categories](#).
Description	Type a description for the tracked link in this field. The description is for internal use only and is not seen by contacts who receive a mailing or survey with the link.

5 To add a merge field to the URL, click the Merge Field button.



a Select the database field you want to merge. Merge fields are populated with data from the contact record, account data or an associated incident, asset, opportunity, organization, or tracked link. You can also use the special fields that are available. The value of this field is appended to the URL as a parameter. For example, if you wanted to pass the login field value from the contact record, specifying http://www.global.example/regform.php?user=$contacts.login would return a URL such as http://www.global.example/regform.php?user=jsmith.

b Click the OK button to append the field to the URL.

6 To spell check the tracked link description, click the Spelling button on the ribbon and refer to Spell checking.

7 Click the Save and Close button to save the tracked link. The Save As window opens.

Note You can click the Save button to save the tracked link without closing it.

8 Select the folder you want to save the tracked link in and type the name of the tracked link in the Name field.

9 Click the Save button to save the tracked link.

Adding files

You can add files to your system that can be viewed by contacts who receive your mailings and surveys. Links to the files can be inserted in documents, templates, and snippets as a link (refer to Inserting unsubscribe links). After your files are added, you can use them as many times as you want.

Important Certain practical limitations exist that restrict the size of files that can be uploaded to Oracle Service Cloud. See Answer ID 280 on our support site.

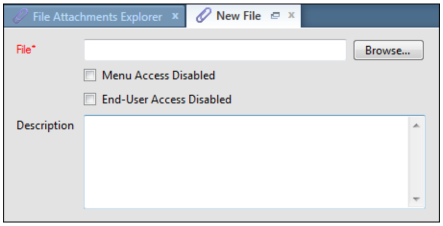
To add a file

1 Click the Content Library button on the navigation pane.

2 Double-click File Attachments Explorer. The File Attachments explorer opens on the content pane.

3 Click the New button. A new file opens on the content pane.

Tip You can also add files from an open file by clicking the New button. Additionally, if your navigation set is configured to add files from the file menu, click File and select Content Library > File. See To configure the file menu.



4 Enter the following field information.

Table 420: File Description

Field	Description
*File	Type the full path name to the file you want to upload in this field or click the Browse button to browse for the file. Click the text in this field when editing a file to preview the file.
Menu Access Disabled	Select this check box to make the file unavailable. Staff members cannot select the file to insert in a document.
End-User Access Disabled	Select this check box to make the file unavailable in mailings and surveys sent to contacts. Contacts will receive a message indicating that access is denied.
Description	Type a description of the file in this field. The description is for internal use only. It is not seen by contacts who receive a mailing or survey with the file.

5 To spell check the file description, click the Spelling button on the ribbon and refer to Spell checking.

6 Click the Save and Close button to save the file. The Save As window opens.

Note You can click the Save button to save the file without closing it.

7 Select the folder you want to save the file in and type the name of the file in the Name field.

8 Click the Save button to save the file.

Using the HTML editor

When creating a document, template, or snippet, you add HTML content using an HTML editor built into the system. The HTML editor contains many of the same options available in basic word processing applications and also has specialized operations such as adding **web forms**, **conditional sections**, **incident threads**, **merge fields**, and **merge reports**.

You can create content in design or source mode. Using design mode, you can create dynamic, well-formatted content even if you do not have previous HTML experience. You can include special formatting in your text and add graphics, links, and other HTML features. You can also add links to existing content.

Note For design mode to be available in Outreach and Feedback, the HTML Design Mode permission must be selected for both Outreach and Feedback in your profile. See Outreach permissions and Feedback permissions.

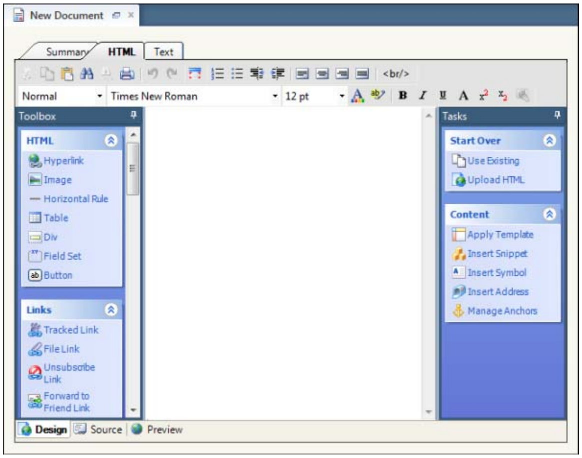
Using source mode, you can create content using HTML source code. Regardless of which mode you use to create content, you can preview how it appears to customers from the Preview tab. See Adding HTML in source mode.

Adding HTML in design mode

Oracle Service Cloud contains an HTML editor for creating dynamic content. If your profile includes the HTML Design Mode permission, you begin in design mode. Otherwise, only source mode is available. See Adding HTML in source mode, Outreach permissions and Feedback permissions.

When in design mode, you can use word processing functions to create HTML, as well as dynamic content, such as adding a **conditional section** or a **merge field**.

You can add several types of links to your content. Links appear as clickable text when the document is used in a mailing or survey or as a web page. When a link is added, you have the option of defining certain attributes depending on the type of link. Links, as well as forms and dynamic content elements, are located in the toolbox.



Tip You can define style and class properties on most toolbox and tasks elements (or options) by right-clicking the element after you add it to the canvas. Keep in mind that style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template. See [To edit style and class](#).

Using the toolbar, you can create HTML using many of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
- Format text in numbered or bulleted lists
- Adjust indentation
- Center, left-justify, or right-justify text and images on the page
- Insert line breaks
- Change font size and style attributes (such as bold, italic, and underline)
- Apply special text formatting (such as color, highlighting, superscripts, and subscripts)
- Copy text formatting using the style applier

Additional functions available in Oracle Service Cloud are accessed through the Toolbox and Tasks sections described in the following tables. Within the Toolbox, there are HTML, Links, and Dynamic Content sections. In Outreach and Feedback, there is also a Forms section. Within the Tasks, there are Start Over and Content sections.

Tip You can insert HTML by clicking a button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas.

Table 421: Toolbox Section Description

Button	Description
HTML	Buttons in this section are used to insert standard HTML elements in your content.
Hyperlink	Click this button to insert a hyperlink. See Inserting hyperlinks.
Image	Click this button to insert an image. See Inserting images.
Horizontal Rule	Click this button to insert a horizontal line.
Table	Click this button to insert a table. See Inserting tables.
Div	Click this button to insert a DIV block, which you can use to group other elements, such as buttons.
Field Set	Click this button to insert a field set.
Button	Click this button to insert a button. Double-click the button on the canvas to edit the button text.
Links	Buttons in this section are used to insert links in your content. **Note:** Some buttons apply only to message templates and are noted as such.
Account Assistance Link	Click this button to insert a link to the Account Assistance page on your customer portal. See Inserting account assistance links.
Answer Link	Click this button to insert a link to any answer you specify. See Inserting links to answers. **Note:** This button is available only in message templates. See Customizing messages.
Browser Link	Click this button to insert a browser link. See Inserting browser links.

Table 421: Toolbox Section Description (Continued)

Button	Description
Chat Link	Click this button to insert a link to the Live Help page on the customer portal. See Inserting chat links. **Note:** This button is available only if Oracle RightNow Chat Cloud Service (Chat) is enabled.
Cloud Link	Click this button to insert a link to a social media service. See Inserting cloud links.
File Link	Click this button to insert a file link. See Inserting unsubscribe links.
Forward to Friend Link	Click this button to insert a forward to friend link. See Inserting forward to friend links.
Incident Link	Click this button to insert a link to any incident you specify. See Inserting links to incidents.
Profile Link	Click this button to insert a link to the Account Settings page on your customer portal. See Inserting profile links.
Proof Comments Link	Click this button to add more than one comment field to the Survey Proof message template that is sent to proofreaders of website link surveys. See Inserting proof comments links. **Note:** This button is available only in message templates. See Customizing messages.
Proof Survey Link	This button is included, by default, on the Survey Proof message template and links to the website link survey you want your proofreaders to review. See Inserting proof survey links. **Note:** This button is available only in message templates. See Customizing messages.
Reset Password	Click this button to insert a reset password link. See Inserting reset password links.
Setup Password	Click this button to insert a link to the Finish Account Creation page on your customer portal. See Inserting setup password links.
Survey Link	Click this button to insert a link to a survey. See Inserting links to surveys.

Table 421: Toolbox Section Description (Continued)

Button	Description
Survey Results Link	This button is included, by default, on the Survey Notification message template and links to a web page that shows the survey's responses. See Inserting survey results links. **Note:** This button is available only in message templates. See Customizing messages.
This Answer Link	Click this button to insert a link to the incident that triggered the message being sent. See Inserting links to answers. **Note:** This button is available only in message templates. See Customizing messages.
This Incident Link	Click this button to insert a link to the incident that triggered the message being sent. For example, the standard Question Receipt email sends a confirmation message after a customer submits a question through the Ask a Question page, an email, or a chat session. By adding a This Incident Link to your Question Receipt message template, you can provide your customers with easy access to the incident created from their question. See To insert a this incident link.
Tracked Link	Click this button to insert a tracked link. See Inserting tracked links.
Unsubscribe All Answers Link	Click this button to insert a link that lets contacts who receive answer notifications unsubscribe from future communications. See Inserting unsubscribe all answers links. This button is available only in message templates. See Customizing messages.
Unsubscribe Link	Click this button to insert an unsubscribe link. See Inserting unsubscribe links.
Unsubscribe This Answer Link	Click this button to insert an unsubscribe link to a specific answer that's been returned as the result of a repeatable answer section. See Inserting unsubscribe this answer links. **Note:** This button is available only on the Answer Update Notification message template. See Customizing messages.
Web Page Link	Click this button to insert a web page link. See Inserting web page links.

Table 421: Toolbox Section Description (Continued)

Button	Description
Forms	Buttons in this section are used to insert web forms and survey questions in your HTML.
Web Form	Click this button to insert a web form to collect customer data. Documents can contain only one web form. See Inserting web forms.
Form Field	Click this button to insert a database field in the web form. Your web form must contain at least one form field. See Inserting web forms.
Survey Question	Click this button to insert a survey question in the web form. See Inserting web forms.
Submit Button	Click this button to insert a button for submitting the web form. See Inserting web forms.
Dynamic Content	Buttons in this section are used to insert dynamic content in your HTML.
Answer Section	Click this button to add any repeatable answer details on your answer update notification messages. See Inserting answer sections. **Note:** This button is available only in message templates. See Customizing messages.
Case Section	Click this button to add a case section to your conditional text. See Inserting case sections.
Conditional Section	Click this button to insert a section of conditional text. See Inserting conditional sections.
Content Placeholder	Click this button to add a content placeholder to your template. When you create a template by uploading an HTML file, you must add a content placeholder because templates cannot be saved without a content placeholder. See To create a template. **Note:** This button is available only for templates. For message templates, this button displays under the HTML section of the toolbox.
Incident Thread	Click this button to insert an **incident thread** that displays all communication between the parties associated with the message. See Inserting incident threads.
Merge Field	Click this button to insert a merge field. See Inserting merge fields.
Merge Report	Click this button to insert a merge report. See Inserting merge reports.

Table 422: Tasks Section Description

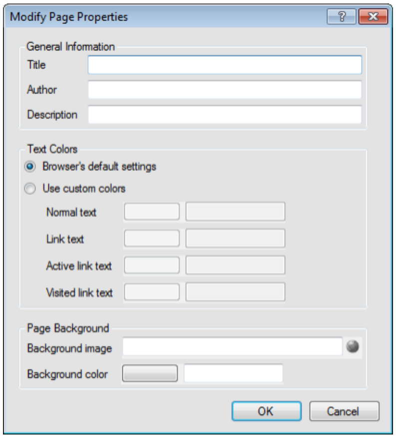
Button	Description
Start Over	Buttons in this section are used to clear all HTML content and start over.
Use Existing	Click this button to clear all HTML elements and start over with an existing document.
Upload HTML	Click this button to clear all HTML elements and start over with content uploaded from an HTML file.
Content	Buttons in this section are used to insert snippets and symbols and manage HTML anchors.
Apply Template	Click this button to select a template to apply to a document. You cannot apply a template to templates or snippets. See Creating templates. **Note:** Once a template has been applied to a document, it can be cleared by clicking the Apply Template button, then clicking the Clear Template button on the Choose Template window.
Insert Snippet	Click this button to insert a snippet. See Creating snippets.
Insert Symbol	Click this button to insert a special symbol. A symbol map opens. Double-click the symbol you want to insert.
Insert Address	Click this button to insert a physical address. See Inserting physical addresses. **Note:** The CAN-SPAM Act of 2003 requires that commercial email messages contain the sender's valid physical postal address.
Manage Anchors	Click this button to add or remove an anchor or go to an anchored site. See Inserting anchors.
Test CAN-SPAM	Click this button to test the document for CAN-SPAM compliance. See CAN-SPAM compliance in mailings. **Note:** This button is available only when editing a document in a mailing message or survey invitation message.

Modifying page properties

You can modify the document's HTML properties to change colors of the text and links, insert a background image or color, and change the document's title.

To modify page properties

1 Right-click in the document and select Page Properties.



2 Enter the following field information.

Table 423: Modify Page Properties Window Description

Field	Description
General Information	Define the web page's general information in this section.
Title	Type the title of the web page.
Author	Type the name of the web page's author.
Description	Type a description for the web page.
Text Colors	Define the colors used for text and links in this section.
Browser's default settings	Select this radio button to use the web browser's default color settings.
Use custom colors	Select this radio button and click the color boxes to define the colors used for plain text, links, active links, and visited links.
Page Background	Define the background image or color used in the document.
Background image	Type a URL to an image to use as the background in this text box.

Table 423: Modify Page Properties Window Description (Continued)

Field	Description
Open URL	Click this button to open the URL in a web browser.
Background color	Click this color box to choose a color to use as the background or type the HTML hexadecimal value of the color in the field to the right of the color box.

3 Click the OK button to save your changes.

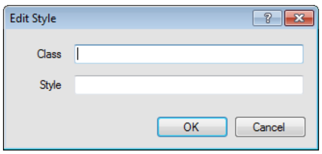
Editing style and class attributes

You can define style and class attributes for most toolbox and tasks elements by right-clicking the element after you add it to the canvas. Keep in mind that style and class must be defined in a CSS file that is available on your web server and linked to with the `<head>` tag of a survey template.

To edit style and class

1 Right-click an element after you add it to the canvas.

2 Select Edit style for <element type> element.



3 Enter the following field information.

Table 424: Edit Style Window Description

Field	Description
Class	Type any class name you want to assign to the element in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings or surveys.
Style	Type any style attributes you want to assign to the element in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).

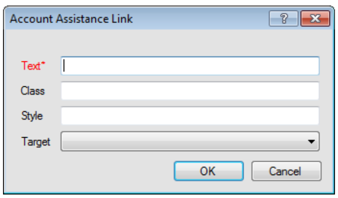
4 Click the OK button to apply the attributes.

Inserting account assistance links

Account assistance links let you link to the Account Assistance page on your customer portal. From this page, your recipients can get help if they do not have or have forgotten their user name or password.

To insert an account assistance link

1 Click the Account Assistance button. The Account Assistance Link window opens.



2 Enter the following field information.

Table 425: Account Assistance Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

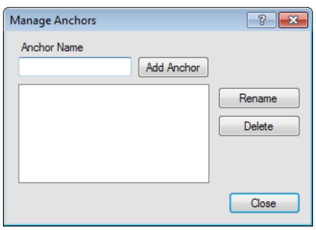
3 Click the OK button to insert the account assistance link.

Inserting anchors

Within the HTML editor, you can add and remove anchors. Anchors are placed at designated locations within a document as a destination for a hyperlink. When you place an anchor in your content, it is invisible when you are in design mode. The anchor code, sometimes referred to as a bookmark, displays only in source mode.

To manage anchors

1 Click the Manage Anchors button. The Manage Anchors window opens.



2 Type the anchor name in the Anchor Name field.

3 Click the Add Anchor button to add the anchor at the insertion point.

4 To delete an anchor, select it and click the Delete button. The anchor is deleted from the list.

5 To rename an anchor, select it, click the Rename button, and type a new name for the anchor.

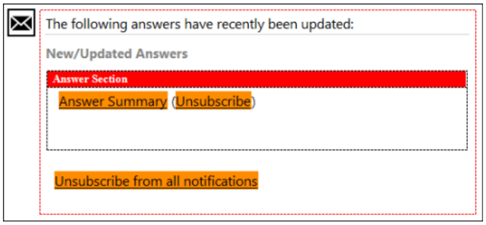
  a Click the OK button to save the new name.

6 Click the Close button to close the Manage Anchors window.

Inserting answer sections

You can use an answer section to display repeatable answer details on your answer update notification messages when more than one answer is sent in the same email. Any content that you include inside the answer section will be repeated. Content outside of the answer section will *not* be repeated.

Let's say you want your message to include the contact's name and you want to show the answer ID for each answer. In this case, you would insert the Answer ID merge field *inside* your answer section and the Contact Name merge field *outside* of the answer section. By inserting Answer ID inside the answer section, this merge field will repeat when more than one answer is sent. Since Contact Name is outside of the answer section, it will not repeat.



An answer section is included, by default, on the Answer Update Notification and Answer Update Notification Expired message templates. You can customize both of these templates in message templates. See Customizing messages.

To insert an answer section

1 Click the Answer Section button. An answer section is inserted into your template.

2 Insert the cursor inside the answer section and click Merge Field to add any fields you want to repeat when more than one answer is sent in the email.

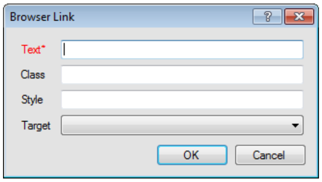
Important Keep in mind that any content outside of the answer section will *not* be repeated when more than one answer is sent in the same notification email. Therefore, if you have content you do not want repeated, add those merge fields outside of the answer section.

Inserting browser links

Browser links let you add a hyperlink to an email message that opens a browser-based version of the same content. This is useful for messages to contacts whose email clients disable image rendering by default.

To insert a Browser link

1 Click the Browser Link button. The Browser Link window opens.



2 Enter the following field information.

Table 426: Browser Link Window Description

Field	Description
*Text	Type the text you want to appear as the hyperlink text.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings.

Table 426: Browser Link Window Description (Continued)

Field	Description
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the browser link.

Inserting case sections

Case sections help you make your content even more relevant to your target audience than by using independent conditional sections. You can specify a logical group of conditions where one, and only one, condition displays to your customer. In a case section, as soon as the first condition is matched, the content for that condition is added and any other conditions are ignored. If no condition within a case section is matched, the content in the default section displays (as long as you have defined it).

For example, you could create a case section that displays information to customers based on their location. The first condition within the case section might be specific to postal codes. If none match, the next condition could be more general, such as states. If neither match, then the default section (if present) displays.

You can add as many conditional sections to your case section as you need to make your content relevant.

Tip Case sections and conditional sections can also be helpful when designing surveys for use on mobile devices. See Customizing surveys for use on mobile devices.

When to use case sections vs. conditional sections

Understanding the difference between case sections and independent conditional sections is essential to be sure your conditional content works the way you expect. Simply stated, a case section shows one, and only one, condition out of a group of conditions. This makes case statements a great tool for setting up OR statements. In contrast, a conditional section can be used to show one or more conditions at the same time. Which one to use depends entirely on your goal.

Show or hide one section—Let's say you want to show a toll-free support number to customers in the U.S. In a straight-forward scenario such as this, when the answer is either "yes" or "no," a simple conditional section does the job. Just define the content you want to display for your single condition and when it matches, your content displays. When the condition does not match, nothing displays.

Show more than one section—In another scenario, you might want to show a toll-free support number to U.S. customers and a list of store locations to customers in Colorado. You can do this by defining two conditional sections—one showing the phone number based on country and another showing locations based on state. For customers who live in Colorado, both the toll-free number and the store locations will display.

Show 1 of 2 sections—If you would rather list only store locations for customers in Colorado and show a toll-free support number to other customers, but you don't want to show both, this is where a case section comes in handy. In your conditional section, list the locations and define your condition based on state. In the default section, define the toll-free number. For customers with a Colorado address, only the locations display. For all other customers, the phone number displays.

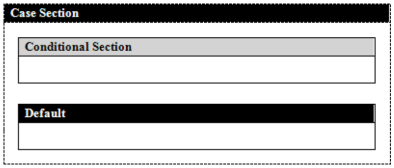
Show 1 of 3 sections—Building on the previous scenario, let's define a case section with multiple conditions where your default section will show an international number to customers living outside of the U.S. Again, you want to show only one condition to each segment of customers. Base the first condition on the state of Colorado, the second condition on the country being the U.S., and define the international number in the default section. Remember, in a case section, the first condition that matches is the only one that displays.

In action, here's how the last scenario plays out.

- If the contact record indicates a Colorado address, the store locations display.
- If the contact record indicates a U.S. address outside of Colorado, the second condition matches and the toll-free U.S. number displays.
- If the contact record has no address or if it does not match Colorado or U.S., the international number you defined for the default section displays. **Note:** If you do not define the default section and the first two conditions do not match any criteria, nothing displays.

To insert a case section

1 Click the Case Section button. The case section displays.



2 Double-click the Conditional Section inside the Case Section.

Or

3 Right-click and select Add Conditional Section. See To insert a conditional section.

Tip You can apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

4 If you want to add another conditional section to your case section, repeat step 2.

5 If you want to add content to the Default section, type it in the field below the default section header.

Tip If you add a conditional section after the default section, it will not be evaluated. Therefore, we recommend that you do not add anything after the default section.

Inserting conditional sections

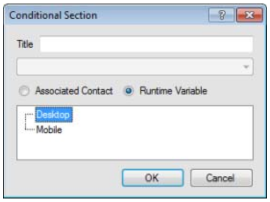
You can add conditional content that displays only when specific criteria is met. For example, you could add conditional sections to a document used in a mailing for segment of customers in a specific postal code. See Creating segments.

In the system-generated message templates (administrator notifications, administrator emails, and contact emails), you can insert conditional sections that display content based on contact, profile, runtime variable, or record type. These options are also available when you insert a conditional section within an incident thread. For example, you could add a conditional section that displays a coupon based on the product specified in the incident. See Editing messages and Inserting incident threads.

If you add more than one conditional section, each condition evaluates separately and if more than one condition matches, content is shown for each matched condition. If you want to display content from only one condition, consider using a **case section** instead of independent conditional sections. See Inserting case sections.

Customizing surveys for use on mobile devices

Case sections and **conditional sections using runtime variables** can be added to the HTML content of your survey's questionnaire if you want to show different content for mobile devices from what you show for desktop mode. For instance, you might want to use a smaller image at the top of your survey for mobile devices than the one you use for surveys viewed on desktops. In another situation, you could use a case section to hide a lengthy matrix question that might not be effective when viewed on a small mobile device. See Inserting case sections and Using matrix questions in mobile surveys.



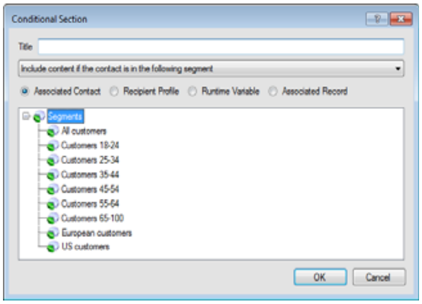
When using conditional and case sections with runtime variables, it's important to remember the following.

- Mobile conditional sections are honored on a mobile device even if mobile optimization is disabled in your survey.
- When using desktop and mobile runtime variables, we recommend that you create content for both variables on one page. You can do this either with a conditional section for each variable, or by adding content that appears for both variables. Otherwise, the runtime variable for which no content is defined will display a blank page.
- If the mobile user selects the Switch to Desktop Mode link, available on the first survey page, all content that displays will be desktop content, even if a mobile device is being used. (Switch to Desktop Mode is available only on the first page of a survey.)
- Test and preview your survey in both mobile and desktop modes to ensure your conditional sections work the way you intend them to.

See Mobile surveys.

To insert a conditional section

1 Click the Conditional Section button. The Conditional Section window opens.



Note The available options are context-sensitive and depend on what type of content you are customizing. For example, in certain message templates or if you've added a conditional section within an incident thread in a mailing or survey, you could add a conditional section that displays a coupon based on the product specified in the incident.

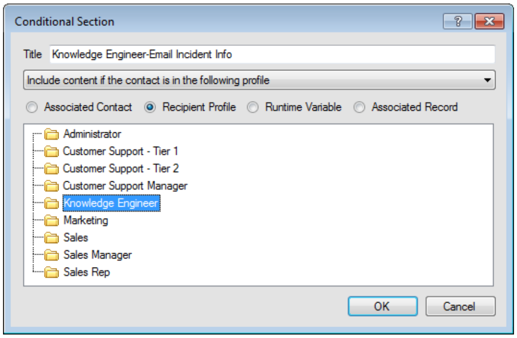
2 Type a title for the conditional section in the Title field.

3 Select an option from the drop-down menu to include content based on whether the contact is in or not in the selected segment.

4 Select a segment from the Segments menu. Segments are created when you define audiences.

5 To create a segment, click New Segment. See Creating segments.

6 For message templates or conditional sections inserted within incident threads in mailings and surveys, select the Associated Contact, Recipient Profile, Runtime Variable, or Associated Record radio button. These options are context-sensitive based on the type of content you are customizing.



a To display text based on contact, see steps 3-4.

b To display text based on recipient profile, select an option from the drop-down menu to include content based on whether the recipient is in or not in the selected profile, and then select a profile.

c To display text based on runtime variable, select Include Contact Information Section. This option is available only in the Email Incident Information (administrator email) message template. It lets the agent decide whether contact information will be sent in the email. See Editing messages.

d To display text based on a record type, select an option from the drop-down menu to include content based on whether the condition is true or false, and then select a record. Next, select an operator to use in comparing the record to the data's value, and then type a value that the record is compared to. See Selecting filter operators.

7 Click the OK button to insert the conditional section.

Tip You can apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

For message templates or conditional sections inserted within incident threads in mailings and surveys, style and class attributes are applied on the incident type thread properties. See Inserting incident threads.

8 Type the content you want to display to your audience in the text box below the conditional section header.

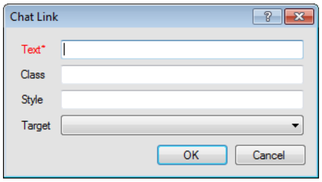
Important Due to the volume of conditional sections that accumulate as new content is created, the **Agedatabase** utility regularly purges the database of orphaned conditional sections (those that have been defined but not used in any campaign, document, or mailing). The PURGE_COND_SECTION_DAYS configuration setting specifies the number of days after which an orphaned conditional section is purged from the database. The default value is 7 days. Set to 0 to turn off conditional section purging.

Inserting chat links

If you have Chat enabled, you can insert a link to the Live Help page for your customers to chat with an agent. For information about enabling Chat, contact your Oracle account manager.

To insert a link to chat

1 Click the Chat Link button. The Chat Link window opens.



2 Enter the following field information.

Table 427: Chat Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.

Table 427: Chat Link Window Description (Continued)

Field	Description
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the chat link.

Inserting cloud links

Cloud links let your contacts track or post your communications on several leading social media sites. You can include cloud links in documents, templates, snippets, mailings, campaigns, surveys, and survey invitation messages.

When a contact clicks a cloud link, the specified service opens in a web browser and prompts the contact for confirmation. The action taken upon confirmation depends on the service being used and the type of link you provided.

Note Most social media services use cookies to identify contacts and automatically log them in to private accounts. As a result, a cloud link's transition to the confirmation page is often seamless. However, if a contact has not created or logged in to an account before clicking a cloud link, the service usually prompts the contact to do so before forwarding for confirmation.

When you create a cloud link, you can select from several leading services and link types. You may also be required to enter the key that is used to identify your organization on the service you have selected.

Table 428: Cloud Link Types and Keys

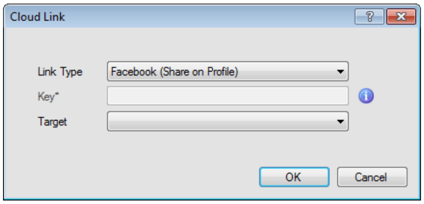
Link Type	Description/Key
Facebook (Share on Profile)	Clicking this link lets contacts share your communication as a message to their Facebook friends, or post a link to a web browser version of your message on their Facebook profile. No key is required.
Facebook (Find Us)	Clicking this link takes contacts to your Facebook group page, where they can join your Facebook group. When this option is selected, you must type your Facebook group ID in the Key field. For example, if your Facebook group URL is http://facebook.com/group.php?gid=0123456789, the key would be "0123456789."
Flickr	Clicking this link takes contacts to your Flickr group page, where they can join your Flickr group. When this option is selected, you must type your Flickr group ID in the Key field. For example, if your Flickr group URL is http://flickr.com/groups/companyname, the key would be "companyname."
Twitter (Tweet)	Clicking this link lets contacts post a link to a web browser version of your message on their Twitter account. No key is required.
Twitter (Follow)	Clicking this link takes contacts to your Twitter page, where they can follow your organization with their Twitter account. When this option is selected, you must type your Twitter group ID in the Key field. For example, if your Twitter URL is http://twitter.com/companyname, the key would be "companyname."
YouTube	Clicking this link takes contacts to your YouTube channel page, where they can join your YouTube channel. When this option is selected, you must type your YouTube group ID in the Key field. For example, if your YouTube group URL is http://youtube.com/companyname, the key would be "companyname."
LinkedIn	Clicking this link takes contacts to your LinkedIn group page, where they can join your LinkedIn group. When this option is selected, you must type your LinkedIn group ID in the Key field. For example, if your LinkedIn group URL is http://linkedin.com/groupRegistration.php?gid=012345, the key would be "012345."

Table 428: Cloud Link Types and Keys (Continued)

Link Type	Description/Key
MySpace (Share on Profile)	Clicking this link lets contacts post a link to a web browser version of your message on their MySpace profile. When this option is selected, you must type a title for your posted link in the Key field.
Community	Clicking this link takes contacts to your community page. No key is required. **Note:** This link type is available only when communities have been enabled for Oracle RightNow Social Experience.

To insert a cloud link

1 From the HTML editor's HTML or Text tab, click the Cloud Link button. The Cloud Link window opens.



2 Enter the following field information.

Table 429: Cloud Link Window Description

Field	Description
Link Type	Click this drop-down menu to select the type of cloud link you want to insert. You can select from the following options. • Facebook (Share on Profile) • Facebook (Find Us) • Flickr • Twitter (Tweet) • Twitter (Follow) • YouTube • LinkedIn • MySpace (Share on Profile) • Community

Table 429: Cloud Link Window Description (Continued)

Field	Description
*Key	Type the unique key value associated with the selected link type. **Note:** This field is inactive when the link type is Facebook (Share on Profile), Twitter (Tweet), or Community.
Hint	Hover over this button for information about the key required for the selected link type.
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window. **Note:** This field displays only when inserting cloud links in the HTML editor.
*Link Text	Type the text you want to appear as the link in this field. **Note:** This field displays only when inserting cloud links in the Text editor.

3 Click the OK button to insert the link.

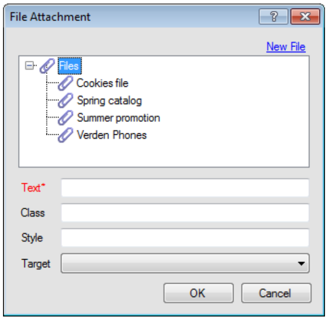
Important The social media services described in this procedure, with the exception of Oracle RightNow Social Experience, are not provided by or affiliated with Oracle. To obtain support or information about terms and conditions for the services mentioned, contact the service provider.

Inserting file links

After files have been defined, you can add them to your HTML as links. See Adding files.

To insert a file link

1 Click the File Link button. The File Attachment window opens.



2 Enter the following information.

Table 430: File Attachment Window Description

Field/Option	**Description**
*Files	Select a file from this list. See Adding files.
New File	Click this text to add a file. The file is selected in the menu after being added. See Adding files.
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

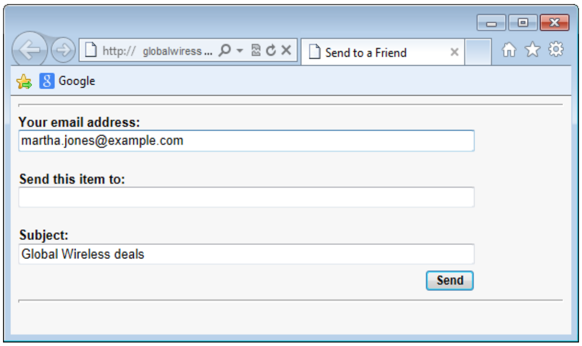
3 Click the OK button to insert the file.

Tip You can also apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

Inserting forward to friend links

Forward to friend links let your customers forward your mailing or survey to additional addresses. The addresses receive a copy of the mailing or survey, but are not added to your contact list.

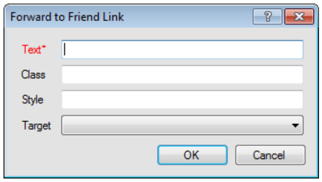
When contacts click the link, a page opens asking them for the email addresses of the friends they want to forward the mailing or survey to. The following figure shows the page that appears to contacts when they click the link.



Note The Subject field of the Send To A Friend form contains the subject from the forwarded message and cannot be edited. Contacts sending to multiple recipients must separate email addresses with a comma or semicolon. Also, recipients of messages sent through the Forward to Friend link see the message, “This message was sent to you by <email_address>,” regardless of whether the sender includes comments when forwarding the message.

To insert a forward to friend link

1 Click the Forward to Friend Link button. The Forward to Friend Link window opens.



2 Enter the following field information.

Table 431: Forward to Friend Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

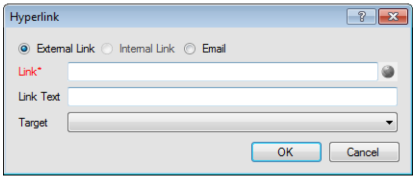
3 Click the OK button to insert the link.

Inserting hyperlinks

You can insert hyperlinks in your HTML content and then define the hyperlink's properties. You can also choose whether to link to an external site or an anchor in this or another document. See Inserting anchors.

To insert a hyperlink

1 Click the Hyperlink button. The Hyperlink window opens.



2 Enter the following field information.

Table 432: Hyperlink Window Description

Field	Description
External Link	Select this radio button to insert a link to a website outside of Oracle Service Cloud.
*Link	Type the full URL of the hyperlink in this field.
Open Hyperlink	Click this button to open the hyperlink in a web browser.
Link Text	Type the text you want to appear as the link in this field.
Target	Select a target from this drop-down menu: • New Window—The URL opens in a new browser. • Same Window—The URL opens in the same frame. • Parent Window—The URL opens in the same frameset. • Browser Window—The URL opens in the same window.
Internal Link	Select this radio button to insert a link to an internal anchor. **Note:** This radio button is available only if an anchor has been added to the document. See Inserting anchors.
Anchor	Click this drop-down menu to select an anchor to link to.
Link Text	Type the text you want to appear as the link in this field.
Email	Select this radio button to insert a link to an email address.
*Address	Type the email address in this field. For example, type lucybauer@example.com to create a link to Lucy Bauer's email address. **Note:** You do not need to prepend the email address with the "mailto:" tag. The system adds the "mailto:" tag when you type the email address in the field.

Table 432: Hyperlink Window Description (Continued)

Field	Description
Link Text	Type the text you want to appear in this field.

3 Click the OK button to insert the link.

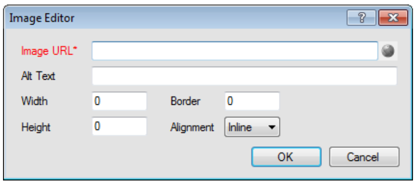
Tip You can also apply style and class attributes by right-clicking an element after you add it to the canvas. See [Editing style and class attributes](#).

Inserting images

You can insert an image that is accessible through a URL in your HTML. You can also define the size of the image, its border properties, and alignment.

To insert an image

1 Click the Image button. The Image Editor opens.



2 Enter the following field information.

Table 433: Image Editor Description

Field	Description
***Image URL**	Type the URL where the image is located.
 Open URL	Click this button to open the URL in a web browser.
Alt Text	Type the alternative text for the image.
Width	Type the width, in pixels, you want the image to appear as.
Height	Type the height, in pixels, you want the image to appear as.

Table 433: Image Editor Description (Continued)

Field	Description
Border	Type the width, in pixels, of the image's border.
Alignment	Click this drop-down menu to select the image's alignment: Inline, Left, Middle, Right, Top, or Bottom. The default alignment is Inline.

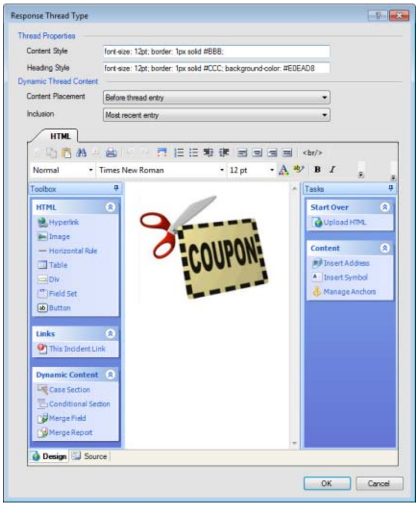
3 Click the OK button to insert the image.

Inserting incident threads

You can add an incident thread to your HTML so that all communication regarding an incident displays in your content. The incident thread lists all activity about an incident, including the original question, responses and updates from agents, customer updates, records of conversations, and internal notes about the incident (which are not visible to the customer). You can filter by author, channel, entry date, entry text, and entry type.

You can also define thread properties, which apply to the entire thread entry, and dynamic thread content, which lets you dynamically add content for a specific thread type. In addition, you can customize the look of your incident thread by defining style and class attributes and sort the display order and limit the number of threads (up to 99) that display in your messages.

In addition to defining style and display attributes for the entire thread entry, you can define where to include your dynamic content—either before or after the thread entry. You can also choose whether your content displays only in the most recent entry, in all entries, or in all entries except the most recent one. In the sample shown here, the response thread type offers customers a coupon before the thread entry and only in the most recent thread.

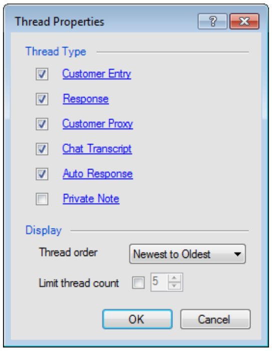


Important While content added from thread type windows is included in the email that is eventually sent, it is not stored in the database. Therefore, it cannot be retrieved later.

To insert an incident thread

1 Click the Incident Thread button. The incident thread displays.

2 To edit the thread properties, double-click the incident thread. The Thread Properties window displays.



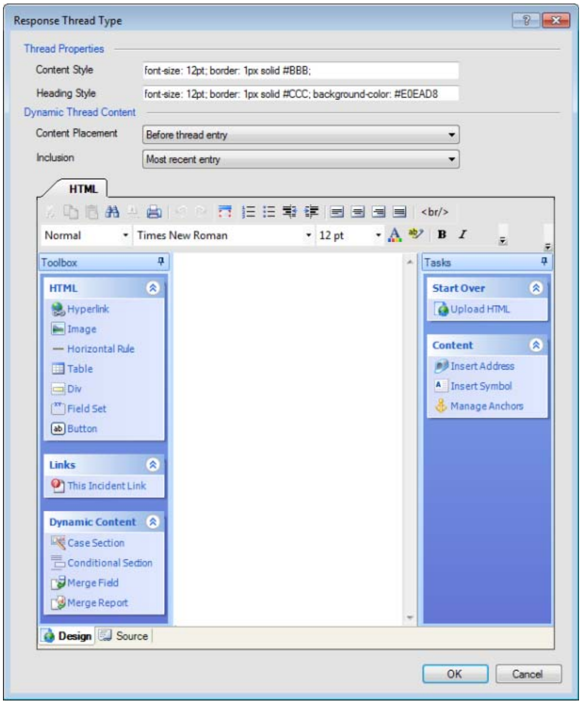
Thread properties display by incident thread type.

3 To define the types of threads that display in your content, clear or select the check boxes in the Thread Types section.

Note In Outreach and Feedback, all thread types, except for the Private Note thread type, are selected by default. In message templates, whether or not the Private Note check box is selected by default depends on the message type. For example, message templates that are designed for agents will have the Private Note check box selected by default. However, on message templates that are designed for customers, the check box will be cleared.

4 To apply formatting styles for your thread content and headings, click the link on the Thread Properties window that is specific to the type of thread you want to edit. For example, clicking the Response link opens the Response Thread Type window.

Click to view



5 Enter the following field information.

Table 434: Thread Type Window Description

Field/Option	Description
Thread Properties	Enter information in this section to define how the content and heading of your incident thread will display. Thread properties apply to the entire thread entry. **Note:** Thread properties are not available when using the text editor. See Creating text content in documents.
Content Style	Type any HTML style and class attributes you want the content of your incident thread to display. **Note:** By default, font-size: 12pt; border: 1px solid #BBB.

Table 434: Thread Type Window Description (Continued)

Field/Option	Description
Heading Style	Type any HTML style and class attributes you want the heading of your incident thread to display. **Note:** By default, font-size: 12pt; border: 1px solid #CCC: back-ground-color: #EOEAD8.
Dynamic Thread Content	This section is used to define the placement of your content and in which thread entries to include the content. **Note:** The options in this section apply only to the content for the specific thread type.
Content Placement	The options in this drop-down menu define the placement of your content—either Before Thread Entry, which is selected by default, or After Thread Entry.
Inclusion	The options in this drop-down menu define where in the incident thread your content displays. Options include the following. • **Most Recent Entry**—Displays your content in only the most recent thread. (Default) • **All Entries**—Displays your content in every thread. • **All Entries Except Most Recent**—Displays your content in every thread except the most recent one.

6 Define the content of your incident thread and other formatting options using the HTML editor. See Using the HTML editor.

7 Click the OK button to save your content and close the window. Notice that the Thread Properties window is still open.

8 To change the thread sort order to display the oldest threads first, select Oldest to Newest in the Thread Order drop-down menu. By default, the most recent threads display.

9 To limit the number of threads that display, select the Limit Thread Count check box.

Note The Limit Thread Count check box is available only if the thread order is set to Newest to Oldest.

a Type the number of threads you want to display (up to 99) in the field next to the Limit Thread Count check box.

Tip You may also want to consider showing conditional content based on the number of threads that are included within the sent message. See Conditional content based on message thread count.

10 Add any other links or dynamic content you need to customize your message.

If an incident is triggered, all communication regarding the incident displays in your message.

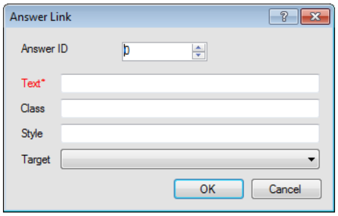
Inserting links to answers

There are two ways you can link to answers from Oracle Service Cloud. Inserting an Answer Link lets you link to any answer you need to reference in the email message sent to your customer. Inserting a This Answer Link lets you link to the answer that triggered the message being sent.

Both the Answer Link and This Answer Link are included, by default, on any answer-related message template. See Customizing messages.

To insert an answer link

1 Click the Answer Link button. The Answer Link window opens.



2 Enter the following field information.

Table 435: Answer Link Window Description

Field	Description
Answer ID	Type the answer ID for the answer you want to link to in this field.
*Text	Type the text you want to appear as the link in this field.

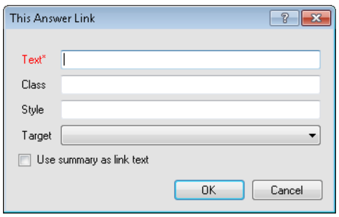
Table 435: Answer Link Window Description (Continued)

Field	Description
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the answer link.

To insert a this answer link

1 Click the This Answer Link button. The This Answer Link window opens.



2 Enter the following field information.

Table 436: This Answer Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.

Table 436: This Answer Link Window Description (Continued)

Field	Description
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.
Use Summary As Link Text	Select this check box to use the answer's summary as the text you want to appear as the link.

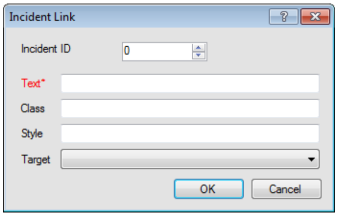
3 Click the OK button to insert the this answer link.

Inserting links to incidents

There are two ways you can link to incidents from Oracle Service Cloud. Inserting an Incident Link lets you link to any incident you need to reference in the email message sent to your customer. Inserting a This Incident Link lets you link to the incident that triggered the message being sent. For instance, the standard Question Receipt email sends a confirmation message after a customer submits a question through the Ask a Question page, an email, or a chat session. By adding a This Incident Link to your Question Receipt message template, you can provide your customers with easy access to the incident created from their question. See Customizing messages.

To insert an incident link

1 Click the Incident Link button. The Incident Link window opens.



2 Enter the following field information.

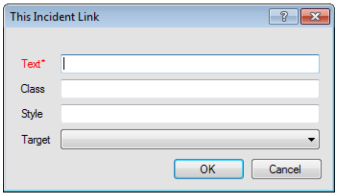
Table 437: Incident Link Window Description

Field	Description
Incident ID	Type the incident ID for the incident you want to link to in this field.
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the incident link.

To insert a this incident link

1 Click the This Incident Link button. The This Incident Link window opens.



2 Enter the following field information.

Table 438: This Incident Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the this incident link.

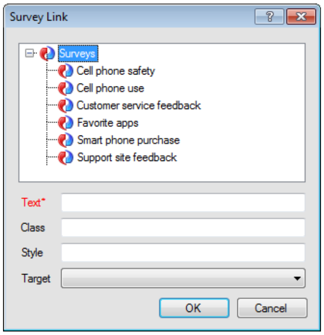
Inserting links to surveys

There are two ways you can link to surveys from Oracle Service Cloud. From mailings, documents, and certain message templates, you can insert a Survey Link that lets you add a link to any existing survey listed in your Surveys explorer. See Creating mailings, Creating documents, and Editing messages.

From a survey, you can insert a Link to This Survey that adds a link to the survey you have open. The Link to This Survey is included, by default, on the survey's invitation message when you create a new survey. See Creating surveys.

To insert a survey link

1 From a document, mailing or message template, click the Survey Link button. The Survey Link window opens.



2 Enter the following information.

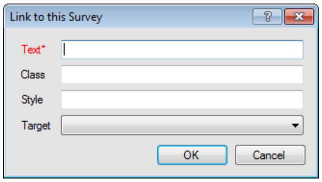
Table 439: Survey Link Window Description

Field/Option	Description
*Surveys	Select a survey from this list. See [Creating surveys]().
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the survey link.

To insert a link to this survey

1 Click the Link to This Survey button. The Link to This Survey window opens.



2 Enter the following information.

Table 440: Link to This Survey Window Description

Field/Option	**Description**
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the link to this survey.

Inserting merge fields

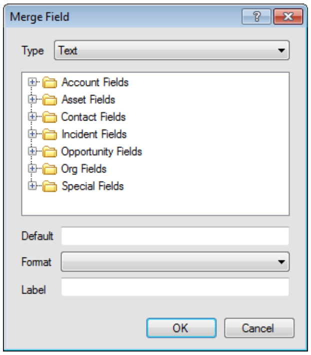
Merge fields allow you to look up account, asset, contact, incident, opportunity, organization, or tracked link information and insert it in the text. For example, you could insert a merge field for the first name field and have contacts' first names appear in their mailing. You could also insert a number of incident fields for documents that are sent as a result of an incident rule or in a campaign that uses an incident action. In the case where a merge field value does not exist, you can specify a default value. Additionally, you can add merge fields to a URL parameter. See [Inserting merge fields to URL parameters](#).

Another category of merge field includes those that do not logically align with any of the other categories. These merge fields are found in the Special Fields folder. Some let you insert merge fields related to certain configuration settings, such as the number of hours an incident set to Waiting stays open or the amount of time in which an incident can be reopened after it is solved. There are also special fields that let you personalize the Subject field of the survey's invitation message by displaying the survey's expiration date or the number of days until the survey expires. Other special fields include interface name, generation time, and SLA name. As with all merge fields, those found in the Special Fields folder are context-sensitive to the type of content you are creating.

There are two types of merge fields: text and image. When you insert a text merge field, you insert the text from part of the record, such as a contact email address. When you insert an image merge field, you insert the URL to an image based on a text or text area contact custom field. The custom field should contain the absolute or relative path to the image you want to display in the document.

To insert a merge field

1 Click the Merge Field button. The Merge Field window opens.



2 To insert a text merge field, click the Type drop-down menu and select Text.

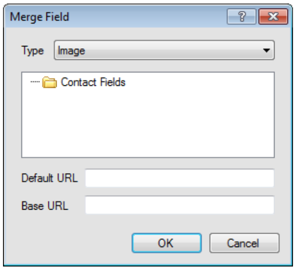
a Enter the following information.

Table 441: Text Merge Field Window Description

Field/Option	Description
*Merge Fields	Select a database column from this list.
Default	Type the default value of the merge field in this field. The default value is used if a value does not exist for the field in a contact record or incident. If you want to include the field only when a value exists, put the merge field in a conditional section. **Note:** This field is not available when adding merge fields to a URL parameter.
Format	Click this drop-down menu to select the format. The options that display are dynamic based on the type of merge field you select. **Note:** This field is not available when adding merge fields to a URL parameter.
Label	Type a label that will display next to the merge field in this field. **Note:** This field is not available when adding merge fields to a URL parameter.

b Click the OK button to insert the merge field.

3 To insert an image merge field, click the Type drop-down menu and select Image.



a Enter the following information.

Table 442: Image Merge Field Window Description

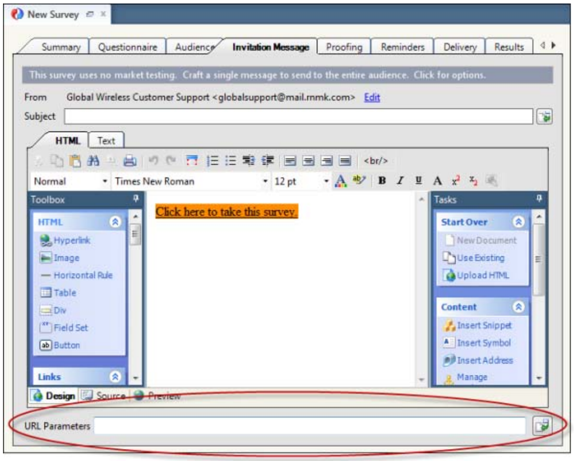
Field/Option	Description
*Merge Fields	Select a text or text area contact custom field from this list. **Note:** The values in the custom field should contain the names of images stored on your web server.
Default URL	Type the default value of the merge field. The default value is used if a value does not exist for the custom field in a contact record. The value should be an absolute URL to an image (for example, http://www.company.com/images/logo.gif).
Base URL	Type the base URL for the merge field if you use relative URLs in the contact custom field. The value of the contact custom field is appended to this URL. For example, if the base URL is http://www.company.com/images/ and the value of the custom field is logo.gif, the result will be http://www.company.com/images/logo.gif. Leave this field blank if the contact custom field uses an absolute URL.

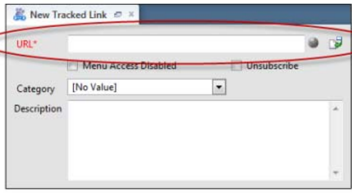
4 Click the OK button to insert the merge field.

Tip You can apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

Inserting merge fields to URL parameters

You can add merge fields to URL parameters you want to attach to links in your messages. URL parameters can be defined on a mailing message, a survey invitation message, or a tracked link. In these cases, the value of the merge field is appended to the URL as a parameter. For example, if you wanted to pass the login field value from the contact record, specifying http://www.global.example/regform.php?user=$contacts.login would return a URL such as http://www.global.example/regform.php?user=jsmith.

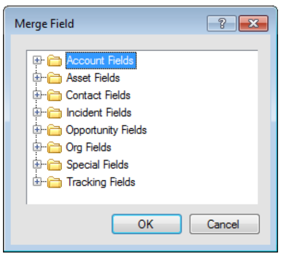




To insert a merge field to a URL parameter

1 Type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

2 Click the Merge Field button to the right of the URL Parameters field.



a Select the database field you want to merge. Merge fields are populated with data from the contact record, account data or an associated incident, asset, opportunity, organization, or tracked link. You can also use the special fields that are available. The value of this field is appended to the URL as a parameter.

b Click the OK button to append the field to the URL.

Inserting merge reports

In addition to merging data into your content one field at a time, you can select and merge full reports, and filter their output and edit their appearance. Merged reports extend data access to your marketing and survey communications so you can develop content that is more dynamic and contextually relevant to your customers.

In most cases, a primary filter is applied to limit the report output so that customers see only their own information. For example, if a report displays a list of all open incidents, customers see only their own open incidents when they view the merged report. Primary filters are automatically applied in the following cases.

- *contacts.c_id*—Primary filter for any mailing (broadcast or transactional) and any survey invitation message. If merging a report on a web page, the contact must be recognized by click-through parameters or cookies.
- *incidents.i_id*—Primary filter for any transactional mailing or survey that is sent using incident rules.
- *opportunities.op_id*—Primary filter for any transactional mailing or survey that is sent using opportunity rules.
- *chats.chat_id*—Primary filter for any transactional mailing or survey that is sent using chat rules.

In certain situations, you may want to disable the primary filter in the merged report, which can be done by clearing the Automatically Apply Primary Filter check box on the Merge Report window. However, special handling is required to ensure that the resulting data is appropriate for your audience. For example, if you want to include a report in a closed incident survey listing each customer's open incidents, the automatic primary filter can restrict the report to show only the incident that triggered the survey. If you disable the primary filter, the report shows all incidents for all contacts. To prevent this, you can manually add a primary filter by editing the report and adding a filter on *contacts.c_id* = ‘’. If you then save the report and send the survey, the merged report filters on individual *c_id* values and displays to customers only incidents associated with their contact record. (Filters can also be performed on *incidents.i_id, opportunities.op_id,* and *chats.chat_id*, as needed.)

Caution Disabling the automatic primary filter removes safeguards intended to restrict the scope of the report to the records related to the recipient. As a result, all data is returned for the report just as it would if opened from the Reports explorer. Depending on how the report is configured, this can be processor intensive and, in some cases, result in contacts receiving information related to other contacts. Unless a primary field filter has been added to the report, we recommend that this check box remain selected.

When merging a report into your content, you must select a preview contact to be used for filtering data on the content editor's Preview tab. This filter limits the data shown in the preview and provides a more accurate representation of the finished content. You can also edit a merged report's display properties and set a default value to be used when no data is returned.

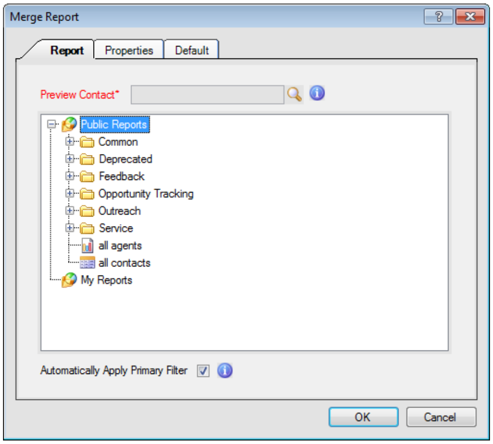
From the Preview tab, you can also use the optional Preview Contact field to filter your preview by a particular contact. This lets you see how your dynamic content, such as merge fields and conditional sections, looks in your content. For example, if you have a conditional section for contacts in a specific postal code, you can preview your message to a single contact who matches the postal code you specify to see if your conditional section works the way you intend it to. This improves the accuracy of your messages and, ultimately, saves you time.

The following procedure describes how to merge a report in the content editor in both HTML and text mode.

To merge a report into content

1 On the Design tab of the content editor, move the cursor to where you want to position the report.

2 Click the Merge Report button. The Merge Report window opens listing all reports available in your **profile**.



3 Click the Search button next to the Preview Contact field. The Contact Search window opens where you can search for a contact to use when the report is previewed on the content editor Preview tab.

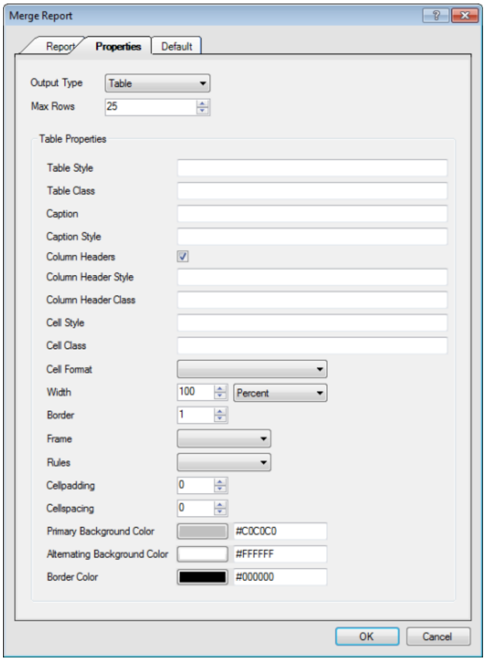
a Select the contact and click the Select button.

4 Select the report you want to merge into your content.

5 To disable the primary filter when the report is run, clear the Automatically Apply Primary Filter check box. The check box is selected by default.

Caution Disabling the primary filter removes the safeguards that restrict the scope of the report to the records related to the recipient.

6 To edit the merge report properties, click the Properties tab and select a report format from the Output Type drop-down menu.



For a description of each merge report property, refer to Setting merge report properties.

7 To specify a default value used when the report returns no information, click the Default tab and enter the default value.

Tip You can also specify a default value once the report is merged by editing the contents of the merge report placeholder.

8 Click the OK button to merge the report. The merge report placeholder is inserted into your content.

9 Click the Preview tab to see how your content looks.

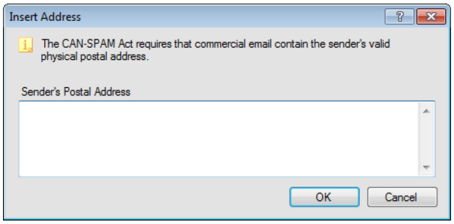
Tip In documents, snippets, and templates, the optional Preview Contact field lets you see how your dynamic content that is specific to a contact looks. For example, if you have a conditional section for customers in a specific postal code, you can preview a contact who matches the postal code you specify to see if your conditional section works the way you intend it to. To preview by contact, repeat step 3.

Inserting physical addresses

You can include a physical address in your HTML so it passes the CAN-SPAM requirement by entering it in a separate area. See CAN-SPAM compliance in mailings.

To add a physical address

1 Click the Insert Address button in the Content section. The Insert Address window opens.



2 Type the physical address of your organization in the Sender's Postal Address field.

3 Click the OK button.

Your address is added to its own section in the document.

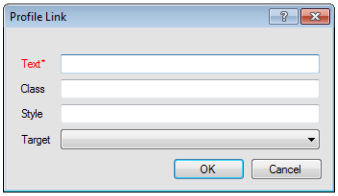
Tip You can apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

Inserting profile links

Profile links let you link to the Account Settings page on your customer portal where your customers can change their user name and update their profile information. See Editing the Account Settings page.

To insert a profile link

1 Click the Profile Link button. The Profile Link window opens.



2 Enter the following field information.

Table 443: Profile Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the profile link.

Inserting proof comments links

Inserting a Proof Comments Link lets you add more than one comment field to the Survey Proof message that is sent to proofreaders of website link surveys. For instance, you might want to add comment fields to gather feedback about specific parts of your message rather than the message as a whole. The Survey Proof message template is defined in message templates. See Customizing messages.

To insert a proof comments link

1 Click the Proof Comments Link button. The Proof Comments Link window opens.

2 Enter the following field information.

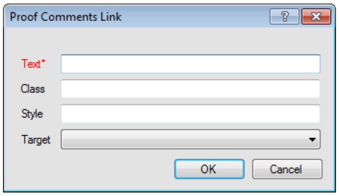


Table 444: Proof Comments Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

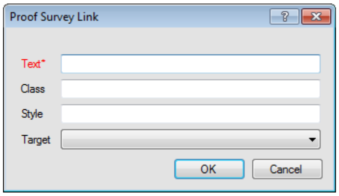
3 Click the OK button to insert the proof comments link.

Inserting proof survey links

Inserting a Proof Survey Link lets you add a link to the website link survey that you want your proofreaders to review. Unlike broadcast and transactional surveys that include a survey link and a comment field in the invitation message sent as part of the proof message, website link surveys rely on the message that is defined by the Survey Proof message template. The Proof Survey Link is included, by default, on the Survey Proof message template. See Customizing messages.

To insert a proof survey link

1 Click the Proof Survey Link button. The Proof Survey Link window opens.



2 Enter the following field information.

Table 445: Proof Survey Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

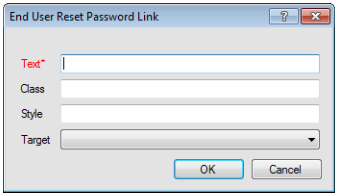
3 Click the OK button to insert the proof survey link.

Inserting reset password links

Reset password links let you link to the Account Assistance page on your customer portal. If any of your recipients do not yet have a password defined in their contact record, providing a reset password link can help them gain access to the customer portal.

To insert a reset password link

1 Click the Reset Password button. The End User Reset Password Link window opens.



2 Enter the following field information.

Table 446: End User Reset Password Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

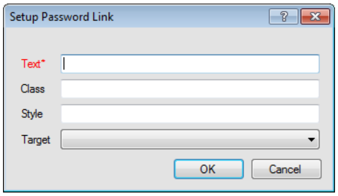
3 Click the OK button to insert the reset password link.

Inserting setup password links

Setup password links let you link to the Finish Account Creation page your the customer portal, which also displays a link to the Account Assistance page.

To insert a setup password link

1 Click the Setup Password Link button. The Setup Password Link window opens.



2 Enter the following field information.

Table 447: Setup Password Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

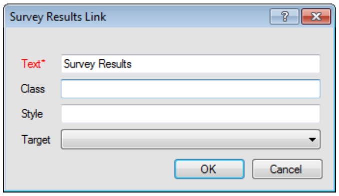
3 Click the OK button to insert the setup password link.

Inserting survey results links

Inserting a Survey Results Link lets you link to a web page showing the survey's responses. The Survey Results Link is included, by default, on the Survey Notification message template. See Customizing messages.

To insert a survey results link

1 Click the Survey Results Link button. The Survey Results Link window opens.



2 Enter the following field information.

Table 448: Survey Results Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

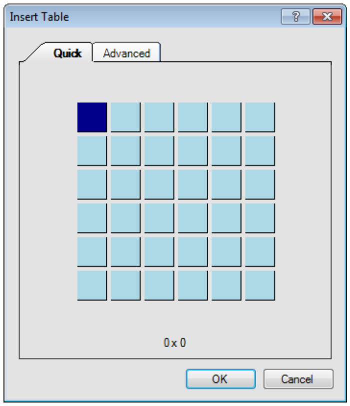
3 Click the OK button to insert the survey results link.

Inserting tables

You can insert a table in your HTML and define the number of rows or columns, and its border properties, cell padding, and cell spacing.

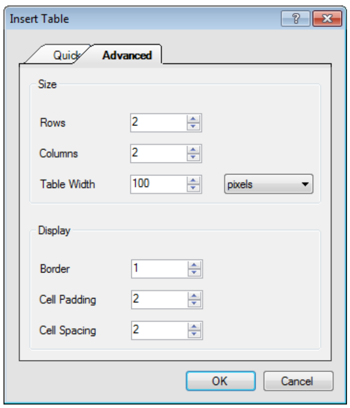
To insert a table

1 Click the Table button. The Insert Table window opens.



2 To insert a table from the Quick tab, hover over and click on the grid to define the number of rows and columns in the table. The table is inserted into your document.

3 To insert a table from the Advanced tab, click the Advanced tab.



a Enter the following field information.

Table 449: Advanced Tab Description

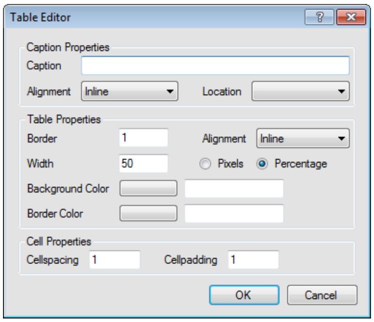
Field	Description
Size	Define the size of the table in this section.
Rows	Enter the number of rows in the table.

Table 449: Advanced Tab Description (Continued)

Field	Description
Columns	Enter the number of columns in the table.
Table Width	Enter the width of the table and select pixels or percent from the drop-down menu.
Display	Define the table’s attributes in this section.
Border	Enter the width, in pixels, of the table’s border.
Cell Padding	Enter the padding, in pixels, of the table’s cells.
Cell Spacing	Enter the spacing, in pixels, of the table’s cells.

b Click the OK button to insert the table.

4 To edit the table properties, right-click the table and select Table Editor > Table Properties.



a Enter the following field information.

Table 450: Table Editor Description

Field	Description
Caption Properties	Define the table’s caption in this section.
Caption	Type the caption of the table.

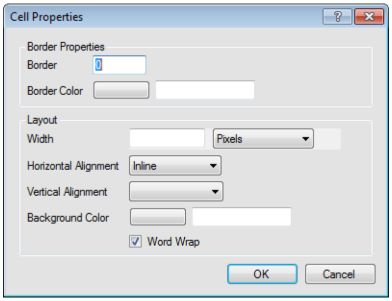
Table 450: Table Editor Description (Continued)

Field	Description
Alignment	Click this drop-down menu and select the alignment of the caption. Your choices are Inline, Left, Centered, and Right. The default alignment is Inline.
Location	Click this drop-down menu and select the location of the caption in relation to the table. Your choices are Top and Bottom.
Table Properties	Define the table's attributes in this section.
Border	Type the width, in pixels, of the table's border.
Alignment	Click this drop-down menu and select the alignment of the table on the page. Your choices are Inline, Left, Centered, and Right. The default alignment is Inline.
Width	Type the width of the table and select the unit from the radio buttons (Pixels or Percentage).
Background Color	Click the color box to select a color for the table's background or type the HTML hexadecimal value of the color in the field to the right of the color box.
Border Color	Click the color box to select a color for the table's borders or type the HTML hexadecimal value of the color in the field to the right of the color box.
Cell Properties	Define the table's attributes in this section.
Cell Spacing	Type the spacing, in pixels, of the table's cells.
Cell Padding	Type the padding, in pixels, of the table's cells.

b Click the OK button.

Tip A list of additional options for adding and removing rows and columns are available by right-clicking the table and selecting Table Editor.

5 To edit a cell's properties, right-click the table cell and select Table Editor > Cell Properties.



a Enter the following field information.

Table 451: Cell Properties Window Description

Field	Description
Border Properties	Define the cell’s border properties in this section.
Border	Enter the width of the cell’s border in pixels.
Border Color	Click the color box to select a color for the cell’s borders or type the HTML hexadecimal value of the color in the field to the right of the color box.
Layout	Define the cell’s layout in this section.
Width	Enter the width of the cell in pixels or as a percentage of the table and select the corresponding unit from the drop-down menu.
Horizontal Alignment	Click this drop-down menu and select the horizontal alignment of the text in the cell. Your choices are Inline, Left, Centered, Right, and Justify. The default alignment is Inline.
Vertical Alignment	Click this drop-down menu and select the vertical alignment of the text in the cell. Your choices are Top, Middle, Bottom, and Baseline.
Background Color	Click the color box to select a color for the cell’s background or type the HTML hexadecimal value of the color in the field to the right of the color box.
Word Wrap	Select this check box to allow text to wrap in the cell.

b Click the OK button to save the cell properties.

Tip Additional options for inserting, merging, splitting, and deleting cells are available by right-clicking the table and selecting Table Editor.

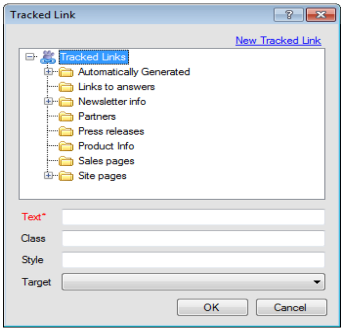
Inserting tracked links

Tracked links let you track the number of link clicks in your survey, mailing, or web page. You can also use tracked links in several of the standard system-generated contact email messages. Adding tracked links to your contact emails are especially useful in tracking your customer-facing incident responses. See Incident response tracking.

After you define your tracked links, you can insert them in your HTML. See Adding tracked links.

To insert a tracked link

1 Click the Tracked Link button. The Tracked Link window opens.



2 Enter the following information.

Table 452: Tracked Link Window Description

Field/Option	Description
*Tracked Links	Select a tracked link from this list. See Adding tracked links.
New Tracked Link	Click this text to create a tracked link. The tracked link is selected in the menu after being added. See Adding tracked links.
*Text	Type the text you want to appear as the link in this field.

Table 452: Tracked Link Window Description (Continued)

Field/Option	Description
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the tracked link.

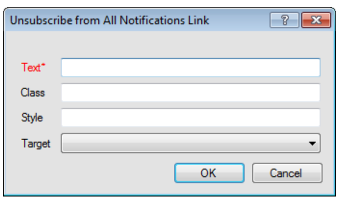
Tip You can also apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

Inserting unsubscribe all answers links

Inserting an Unsubscribe All Answers Link lets you add a link that contacts who receive answer notifications can use to unsubscribe from future communications. Answer notification messages are defined in message templates. See Customizing messages.

To insert an unsubscribe all answers link

1 Click the Unsubscribe All Answers Link button. The Unsubscribe From All Notifications Link window opens.



2 Enter the following field information.

Table 453: Unsubscribe From All Notifications Link Window Description

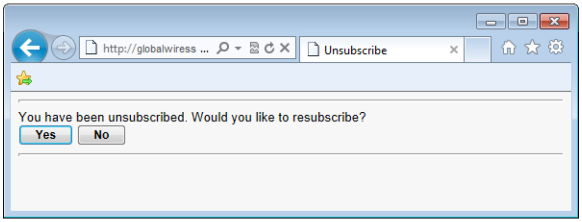
Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the unsubscribe all answers link.

Inserting unsubscribe links

Unsubscribe links let your contacts opt out of future mailings and surveys. You can create an unsubscribe link that allows them to globally opt out of all future mailings and surveys, opt out of surveys only, or opt out of audiences defined by a custom opt-in field. See Managing contact opt-ins.

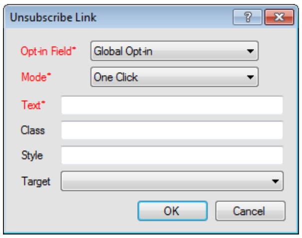
You can unsubscribe contacts with a single click of the link, or direct them to a page to confirm that they want to unsubscribe. When prompting for confirmation, you can choose to set the opt-in field to No either before or after contacts confirm through the Unsubscribe page.



Note All mailings include a List-Unsubscribe mail header which some mail clients use to automatically provide an unsubscribe link when the message is viewed by a recipient. However, because this header is not supported by all mail clients, you should add an unsubscribe link to your message, as described in the following procedure.

To insert an unsubscribe link

1 Click the Unsubscribe Link button. The Unsubscribe Link window opens.



2 Enter the following field information.

Table 454: Unsubscribe Link Window Description

Field	Description
*Opt-in Field	Click this drop-down menu to select a previously defined custom opt-in field, select Survey Opt-in to let contacts unsubscribe from surveys, or select Global Opt-in to let contacts unsubscribe from all mailings and surveys. The default option is Global Opt-in. See Managing contact opt-ins.

Table 454: Unsubscribe Link Window Description (Continued)

Field	Description
*Mode	Click this drop-down menu to select how the link functions. You can select from three options: • "One Click" sets all global, survey, and custom opt-in fields to No when contacts click the link. • "Prompt, then set field" opens a web page where contacts must confirm their choice to unsubscribe before the field is set. • "Set field, then prompt" also opens a web page to confirm, but the field is set first. The default option is One Click.
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the unsubscribe link.

Tip You can also apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

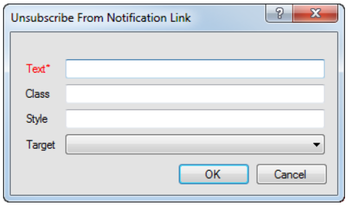
Inserting unsubscribe this answer links

When you use answer sections to display repeatable content on the Answer Update Notification message template, an Unsubscribe This Answer Link is included, by default, inside the answer section. This link adds an unsubscribe link to each answer that is included in the email notification and is available only on the Answer Update Notification message template.

To insert an unsubscribe this answer link

1 Click the Unsubscribe This Answer Link button. The Unsubscribe From Notification Link window opens.

Note This button is available only on the Answer Update Notification message template.



2 Enter the following field information.

Table 455: Unsubscribe From Notification Link Window Description

Field	Description
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click OK to insert the unsubscribe this answer link.

Tip You can also apply style and class attributes by right-clicking an element after you add it to the canvas. See Editing style and class attributes.

- Customizing messages
- Inserting answer sections

Inserting web forms

When creating HTML content, you have the option to add web forms to collect customer data. You can add any database contact field, contact custom field, or survey question to the web form, letting you populate a contact record based on the submitted form.

A contact record is created each time a contact submits a form, unless any of the following occurs: the email address is included in the form, cookies are set through a survey or campaign (see Feedback Surveys and Outreach Campaigns), or the contact opens the form from a link in a mailing. If an email address exists or the repeat visitor has a cookie set for the form, the contact record is updated rather than creating a new record. If email address sharing is enabled and the email address is shared by multiple contacts, the web form submission is associated with the contact deemed to be the best fit. See Email address sharing.

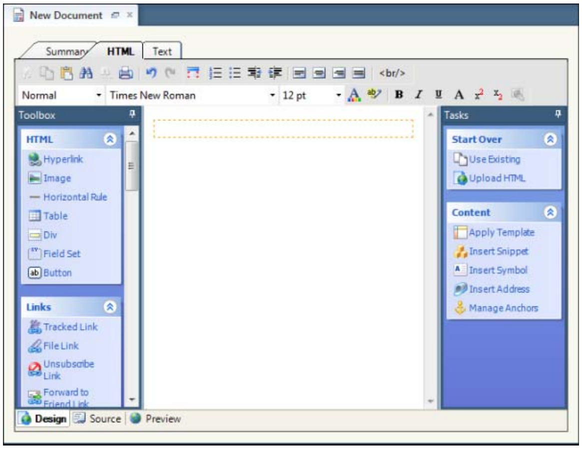
Also, if a contact submits a value for Organization Name *(contacts.ma_org_name)* in a web form, Oracle Service Cloud searches existing organization records for a match. If a match is found, the contact is associated to the matching organization.

Important There is no client-side validation when a web form is used in an email. For security reasons, most email clients disallow the submission of forms from email messages. Therefore, embedding a web form in the body of a mailing or survey invitation message can result in an extremely low submission rate. As an alternative, we recommend creating the web form in a served web page and including a link to the page in your message. See Editing Serve Web Page attributes.

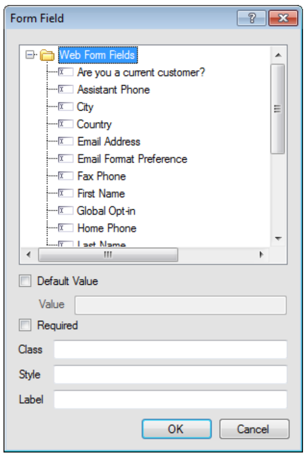
You can also insert standard HTML objects in the form, such as images and tables, and click and drag form elements into place through the HTML editor. When you finish the web form, you can add a Submit button with one click.

To add a web form

1 Click the Web Form button. The web form section appears in the HTML content bordered by an orange dotted line.



2 Insert the cursor in the web form section and click the Form Field button to insert a field. The Form Field window opens.



3 Enter the following information.

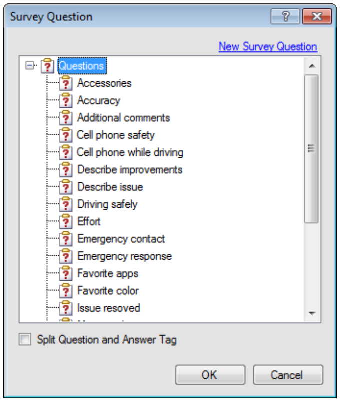
Table 456: Form Field Window Description

Field/Option	Description
*Web Form Fields	Select a database field from this list.
Default Value	Select this check box to add a default value for the field and then type or select the value from the text box.
Required	Select this check box to make the field required. **Note:** You must add your own visual indicator that the field is required (for example, *).
Class	Type the class name you want to assign to the field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Style	Type any style attributes you want to assign to the field in this text box. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Label	Type a label for the field as you want it to display. The default label is the name of the web form field.
Display As	If an opt-in field or radio custom field is selected, select Radio Buttons or Check Boxes to select how to display the field in the web form.

Note Custom field masks are not enforced in web forms.

4 Click the OK button to insert the field.

5 To add a survey question, click the Survey Question button. The Survey Question window opens.



- **a** Select a survey question from the Questions list.
- **b** To create a question, click New Survey Question. A window opens where you can create a question. See Creating questions.
- **c** To show the question and the answer as two separate fields on the web form, select the Split Question and Answer Tag check box. This lets you control where the question and answer portions of the question display.
- **d** Click the OK button to insert the question.

6 Click the Submit Button button to add the Submit button to the web form.

Note You must include a Submit button with the form. If using your own HTML code, you must include the attributes used in the Submit button. Therefore, we recommend that you use the HTML editor to insert the Submit button. You can double-click the button to edit the button text, or switch to source mode to use advanced options such as using an image for the button.

Once you add a web form to a document and serve the document in a campaign or survey, you can modify the URL of the web form page to include parameters to prefill one or more of the fields on the form. See Prefilling web form fields.

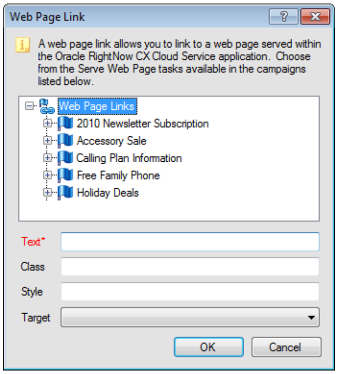
Inserting web page links

Web page links let you link to another document in Oracle Service Cloud. When you create a campaign that serves a web page as an action, you make the page available to link to. See Creating campaigns.

To insert a web page link

1 Click the Web Page Link button. The Web Page Link window opens.

Note Your campaign must be launched for it to appear in the Web Page Links list. See Launching and suspending campaigns.



2 Enter the following information.

Table 457: Web Page Link Window Description

Field/Option	Description
*Web Page Links	Select a web page from this list. See Editing Serve Web Page attributes for information about web pages served in campaigns.
*Text	Type the text you want to appear as the link in this field.
Class	Type any class name you want to assign to the link in this field. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings.
Style	Type any style attributes you want to assign to the link in this field. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).

Table 457: Web Page Link Window Description (Continued)

Field/Option	Description
Target	Click this drop-down menu and select the target for the link: New Window, Same Window, Parent Window, or Browser Window.

3 Click the OK button to insert the web page link.

Setting merge report properties

The following table describes the properties that can be defined from the Properties tab of the Merge Report window when merging a report into HTML content. Some properties are also available when merging into text content and are noted as well.

Table 458: Merge Report Properties Description

Output Type/Field	Description
Table	Select this output type to display the report data as a table in your content.
Max Rows	Type the maximum number of rows for the table. Click the up or down arrow to increase or decrease the value.
Table Properties	The settings in this section define the appearance of the table when it is merged.
Caption	Type the caption you want to appear at the top of the table. **Note:** This setting is also available when merging a report into text content.
Table Style	Type any style attributes you want to apply to the table.
Table Class	Type any class attributes you want to apply to the table.
Caption Style	Type any style attributes you want to apply to the table caption. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Column Headers	Select this check box to display column headers for the table. **Note:** This setting is also available when merging a report into text content.

Table 458: Merge Report Properties Description (Continued)

Output Type/Field	Description
Column Header Style	Type any style attributes you want to apply to the column headers. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Column Header Class	Type the class name you want to apply to the column headers. You must define the class in your content's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Cell Style	Type any style attributes you want to apply to the table cells. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
Cell Class	Type the class name you want to apply to the table cells. You must define the class in your content's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Cell Format	Click this drop-down menu to select a case format for cells in the table. **Note:** This setting is also available when merging a report into text content.
Width	Enter the width of the table and select pixels or percent from the drop-down menu.
Border	Enter the width, in pixels, of the table's border.

Table 458: Merge Report Properties Description (Continued)

Output Type/Field	Description
Frame	Click this drop-down menu to apply an HTML style to your frame. Options include the following. • **Void**—Outside borders are not shown. • **Above**—Top outside border is shown. • **Below**—Bottom outside border is shown. • **Hsides**—Top and bottom outside borders are shown. • **Vsides**—Left and right outside borders are shown. • **Lhs**—Left outside border is shown. • **Rhs**—Right outside border is shown. • **Box**—Outside borders are shown on all four sides. • **Border**—Outside borders are shown on all four sides.
Rules	Click this drop-down menu to apply an HTML style to the lines in your table. Options include the following. • **None**—No lines are shown. • **Groups**—Lines are shown between row groups and column groups. • **Rows**—Lines are shown between rows. • **Cols**—Lines are shown between columns. • **All**—Lines are shown between rows and columns.
Cell Padding	Enter the padding, in pixels, of the table's cells.
Cell Spacing	Enter the spacing, in pixels, of the table's cells.
Primary Background Color	Click this color box to select a primary color for the cell's background or type the HTML hexadecimal value of the color in the field to the right of the color box.
Alternating Background Color	Click this color box to select a primary color for the cell's background or type the HTML hexadecimal value of the color in the field to the right of the color box.
Border Color	Click this color box to select a primary color for the cell's background or type the HTML hexadecimal value of the color in the field to the right of the color box.
List	Select this output type to display the report data as a list in your content.
Max Rows	Type the maximum number of rows for the list. Click the up or down arrow to increase or decrease the value.

Table 458: Merge Report Properties Description (Continued)

Output Type/Field	Description
List Type	Select the radio button next to the type of list you want to display.
Ordered List	Select this radio button to display a numbered list.
Unordered List	Select this radio button to display a bulleted list.
List Style	Type any style attributes you want to apply to the list text. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).
List Class	Type the class name you want to apply to the list text. You must define the class in your content's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.
Format	Click this drop-down menu to select a case format for the list text. The available options are Lowercase, Uppercase, and Proper Case. **Note:** This setting is also available when merging a report into text content.
Single Value	Select this output type to display only the value of the field in the report's first row and first column in your content.
Format	Click this drop-down menu to select a case format for the single value text. The available options are Lowercase, Uppercase, and Proper Case. **Note:** This setting is also available when merging a report into text content.
Style	Type any style attributes you want to apply to the single value output. Style attributes define how the text appears, such as color and font (for example, color: red; font-weight: bold; font-style: italic).

Table 458: Merge Report Properties Description (Continued)

Output Type/Field	Description
Class	Type the class name you want to apply to the single value output. You must define the class in your content's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag. **Note:** Because few third-party mail clients consistently support CSS, you should use style attributes instead of CSS for content included in mailings and surveys.

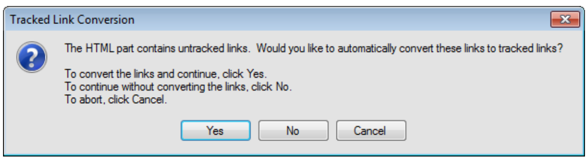
Tracked link conversion

When a document, template, or snippet with HTML content is saved, you can choose to convert the links in the HTML to tracked links. Oracle Service Cloud automatically finds any links by searching for HTML anchor tags with an *href* attribute that do not begin with "mailto:" or "#." In addition, the system finds links that are part of an image map by searching for HTML area tags with an *href* attribute.

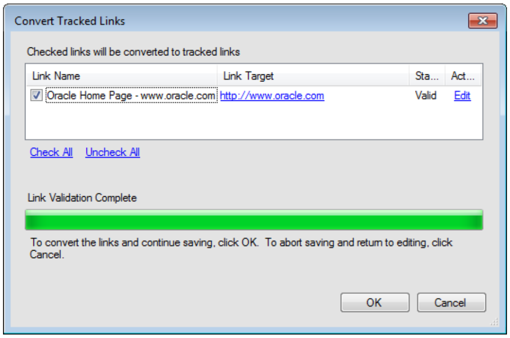
When you save, the system searches for links and prompts you to convert them to tracked links. After you confirm, the links are validated and converted to tracked links. The tracked links are named using the link text and the URL. For example, the link "Oracle Home Page" will be named "Oracle Home Page – oracle.com." If the link is an image or part of an image map, the name includes "[Image: <image_name>]" or "[Image Map: <image_name>]."

To convert links to tracked links

1 Save the document, template, or snippet. The HTML content is scanned and the Tracked Link Conversion message opens if links are found.



2 Click the Yes button to convert the links to tracked links.



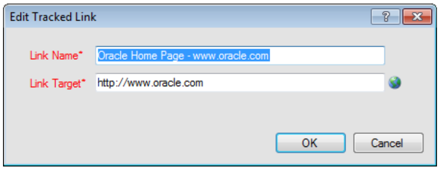
Each link in the document is validated and the results display in the window. The following fields display.

Table 459: Convert Tracked Links Window Description

Field	Description
Link Name	This column lists the names of the tracked links created from the HTML links.
Link Target	This column lists the URLs of the tracked links. You can open the link in a browser by clicking the link target.
Status	This column lists the status of the link validation. The status can be Valid, Broken, or Validating.
Action	Click Edit in this column to edit the tracked link's name and target.
Check All	Click this text to select all check boxes in the list of tracked links. Selected links are converted.
Uncheck All	Click this text to clear all check boxes in the list of tracked links. Cleared links are not converted.

3 Select the links you want to convert by clicking the check boxes next to the link names.

4 To edit the name and URL of a link, click Edit.



a Type the name of the tracked link in the Link Name field.
b Type the URL of the tracked link in the Link Target field.
c To open the link in a web browser, click the View URL in Web Browser button.
d Click the OK button to save the changes to the tracked link.

5 Click the OK button to convert the selected tracked links.

Important The tracked links can be viewed or edited from the Tracked Links explorer (refer to Adding tracked links). The links are stored in a folder named "Automatically Generated" and a subfolder named by the date the conversion was done (YYYY MM DD). See Automatically generated folders.

Adding HTML in source mode

The HTML editor contains an option to create your documents using HTML code. You can type HTML code directly in the editor to create your document, template, or snippet. The editor displays your code using colored text to indicate structure and syntax. There are also special functions available that you can access through the Toolbox and Tasks sections.

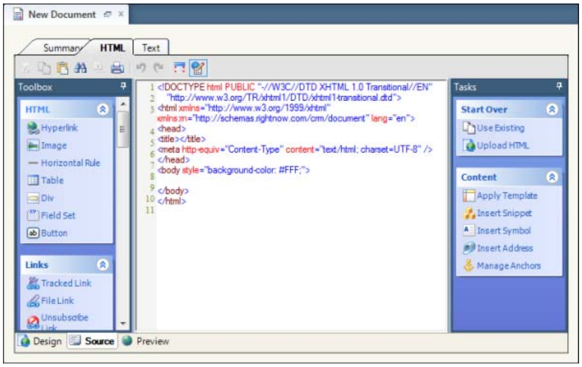
Upon saving, the system automatically validates your code formatting and notifies you about any errors.

Note By default, the editor requires your code to be XHTML compliant before it can be saved. To allow code to be saved without XHTML compliance, disable the HTML_TIDY_ENFORCE_XHTML configuration setting (RightNow User Interface > Misc. Customization > HTML Editor).

To add HTML in source mode

Click the Source tab.

Tip Source mode automatically places the cursor after the opening `<body>` tag.



The Source tab has a toolbar and a section for typing your source code. Using the toolbar, you can create HTML using some of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
- Enable or disable syntax highlighting

Tip It's a good idea to preview your work when using Source mode. When you switch between the Source and Preview tabs, your cursor stays where you left it, making it easy to check your work. See Previewing documents.

The Source tab also has special functions that you can access through the Toolbox and Tasks sections. See Toolbox Section Description and Tasks Section Description.

Tip You can insert HTML by clicking a button in the Toolbox or Tasks section, or by dragging and dropping the button to a specific location on the canvas.

Using dynamic content

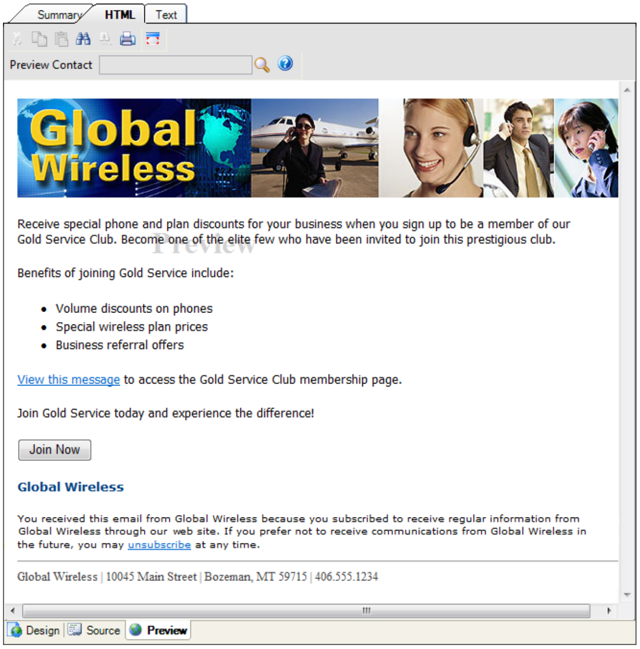
In addition to HTML, Oracle Service Cloud supports the passing of specific JavaScript events to fields within web forms and surveys. This provides increased flexibility in personalizing the appearance and behavior of fields and questions as they are completed. For example, an “onclick” event can be specified to dynamically enable a phone number field when a customer selects a check box indicating they want to be contacted by phone. The following table describes the supported events and field types.

Table 460: Supported JavaScript Events and Field Types

Event	Field Types
onselect	Text fields such as email, first_name, last_name, or any custom field of type text field, text area, or integer.
onchange	• Text fields such as email, first_name, last_name, or any custom field of type text field, text area, or integer. • Drop-down menus such as country, province, or any custom field of type menu, date, or date time.
onblur	• Text fields such as email, first_name, last_name, or any custom field of type text field, text area, or integer. • Drop-down menus such as country, province, or any custom field of type menu, date, or date time. • Radio buttons and check boxes such as opt-in fields, or any custom field of type opt-in or yes/no.
onfocus	• Text fields such as email, first_name, last_name, or any custom field of type text field, text area, or integer. • Drop-down menus such as country, province, or any custom field of type menu, date, or date time. • Radio buttons and check boxes such as opt-in fields, or any custom field of type opt-in or yes/no.
onclick	• Text fields such as email, first_name, last_name, or any custom field of type text field, text area, or integer. • Drop-down menus such as country, province, or any custom field of type menu, date, or date time. • Radio buttons and check boxes such as opt-in fields, or any custom field of type opt-in or yes/no.
disabled	Text fields such as email, first_name, last_name, or any custom field of type text field, text area, or integer.

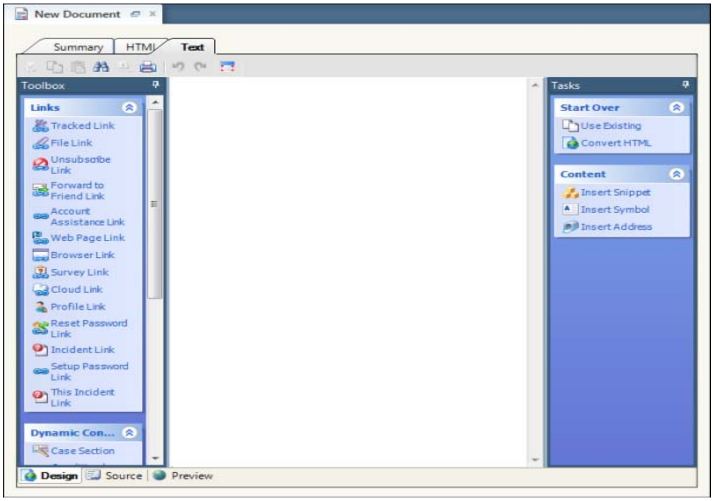
Previewing documents

The Preview tab provides you with a preview of the HTML and text versions of your document, template, or snippet as it will appear in Internet Explorer. The content displays as customers will see it in their email client or on a web page.



Creating and editing text

You can create text-only messages for your customers who can receive only plain text emails. Unlike the HTML editor, the text editor does not contain text formatting options. It does, however, contain links for additional functions related to Oracle Service Cloud, such as adding a **merge field**, or **conditional section**. You can also add several types of links to your content. When a link is added, you have the option of defining certain attributes depending on the type of link. Links in plain text cannot be clicked and customers need to copy the URL into their web browser.



Using the toolbar, you can use several of the same options available in basic word processing applications. Functions include:

- Cut, copy, and paste
- Find and replace text
- Print the document
- Undo and redo changes
- Switch to full screen
- Enable or disable syntax highlighting

The special functions available in Oracle Service Cloud are accessed through the Toolbox and Tasks sections described in the following table.

Table 461: Toolbox and Tasks Sections Description

Button	Description
Links	Buttons in this section are used to insert links in your content.
Account Assistance Link	Click this button to insert a link to the Account Assistance page on your customer portal. See Inserting account assistance links.

Table 461: Toolbox and Tasks Sections Description (Continued)

Button	Description
Answer Link	Click this button to insert a link to any answer you specify. See Inserting links to answers. **Note:** This button is available only in message templates. See Customizing messages.
Browser Link	Click this button to insert a browser link. See Inserting browser links.
Chat Link	Click this button to insert a link to the Live Help page on the customer portal. See Inserting chat links. **Note:** This button is available only if Chat is enabled.
Cloud Link	Click this button to insert a link to a social media service. See Inserting cloud links.
File Link	Click this button to insert a file link. See Inserting unsubscribe links.
Forward to Friend Link	Click this button to insert a forward to friend link. See Inserting forward to friend links.
Incident Link	Click this button to insert a link to any incident you specify. See Inserting links to incidents.
Profile Link	Click this button to insert a link to the Account Settings page on your customer portal. See Inserting profile links.
Reset Password	Click this button to insert a reset password link. See Inserting reset password links.
Setup Password	Click this button to insert a link to the Finish Account Creation page on your customer portal. See Inserting setup password links.
Survey Link	Click this button to insert a link to an existing survey. See Inserting links to surveys.
This Answer Link	Click this button to insert a link to the incident that triggered the message being sent. See Inserting links to answers.

Table 461: Toolbox and Tasks Sections Description (Continued)

Button	Description
This Incident Link	Click this button to insert a link to the incident that triggered the message being sent. For example, the standard Question Receipt email sends a confirmation message after a customer submits a question through the Ask a Question page, an email, or a chat session. By adding a This Incident Link to your Question Receipt message template, you can provide your customers with easy access to the incident created from their question. See To insert a this incident link.
Tracked Link	Click this button to insert a tracked link. See Inserting tracked links.
Unsubscribe All Answers Link	Click this button to insert a link that lets contacts who receive answer notifications unsubscribe from future communications. See Inserting unsubscribe all answers links. This button is available only in message templates. See Customizing messages.
Unsubscribe Link	Click this button to insert an unsubscribe link. See Inserting unsubscribe links.
Unsubscribe This Answer Link	Click this button to insert an unsubscribe link to a specific answer that's been returned as the result of a repeatable answer section. See Inserting unsubscribe this answer links. **Note:** This button is available only on the Answer Update Notification message template. See Customizing messages.
Web Page Link	Click this button to insert a web page link. See Inserting web page links.
Dynamic Content	Buttons in this section are used to insert dynamic content.
Answer Section	Click this button to add any repeatable answer details on your answer update notification messages. See Inserting answer sections. **Note:** This button is available only in message templates. See Customizing messages.
Case Section	Click this button to add a case section to your conditional text. See Inserting case sections.
Conditional Section	Click this button to insert a section of conditional text. See Inserting conditional sections.

Table 461: Toolbox and Tasks Sections Description (Continued)

Button	Description
Incident Thread	Click this button to insert an **incident thread** that displays all communication between the parties associated with the message. See Inserting incident threads.
Merge Field	Click this button to insert a merge field. See Inserting merge fields.
Merge Report	Click this button to insert a merge report. See Inserting merge reports.
Start Over	Buttons in this section are used to clear all content and start over.
Use Existing	Click this button to clear all content and start over with an existing document.
Convert HTML	Click this button to clear all text and start over with a converted HTML file. See Creating text content in documents.
Content	Buttons in this section are used to insert snippets and symbols.
Insert Snippet	Click this button to insert a snippet. See Creating snippets.
Insert Symbol	Click this button to insert a special symbol. A symbol map opens. Double-click the symbol you want to insert.
Insert Address	Click this button to insert a physical address. Refer to Inserting physical addresses. **Note:** The CAN-SPAM Act of 2003 requires that commercial email messages contain the sender's valid physical postal address.

Prefilling web form fields

Web forms can display with one or more fields prefilled with data, letting you simplify the form completion process for your contacts. By appending specially formatted parameters to the web page URL, any database or custom contact field that appears on the form can be set with a default value. Field values submitted in a prefilled form overwrite the existing values in the contact record.

Prefilled values can be unique to the placement of each link. For example, you can publish links at three different sites to a single web form but configure each link to prefill fields on the form with different values.

To prefill fields in a web form, the document containing the form must first be served in a campaign or advanced survey using a Serve Web Page element. See Editing Serve Web Page attributes.

To prefill web form fields

1 Open the campaign or survey that serves the document containing the web form.

2 Double-click the Serve Web Page element to open the Serve Web Page window.

3 To prefill the web form with any field information that can be derived from a contact's Oracle Service Cloud browser cookie, click the User Identification tab.

   a Select the Other Credentials radio button.

   b Select the Cookie check box to enable browser cookie identification.

Note Prefilled field values override any common values set by the cookie.

   c Select the Email Click-Through Parameters check box to enable parameters passed in the URL.

4 Click the Web Page tab and click the Copy URL button.

   a Click OK to acknowledge that the web page URL has been copied to the clipboard.

5 Click OK to close the window.

6 If you have not already launched the campaign or survey, click the Launch button on the Home tab.

   a Click OK to launch and save.

7 Open a new web browser and paste the web page URL into the browser's address field.

8 Append parameters to the URL to define which fields you want to prefill. See Appending field parameters.

   a Submit the URL in your web browser and confirm the fields are prefilled as you want.

9 Copy the updated URL from the browser's address field and publish the link to your designated external sources.

Appending field parameters

Every field in a web form is associated with a parameter that can be passed a value in the web page URL, and multiple parameters may be passed at once to define multiple field values. To define a prefilled value for a specific field, append its parameter to the web page URL in the following format:

```
/wf_2_<field_ID>/<prefill value>
```

Each field's parameter contains a unique field ID. You can view custom field IDs on the Custom Fields editor by hovering over each field. For example, if a custom field has an ID of 3, the parameter would be:

```
/wf_2_3/<prefill value>
```

Default contact fields also have unique field IDs. For example, if you select the Country field, which has an ID of 100022, the parameter would be:

```
/wf_2_100022/<prefill value>
```

The following table lists each default contact field and its field ID.

Table 462: Contact Field IDs

Field Name	Field	Field ID
Last Name	last_name	100002
First Name	first_name	100003
Email Address	email	100004
Email Address Alternate 1	email_alt1	100010
Email Address Alternate 2	email_alt2	100011
Title	title	100013
Office Phone	ph_office	100015
Mobile Phone	ph_mobile	100016
Fax Phone	ph_fax	100017
Assistant Phone	ph_asst	100018
Home Phone	ph_home	100019
Street	street	100020

Table 462: Contact Field IDs (Continued)

Field Name	Field	Field ID
Country	country_id	100022
State/Province	prov_id	100023
Postal Code	postal_code	100024
Global Opt-in	ma_opt_in	100025
Organization Name (Outreach)	ma_org_name	100027
Invalid Email Flag	email_invalid	100028
Email Format Preference	ma_mail_type	100029
Organization Name Alternate (Outreach)	ma_alt_org_name	100051
Last Name Alternate	alt_last_name	100052
First Name Alternate	alt_first_name	100053
Survey Opt-In	survey_opt_in	100054

Note For descriptions of these fields, click the Configuration button on the navigation pane and double-click Data Dictionary under Database.

The prefill values that can be passed in a parameter depend on the field type. All database contact fields and contact custom fields are one of the following types.

- **Text Field or Text Area**—The value of a text field or text area is expressed in the URL as text. Append the text you want as the value of the field, and the field prefills with that text. For example, to prefill the Postal Code field with the text "59771," append that value to the field's parameter as follows:
  ```
  /wf_2_100024/59771
  ```
- **Integer**—The value of an integer field is expressed in the URL as an integer. Append the integer you want as the value of the field, and the field prefills with that integer. For example, to prefill a custom field (ID 301) with the number "5," append that value to the field's parameter as follows:
  ```
  /wf_2_301/5
  ```

- **Menu**—The value of a menu field item is expressed in the URL as a unique ID number. (Menu item IDs can be obtained by viewing the source code of the form in a web browser.) Append the ID of the menu item to prefill the field with the text of that menu item. For example, to prefill the State/Province field with "MT," append its menu item ID value to the field's parameter as follows:
  ```
  /wf_2_100023/32
  ```
- **Radio or Opt-in**—The value of a radio or opt-in field is expressed in the URL as 0 for a "No" value or 1 for a "Yes" value. Append either 0 or 1 and the No or Yes radio button will be selected. For example, to select the Yes radio button on the Global Opt-in field, append "1" to the field's parameter as follows:
  ```
  /wf_2_100025/1
  ```
- **Date or Date/Time**—The value of a date or date/time field is expressed in the URL in a special time format. Append the formatted value to prefill the field with the equivalent date or date/time. Use the following formats to pass values to date and date/time fields:
  ```
  <Year>-<Month>-<Day>T
  <Year>-<Month>-<Day>T<hour>:<minute>
  ```
  For example, to prefill a custom date field (ID 320) with the date "November 1, 2005," append "2005-11-01T" to the field's parameter as follows:
  ```
  /wf_2_320/2005-11-01T
  ```
  Or, to prefill a custom date/time field (ID 320) with the date and time "November 1, 2005, 3:32 PM," append "2005-11-01T15:32" to the field's parameter as follows:
  ```
  /wf_2_320/2005-11-01T15:32
  ```

Note Remember to include the "T" after the date when declaring a value in date or date/time format.

You can prefill multiple fields on a form at once by appending multiple parameters to a single URL, separated by slashes. The following example shows a URL that has been modified to prefill three fields: State, Country, and a service provider custom field.

To prefill these fields, the following three parameters were added to the end of the URL:

- /wf_2_100023/32—The State field is assigned the numeric ID value of 32 for the menu option "Montana."
- /wf_2_100022/1—The Country field is assigned the numeric ID value of 1 for the menu option "U.S."
- /wf_2_3/985—The custom service provider field is assigned the numeric ID value of 985 for the menu option "Technicomm."

Web form and survey security

When customers submit information to websites, it is common to verify that the information originates from a human rather than a bot (an automated software program) being run for malicious purposes. Oracle Service Cloud provides web form and survey security that automatically requires human validation when abuse is suspected. For example, when a standard action is performed repeatedly in a short amount of time.

Validation is accomplished through the use of a CAPTCHA, a dialog containing distorted words that the customer is asked to type. When the words are typed correctly, a human is assumed to be on the client side. Once customers have correctly entered a CAPTCHA, they are not asked for verification again as long as the visit has not ended or does not exceed an hour.

Note Because CAPTCHA runs behind the scenes, it is presented to the customer only when a web form or survey displays and requires the customer to type data and submit it to the system.

71

Outreach Mailings

Oracle RightNow Outreach Cloud Service (Outreach) provides a centralized, intuitive method of sending emails to specific audiences. You can create messages using text and HTML documents, and choose contact lists and segments to be included in or excluded from the mailing. Mailings can then be sent all at once or at times determined by specific criteria or transactional events.

Outreach also provides extensive tools for proofing and testing mailings. You can send mailings to one or more people for approval and track the status of their review. You can also send mailings to smaller subsets of the defined **audience** and view analytics regarding how many emails sent to the subset bounced or were opened, clicked though, replied to, or unsubscribed to. This lets you fine-tune the mailing before broadcasting it to the entire audience, and also lets you determine how effective it was after the entire broadcast.

- Defining the broadcast mailing audience
- Audiences
- Content Library

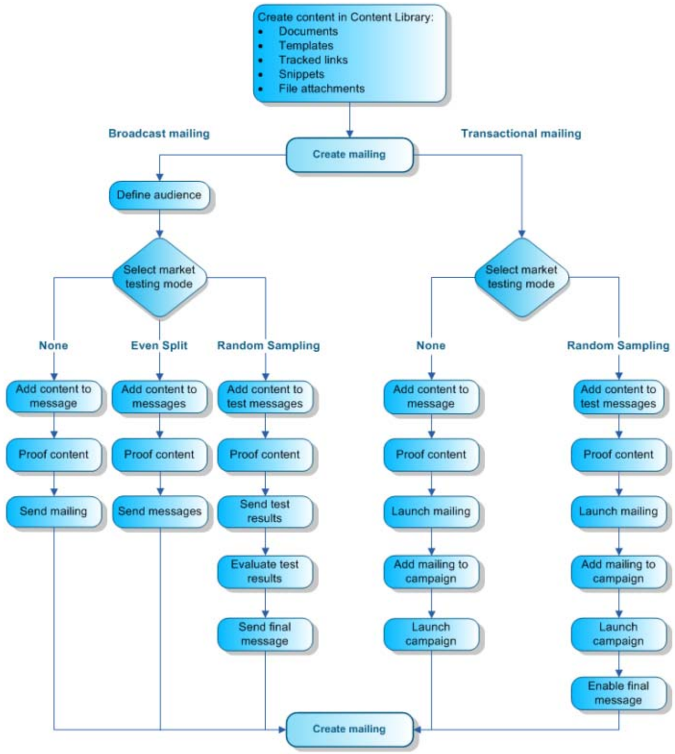
Creating mailings

You can target and email different groups of your customers. When you create a mailing, you define the content of the message and the group of customers who will receive it. You can include and exclude a total of fifty contact lists or segments of contacts from your mailing. You can also send test mailings and proofs before committing to a final email.

There are two types of mailings you can create, distinguished by delivery method.

- **Broadcast mailings** are used to send a message to a specified **audience** at a time you choose.
- **Transactional mailings** are event-triggered, so the email is sent when actions you define occur, such as a campaign action or a rule action.

The following figure shows the process for creating and sending a mailing.



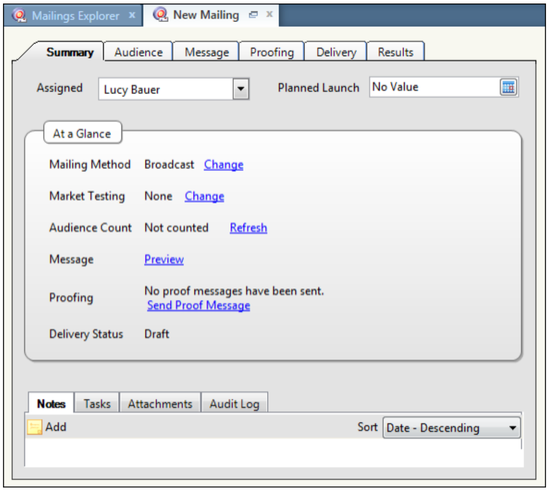
Note The following procedure assumes that you access the Mailings explorer from the Mailings **navigation list**. However, this explorer may reside in a different navigation list.

To create a mailing

1 Click the Mailings button on the navigation pane and double-click Mailings Explorer. The Mailings explorer opens on the content pane.

2 Click the New button. A new mailing opens on the content pane.

Tip You can also create a mailing from an open mailing by clicking the New button. Additionally, if your navigation set is configured to add mailings from the file menu, click File and select Mailing in the Create New Item section. See To configure the file menu.



3 To create a broadcast mailing (the mailing method selected by default), see Creating broadcast mailings.

4 To change to a transactional mailing, see To change the mailing method. Then, to create the transactional mailing, see Creating transactional mailings.

- ❖ Defining the broadcast mailing audience
- ❖ Audiences
- ❖ Content Library

Mailing delivery statuses

Your **broadcast** and **transactional mailings** must follow certain steps that are defined by the mailing's delivery status. Delivery status indicates the mailing's current state as it progresses through the distribution process.

The following table describes the delivery statuses for broadcast and transactional mailings and indicates whether the status is set by a staff member action or updated automatically by the system. For more about mailing delivery, see Accessing broadcast delivery options and Accessing transactional delivery options.

Table 463: Broadcast and Transactional Mailing Delivery Statuses Description

Status	Survey Type	Description
Draft	Broadcast Transactional	This is the preliminary status of a mailing. When a mailing is created, it is automatically set to the Draft status. The status reverts to Draft if a staff member unschedules the mailing.
Scheduled	Broadcast	This status indicates a mailing is ready to be sent at a scheduled date and time. When a staff member selects the send time, the mailing is automatically set to the Scheduled status.
Launched	Transactional	This status indicates a mailing has been launched and can be included in a rule or campaign. Staff members launch a mailing by clicking the Launch button on the Delivery tab. **Note:** A launched mailing cannot be edited. However, you can suspend the mailing's message, make edits, and then re-launch it. See Suspending transactional mailings.
Recurrence Scheduled	Broadcast	This status indicates a mailing is scheduled for recurring runs. When a staff member selects a recurrence pattern, the mailing is automatically set to the Recurrence Scheduled status.
Preparing to Send	Broadcast	This status indicates a mailing is about to be sent. The status changes to Preparing to Send when a staff member clicks the Send Now button.
Sending	Broadcast	This status indicates a mailing is currently being sent to customers. The system automatically sets the mailing's status to Sending after the mailing is done preparing to send or at the mailing's scheduled date and time.

Table 463: Broadcast and Transactional Mailing Delivery Statuses Description (Continued)

Status	Survey Type	Description
Suspended	Broadcast Transactional	This status indicates a mailing is temporarily suspended from the Sending or Scheduled status. Staff members can change the status to Suspended by clicking the Suspend button on the Delivery tab.
Suspended by Error	Broadcast Transactional	This status indicates a mailing encountered an error and was suspended by the system.
Canceled	Broadcast Transactional	This status indicates the survey was manually canceled. Staff members can cancel a mailing by clicking the Cancel Mailing button on the Delivery tab. **Note:** A canceled mailing can no longer be modified or sent. However, it can be copied to a new mailing, and the copy can be modified and sent.
Completed	Broadcast	This status indicates a mailing was sent. The system automatically sets a mailing's status to Completed from the Sending status.

Managing mailings

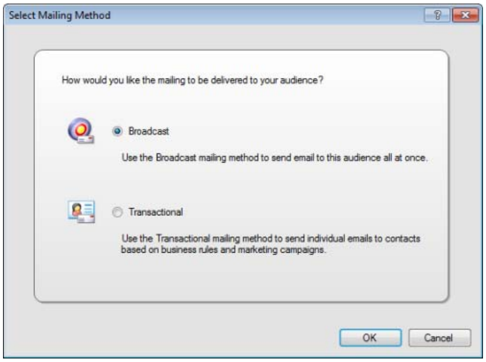
When creating or editing a mailing, the Summary tab provides a variety of mailing management functions, including the following.

- **Changing the mailing method**—Once you create a mailing, you can change its mailing method type. The mailing methods available are Broadcast and Transactional. Broadcast mailings with recurrence activated are shown as Recurring Broadcast.
- **Adding notes**—You may want to add notes to a mailing that are not sent to audience members. You can use notes to provide additional information about the mailing that can be viewed by staff members as they are working with the mailing.
- **Adding tasks**—You can assign new or existing tasks to mailings and edit, delete, and forward tasks to other staff members. You can also view each task associated with the mailing.

Other common functions available from the Summary tab include the ability to add file attachments or view the **audit log** to see when the mailings were created and edited and when mailing delivery statuses were changed. See Working with records.

To change the mailing method

1 On the Summary tab of an open mailing, click Change next to Mailing Method. The Select Mailing Method window opens.



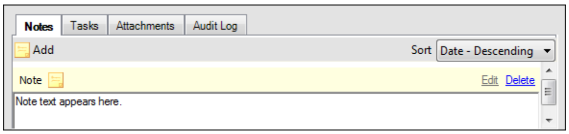
2 Select the Broadcast or Transactional radio button.

3 Click the OK button. The mailing changes to the method you selected.

Note You can switch mailing methods only when the delivery status of the mailing is Draft, Suspended, or Error and no emails have been sent. See Mailing delivery statuses.

To add a note

1 On the Summary tab of an open mailing, click the Notes tab.



2 Click the Add button.

3 Enter the text of the note.

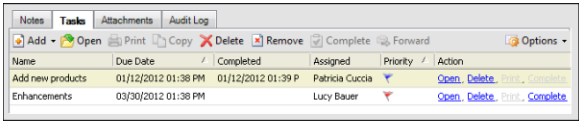
4 To sort the notes by ascending or descending date, click the Sort drop-down menu and select the sort option.

5 To edit an existing note, click Edit next to the note.

6 To permanently delete a note, click Delete next to the note.

To add a task

1 On the Summary tab of an open mailing, click the Tasks tab.



2 To add a new task to the mailing, click the Add button, select Add New, complete the task information, and click the OK button. See Adding tasks for the procedure to complete the fields on this window.

3 To add an existing task to the mailing, click the Add button, select Add Existing, search for the task you want to add, and click the Select button. See To search for a task from an open record.

You can perform other task actions on the Tasks tab. The following table describes the buttons on the Tasks tab toolbar and tells you what actions you can take on tasks.

Table 464: Tasks Tab Toolbar Description

Button	Description
Add	Click this button to display a drop-down menu containing the following options.
Add New	Select this option to add a task. See Adding tasks for the procedure to complete the fields on this window.
Add Existing	Select this option to add an existing task. After finding and selecting a task, the task is added to the task list for the mailing. See To search for a task from an open record for information about the Task Search window.
Open	Click this button to open the selected task for editing.
Print	Click this button to print the task.

Table 464: Tasks Tab Toolbar Description (Continued)

Button	Description
Copy	Click this button to copy the task.
Delete	Click this button to permanently delete the task.
Remove	Click this button to remove the selected task from the mailing (without deleting the task).
Complete	Click this button to mark the task completed.
Forward	Click this button to send the task to one or more recipients.
Options	Click this button to select an option for managing the output and display of information on the tab, such as print, forward, or export. See Changing output options for information about other options, such as Auto Filter, Slice, Cross Tab, and Rollups.

Creating broadcast mailings

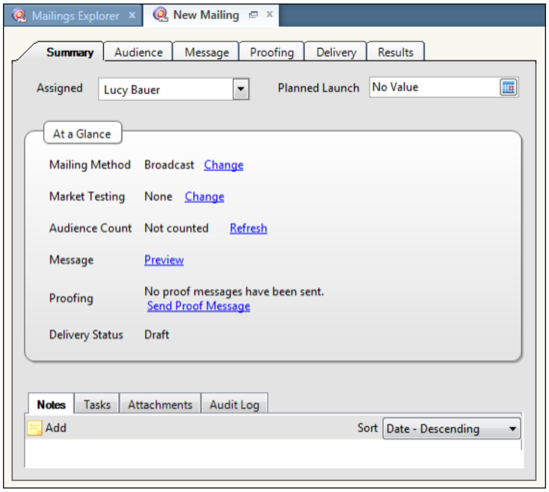
You can create a broadcast mailing if you want to email a group of contacts in your knowledge base. Broadcast mailings are sent to an audience you define. The content of the email can be added as you create the mailing, or by using a previously defined document (see Creating documents). You can also choose to market test your mailing by sending different message content to subsections of your audience (see Market testing in broadcast mailings).

Important The delivery of broadcast mailings can be impaired by factors beyond the scope of Outreach. For a list of best practices for optimizing your message delivery and improving delivery and participation rates, see *Best Practices for Email Marketing*.

To create a broadcast mailing

1 On the Mailings explorer, click the New button on the ribbon. A new broadcast mailing opens on the content pane.

Tip You can also create a mailing from an open mailing by clicking the New button. Additionally, if your navigation set is configured to add mailings from the file menu, click File and select Mailing in the Create New Item section. See To configure the file menu.



By default, the Summary tab is active. From here, you can review general information about the mailing in the At a Glance section, as well as manage the mailing's notes, tasks, and attachments (see Managing mailings). As you create the mailing, you move through each tab to complete the mailing's elements.

Note You can also add custom tabs to your mailings. Custom tabs give you quick access to elements you frequently use in your mailings. See Adding custom tabs.

2 To assign the mailing to another staff member (by default, the mailing is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

a To search for a staff member, type the staff member’s name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

3 Click the calendar in the Planned Launch field to select a date for the launch. This field is for planning purposes only. The email is not sent on this date.

4 Click the text in the At a Glance section described in the following table to perform common mailing functions.

Table 465: At a Glance Section Description

Field	Description
Mailing Method	This field displays the mailing method currently selected for the mailing. Click Change to change the method and see Managing mailings.
Market Testing	This field displays the market testing mode of the mailing. Click Change to change market testing modes. See Market testing in broadcast mailings.
Audience Count	This field displays the most recent audience count and the time and date it was performed. Click Refresh to perform an updated count. To view the details of the count, click Details and see Viewing audience count details in mailings. **Note:** Occasionally, the **replication database** used to process mailings can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current, the audience count is labeled “Estimated.”
Message	Click Preview to preview the mailing.
Proofing	This field displays the cumulative number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See Sending a proof message.

Table 465: At a Glance Section Description (Continued)

Field	Description
Delivery Status	This field displays the delivery status of the mailing and the number of emails sent and delivered. See Accessing broadcast delivery options.

5 Click the Audience tab to define an audience for the mailing. See Defining the broadcast mailing audience.

6 Click the Message tab to create the email sent to the mailing audience. See Customizing the message in broadcast mailings.

7 Click the Proofing tab to send a proof of the mailing for internal review before sending it to the entire audience. See Sending a proof message.

8 Click the Delivery tab to select delivery options. See Accessing broadcast delivery options.

9 Click the Results tab to view the report associated with the mailing. See Viewing mailing results.

Note If your application is configured with custom tabs for mailings, they display after the Results tab. See Adding custom tabs.

10 To spell check the mailing, click the Spelling button and refer to Spell checking.

11 Click the Save and Close button to save the mailing. The Save As window opens.

Note You can click the Save button to save the mailing without closing it.

12 Select the folder you want to save the mailing in and type the name of the mailing in the Name field.

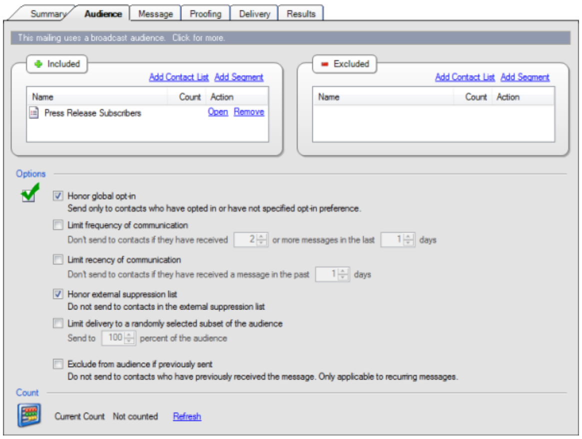
13 Click the Save and Close button to save the mailing.

Defining the broadcast mailing audience

You specify the **audience** your mailing will be sent to from the Audience tab. You can include and exclude a total of fifty contact lists and segments, each containing a vast number of contacts. For example, you could include twenty-two segments of contacts and exclude twenty-eight contact lists for a total of fifty lists. You can also restrict the scope of your audience, set mailing frequency and recency limits, and specify how to handle global opt-in and suppression options. See Audiences.

To define the audience

1 From an open mailing, click the Audience tab.



2 To include a list in the audience, click Add Contact List in the Included section. The Select Contact List window opens.

   a To add a contact list, click New Contact List and refer to Adding contact lists.
   b Select the list you want to include in the mailing's audience and click the OK button. The list is added to the Included grid. Contacts belonging to the list will receive the mailing unless they are in an excluded segment or list.

3 To include a segment in the audience, click Add Segment in the Included section. The Select Segment window opens.

   a To add a segment, click New Segment and refer to Creating segments.
   b Select the segment you want to include in the mailing's audience and click the OK button. The segment is added to the Included grid. Contacts belonging to the segment will receive the mailing unless they are in an excluded segment or list.

4 To exclude a list from the audience, click Add Contact List in the Excluded section. The Select Contact List window opens.

a Select the list you want to exclude from the mailing's audience and click the OK button. The list is added to the Excluded grid. Contacts belonging to the list will not receive the mailing.

5 To exclude a segment from the audience, click Add Segment in the Excluded section. The Select Segment window opens.

a Select the segment you want to exclude from the mailing's audience and click the OK button. The segment is added to the Excluded grid. Contacts belonging to the segment will not receive the mailing.

6 To edit a list or segment that is included in or excluded from the mailing, click Open next to the list or segment name. See Managing contact lists.

7 To remove a list or segment from the Included or Excluded sections, click Remove next to the list or segment name.

8 Enter field information in the Options section described in the following table.

Table 466: Options Section Description

Field	Description
Honor global opt-in	Select this check box to send the mailing to contacts who did not explicitly opt out of receiving mailings. Clear this check box to send the mailing to all contacts in the audience, regardless of their opt-in preference.
Limit frequency of communication	Select this check box to set a mailing frequency limit, and then enter a maximum number of mailings and a number of days in which contacts can receive messages before they are excluded from mailings. When the mailing is launched, it is not sent to any contacts who have received the maximum number of mailings within the designated time period. For more information about how this setting works, see Frequency and recency limits. **Note:** The minimum you can enter is 2 in the last 1 day. The maximum number of days you can enter is 90. **Tip:** To ensure contacts receive only 1 email every “x” number of days, use the Limit recency of communication setting described next.

Table 466: Options Section Description (Continued)

Field	Description
Limit recency of communication	Select this check box to set a mailing recency limit. Enter the minimum number of days that can elapse before contacts receive another email. When the mailing is launched, it is not sent to any contacts who have received a mailing in the past specified number of days. For more information about how this setting works, see Frequency and recency limits. **Note:** The maximum number of days you can enter is 90. The default value is 1 day. **Tip:** Use this check box to ensure contacts receive only one email every "x" number of days. For instance, if you want your contacts to receive only one email per week, you can select this check box and then set the field to seven.
Honor external suppression list	Select this check box to exclude contacts in the external suppression list from receiving the mailing. Clear this check box to send the mailing to all contacts in the audience, even if they are in the external suppression list. See External Suppression List.
Limit delivery to a randomly selected subset of the audience	Select this check box to send the mailing to a subset of the audience. Type a percentage or use the up and down arrows to select a percentage of the audience to send the mailing to.
Allow delivery of messages to multiple contacts sharing the same email address	Select this check box to send messages to multiple contacts sharing the same email address. If this check box is cleared, the message is sent only to the contact most recently updated. This option is available only when email address sharing is enabled. See Email address sharing. **Caution:** Because duplicate messages sent to a single address are a common characteristic of spam, you should select this check box only when necessary. When the check box is selected and you attempt to schedule or send a mailing, survey, or proof, and duplicate email addresses exist in your audience, a message warns you that your reputation as a bulk email sender may be adversely affected and impact your ability to send future communications. See *Best Practices for Email Marketing*.
Exclude from audience if previously sent	Select this check box to exclude contacts from the audience who were previously sent a message from the same mailing. This option applies only to recurring mailings. Contacts excluded in this manner are also excluded from the audience count. See Setting mailing recurrence.

9 To count the number of contacts who will receive the mailing, click Refresh in the Current Count section. Once the audience has been counted, the last count also displays in this section.

Note Occasionally, the **replication database** used to process mailings can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current, the audience count is labeled "Estimated."

10 To view the details of an audience count, click Details in the Current Count section after the count has been performed.

❖ Audiences

Frequency and recency limits

There are several settings that let you limit the number of emails your customers receive through mailings and surveys. Two of the settings limit the frequency and recency of email communication with your customers.

Frequency limits let you control the frequency at which your customers receive email from your organization—in other words, how often an email will be sent to your customers. Recency limits let you define the number of days that pass between the emails that you send. Frequency is set using the Limit Frequency of Communication check box and recency is set using the Limit Recency of Communication check box, both accessed on the Audience tab of your mailing or survey. For specific details about defining these settings, see Options Section Description.

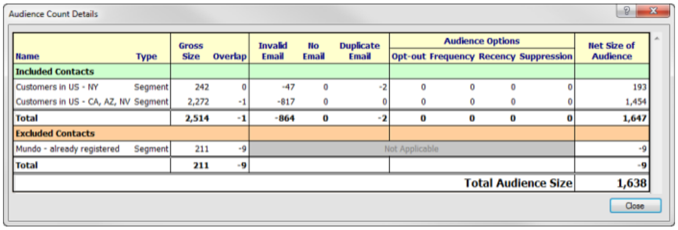
- **Frequency and recency settings apply to the sending of email.** These settings are not impacted by survey completion, views, or clicks. Following are two examples that demonstrate this point.
  - ▷ A customer received an email 31 days ago that included a transactional survey. However, the customer just submitted the survey yesterday. If recency on the next mailing is set to 30 days, the customer could receive another email from the system.
  - ▷ An agent presents a website link survey in a new browser window at the end of a chat. Since website link surveys are not associated with email, recency limits do not apply to this survey.
- **Frequency and recency settings apply to emails sent from both Outreach and Feedback** and cannot be applied to only one product area. For example, suppose you have a rule to send a transactional survey after an incident is solved. Also suppose you add an Outreach broadcast mailing with frequency limited to no more than two messages in the last seven days. Now, one of your customers has two incidents: one solved

on Monday and the other solved on Tuesday. If the broadcast mailing is scheduled for future delivery on Thursday, the customer will **not** receive the Outreach email sent by the mailing because of the two Feedback surveys emailed earlier in the week.

- **The system checks for frequency and recency limits at the time the email is sent.** The system performs frequency and recency checks at the scheduled mailing or survey time. (The system also checks for custom logic such as any segments or business rules at this time.)

Viewing audience count details in mailings

You can view the audience count to see how the count is calculated. You can see the included and excluded lists and segments, along with the number of invalid emails and opt-outs. When you click Details after counting the audience, the Audience Count Details window opens.



Audience Count Details

Name	Type	Gross Size	Overlap	Invalid Email	No Email	Duplicate Email	Audience Options: Opt-out	Frequency	Recency	Suppression	Net Size of Audience
Included Contacts											
Customers in US - NY	Segment	242	0	-47	0	-2	0	0	0	0	193
Customers in US - CA, AZ, NV	Segment	2,272	-1	-817	0	0	0	0	0	0	1,454
Total		**2,514**	**-1**	**-864**	**0**	**-2**	**0**	**0**	**0**	**0**	**1,647**
Excluded Contacts											
Mundo - already registered	Segment	211	-9	Not Applicable							-9
Total		**211**	**-9**								**-9**
										Total Audience Size	**1,638**

Close

The following table describes the columns on the Audience Count Details window.

Table 467: Audience Count Details Window Description

Column	Description
Name	Lists the name of each segment or contact list included in or excluded from the mailing.
Type	Lists whether the audience subset is a contact list or segment.
Gross Size	Lists the number of contacts belonging to the list or segment.
Overlap	Lists the number of contacts belonging to the list or segment who also belong to another list or segment in the audience.
Invalid Email	Lists the number of contacts belonging to the list or segment who have an invalid email address.
No Email	Lists the number of contacts belonging to the list or segment who do not have an email address.

Table 467: Audience Count Details Window Description (Continued)

Column	Description
Duplicate Email	Lists the number of email addresses shared by multiple contacts. If the check box is selected on the Audience tab that allows delivery to multiple contacts sharing the same email address, this count is included in the net size count of the audience. If the check box is not selected, it is subtracted from the gross size when calculating the net size of the audience. **Note:** This option is available only when email address sharing is enabled. See Email address sharing.
Opt-out	Lists the number of contacts belonging to the list or segment who have opted out of mailings.
Frequency	Lists the number of contacts belonging to the list or segment who are filtered by the mailing frequency settings.
Recency	Lists the number of contacts belonging to the list or segment who are filtered by the mailing recency settings.
Suppression	Lists the number of contacts belonging to the list or segment who belong to the external suppression list.
Net Size of Audience	Lists the number of contacts in each list or segment who are included in or excluded from the mailing.
Total Audience Size	Lists the net total number of contacts who will receive the mailing.

Audiences are filtered from mailings in the following order.

1. Excluded segments and contacts
2. Contacts without an email address
3. Contacts with an invalid email address
4. Contacts who have opted out
5. Shared email addresses and duplicate contacts (overlaps in included lists or segments)
6. Contacts in the external suppression list
7. Contacts filtered by recency settings
8. Contacts filtered by frequency settings

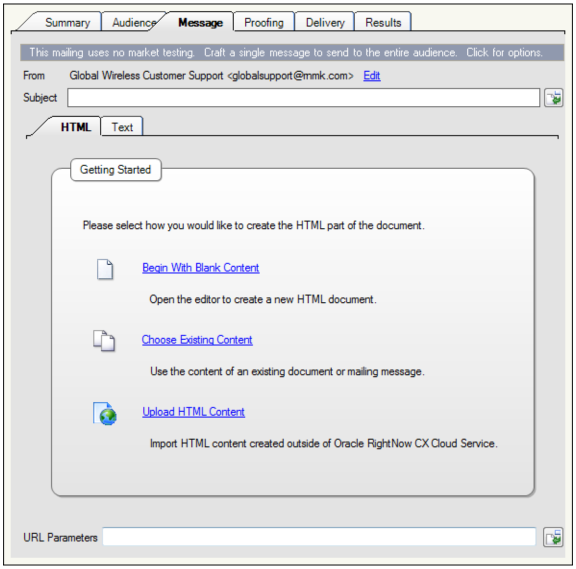
- ❖ Audiences

Customizing the message in broadcast mailings

From the Message tab, you can activate market testing, specify the mailbox settings for the mailing, the subject of the email, and any URL parameters you want to attach to links in the message. In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site.

To create a message

1 From an open mailing, click the Message tab.



2 To activate market testing, click the information bar (just above the From address field) and select Change Market Testing Mode. See Market testing in broadcast mailings.

3 To change the mailbox sending the message, or the From and Reply-to addresses, click Edit next to the From address. See Customizing mailing message headers.

4 Type the subject of the message in the Subject field.

Ensuring that contacts read your message

Because most mail clients list new messages by From address and subject, the contents of these fields are critical to having your message read. Refine your message subject to be concise yet informative and make sure it clearly states your purpose and any special conditions of your offer. If it isn't clear who you are or what you want, your message can be easily passed over.

5 To add a merge field to the subject, click the Merge Field button (to the right of the Subject field) and select the field. Merge fields add personalized elements to the subject, such as the contact's first name.

6 To create an HTML message from scratch, click Begin with Blank Content and refer to Using the HTML editor.

7 To create an HTML message by using an existing document, click Choose Existing Content and refer to Choosing existing content.

8 To create an HTML message by uploading your own HTML page, click Upload HTML Content and refer to Uploading HTML content.

9 To create a text version of the message, click the Text tab.

- **a** To create a text message from scratch, click Begin with Blank Content and refer to Using the HTML editor.
- **b** To create a text message by copying an existing document, click Choose Existing Content and refer to Choosing existing content.
- **c** To create a text message by converting an HTML page to text, click Convert HTML Content and refer to Converting HTML content.

Caution The system automatically creates a document containing the content created on the Message tab and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the mailing, those changes will also be made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes will also be made to the text on the Message tab in the mailing. See Automatically generated folders.

10 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

11 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See Inserting merge fields to URL parameters.

Customizing mailing message headers

By default, Outreach uses the name and email addresses specified in the outgoing email settings of your default Outreach mailbox (see Adding and editing mailboxes). If you want to use a different name and email address for your mailing, such as a branded email address, you can do so by customizing the message header. When a recipient views your mailing, the name and email addresses defined in the customized header are used instead of those specified in the default Outreach mailbox.

Using branded email domains

Using email addresses branded with your company's domain name can help recipients recognize your organization as the sender, improving **deliverability**. However, care must be taken to ensure that bounce notifications are processed correctly. Review the following recommended best practices when using branded domains to send mailings.

1. **Keep the mailbox configuration provided by Oracle**—At the time your site was created, an Oracle representative probably helped configure your Outreach mailbox settings using a mail account with an Oracle domain, such as rnmk.com. These settings should be left as is to ensure bounce errors are processed. See Email bounce handling.

2. **Customize the message header**—When creating the mailing message, add your branded email address by customizing the message header. Customizing the message header does not affect **bounce** processing, but contact replies to your email will be sent to the branded address.

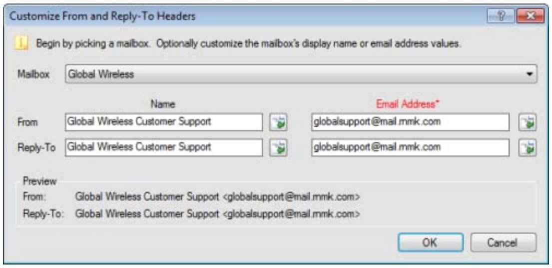
3. **Implement email authentication**—Implementing a form of authentication for your branded email accounts can help protect your reputation and secure your mail delivery rates. Oracle Service Cloud supports two forms of authentication.
   - **Sender Policy Framework**—Sender Policy Framework (SPF) is an email authentication option that designates permitted senders of email originating from your domain, excluding those with mismatched or incorrectly specified SPF records. See Answer ID 2489 on our support site for information about implementing SPF on your site.
   - **DomainKeys/DomainKeys Identified Mail**—DomainKeys (DK) and DomainKeys Identified Mail (DKIM) are email authentication options that use cryptographic signatures to designate email as originating from an authorized email delivery provider, excluding messages sent from those with unsigned or incorrectly assigned signatures. See Answer ID 2701 on our support site for information about implementing DK and DKIM on your site.

Important Be sure to regularly monitor mail received by the email addresses specified in your custom message header. If you want replies to your mailing to be converted to incidents in Oracle Service Cloud, your mail administrator must configure SMTP forwarding from that mail account to an account configured in Oracle Service Cloud. See Adding and editing mailboxes.

Also note that when an email message cannot be delivered, it usually results in a “bounce” error notification. Bounce notifications are sent to the Envelope From/Bounce Address defined in your Outreach mailbox’s outgoing email settings even if the message header is customized using the following procedure. See Email bounce handling.

To customize the mailing message header

1 On the Message tab of an open mailing, click Edit next to the From field.



2 Enter the following field information.

Table 468: Customize From and Reply-To Headers Window Description

Field	Description
Mailbox	Click this drop-down menu and select a mailbox to change the mailbox from the default. See Email handling in Outreach and Feedback.
From	Type the name and email address that you want the message to appear from in the From text boxes.
Name	Type the name you want the message to appear from.
*Email Address	Type the email address you want the message to appear from.

Table 468: Customize From and Reply-To Headers Window Description (Continued)

Field	Description
Reply-To	Type the name and email address that you want the message to reply to in the Reply-To text boxes.
Name	Type the name you want to appear as the reply-to address.
*Email Address	Type the email address you want to appear as the reply-to address. **Important:** If you use incidents, the Reply-To Address must match the Envelope From/Bounce Address unless your own mail administrator has set up SMTP forwarding for this address to automatically forward to the Envelope From/Bounce Address in the mailbox's outgoing emails settings. See Outgoing Email Settings.
Merge Field	Click this button to add merge fields to the from name and address or reply-to name and address.
Preview	This section displays how the from and reply-to addresses appear.

3 Click the OK button to save your settings and close the window.

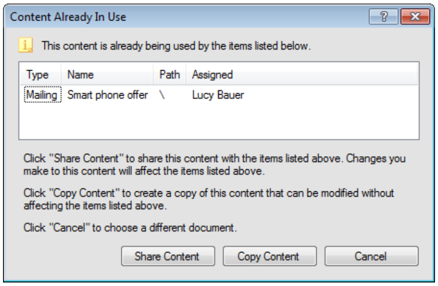
Choosing existing content

As an alternative to creating a message from scratch, you can base your message on existing content. You can choose to copy a document's content into your message and customize it, or share the content with other surveys and messages that use the document. See Creating documents.

To insert existing content

1 On the Message tab of an open mailing, click Choose Existing Content. The Choose Document window opens.

2 Select the document you want to use and click the OK button. If it is not already in use by another mailing, campaign, or survey, the content is added to your message. Otherwise, the Content Already in Use window opens.



a To share the document with the items indicated in the grid, click the Share Content button. When you share a document, you can edit the content of the document, but all other messages that share it are also modified. Likewise, if another staff member edits the document, your message is also modified.

b To create a copy of the document, click the Copy Content button. If you edit the copied content, the original document is not affected. Conversely, if the content of the original document is modified, it does not affect your copy of the message.

Caution The system automatically creates a document containing the copied content and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the mailing, those changes are also made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes are also made to the content on the Message tab in the mailing. See Automatically generated folders.

Uploading HTML content

You can upload an HTML file into your mailing to create your message. The HTML document must be stored in a file accessible through your workstation. You cannot access the HTML of a web page.

To upload HTML content

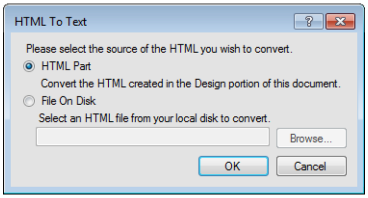
1. On the Message tab of an open mailing, click Upload HTML Content.
2. Select the HTML file you want to upload.
3. Click the Open button. The HTML is inserted in your message.

Converting HTML content

When creating a text message, you can take HTML content from the HTML message or from an HTML file and convert it to plain text.

To convert HTML content

1 On the Message tab of an open mailing, click the Text tab and click Convert HTML Content.



2 To convert the HTML message to text, select the HTML Part radio button.

Note You should finalize your HTML content before converting it to text.

3 To convert an HTML file to text, select the File On Disk radio button and browse for the file.

4 Click the OK button to insert the converted HTML in the text part of your message.

Market testing in broadcast mailings

When creating a broadcast mailing, you can test different content and designs on a subset of your audience by using market testing. Market testing is available in two modes.

- **Even split**—This mode sends your test messages to equal portions of your audience. For example, if you created four messages, each message would be sent to twenty-five percent of your audience. In this way, you can test different content and designs for use in future mailings.

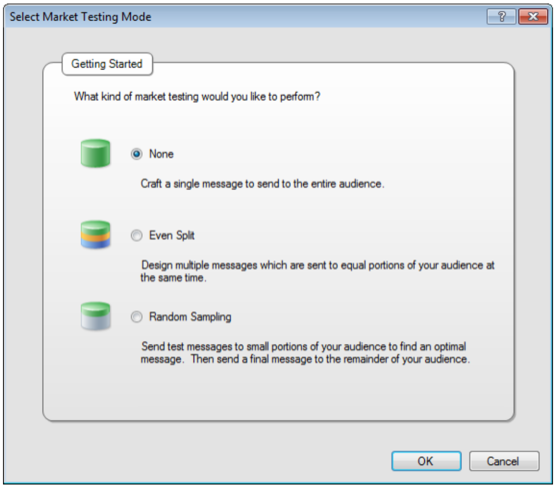
- **Random sampling**—This mode sends test messages to a percentage of the audience you specify. After the test messages are sent, you send a final message to remaining audience members. For example, you could send two messages to five percent of your audience each. After determining the most effective message, you would send a final message to any audience members who had not received a test message.

Important By default, the Message tab is set up without market testing. This means you create and send only one message with the mailing.

To activate market testing

1 On the Message tab of an open mailing, click the information bar (just above the From address field) and select Change Market Testing Mode. The Select Market Testing Mode window opens.

Note You can also access this window on the Summary tab by clicking Change next to Market Testing.



2 To send test messages to equal portions of your audience, select the Even Split radio button. See Creating messages in even split mode.

3 To send test messages to a percentage of your audience, select the Random Sampling radio button. See Creating messages in random sampling mode.

4 To disable market testing, select the None radio button.

Note If you have created more than one test message, the Select Message To Keep window opens asking which message you want to use. You must select a message to keep before you can disable market testing.

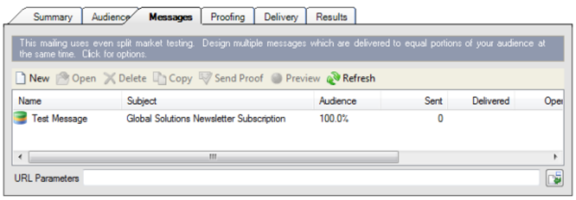
5 Click the OK button.

Creating messages in even split mode

When creating messages in even split mode, you define different message content and proofing options for each version of your message. Your audience is split evenly between the messages. The messages are sent at the same time and share delivery options.

To create messages in even split mode

1 From the Select Market Testing Mode window, select the Even Split radio button and click the OK button. The market testing page displays in even split mode.



By default, you have one test message being sent to 100 percent of the audience. From here, you can add more messages, edit messages, send proofs, or view results. You can also see information about each message, described in the following table.

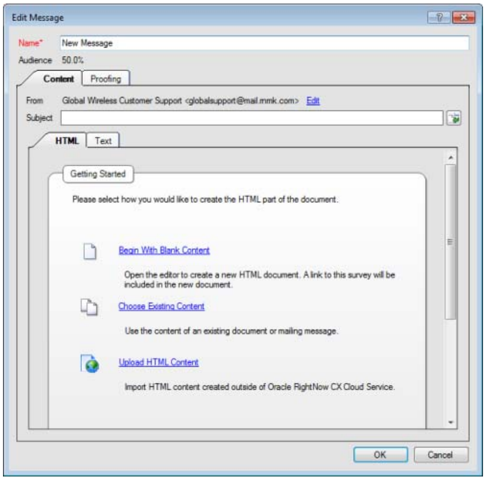
Table 469: Messages Description

Column	Description
Name	This column displays the name of the message.
Subject	This column displays the email's subject line for the message.
Audience	This column displays the percentage of the audience the message will be sent to.
Sent	This column displays the number of emails sent with the message.

Table 469: Messages Description (Continued)

Column	Description
Delivered	This column displays the number of emails sent with the message that did not bounce.
Opened	This column displays the number of unique email recipients who opened the message.
Clicked	This column displays the number of unique email recipients who clicked a tracked link.
Unsubscribed	This column displays the number of email recipients who unsubscribed from mailings. **Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See Inserting unsubscribe links.
Replied	This column displays the number of times the mailing was replied to.

2 Click the New button to add another message. The Edit Message window opens.



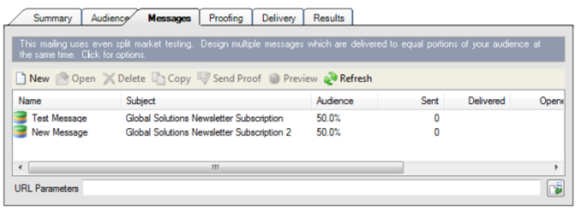
3 Type the name of the message in the Name field.

4 Type the subject of the message in the Subject field on the Content tab. See Customizing the message in broadcast mailings.

5 Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See Using the HTML editor and Creating and editing text.

6 To send a proof message, click the Proofing tab on the Edit Message window. See Sending a proof message.

7 Click the OK button to save the message. The new message is added to the Messages tab.



8 To open a message for editing, select the message and click the Open button.

9 To delete a message, select the message and click the Delete button.

10 To copy a message to create another test message, select the message and click the Copy button.

Important A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages is not shared with the original test message or subsequent copies. See Automatically generated folders.

11 To send a proof of a message, select the message and click the Send Proof button. See Sending a proof message.

12 To preview the content of a message, select the message and click the Preview button.

13 To refresh the message statistics, click the Refresh button.

14 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

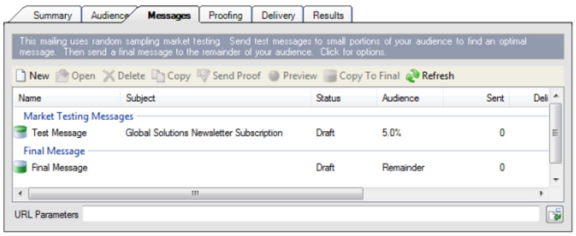
15 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See Inserting merge fields to URL parameters.

Creating messages in random sampling mode

You should use random sampling mode when you want to send a sample of test messages to your audience before determining the best one to use as a final message. When creating messages in random sampling mode, you define different message content, designs, delivery, and proofing options for each version of your message. Once you evaluate the effectiveness of your test messages, you create a final message and send it.

To create messages in random sampling mode

1 From the Select Market Testing Mode window, select the Random Sampling radio button and click the OK button. The market testing page displays in random sampling mode.



By default, you have one test message being sent to five percent of the audience, and one final message sent to the remainder of the audience. You can add more messages, edit the messages, send proofs, or view results. From here, you can also see information about each message, described in the following table.

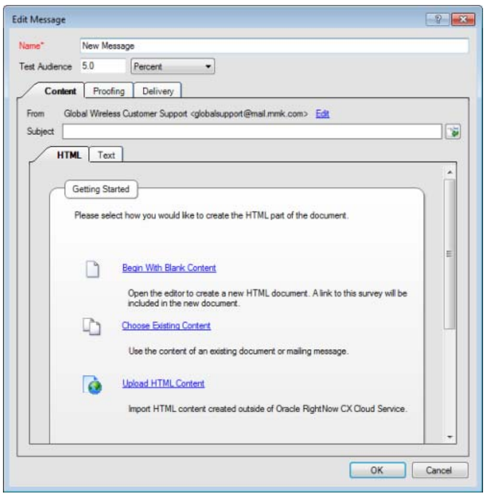
Table 470: Messages Description

Column	Description
Name	This column displays the name of the message.
Subject	This column displays the email's subject line for the message.
Status	This column displays the status of the message. See Mailing delivery statuses.
Audience	This column displays the percentage of the audience the message will be sent to.
Sent	This column displays the number of emails sent with the message.
Delivered	This column displays the number of emails sent with the message that did not bounce.

Table 470: Messages Description (Continued)

Column	Description
Opened	This column displays the number of unique email recipients who opened the message.
Clicked	This column displays the number of unique email recipients who clicked a tracked link.
Unsubscribed	This column displays the number of email recipients who unsubscribed from mailings. **Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See Inserting unsubscribe links.
Replied	This column displays the number of times the mailing was replied to.

2 Click the New button to add another message. The Edit Message window opens.



3 Type the name of the message in the Name field.

4 Type the number or percentage of recipients you want to receive the message in the Test Audience field and select Percent or Recipients from the drop-down menu.

Note The percentage of recipients is based on the number of contacts in the audience at the time the mailing is sent.

5 Type the subject of the message in the Subject field on the Content tab. See Customizing the message in broadcast mailings.

6 Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See Using the HTML editor and Creating and editing text.

7 To send a proof message, click the Proofing tab on the Edit Message window. See Sending a proof message.

8 Click the Delivery tab on the Edit Message window to define the delivery options for the message. See Accessing broadcast delivery options.

Note When sending multiple test cells, we recommend scheduling them to be sent all at one time rather than a few minutes apart. This minimizes any performance impact on your database by sharing audience segmentation processes across all of the sending cells, instead of performing them multiple times.

9 Click the OK button to save the test message. The new message is added to the Messages tab.

10 To open a message for editing, select the message and click the Open button.

11 To delete a message, select the message and click the Delete button.

Note You cannot delete the final message.

12 To copy a message to create a new message, select the message and click the Copy button.

Important A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages is not shared with the original test message or subsequent copies. See Automatically generated folders.

13 To send a proof of a message, select the message and click the Send Proof button. See [Sending a proof message](#).

14 To preview the content of a message, select the message and click the Preview button.

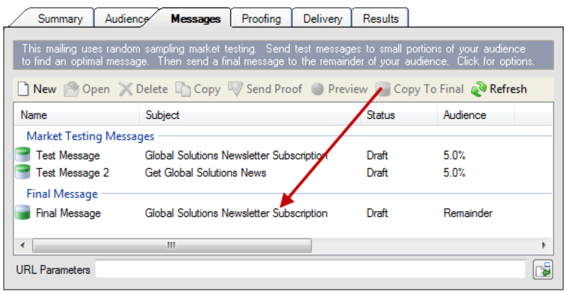
15 To refresh the message statistics, click the Refresh button.

16 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

17 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See [Inserting merge fields to URL parameters](#).

18 Once you are satisfied with your message, you must copy it as your final message and then define delivery options.

a Select the message and click the Copy To Final button. The message you selected is copied to the Final Message section of the Messages tab.



b Select the final message and click the Open button.

c Click the Delivery tab on the Edit Message window to define delivery options.

[Scheduling mailings for market testing](#)

Market testing your mailings works best when you schedule the test messages at the same time rather than launching them a few minutes apart. By scheduling test messages at the same time, the database and servers have to process data only once instead of multiple times.

Sending a proof message

An important part of sending a mailing is proofing the content to ensure the message is approved by the necessary contacts and staff members and as a final check for any mistakes. You can send a proof to any combination of staff accounts, staff groups, **proof lists**, **distribution lists**, and distribution list available addresses, and then view the results of the proof from the Proofing tab. For information about distribution lists, see Managing distribution lists.

Once a reviewer has approved or rejected the proof, the mailing's assigned staff member will receive a Mailing Proof Response Notification. This notification can be customized using message templates and is found in the Administrator Notifications message type under the Outreach category. See Customizing messages.

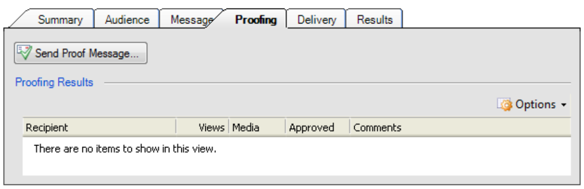
Note Any conditional sections contained in your message display in the proof message. However, reviewers see the conditional sections only if they can be mapped to contact records that allow access to those conditional sections.

Send proofs to key staff

When sending proofs, consider adding key members of your customer support, sales, and marketing teams. Sharing a sample of each mailing can help you ensure that all contact "touch points" (groups in your organization that work directly with customers) are aware of the messages being communicated to your customers. Providing a consistent message across all channels is key to providing a world-class customer experience.

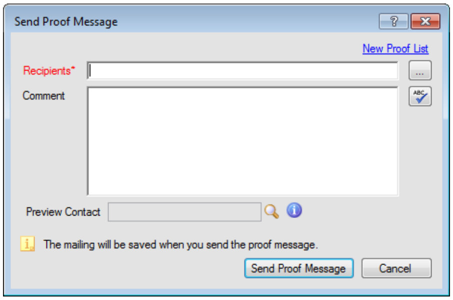
To send a proof

1 From an open mailing, click the Proofing tab.



2 Click the Send Proof Message button to select proof recipients and send a proof of the mailing. The Send Proof Message window opens.

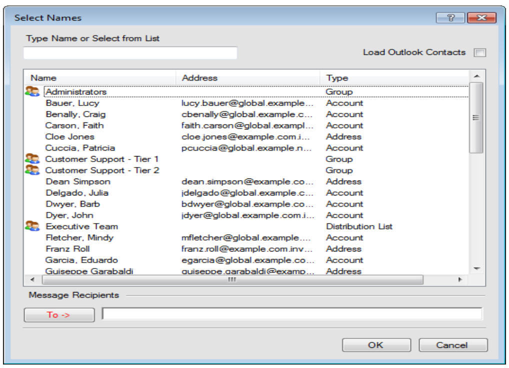
Note From the Summary tab, clicking Send Proof Message opens the Send Proof Wizard where you can select the mailing you want to send for a proof, and then follow the wizard as it steps you through the process of sending your message.



3 To create a proof list, click New Proof List and refer to Adding contact lists.

4 Type an email address or the name of a group, distribution list, or proof list in the Recipients field.

5 To select proof recipients from a list, click the Select Recipients button (to the right of the Recipients field). The Select Names window opens.



a Select a staff member, address, group, distribution list, or proof list and click the To button to add it to the To field.

b To find a staff member, address, group, distribution list, or proof list, type the name in the text box above the list. The first item matching those letters is selected in the grid.

c To import your contacts from the default Contacts folder in Outlook, select the Load Outlook Contacts check box. This is useful for displaying contacts that are not included in Oracle Service Cloud. See Synchronizing contacts.

d Click the OK button to close the window.

6 Type any comments you want to appear in the message in the Comment text box.

7 To spell check the Comment field, click the Spell Check button (to the right of the Comment field) and refer to Spell checking.

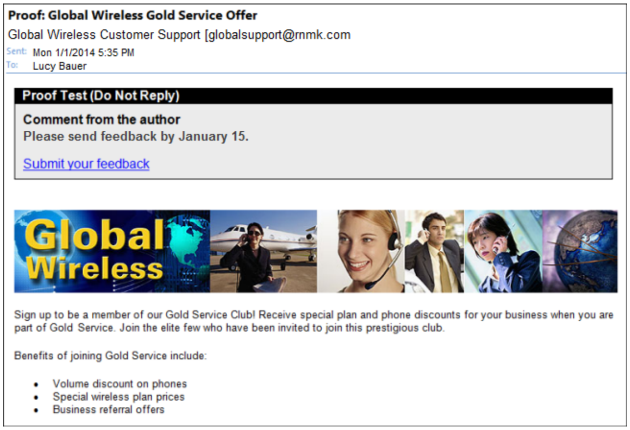
8 To customize your proof message by contact record, which lets your reviewers see how any dynamic content will look for a specific contact, click the Search button next to the Preview Contact field on the bottom of the window. The Contact Search window opens.

a Type your search criteria in one or more of the available fields and click the Search button. A list of contacts that match your search criteria displays in the grid below the search criteria fields. You can then select a contact and click the Select button. The Contact Search window closes and the contact name you selected populates the Preview Contact field on the Send Message Proof window.

9 Click the Send Proof Message button to save the mailing and send the proof message to the specified recipients.

Accepting or rejecting proof mailings

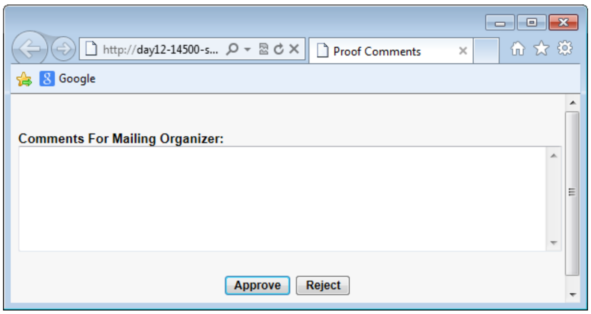
After you send a proof, the recipients can accept or reject the mailing. The proof email automatically displays a link to a web page where the tester can accept or reject the mailing. The word “Proof:” is prepended to the message subject. The following figure shows an email with the proof tester link.



The mailing's assigned staff member receives a Mailing Proof Response Notification every time a reviewer submits feedback.

To accept or reject a proof email

1 In a proof email, click the Submit Your Feedback link. A new window opens where you can make comments and accept or reject the proof.



2 Type any comments related to the proof mailing in the Comments for Mailing Organizer text box.

3 To approve the mailing, click the Approve button.

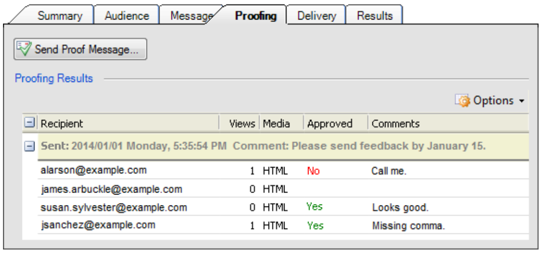
Or

To reject the mailing, click the Reject button.

A message displays confirming your submission.

Viewing proof results

Once you have sent the proof message, you can easily check the proof results from the Proofing tab. The Proofing Results section lists all message proofs that were previously sent for the selected mailing, grouped by date and time. You can see how many times the proof was viewed, who accepted and rejected the proof, and any comments from the proof testers.



The columns in this section are described in the following table.

Table 471: Proofing Results Description

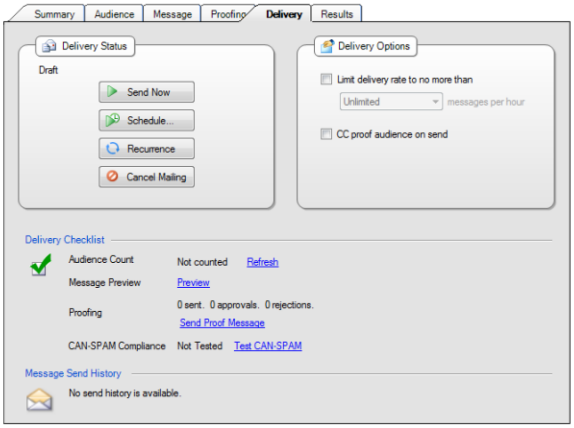
Column	Description
Recipient	This column displays all recipients of the proof mailing.
Views	This column displays the number of times each recipient views the message.
Media	This column displays whether the recipient received HTML or text content.
Approved	This column displays whether each recipient approved the proof (Yes or No). The column is blank if the recipient has yet to approve or reject the proof.
Comments	This column displays the recipient's comments.

Accessing broadcast delivery options

After you have defined the audience, created a message, and sent a proof mailing, you can send the mailing to your customers. The Delivery tab lets you choose to send the mailing immediately or schedule its delivery for sometime in the future. In addition, you can control the speed of the delivery and access common administration tasks for the mailing.

To access broadcast delivery options

From an open mailing, click the Delivery tab.



The Delivery tab is divided into sections. The Delivery Status section displays the status of the mailing (see Mailing delivery statuses) and contains buttons for controlling the sending of the mailing. You can perform the following tasks from this section.

- **Send a mailing**—See Sending mailings.
- **Schedule a mailing**—See Scheduling mailings.
- **Reschedule a mailing**—See Scheduling mailings.
- **Mailing recurrence**—See Setting mailing recurrence.
- **Suspend a mailing**—See Suspending broadcast mailings.
- **Cancel a mailing schedule**—See Scheduling mailings.
- **Cancel a mailing**—See Canceling broadcast mailings.

.

Important Some high-volume sites are configured to send mailings from a **replication database** to reduce the impact of large processes on the **operational database**. Because the sync between the replication database and the operational database can occasionally fall behind, the **mailer daemon** (also called RNMD) uses a fail-safe function before sending to ensure that the replication database is caught up. If it is not, the mailing is delayed until the replication database has been synchronized. The fail-safe function ensures that the mailing reflects the current state of your production contact records (including those that are opted out or have email addresses marked as invalid) at the time the mailing is sent. If you are uncertain whether your site uses the replication database to send mailings, contact support or your Oracle account manager.

The Delivery Options section allows you to set options related to sending the mailing. See Sending mailings.

On the bottom of the tab, delivery information about the mailing is available for you to quickly scan and assess in the Delivery Checklist and Message Send History sections. The following table describes these sections.

Table 472: Delivery Sections Description

Section	Description
Delivery Checklist	This section displays the audience count and proof history and provides a link to preview the survey.
Audience Count	This field displays the most recent audience count and the time and date it was performed. Click Refresh to perform an updated count. See Defining the broadcast mailing audience. **Note:** Occasionally, the replication database used to process mailings can fall slightly behind the operational database. If the system determines that the replication contact data is not current, the audience count is labeled “Estimated.”
Message Preview	This section contains a link to preview the message that is sent with the mailing. Click Preview to preview the message.
Proofing	This section displays a summary report of message proofs associated with the mailing. Click Send Proof Message to send the message as a proof. See Sending a proof message.

Table 472: Delivery Sections Description (Continued)

Section	Description
CAN-SPAM Compliance	This section displays the results of the CAN-SPAM compliance test. Click Test CAN-SPAM to test the mailing for compliance with the CAN-SPAM Act. Click Details to view the results of a test. See CAN-SPAM compliance in mailings.
Message Send History	This section displays a log of events relating to the delivery status of the mailing. If the mailing has not been sent, it is noted here.

Sending mailings

Broadcast mailings can be sent immediately from the Delivery tab. The status changes to **Preparing to Send** and then the mailing is sent to your defined audience. Once the mailing finishes sending, the status is **Completed**.

To send a broadcast mailing

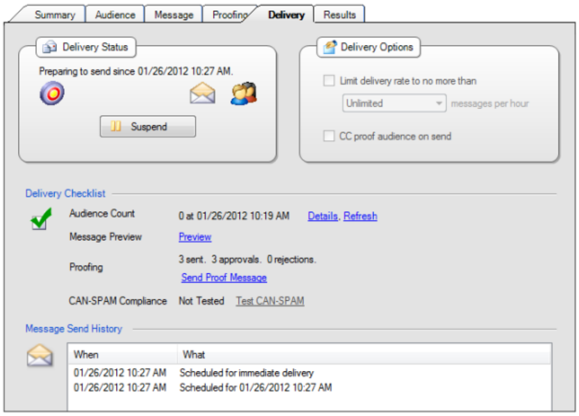
1 On the Delivery tab of an open mailing, enter field information in the Delivery Options section described in the following table.

Table 473: Delivery Options Section Description

Field	Description
Limit delivery rate to no more than x messages per hour	Select this check box to control the rate of delivery, and then click the drop-down menu to select the number of emails to send per hour when the Limit Delivery Rate check box is selected.
CC proof audience on send	Select this check box to copy the sent mailing to your proof message recipients. The phrase "Proof Copy:" is prepended to the message subject. **Note:** Proof members may receive two messages if they are also part of the audience.

2 Click the Send Now button. A message asks you to confirm that you want to send the mailing.

3 Click the Yes button on the confirmation message to send the message. The delivery status on the Delivery tab changes to Preparing to Send and you can see the delivery progress of the message along with the audience count.



When the mailing finishes sending, the status changes to Completed and the Delivery Status section displays the number of emails sent and delivered.

Scheduling mailings

You can schedule broadcast mailings to be sent on a specified date and time. This lets you coordinate sending a mailing before the actual send date (for example, to coincide with a product launch). Once scheduled, the mailing sends automatically.

To schedule a mailing

1 On the Delivery tab of an open mailing, enter field information in the Delivery Options section as described in the following table.

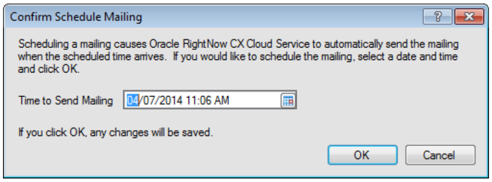
Table 474: Delivery Options Section Description

Field	Description
Limit delivery rate to no more than x messages per hour	Select this check box to control the rate of delivery, and then click the drop-down menu to select the number of emails to send per hour when the Limit Delivery Rate check box is selected.

Table 474: Delivery Options Section Description (Continued)

Field	Description
CC proof audience on send	Select this check box to copy the sent mailing to your proof message recipients. The phrase “Proof Copy:” is prepended to the message subject. **Note:** Proof members may receive two messages if they are also part of the audience.

2 Click the Schedule button. The Confirm Schedule Mailing window opens.



3 Type the date and time you want to send the mailing or click the calendar to open a calendar and select the date.

4 Click the OK button to save the schedule. The Delivery Status section displays the time and date the mailing is scheduled to be sent.

5 To reschedule the mailing, click the Reschedule button.

6 To cancel a mailing’s schedule, click the Unschedule button.

Note Although you do not have to wait until all the test messages are sent before scheduling a final mailing, all of the test messages must be sent before the final mailing can be sent.

Setting mailing recurrence

Mailing recurrence lets you send broadcast mailings at regular daily, weekly, monthly, or yearly intervals with a number of flexible options.

- You can schedule mailings to run during a specific date range, or set no end date to allow recurrences to run indefinitely.

- You can schedule mailings to run on specific days of the month or specific months of the year.
- You can send a message to each contact in your audience only once or every time the recurrence is initiated.
- You can select the time of day that you want messages to begin sending.

Note Occasionally, the **replication database** used to process mailings can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current at the scheduled recurrence time, it waits until the data is appropriately synchronized before sending.

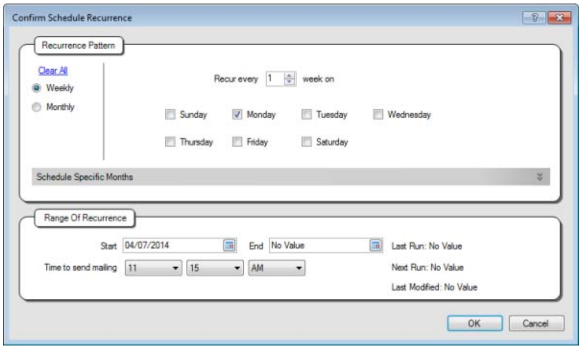
Before setting a recurring schedule, you must first define the audience and the message subject and content. Once recurrence has been set, you can click the Suspend button to suspend recurrences. This saves the recurrence information so it can be edited or reactivated.

Information about past recurrences—such as the time last run, next scheduled run time, the time the schedule was last updated, and basic results data—is stored in the knowledge base and tracked in the Recurring Mailings Summary report. Also, each recurrence is tracked in the mailing's **audit log** along with a description of how many emails were sent. See Audit logs.

To add or edit a recurring schedule for a broadcast mailing

1 From an open mailing, click the Delivery tab.

2 Click the Recurrence button. The Confirm Schedule Recurrence window opens.



3 Enter the following field information.

Table 475: Confirm Schedule Recurrence Window Description

Field	Description
Recurrence Pattern	Select the weekly or monthly interval when the mailing should be sent. For example, a mailing could be sent every two weeks on Tuesday, or every month on the 7th and 19th.
Clear All	Click this text to clear all selected recurrence pattern check boxes.
Monthly	Select this radio button to display check boxes for the days of the month. You can then select the days of the month when the mailing should be sent.
Weekly	Select this radio button to display check boxes for each day of the week. You can then select the check boxes next to the days when you want the mailing to be sent. When you select this radio button, a Recur drop-down menu displays where you can specify the frequency of the weekly mailing. For example, if you want to send a mailing every week on the days selected, enter 1 in the field. If you want the mailing to be sent every third week on the days selected, enter 3 in the field. This field accepts values from 1 to 99.
Schedule Specific Months	Click this header to display check boxes for the months of the year. Select the months during which the mailing should be sent. By default, every month is selected, but if you do not want to send during a specific month, you can clear the check box for that month.
Clear All	Click this text to clear all check boxes for the selected months.
Range of Recurrence	Options in this section let you specify a date range for the recurrence and time of day at which the mailing is sent.
Start End	Enter the start and end date of the schedule or click the calendar from which you can select the start and end date. The current day is the default start date.
Time to send mailing	Enter the time of day to begin sending the mailing.

4 Click the OK button to save the recurrence settings and return to the Delivery tab.

5 To suspend the recurrence, click the Suspend button.

a Click the OK button to confirm you want to suspend the recurrence.

Note Once recurrence is suspended, you can click the Recurrence button again to edit or reactivate it.

6 To exclude contacts from the audience that were included in a previous instance of the recurrence, click the Audience tab and select the Exclude From Audience if Previously Sent check box.

Note By default, a recurring mailing is sent on every recurrence to every contact who matches your audience, even contacts who previously received an instance of the same message. If you want each contact to receive only one instance of a recurring mailing, you need to exclude contacts from the audience that were previously sent to. This is often helpful when sending a one-time offer—for example, to all contacts who are having a birthday in the next month.

Suspending broadcast mailings

You may want to stop sending a mailing while it is sending or preparing to send. You can temporarily stop a mailing from sending by suspending it.

To suspend a mailing

1 On the Delivery tab of an open mailing, click the Suspend button. This button appears only when a mailing is in the process of being sent. The Confirm Suspend message appears asking you to confirm that you want to suspend the mailing.

2 Click the Yes button to confirm suspending the mailing.

The status changes to Suspended and the Delivery Status section displays the number of audience members the mailing was already sent and delivered to.

Canceling broadcast mailings

You can cancel a mailing at any time. When you cancel a mailing, the mailing is saved and you can still view mailing results. However, the mailing can no longer be sent or modified. To temporarily suspend a mailing, see Suspending broadcast mailings.

Tip A canceled mailing can no longer be modified or sent. However, it can be copied to a new mailing, and the copy can be modified and sent.

To cancel a mailing

1 On the Delivery tab of an open mailing, click the Cancel Mailing button. The Confirm Canceling Mailing message appears asking you to confirm that you want to cancel the mailing.

2 Click the Yes button to cancel the mailing. The delivery status changes to Canceled.

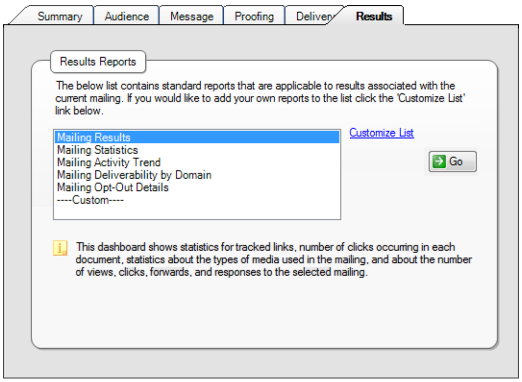
Viewing mailing results

One of the most important benefits of sending mailings is the ability to analyze the results. With Outreach, you have direct access to a comprehensive dashboard from the Results tab. You can get up-to-the-minute statistics of mailing results, including the number of clicks, unsubscribes, forwards, and **bounces** as well as the number of emails sent and delivered.

Important The email gateway must be activated in order for the **Techmail** utility to capture bounce data for analytics. See Email bounce handling.

To view mailing results

1 From an open mailing, click the Results tab.



2 Select a report from the Results Reports list.

Tip When you select a report, the report description displays in the area below the list to help you understand the purpose of the report.

3 Click the Go button. The report is displayed on the content pane in a new tab.

4 To view a definition of the report, including its tables, filters, and column descriptions, click the Definition button on the ribbon and select View. See Viewing and exporting report definitions.

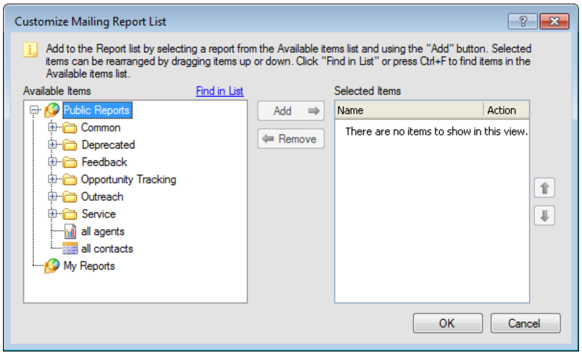
5 To view the same report for a different mailing, select the mailing from the Mailing drop-down menu at the top of the open report and click the Search button.

Customizing the mailing report list

The mailing report list provides a set of useful standard reports that display results information about the mailing you are editing. However, you can add or remove reports to customize the list.

To customize the mailing report list

1 From the Results tab of an open mailing, click Customize List next to the reports list. The Customize Mailing Report List window opens.



2 To add a report to the mailing report list, select a report from the Available Items list and click the Add button. You can also double-click reports to add them.

3 To search for a report in the Available Items list, click Find In List and enter the name of the report you are looking for.

4 To remove a report from the mailing report list, select the report in the Selected Items list and click the Remove button.

5 To rearrange the order of the reports you are adding, select a report in the Selected Items list and click the up or down arrow.

Tip You can also drag and drop reports to adjust their position.

6 Click the OK button to close the window and update the list. Added reports are displayed at the bottom of the list.

Creating transactional mailings

Transactional mailings let you send a mailing when an event occurs. For instance, you can send the email as part of a campaign. See Editing Transactional Mailing attributes.

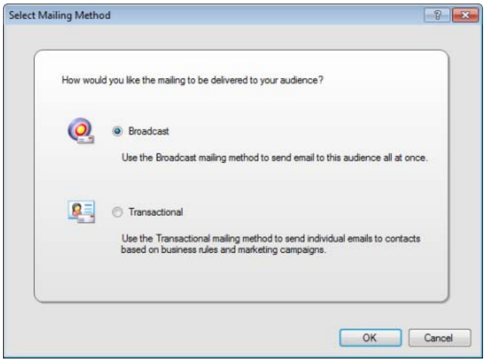
Transactional mailings can also be sent from a contact, opportunity, or incident rule when a creation or update occurs. For example, when an incident is closed, you can send a mailing to the incident contact to notify them of product updates. See Actions for rule bases.

To create a transactional mailing

1 From the Mailings explorer, click the New button on the ribbon. A new broadcast mailing opens on the content pane.

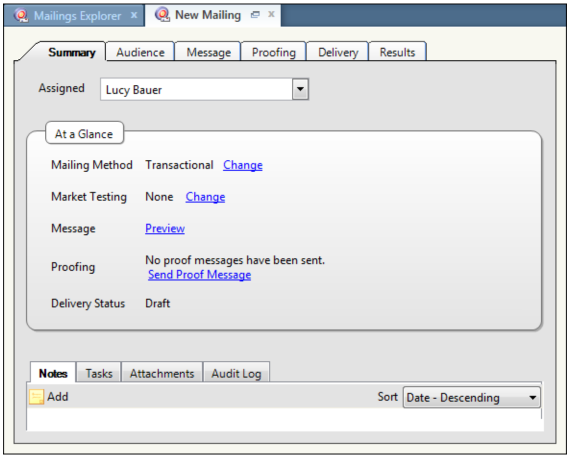
Tip You can also create a mailing from an open mailing by clicking the New button. Additionally, if your navigation set is configured to add mailings from the file menu, click File and select Mailing in the Create New Item section. See To configure the file menu.

2 Click Change in the Mailing Method section of the Summary tab. The Select Mailing Method window opens.



3 Select the Transactional radio button.

4 Click the OK button.



By default, the Summary tab is active. From here, you can review general information about the mailing in the At a Glance section, as well as manage the mailing's notes, tasks, and attachments (see Managing mailings). As you create the mailing, you move through each tab to complete the mailing's elements.

Note You can also add custom tabs to your mailings. Custom tabs give you quick access to elements you frequently use in your mailings. See Adding custom tabs.

5 To assign the mailing to another staff member (by default, the mailing is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

a To search for a staff member, type the staff member's name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

6 Click the text in the At a Glance section described in the following table to perform common mailing functions.

Table 476: At a Glance Section Description

Field	Description
Mailing Method	This field displays the mailing method currently selected for the mailing. Click Change to change the method and refer to Managing mailings.
Market Testing	This field displays the market testing mode of the mailing. Click Change to change market testing modes. See Market testing in transactional mailings.
Message	Click Preview to preview the mailing.
Proofing	This field displays the number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See Sending a proof message.
Delivery Status	This field displays the delivery status of the mailing and the number of emails sent and delivered. See Accessing transactional delivery options.

7 Click the Audience tab to define an audience for the mailing. See Defining the transactional mailing audience.

8 Click the Message tab to create the email sent to the mailing audience. See Customizing the message in transactional mailings.

9 Click the Proofing tab to send a proof of the mailing for internal review before sending it to the entire audience. See Sending a proof message.

10 Click the Delivery tab to select delivery options. See Accessing transactional delivery options.

11 Click the Results tab to view the report associated with the mailing. See Viewing mailing results.

Note If your application is configured with custom tabs for mailings, they display after the Results tab. See Adding custom tabs.

12 To spell check the mailing, click the Spell Check button and refer to Spell checking.

13 Click the Save and Close button to save the mailing. The Save As window opens.

Note You can click the Save button to save the mailing without closing it.

14 Select the folder you want to save the mailing in and type the name of the mailing in the Name field.

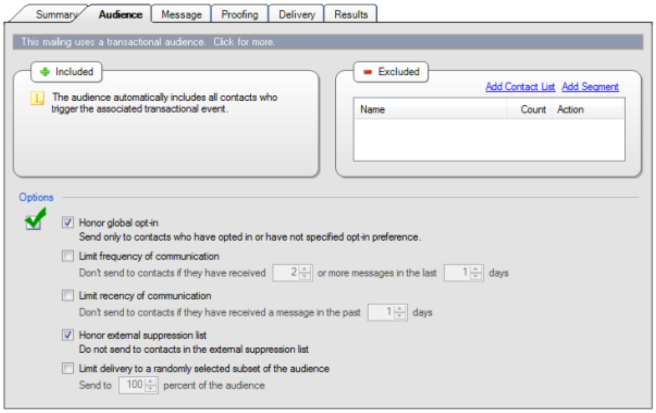
15 Click the Save button to save the mailing.

Defining the transactional mailing audience

Even though your rules and campaigns determine which customers receive the mailing, you still need to define certain audience elements if you want to exclude certain customers or configure opt-out and external suppression list settings. You can also restrict the scope of your audience, set mailing frequency and recency limits, and specify how to handle global opt-in and suppression options. See Audiences.

To define the audience

1 From an open mailing, click the Audience tab.



Note The audience for a transactional mailing automatically includes all contacts who trigger the associated transactional event. For that reason, you can select only who is excluded from the mailing, not who is included in it. You can exclude a total of fifty contact lists and segments, each containing a vast number of contacts.

2 To exclude a list from the audience, click Add Contact List in the Excluded section. The Select Contact List window opens.

   a To add a contact list, click New Contact List and refer to Adding contact lists.

   b Select the list you want to exclude from the mailing's audience and click the OK button. The list is added to the Excluded grid. Contacts belonging to the list do not receive the mailing.

3 To exclude a segment from the audience, click Add Segment in the Excluded section. The Select Segment window opens.

   a To add a segment, click New Segment and refer to Creating segments.

   b Select the segment you want to exclude from the mailing's audience and click the OK button. The segment is added to the Excluded grid. Contacts belonging to the segment do not receive the mailing.

4 To edit a list or segment that is excluded from the mailing, click Open next to the list or segment name. See Audiences.

5 To remove a list or segment from the Excluded section, click Remove next to the list or segment name.

6 Enter field information in the Options section described in the following table.

Table 477: Options Description

Field	Description
Honor global opt-in	Select this check box to send the mailing to contacts who did not explicitly opt out of receiving mailings. Clear this check box to send the mailing to all contacts in the audience, regardless of their opt-in preference.
Limit frequency of communication	Select this check box to set a mailing frequency limit, and then enter a maximum number of mailings and a number of days in which contacts can receive messages before they are excluded from mailings. When the mailing launches, it is not sent to any contacts who have received the maximum number of mailings within the designated time period. For more information about how this setting works, see Frequency and recency limits. **Note:** The minimum you can enter is 2 in the last 1 day. The maximum number of days you can enter is 90. **Tip:** To ensure contacts receive only 1 email every "x" number of days, use the Limit recency of communication setting described next.
Limit recency of communication	Select this check box to set a mailing recency limit. Enter the minimum number of days that should elapse before contacts receive another email. When the mailing launches, it is not sent to any contacts who have received a mailing in the past specified number of days. For more information about how this setting works, see Frequency and recency limits. **Note:** The maximum number of days you can enter is 90. The default value is 1 day. **Tip:** Use this check box to ensure contacts receive only one email every "x" number of days. For instance, if you want your contacts to receive only one email per week, you can select this check box and then set the field to seven.
Honor external suppression list	Select this check box to exclude contacts in the external suppression list from receiving the mailing. Clear this check box to send the mailing to all contacts in the audience, even if they are in the external suppression list. See External Suppression List.
Limit delivery to a randomly selected subset of the audience	Select this check box to send the mailing to a random subset of the audience. Type a percentage or use the up and down arrows to select a percentage of the audience to send the mailing to.

Table 477: Options Description (Continued)

Field	Description
Allow delivery of messages to multiple contacts sharing the same email address	Select this check box to send messages to multiple contacts sharing the same email address. If this check box is cleared, the message is only sent to the contact most recently updated. **Caution:** Because duplicate messages sent to a single address are a common characteristic of spam, you should select this check box only when necessary. When the check box is selected and you attempt to schedule or send a mailing, survey, or proof, and duplicate email addresses exist in your audience, a message warns you that your reputation as a bulk email sender may be adversely affected and impact your ability to send future communications. See *Best Practices for Email Marketing*. **Note:** This option is available only when email address sharing is enabled. See Email address sharing.

Customizing the message in transactional mailings

From the Message tab, you can activate **market testing** and specify the mailbox settings for the mailing, the subject of the email, and any URL parameters you want to attach to links in the message. In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site.

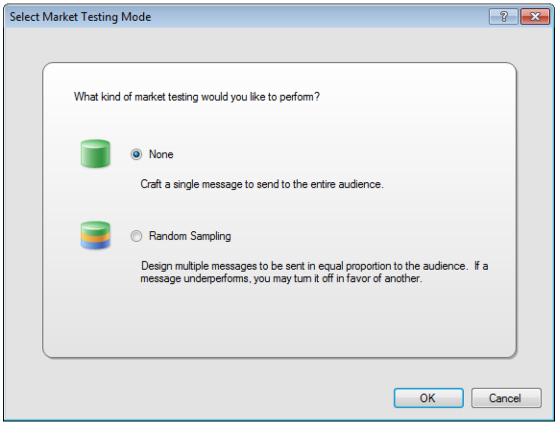
Creating a message follows the same procedure as creating a message in a broadcast mailing. See To create a message.

Market testing in transactional mailings

When creating a transactional mailing, you can test different formats on equal portions of your audience. If more than one message is created when market testing is used, then contacts sent the email through a campaign or rule are sent one of the messages. All messages have an equal number of recipients. In other words, when the mailing is **launched** through a campaign, it rotates between messages.

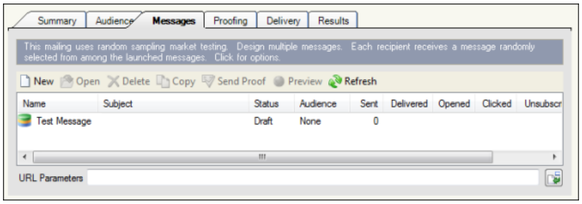
To activate market testing

1 On the Message tab of an open mailing, click the information bar and select Change Market Testing Mode. The Select Market Testing Mode window opens.



2 Select the Random Sampling radio button.

3 Click the OK button. The market testing page displays in random sampling mode.



By default, one message is sent to 100 percent of the audience. From here, you can add more messages, edit the messages, send proofs, or view results. You can also see information about each message, described in the following table.

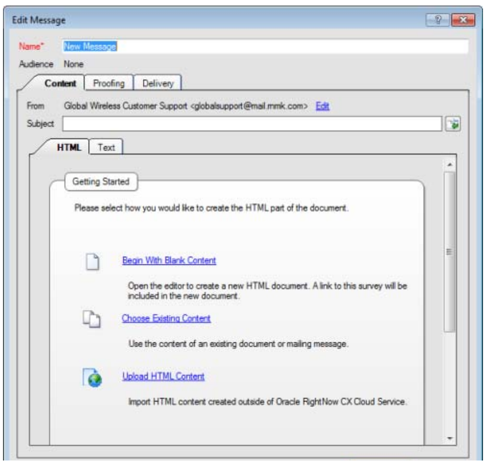
Table 478: Messages Description

Column	Description
Name	This column displays the name of the message.
Subject	This column displays the email's subject line for the message.

Table 478: Messages Description (Continued)

Column	Description
Status	This column displays the delivery status of the message.
Audience	This column displays the percentage of the audience the message is sent to.
Sent	This column displays the number of emails sent with the message.
Delivered	This column displays the number of emails sent with the message that did not bounce.
Opened	This column displays the number of unique email recipients who opened the message.
Clicked	This column displays the number of unique email recipients who clicked a tracked link.
Unsubscribed	This column displays the number of email recipients who unsubscribed from mailings. **Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See [Inserting unsubscribe links]().
Replied	This column displays the number of times the mailing was replied to.

4 Click the New button to add a second test message. The Edit Message window opens.



5 Type the name of the message in the Name field.

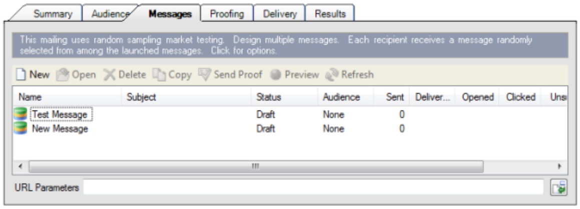
6 Type the subject of the message in the Subject field on the Content tab. See Customizing the message in transactional mailings.

7 Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See Using the HTML editor and Creating and editing text.

8 To send a proof message, click the Proofing tab on the Edit Message window. See Sending a proof message.

9 Click the Delivery tab on the Edit Message window to access delivery options. See Accessing transactional delivery options.

10 Click the OK button to save the message. The new test message appears on the Messages tab.



11 To open a message for editing, select the message and click the Open button.

12 To delete a message, select the message and click the Delete button.

13 To copy a message to create another test message, select the message and click the Copy button.

Important A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages are not shared with the original test message or subsequent copies. See Automatically generated folders.

14 To send a proof of a message, select the message and click the Send Proof button. See Sending a proof message.

15 To preview the content of a message, select the message and click the Preview button.

16 To refresh the message statistics, click the Refresh button.

17 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

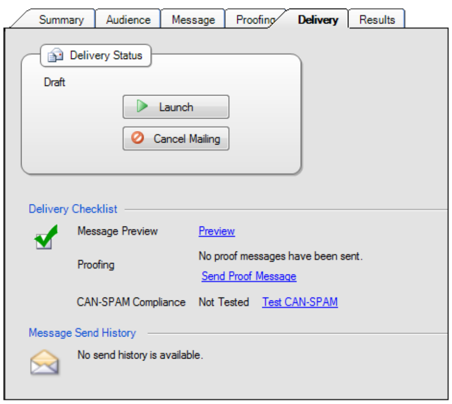
18 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See Inserting merge fields to URL parameters.

Accessing transactional delivery options

After you have defined the audience, created a message, and proofed the mailing, you can launch the mailing so it becomes active in rules and campaigns. From the Delivery tab, you can launch, suspend, or cancel the mailing, as well as access common administration tasks and see the send history.

To access transactional delivery options

From an open mailing, click the Delivery tab.



The Delivery tab is divided into sections. The Delivery Status section displays the status of the mailing (see Mailing delivery statuses) and contains buttons for controlling the sending of the mailing. You can perform the following tasks from this section.

- **Launch a mailing**—See Launching mailings.
- **Suspend a mailing**—See Suspending transactional mailings.
- **Cancel a mailing**—See Canceling transactional mailings.

Below this section, delivery information about the mailing is available for you to quickly scan and assess. The following table describes the Delivery sections.

Table 479: Delivery Sections Description

Section	Description
Message Preview	This section contains a link to preview the message that is sent with the mailing. Click Preview to preview the message.
Proofing	This section displays a summary report of message proofs associated with the mailing. Click Send Proof Message to send the message as a proof. See Sending a proof message.
CAN-SPAM Compliance	This section displays the results of the CAN-SPAM compliance test. Click Test CAN-SPAM to test the mailing for compliance with the CAN-SPAM Act. Click Details to view the results of a test. See CAN-SPAM compliance in mailings.
Message Send History	This section displays a log of events relating to the delivery status of the mailing. If the mailing has not been sent, it is noted here.

Launching mailings

Transactional mailings must be launched before they can be used in rules or campaigns. Once you launch a mailing, the status changes to Launched. From the Launched status, you can suspend the mailing or cancel it.

Note A launched transactional mailing cannot be edited. However, you can suspend the transactional mailing's message, make edits, and then re-launch it. See Suspending transactional mailings.

To launch a mailing

1 From the Delivery tab of an open mailing, click the Launch button. A message opens asking you to confirm that you want to launch the mailing.

2 Click the Yes button on the confirmation message to launch the mailing. The delivery status on the Delivery tab changes to Launched and you can see how many mailings were sent and delivered.

Important Some high-volume sites are configured to send mailings from a **replication database** to reduce the impact of large processes on the **operational database**. Because the sync between the replication database and the operational database can occasionally fall behind, the **mailer daemon** uses a fail-safe function before sending to ensure that the replication database is caught up. If it is not, the mailing waits until the replication database is synchronized. This fail-safe function ensures that the mailing reflects the current state of your production contact records (including those that are opted out or have email addresses marked as invalid) at the time the mailing is sent. If you are uncertain whether your site uses a replication database to send mailings, contact support or your Oracle account manager.

Suspending transactional mailings

You may want to stop sending a mailing after it has already been launched. You can temporarily stop a mailing from sending by suspending it.

To suspend a mailing

1 From the Delivery tab of an open mailing, click the Suspend button. This button appears only when a mailing has been launched. The Confirm Suspend message appears asking you to confirm that you want to suspend the mailing.

2 Click the Yes button to confirm suspending the mailing.

The status changes to Suspended and the Delivery Status section displays the number of audience members the mailing was already sent and delivered to.

Canceling transactional mailings

You can cancel a mailing at any time. When you cancel a mailing, the mailing is saved and you can still view mailing results. However, the mailing cannot be launched again or further modified.

Tip A canceled mailing can no longer be modified or sent. However, it can be copied to a new mailing, and the copy can be modified and sent.

To cancel a mailing

1 From the Delivery tab of an open mailing, click the Cancel Mailing button. The Confirm Canceling Mailing message appears asking you to confirm that you want to cancel the mailing.

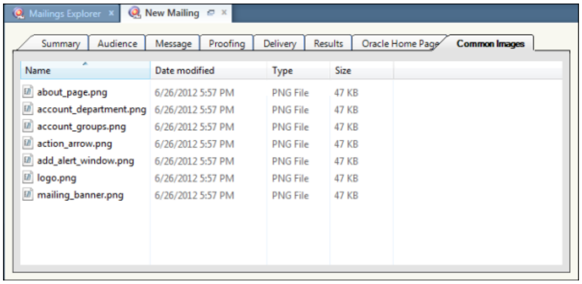
2 Click the Yes button to cancel the mailing. The delivery status changes to Canceled.

Adding custom tabs

Custom tabs give you quick access to elements you use frequently in your mailings. For example, if you use images in your mailings, you could add a tab with a URL link to the place where your images are stored. Likewise, if you use a web-based email deliverability tool (or any other type of web-based program), you could link to those programs.

You can also use merge fields in your custom tab to include attributes of the mailing in query string parameters or URL redirect links. See Inserting merge fields and Editing Redirect to URL attributes.

Custom tabs display after the Results tab on the mailings editor.



To add a custom tab to mailings

1 Click the Configuration button on the navigation pane.

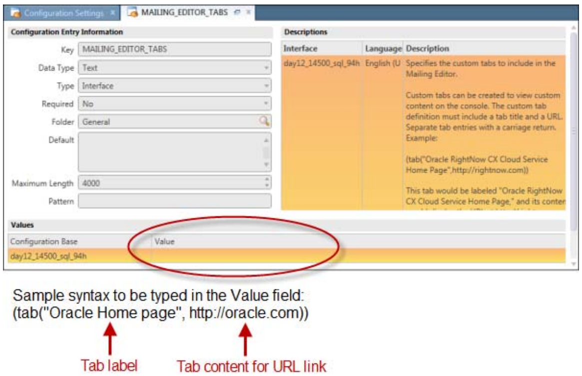
2 Double-click Configuration Settings under Site Configuration. The Search window opens.

3 Clear the Select All check box in the Folders field, select the RightNow User Interface check box, and click the Search button. The Configuration Settings editor opens.

4 Double-click the MAILING_EDITOR_TABS setting under RightNow User Interface > Miscellaneous > General to open the setting on the content pane.

Tip To display configuration settings in alphabetical order, click in the Key column header.

5 To add a URL link to your custom tab, type the label name and the associated link in the Value field using the following syntax: (tab("<label name>",<URL>))



6 To add a merge field, type the following sample code in the Value field:

```
(tab("Revenue",http://oracle.com/
revenue?report.php?mailing=$mailing.mailing_id))
```

7 To add more than one custom tab, press **Enter** to begin a separate line, and repeat steps 5–6.

8 Click the Save and Close button.

Note Your custom tab displays next to the Results tab on every new and existing mailing after you log out and then log back in.

CAN-SPAM compliance in mailings

Legal definitions and penalties for spam vary among countries. Therefore, it is important to stay abreast of current and pending legislation in the United States and other countries. There are many sites that you can check to stay current with the laws and to make sure your site is compliant.

The CAN-SPAM Act of 2003 requires that email marketers adhere to certain rules when sending commercial emails. Included in the requirements are the following conditions:

- Email does not contain false or misleading header information.
- Email does not use a deceptive subject line.
- Email contains a way for recipients to opt out of all emails, not just specific types.
- Email does not send to contacts that have previously opted out.
- Email must be identified as an advertisement in the subject line.
- Email includes the sender's physical mailing address, which must be displayed in ASCII text.
- Email that contains adult content is identified as such in the subject line.
- Email does not send to harvested or generated email addresses.
- Email does not send to domains in the Federal Communications Commission (FCC) wireless domain list.

Oracle Service Cloud helps you identify CAN-SPAM compliance issues. When creating a mailing or survey with a message, the system automatically checks that the message contains a physical address and an unsubscribe link, and honors global opt-in preferences. The remaining requirements must be manually verified by the staff member saving the mailing or survey.

For information about the CAN-SPAM Act, refer to the Federal Trade Commission (FTC) website.

Important The checklist is used to gauge your compliance with CAN-SPAM. You should use this checklist in conjunction with and not as a replacement for legal counsel.

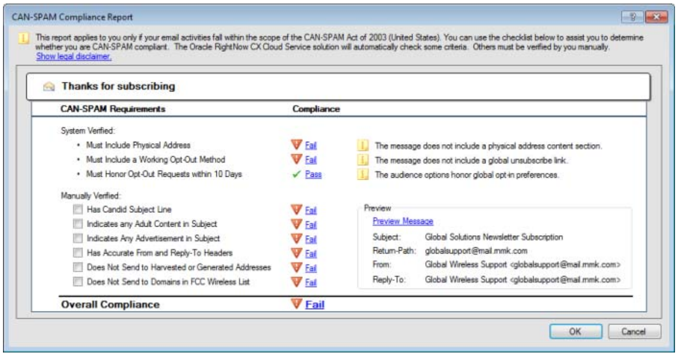
You can check for CAN-SPAM compliance from the Message tab of a mailing, the Invitation Message tab of a survey, or the Delivery tab of a mailing or survey.

To check CAN-SPAM compliance

1. From the Message tab of an open mailing, click the Test CAN-SPAM button in the Content section of the HTML editor.

   Or

   From the Delivery tab, click Test CAN-SPAM in the Delivery Checklist section. The CAN-SPAM Compliance Report opens.



The report shows whether each system-verified requirement passed or failed. The manually verified requirements can be selected or cleared based on your manual verifications. The following table describes the fields on the window.

Table 480: CAN-SPAM Compliance Report Description

Field	Description
System Verified	This section shows whether the following system-verified requirements passed or failed.
Must Include Physical Address	The system automatically verifies that a physical address is included in the message. For this requirement to pass, you must have inserted a physical address using the Insert Address button on the HTML editor. See Inserting physical addresses. If a text address has not been inserted using the Insert Address button, the requirement fails.
Must Include a Working Opt-Out Method	The system automatically verifies that a global unsubscribe link is included in the message. The unsubscribe link can be added by using the Unsubscribe Link button in the toolbox of the HTML editor. When this button is clicked, a window opens for selecting the opt-in field. If Global Opt-In is selected, the requirement passes when CAN-SPAM compliance is checked.

Table 480: CAN-SPAM Compliance Report Description (Continued)

Field	Description
Must Honor Opt-Out Requests within 10 Days	The system automatically verifies whether the global opt-in setting is honored by the mailing or survey. By default, the Honor Global Opt-In check box is selected on the Audience tab, which prevents messages from sending to contacts who have globally opted out of receiving communications. If this check box is not selected, the requirement fails when compliance is checked. Since contacts are instantly unsubscribed when they globally opt out of mailings, any global opt-out requests are automatically met within 10 days.
Manually Verified	This section allows you to select whether the following requirements passed or failed.
Has Candid Subject Line	You must manually verify that the message uses a candid subject line. CAN-SPAM compliance requires that the subject line of an email accurately reflects its contents. To pass this requirement, you should ensure that the subject line is not deceptive to the email recipient. You can view the subject line in the Preview section.
Indicates any Adult Content in Subject	You must manually verify that the subject identifies adult content in the message. The CAN-SPAM act requires that a message containing adult content must contain the text "SEXUALLY EXPLICIT" in the subject line of the email. You can view the subject line in the Preview section.
Indicates Any Advertisement in Subject	You must manually verify that the subject identifies the message as an advertisement, when applicable. The CAN-SPAM act requires that the message contains clear and conspicuous notice that the message is an advertisement or solicitation. To pass this requirement, you should ensure that the subject line accurately reflects the message's content. You can view the subject line in the Preview section.
Has Accurate From and Reply-To Headers	You must manually verify that the From and Reply-To headers contain accurate information. CAN-SPAM compliance requires that the From and Reply-To headers and routing information, including the originating name and email address, must accurately identify your organization. You can view the From and Reply-To headers and the return path in the Preview section.

Table 480: CAN-SPAM Compliance Report Description (Continued)

Field	Description
Does Not Send to Harvested or Generated Addresses	You must manually verify that you are not sending the message to harvested or generated addresses. Harvested email addresses are gathered from websites or web services that have published a notice prohibiting the transfer of email addresses for the purpose of sending email. Generated email addresses are formed by using a "dictionary attack," by combining names, letters, or numbers into multiple permutations.
Does Not Send to Domains in FCC Wireless List	You must manually verify that you are not sending the message to email addresses that contain domains in the FCC wireless list. The CAN-SPAM act prevents the sending of messages to wireless devices, such as mobile phones. The FCC publishes a list of domain names used by cellular companies that you can download at downloadable list of domain names used by cellular companies.
Overall Compliance	This section indicates whether the email is entirely CAN-SPAM compliant. All of the compliance criteria in this table must be met for overall compliance to pass.
Preview	This section lets you preview the following parts of a mailing.
Preview Message	Click this text to preview the message.
Subject	Displays the subject of the mailing message.
Return-Path	Displays the mailbox address the message is being sent from.
From	Displays the From address of the message.
Reply-To	Displays the Reply-To address of the message.

2 Select the check box next to the manually verified items that you have verified.

3 Click the OK button.

Improving your email marketing

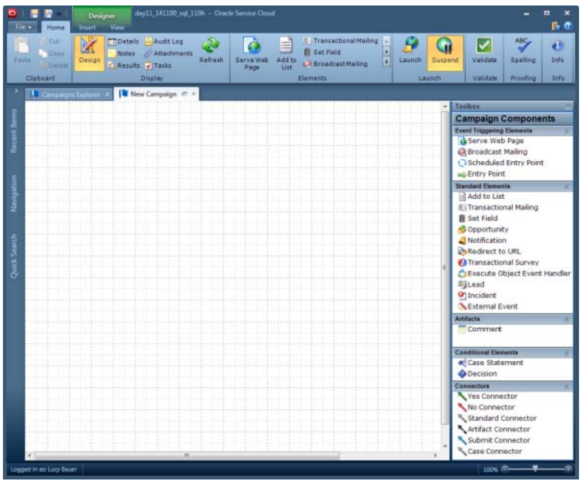
In addition to anti-spam legislation, many other external factors can negatively impact the efficiency and success of your mailings. It is important that you follow industry-accepted best practices to protect your reputation, optimize your audience, and produce well-formed content. While these best practices do not guarantee that your emails will always be accepted, they improve the chances that your messages will be delivered to the intended recipients with minimal interference from content monitors and filters. Since these practices are focused on improving the quality of your contact data as well as your messages, your conversion rates will most likely improve as well. For a list of best practices, see *Best Practices for Email Marketing*.

72

Outreach Campaigns

Oracle RightNow Outreach Cloud Service (Outreach) provides a powerful solution for building and managing dynamic, multiple-step marketing campaigns. Using the intuitive campaign designer, you can create your campaign as a flow diagram comprised of a series of conditional elements that can trigger a variety of business processes. Based on criteria you define, your campaign can send mailings, add contacts to **lists**, create **incidents** and **opportunities**, notify staff, and perform many other useful actions.

When creating and editing a campaign, you perform most tasks using the ribbon, canvas, and campaign components. These tools provide all of the resources you need to design and launch any campaign, simple or complex.



In addition, you can define a budget and predict your campaign's return on investment. Once your campaign is launched, you can review its results and compare them against your estimates to evaluate the effectiveness of your design.

Campaign design ribbon

The campaign design ribbon includes three standard tabs (Home, Insert, and View) as well as two contextual tabs (Element Tools and Path Tools) that become visible when an element or connector is selected on the canvas. Each tab has one or more groups containing buttons you can use to modify the campaign or elements on the canvas.

Home tab

The Home tab gives you access to options that impact the entire campaign. For example, you can manage campaign details, review results, create tasks, select element types, and validate, launch, and suspend the campaign.

The groups and buttons on the Home tab are described in the following table.

Table 481: Home Tab Description

Group/Button	Description
Clipboard	The buttons in this group provide access to basic editing commands when working with components on the canvas.
Paste	Click this button to paste the contents of the clipboard.
Cut	Click this button to cut selected components from the canvas to the clipboard.
Copy	Click this button to copy selected components from the canvas to the clipboard.
Delete	Click this button to delete selected components from the canvas.
Display	The buttons in this group display different campaign details on the **content pane**.
Design	Click this button to display the design canvas on the content pane. When a campaign is first created, this button is active by default.

Table 481: Home Tab Description (Continued)

Group/Button	Description
Details	Click this button to display the campaign details on the content pane. Refer to Managing campaigns.
Notes	Click this button to add notes about the campaign.
Results	Click this button to review the campaign results.
Audit Log	Click this button to view the **audit log**.
Attachments	Click this button to add attachments to the campaign.
Tasks	Click this button to add tasks to the campaign. Refer to Managing campaigns.
Refresh	Click this button to see the latest updated information as you are editing your campaign. For example, on a Scheduled Entry Point, clicking this button would update the last run, next run, and last modified information.
Elements	The buttons in this group let you add campaign components to your flow diagram. For a description of available components, refer to Designing flow diagrams in campaigns. **Note:** Components can also be accessed from the Campaign Components toolbox.
Launch	The buttons in this group let you launch or suspend the campaign.
Launch	Click this button to launch the campaign.
Suspend	Click this button to suspend the campaign. When a campaign is first created, this button is active by default.
Validate	Click this button to check the campaign flow diagram for errors. Refer to Validating campaigns.
Spelling	Click this button to check for spelling errors in the editable text portions of the campaign.
Info	Click this button to view information about the campaign.

Insert tab

The Insert tab allows you to add components to your campaign flow diagram, either one at a time or in predefined campaign templates.

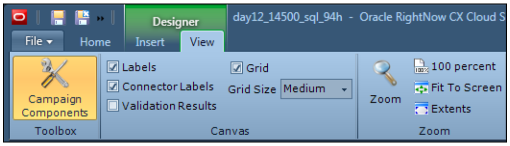
The groups and buttons on the Insert tab are described in the following table.

Table 482: Insert Tab Description

Group/Button	Description
Template	The buttons in this group let you select a predefined flow template to apply to your campaign. Refer to Campaign templates. **Caution:** When you add a template, any content you previously added is deleted from the canvas.
Ad Conversion	Hover over this button to see a preview of the Ad Conversion campaign template. Click the button to add the template to the canvas. Refer to Ad Conversion.
Email Promotion	Hover over this button to see a preview of the Email Promotion campaign template. Click the button to add the template to the canvas. Refer to Email Promotion.
Event Registration	Hover over this button to see a preview of the Event Registration campaign template. Click the button to add the template to the canvas. Refer to Event Registration.
Information Request	Hover over this button to see a preview of the Information Request campaign template. Click the button to add the template to the canvas. Refer to Information Request.
Subscription Management	Hover over this button to see a preview of the Subscription Management campaign template. Click the button to add the template to the canvas. Refer to Subscription Management.
Elements	The buttons in this group let you select components to add to your flow diagram. Refer to Designing flow diagrams in campaigns. **Note:** Components can also be accessed from the toolbox.

View tab

The View tab provides access to the component toolbox and options for changing your view of the design canvas.



The groups and buttons on the View tab are described in the following table.

Table 483: View Tab Description

Group/Button	Description
Campaign Components	Click this button to display the toolbox.
Canvas	The check boxes and drop-down menu in this group let you select canvas options.
Labels	Select this check box to display labels for elements in the diagram.
Connector Labels	Select this check box to display labels for connectors in the diagram. Labels display by default.
Validation Results	Select this check box to display validation icons in the diagram.
Grid	Select this check box to display the canvas grid.
Grid Size	Click this drop-down menu to select the size of the canvas grid.
Zoom	The buttons in this group let you select a zoom level for the canvas.
Zoom	Click this button to access the Zoom Options window. Refer to To select zoom options.
100 percent	Click this button to view the canvas at its normal size.
Fit To Screen	Click this button to adjust the zoom level to show all elements.
Extents	Click this button to show the entire canvas.

As described in the previous table, you can change the view of the design canvas from the View tab, including displaying design grid elements and adjusting the zoom level. These options make it easier to review and edit your flow diagram.

To select canvas options

1 To display labels for elements on the canvas, select the Labels check box.

2 To display labels for connectors on the canvas, select the Connector Labels check box.

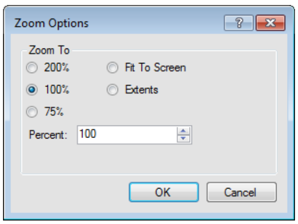
3 To display validation results on the canvas, select the Validation Results check box and refer to Validating campaigns.

4 To display the canvas grid, select the Grid check box.

5 To change the size of the canvas grid, click the Grid Size drop-down menu.

To select zoom options

1 From an open campaign, click the Zoom button on the View tab. The Zoom Options window opens.



2 To specify a desired zoom level, select a radio button in the Zoom To section.

a To adjust the zoom level to show all components, select the Fit to Screen radio button.

b To show the entire canvas, select the Extents radio button.

3 Type a zoom percentage in the Percent field. Click the up or down arrow to increase or decrease the value.

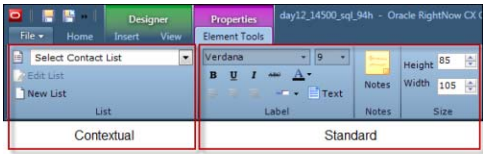
Tip You can also change the magnification of the canvas using the zoom slider located in the bottom right corner of the Service Console.

4 Click the OK button to close the window.

Contextual tabs

When you select an element or connector on the canvas, the ribbon displays a fourth contextual tab. When an element is selected, the Element Tools tab appears. This tab is divided into two sections. On the left are contextual groups and buttons, meaning they change depending on the element selected. On the right are standard groups and buttons, meaning they display no matter what element is selected.

The following figure displays the Element Tools tab and shows the contextual group of buttons for the Add to List element on the left and the standard group of buttons on the right.



The standard groups and buttons on the Element Tools tab are described in the following table.

Table 484: Element Tools Tab Description

Group/Button	Description
Label	The buttons in this group let you change the font style, size, and color. You can select font attributes, such as bold and italic, and change the text's alignment.
 (Label Position)	Click this button to select the position of the label relative to the element. The default label position of a new element is Inside.
	Click this button to type the text of the element label. **Note:** You can also edit the label text inline by clicking the element label.
Notes	Click this button to type notes about the element.
Size	The buttons in this group let you change the height and width of the element.

Another contextual tab that displays on the ribbon is the Path Tools tab. This tab displays when you select a connector. The buttons on this tab let you format the connector and change the connector type.

The standard groups and buttons on the Path Tools tab are described in the following table. Also see Creating connectors in campaigns.

Table 485: Path Tools Tab Description

Group/Button	Description
Type	Click this drop-down to change the type of the selected connector. **Note:** A connector's type can be changed only when it is not connected to a standard or event-triggering element.
Style	The buttons in this group let you change the line style of the selected connector.
Straight	Click this button to set the connector line style to straight.
Square	Click this button to set the connector line style to square.
Rounded Square	Click this button to set the connector line style to rounded square.
Curved	Click this button to set the connector line style to curved.

Creating campaigns

Outreach provides an intuitive graphical interface for creating and editing campaigns. When designing a campaign, you can drag components from the toolbox and order them on the canvas. (You can select components from either the Home or Insert tab on the ribbon.)

ORACLE SERVICE CLOUD Watch Tutorial

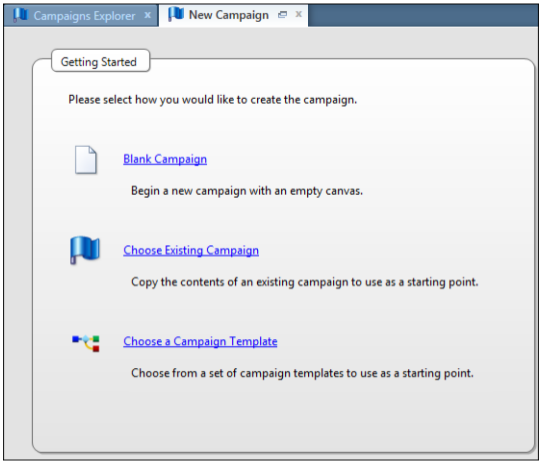
You can also define the objectives for the campaign by including a text summary and estimating expenses and return on investment. Once the campaign has been launched, you can view its results to assess the effectiveness of your efforts.

Note The following procedure assumes that you access the Campaigns explorer from the Campaigns **navigation list**. However, this explorer may reside in a different navigation list.

To create a campaign

1 Click the Campaigns button on the **navigation pane** and double-click Campaigns Explorer. The Campaigns explorer opens on the **content pane**.

2 Click the New button to select a starting point for your new campaign.



a Click Blank Campaign to open a new campaign with a blank design canvas.
b To create a new campaign by copying the design of an existing campaign, click Choose Existing Campaign and refer to Choosing an existing design.
c To create a new campaign by copying a campaign template, click Choose a Campaign Template and refer to Campaign templates.

Tip You can also create campaigns from an open campaign by clicking the New button. Additionally, if your navigation set is configured to add campaigns from the file menu, click File and select Campaign in the Create New Item section. See To configure the file menu.

By default, the design canvas is active when creating a campaign. From here, you can design the campaign's flow diagram. Refer to Designing flow diagrams in campaigns.

3 Click the Details button to manage campaign details, including assignment, start and end dates, and objectives. Refer to Managing campaigns.

4 Click the Results button to view the campaign results. Note that this report will display no data until the campaign has been launched. Refer to Viewing results.

5 Click the Tasks button to add tasks to the campaign. Refer to Adding tasks to campaigns.

6 Click the Save and Close button to save the campaign. The Save As window opens.

Note You can click the Save button to save the campaign without closing it.

7 Select the folder you want to save the campaign in and type the name of the campaign in the Name field.

8 Click the Save button to save the campaign.

Designing flow diagrams in campaigns

The first step in creating a campaign is to design a flow diagram. The flow diagram is a graphical representation of the campaign's "flow," the actions and decisions your campaign will perform, and the order in which it will perform them. Your flow diagram can be as simple as a single path connecting a few actions, or it can be complex, routing your audience through dozens of actions, paths, and decision points. With its simplified graphical interface, Outreach makes creating a complex workflow as easy as clicking and dragging components into a logical order.

Whether your business needs are simple or complex, start by reviewing the elements available in the toolbox and consider how each might help accomplish your campaigns's key objectives. Once you have a clear idea which elements will be useful, you can create the flow diagram by dragging them from the toolbox to the canvas, inserting each element in a logical position, and connecting them to define the sequence of action. Once an element has been inserted, you can double-click it to open a window where you can edit its attributes.

Tip When explaining attributes that can be edited on a window or the ribbon, we describe the procedure using the window. However, keep in mind that the ribbon provides easy access to most of the same attributes available on windows, without the need to double-click. Campaign components can also be dragged to your flow diagram from the Elements groups on the Home and Insert tabs.

When a campaign is launched and a contact performs the first **action**, the decisions and actions in each element are evaluated and executed in the sequence you have specified. For example, when a contact submits a web form, your campaign evaluates the information provided and executes the next action, such as creating a sales lead and sending a follow-up message to the contact.

To create a flow diagram

1 From an open campaign, drag and drop an element from the toolbox onto the canvas. Refer to the following table for a description of the available elements.

Table 486: Elements Description

Element	**Description**
Event Triggering Elements	Event-triggering elements serve as starting points for campaigns.
Serve Web Page	Drag and drop this element to serve a web page. After adding this element, double-click it to define its attributes. Right-click to preview the web page. Refer to Editing Serve Web Page attributes.
Broadcast Mailing	Drag and drop this element to send a broadcast mailing. **Note:** Once a broadcast mailing has been added to a campaign, it cannot be added to any other campaign. After adding this element, double-click it to define its attributes. Refer to Editing Broadcast Mailing attributes.
Scheduled Entry Point	Drag and drop this element to create an entry point to the campaign based on a recurring schedule. After adding this element, double-click it to define its attributes. Refer to Editing Scheduled Entry Point attributes.

Table 486: Elements Description (Continued)

Element	Description
Entry Point	Drag and drop this element to create a standard entry point to the campaign. Entry points can be used to send a contact through the campaign from an outside source by using the Data Upload Wizard. After adding this element, double-click it to define its attributes. Refer to Editing Entry Point attributes.
Standard Elements	Standard elements perform actions when specified criteria are met.
Add to List	Drag and drop this element to add the contact to a list. After adding this element, double-click it to define its attributes. Refer to Editing Add to List attributes.
Transactional Mailing	Drag and drop this element to send a transactional mailing to the contact. After adding this element, double-click it to define its attributes. Refer to Editing Transactional Mailing attributes.
Set Field	Drag and drop this element to set one of the fields in the contact record. After adding this element, double-click it to define its attributes. Refer to Editing Set Field attributes.
Opportunity	Drag and drop this element to create an opportunity from the contact record. After adding this element, double-click it to define its attributes. Refer to Editing Opportunity attributes.
Notification	Drag and drop this element to send a notification to one or more staff members. After adding this element, double-click it to define its attributes. Refer to Editing Notification attributes.
Redirect to URL	Drag and drop this element to redirect the contact to a URL. After adding this element, double-click it to define its attributes. Refer to Editing Redirect to URL attributes.
Transactional Survey	Drag and drop this element to send a transactional survey to the contact. After adding this element, double-click it to define its attributes. Refer to Editing Transactional Survey attributes.
Execute Object Event Handler	Drag and drop this element to add a contact-related object event handler that will trigger an external event action. See Editing Execute Object Event Handler attributes.

Table 486: Elements Description (Continued)

Element	Description
Lead	Drag and drop this element to create a lead from the contact record. After adding this element, double-click it to define its attributes. Refer to Editing Lead attributes.
Incident	Drag and drop this element to create an incident from the contact record. After adding this element, double-click it to define its attributes. Refer to Editing Incident attributes.
External Event	Drag and drop this element to run an external event. External events are scripts that run outside of Oracle Service Cloud. After adding this element, double-click it to define its attributes. Refer to Editing External Event attributes.
Artifacts	Artifact elements let you make comments about your campaign. They do not affect the outcome of your flow diagram.
Comment	Drag and drop this artifact to add comments about your flow diagram or a specific campaign component. A comment artifact does not require a connector, but if your comment is about a specific element, use the Artifact connector type. See Creating connectors in campaigns.
Conditional Elements	Conditional elements produce multiple path outcomes based on decisions.
Case Statement	Drag and drop this element to add a case statement to the campaign. A case statement is a type of conditional element that lets you add multiple choice decisions. This give you an easy way to add diverse branching capabilities to your campaigns based on conditions defined in the workflow. Case statements are unique because they have an outgoing path for every condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated. Refer to Creating connectors in campaigns. After adding the case statement, double-click it to define its attributes. Refer to Editing Case Statement attributes.

Table 486: Elements Description (Continued)

Element	Description
Decision	Drag and drop this element to add a decision point. A decision allows you to specify conditions the contact must meet to advance in the workflow. You can create two outgoing paths from a decision: Yes (contact meets the criteria) and No (contact does not meet the criteria). Refer to Creating connectors in campaigns. After adding the decision, double-click it to define its attributes. Refer to Editing Decision attributes.

2 To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second. Refer to Creating connectors in campaigns.

3 To change the formatting of an element, select the element and refer to the following table.

Table 487: Element Tools Tab Description

Group/Button	Description
Label	The buttons in this group let you change the font style, size, and color. You can select font attributes, such as bold and italic, and change the text's alignment.
 (Label Position)	Click this button to select the position of the label relative to the element. The default label position of a new element is Inside.
	Click this button to type the text of the element label. **Note:** You can also edit the label text inline by clicking the element label.
Notes	Click this button to type notes about the element.
Size	The buttons in this group let you change the height and width of the element.

Tip To select multiple elements at once, press **Ctrl** and select each component.

4 To cut, copy, or paste one or more components, click the appropriate button on the Clipboard group of the Home tab.

5 To undo an action on the canvas, click the Undo button on the Quick Access toolbar.

6 To redo an action on the canvas, click the Redo button on the Quick Access toolbar.

7 To export an image of the canvas to your workstation, click File and select Export Image.

Creating connectors in campaigns

Connectors are components used to link elements and indicate flow direction. Elements can be connected to other elements depending on their type. The type of connector is indicated by its color, as described in the following table.

Table 488: Types of Connectors

Connector	Color	Description
Yes	Green	This type of connector links a decision element to another element. The path is taken if the contact meets the criteria specified in the decision.
No	Red	This type of connector links a decision element to another element. The path is taken if the contact does not meet the criteria specified in the decision.
Standard	Gray	This type of connector links one element to another element. The second action is performed immediately after the first.
Artifact	Black (Dashed)	This type of connector links a comment to an element.
Submit	Blue	This type of connector submits an element's web form fields to the database and then links to another element. A web form can be a document with a web form or survey questions. **Note:** In order for the submit connector to work, there must be a submit action on the web form that's used in the campaign. See Inserting survey results links.

Table 488: Types of Connectors (Continued)

Connector	Color	Description
Case	Gray	This type of connector links a case statement element to another element. The path is taken if the contact meets the criteria specified in the case statement.

Each element can have a specific number of incoming and outgoing connectors. Refer to the following table for a list of the number of connectors allowed in each element.

Table 489: Connectors Allowed for Element Types

Element	Connectors Allowed
Add to List	• Unlimited incoming connectors • 1 outgoing standard connector
Broadcast Mailing	• No incoming connectors • 1 outgoing submit path
Case Statement	• Unlimited incoming connectors • 1 outgoing connector for each choice.
Decision	• Unlimited incoming connectors • 1 outgoing Yes connector • 1 outgoing No connector
Entry Point	• No incoming connectors • 1 outgoing standard connector
Execute Object Event Handler	• Unlimited incoming connectors • 1 outgoing standard connector
External Event	• Unlimited incoming connectors • 1 outgoing standard connector
Incident	• Unlimited incoming connectors • 1 outgoing standard connector
Lead	• Unlimited incoming connectors • 1 outgoing standard connector
Notification	• Unlimited incoming connectors • 1 outgoing standard connector

Table 489: Connectors Allowed for Element Types (Continued)

Element	Connectors Allowed
Opportunity	• Unlimited incoming connectors • 1 outgoing standard connector
Redirect to URL	• Unlimited incoming connectors • 1 outgoing standard connector
Scheduled Entry Point	• No incoming connectors • 1 outgoing standard connector
Serve Web Page	• Unlimited incoming connectors • 1 outgoing standard connector (if incoming path exists) • 1 outgoing submit connector
Set Field	• Unlimited incoming connectors • 1 outgoing standard connector
Transactional Mailing	• Unlimited incoming connectors • 1 outgoing standard connector • 1 outgoing submit connector
Transactional Survey	• Unlimited incoming connectors • 1 outgoing standard connector • 1 outgoing submit connector

To connect an element

To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. The anchor is highlighted when the connector is able to link to it. The connector arrow will point from the first element to the second. When you connect your element types this way, the system automatically applies the correct connector type.

Note If you use the wrong connector type, the element anchor will not be highlighted. See Connectors Allowed for Element Types.

Other ways to connect elements include:

- Hover over the first element and click a blue arrow to link to an adjoining element.

- Drag one element over another, hover over its blue arrow until it turns dark blue, and then drop to connect the elements. Connecting your elements this way auto-links them with the correct connector type.
- Click an element from the toolbox, and then hover over an element on the canvas and click its blue arrow to drop and auto-link the new element.
- Drag and drop a connector from the toolbox to the canvas, and then drag the ends of the connector to the elements you want to link.

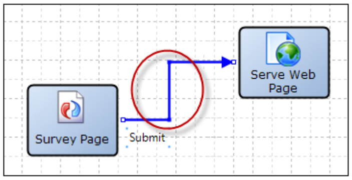
Tip To auto-link your elements, drag your connector over both elements until they are highlighted, and then drop to connect them. Remember, if you select the wrong connector type, your elements will not be highlighted.

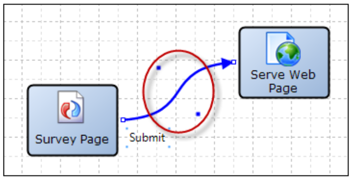
To connect to a different element

Click a midpoint on the connector to select it and drag one of its ends to an anchor on a different element to create a different connection.

To edit a square or curved connector

Click a midpoint on a square or curved connector to select it and drag the calibration points to adjust the shape of the connection. The following figures show the calibration points on square and curved connectors.





To delete a connector

Click a midpoint on the connector to select it and press **Delete**.

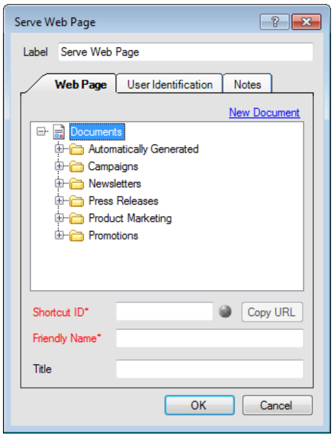
Editing Serve Web Page attributes

Once you add a Serve Web Page element to your flow diagram, you can edit its attributes to select a document to serve as a web page through Oracle Service Cloud. You can specify the shortcut ID used to generate the URL and choose whether to prefill the web form in the document with contact fields stored in the contact's cookies or passed as parameters in the URL. You can also customize the title of the page you are editing. The page title displays in the title bar of the web browser when the survey is taken. Refer to Creating documents.

Tip Use a submit path to connect this element to the next element when the web page contains a web form or survey questions.

To edit Serve Web Page attributes

1 Double-click the Serve Web Page element to open the Serve Web Page window.



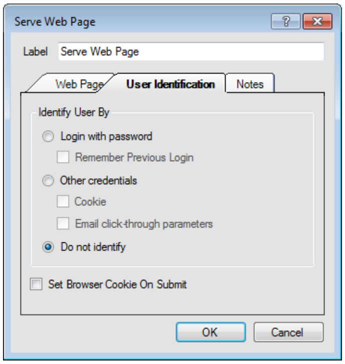
2 Type the name of the element in the Label field.

3 Enter the following field information.

Table 490: Serve Web Page Window Description

Field	Description
Documents	Select the document you want to use as a web page from this list. To search for a document, right-click the list and select Search. Then type the document name in the Find field.
New Document	Click this text to create a document. Refer to Creating documents.
***Shortcut ID**	Type the shortcut ID that is used to format the URL in this field. The URL for the document will be: http://<your_domain>/ci/documents/detail/2/<shortcut_ID> **Note:** This shortcut ID must be unique for all Serve Web Page elements in all surveys and campaigns.
 (View Web Page)	Click this button to open the web page in a browser. **Note:** The button is inactive until the campaign is launched. If the shortcut ID is edited after launching, the button is inactive until the campaign is saved.
	Click this button to copy the web page URL to the clipboard. **Note:** The URL will not be valid until the campaign is launched.
***Friendly Name**	Type the name of your web page. This name is used when linking to the web form from another document.
Title	Type the name of the page as you want it to display in the title bar of the web browser when the survey is taken. **Note:** If you leave this field blank, either the document title or the template title will display in the web browser title bar. If a template has been applied to the document the web page uses, then the template title is used.

4 Click the User Identification tab.



Note You can specify default values for the settings on the User Identification tab by editing optional configuration settings. Refer to Customizing Outreach and Feedback settings.

5 Enter the following field information.

Table 491: User Identification Tab Description

Field	Description
Identify User By	Select from the following options to prefill a web form (if one is included in your document).
Login with Password	Select this radio button to require the contact to log in to the **customer portal** before viewing the web form.
Remember Previous Login	Select this check box to identify the contact through the contact's Oracle Service Cloud login cookie. If a login cookie does not exist, the contact is redirected to the login page on the customer portal. If this check box is cleared, the contact is always required to log in through the customer portal before viewing the web form.
Other Credentials	Select this radio button to identify the contact by a cookie or through URL parameters.
Cookie	Select this radio button if you want to use the contact's browser cookie to prefill the web form. The contact's record is updated with the form submission.

Table 491: User Identification Tab Description (Continued)

Field	Description
Email Click-Through Parameters	Select this radio button if you want to use parameters passed in the URL to prefill the web form. **Note:** If using this option to prefill a web form from a link in a mailing, be sure to use a web page link instead of a **tracked link**. Because tracked links are used to redirect to external sites, they do not support click-through parameters.
Do Not Identify	Select this radio button if you never want the web form to be pre-filled. **Note:** A contact record is updated through the web form if the email address field is included and can be matched to an existing record.
Set Browser Cookie on Submit	Select this check box if you want to set the contact's browser cookie upon submitting the form. If the contact accesses any form later, the form will be prefilled if the Cookie radio button is selected for that form.

Tip You can set default values for the user identification fields by editing the configuration settings located at Outreach and Feedback > General > Campaigns. Note that default values specified by these settings impact both new campaigns and new advanced surveys.

6 To add any notes associated with the element, click the Notes tab and type the notes.

7 Click the OK button.

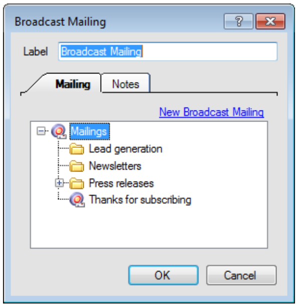
Editing Broadcast Mailing attributes

Once you add a Broadcast Mailing element to your flow diagram, you can edit its attributes to define which mailing to send. You can choose to create a mailing or use an existing mailing in your database. Refer to Creating broadcast mailings.

Tip Use a submit connector to connect this element to the next element when the mailing contains a web form.

To edit Broadcast Mailing attributes

1 Double-click the Broadcast Mailing element to open the Broadcast Mailing window.



2 Type the name of the element in the Label field.

3 Select the mailing you want to send from the list.

a To search for a mailing, right-click the list and select Search. Then type the mailing name in the Find field.

4 To create a broadcast mailing, click New Broadcast Mailing and refer to To create a broadcast mailing.

Note When adding a new broadcast mailing to a campaign, you cannot send or schedule the mailing until you save the campaign.

5 To add any notes associated with the element, click the Notes tab and type the notes.

6 Click the OK button.

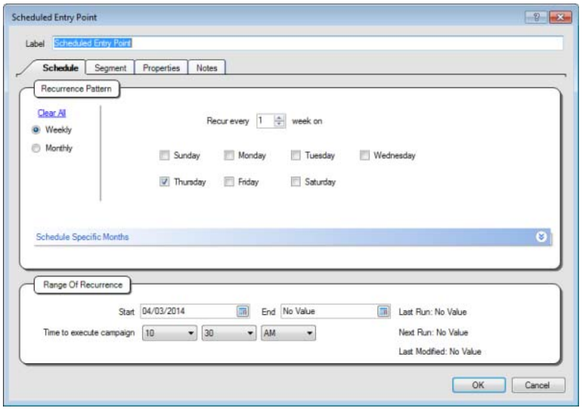
Editing Scheduled Entry Point attributes

Once you add a Scheduled Entry Point element to your flow diagram, you can edit its attributes to schedule regular runs of a campaign for a designated segment. Once launched, a scheduled campaign can be edited, suspended, rescheduled, or canceled at any time. Information about past runs—such as the time last run, next scheduled run time, the time the schedule was last updated, and basic results data—is stored in the knowledge base and tracked in the Recurring Campaigns Summary report. Also, each recurrence is tracked in the campaign's **audit log** along with a description of how many contacts were processed. Refer to Audit logs.

Note To avoid conflicts, campaigns may contain only one Scheduled Entry Point. Those containing a Scheduled Entry Point cannot contain a broadcast mailing and cannot be selected to run automatically when using the Data Upload Wizard.

To edit Scheduled Entry Point attributes

1 Double-click the Scheduled Entry Point element to open the Scheduled Entry Point window.



2 Type the name of the entry point in the Label field.

3 Enter the following field information on the Schedule tab.

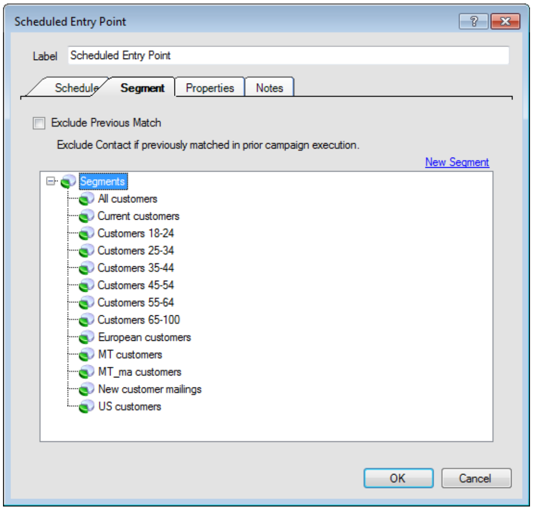
Table 492: Scheduled Entry Point Window Description

Field	Description
Recurrence Pattern	Select the weekly or monthly interval for the campaign to be launched. For example, a mailing can be sent every two weeks on Tuesday, or every month on the 7th and 19th.
Clear All	Click this text to clear all selected recurrence pattern check boxes.

Table 492: Scheduled Entry Point Window Description (Continued)

Field	Description
Monthly	Select this radio button to display check boxes for the days of the month. You can then select the days of the month when you want to send the campaign.
Weekly	Select this radio button to display check boxes for each day of the week. You can then select the check boxes next to the days when you want to send the campaign. When you select this radio button, a Recur drop-down menu displays where you specify the frequency of the weekly mailing or survey. For example, if you want to send a mailing every week on the days selected, enter 1 in the field. If you want the mailing to be sent every third week on the days selected, enter 3 in the field. This field accepts values from 1 to 99.
Schedule Specific Months	Click this header to display check boxes for the months of the year. Select the months during which you want to send the campaign. By default, every month is selected, but if you do not want to send during a specific month, you can clear the check box for that month.
Clear All	Click this text to clear all check boxes for the selected months.
Range of Recurrence	Options in this section let you specify a date range for the recurrence and time of day to send the campaign.
Start	Enter the start date of the schedule or click the calendar to open a calendar from which you can select the start date. The current day is the default start date.
End	Enter the end date of the schedule or click the calendar to open a calendar from which you can select the end date.
Time to execute campaign	Enter the time of day to begin sending the campaign.

4 Click the Segment tab and select the segment you want the campaign to act on.



a. To exclude contacts from the segment that were included in a previous instance of the recurrence, select the Exclude Previous Match check box.
b. To create a new segment, click New Segment.

5. Click the Properties tab and type the shortcut ID of the entry point in the Shortcut ID field. This value is used to identify the entry point and must be unique for each campaign.

6. Type the name of the entry point in the Friendly Name field.

7. To add any notes associated with the entry point, click the Notes tab and type the notes.

8. Click the OK button.

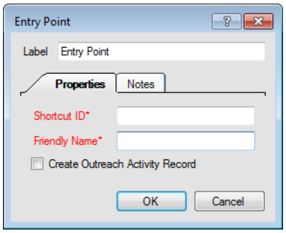
Editing Entry Point attributes

Once you add an Entry Point element to your flow diagram, you can edit its attributes to define its name and shortcut. The shortcut can be passed as a parameter to send contacts through the campaign, beginning at the entry point.

The entry point can also be used when contacts are uploaded using the Data Import Wizard. Refer to Importing data.

To edit Entry Point attributes

1. Double-click the Entry Point element to open the Entry Point window.



2 Type the name of the entry point in the Label field.

3 Type the shortcut ID of the entry point in the Shortcut ID field. This value is used to identify the entry point and must be unique for each campaign.

4 Type the name of the entry point in the Friendly Name field.

5 Select the Create Outreach Activity Record check box to record a transaction when a contact enters the flow diagram at an entry point. This can be used to report on the entry point in outreach activity reports, including on the Outreach Activity tab when editing a contact record.

6 To add any notes associated with the entry point, click the Notes tab and type the notes.

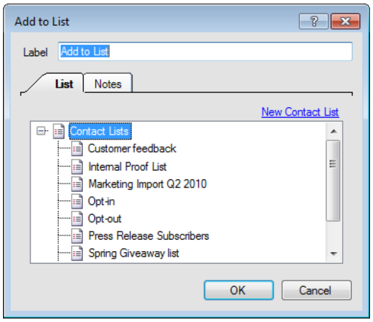
7 Click the OK button.

Editing Add to List attributes

Once you add an Add to List element to your flow diagram, you can edit its attributes to define which list the contact is added to. You can select from predefined lists in your system or create a list. Refer to Adding contact lists.

To edit Add to List attributes

1 Double-click the Add to List element to open the Add to List window.



2 Type the name of the element in the Label field.

3 Select a contact list from the List tab.

a To search for a contact list, right-click the list and select Search. Then type the list name in the Find field.

4 To create a contact list, click New Contact List and refer to To add a contact list.

5 To add any notes associated with the element, click the Notes tab and type the notes.

6 Click the OK button.

Editing Transactional Mailing attributes

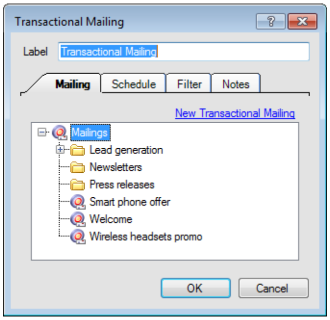
Once you add a Transactional Mailing element to your flow diagram, you can edit its attributes to define which mailing to send to a contact. In addition, you can choose to send the mailing immediately, at an exact time, or at a certain interval. If the mailing is scheduled to be sent at a certain interval, it is stored until the **mailer daemon** sends it. By default, the mailer daemon sends scheduled transactional mailings every fifteen minutes. If you want the utility to send mailings more frequently, you must edit the RNMD_EVENT_PROC_INTERVAL configuration setting.

Note The Transactional Mailing element simply schedules a mailing to be sent. It does not pause the processing of the flow until the mailing is sent. Therefore, any elements following this element in the flow continue to be processed immediately, even if the mailing is scheduled to be sent in the future.

This element can be filtered using segments. If you choose to filter a transactional mailing, you can select whether contacts who are in or not in the segment will be sent an email. Refer to Creating transactional mailings.

To edit Transactional Mailing attributes

1 Double-click the Transactional Mailing element to open the Transactional Mailing window.



2 Type the name of the element in the Label field.

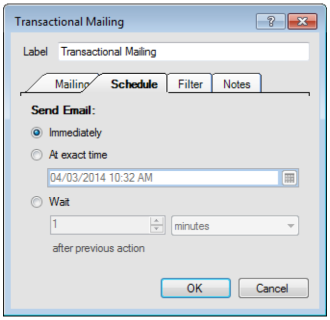
3 Select the mailing you want to send.

a To search for a mailing, right-click the list and select Search. Then type the mailing name in the Find field.

Note In order to send a transactional mailing, it must be in a launched state. If you select a transactional mailing that has not been launched, it does not send and the system advances to the next element in your flow diagram.

4 To create a transactional mailing, click New Transactional Mailing and refer to [To create a transactional mailing](#).

5 Click the Schedule tab.

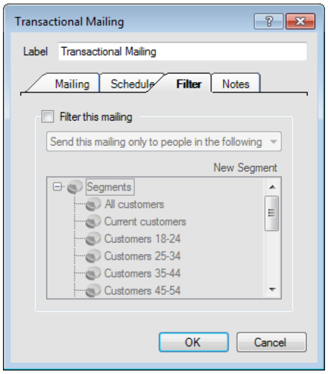


6 Enter the following field information.

Table 493: Schedule Tab Description

Field	Description
Immediately	Select this radio button to send the email immediately after the action occurs.
At exact time	Select this radio button and click the calendar (to the right of the date field) to select a specific date and time to send the email. **Note:** If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a delivery time for the mailing is scheduled.
Wait	Select this radio button to send the mailing a specified amount of time after the action is triggered in the flow. Use the up and down arrows to select the number of units, and click the drop-down menu to select the interval (minutes, hours, days, or weeks). **Note:** If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a delivery time for the mailing is scheduled.

7 Click the Filter tab to select whether or not contacts should be included in the segment to be filtered from the mailing.



8 Select the Filter this Mailing check box.

9 Click the drop-down menu and select whether or not customers in the segment will receive the mailing.

10 Select a segment for the mailing.

11 To add a segment, click New Segment and refer to To create a segment.

12 To add any notes associated with the element, click the Notes tab and type the notes.

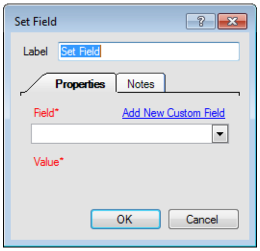
13 Click the OK button.

Editing Set Field attributes

Once you add a Set Field element to your flow diagram, you can edit its attributes to specify the value of contact fields. You can specify a number of different field values, including opt-in status, state, or any contact custom fields defined in your system.

To edit Set Field attributes

1 Double-click the Set Field element to open the Set Field window.



2 Type the name of the element in the Label field.

3 Click the Field drop-down menu and select the contact field you want to set the value of.

4 To add a new contact custom field, click Add New Custom Field and refer to Adding and editing custom fields.

5 Enter a value for the contact field you selected.

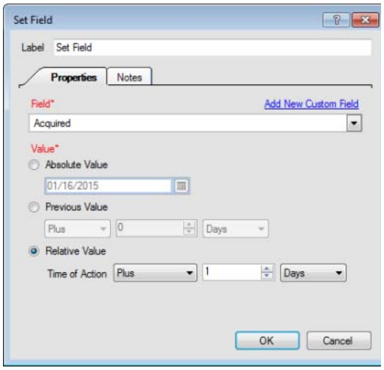
Note In addition to setting explicit (absolute) values, you can set null values for text and text area fields as well as relative values for some field types. Relative values are defined by adding or subtracting (or appending or prepending) a value to the field's previous value. Refer to Setting relative field values.

6 To add any notes associated with the element, click the Notes tab and type the notes.

7 Click the OK button.

Setting relative field values

In addition to setting absolute field values for date, date/time, integer, text, and text area fields, you can set relative values. When setting a value for one of these field types, clicking the Value drop-down menu presents additional options for adding or subtracting (or appending or prepending) a value to the field's previous value. For example, you can increment the value of an integer field by 1 or append text to a contact text field. For date and date/time fields, you can also set a value relative to the time of action, such as adding one day to the current date and time.



Options for setting relative field values vary by field type and are described in the following table.

Table 494: Relative Field Value Options

Field Type	Value Options
Date	Add or subtract a number of days or weeks to or from the previous value or the current date.
Date/Time	Add or subtract a number of minutes, hours, days, or weeks to or from the previous value or the current date and time.

Table 494: Relative Field Value Options (Continued)

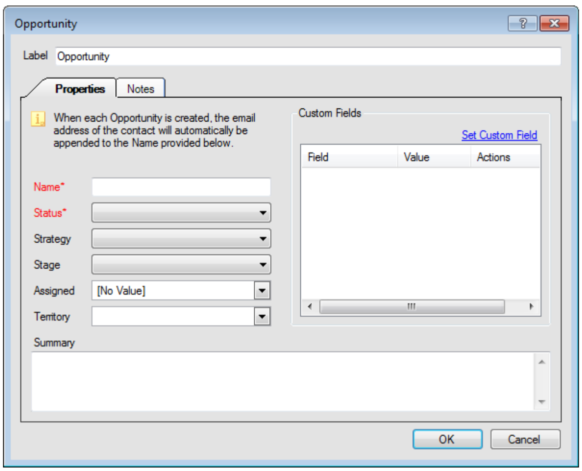
Field Type	Value Options
Integer	Add or subtract an integer value to or from the current value. **Note:** The resulting value cannot be greater than the maximum value defined for the field or less than the minimum. Therefore, the maximum value you can add or subtract is the field's maximum value minus the field's minimum value. For example, if the field maximum is 8 and the field minimum is -8, the maximum value you can add or subtract from the current value is 16.
Text Field	Prepend or append a text value to the current text value.
Text Area	Prepend or append a text value to the current text value.

Editing Opportunity attributes

Once you add an Opportunity element to your flow diagram, you can edit its attributes to define fields of the opportunity created by this element. You can specify the opportunity's name, status, strategy, stage, assigned sales representative, and territory. Refer to Opportunities overview.

To edit Opportunity attributes

1 Double-click the Opportunity element to open the Opportunity window.



2 Type the name of the element in the Label field.

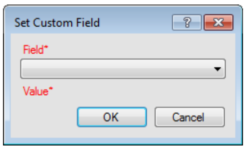
3 Enter the following field information.

Table 495: Opportunity Window Description

Field	Description
*Name	Type the name of the opportunity in this field.
*Status	Click this drop-down menu to assign a status to the opportunity.
Strategy	Click this drop-down menu to assign the opportunity to a strategy.
Stage	Click this drop-down menu to assign the opportunity to a stage. The options in this menu depend on the strategy selected.
Assigned	Click this drop-down menu to assign the opportunity to a sales representative. Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members. **Tip:** Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.
Territory	Click this drop-down menu to assign the opportunity to a territory.
Summary	Type a summary of the opportunity in this field.

4 Click Set Custom Field to set custom fields for the opportunity. The Set Custom Field window opens.

Note You must define custom fields in the Custom Fields editor before you can set a custom field for an opportunity. See Adding and editing custom fields.



a Click the Field drop-down menu to select the custom field you want to set.

b Enter the value of the custom field in the Value field.
c Click the OK button. The custom field and its value appear in the Custom Fields grid.

5 To edit the value of a custom field, click Edit next to the custom field.

6 To remove the set value of a custom field, click Delete next to the custom field.

7 To add any notes associated with the element, click the Notes tab and type the notes.

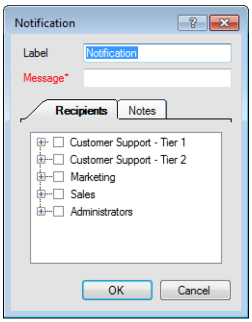
8 Click the OK button.

Editing Notification attributes

Once you add a Notification element to your flow diagram, you can edit its attributes to define which staff members to notify. You can select multiple staff accounts and customize the notification message. Details about the notification and contact record are automatically included in the notification email.

To edit Notification attributes

1 Double-click the Notification element to open the Notification window.



2 Type the name of the element in the Label field.

3 Type the message you want to appear in the subject line of the notification in the Message field.

4 Select the check boxes of the staff members you want to notify.

5 To add any notes associated with the element, click the Notes tab and type the notes.

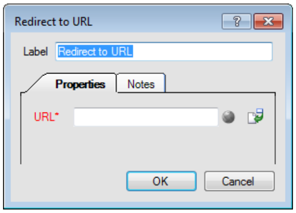
6 Click the OK button.

Editing Redirect to URL attributes

Redirect to URL elements let you define a web page that your customers are redirected to once they complete the previous action in the workflow. After you add a Redirect to URL element to your flow diagram, you can edit its attributes to specify the URL you want to send the contact.

To edit Redirect to URL attributes

1 Double-click the Redirect to URL element to open the Redirect to URL window.



2 Type the name of the element in the Label field.

3 Type the URL of the website you want to redirect the contact to in the URL text box. The protocol must be specified. The following protocols are supported:

- file:///
- ftp://
- gopher://
- http://
- https://
- mailto:
- nntp:
- news:

4 To open the URL in a browser, click the Open URL button (to the right of the URL field).

5 To add a contact, incident, opportunity, or tracked link field to the URL as a parameter, click the Merge Field button (to the right of the Open URL button). See Inserting merge fields.

6 To add any notes associated with the element, click the Notes tab and type the notes.

7 Click the OK button.

Editing Transactional Survey attributes

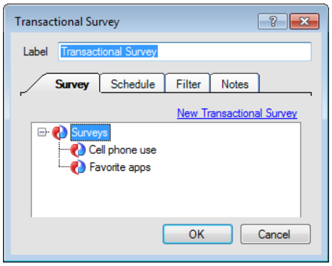
Once you add a Transactional Survey element to your flow diagram, you can edit its attributes to define which survey to send to a contact. In addition, you can choose to send the survey immediately, at an exact time, or at a certain interval. If the survey is scheduled to be sent at a certain interval, the survey is stored until the **mailer daemon** sends it. By default, the mailer daemon is scheduled to send scheduled transactional surveys every fifteen minutes.

Note The Transactional Survey element simply schedules a survey to be sent. It does not pause the processing of the flow until the survey is sent. Therefore, any elements following this element in the flow continue to process immediately, even if the survey is scheduled to be sent in the future.

This element can be filtered using segments. If you choose to filter a transactional survey, you can select whether contacts who are in or not in the segment will be sent an email. Refer to Creating transactional surveys.

To edit Transactional Survey attributes

1 Double-click the Transactional Survey element to open the Transactional Survey window.



2 Type the name of the element in the Label field.

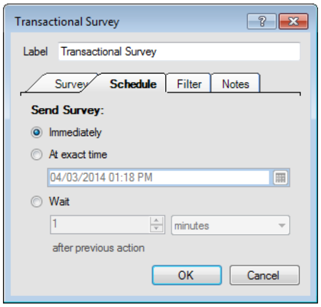
3 Select the survey you want to send.

a To search for a survey, right-click the list and select Search. Then type the survey name in the Find field.

Note In order to send a transactional survey, it must be in a launched state. If you select a transactional survey that has not been launched, it is not sent and the system advances to the next element in your flow diagram.

4 To create a transactional survey, click New Transactional Survey and refer to [To create a transactional survey](#).

5 Click the Schedule tab.

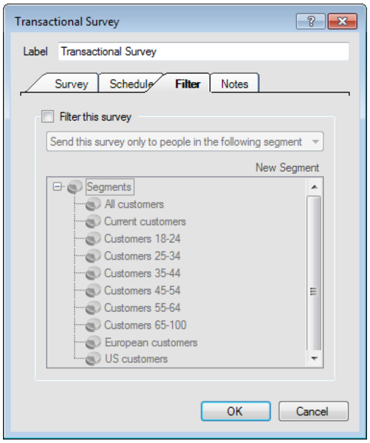


6 Enter the following field information.

Table 496: Schedule Tab Description

Field	Description
Immediately	Select this radio button to send the survey immediately after the action occurs.
At exact time	Select this radio button and click the calendar (to the right of the date field) to select a specific date and time to send the survey. **Note:** If this option is selected, a clock icon appears on the Transactional Survey element to indicate that a delivery time for the survey is scheduled.
Wait	Select this radio button to send the survey a specified amount of time after this action is triggered in the flow. Use the up and down arrows to select the number of units, and click the drop-down menu to select the interval (minutes, hours, days, or weeks). **Note:** If this option is selected, a clock icon appears on the Transactional Survey element to indicate that a delivery time for the survey is scheduled.

7 Click the Filter tab.



8 Select the Filter this Survey check box.

9 Click the drop-down menu and select whether or not customers in the segment will receive the survey.

10 Select a segment for the survey.

11 To add a segment, click New Segment and refer to To create a segment.

12 To add any notes associated with the element, click the Notes tab and type the notes.

13 Click the OK button.

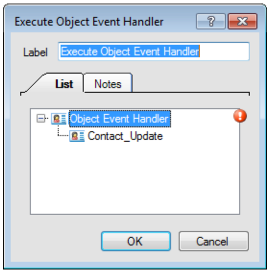
Editing Execute Object Event Handler attributes

You can add contact-related object event handlers to your campaign that can be associated with create and update operations on contact objects. Object event handlers are added and managed on the process designer in a virtual container called the **process model**. Once you add your object event handlers on the process designer and deploy the process model, you can add an Execute Object Event Handler element to your flow diagram and then associate it with one your object event handlers to trigger an action. See Adding object event handlers.

Note Only synchronous object event handlers are applicable to campaigns.

To edit Execute Object Event Handler attributes

1 Double-click the Execute Object Event Handler element. The Execute Object Event Handler window opens.



Note Contact objects must be added on the process designer and then the process model must be deployed for objects to display on the List tab.

2 Type the name of the element in the Label field.

3 Select an object event handler from the List tab.

4 To add notes about the object event handler, click the Notes tab and type your notes.

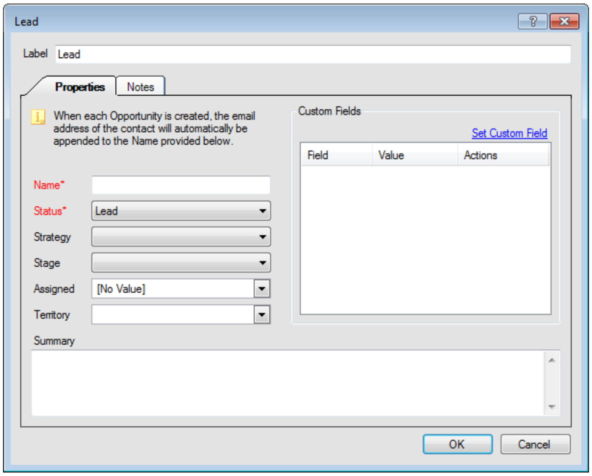
5 Click the OK button to add the object event handler to the flow.

Editing Lead attributes

Once you add a Lead element to your flow diagram, you can edit its attributes to define fields of the lead created by this element. You can specify the lead's status, strategy, stage, assigned sales representative, and territory. Refer to Accepting and rejecting leads.

To edit Lead attributes

1 Double-click the Lead element to open the Lead window.



2 Type the name of the element in the Label field.

3 Enter the following field information.

Table 497: Lead Window Description

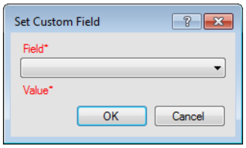
Field	Description
*Name	Type the name of the lead in this field.
*Status	Click this drop-down menu to assign a status to the lead. Only statuses with a Lead status type display. This field is set to Lead by default.
Strategy	Click this drop-down menu to assign the lead to a strategy. Only strategies with a stage assigned the Lead status type display.
Stage	Click this drop-down menu to assign the lead to a stage. The options in this menu depend on the strategy selected.

Table 497: Lead Window Description (Continued)

Field	Description
Assigned	Click this drop-down menu to assign the lead to a sales representative. Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members. **Tip:** Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.
Territory	Click this drop-down menu to assign the lead to a territory.
Summary	Type a summary of the lead in this field.

4 Click Set Custom Field to set custom fields for the lead. The Set Custom Field window opens.

Note You must define custom fields in the Custom Fields editor before you can set a custom field for a lead. See Adding and editing custom fields.



a Click the Field drop-down menu to select the custom field you want to set.
b Enter the value of the custom field in the Value field.
c Click the OK button. The custom field and its value appear in the Custom Fields grid.

5 To edit the value of a custom field, click Edit next to the custom field.

6 To remove the set value of a custom field, click Delete next to the custom field.

7 To add any notes associated with the element, click the Notes tab and type the notes.

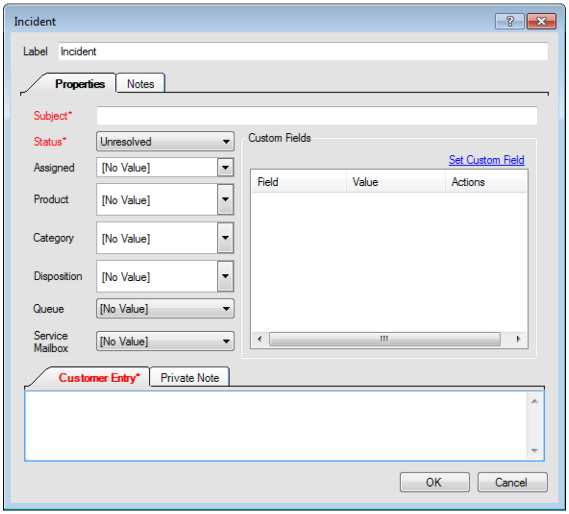
8 Click the OK button.

Editing Incident attributes

Once you add an Incident element to your flow diagram, you can edit its attributes to define the subject, status, and other elements of the created incident. Refer to Incidents overview.

To edit Incident attributes

1 Double-click the Incident element to open the Incident window.



2 Type the name of the element in the Label field.

3 Enter the following field information.

Table 498: Incident Window Description

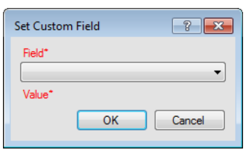
Field	Description
*Subject	Type the subject of the incident in this text box.
*Status	Click this drop-down menu to select a status to assign to the incident. The default status is Unresolved.

Table 498: Incident Window Description (Continued)

Field	Description
Assigned	Click this drop-down menu to select a group or staff member to assign to the incident. Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members. **Tip:** Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.
Product	Click this drop-down menu to select a product for the incident.
Category	Click this drop-down menu to select a category for the incident.
Disposition	Click this drop-down menu to select a disposition for the incident.
Queue	Click this drop-down menu to select a queue for the incident.
Service Mailbox	Click this drop-down menu to select a mailbox to associate with the incident.
*Customer Entry	Type a default value for the customer thread in this text box.
Private Note	Click this tab to type a default value for the notes thread.

4 Click Set Custom Field to set custom fields for the incident. The Set Custom Field window opens.

Note You must define custom fields in the Custom Fields editor before you can set a custom field for an incident. See Adding and editing custom fields.



a Click the Field drop-down menu to select the custom field you want to set.

b Enter the value of the custom field in the Value field.

c Click the OK button. The custom field and its value appear in the Custom Fields grid.

5 To edit the value of a custom field, click Edit next to the custom field.

6 To remove the set value of a custom field, click Delete next to the custom field.

7 To add any notes associated with the element, click the Notes tab and type the notes.

8 Click the OK button.

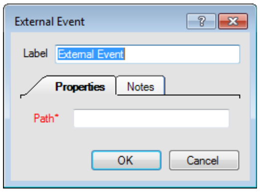
Editing External Event attributes

Once you add an External Event element to your flow diagram, you can edit its attributes to specify the path to your external event. In order to pass contact data to the external event, you must create a template file specifying the data format. For information about external events or assistance in creating external event template files, contact your Oracle account manager.

Important External events have been deprecated and may be permanently removed in a future release. Instead, you can use contact-related object event handlers to trigger actions. See Editing Execute Object Event Handler attributes.

To edit External Event attributes

1 Double-click the External Event element to open the External Event window.



2 Type the name of the element in the Label field.

3 Type the full path name of a script or program used to externally process the event in the Path field.

4 To add any notes associated with the element, click the Notes tab and type the notes.

5 Click the OK button.

Adding Comment artifacts

The toolbox also provides a Comment artifact that allows you to enter comments in your diagram without impeding the campaign flow. Comments are added to the canvas in the same way elements are and can be linked to elements using the Artifact connector type.

To add a comment

1 Drag and drop a Comment artifact from the toolbox onto the canvas.

2 Click the artifact to type your comments.

3 To connect the artifact to an element, click an anchor on the artifact and drag to an anchor on the element. The anchor is highlighted when the connector is able to link to it.

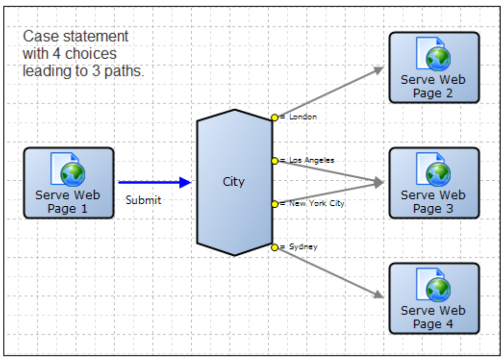
Editing Case Statement attributes

Case statements help you branch your workflow based on multiple conditions that you define. They are unique because you define an outgoing path for each condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated.

Once you add a case statement element to your flow diagram, you can edit its attributes to branch your flow to different paths based on whether contacts meet certain conditions. When you edit the case statement, you can define multiple conditions using a contact field in the database, a question, or a score.

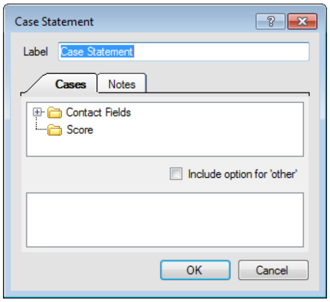
Score pertains to the cumulative score from all preceding survey question responses. Score always displays on the Cases tab, even when no survey is used in the campaign. Questions, on the other hand, are available only if a survey exists in your campaign.

Case statements differ from decisions because they let you add multiple paths to your flow.



To edit Case Statement attributes

1 Double-click the Case Statement element to open the Case Statement window.

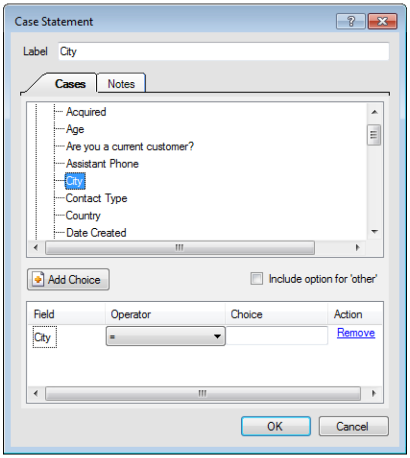


2 Select a contact field or score from the Cases tab.

Note Keep in mind that depending on the item you select, choices are either already defined by default or you must define them.

3 If you want to add an “other” path to your case statement, select the Include Option for Other check box.

4 To add a choice that is not defined by default, click the Add Choice button. The bottom section of the Case Statement window displays options to define logical expressions for your choices.



Note The Add Choice button does not display if choices have already been defined by default. For example, Contact Type or Global Opt-in under Default Contact Fields have choices defined. Therefore, the Add Choice button does not display when these fields are selected.

5 Click the Operator drop-down menu to select the logical symbol that completes your expression.

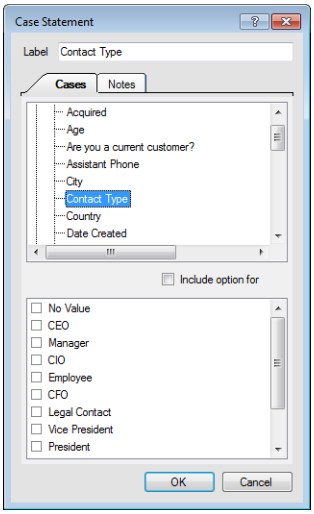
6 Type the field's value in the Choice field.

7 To add another choice that is not defined by default, repeat steps 4 through 6.

8 To delete a choice, select the choice and click Remove.

9 To add a choice that is defined by default, select the check boxes next to the choices you want to include in your case statement.

Note Cases with menu, yes/no, and opt-in items present you with default choices defined by the database.



10 To add any notes associated with the element, click the Notes tab and type the notes.

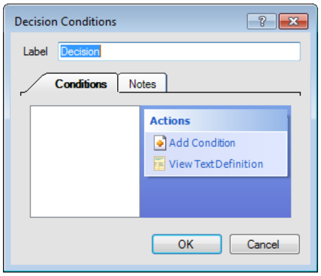
11 Click the OK button to add the case statement to the flow.

Editing Decision attributes

Decision elements let you branch your workflow based on two outgoing paths you define. Once you add a Decision element to your flow diagram, you can edit its attributes requiring contacts to meet certain criteria before moving down the Yes path. Contacts who do not meet the criteria are moved down the No path (if one exists). When you edit the decision, you can define conditions based on contact fields or question responses and a logical expression based on the conditions.

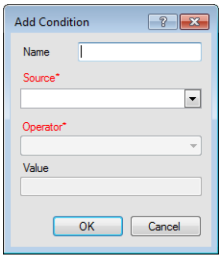
To edit Decision attributes

1 Double-click the Decision element to open the Decision Conditions window.



2 Type the name of the decision in the Label field.

3 Click the Add Condition button to create a condition for the Yes path. The Add Condition window opens.



a Type the name of the condition in the Name field.

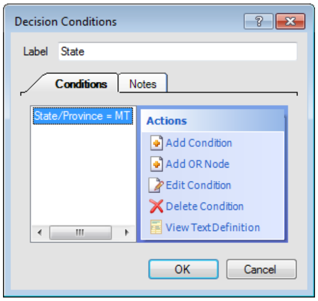
b Click the Source drop-down menu and select a database field or survey question.

c Click the Operator drop-down menu and select the logical symbol that completes the condition.

d Type the value of the field or click the drop-down menu and select the value in the Value field.

e Click the OK button to add the condition to the decision.

This expression determines which contacts meet the condition (for example, State/Province=MT or <menu question>=<specified answer>).



By default, when multiple conditions are added, they are joined by AND. When the AND operator is used, contacts are moved down the Yes path when all the conditions are met. You can further limit your data set by using the Boolean operators OR and NOT. When the OR operator is used, contacts are moved down the Yes path when any of the conditions are met.

4 To add an OR to your expression, click the Add OR Node button. Conditions attached to the OR node are joined by OR.

5 To edit a condition, select the condition and click the Edit Condition button.

6 To delete a condition, select the condition and click the Remove Condition button.

Note The Add OR Node, Edit Condition, and Delete Condition buttons display only after you have added a condition.

7 Click the View Text Definition button to see your conditions as a logical expression.

8 To add any notes associated with the element, click the Notes tab and type the notes.

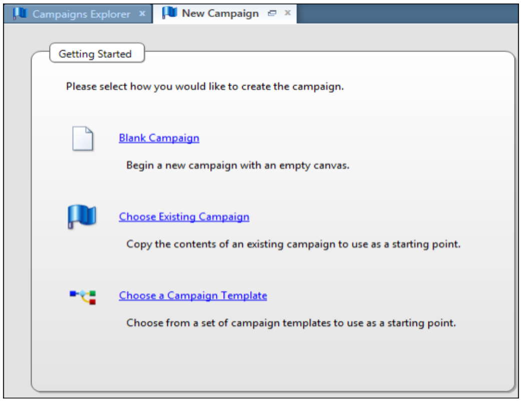
9 Click the OK button.

Choosing an existing design

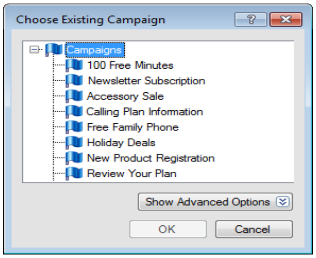
When creating a new campaign, there may be times when you want to start with a flow diagram that was previously designed for another campaign. This can be accomplished by making a copy of an existing campaign to create your new campaign. When you copy a campaign to create your design, you can also choose to copy element attributes from the original or start with empty attributes. You can then make changes and additions to the new campaign without impacting the original.

To choose an existing design

1 Click the New button to open the Getting Started section to select a starting point for your campaign.

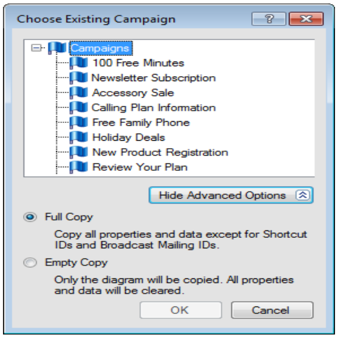


2 Click Choose Existing Campaign. The Choose Existing Campaign window opens.



3 Select the campaign you want to use.

4 To select how the campaign is inserted, click the Show Advanced Options button.



- **a** To copy the campaign diagram's element attributes, including labels and other fields, select the Full Copy radio button. (Broadcast mailing IDs and shortcut IDs will not be copied, as these values must be unique.)
- **b** To copy the campaign diagram without its element attributes, select the Empty Copy radio button. (After copying, you will need to edit each element to enter its attributes.)

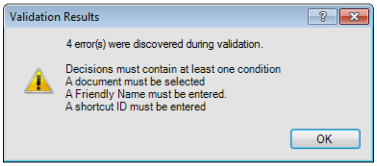
5 Click the OK button to add the campaign design to your diagram.

Tip Outreach also provides a number of predefined campaign templates that support common business processes. Refer to Campaign templates.

Validating campaigns

As you create a flow diagram for your campaign, Outreach validates all flow components to ensure all required attributes have been specified. Although validation occurs in real time as you add and update the components, you can also force validation manually at any time by clicking the Validate button on the Home tab.

You can choose to display validation flags by selecting the Validation Results check box on the View tab (see View tab). This way, valid components are flagged with a green check mark, while those found to be invalid are flagged with a red exclamation point and a small button you can click to view the validation error. If you attempt to launch a campaign without first addressing its validation errors, the flags automatically display (even if you have not selected the Validation Results option) along with a message summarizing the errors, as shown in the following figure.



Launching and suspending campaigns

After you have designed and validated your campaign, you must launch it to make it active. Once a campaign has been launched, you can suspend it and relaunch it at a later time.

To launch or suspend a campaign

1 To launch or relaunch the campaign, click the Launch button on the Home tab.

  a Click the OK button to save the campaign in a launched state.

2 To suspend the campaign, click the Suspend button.

  a Click the OK button to save the campaign in a suspended state.

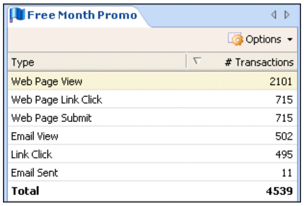
3 Click the Save button to save the campaign.

Important When you suspend a campaign, you do not suspend all of the mailings that are associated with the campaign. You are simply preventing new contacts from entering the flow.

If you want to suspend mailings that are included in the campaign flow, you must do so from the mailings. See Suspending broadcast mailings.

Viewing results

When you click the Results button on the Home tab, the content pane displays a report listing the type of transactions that have occurred over the life of the campaign, sorted by the number of instances.



Free Month Promo

Options

Type	# Transactions
Web Page View	2101
Web Page Link Click	715
Web Page Submit	715
Email View	502
Link Click	495
Email Sent	11
Total	**4539**

In addition to the campaign results, Outreach features a variety of reports for viewing detailed campaign performance statistics. See [Viewing reports](#).

Managing campaigns

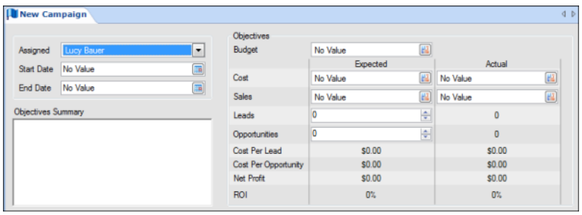
In addition to the flow diagram, campaigns can be further defined by a variety of other configuration options, including campaign objectives, tasks, notes, and file attachments. You can also view an **audit log** to see when a campaign was created and edited. This section describes how to create objectives and tasks for your campaign. For information about notes, file attachments, and the audit log, refer to [Working with records](#).

Setting campaign details

The campaign details settings let you assign a campaign to a staff member, set start and end dates, and define the campaign's objectives. Once a campaign is launched, this section also displays a report listing opportunities generated by the campaign.

To manage campaign details

1 Click the Details button on the Home tab. The campaign details display on the content pane.



2 To assign the campaign to another staff member (by default, the campaign is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

a To search for a staff member, type the staff member's name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

3 Click the calendar next to the Start Date field to select the date the campaign is scheduled to start.

4 Click the calendar next to the End Date field to select the date the campaign is scheduled to end.

Note The Start Date and End Date fields are for planning purposes only. They do not affect campaign launch or suspend dates. See To launch or suspend a campaign.

5 Type a description of your campaign objectives in the Objectives Summary text box.

You can use the settings in the Objectives section to track key attributes of the campaign, such as its budget, its expected cost, and the number of leads the campaign is expected to generate. Once you know the actual cost and sales of your campaign, you can enter those figures as well, and the system uses them to calculate cost per lead, cost per opportunity, net profit, and return on investment (ROI).

6 Enter the following field information.

Table 499: Objectives Fields Description

Field	Description
Budget	Type the amount budgeted for the campaign, select the currency used, and click the Exchange Rates button to select the exchange period.

Table 499: Objectives Fields Description (Continued)

Field	Description
Expected Cost Actual Cost	Type the expected cost of the campaign, select the currency used, and click the Exchange Rates button to select the exchange period. Once the campaign has ended, type the actual cost of the campaign.
Expected Sales Actual Sales	Type the expected amount of sales resulting from the campaign, select the currency used, and click the Exchange Rates button to select the exchange period. Once the campaign has ended, type the actual amount of sales resulting from the campaign.
Expected Leads	Enter the number of leads expected to be generated from the campaign.
Actual Leads	This field displays the actual number of leads generated from the campaign through the Lead element.
Expected Opportunities	Enter the number of opportunities expected to be generated from the campaign.
Actual Opportunities	This field displays the actual number of opportunities generated from the campaign through the Opportunity element.
Expected Cost Per Lead Actual Cost Per Lead	These fields display the expected cost per lead, and once the campaign has ended, the actual cost per lead. The values are calculated by dividing the expected cost by the expected leads.
Expected Cost Per Opportunity Actual Cost Per Opportunity	These fields display the expected cost per opportunity, and once the campaign has ended, the actual cost per opportunity. The values are calculated by dividing the expected cost by the expected opportunities.
Expected Net Profit Actual Net Profit	These fields display the expected net profit, and once the campaign has ended, the actual net profit. The values are calculated by subtracting the expected cost from the expected sales.
Expected ROI Actual ROI	These fields display the expected return on investment, and once the campaign has ended, the actual return on investment. The values are the percentage difference between the expected cost and expected sales.

7 Click the Save button to save the campaign.

Note To view data associated with campaign objectives, you can view the Opportunities by Stage report located below the objectives section. For information about this report, click the Options button and select View Definition.

Adding tasks to campaigns

To manage other work related to a campaign, you can create and assign tasks to yourself and other staff members. You can then track the overall progress of those tasks by viewing their due date and completion percentage. This section describes the options available for creating and assigning tasks. Refer to Tasks overview.

To add a task

1 Click the Tasks button on the Home tab. The Tasks section opens on the content pane.

2 Perform task actions described in the following table.

Table 500: Tasks Toolbar Description

Button	Description
Tasks	Click this button to display a drop-down menu containing the following options.
Add New	Select this option to add a new task. Refer to To add a task for the procedure to complete the fields on this window.
Add Existing	Select this option to add an existing task. After finding and selecting a task, the task is added to the task list for the campaign. Refer to To search for a task from an open record.
Open	Click this button to open the selected task for editing.
Print	Click this button to print the selected task.

Table 500: Tasks Toolbar Description (Continued)

Button	Description
Copy	Click this button to copy the selected task.
Delete	Click this button to permanently delete the selected task.
Remove	Click this button to remove the selected task from the campaign (without deleting the task).
Complete	Click this button to mark the selected task completed.
Forward	Click this button to open the Task Forward window and send the task to specific recipients.
Options	Click this button to select an option for managing the output and display of information on the tab, such as print, forward, or export. Refer to Changing output options for information about other options, such as Auto Filter, Slice, Cross Tab, and Rollups.

Campaign templates

Outreach provides several predefined templates as a starting point for creating your campaign's flow diagram. When you choose a template, the elements and connectors associated with that template are added to your diagram. You can add and remove elements to further customize your campaign. You then open each element to assign its attributes and configure it to meet your business needs.

To apply a campaign template

1 From the Template group of the Insert tab, hover over each template button to see it previewed on the content pane. A tooltip displays a description of the template.

- **Ad Conversion**—This template updates a contact submitted through a web form to create a lead if the contact is interested in the promotion. Refer to Ad Conversion.
- **Email Promotion**—This template sends a broadcast email and actions are taken based on a contact's level of interest. Refer to Email Promotion.

- **Event Registration**—This template sends an invitation to an event and uses a web form for registration. Refer to Event Registration.
- **Information Request**—This template is used to gather information about contacts through a questionnaire. Refer to Information Request.
- **Subscription Management**—This template allows contacts to update their subscription preferences. Refer to Subscription Management.

2 Click a template button to add the template to the canvas. A message opens warning you that selecting a template overwrites the existing content on the canvas.

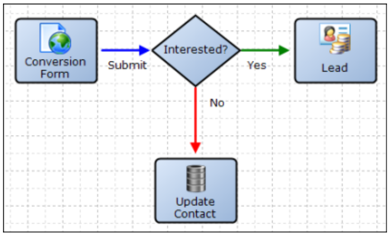
3 Click the OK button. The template is inserted in the diagram.

4 Double-click each element to edit its attributes. Refer to Designing flow diagrams in campaigns.

5 Click the Save button to save the campaign.

Ad Conversion

This template uses a web form to determine if a contact is interested in a promotion or product. Based on the web form, the contact record is either updated to set a field, or the contact is converted to a sales lead.



Each component of the template is described in the following table.

Table 501: Ad Conversion Description

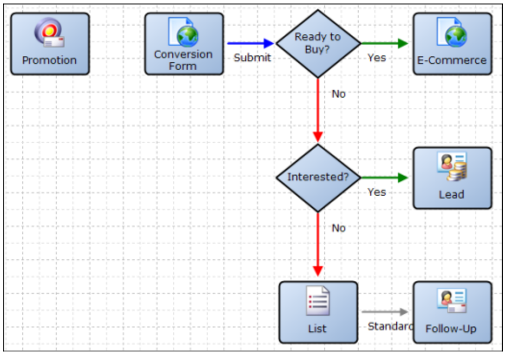
Component	Description
Conversion Form	This Serve Web Page element starts the campaign. Double-click the element to select or create a document that uses a web form to determine customer interest.

Table 501: Ad Conversion Description (Continued)

Component	Description
Interested?	This conditional element determines which path contacts should follow based on their interest. Double-click the element to choose a contact field to base the decision on.
Lead	This element creates a lead from the contact record for contacts who are interested. Double-click the element to set fields associated with the lead.
Update Contact	This element updates the contact record if the customer is not interested. Double-click the element to choose which contact field to update.

Email Promotion

This template sends a broadcast email and actions are taken based on a contact's level of interest in the promotion. The broadcast email sends a link to a web form. Based on two levels of interest (ready to buy and interested), the customer is either sent to the purchase page, added as a lead to Oracle RightNow Opportunity Tracking Cloud Service, or added to a contact list and sent a follow-up email.



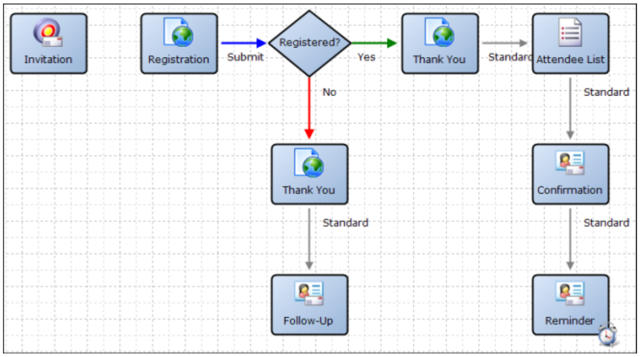
Each component of the template is described in the following table.

Table 502: Email Promotion Description

Component	Description
Promotion	This element sends a broadcast mailing to contacts inviting them to click through to the conversion form. Double-click the element to select or create a mailing that links to the conversion form.
Conversion Form	This element serves a document as a web page. Double-click the element to select or create a document that uses a web form to determine customer interest.
Ready to Buy?	This conditional element determines the path contacts should follow based on whether they are ready to buy the product. Double-click the element to choose a contact field to base the decision on.
E-Commerce	This element serves a document as a web page to contacts who are ready to buy. Double-click the element to select or create a document as a sales form.
Interested?	This conditional element determines the path contacts should follow based on interest. Double-click the element to choose a contact field to base the decision on.
Lead	This element creates a lead from the contact record for contacts who are interested. Double-click the element to set fields associated with the lead.
List	This element adds contacts who are not interested to a contact list. Double-click the element to select or create the list you want to add the contacts to.
Follow-Up	This element sends a transactional mailing to contacts who are not interested as a follow-up. Double-click the element to select or create a mailing and decide when to send it and how to filter it.

Event Registration

This template sends an invitation to an event and uses a web form for registration. When contacts register, they are added to a list and receive emails to thank them, confirm their registration, and remind them of the event. Contacts who do not register are sent a thank you email and an email to follow up.



Each component of the template is described in the following table.

Table 503: Event Registration Description

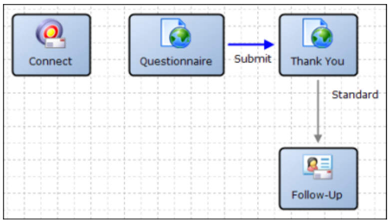
Component	Description
Invitation	This element sends a broadcast mailing to contacts inviting them to click through to the registration form. Double-click the element to select or create a mailing that links to the registration form.
Registration Form	This element serves a document as a web page. Double-click the element to select or create a document that uses a web form to register contacts for an event.
Registered?	This conditional element determines which path contacts should follow based on whether they registered for the event. Double-click the element to choose a contact field to base the decision on.
Thank You (Yes path)	This element serves a document as a web page to contacts who registered for the event. Double-click the element to select or create a document as a thank-you page.
Attendee List	This element adds contacts who registered for the event to a contact list. Double-click the element to select or create the list you want to add the contacts to.
Confirmation	This element sends a transactional mailing to contacts to confirm their registration. Double-click the element to select or create a mailing as a confirmation.

Table 503: Event Registration Description (Continued)

Component	Description
Reminder	This element sends a transactional mailing to contacts who registered to remind them of the event. Double-click the element to select or create a mailing as a reminder and decide when to send it.
Thank You (No path)	This element serves a document as a web page to contacts who did not register for the event. Double-click the element to select or create a document as a thank-you page.
Follow-Up	This element sends a transactional mailing to contacts who did not register as a follow-up. Double-click the element to select or create a mailing and decide when to send it and how to filter it.

Information Request

This template is used to gather information about contacts through a questionnaire. Contacts are sent a broadcast mailing inviting them to fill out a web form. After submitting the web form, contacts are redirected to a thank-you page and then sent a follow-up email.



Each component of the template is described in the following table.

Table 504: Information Request Description

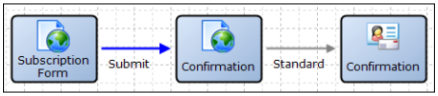
Component	Description
Connect	This element sends a broadcast mailing to contacts inviting them to fill out the web form. Double-click the element to select or create a mailing that links to the questionnaire.
Questionnaire	This element serves a document as a web page. Double-click the element to select or create a document that uses a web form to gather contact information.

Table 504: Information Request Description (Continued)

Component	Description
Thank You	This element serves a document as a web page to contacts who submitted the questionnaire. Double-click the element to select or create a document as a thank-you page.
Follow-Up	This element sends a transactional mailing to contacts who submitted the questionnaire. Double-click the element to select or create a mailing and decide when to send it and how to filter it.

Subscription Management

This template allows contacts to update their subscription preferences. Contacts can update their information through a web form. After submitting the web form, they are redirected to a web page that confirms their submission and then sent a transactional mailing as additional confirmation.



Each component of the template is described in the following table.

Table 505: Subscription Management Description

Component	Description
Subscription Form	This element serves a document as a web page. Double-click the element to select or create a document that uses a web form to gather contact information.
Confirmation (Serve Web Page)	This element serves a document as a web page to contacts who submitted the subscription form. Double-click the element to select or create a document as a confirmation page.
Confirmation (Transactional Mailing)	This element sends a transactional mailing to contacts who submitted the subscription form. Double-click the element to select or create a mailing and decide when to send it and how to filter it.

Note In addition to using predefined campaign templates, you can reuse flow diagrams from previously created campaigns. Refer to Choosing an existing design.

Customizing Outreach and Feedback settings

Outreach provides many options that can be enabled by editing configuration settings. These settings are used to set cookie expiration times, define default values for Serve Web Page element properties, and specify whether documents can be edited after having been sent in a mailing. You can also define the subject line of Forward to Friend emails and specify a default URL to load in cases where a blank page would display.

To access Outreach and Feedback settings

1 Double-click Configuration Settings under Site Configuration. The Search window opens, where you can filter your search results.

2 Clear the Select All check box under the Folders field and then select the Outreach and Feedback check box.

3 To search for a specific configuration setting in the Outreach and Feedback folder, type the setting name in the Key field. (The Key field is not case sensitive.)

Tip You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.

4 Click the Search button. The Configuration Settings editor displays the settings that match your search criteria.

Tip To display configuration settings in alphabetical order, click in the Key column header.

5 Expand the folders under Outreach and Feedback > General.

6 Customize the settings under the specific Campaigns and Miscellaneous folders.

For information about a setting, see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating new configuration settings, see Site Configuration.

73

Feedback Questions

Before you create **surveys** in Oracle RightNow Feedback Cloud Service (Feedback), you must first create the questions that your respondents will answer. You can choose different question types to gather responses of different qualities, and you can customize display characteristics of each question.

For example, you can provide space for your respondents to enter their answers in their own words, returning data that is often specific and insightful. Alternately, you can offer respondents a choice of prewritten answers to a question, which provides you with a consistent, easily interpreted data set. You can also **score** choice questions and use Oracle RightNow Analytics Cloud Service (Analytics) to evaluate responses as numerical values.

While some types of question may be more useful than others based on your needs, any combination of question types can be added to a survey. By presenting questions that are concise and meaningful, you can ensure that the feedback you receive will be clear and actionable.

Writing effective questions

When writing a question, it is important to respect your respondents' time and be clear about the information you are requesting. The following best practices can help you optimize survey completion rates while obtaining the most meaningful respondent feedback.

Adopt an engaging tone—Speak respectfully to respondents. The more welcoming your language, the more likely your audience is to complete each question.

Use common words—Choose your words carefully. To ensure comprehension and accuracy, it is best to assume that your respondents are not familiar with industry jargon and complex terminology. (One effective rule of thumb is to write for a sixth-grade reading level.)

Keep questions specific and short—State each question in a way that is meaningful to your respondents and your analysis. Rephrase questions that are vague or verbose. When creating a choice question, clearly define its lowest and highest values. For example, on a scale of 1 to 5, what 1 means and what 5 means.

Understand each question's goal—Refine your questions to provoke the answers most meaningful to your analysis. A well-framed question increases the significance of your data.

Limit the number of questions—Include only questions that are essential to your goal. If two questions would return similar answers, combine them to eliminate the redundancy. If you must include several questions that are similar in form and content, consider creating a **matrix question** to save space. When creating choice and matrix questions, keep the number of answer selections to a minimum while still accommodating all possible answers.

Spell check your questions—Remember to spell check your questions using the Spelling button available on the ribbon.

To learn more about writing effective survey questions, see *Best Practices for Improving Survey Participation*.

❖ Creating questionnaires in basic mode

Creating questions

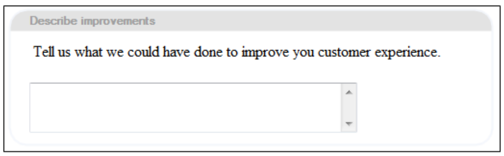
Feedback provides a flexible set of features for creating questions to add to your **surveys**. When you create a survey question, you define the question name, type, and text that respondents see on the survey. You can also assign a **score** to each question choice.

When creating questions, you can choose from three question types—text, choice, and matrix.

Important Questions can be edited after they have been created, even if they have been used in a survey. However, if you edit a question's text or choices, those changes appear immediately in any survey it has been included in. For this reason, if you want to preserve the integrity of the data returned by the original question, we recommend creating a new question rather than editing the existing question.

Text questions

Text questions let respondents type their answer to the question. You can create text questions when you want your respondents to be able to answer in their own words without having to choose from predefined options. For example, "Do you have any suggestions?" When you create a text question, you define only the question and the available space the respondent has to answer.



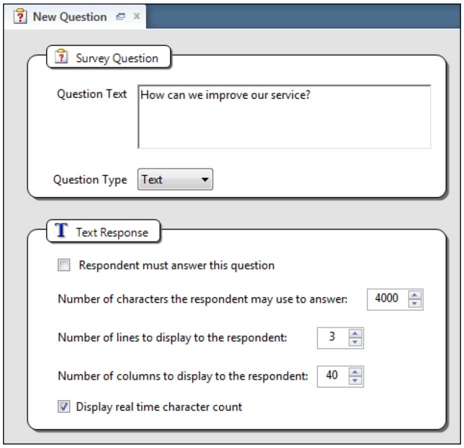
To create a text question

1. From the Questions explorer, click the New button on the ribbon. A new question opens on the content pane.

Tip You can also create questions from an open question by clicking the New button. Additionally, if your navigation set is configured to add questions from the file menu, click File and select Surveys > Question. See To configure the file menu.

2. Type the text of the question in the Question Text field. This will be the question you want the respondent to answer. For example, “How can we improve our service?”

3. Select Text from the Question Type drop-down menu.



4. Enter the following field information.

Table 506: Text Question Description

Field	Description
Respondent must answer this question	Select this check box to require the respondent to answer the question. The survey cannot be submitted without answering the question.

Table 506: Text Question Description (Continued)

Field	Description
Number of characters the respondent may use to answer	Type or use the arrows to select the number of characters the respondent can enter into the answer field. The maximum value is 4,000 characters, and the minimum value is 1 character. The default is 4,000 characters.
Number of lines to display to the respondent	Type or use the arrows to select the number of lines in the answer field. The maximum value is 30 lines, and the minimum value is 1 line. The default is 3 lines.
Number of columns to display to the respondent	Type or use the arrows to select the width of the answer field. The maximum value is 125 columns, and the minimum value is 1 column. The default is 40 columns.
Display real time character count	Clear this check box to remove the real-time character count that displays to survey respondents when they enter a text response. This check box is selected by default.

5 Click the Display Options button on the ribbon to define HTML properties for the question and answer. The Display Options window opens.

6 Enter the following field information.

Table 507: Text Question Display Options

Field	Description
Question Text Display Options	Enter information in this section to define how the question text appears in the survey. **Note:** Style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template.
HTML Style	Type any HTML style and class attributes you want to assign to the question text in these fields. Style and class attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.
HTML Class	

Table 507: Text Question Display Options (Continued)

Field	Description
Answer Text Display Options	Enter information in this section to define how the answer text appears in the survey. **Note:** Style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template.
HTML Style	Type any HTML style and class attributes you want to assign to the answer text in these fields. Style and class attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.
HTML Class	
Counter Options	Enter information in this section to define the appearance of the real-time character count that displays to respondents.
Counter Default Color	Click the color box to select a default color for the counter text or type the HTML hexadecimal value of the color in the field to the right of the color box.
Counter Warning Color	Click the color box to select a warning color for the counter text or type the HTML hexadecimal value of the color in the field to the right of the color box. The warning color is used when the number of characters in the answer field exceeds the maximum value allowed.

7 Click the OK button to save the display options.

8 To preview the question before saving it, click the Preview Question button on the ribbon. The Question Preview window opens.

a Click the OK button to close the window.

9 To spell check your question, click the Spelling button on the ribbon.

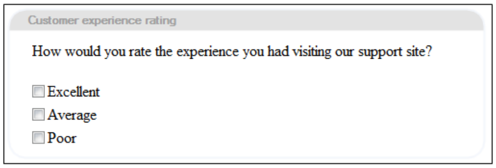
10 Click the Save and Close button. The Save As window opens.

11 Select the folder you want to save the question in and type the name of the question in the Name field.

12 Click the Save button to save the question.

Choice questions

Creating choice questions lets you define the available responses for the question, allowing respondents to choose their answer from a menu, radio button, check box, or list. Choice questions may be scored and evaluated in Analytics.



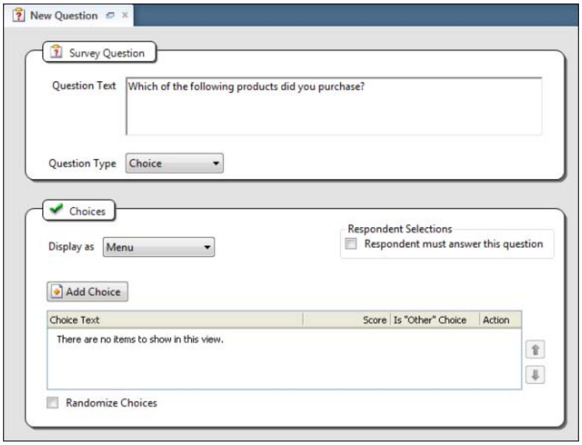
To create a choice question

1 From the Questions explorer, click the New button. A new question opens on the content pane.

Tip You can also create questions from an open question by clicking the New button. Additionally, if your navigation set is configured to add questions from the file menu, click File and select Surveys > Question. See To configure the file menu.

2 Type the text of the question in the Question Text field. This will be the question you want the respondent to answer. For example, "Which of the following products did you purchase?"

3 Select Choice from the Question Type drop-down menu. Choice is the default.



4 Click the Display As menu and select one of the following question display types.

- **Radio**—The choices appear as radio buttons following the question. Respondents can select only one of the predefined choices to answer the question.
- **Checkbox**—The choices appear as check boxes. Respondents can select as many check boxes as you define.
- **Menu**—The choices appear in a drop-down menu. Respondents click the drop-down menu to select one of the predefined choices to answer the question. Menu is the default for Choice questions.
- **List**—The choices appear in a list. Respondents can select as many list items as you define to answer the question.

Note The question display type affects which fields display in the Choices section.

5 Enter the following field information in the Choices section.

Table 508: Choices Section Description

Field	Description
Respondent Selections	Select whether respondents are required to answer this question and set the minimum and maximum number of choices respondents can select.

Table 508: Choices Section Description (Continued)

Field	Description
Respondent must answer this question	Select this check box to require respondents to answer the question. The survey cannot be submitted without answering the question.
Minimum	Type the minimum or maximum number of choices respondents must select in these fields or use the up and down arrows to select a number. The minimum number cannot be more than the maximum number. **Note:** These fields display only for List and Checkbox choice types.
Maximum	
Add Choice	Click this button to add a choice to the choice list.
Choices Panel	The choices panel displays all choices defined for the question. You can drag and drop the choices to reorder the list.
Choice Text	Type the text of the choice in this field.
Score	Type the score for the choice in this field or use the up and down arrows to select a number. The score value is used to assign a relative weight to each choice based on the contact's answers. Survey scores may be used as rule conditions or to trigger survey final actions. Refer to Adding actions with the Survey Final Action wizard.
Is "Other" Choice	Double-click this field and then click the drop-down menu and select Yes to set the choice to "other." This lets respondents type an additional choice in the list. **Note:** Only one choice can be set to "other" when the question is saved.
Action	This column displays actions that can be taken on choices.
Edit	Click this button to edit the choice in the choice list.
Remove	Click this button to remove the choice from the list.
	Click the up or down arrow to move the selected choice one position higher or lower in the list.

Table 508: Choices Section Description (Continued)

Field	Description
Randomize Choices	Select this check box to indicate whether the choices display to respondents in a random order. If the check box is not selected, the choices display in the order in which they are listed in the choice list.
Number of choices to display per line	Type the number of choices to display per line in this field or use the up and down arrows to select a number. **Note:** This field displays only for Radio and Checkbox choice types.

6 Click the Display Options button on the ribbon to define HTML properties for the question and answer. The Display Options window opens.

7 Enter the following field information.

Table 509: Choice Question Display Options

Field	Description
Question Text Display Options	Enter information in this section to define how the question text appears in the survey. **Note:** Style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template.
HTML Style	Type any HTML style and class attributes you want to assign to the question text in these fields. Style and class attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.
HTML Class	

Table 509: Choice Question Display Options (Continued)

Field	Description
Answer Text Display Options	Enter information in this section to define how the answer text appears in the survey. These attributes are applied to the question's listed choices. **Note:** Style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template.
HTML Style	Type any HTML style and class attributes you want to assign to the answer text in these fields. Style and class attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.
HTML Class	

8 Click the OK button to save the display options.

9 To preview the question before saving it, click the Preview Question button on the ribbon. The Question Preview window opens.

a Click the OK button to close the window.

10 To spell check your question, click the Spelling button on the ribbon.

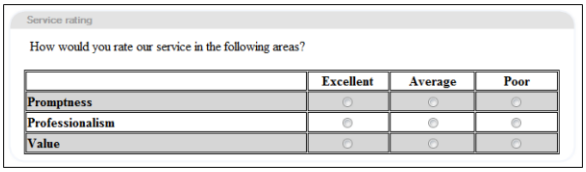
11 Click the Save and Close button. The Save As window opens.

12 Select the folder you want to save the question in and type the name of the question in the Name field.

13 Click the Save button to save the question.

Matrix questions

In cases where a series of questions can be responded to with the same set of answer choices, matrix questions can help streamline a survey's appearance by grouping the questions together in a table. Answer choices are displayed using either radio buttons (to permit only one answer to each question) or check boxes (to allow more than one answer). If you choose radio buttons, you can restrict selections to one choice per row, forcing respondents to rank their answers.



To create a matrix question

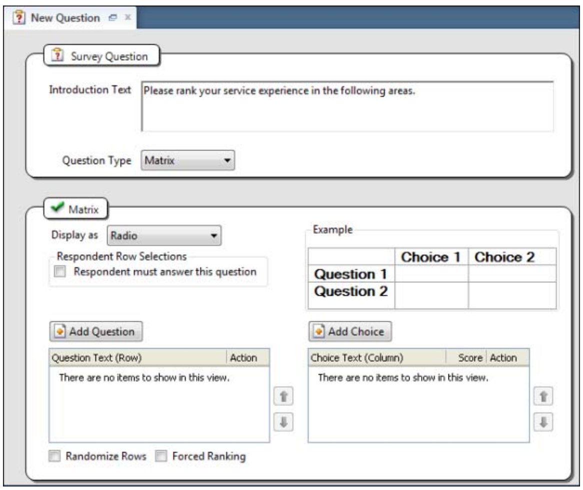
1 From the Questions explorer, click the New button. A new question opens on the content pane.

Tip You can also create questions from an open question by clicking the New button. Additionally, if your navigation set is configured to add questions from the file menu, click File and select Surveys > Question. See To configure the file menu.

2 Select Matrix from the Question Type drop-down menu.

3 Type the introductory text for the matrix in the Introduction Text field.

This text summarizes the group of questions in the matrix For example, “Please rank your service experience in the following areas.”



4 Enter field information in the Matrix section.

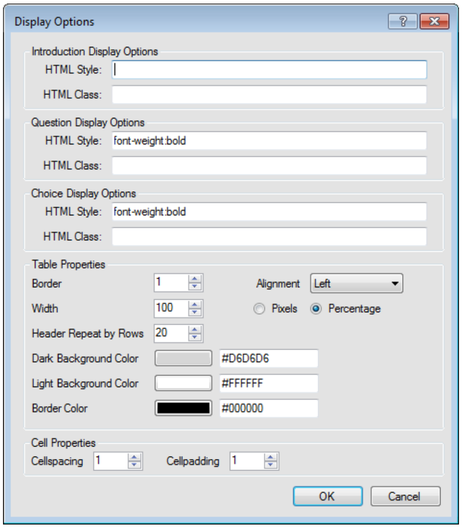
Table 510: Matrix Section Description

Field	Description
Display As	Click this drop-down menu to select how answer choices are displayed. Options include Radio or Checkbox. Radio is the default. **Note:** The question display type affects which fields display in the Matrix section.
Respondent Row Selections	These settings define whether matrix questions are required and the number of answers that can be selected per question.
Respondent must answer each question	Select this check box to require respondents to answer each of the questions in the matrix. The questionnaire cannot be submitted without answering all of the listed questions.
Minimum	Type the minimum or maximum number of choices respondents must select in these fields or use the up and down arrows to select a number. The minimum number cannot be more than the maximum number. **Note:** These fields display only for Checkbox choice type.
Maximum	
Example	This is a sample to illustrate the position of questions and choices in a matrix table. **Note:** This example does not display table, cell, or border styles defined in the display options, nor does it display questions or choices that have been added to the lists.
Questions Panel	The question list displays all questions defined for the matrix. You can drag and drop the questions to reorder the list.
Add Question	Click this button to add a question to the matrix.
Question Text (Row)	This column displays the question text. Question text entries appear as labels in the rows of the matrix table.
Action	This column displays actions that can be taken on questions.
Edit	Click this button to edit the question.
Remove	Click this button to remove the question.
	Click the up or down arrow to move the selected choice one position higher or lower in the list.

Table 510: Matrix Section Description (Continued)

Field	Description
Choices Panel	The choice list displays all choices defined for the matrix. You can drag and drop the choices to reorder the list.
Add Choice	Click this button to add a choice to the matrix.
Choice Text (Column)	This column displays the choice text. Choice text entries appear as labels in the columns of the matrix table.
Score	Type the score for the choice in this field or use the up and down arrows to select a number. The score value is used to assign a relative weight to each choice and allows for survey calculations to trigger rules or campaign actions based on the respondent's answers. For information about using rules with survey results, see Last Survey Score field description under Incident conditions. Also see Adding rules.
Action	This column displays actions that can be taken on choices.
Edit	Click this button to edit the choice.
Remove	Click this button to remove the choice.
	Click the up or down arrow to move the selected choice one position higher or lower in the list.
Randomize Rows	Select this check box to display the questions in the matrix in a random order. If the check box is not selected, the questions display in the order in which they are listed in the list of questions.
Forced Ranking	Select this check box with radio button choices to restrict survey respondents to select only one choice per column. This option is useful when designing a matrix containing rows of items that you want your respondents to rank. Since matrix questions with radio buttons allow only one choice to be selected per row, the additional restriction on columns forces respondents to rank their answers. **Note:** When Forced Ranking is selected, the matrix must contain the same number of rows (questions) as it does columns (choices).

5 Click the Display Options button on the ribbon to define HTML properties for the question and answer. The Display Options window opens.



6 Enter the following field information.

Table 511: Matrix Question Display Options

Field	Description
Introduction Display Options	Enter information in this section to define how the introduction text appears in the survey. **Note:** Style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template.
HTML Style	Type any HTML style and class attributes you want to assign to the introduction text in these fields. Style and class attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.
HTML Class	

Table 511: Matrix Question Display Options (Continued)

Field	Description
Question Display Options	Enter information in this section to define how the question text appears in the matrix. **Note:** Style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template.
HTML Style	Type any HTML style and class attributes you want to assign to the question text in these fields. Style and class attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.
HTML Class	
Choice Display Options	Enter information in this section to define how the choice options appear in the matrix. These attributes are applied to the question's listed choices. **Note:** Style and class must be defined in a CSS file that is available on your web server and linked to in the `<head>` tag of a survey template.
HTML Style	Type any HTML style and class attributes you want to assign to the choice options in these fields. Style and class attributes define how the text appears, such as color and font. For example, color: red; font-weight: bold; font-style: italic.
HTML Class	
Table Properties	Define the table's attributes in this section.
Border	Type the width, in pixels, of the table's border or use the up and down arrows to select a number.
Alignment	Click this drop-down menu and select the alignment of the table on the page. Your choices are Left, Centered, and Right.
Width	Type the width of the table, or use the up and down arrows to select a number, and select the unit from the radio buttons (Pixels or Percentage).
Header Repeat by Rows	Type the number of rows after which the header row will be repeated, or use the up and down arrows to select a number.
Dark Background Color	Click the color box to select a color for the table's dark background or type the HTML hexadecimal value of the color in the field to the right of the color box.

Table 511: Matrix Question Display Options (Continued)

Field	Description
Light Background Color	Click the color box to select a color for the table’s light background or type the HTML hexadecimal value of the color in the field to the right of the color box.
Border Color	Click the color box to select a color for the table’s borders or type the HTML hexadecimal value of the color in the field to the right of the color box.
Cell Properties	Define the table’s attributes in this section.
Cell Spacing	Type the spacing and padding, in pixels, of the table’s cells or use the up and down arrows to select a number.
Cell Padding	

7 Click the OK button to save the display options.

8 To preview the question before saving it, click the Preview Question button on the ribbon. The Question Preview window opens.

   a Click the OK button to close the window.

9 To spell check your question, click the Spelling button on the ribbon.

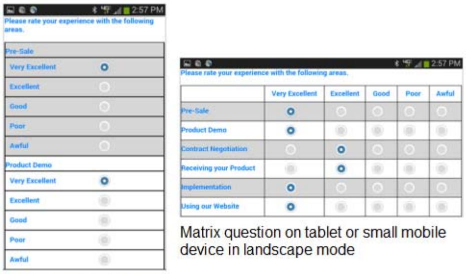
10 Click the Save and Close button. The Save As window opens.

11 Select the folder you want to save the question in and type the name of the question in the Name field.

12 Click the Save button to save the question.

Using matrix questions in mobile surveys

When matrix questions display on a small mobile device (400 pixels wide or less), questions and choices automatically reflow to display in a vertical table. Larger mobile devices, such as tablets (or when small devices are viewed in landscape mode), are wide enough to display matrix questions horizontally, in the same way they display when viewed on a desktop. See Mobile surveys.

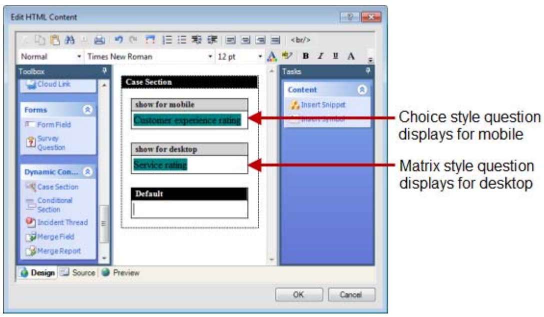


Matrix question on tablet or small mobile device in landscape mode

Matrix question on small mobile device

Instead of using matrix questions in your mobile surveys, consider adding a case section with conditional content using runtime variables to the HTML content of your questionnaire. This way, you can show different content for mobile devices from what you show for desktop mode. See Customizing surveys for use on mobile devices.

Following is an example of how you could use a case section with conditional content for both variables to hide a matrix question that wouldn't be effective when viewed on a small mobile device.



You could accomplish the same effect by adding a conditional section for each variable. Either way, the important takeaway is to create content for both variables on a single page. Otherwise, the variable for which no content is defined will display a blank page.

Important Remember to test and preview your survey in both mobile and desktop modes and on applicable mobile devices and browsers to ensure your conditional sections work the way you intend them to.

74

Feedback Surveys

Once you have defined the **questions** you want to ask (see Creating questions), you can easily present them to your audience in surveys. Oracle RightNow Feedback Cloud Service (Feedback) contains flexible tools for creating custom surveys in a variety of formats. Surveys can be sent as mailings, served as web pages, or sent as events triggered by a campaign or business rule. With a wide range of formatting and customization options, including survey reminders, market testing, and full analytics integration for tracking results, surveys provide you with a powerful channel for inviting, gathering, and analyzing customer feedback.

Note Surveys are designed to comply with Oracle accessibility guidelines. For current information regarding our approach to accessibility, refer to Oracle's Accessibility Program.

- Creating questions
- Audiences

Creating surveys

You can create four types of surveys, distinguished by invitation method.

- **Broadcast surveys** are used to send broadcast invitations to specified **audiences** at a time you choose.
- **Transactional surveys** send invitations triggered by events that you define, such as an incident resolution or a campaign action.
- **Website link surveys** rely on separate invitation delivery mechanisms, such as a link to the survey placed on a web page.

- **Polling surveys** display as a single question on a **customer portal** page or any page that is external to the customer portal, such as a "Poll of the Day." After customers submit their response, they see a poll results chart or a thank-you message.

Although available features vary by invitation method, every survey is presented through a web page and can be linked to from outside of Oracle Service Cloud. With the exception of polling surveys, surveys can be added to **workspaces**, letting your agents complete surveys by proxy (on behalf of contacts) during telephone interactions (see Proxy surveys). Whatever methods you choose for delivering surveys, the basic steps for creating them are the same.

Important Keep in mind that if you want to use survey reminders, it is best to add them as a part of your initial survey creation process because reminders are scheduled based on when the initial survey is sent. The survey type (broadcast or transactional) also plays a role. For these reasons, we recommend implementing survey reminders into your strategy from the start. See Adding survey reminders.

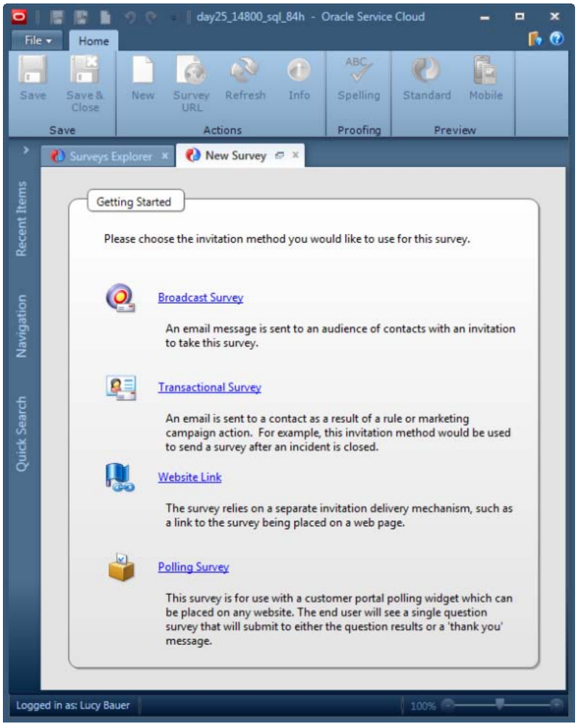
To create a survey

1 Click the Surveys button on the navigation pane and double-click Surveys Explorer.

Note The following procedure assumes that you access the Surveys explorer from the Surveys **navigation list**. However, this explorer might reside in another navigation list.

2 Click the New button on the ribbon. A new survey opens on the content pane.

Tip You can also create surveys from an open survey by clicking the New button. Additionally, if your navigation set is configured to add surveys from the file menu, click File and select Surveys > Survey. See To configure the file menu.



3 To create a broadcast survey, click Broadcast Survey and refer to Creating broadcast surveys.

4 To create a transactional survey, click Transactional Survey and refer to Creating transactional surveys.

5 To create a website link survey, click Website Link and refer to Creating website link surveys.

6 To create a polling survey, click Polling Survey and refer to Creating polling surveys.

7 Click the Save and Close button to save the survey.

Note You can click the Save button to save the survey without closing it.

8 Select the folder you want to save the survey in and type the name of the survey in the Name field.

9 Click the OK button to save the survey.

Survey delivery statuses

Your **broadcast** and **transactional surveys** must follow certain steps that are defined by the survey's delivery status. Delivery status indicates the survey's current state as it progresses through the distribution process.

The following table describes the delivery statuses for broadcast and transactional surveys and indicates whether the status is set by a staff member action or updated automatically by the system. For more about survey delivery, see Accessing broadcast delivery options and Accessing transactional delivery options.

Table 512: Broadcast and Transactional Survey Delivery Statuses Description

Status	Survey Type	Description
Draft	Broadcast Transactional	This is the preliminary status of a survey. When a survey is created, it is automatically set to the Draft status. The status reverts to Draft if a staff member unschedules a survey.
Scheduled	Broadcast	This status indicates a survey is ready to be sent at the scheduled send date and time. When a staff member selects the send time, the survey is automatically set to the Scheduled status.
Launched	Transactional	This status indicates a survey has been launched and can be included in a rule or campaign. Staff members launch a survey by clicking the Launch button on the Delivery tab. **Important:** By default, a launched survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, suspend the survey's invitation message, make edits, and then relaunch it. See Launching surveys.
Recurrence Scheduled	Broadcast	This status indicates a survey is scheduled for recurring runs. When a staff member selects a recurrence pattern, the survey is automatically set to the Recurrence Scheduled status.

Table 512: Broadcast and Transactional Survey Delivery Statuses Description (Continued)

Status	Survey Type	Description
Preparing to Send	Broadcast	This status indicates a survey is about to be sent. The status changes to Preparing to Send when a staff member clicks the Send Now button.
Sending	Broadcast	This status indicates a survey is currently being sent to customers. The system automatically sets the survey's status to Sending after the survey is done preparing to send or at the survey's scheduled date and time.
Suspended	Broadcast Transactional	This status indicates a survey is temporarily suspended from the Sending or Scheduled status. Staff members can change the status to Suspended by clicking the Suspend button on the Delivery tab.
Expired	Broadcast Transactional	This status indicates a survey has expired. Surveys can be set to expire based on date or maximum number of responses. Once the first expiration criterion is met, the status is set to Expired and cannot be changed. See Setting survey expiration.
Suspended by Error	Broadcast Transactional	This status indicates a survey encountered an error and was suspended by the system.
Canceled	Broadcast Transactional	This status indicates a survey was manually canceled. Staff members can cancel a survey by clicking the Cancel Invitation Message button on the Delivery tab. **Important:** By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey, and then modify and send the copied survey. See Canceling broadcast surveys and Canceling transactional surveys.
Completed	Broadcast	This status indicates a survey was sent. The system automatically sets a survey's status to Completed from the Sending status.

Managing surveys

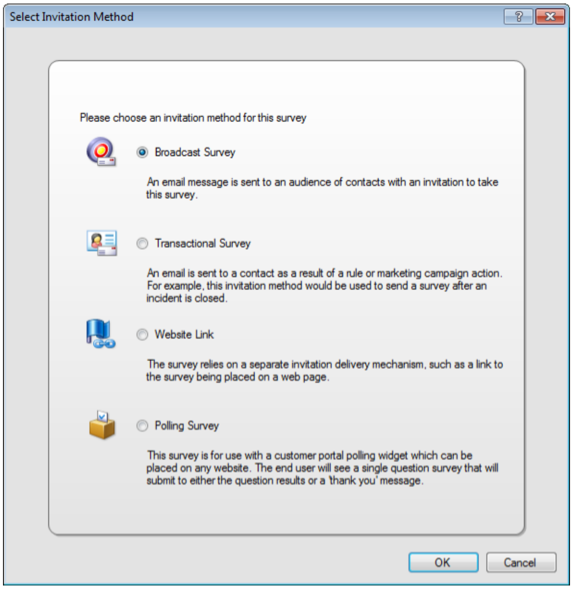
When creating or editing a survey, the Summary tab provides a variety of survey management functions. Most of these functions vary depending on the survey invitation method, but some can be used on any survey, including the following.

- **Changing the survey invitation method**—Once you create a survey, you can change its invitation method type. The invitation methods available are Broadcast, Transactional, Website Link, and Polling Survey. Broadcast surveys with an active recurrence are labeled Recurring Broadcast Survey.
- **Deactivating an active survey**—When you change the survey status to Inactive, customers cannot submit responses to the survey and receive a warning message when attempting to access the survey URL.
- **Setting survey expiration**—Customizing the availability of your surveys makes the feedback you receive from your customers more timely and actionable, and therefore, more meaningful for your organization. See Setting survey expiration.
- **Adding notes**—You may want to add notes to a survey that are not sent to audience members. You can use notes to provide additional information about the survey that can be viewed by staff members as they are working with the survey.
- **Adding tasks**—You can assign new or existing tasks to surveys and edit, delete, and forward tasks to other staff members. You can also view each task associated with the survey.

Other common functions available from the Summary tab include the ability to add file attachments or view the **audit log** to see when the surveys and broadcast survey reminders were created and edited and when delivery statuses changed. See Working with records.

To change the invitation method of a survey

1 On the Summary tab of an open survey, click Change next to Invitation Method. The Select Invitation Method window opens.



2 Select the Broadcast Survey, Transactional Survey, Website Link, or Polling Survey radio button.

3 Click the OK button. The survey invitation method changes to the type you select.

Note You can switch invitation methods only when the delivery status of the message is Draft and no rules or campaigns reference the survey. See Survey delivery statuses.

To deactivate a survey

1 On the Summary tab of an open survey, click Deactivate next to Survey Status. The Disable Survey window opens.

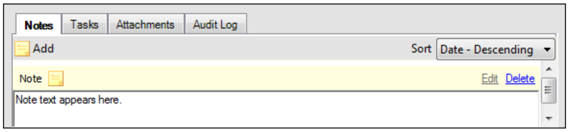
2 Click Yes to confirm you want to deactivate the survey. The survey status changes to Inactive.

3 To reactivate the survey, click Activate. The Activate Survey window opens.

   a Click Yes to confirm you want to activate the survey. The survey status changes to Active.

To add a note

1 On the Summary tab of an open survey, click the Notes tab.



2 Click the Add button and type the text of the note.

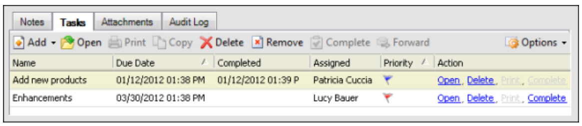
3 To sort the notes by either ascending or descending date, click the Sort drop-down menu and select the sort option.

4 To edit an existing note, click Edit next to the note.

5 To permanently delete a note, click Delete next to the note.

To add a task

1 On the Summary tab of an open survey, click the Tasks tab.



2 To add a new task to the survey, click the Add button, select Add New, complete the task information, and click the OK button. See Adding tasks for the procedure to complete the fields on this window.

3 To add an existing task to the survey, click the Add button, select Add Existing, search for the task you want to add, and click the Select button. See To search for a task from an open record.

You can perform other actions on the tasks on the Tasks tab. The following table describes the buttons on the Tasks tab toolbar and tells you what actions you can take on tasks.

4 Enter the following field information.

Table 513: Tasks Tab Toolbar Description

Button	Description
Add	Click this button to display a drop-down menu containing the following options.
Add New	Select this option to add a new task. See Adding tasks for the procedure to complete the fields on this window.
Add Existing	Select this option to add an existing task. After finding and selecting a task, the task is added to the task list for the survey. See To search for a task from an open record.
Open	Click this button to open the selected task for editing.
Print	Click this button to print the selected task.
Copy	Click this button to copy the selected task.
Delete	Click this button to permanently delete the selected task.
Remove	Click this button to remove the selected task from the survey (without deleting the task).
Complete	Click this button to mark the selected task completed.
Forward	Click this button to open the Task Forward window and send the task to specific recipients.
Options	Click this button to select an option for managing the output and display of information on the tab, such as print, forward, export, or display options. See Changing output options for information about other options, such as Auto Filter, Slice, Cross Tab, and Rollups.

Setting survey expiration

Because many surveys are needed for only a limited period of time, you can set an absolute date and time when a survey automatically expires. In addition to an absolute expiration date, broadcast and transactional surveys can be set to expire relative to the date you send the invitation message.

Relative expiration can help you capture feedback in a relevant time frame so that you can make decisions based on your insight. Say you create a recurring survey that filters every day for new customers to gather feedback about why your organization was selected. Also, you want to receive this feedback within 30 days. Since the survey is triggered daily, setting a relative expiration date instead of an absolute date keeps the survey active for all new customers, but also sets an expiration date relative to the contact it is sent to. See Setting survey recurrence.

You can also set survey expiration based on the maximum number of survey responses you have received. For instance, suppose you want to offer your customers an incentive for their feedback. You could offer a coupon to the first 1,000 responses you receive. This option is available for all survey types, including survey by proxy.

In addition, you can customize the expiration message, per survey, that recipients receive if they try to take an expired survey. This helps ensure your recipients know the right course of action to take when an expiration message displays.

Important Once the first expiration criterion is met, the survey status is set to Expired and the status cannot be changed. Therefore, if you want to make changes to your expiration criteria, you must do it before the first criterion is met.

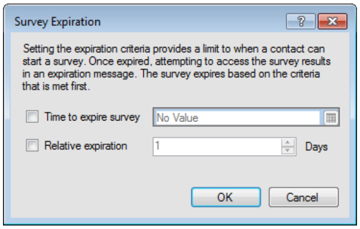
To set an absolute expiration date

Tip If you set both an absolute expiration date and a relative expiration date, the criteria that is met first triggers the survey to expire. For a scenario illustrating when it can be useful to set both, see the example at the end of this procedure.

1 On the Summary tab of an open survey, click Edit next to Expiration Date. The Survey Expiration window opens.

   Or

   To change an existing expiration date, click the expiration date.



2 Select the Time to Expire Survey check box and then type the date and time you want the survey to expire or click the calendar to select the date.

3 To expire a survey at the current date and time, click Today – [Date].

4 To cancel an existing survey expiration date, click No Value.

5 Click the OK button to save your changes. The window closes and the Expiration Date field displays the time and date the survey is scheduled to expire.

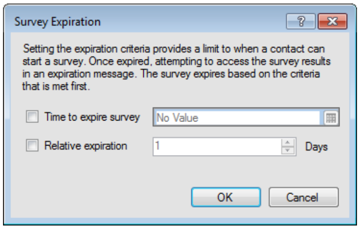
Example

In rare cases, you may want to set both an absolute and a relative expiration date. Suppose you set an absolute expiration for the last day of the year, but your survey is either transactional or recurring. In other words, either an event triggers the survey to send or it is scheduled to send daily. You also want your survey to expire 30 days from the send date. By setting both an absolute and a relative expiration, you ensure that you get your response within the 30-day time frame or before the end of the year.

To set a relative expiration date

Tip If you set both an absolute expiration date and a relative expiration date, the criteria that is met first triggers the survey to expire. For a scenario illustrating when it would be useful to set both, see the example at the end of the procedure To set an absolute expiration date.

1 On the Summary tab of an open survey, click Edit next to Expiration Date. The Survey Expiration window opens.



2 Select the Relative Expiration check box and then type the number of days you want to set the survey to expire after you send the invitation message. The maximum number of days you can set a survey to expire is 365.

3 Click the OK button to save your changes. The window closes and the Expiration Date field on the Summary tab displays the number of days after you send the invitation message that the survey is scheduled to expire.

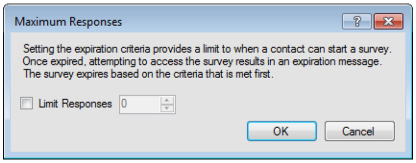
Note

- If a contact is past the first page of a survey and the survey expires, the survey will be accepted (as long as the contact finishes the survey in that session). This means there is a chance that responses will be logged after the expiration date.
- For recurring surveys, only an absolute expiration date will expire an entire survey because relative expiration applies only to the contact the survey is sent to. See Setting survey recurrence.

To set expiration based on maximum number of responses

Tip If you set both an absolute expiration date and a maximum number of responses, the criteria that is met first triggers the survey to expire.

1 On the Summary tab of an open survey, click Edit next to Expiration Max Responses. The Maximum Responses window opens.



2 Select the Limit Responses check box and then type the maximum number of responses you want to allow. The maximum number of survey responses you can define is one million.

3 Click the OK button to save your changes. The window closes and the Expiration Max Responses field on the Summary tab displays the maximum number of responses defined, the number of responses received, and the number of responses that are still allowed.

4 To update the number of received and remaining responses that display on the Summary tab, click the Refresh button on the ribbon.

Note A response is counted as soon as the answer to the first question is submitted.

To customize the expiration message

1 On the Summary tab of an open survey, click Edit next to Expiration Message. The Survey Expiration Message window opens.

2 Type the message you want recipients to see if they try to take an expired survey in the Expiration Message text box. You can use HTML tags in this text box.

Note If you do not define your own survey expiration message, the system's default message is used.

3 Click the OK button to save your changes.

Adding survey reminders

For broadcast and transactional surveys, you can now add up to four automatic reminder messages to create a sense of urgency for customers to complete surveys within a time frame you specify. Reminders prompt your audience to take the survey if they have forgotten about it or to finish it if they have already started but have not yet submitted it. This increases your participation rates and, ultimately, gives you more data about your customer experiences.

Tip To be most effective, survey reminders need to be a part of your initial survey creation process because reminders are scheduled based on when the initial survey is sent. The survey type (broadcast or transactional) also plays a role.

- For broadcast surveys (with the exception of recurring broadcast surveys), you cannot add reminders after the broadcast survey is sent.
- For transactional surveys, reminders will apply only to the invitation messages sent after the reminder has been added. For example, if you have a transactional survey that has been triggered to send by an external event and then you decide to add reminders, the reminders will start sending only after your next survey is triggered.

For these reasons, we recommend implementing survey reminders into your strategy from the start.

The audience for survey reminders can include recipients who have not started the survey, recipients who have started but have not completed the survey, or both. When a reminder is sent to a customer who has started the survey, the survey page that the customer was on is the page that opens (as long as cookies are enabled on the customer's computer) when the customer comes back to finish the survey.

You can also exclude segments of your audience from your reminders. For example, suppose you have a customer who unsubscribed from your list since the initial invitation message was sent. You could create a segment that uses a custom opt-out field in the filter criteria and then exclude that segment from your audience. See Creating segments.

Note

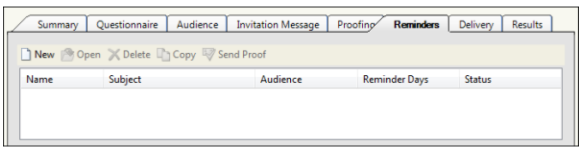
- Survey reminders apply global opt-in and external suppression list options to your reminder audience if those options are selected on the Audience tab of your survey. However, even if recency and frequency of communication options are selected for the initial audience, they are not applied to the reminder audience because the scheduling and frequency options you define for each reminder take precedence over any recency and frequency options that may be selected for the initial survey audience.
- The system is designed to prevent duplicates by allowing only one reminder to be sent to the same audience on the same day.

While there are two standard reports that apply to survey reminders (Survey Reminder Statistics and Broadcast Response Timeline), you can use the audit log to track your broadcast survey reminders without needing to run a report. When reminders are sent for broadcast surveys, a new row is added to the audit log, which is available on the survey's Summary tab. For details about survey reminder reports, see Best practices for survey reminders.

Tip Survey reminders can be scheduled to send between 1 and 365 days after your initial invitation message is sent. Since it takes at least one day before your first reminder can be sent, be sure to take this time factor into account when creating survey reminders.

To add a survey reminder

1 From an open survey, click the Reminders tab.

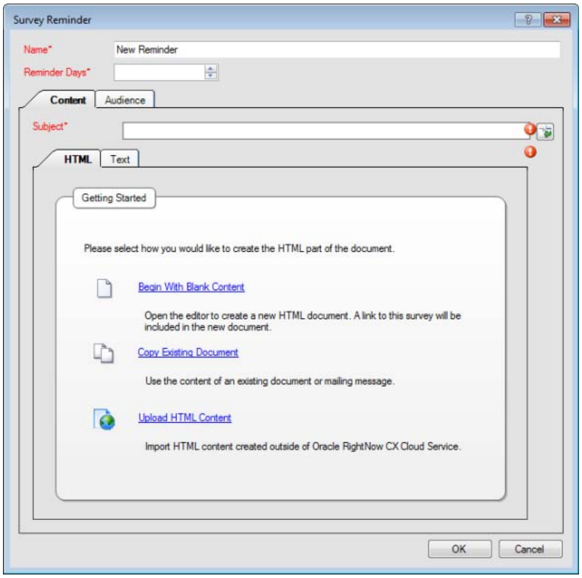


You can send up to four reminder messages to your audience. From the toolbar, you can create a reminder, edit, delete, and send proofs of your reminders.

Table 514: Reminders Tab Description

Column	**Description**
Name	This column displays the name of the survey reminder.
Subject	This column displays the email's subject line for the message that is sent to your audience about the survey reminder.
Audience	This column displays the recipients who are included in the reminder messages' audience. Options available include the following: • Not Started—Sends the invitation message to recipients who have not submitted any pages of the survey. • In Progress— Sends the invitation message to recipients who have started but have not completed the survey. **Note:** By default, both options are selected.
Reminder Days	This column displays the number of days after the initial invitation message was sent that the reminder message will be sent. **Note:** The minimum value of this field is 1 day and the maximum value is 365 days.
Status	This column displays the delivery status of the reminder. See Survey delivery statuses. **Note:** This column is available only for broadcast survey reminders.

2 Click the New button to add your first reminder message. The Survey Reminder window opens.



3 Type the name of the reminder message in the Name field.

Tip Be specific when naming your reminder messages to help keep track of the different reminders you create. For example, "1st reminder sent 7 days after invite."

4 Type the number of days after the initial invitation message is sent that the reminder message will be sent in the Reminder Days field.

Note This value must be unique for each reminder that you add. This prevents duplicates by allowing only one reminder to be sent to the same audience on the same day.

5 Type the subject your audience will see in the reminder message's email subject line in the Subject field.

6 To insert a merge field into the subject line of your reminder message, click the Merge Field button (to the right of the Subject field) and select the field. For example, you could use the special field, Survey Expiration Date, to let your audience know when the survey expires. See Inserting merge fields.

7 Define your message text and any other content or formatting options for your reminder using either the HTML editor or the text editor on the Content tab. See [Using the HTML editor] and [Creating and editing text].

8 Click the Audience tab to define the audience for your reminder.

By default, both the Not Started and the In Progress check boxes are selected in the Included section.

a Clear the Not Started check box to send the reminder message only to recipients who have started the survey.

b Clear the In Progress check box to send the reminder message only to recipients who have *not* started the survey.

9 To exclude a segment from the audience, click Add Segment in the Excluded section. The Select Segment window opens where you can select segments you want to exclude.

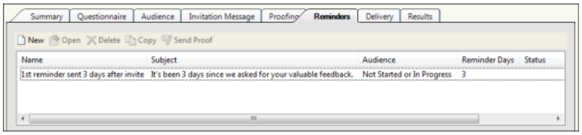
10 To edit a segment that is excluded from the reminder, click Open next to the segment name. See [Adding segment filters].

11 To remove a segment from the Excluded section, click Remove next to the segment name.

12 To count the number of contacts who will receive the reminder, click Refresh in the Count section.

Note Keep in mind that the Count section is available only for broadcast surveys and data is available only after the survey reminder is sent.

13 Click the OK button to save the reminder. The new reminder is added to the Reminders tab.



14 To add another reminder, click the New button and repeat steps 3-13.

15 To copy a message to create another reminder, select the message and click the Copy button. You can then open the copy and make your edits.

Important A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a reminder message. Changes made to content in any of the copied reminder messages are not shared with the original reminder message or subsequent copies. See Automatically generated folders.

16 To open a reminder for editing, select the reminder and click the Open button.

17 To delete a reminder, select the reminder and click the Delete button.

18 To send a proof of a reminder message, select the message and click the Send Proof button. See Sending a proof survey.

Important After a reminder is sent, you cannot edit, proof, or delete that reminder. However, for transactional surveys, you can suspend the reminder, make edits, and then re-launch it. See Survey delivery statuses.

Best practices for survey reminders

To be most effective, survey reminders need to be a part of your initial survey creation process because reminders are scheduled based on when the initial survey is sent. The survey type (broadcast or transactional) also plays a role.

- For broadcast surveys (with the exception of recurring broadcast surveys), you cannot add reminders after the broadcast survey is sent.
- For transactional surveys, reminders will apply only to the invitation messages sent after the reminder has been added. For example, if you have a transactional survey that has been triggered to send by an external event and then you decide to add reminders, the reminders will start sending only after your next survey is triggered.

For these reasons, we recommend implementing survey reminders into your strategy from the start.

Other best practices for using survey reminders include the following.

- **Add reminders quickly**—An efficient way to add more than one reminder is to simply copy your first reminder, and then open each new reminder to edit the Name, Reminder Days, and Subject fields, as well as any message text you may want to change.
- **Plan message delivery timing**—Since it takes at least one day before your first reminder can be sent, be sure to take this time factor into account when creating survey reminders.
- **Protect your reputation**—Even though you can add four survey reminders to each survey, be careful not to overwhelm your customers with too many reminders. For example, if you've sent a survey that expires in seven days, you probably don't need to send four reminders. Seriously consider the appropriate number of reminders to send for your specific situation. Otherwise, you risk harming your reputation with your customers. For more information about protecting your reputation, see *Best Practices for Email Marketing*.

- **Track reminder success**—View the effectiveness of survey reminders using our standard reports. See Viewing survey results.
  - ▷ **Survey Reminder Statistics**—This report lets you see the total number of email messages that were sent, viewed, and clicked (opened) for both the initial invitation message as well as for all of the reminders. Being able to see both the viewed and clicked statistics lets you evaluate which reminder prompted the customer to open the survey. In other words, which one was most effective. This report also returns the number of emails that bounced.
  - ▷ **Broadcast Response Timeline**—This report lets you see trends by using a time line to show the peaks and valleys in your survey response numbers. Available only for broadcast survey reminders, responses received from the date the initial invitation message was sent through the date the survey was last submitted display on the report. It also shows both the number of survey invitations and the number of reminders sent. (This report is not available on the Results tab if the broadcast survey is a recurring survey or if it uses market testing.)

Mobile surveys

Surveys are automatically optimized for readability and touchscreen compatibility making them user-friendly on mobile devices. The system detects whether the survey is being taken on a mobile device or a standard web device, such as a desktop or laptop. When a mobile device is detected, the survey is optimized so that taking it from that device is easy. For example, text is larger so it is readable without needing to zoom into the page, and answer choices and buttons are easy to select with the touch of a finger.

Landing pages, including Thank You, Forward to Friend, and Unsubscribe, have also been optimized for mobile.

While there are many features available for mobile optimization, the following example shows styling differences that would make this particular survey more difficult to take if mobile optimization was not applied. The screen shot on the right shows a survey that has not been optimized for mobile.

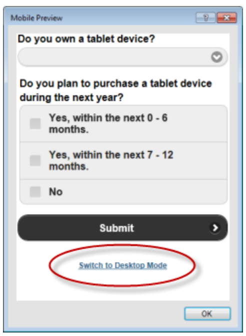
Mobile optimization is enabled, by default, on the Survey Options window. See [Specifying survey options].

Tip Because different mobile devices and browsers display surveys in different ways, we recommend testing your surveys on applicable mobile devices and browsers before you launch them.

To preview your survey for mobile

1 From an open survey, click the Mobile button on the ribbon. The Mobile Preview window opens as it would display if viewed from a mobile device.

2 To see how the survey would look on a mobile device without mobile optimization applied, click the Switch to Desktop Mode link at the bottom of the Mobile Preview window.



3 Click OK to close the window.

Best practices for mobile surveys

When designing surveys for use on mobile devices, keep the following points in mind.

If a survey uses a **template**, the template is not applied when the survey is viewed on a mobile device because most templates are not optimized for mobile. If you want to create an appropriately sized template to be used for mobile, you could add HTML content with a conditional section for mobile runtime that included a smaller image. See Customizing surveys for use on mobile devices.

Mobile optimization automatically resizes fonts for a user-friendly mobile experience. Therefore, **font size**, even if you modify the default setting, is ignored on mobile devices when mobile optimization is enabled.

Keep in mind that certain fonts are not supported or consistently displayed on every mobile device. The list of widely **supported fonts** for most mobile devices includes the following.

- Arial
- Courier and Courier New
- Georgia (with the exception of Android)
- Helvetica
- Times and Times New Roman
- Trebuchet MS (with the exception of Android)
- Verdana

For basic surveys, **class and style button properties** are ignored on mobile devices when mobile optimization is enabled. However, you can modify button properties on advanced surveys by using a WebDAV client to access your Customer Portal file structure, and then opening the */cp/customer/assets/feedback* folder to edit the *mobile.css* file. See WebDAV for the Customer Portal and The customer folder.

When using **case** and **conditional sections** with runtime variables, it's important to remember the following.

- Mobile conditional sections work when a mobile device is detected even if mobile optimization is disabled on the survey.
- If the mobile user selects the Switch to Desktop Mode link, available on the first survey page, all content that displays will be desktop content, even if a mobile device is being used. (Switch to Desktop Mode is available only on the first page of the survey.)
- When using desktop and mobile runtime variables, we recommend that you create content for both variables on one page. You can do this either with a conditional section for each variable, or by adding content that appears for both variables. Otherwise, the runtime variable for which no content is defined will display a blank page.

See Customizing surveys for use on mobile devices.

Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them. See To preview your survey for mobile.

Track mobile survey use by analyzing usage trends with our standard reports. In addition, the **Mobile Survey Trends Dashboard** displays all three mobile survey reports in one place for easy analysis. See Viewing survey results.

The three mobile survey reports (Mobile Survey Trend, Mobile Survey Browser Trend, and Mobile Survey Operating System Trend) and the dashboard are located in Public Reports > Feedback > Survey Responses > Mobile Surveys. A fourth report (Standard Versus Mobile Survey Trend), which is not included on the dashboard, is located in Public Reports > Feedback > Survey Responses.

- **Mobile Survey Trend** shows the number of mobile surveys started and completed over time as well as the completion rate.
- **Mobile Survey Browser Trend** shows the number of mobile surveys submitted per browser over time.
- **Mobile Survey Operating System Trend** shows the number of mobile surveys submitted per operating system over time.
- **Standard Versus Mobile Survey Trend** shows the number of surveys taken on a mobile device versus surveys taken on a standard web device, such as a desktop. If no columns for mobile devices display on the report, either the survey was not enabled for mobile optimization or no mobile devices were used to take the survey.

Because different mobile devices and browsers display surveys in different ways, we recommend testing your surveys on applicable mobile devices and browsers before you launch them.

Proxy surveys

Any broadcast, transactional, or website link survey can be added to a **workspace**, letting your agents complete surveys on behalf of contacts during telephone interactions. Surveys can be embedded in contact, organization, incident, or opportunity workspaces by inserting a Survey By Proxy control. See Adding controls to workspaces and scripts.

Together with Feedback's **advanced mode** features, proxy surveys can be used to initiate more complex processes, such as creating leads and tasks, setting contact field values, sending staff notifications, and triggering external events. This makes proxy surveys useful for meeting a variety of key business needs.

- An incident-based proxy survey can be used by customer support agents to invite feedback about how a support call was handled or assess interest in new service offerings.

- An organization-based or contact-based proxy survey can be used by marketing personnel to prequalify leads and opportunities for the sales team or add contacts to segments based on their explicitly confirmed interests.
- Opportunity-based proxy surveys can be used by sales reps to gather feedback about specific sales interactions or assess how well a product fits a given area of need.

Creating broadcast surveys

You can create a broadcast survey if you want to survey a group of contacts in your knowledge base. Similar to **mailings**, broadcast surveys are sent at a certain time to an audience you define. A link to the survey is sent by email using your own content or a previously defined document (see Creating documents). Customers can then click the link to complete the survey.

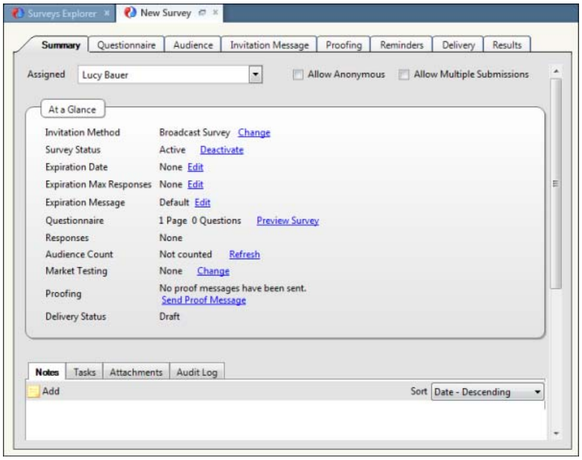
Important The delivery and participation rates of survey invitation emails can be impaired by factors beyond the scope of Feedback. For a description of these issues and how best to optimize your message delivery, see *Best Practices for Email Marketing*.

To create a broadcast survey

1 From the Surveys explorer, click the New button on the ribbon. A new survey opens on the content pane.

Tip You can also create surveys from an open survey by clicking the New button. Additionally, if your navigation set is configured to add surveys from the file menu, click File and select Surveys > Survey. See To configure the file menu.

2 Click Broadcast Survey.



By default, the Summary tab is active. From here, you can review general information about the survey in the At a Glance section, as well as manage the survey's notes, tasks, and attachments (see Managing surveys). As you create the survey, you move through each tab to complete the survey's elements.

3 To assign the survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

a To search for a staff member, type the staff member's name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

4 To let customers answer the survey anonymously, select the Allow Anonymous check box. Contact information is not required to answer the survey.

Note Selecting Allow Anonymous in your survey does not mean that all responses are anonymous. If a survey invitation is sent to a contact or an Oracle Service Cloud cookie is detected on the contact's computer, or the survey itself contains an email address field, Feedback attempts to use that information to identify the contact. For information about using cookies to identify contacts, see Specifying survey options.

5 To let customers submit the survey more than once, select the Allow Multiple Submissions check box.

Note The Allow Multiple Submissions option is not visible for recurring surveys, which always allow multiple submissions. However, recurring surveys can be configured to exclude contacts from the audience that were included in a previous instance of the recurrence. See Setting survey recurrence.

6 Click the text in the At a Glance section described in the following table to perform common survey functions.

Table 515: At a Glance Section Description

Field	Description
Invitation Method	This field displays the invitation method currently selected for the survey. Click Change to change the method and see To change the invitation method of a survey.
Survey Status	This field displays whether the survey is active or inactive. Customers cannot submit responses to an inactive survey and receive a warning message when attempting to access the survey URL. See To deactivate a survey.
Expiration Date	This field displays the survey's expiration date and time. By default, no expiration date is set. See To set an absolute expiration date and To set a relative expiration date.
Expiration Max Responses	This field displays the number of responses a survey can accept. If set, this field also displays the number of responses received, as well as the number of surveys that are still allowed. The maximum number of survey responses you can define is one million. See To set expiration based on maximum number of responses.
Expiration Message	Click Edit to customize the survey's expiration message. See To customize the expiration message. **Note:** If you do not define your own survey expiration message, the system's default message is used.
Questionnaire	This field displays how many pages and questions are in the survey. Click Preview Survey to preview the survey.
Responses	This field displays how many surveys were started and completed by customers.

Table 515: At a Glance Section Description (Continued)

Field	Description
Audience Count	This field displays the most current audience count and when the last count was performed. Click Refresh to update the audience count. To view the details of the audience count, click Details and see Viewing audience count details in surveys. **Note:** Occasionally, the **replication database** used to process mailings can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current, the audience count is labeled “Estimated.”
Market Testing	This field displays the market testing mode of the survey. Click Change to change market testing modes. See Market testing in broadcast surveys.
Proofing	This field displays the number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See Sending a proof survey.
Delivery Status	This field displays the delivery status of the survey and the number of emails sent and delivered. See Survey delivery statuses.

7 Click the Questionnaire tab to add questions and HTML content to the survey. See Creating questionnaires in basic mode and Creating questionnaires in advanced mode.

8 Click the Audience tab to define an audience for the survey. See Defining the broadcast survey audience.

9 Click the Invitation Message tab to create the message sent to the survey audience. See Customizing the invitation message in broadcast surveys.

10 Click the Reminders tab to create automatic email messages that will prompt your customers either to start taking the survey or to finish it if they have already started. See Adding survey reminders.

11 Click the Proofing tab to send a proof of the email for internal review before sending it to the entire audience. See Sending a proof survey.

12 Click the Delivery tab to select delivery options. See Accessing broadcast delivery options.

13 To view the reports associated with the survey, click the Results tab. See Viewing survey results.

14 To preview the survey as it would be viewed on a standard web device, such as a desktop or a laptop, click the Standard button on the ribbon. The survey preview opens in a web browser.

Important If a survey contains an email address field and you submit a value for the field in the survey preview, the form creates or updates contact records so that advanced survey functions can be tested. For this reason, be sure to use only test contact addresses to avoid updating production contacts when testing survey previews.

Also, be careful not to use the preview survey URL in place of the URL of your completed survey (described in step 16). Information submitted on a preview survey is discarded and has no effect on the data collected by the live survey. For identification purposes, each preview survey displays a watermark to ensure it is not confused with a live survey.

15 To preview the survey as it would be viewed from a mobile device, click the Mobile button on the ribbon. See Mobile surveys.

Note Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.

16 To copy the URL of the survey to your clipboard, click the Survey URL button on the ribbon. The Survey URL message opens.

A URL is automatically assigned to the survey. This is the URL that your invitation message links to and your customers visit to complete the survey. From this window, you can view the URL and it is automatically copied to your workstation's clipboard.

a Click the OK button when you are finished viewing the URL to close the window.

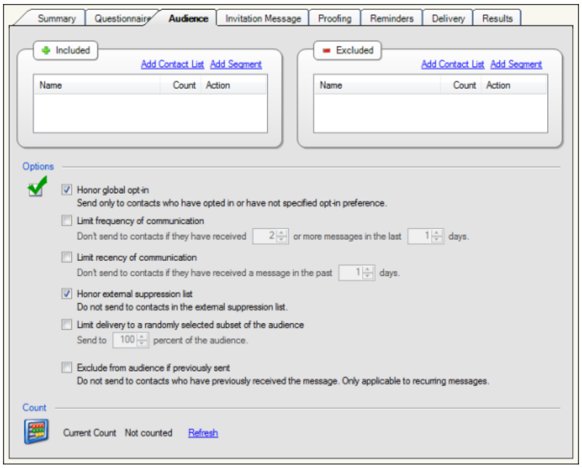
17 Click the Save and Close button to save the survey.

Defining the broadcast survey audience

You specify the **audience** your survey invitations are sent to from the Audience tab. You can include and exclude a total of fifty contact lists and segments, each containing a vast number of contacts. For example, you could include twenty-two segments of contacts and exclude twenty-eight contact lists for a total of fifty lists. You can also restrict the scope of your audience, set survey frequency and recency limits, and specify how to handle global opt-in and suppression options. See Audiences for complete details and procedures about using contact lists and segments in surveys and mailings.

To define the audience

1 From an open survey, click the Audience tab.



2 To include a list in the audience, click Add Contact List in the Included section. The Select Contact List window opens.

- **a** To add a contact list, click New Contact List and refer to Adding contact lists.
- **b** Select the list you want to include in the survey's audience and click the OK button. The list is added to the Included grid. Contacts belonging to the list receive the survey.

3 To include a segment in the audience, click Add Segment in the Included section. The Select Segment window opens.

- **a** To add a segment, click New Segment and refer to Creating segments.

b Select the segment you want to include in the survey's audience and click the OK button. The segment is added to the Included grid. Contacts belonging to the segment receive the survey.

4 To exclude a list from the audience, click Add Contact List in the Excluded section. The Select Contact List window opens.

a Select the list you want to exclude from the survey's audience and click the OK button. The list is added to the Excluded grid. Contacts belonging to the list do not receive the survey.

5 To exclude a segment from the audience, click Add Segment in the Excluded section. The Select Segment window opens.

a Select the segment you want to exclude from the survey's audience and click the OK button. The segment is added to the Excluded grid. Contacts belonging to the segment do not receive the survey.

6 To edit a list or segment that is included in or excluded from the survey, click Open next to the list or segment name. See Managing contact lists and Adding segment filters.

7 To remove a list or segment from the Included or Excluded sections, click Remove next to the list or segment name.

8 Enter the following field information in the Options section.

Table 516: Options Description

Field	Description
Honor global opt-in	Select this check box to send the survey to contacts who did not explicitly opt out of receiving surveys or mailings. Clear this check box to send the survey to all contacts in the audience, regardless of their opt-in preference.

Table 516: Options Description (Continued)

Field	Description
Limit frequency of communication	Select this check box to set a frequency limit, then enter a maximum number of surveys and mailings and a number of days in which contacts can receive messages before they are excluded from surveys. The survey is not sent to any contacts who have received the maximum number of surveys and mailings within the designated time period. For more information about how this setting works, see Frequency and recency limits. **Note:** The minimum you can enter is 2 in the last 1 day. The maximum number of days you can enter is 90. **Tip:** To ensure contacts receive only 1 email every "x" number of days, use the Limit recency of communication setting described next.
Limit recency of communication	Select this check box to set a recency limit. Enter the minimum number of days that should elapse before contacts receive another email. The survey is not sent to any contacts who have received a survey or mailing email in the past specified number of days. For more information about how this setting works, see Frequency and recency limits. **Note:** The maximum number of days you can enter is 90. The default value is 1 day. **Tip:** Use this check box to ensure contacts receive only one email every "x" number of days. For instance, if you want your contacts to receive only one email per week, you can select this check box and then set the field to seven.
Honor external suppression list	Select this check box to exclude contacts in the external suppression list from receiving the survey. Clear this check box to send the survey to all contacts in the audience, even if they are in the external suppression list. See External Suppression List for complete details and procedures about the external suppression list.
Limit delivery to a randomly selected subset of the audience	Select this check box to send the survey to a random subset of the audience. Type a percentage or use the up and down arrows to select a percentage of the audience to send the survey to.

Table 516: Options Description (Continued)

Field	Description
Allow delivery of messages to multiple contacts sharing the same email address	**Caution:** Because duplicate messages sent to a single address are a common characteristic of spam, you should select this check box only when necessary. When the check box is selected and you attempt to schedule or send a mailing, survey, or proof, and duplicate email addresses exist in your audience, a message warns you that your reputation as a bulk email sender may be adversely affected and impact your ability to send future communications. See *Best Practices for Email Marketing*. Select this check box to send messages to multiple contacts sharing the same email address. If this check box is cleared, the message is sent only to the contact most recently updated. This option is available only when email address sharing is enabled. See Email address sharing.
Exclude from audience if previously sent	Select this check box to exclude contacts from the audience that were previously sent an invitation from the same survey. **Note:** This option applies only to recurring surveys. Contacts excluded in this manner are also excluded from the audience count. See Setting survey recurrence.

9 To count the number of contacts who will receive the survey, click Refresh in the Current Count section. Once the audience has been counted, the last count also displays in this section.

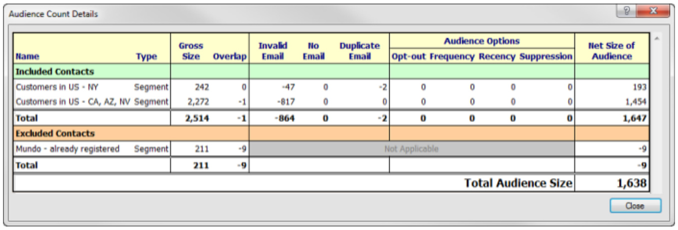
Note Occasionally, the **replication database** used to process mailings can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current, the audience count is labeled “Estimated.”

10 To view the details of an audience count, click Details in the Current Count section after the count has been performed.

❖ Audiences

Viewing audience count details in surveys

You can view the audience count to see how the count is calculated. You can see the included and excluded lists and segments, along with the number of invalid emails and opt-outs. When you click Details after counting the audience, the Audience Count Details window opens.



Audience Count Details

Name	Type	Gross Size	Overlap	Invalid Email	No Email	Duplicate Email	Audience Options				Net Size of Audience
							Opt-out	Frequency	Recency	Suppression	
Included Contacts											
Customers in US - NY	Segment	242	0	-47	0	-2	0	0	0	0	193
Customers in US - CA, AZ, NV	Segment	2,272	-1	-817	0	0	0	0	0	0	1,454
Total		**2,514**	**-1**	**-864**	**0**	**-2**	**0**	**0**	**0**	**0**	**1,647**
Excluded Contacts											
Mundo - already registered	Segment	211	-9	Not Applicable							-9
Total		**211**	**-9**								**-9**
										Total Audience Size	**1,638**

Close

The following table describes the columns on the Audience Count Details window.

Table 517: Audience Count Details Window Description

Column	Description
Name	Lists the name of each segment or contact list included in or excluded from the survey.
Type	Lists whether the audience subset is a contact list or segment.
Gross Size	Lists the number of contacts belonging to the list or segment.
Overlap	Lists the number of contacts belonging to the list or segment who also belong to another list or segment in the audience.
Invalid Email	Lists the number of contacts belonging to the list or segment who have an invalid email address.
No Email	Lists the number of contacts belonging to the list or segment who do not have an email address.
Duplicate Email	Lists the number of email addresses shared by multiple contacts. If the check box is selected on the Audience tab, allowing delivery to multiple contacts sharing the same email address, this count is included in the net size count of the audience. If the check box is not selected, it is subtracted from the gross size when calculating the net size of the audience. **Note:** This option is available only when email address sharing is enabled. See Email address sharing.
Opt-out	Lists the number of contacts belonging to the list or segment who have opted out of surveys.
Frequency	Lists the number of contacts belonging to the list or segment who are filtered by the survey frequency settings.

Table 517: Audience Count Details Window Description (Continued)

Column	Description
Recency	Lists the number of contacts belonging to the list or segment who are filtered by the survey recency settings.
Suppression	Lists the number of contacts belonging to the list or segment who belong to the external suppression list.
Net Size of Audience	Lists the number of contacts in each list or segment who are included in or excluded from the survey.
Total Audience Size	Lists the net total number of contacts who receive the survey.

Audiences are filtered from invitation emails in the following order.

- Excluded segments and contacts
- Contacts without an email address
- Contacts with an invalid email address
- Contacts who have opted out
- Shared email addresses and duplicate contacts (overlaps in included lists or segments)
- Contacts in the external suppression list
- Contacts filtered by recency settings
- Contacts filtered by frequency settings

❖ Audiences

Customizing the invitation message in broadcast surveys

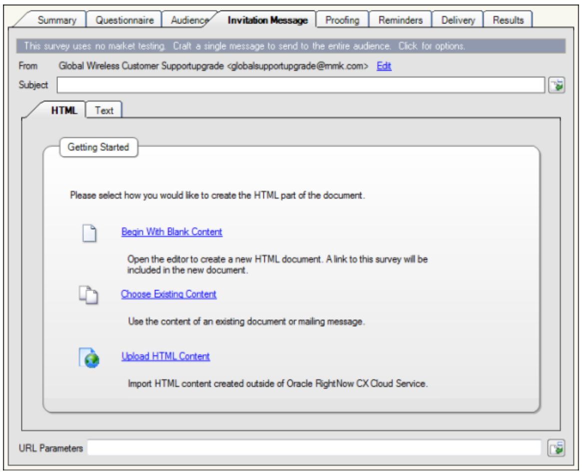
The invitation message is what your customers receive in the email to invite them to participate in the survey. From the Invitation Message tab, you can activate market testing, specify the mailbox settings for the message, the subject of the email, and any URL parameters you want to attach to the survey link in the message. In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site.

Important By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey and then modify and send the copied survey. See To cancel a survey invitation message.

Alternately, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback > General > Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

To create an invitation message

1 From an open survey, click the Invitation Message tab.



2 To activate market testing, click the information bar (just above the From address field) and select Change Market Testing Mode. See Market testing in broadcast surveys.

3 To change the mailbox sending the message or the From and Reply-To addresses, click Edit next to the From address. See Customizing survey invitation message headers.

4 Type the subject of the message in the Subject field.

Writing effective subject lines

Because most mail clients list new messages by From address and subject, the contents of these fields are critical to having your message read. Refine your message subject to be concise yet informative and make sure it clearly states your purpose. If it isn't clear who you are or what you want, your message can be easily passed over.

5 To add a **merge field** to the subject, click the Merge Field button (to the right of the Subject field) and select the field. See Inserting merge fields.

6 To create an HTML invitation message from scratch, click Begin with Blank Content and see Using the HTML editor.

7 To create an HTML invitation message by copying an existing document, click Choose Existing Content and see Choosing existing content.

8 To create an HTML invitation message by uploading your own HTML page, click Upload HTML Content and see Uploading HTML content.

9 To create a text version of the invitation message, click the Text tab.

   a To create a text invitation message from scratch, click Begin with Blank Content and see Creating and editing text.

   b To create a text invitation message by copying an existing document, click Choose Existing Content and see Choosing existing content.

   c To create a text invitation message by converting an HTML page to text, click Convert HTML Content and see Converting HTML content.

Note The system automatically creates a document containing the content created on the Invitation Message tab and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the survey, those changes are also made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes are also made to the text on the Invitation Message tab in the survey. See Automatically generated folders.

10 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

11 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See Inserting merge fields to URL parameters.

Customizing survey invitation message headers

By default, Oracle RightNow Feedback Cloud Service (Feedback) uses the name and email addresses specified in the outgoing email settings of your default Outreach mailbox (see Adding and editing mailboxes). If you want to use a different name and email address for your survey's invitation message, such as a branded email address, you can do so by customizing the message header. When a recipient views your invitation message, the name and email addresses defined in the customized header are used instead of those specified in the default Outreach mailbox.

Using branded email domains

Using email addresses branded with your company's domain name can help recipients recognize your organization as the sender, improving **deliverability**. However, care must be taken to ensure that bounce notifications are processed correctly. Review the following recommended best practices when using branded domains to send survey invitations.

1. **Keep the mailbox configuration provided by Oracle**—At the time your site was created, an Oracle representative probably helped configure your Outreach mailbox settings using a mail account with an Oracle domain, such as rnmk.com. These settings should be left as is to ensure bounce errors are processed. See Email bounce handling.

2. **Customize the message header**—When creating the survey invitation message, add your branded email address by customizing the message header. Customizing the message header does not affect **bounce** processing, but contact replies to your email are sent to the branded address.

3. **Implement email authentication**—Implementing a form of authentication for your branded email accounts can help protect your reputation and secure your mail delivery rates. Authentication options include the following:

   - **Sender Policy Framework**—Sender Policy Framework (SPF) is an email authentication option that designates permitted senders of email originating from your domain, excluding those with mis-matched or incorrectly specified SPF records. See Answer ID 2489 on our support site for information about implementing SPF on your site.

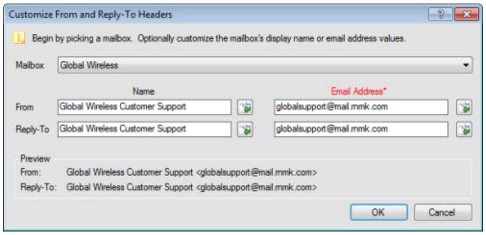
   - **DomainKeys/DomainKeys Identified Mail**—DomainKeys (DK) and DomainKeys Identified Mail (DKIM) are email authentication options that use cryptographic signatures to designate email as originating from an authorized email delivery provider, excluding messages sent from those with unsigned or incorrectly assigned signatures. See Answer ID 2701 on our support site for information about implementing DK and DKIM on your site.

Important Be sure to regularly monitor mail received by the email addresses specified in your custom message header. If you want replies to your survey invitations to be converted to incidents, your mail administrator must configure SMTP forwarding from that mail account to an account configured in Oracle Service Cloud. See Adding and editing mailboxes.

Also note that when an email message cannot be delivered, it usually results in a "bounce" error notification. Bounce notifications are sent to the Envelope From/Bounce Address defined in your Outreach mailbox's outgoing email settings even if the message header is customized using the following procedure. See Email bounce handling.

To customize the survey invitation message header

1 From the Invitation Message tab of an open survey, click Edit next to the From field.



2 Enter the following field information.

Table 518: Customize From and Reply-To Headers Window Description

Field	Description
Mailbox	Click this drop-down menu and select a mailbox to change the mailbox from the default. See Email Management for complete details and procedures about email handling.
From	Type the name and email address that you want the message to appear from in the From text boxes.
Name	Type the name you want the message to appear from.
*Email Address	Type the email address you want the message to appear from.

Table 518: Customize From and Reply-To Headers Window Description (Continued)

Field	Description
Reply-To	Type the name and email address that you want the message to reply to in the Reply-To text boxes.
Name	Type the name you want to appear as the reply-to address.
*Email Address	Type the email address you want to appear as the reply-to address. **Important:** If you use incidents, the Reply-To Address must match the Envelope From/Bounce Address unless your own mail administrator has set up SMTP forwarding for this address to automatically forward to the Envelope From/Bounce Address in the mailbox's outgoing emails settings. See Outgoing Email Settings and Answer ID 1272 on our support site.
Merge Field	Click this button to add merge fields to the from name and address or reply-to name and address.
Preview	This section displays how the from and reply-to addresses appear.

3 Click the OK button to save your settings and close the window.

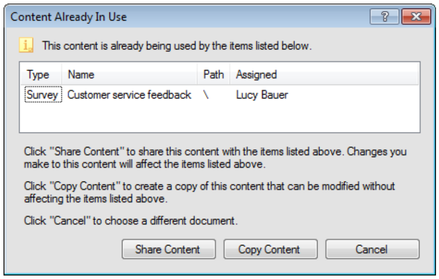
Choosing existing content

As an alternative to creating a message from scratch, you can base your message on existing content. You can choose to copy a document's content into your message and customize it, or share the content with other surveys and messages that use the document. See Creating documents.

To insert existing content

1 From an open survey, click Choose Existing Content on the Invitation Message tab. The Choose Document window opens.

2 Select the document you want to use and click the OK button. If it is not already in use by another mailing, campaign, or survey, the content is added to your message. Otherwise, the Content Already in Use window opens.



a To share the document with the items indicated in the grid, click the Share Content button. When you share a document, you can edit the content of the document, but all other messages that share it are also modified. Likewise, if another staff member edits the document, your message is also modified.

b To create a copy of the document, click the Copy Content button. If you edit the copied content, the original document is not affected. Conversely, if the content of the original document is modified, it does not affect your copy of the message.

Caution The system automatically creates a document containing the copied content and stores it in the Automatically Generated folder in the Documents explorer. When you update the document in the survey, those changes are also made to the automatically generated copy. In addition, if you make any changes to the copy in the Automatically Generated folder, those changes are also made to the content on the Invitation Message tab in the survey. See Automatically generated folders.

Uploading HTML content

You can upload an HTML file into your survey to create your invitation message. The HTML document must be stored in a file accessible through your local workstation. You cannot access the HTML of a web page.

To upload HTML content

1 From an open survey, click Upload HTML Content on the Invitation Message tab.

2 Select the HTML file you want to upload.

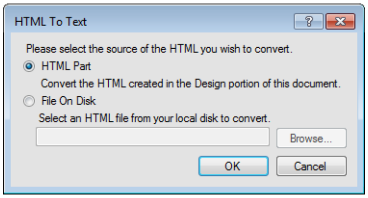
3 Click the Open button. The HTML is inserted in your invitation message.

Converting HTML content

When creating a text invitation message, you can take HTML content from the HTML message or from an HTML file and convert it to plain text.

To convert HTML content

1 From the Invitation Message tab of an open survey, click the Text tab and click Convert HTML Content.



2 To convert the HTML invitation message to text, select the HTML Part radio button.

3 To convert an HTML file to text, select the File On Disk radio button and browse for the file.

4 Click the OK button to insert the converted HTML in the text part of your message.

Market testing in broadcast surveys

When creating a broadcast survey, you can test different content and designs on a subset of your audience by using **market testing**. Market testing is available in two modes.

ORACLE SERVICE CLOUD Watch Tutorial

- **Even split**—This mode sends your test message to equal portions of your audience. For example, if you created four messages, each message would be sent to twenty-five percent of your audience. In this way, you can test different content and designs for use in future messages.

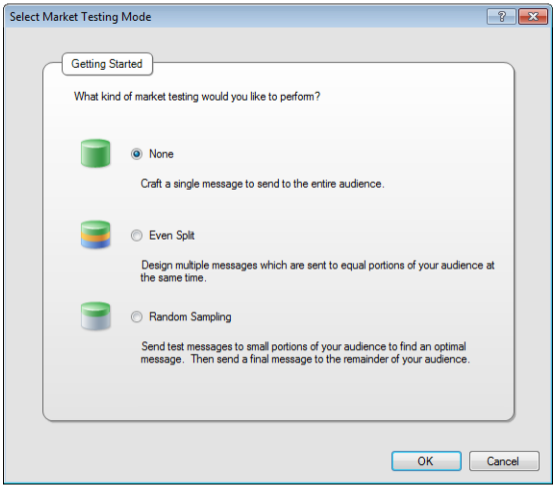
- **Random sampling**—This mode sends test messages to a percentage of the audience you specify. After the test messages are sent, you send a final message to remaining audience members. For example, you could send two messages to five percent of your audience each. After determining the most effective message, you would send a final message to any audience members who had not received a test message.

Important By default, the Invitation Message tab is set up without market testing. This means you create and send only one invitation message.

To activate market testing

1 On the Invitation Message tab of an open survey, click the information bar (just above the From address field) and select Change Market Testing Mode. The Select Market Testing Mode window opens.

Note You can also access this window on the Summary tab by clicking Change next to Market Testing.



2 To send test messages to equal portions of your audience, select the Even Split radio button. See [Creating messages in even split mode](#).

3 To send test messages to a percentage of your audience, select the Random Sampling radio button. See [Creating messages in random sampling mode](#).

4 To disable market testing, select the None radio button.

Note If you have created more than one test messages, the Select Message To Keep window opens asking you which message you want to use. You must select a message to keep before you can disable market testing.

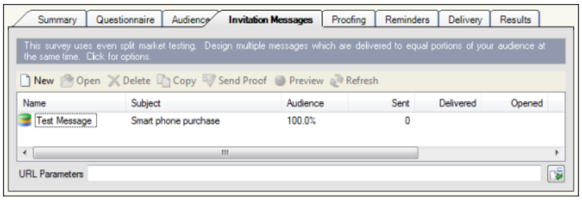
5 Click the OK button.

Creating messages in even split mode

When creating messages in even split mode, you define different message content and proofing options for each version of your message. Your audience is split evenly between the messages. The messages are sent at the same time and share delivery options.

To create messages in even split mode

1 From the Select Market Testing Mode window, select the Even Split radio button and click the OK button. The market testing page displays in even split mode.



By default, you send one test message to 100 percent of the audience. You can add additional messages, edit the messages, send proofs, or view results. From here, you can also see information about each message, described in the following table.

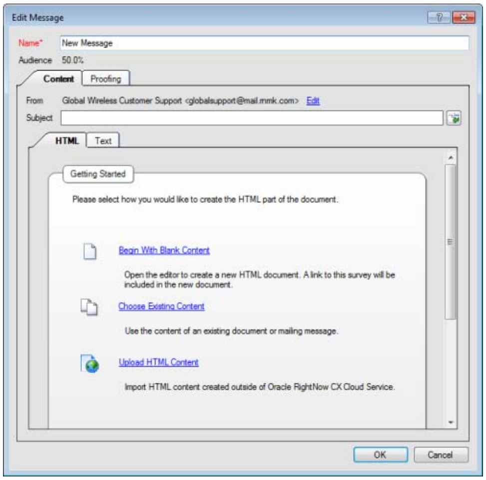
Table 519: Invitation Messages Description

Column	Description
Name	This column displays the name of the message.
Subject	This column displays the email's subject line for the message.
Audience	This column displays the percentage of the audience the message is sent to.
Sent	This column displays the number of emails sent with the message.

Table 519: Invitation Messages Description (Continued)

Column	Description
Delivered	This column displays the number of emails sent with the message that did not bounce.
Opened	This column displays the number of unique email recipients who opened the message.
Clicked	This column displays the number of unique email recipients who clicked a tracked link.
Unsubscribed	This column displays the number of email recipients who chose to unsubscribe from future emails. **Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See Inserting unsubscribe links.
Replied	This column displays the number of times the survey message was replied to.

2 Click the New button to add a second test message. The Edit Message window opens.



3 Type the name of the message in the Name field.

4 Type the subject of the message in the Subject field on the Content tab. See Customizing the invitation message in broadcast surveys.

5 Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See Using the HTML editor and Creating and editing text.

6 To send a proof message, click the Proofing tab on the Edit Message window. See Sending a proof survey.

7 Click the OK button to save the message. The new message is added to the Invitation Messages tab.

8 To open a message for editing, select the message and click the Open button.

9 To delete a message, select the message and click the Delete button.

10 To copy a message to create another test message, select the message and click the Copy button.

Important A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages are not shared with the original test message or subsequent copies. See Automatically generated folders.

11 To send a proof of a message, select the message and click the Send Proof button. See Sending a proof survey.

12 To preview the content of a message, select the message and click the Preview button.

13 To refresh the message statistics, click the Refresh button.

14 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

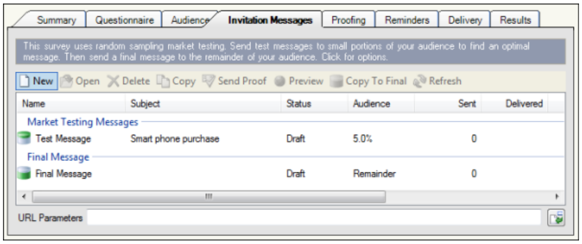
15 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See Inserting merge fields to URL parameters.

Creating messages in random sampling mode

You should use random sampling mode when you want to send a sample of test messages to your audience before determining the best one to use as a final message. When creating messages in random sampling mode, you define different message content, designs, delivery, and proofing options for each version of your message. Once you evaluate the effectiveness of your test messages, you can create a final message and send it.

To create messages in random sampling mode

1 From the Select Market Testing Mode window, select the Random Sampling radio button and click the OK button. The market testing page displays in random sampling mode.



By default, you send one test message to five percent of the audience, and one final message sent to the remainder of the audience. You can add additional messages, edit the messages, send proofs, or view results. From here, you can also see information about each message, described in the following table.

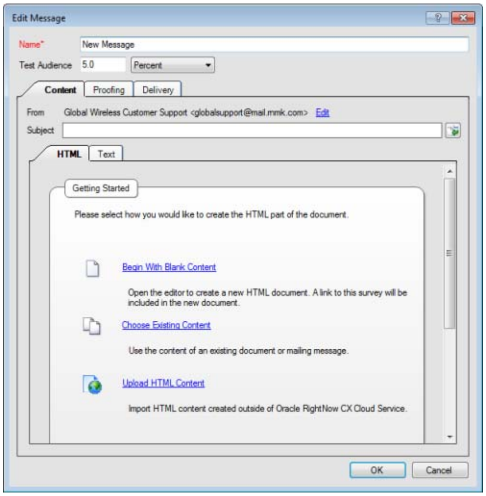
Table 520: Invitation Messages Description

Column	Description
Name	This column displays the name of the message.
Subject	This column displays the email's subject line for the message.
Status	This column displays the status of the message. See Survey delivery statuses.
Audience	This column displays the percentage of the audience the message is sent to.
Sent	This column displays the number of emails sent with the message.
Delivered	This column displays the number of emails sent with the message that did not bounce.
Opened	This column displays the number of unique email recipients who opened the message.
Clicked	This column displays the number of unique email recipients who clicked a tracked link.

Table 520: Invitation Messages Description (Continued)

Column	Description
Unsubscribed	This column displays the number of email recipients who chose to unsubscribe from future emails. **Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See Inserting unsubscribe links.
Replied	This column displays the number of times the survey message was replied to.

2 Click the New button to add a second test message. The Edit Message window opens.



3 Type the name of the message in the Name field.

4 Type the number or percentage of recipients you want to receive the message in the Test Audience field and select Percent or Recipients from the drop-down menu.

5 Type the subject of the message in the Subject field on the Content tab. See Customizing the invitation message in broadcast surveys.

6 Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See Using the HTML editor and Creating and editing text.

7 To send a proof message, click the Proofing tab on the Edit Message window. See Sending a proof survey.

8 Click the Delivery tab on the Edit Message window to define the delivery options for the test message. See Accessing broadcast delivery options.

Note When sending multiple test messages, we recommend scheduling them to be sent all at one time rather than a few minutes apart. This minimizes any performance impact on your database by sharing audience segmentation processes across all of the sending cells instead of performing them multiple times.

9 Click the OK button to save the test message. The new message is added to the Invitation Messages tab.

10 To open a message for editing, select the message and click the Open button.

11 To delete a message, select the message and click the Delete button.

Note You cannot delete the final message.

12 To copy a message to create a new message, select the message and click the Copy button.

Important A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages is not shared with the original test message or subsequent copies. See Automatically generated folders.

13 To send a proof of a message, select the message and click the Send Proof button. See Sending a proof survey.

14 To preview the content of a message, select the message and click the Preview button.

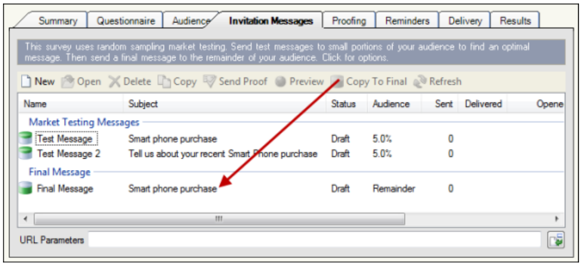
15 To refresh the message statistics, click the Refresh button.

16 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

17 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See Inserting merge fields to URL parameters.

18 Once you are satisfied with your message, you must copy it as your final message and then define delivery options.

a Select the message and click the Copy To Final button. The message you selected is copied to the Final Message section of the Invitation Messages tab.



b Select the final message and click the Open button.

c Click the Delivery tab on the Edit Message window to define delivery options.

Scheduling surveys for market testing

Market testing your surveys works best when you schedule the test messages at the same time rather than sending them a few minutes apart. By scheduling test messages at the same time, the database and servers only have to process data once instead of multiple times.

Sending a proof survey

An important step in creating a survey is proofing the content to ensure the survey is approved by the necessary contacts and staff members and as a final check for any mistakes. You can send a proof to any combination of staff accounts, staff groups, **proof lists**, **distribution lists**, and distribution list available addresses, and then view the results of the proof from the Proofing tab. See To add or edit a distribution list.

Once a reviewer has approved or rejected the proof, the survey's assigned staff member will receive a Survey Proof Response Notification. This notification can be customized using message templates and is found in the Administrator Notifications message type under the Feedback category. See Customizing messages.

Proof surveys are subject to the following behaviors and limitations.

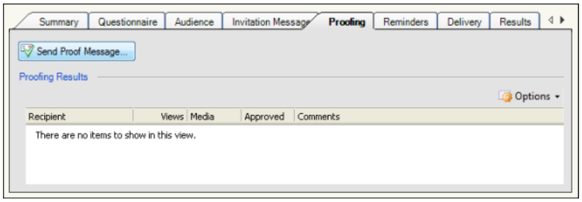
- If your message contains **conditional sections**, all conditional sections display in the proof message. However, reviewers see the conditional sections only if they can be mapped to contact records that allow access to those conditional sections.
- If a form on the proof contains an email address field and a reviewer submits a value for the field in the survey preview, a contact record is created or updated so that advanced survey functions can be tested. For this reason, be sure that your reviewers use only test contact addresses to avoid updating production contacts when testing survey proofs.
- To ensure the proofing process does not impact statistics once the survey has been sent, Feedback does not retain data submitted from proof surveys. If you want to submit test responses without impacting a survey's statistics, you can copy the survey and test using the copy instead.

Send proofs to key staff

When sending proofs, consider adding key members of your customer support, sales, and marketing teams. Sharing a sample of each mailing can help you ensure that all contact "touch points" (groups in your organization that work directly with customers) are aware of the messages being communicated to your customers. Providing a consistent message across all channels is key to providing a world-class customer experience.

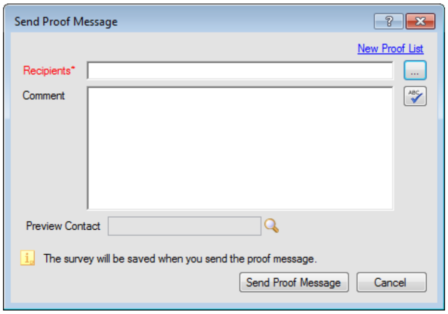
To send a proof

1 From an open survey, click the Proofing tab.



2 Click the Send Proof Message button to select proof recipients. The Send Proof Message window opens.

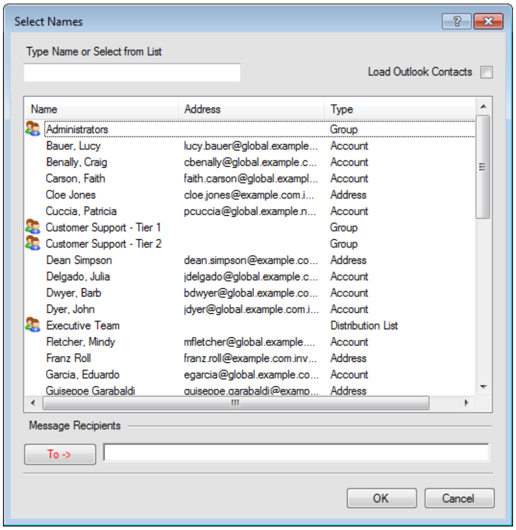
Note From the Summary tab, clicking Send Proof Message opens the Send Proof Wizard where you can select the survey you want to send for a proof, and then follow the wizard as it steps you through the process of sending your message.



3 To create a proof list, click New Proof List and refer to Adding contact lists.

4 Type an email address or the name of a group or proof list in the Recipients field.

5 To select proof recipients from a list, click the Select Recipients button (to the right of the Recipients field). The Select Names window opens.



a Select a staff member, address, group, or proof list and click the To button to add it to the To field.

b To find a specific staff member, address, group, or proof list, type the name in the text box above the list. The first item matching those letters is selected in the grid.

c To import your contacts from the default Contacts folder in Outlook, select the Load Outlook Contacts check box. This is useful for displaying contacts that are not included in Oracle Service Cloud. See Synchronizing contacts.

d Click the OK button to close the window.

6 Type any comments you want to appear in the message in the Comment text box.

7 To spell check the Comment field, click the Spell Check button (to the right of the Comment field) and refer to Spell checking.

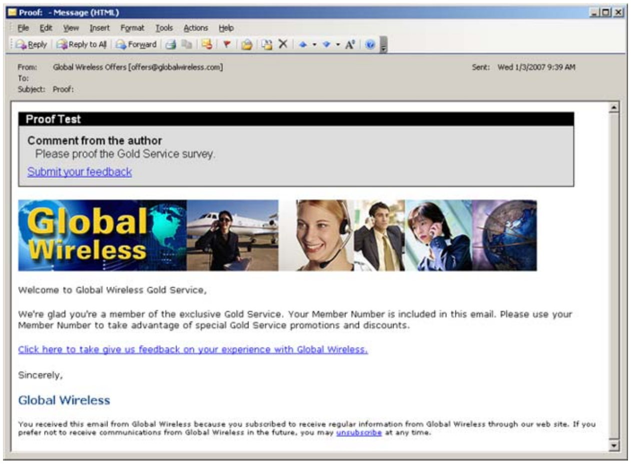
8 To customize your proof message by contact record, which lets your reviewers see how dynamic content will look for a specific contact, click the Search button next to the Preview Contact field on the bottom of the window. The Contact Search window opens.

a Type your search criteria in one or more of the available fields and click the Search button. A list of contacts that match your search criteria displays in the grid below the search criteria fields. You can then select a contact and click the Select button. The Contact Search window closes and the contact name you selected populates the Preview Contact field on the Send Message Proof window.

9 Click the Send Proof Message button send the proof message to the specified recipients.

Accepting or rejecting proof surveys

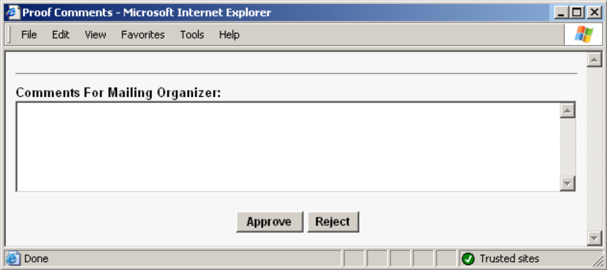
After you send a proof, the recipients can accept or reject the survey. The proof email automatically displays a link to a web page where the tester can accept or reject the survey. The following figure shows an email with the proof test link.



The survey's assigned staff member receives a Survey Proof Response Notification every time a reviewer submits feedback.

To accept or reject a proof email

1 In a proof email, click the Submit Your Feedback link. A new window opens where you can make comments and accept or reject the proof. The following figure shows the Proof Comments page.



2 Type any comments related to the proof survey in the Comments for Mailing Organizer text box.

3 To approve the survey, click the Approve button.

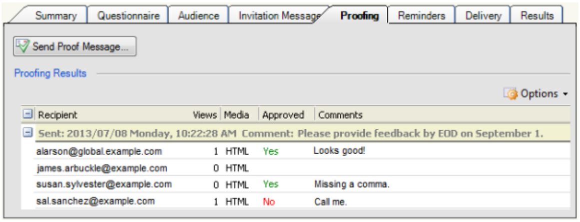
Or

To reject the survey, click the Reject button.

A message displays confirming your submission.

Viewing proof results

Once you have sent out the proof message, you can easily check the proof results from the Proofing tab. The Proofing Results section lists all message proofs that were previously sent for the selected survey, grouped by date and time. You can see how many times the proof was viewed, who accepted and rejected the proof, and any comments from the proof testers.



The columns in this section are described in the following table.

Table 521: Proofing Results Description

Column	Description
Recipient	This column displays all recipients of the proof survey.
Views	This column displays the number of times each recipient has viewed the message.
Media	This column displays the media the proof was sent in (HTML, text, or multipart).
Approved	This column displays whether each recipient approved the test proof (Yes or No).
Comments	This column displays the recipient’s comments.

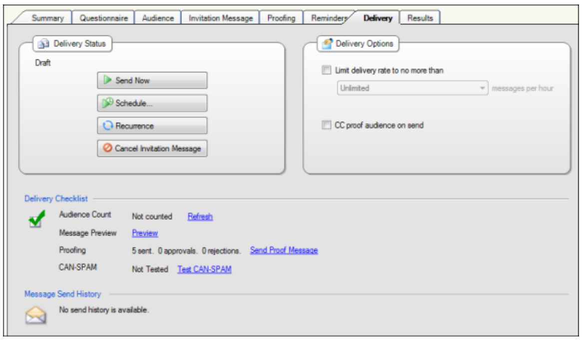
Accessing broadcast delivery options

After you have created the **questionnaire**, defined the audience, created an invitation message, and sent proofs of the survey, you can send the survey to your customers. The Delivery tab lets you choose to send the survey immediately or schedule its delivery for sometime in the future. In addition, you can control the speed of the delivery and access common administration tasks for the survey.

Note You must create a questionnaire before delivering the survey. See Creating questionnaires in basic mode.

To access broadcast delivery options

From an open survey, click the Delivery tab.



The Delivery tab is divided into sections. The Delivery Status section displays the status of the survey (see Survey delivery statuses) and contains buttons for controlling the sending of the survey. You can perform the following tasks from this section.

- **Send a survey**—See Sending surveys.
- **Schedule a survey**—See Scheduling surveys.
- **Unschedule a survey**—See Scheduling surveys.
- **Reschedule a survey**—See Scheduling surveys.
- **Set a recurring survey**—See Setting survey recurrence.
- **Suspend a survey**—See Suspending broadcast surveys.

- **Cancel a survey**—See [Canceling broadcast surveys].

Important Some high-volume sites are configured to send surveys from a **replication database** to reduce the impact of large processes on the **operational database**. Because the sync between the replication database and the operational database can occasionally fall behind, the **mailer daemon** (also called RNMD) uses a fail-safe function before sending to ensure that the replication database is caught up. If it is not, the survey is delayed until the replication database has been synchronized. The fail-safe function ensures that the survey reflects the current state of your production contact records (including those that are opted out or have email addresses marked as invalid) at the time the survey is sent. If you are uncertain whether your site uses the replication database to send surveys, contact support or your Oracle account manager.

The Delivery Options section lets you set options related to sending the survey. See Sending surveys.

On the bottom of the tab, delivery information about the survey is available for you to quickly scan and assess in the Delivery Checklist and Message Send History sections. The following table describes these sections.

Table 522: Delivery Sections Description

Section	Description
Delivery Checklist	This section displays the audience count and proof history and provides a link to preview the survey.
Audience Count	Once an audience count has been performed, this section displays the most recent count and the time and date it was performed. Click Refresh to perform an updated audience count. See Defining the broadcast survey audience. **Note:** Occasionally, the **replication database** used to process mailings can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current, the audience count is labeled “Estimated.”
Message Preview	This section contains a link to preview the message that is sent with the survey. Click Preview to preview the message.
Proofing	This section displays a summary report of message proofs associated with the survey. Click Send Proof Message to send the message as a proof. See Sending a proof survey.

Table 522: Delivery Sections Description (Continued)

Section	Description
CAN-SPAM Compliance	This section contains a link to test the survey's compliance with the CAN-SPAM Act of 2003. If you have already tested CAN-SPAM compliance, the test results and a link to the details of the test display. See CAN-SPAM compliance in surveys.
Message Send History	This section displays a log of events relating to the delivery status of the survey. If the survey has not been sent, it is noted here.

Sending surveys

Broadcast surveys can be sent immediately from the Delivery tab. The status changes to Preparing to Send and then the survey is sent to your defined audience. Once the survey is finished sending, it is marked Completed.

To send a survey

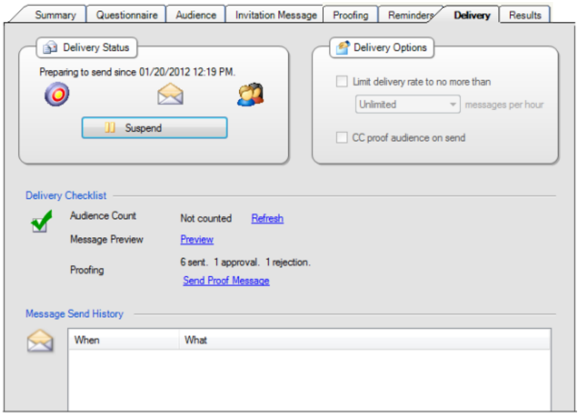
1 From the Delivery tab of an open survey, enter the following field information in the Delivery Options section.

Table 523: Delivery Options Section Description

Field	Description
Limit delivery rate to no more than x messages per hour	Select this check box to control the rate of delivery and then click the drop-down menu to select the number of emails to send per hour.
CC proof audience on send	Select this check box to copy the sent survey to your proof message recipients. The phrase "Proof Copy:" is prepended to the message subject. **Note:** Proof members may receive two messages if they are also part of the audience.

2 Click the Send Now button. A window opens asking you to confirm that you want to send the survey.

3 Click the Yes button to send the survey. The delivery status on the Delivery tab changes to Preparing to Send and you can see the delivery progress of the survey.



a When the survey is finished sending, the status changes to Completed and the Delivery Status section displays the number of emails sent and delivered.

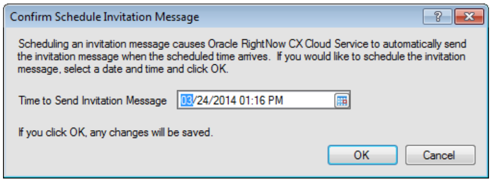
Scheduling surveys

You can schedule broadcast surveys to be sent on a specified date and time. This lets you coordinate sending a survey before the actual send date. For example, to send a survey that coincides with a product launch. Once scheduled, the survey automatically sends.

To schedule a survey

1 From the Delivery tab of an open survey, enter field information in the Delivery Options section. Click here for field descriptions.

2 Click the Schedule button. The Confirm Schedule Invitation Message window opens.



3 Type the date and time you want to send the survey or click the calendar (to the right of the Time to Send Invitation Message field) and select the date.

4 Click the OK button to save the schedule. The Delivery Status section displays the time and date the survey is scheduled to send.

5 To unschedule a survey without canceling it, click the Unschedule button. This way, the survey can be scheduled later.

6 To reschedule the survey, click the Reschedule button.

7 To cancel a survey schedule, click the Cancel Invitation Message button.

   a Click the OK button to confirm you want to cancel the invitation message.

Tip To edit or send a survey that has been canceled, first copy the survey and then edit or send the survey copy. See Canceling broadcast surveys.

Setting survey recurrence

Survey recurrence lets you send broadcast survey invitations at regular daily, weekly, monthly, or yearly intervals with a number of flexible options.

- You can schedule invitations to send during a specific date range, or set no end date to allow recurrences to run indefinitely.
- You can schedule invitations to send on specific days of the month or specific months of the year.
- You can send an invitation to each contact in your audience only once or include all matching contacts every time the recurrence is initiated.
- You can select the time of day that you want invitations to begin sending.

Note Occasionally, the **replication database** used to process surveys can fall slightly behind the **operational database**. If the system determines that the replication contact data is not current at the scheduled recurrence time, it waits until the data is appropriately synchronized before sending.

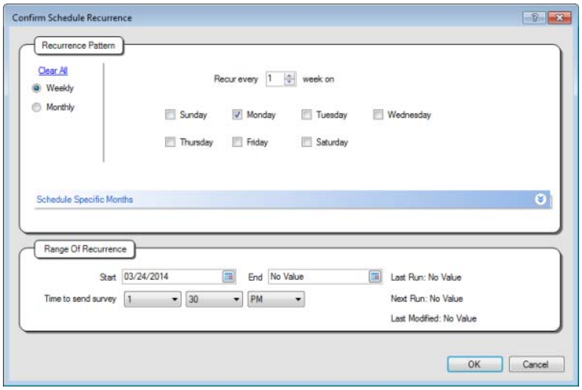
Before you set a recurring schedule, you must first define the audience and the invitation message subject and content. Once recurrence has been set, you can click the Suspend button to suspend recurrences. This saves the recurrence information so it can be edited or reactivated.

Information about past recurrences—such as the time last run, next scheduled run time, the time the schedule was last updated, and basic results data—is stored in the knowledge base and tracked in the Recurring Surveys Summary report (Public Reports > Feedback > Survey Performance). Also, each recurrence is tracked in the survey's **audit log** along with a description of how many invitations were sent. See Audit logs.

To add or edit a recurring schedule for a broadcast survey

1 From an open survey, click the Delivery tab.

2 Click the Recurrence button. The Confirm Schedule Recurrence window opens.



3 Enter the following field information.

Table 524: Confirm Schedule Recurrence Window Description

Field	**Description**
Recurrence Pattern	Select the weekly or monthly interval when the survey should be sent. For example, a survey could be sent every two weeks on Tuesday, or every month on the 7th and 19th.
Clear All	Click this text to clear all selected recurrence pattern check boxes.
Monthly	Select this radio button to display check boxes for the days of the month. You can then select the days of the month when the survey should be sent.
Weekly	Select this radio button to display check boxes for each day of the week. You can then select the check boxes next to the days when you want the survey to be sent. When you select this radio button, a Recur drop-down menu displays where you can specify the frequency of the weekly survey. For example, if you want to send a survey every week on the days selected, enter 1 in the field. If you want the survey to send every third week on the days selected, enter 3 in the field. This field accepts values from 1 to 99.

Table 524: Confirm Schedule Recurrence Window Description (Continued)

Field	Description
Schedule Specific Months	Click this header to display check boxes for the months of the year. Select the months during which the survey should send. By default, every month is selected, but if you do not want to send during a specific month, you can clear the check box for that month.
Clear All	Click this text to clear all check boxes for the selected months.
Range of Recurrence	Options in this section let you specify a date range for the recurrence and time of day at which the survey is sent.
Start	Enter the start and end dates of the schedule or click the calendars to select the dates. The current day is the default start date.
End	
Time to send survey	Enter the time of day to begin sending the survey.

4 Click the OK button to save the recurrence settings and return to the Delivery tab.

5 To suspend the recurrence, click the Suspend button. The Confirm Suspend window opens.

a Click the OK button to confirm you want to suspend the recurrence.

Note Once recurrence is suspended, you can click the Recurrence button again to edit or reactivate it.

6 To exclude contacts from the audience that were included in a previous instance of the recurrence, click the Audience tab and select the Exclude From Audience if Previously Sent check box.

Note By default, a recurring survey sends on every recurrence to every contact that matches your audience, even contacts who previously received an instance of the same message. If you want each contact to receive only one instance of a recurring survey, you must exclude contacts from the audience that were previously sent to. This is often helpful when sending a one-time offer—for example, to all contacts who are having a birthday in the next month.

Suspending broadcast surveys

You may want to stop sending a survey while it is sending or preparing to send. You can temporarily stop a survey from sending by suspending it.

To suspend a survey

1. From the Delivery tab of an open survey, click the Suspend button. This button appears only when a survey is in the process of sending. The Confirm Suspend message opens asking you to confirm that you want to suspend the survey.
2. Click the Yes button to confirm suspending the survey.

   The status changes to Suspended and the Delivery Status section displays the number of audience members the survey was already sent and delivered to.

Canceling broadcast surveys

You can cancel a survey invitation message at any time. When you cancel the survey invitation message, the survey is saved and you can still view survey results. However, the invitation message cannot be sent or further modified.

Important By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey and then modify and send the copied survey.

Alternately, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback > General > Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

To cancel a survey invitation message

1. From the Delivery tab of an open survey, click the Cancel Invitation Message button. The Confirm Cancel Invitation Message window opens asking you to confirm that you want to cancel the invitation message.
2. Click the Yes button to cancel the survey. The delivery status changes to Canceled.

Viewing survey results

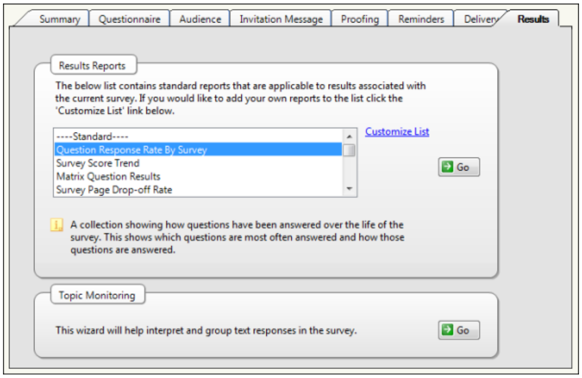
In addition to helping you create and send effective surveys, Feedback provides a comprehensive set of reports and monitoring tools to help you process and analyze the results. The Results tab displays a list of standard reports that present survey response data as well as information about the effectiveness of your survey invitation messages, such as total emails sent and delivered, survey link clicks, unsubscribes, **bounces**, and forwards. You can also track question response rates, survey reminder statistics, mobile survey trends, and trending information based on timeline. Other reports can be added to the list to provide more analytical options for your survey.

Important The email gateway must be activated in order for the **Techmail** utility to capture bounce data for analytics. See Email bounce handling.

Feedback also features topic monitoring for text responses in the survey. Topic monitoring helps you analyze text responses by grouping them into topics and identifying them by common keywords. See Topic monitoring.

To view survey results

1 From an open survey, click the Results tab.



2 Select a report from the Results Reports list.

Tip When you select a report, the report description displays in the area below the list to help you understand the purpose of the report.

3 Click the Go button. The report displays on the content pane in a new tab.

4 To view a definition of the report, including its tables, filters, and column descriptions, click the Definition button on the ribbon and select View.

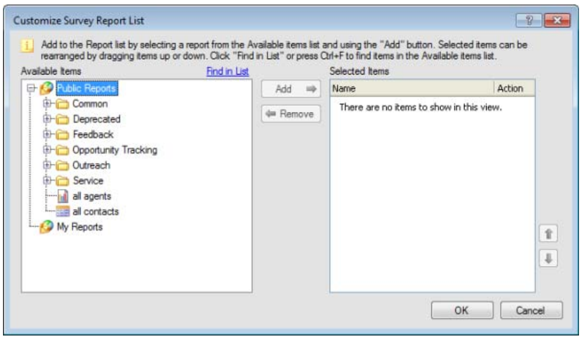
5 To view the same report for a different survey, select the survey from the Survey Name drop-down menu and click the Search button.

Customizing the survey report list

The survey reports list provides a set of useful standard reports that display results information about the survey you are editing. However, you can add or remove reports to customize the list.

To customize the survey report list

1 From the Results tab of an open survey, click Customize List next to the reports list. The Customize Survey Report List window opens.



2 To add a report to the survey report list, select a report from the Available Items list and click the Add button.

Or

Press **Ctrl** while selecting each report you want to add at the same time. You can also press **Shift** to select multiple consecutive reports.

3 To search for a report in the Available Items list, click Find In List and enter the name of the report you are looking for.

4 To remove a report from the survey report list, select the report in the Selected Items list and click the Remove button.

5 To rearrange the order of the reports you are adding, select a report in the Selected Items list and click the up or down arrow.

Tip You can also drag and drop reports to adjust their position.

6 Click the OK button to close the window and update the list. Added reports display at the bottom of the list.

Tracking transactional survey results by agent

Tracking which agent was assigned to the incident (or opportunity) at the time the transactional survey was sent is important for gauging agent success rates. The *question_sessions.acct_id* field is used to track this information, and is available when reporting on survey results. The account ID value *(acct_id*) is added directly to the Question Sessions *(question_sessions)* table. Because system processes can ultimately change the agent assignment at any point in its lifecycle, even after a related transactional survey is sent, this ensures that the agent the survey results are tied to are accurate.

When the survey is sent, the account ID for the related record is encrypted in the URL that is included in the survey's invitation message. When the survey is submitted, that account ID value is set in the *question_sessions.acct_id* field of the Question Sessions table. Since the account ID is included in the URL at the time the survey is sent, even if the agent assigned to the record changes between when the survey is sent and submitted, the account ID value submitted for the survey does not change from the send time value.

Note This functionality also applies to surveys popped at the end of a chat session. In this case, however, *question_sessions.acct_id* is based on the final agent assigned at the end of the chat session and is set when the survey is completed.

See Creating transactional surveys.

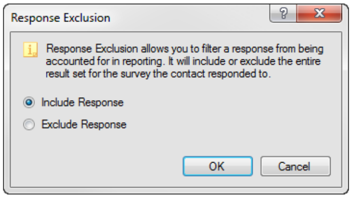
Excluding survey responses

If you find a survey response that is invalid—for example, a question appears to have been misunderstood or answered incorrectly—you can improve the accuracy of your data by excluding the response from your survey results. The following procedure describes how a response can be excluded from (or included back into) a survey results report.

Note When you exclude a survey response, you exclude all answers submitted by the contact during the entire survey response session. Excluded responses are not actually deleted from the system. Instead, the *question_sessions.ac_ignore* field is set to Yes, which excludes the response session from any reports that include this filter. For this reason, excluding (or including) a survey response affects its visibility across all reports that filter on the *question_sessions.ac_ignore* field.

To exclude or include a survey response

1 From an open survey results report, select the record from which you want to exclude a response and click the Response Exclusion button. The Response Exclusion window opens.



Note The Response Exclusion button is enabled only on reports with response data that list results.

2 To exclude the response from survey results, select the Exclude Response radio button.

3 Click OK.

4 To see your change reflected on your report, click the Refresh button on the ribbon.

Important Remember, when you exclude a survey response you exclude all answers submitted by the contact.

5 To include a previously excluded response back into the survey results, click the Search button on the ribbon.

   a Clear the No check box, select the Yes check box, and click Search. By changing your search criteria for response exclusions, you've changed the data that displays on the report. Now, all records that have responses excluded will display.
   b Click the Response Exclusion button on the ribbon. The Response Exclusion window opens with the Include Response check box selected.
   c Click OK.
   d To see the responses added back into your report, click the Search button on the ribbon and change your Response Exclusion criteria from Yes to No.
   e Click Search. All records that are set to "Include Response," including those that had previously been excluded, now display.

Important This feature does not work when cross tabbing is used in the report or if the report displays data from multiple responses in a single row.

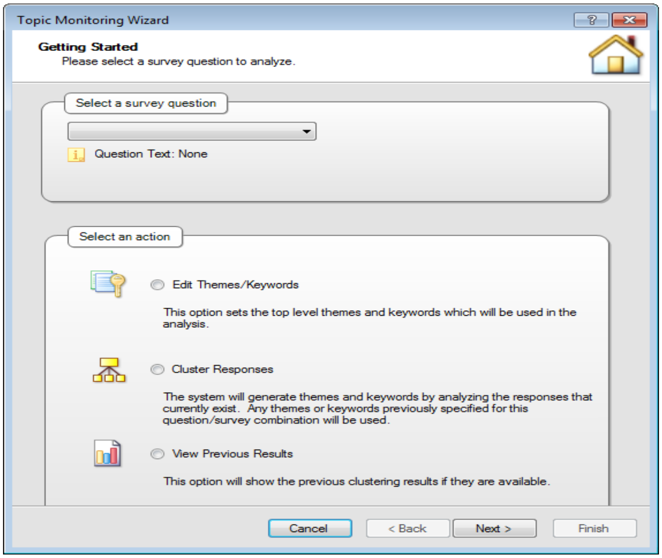
Topic monitoring

Text responses often provide the most valuable information received from customers. However, text responses can be more difficult to analyze than multiple choice questions that can be counted and included in graphs. A useful approach for analyzing text responses is to group responses containing similar content and look for emerging themes. Since the process of clustering (grouping responses and identifying themes) can be time consuming and tedious, Feedback can automatically perform this task, providing an easy method to spot trends in text responses to your survey questions.

Topic monitoring lets you view the distribution of responses across themes and drill down into themes or sub-themes to read individual responses. Themes are accessed through the survey Results tab and the topic monitoring report in Analytics.

To cluster text responses

1 In the Topic Monitoring section on the Results tab, click the Go button. The Topic Monitoring Wizard opens.



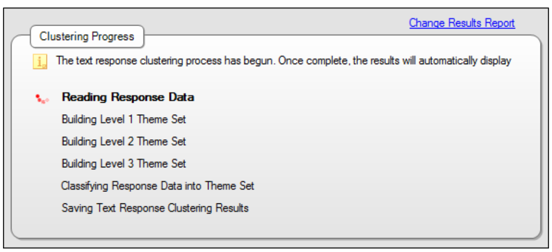
2 Select a question from the Select a Survey Question drop-down menu. The question text appears below the menu.

Note In order to be clustered, the question you select must have received at least ten responses.

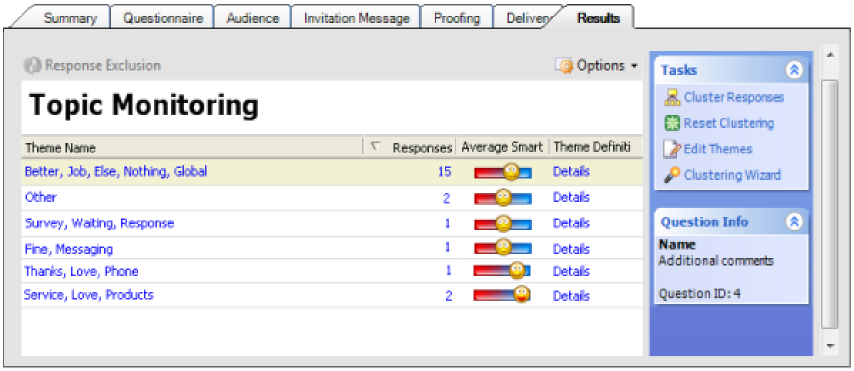
3 Select the Cluster Responses radio button. See [Editing themes](#).

4 To view recent cluster results without re-clustering, select View Previous Results and refer to the Topic Monitoring Report Description table below.

5 Click the Finish button. The Topic Monitoring Wizard closes and the Clustering Progress section displays on the Results tab.



When clustering is complete, the resulting themes display on the Results tab.



The following table describes the topic monitoring report after clustering.

Table 525: Topic Monitoring Report Description

Field	Description
Report Fields	Topic monitoring results include the following information.
Theme Name	This column displays the keywords that identify the theme or the name specified for the theme. Click the theme name to drill down into sub-themes, if they exist.
Responses	This column displays the number of text responses included in the theme. Click this number to drill down into the report and view a list of the text answers.
Average SmartSense	This column displays the average **SmartSense** rating for the text responses included in the theme.
Theme Definition	Click Details to view the top keywords for the theme and the theme type.
Change Results Report	Click this text to return to the default Results tab.
Tasks	Use the buttons in this section to cluster responses, reset clustering, edit themes, and open the Topic Monitoring Wizard.
Cluster Responses	Click this button to recluster the responses using your customized themes.

Table 525: Topic Monitoring Report Description (Continued)

Field	Description
Reset Clustering	Click this button to recluster the responses without using your customized themes. **Note:** Your custom themes are retained. However, they cannot be used during this clustering session.
Edit Themes	Click this button to edit the themes used in clustering. See [Editing themes](#).
Clustering Wizard	Click this button to open the Topic Monitoring Wizard and cluster responses for a different question.
Question Info	This section displays the name and Question ID of the selected question.

Editing themes

If you want to create your own themes based on specific words, you can customize the keywords that determine the themes used during clustering by editing themes. You can edit themes through the Topic Monitoring Wizard or from the Results tab displaying response themes for a question. You can edit suggested themes or create new ones. During the clustering process, the themes you create are emphasized more than automatically generated themes.

To edit themes

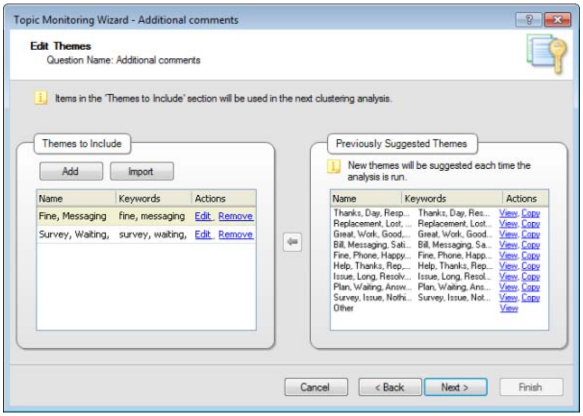
1. In the Topic Monitoring section on the Results tab, click the Go button. The Topic Monitoring Wizard opens.

   Or

   Click the Edit Themes button in the Survey Tasks section on the Results tab that displays response themes for a question.

   Note Response themes are only displayed after clustering has finished and there are at least ten question responses for the survey.

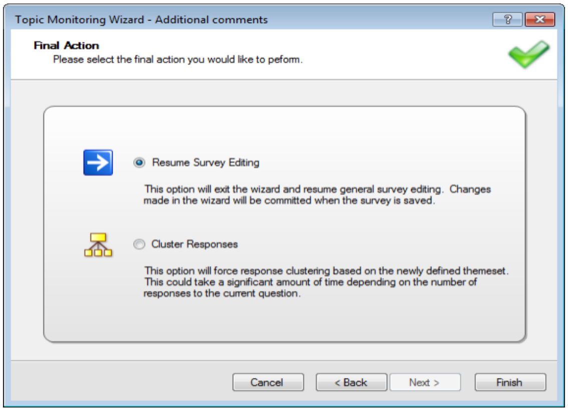
2. Select a question from the Select a Survey Question drop-down menu. The question text appears below the menu.
3. Select the Edit Themes/Keywords radio button on the Getting Started window of the Topic Monitoring Wizard and click the Next button. The Edit Themes window opens.



The Edit Themes window is divided into two sections: Themes to Include and Previously Suggested Themes. The Themes to Include section displays a list of themes that are used in clustering. You can also add and import themes through this section. See Working with themes.

The Previously Suggested Themes section displays a list of themes that were created during the clustering process. Suggested themes change each time responses are clustered. However, you can prevent a suggested theme from being automatically modified by moving it to the Themes to Include section. See Working with themes.

4 When you are done editing themes, click the Next button. The Final Action window opens.



5 To close the Topic Monitoring Wizard and return to the survey without clustering responses, select the Resume Survey Editing radio button.

Or

To cluster responses and return to the survey, select the Cluster Responses radio button.

Note If you select the Resume Survey Editing radio button, changes made to themes are saved, but responses are not clustered. The next time you cluster responses, your themes are applied.

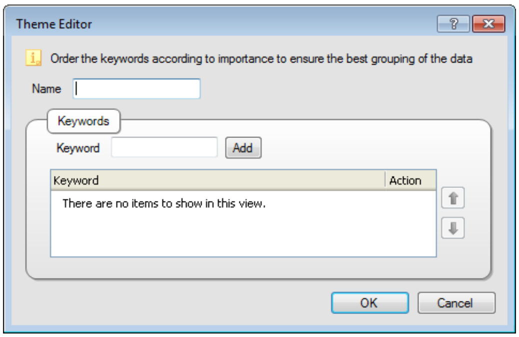
6 Click the Finish button.

Working with themes

When editing themes, you can perform actions on existing themes, add custom themes, and import themes from existing survey questions. For the procedure to edit themes, see Editing themes.

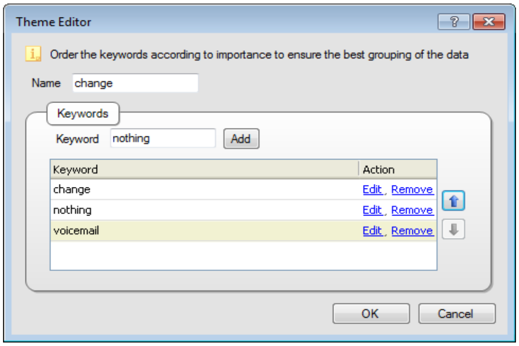
To add custom themes

1 Click the Add button in the Themes to Include section. The Theme Editor opens.



2 Type a name for the theme in the Name field.

3 In the Keyword field, type a keyword that you want associated with this theme and click the Add button. The keyword appears in the Keyword list.



Note Multiword keywords are not supported by the topic monitor. If multiple words are entered for a single keyword value, only the first word will be used. If the resulting outcome produces too many matches that are irrelevant to your search, try adding other keywords that relate to an appropriate subset of your topic. For example, adding the multiword phrase "customer experience" as a keyword will produce the same effect as adding the single keyword "customer" and the word "experience" will be ignored. For a more accurate result set, add keywords "customer" and "experience" separately.

4 To edit a keyword, click Edit next to the keyword.

5 To remove a keyword from the list, click Remove next to the keyword.

6 To move a keyword up or down in the list, use the up and down arrows to the right of the keyword list.

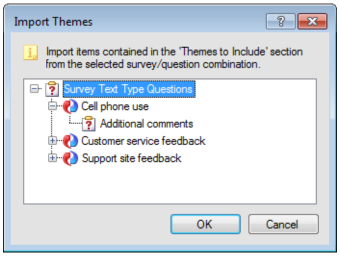
Note When responses are clustered, the keywords at the top of the list are considered more important than the keywords at the bottom of the list.

7 Click the OK button.

To import themes

1 Click the Import button in the Themes to Include section. The Import Themes window opens.

Note Only questions that have been clustered or have custom themes display in the tree.

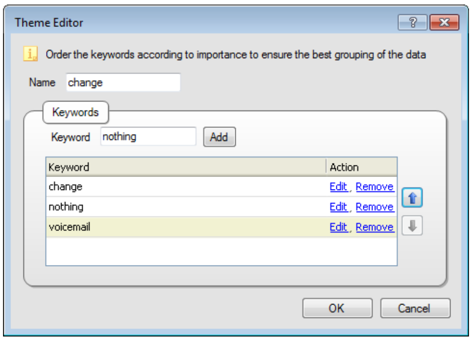


2 Select a question from the tree and click the OK button. The imported themes appear in the Themes to Include section.

Note All themes included with the question are imported. You can edit or delete them after the import. Suggested themes are not imported.

To edit a theme

1 Click Edit next to the theme in the Themes to Include section. The Theme Editor opens.



2 To edit a keyword, click Edit next to the keyword.

3 To remove a keyword from the list, click Remove next to the keyword.

4 To move a keyword up or down in the list, use the up and down arrows to the right of the keyword list.

Note When responses are clustered, the keywords at the top of the list are considered more important than the keywords at the bottom of the list.

5 Click the OK button to save your changes.

To view a suggested theme

Click View next to the theme in the Previously Suggested Themes section. The View Theme window opens.

To include a suggested theme

Click Copy next to the suggested theme in the Previously Suggested Themes section. The suggested theme appears in the Themes to Include section.

Or

Select a theme and click the left arrow between the Themes to Include and Previously Suggested Themes sections.

Adding stopwords

After clustering your text responses, you might find that commonly used words appear as topics. If you want to remove words from the clustering process to prevent them from being used as topics, you can add the words to the stopword list *exclude_responses.txt*. You can access the *exclude_responses.txt* file from the File Manager. See Wordlist files.

Note When adding stopwords to the list, you must specify all forms of the word that you want to exclude. For example, if you do not want “phone” or “phones” used as topics, you must add them both to the list.

Best practices for topic monitoring

The best practices for topic monitoring varies depending on your goals. However, general practices can be applied in all situations to help you find the information you are looking for.

1 **Cluster responses**—**Cluster** responses before you add stopwords or customize themes. See Topic monitoring.

2 **Review themes**—Review the predefined themes and sub-themes to determine if they are satisfactory. Look for common words that you think might be breaking your themes into smaller, less definitive clusters. Also look for certain words that you think might be useful in creating distinctive, useful themes.

3 **Add stopwords**—If you determine that there are common words that do not contribute to the creation of distinctive clusters, add them to the stopword list. See Adding stopwords.

Note The stopwords you add are applied to all the responses you cluster.

4 **Add custom themes**—If you determine that there are certain words that can help create distinctive, useful themes, add a custom theme containing these keywords. See To add custom themes.

Tip Custom themes are most helpful in creating distinctive clusters when they use synonyms. For example, a theme containing the word “software” should also contain the words “application” and “program.” If you find that a word is often misspelled, you can include the common misspelling as a keyword.

5 **Cluster responses again**—Cluster the responses again and, if necessary, repeat the previous steps of reviewing themes, adding stopwords, and adding custom themes until you are satisfied with the resulting themes.

Tip If you use these steps and get results that are less satisfactory than the predefined themes, reset clustering by clicking the Reset Clustering button in the Tasks section of the Results tab. Any custom themes you created are retained, but they are not used in the clustering session.

Creating transactional surveys

Transactional surveys let you survey customers when an event occurs. When a transactional survey is triggered, the system sends your customer an email message that links to a survey on a web page. You can send the email as part of a campaign or as a part of a contact, opportunity, incident, or chat rule. For example, when an incident is closed, a rule can send a survey to the incident's **primary contact** to find out how satisfied the contact was with your customer service.

The following sections describe how transactional surveys are used across Oracle Service Cloud.

- For information about using transactional survey attributes in campaigns, see Editing Transactional Survey attributes.
- For information about tracking transactional survey results by agent, see Tracking transactional survey results by agent.
- For information about using transactional surveys in rules, see Choosing actions.

To create a transactional survey

1 From the Surveys explorer, click the New button on the ribbon. A new survey opens on the content pane.

Tip You can also create surveys from an open survey by clicking the New button. Additionally, if your navigation set is configured to add surveys from the file menu, click File and select Surveys > Survey. See To configure the file menu.

2 Click Transactional Survey.

By default, the Summary tab is active. From here, you can review general information about the survey in the At a Glance section, as well as manage the survey's notes, tasks, and attachments. As you create the survey, you move through each tab to complete the survey's elements.

3 To assign the survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

a To search for a staff member, type the staff member's name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

4 To let customers answer the survey anonymously, select the Allow Anonymous check box. Contact information is not required.

Note Selecting Allow Anonymous in your survey does not mean that all responses will be anonymous. If a survey invitation is sent to a contact or an Oracle Service Cloud cookie is detected on the contact's computer, or the survey itself contains an email address field, Feedback attempts to use that information to identify the contact.

5 Click the text in the At a Glance section described in the following table to perform common survey functions.

Table 526: At a Glance Section Description

Field	Description
Invitation Method	This field displays the invitation method currently selected for the survey. Click Change to change the method and refer to To change the invitation method of a survey.
Survey Status	This field displays whether the survey is active or inactive. Customers cannot submit responses to an inactive survey and receive a warning message when attempting to access the survey URL. See To deactivate a survey.
Expiration Date	This field displays the survey's expiration date and time. By default, no expiration date is set. See To set an absolute expiration date and To set a relative expiration date.
Expiration Max Responses	This field displays the number of responses a survey can accept. If set, this field also displays the number of responses received, as well as the number of surveys that are still allowed. The maximum number of survey responses you can define is one million. See To set expiration based on maximum number of responses.

Table 526: At a Glance Section Description (Continued)

Field	Description
Expiration Message	Click Edit to customize the survey's expiration message. See To customize the expiration message. **Note:** If you do not define your own survey expiration message, the system's default message is used.
Questionnaire	This field displays how many pages and questions are in the survey. Click Preview Survey to preview the survey.
Responses	This field displays how many surveys were started and completed by customers.
Market Testing	This field displays the market testing mode of the survey. Click Change to change market testing modes. See Market testing in transactional surveys.
Proofing	This field displays the number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See Sending a proof survey.
Delivery Status	This field displays the delivery status of the survey and the number of emails sent and delivered. See Survey delivery statuses.
Rule Visibility	Select which rules the survey can be used in. For example, select the Incidents check box if you want this survey available in an incident rule. You can select from contact, opportunity, incident, and chat rules.

6 Click the Questionnaire tab to add questions and HTML content to the survey. See Creating questionnaires in basic mode and Creating questionnaires in advanced mode.

7 Click the Audience tab to define an audience for the survey. See Defining the transactional survey audience.

8 Click the Invitation Message tab to create the message sent to the survey audience. See Customizing the invitation message in broadcast surveys.

9 Click the Proofing tab to send a proof of the message for internal review before sending it to the entire audience. See Sending a proof survey.

10 Click the Reminders tab to create automatic email messages that will prompt your customers either to start taking the survey or to finish it if they have already started. See Adding survey reminders.

11 Click the Delivery tab to select delivery options. See Accessing transactional delivery options.

12 To view the reports associated with the survey, click the Results tab. See Viewing survey results.

13 To preview the survey as it would be viewed on a standard web device, such as a desktop or a laptop, click the Standard button on the ribbon. The survey preview opens in a web browser.

Note If a survey contains an email address field and you submit a value for the field in the survey preview, the form creates or updates contact records so that advanced survey functions can be tested. For this reason, be sure to use only test contact addresses to avoid updating production contacts when testing survey previews.

Also, be careful not to use the preview survey URL in place of the URL of your completed survey (described in the following step). Information submitted on a preview survey is discarded and has no effect on the data collected by the live survey. For identification purposes, each preview survey displays a watermark to ensure it is not confused with a live survey.

14 To preview the survey as it would be viewed from a mobile device, click the Mobile button on the ribbon. See Mobile surveys.

Note Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.

15 To copy the URL of the survey to your clipboard, click the Survey URL button on the ribbon. The Survey URL message opens.

A URL is automatically assigned to the survey. This is the URL that your invitation message links to and your customers visit to complete the survey. From this window, you can view the URL and it is automatically copied to your workstation's clipboard.

a Click the OK button when you are finished viewing the URL to close the window.

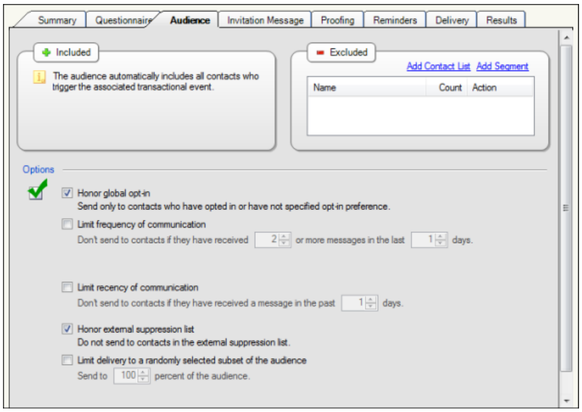
16 Click the Save and Close button to save the survey.

Defining the transactional survey audience

Even though your rules and campaigns determine which contacts receive the survey, you still need to define certain audience options if you want to exclude specific contacts or configure opt-out and external suppression list settings. You can also set survey frequency and recency limits to narrow your audience. See Audiences for complete details and procedures about using contact lists and segments in surveys and mailings.

To define the audience

1 In the open survey, click the Audience tab.



Note The audience for a transactional survey automatically includes all contacts who trigger the associated transactional event. For that reason, you can select only who is excluded from the survey, not who is included in it. You can exclude a total of fifty contact lists and segments, each containing a vast number of contacts.

2 To exclude a list from the audience, click Add Contact List in the Excluded section. The Select Contact List window opens.

a To add a contact list, click New Contact List and refer to Adding contact lists.

b Select the list you want to exclude from the survey's audience and click the OK button. The list is added to the Excluded grid. Contacts belonging to the list do not receive the survey.

3 To exclude a segment from the audience, click Add Segment in the Excluded section. The Select Segment window opens.

   a To add a segment, click New Segment and refer to Creating segments.

   b Select the segment you want to exclude from the survey's audience and click the OK button. The segment is added to the Excluded grid. Contacts belonging to the segment do not receive the survey.

4 To edit a list or segment that is excluded from the survey, click Open next to the list or segment name. See To add a contact list and To create a segment.

5 To remove a list or segment from the Excluded section, click Remove next to the list or segment name.

6 Enter the following field information in the Options section.

Table 527: Options Description

Field	Description
Honor global opt-in	Select this check box to send the survey to contacts who did not explicitly opt out of receiving surveys and mailings. Clear this check box to send the survey to all contacts in the audience, regardless of their opt-in preference.
Limit frequency of communication	Select this check box to set a frequency limit and then enter a maximum number of surveys and mailings and a number of days in which contacts can receive messages before they are excluded from surveys. When the survey is launched, it is not sent to any contacts who have received the maximum number of surveys and mailings within the designated time period. The minimum you can enter is two in the last one day. **Note:** The minimum you can enter is 2 in the last 1 day. The maximum number of days you can enter is 90. **Tip:** To ensure contacts receive only 1 email every "x" number of days, use the Limit recency of communication setting described next.

Table 527: Options Description (Continued)

Field	Description
Limit recency of communication	Select this check box to set a recency limit. Enter the minimum number of days that should elapse before contacts receive another email. When the survey is launched, it is not sent to any contacts who have received a survey or mailing email in the past specified number of days. **Note:** The maximum number of days you can enter is 90. The default value is 1 day. **Tip:** Use this check box to ensure contacts receive only one email every "x" number of days. For instance, if you want your contacts to receive only one email per week, you can select this check box and then set the field to seven.
Honor external suppression list	Select this check box to exclude contacts in the external suppression list from receiving the survey. Clear this check box to send the survey to all contacts in the audience, even if they are in the external suppression list. See External Suppression List for complete details and procedures about the external suppression list.
Limit delivery to a randomly selected subset of the audience	Select this check box to send the survey to a random subset of the audience. Type a percentage or use the up and down arrows to select a percentage of the audience to send the survey to.
Allow delivery of messages to multiple contacts sharing the same email address	**Caution:** Because duplicate messages sent to a single address are a common characteristic of spam, you should select this check box only when necessary. When the check box is selected and you attempt to schedule or send a mailing, survey, or proof, and duplicate email addresses exist in your audience, a message warns you that your reputation as a bulk email sender may be adversely affected and impact your ability to send future communications. See *Best Practices for Email Marketing*. Select this check box to send messages to multiple contacts sharing the same email address. If this check box is cleared, the message is sent only to the contact most recently updated. This option is available only when email address sharing is enabled. See Email address sharing.

Customizing the invitation message in transactional surveys

From the Invitation Message tab, you can activate **market testing** and specify the mailbox settings for the mailing, the subject of the email, and any URL parameters you want to attach to links in the message. In addition, you can create either plain text or HTML messages from scratch, from existing content, or by uploading HTML from another site.

Creating an invitation message follows the same procedure as creating an invitation message in a broadcast survey. See Customizing the invitation message in broadcast surveys.

Important By default, a transactional survey that has been launched or canceled can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, suspend a launched survey's invitation message, make edits, and then relaunch it. See To suspend a survey. For a canceled survey, you can copy it, and then modify and send the copy. See To cancel a survey invitation message.

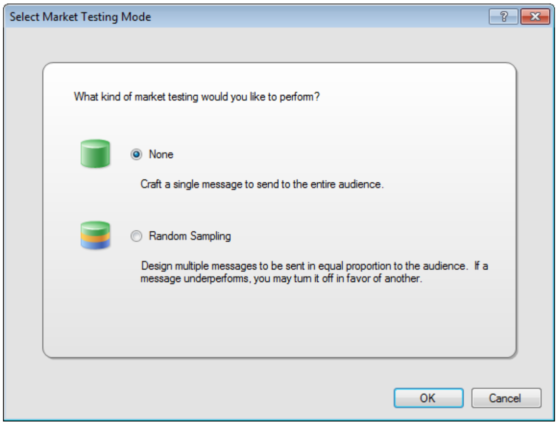
Alternately, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback > General > Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

Market testing in transactional surveys

When creating a transactional survey, you can test different formats on equal portions of your audience. If more than one invitation message is created when market testing is used, then contacts sent the email through a campaign or rule are sent one of the invitation messages. All emails have an equal number of recipients. In other words, when the survey is **launched** through a campaign, it rotates between invitation messages.

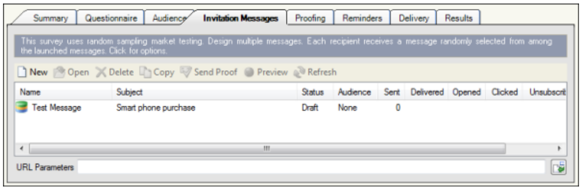
To activate market testing

1 On the Invitation Message tab of an open survey, click the information bar and select Change Market Testing Mode. The Select Market Testing Mode window opens.



2 Select the Random Sampling radio button.

3 Click the OK button. The market testing page displays in random sampling mode.



By default, you send one test message to 100 percent of the audience. You can add additional messages, edit the messages, send proofs, or view results. From here, you can also see information about each message, described in the following table.

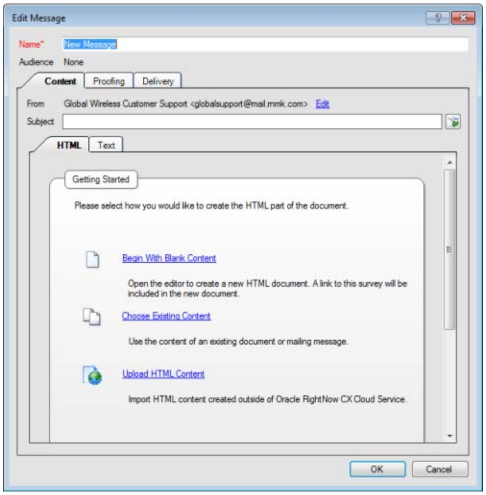
Table 528: Invitation Messages Description

Column	Description
Name	This column displays the name of the message.
Subject	This column displays the email's subject line for the message.
Status	This column displays the delivery status of the message. Refer to Survey delivery statuses.
Audience	This column displays the percentage of the audience the message is sent to.

Table 528: Invitation Messages Description (Continued)

Column	Description
Sent	This column displays the number of emails sent with the message.
Delivered	This column displays the number of emails sent with the message that did not bounce.
Opened	This column displays the number of unique email recipients who opened the message.
Clicked	This column displays the number of unique email recipients who clicked a tracked link.
Unsubscribed	This column displays the number of email recipients who chose to unsubscribe from future emails. **Note:** Unsubscribe sets global opt-in in both Outreach and Feedback. See Inserting unsubscribe links.
Replied	This column displays the number of times the survey message was replied to.

4 Click the New button to add a second test message. The Edit Message window opens.



5 Type the name of the message in the Name field.

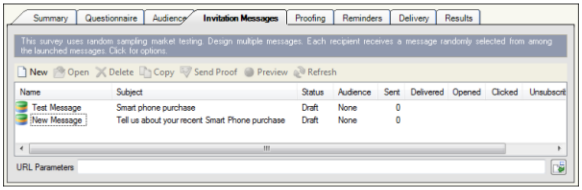
6 Type the subject of the message in the Subject field on the Content tab. See Customizing the invitation message in transactional surveys.

7 Define any other content or formatting options you may want to test using either the HTML editor or the text editor on the Content tab. See Using the HTML editor and Creating and editing text.

8 To send a proof, click the Proofing tab on the Edit Message window. See Sending a proof survey.

9 Click the Delivery tab on the Edit Message window to access delivery options for the test message. See Accessing transactional delivery options.

10 Click the OK button to save the message. The new message appears on the Invitation Messages tab.



11 To open a message for editing, select the message and click the Open button.

12 To delete a message, select the message and click the Delete button.

13 To copy a message to create a new message, select the message and click the Copy button.

Important A document is automatically created and stored in the Automatically Generated folder in the Documents explorer for every copy of a test message. Changes made to content in any of the copied test messages are not shared with the original test message or subsequent copies. See Automatically generated folders.

14 To send a proof, select the message and click the Send Proof button. See Sending a proof survey.

15 To preview the content of a message, select the message and click the Preview button.

16 To refresh the message statistics, click the Refresh button.

17 To add URL parameters, type any parameters you want to append to the links in your message (for example, p1=v1&p2=v2) in the URL Parameters field.

18 To add a merge field to the URL parameters, click the Merge Field button to the right of the URL Parameters field and select the field. See Inserting merge fields to URL parameters.

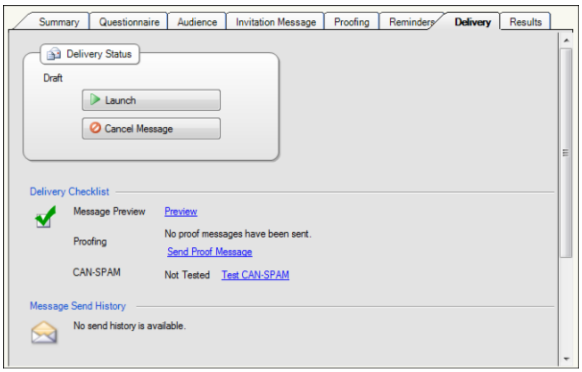
Accessing transactional delivery options

After you have created the **questionnaire**, defined the audience, created an invitation message, and proofed the survey, you can launch the survey so you can send the survey in rules and campaigns. From the Delivery tab, you can launch, suspend, or cancel the survey, as well as access common administration tasks and see the send history.

Note You must create a questionnaire before delivering the survey. See Creating questionnaires in basic mode.

To access transactional delivery options

From an open survey, click the Delivery tab.



The Delivery tab is divided into sections. The Delivery Status section displays the status of the survey (see Survey delivery statuses) and contains buttons for controlling the sending of the survey. You can perform the following tasks from this section.

- **Launch a survey**—See Launching surveys.
- **Suspend a survey**—See Suspending transactional surveys.
- **Cancel a survey**—See Canceling transactional surveys.

On the bottom of the tab, delivery information about the survey is available for you to quickly scan and assess. The following table describes the Delivery Checklist and Message Send History sections.

Table 529: Delivery Sections Description

Section	Description
Delivery Checklist	This section displays the audience count and proof history and provides a link to preview the survey.
Message Preview	This section contains a link to preview the message that is sent with the survey. Click Preview to preview the invitation message.
Proofing	This section displays a summary report of message proofs associated with the survey. Click Send Proof Message to send the message as a proof. See Sending a proof survey.
CAN-SPAM Compliance	This section contains a link to test the survey's compliance with the CAN-SPAM Act of 2003. If you have already tested CAN-SPAM compliance, the test results and a link to the details of the test display. See CAN-SPAM compliance in surveys.
Message Send History	This section displays a log of events relating to the delivery status of the survey. If the survey has not been sent, it is noted here.

Launching surveys

Transactional surveys must be launched before they can be used in rules or campaigns. Once you launch a survey, the status changes to Launched. From the Launched status, you can suspend the survey's invitation message or cancel it.

Important By default, a launched transactional survey can no longer be edited. This ensures that you can accurately track the content you send your customers. You can, however, suspend the survey's invitation message, make edits, and then relaunch it. See Suspending transactional surveys.

Alternately, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback > General > Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

To launch a survey

1 From the Delivery tab of an open survey, click the Launch button. A window opens asking you to confirm that you want to launch the survey.

2 Click the Yes button to launch the survey. The delivery status on the Delivery tab changes to Launched and you can see how many surveys were sent and delivered.

Important Some high-volume sites are configured to send surveys from a **replication database** to reduce the impact of large processes on the **operational database**. Because the sync between the replication database and the operational database can occasionally fall behind, the **mailer daemon** (also called RNMD) uses a fail-safe function before sending to ensure that the replication database is caught up. If it is not, the survey is delayed until the replication database has been synchronized. The fail-safe function ensures that the survey reflects the current state of your production contact records (including those that are opted out or have email addresses marked as invalid) at the time the survey is sent. If you are uncertain whether your site uses the replication database to send surveys, contact support or your Oracle account manager.

Suspending transactional surveys

You may want to stop sending a survey after it has already been launched. You can temporarily stop a survey from sending by suspending it.

To suspend a survey

1 From the Delivery tab of an open survey, click the Suspend button. This button appears only when a survey has been launched. The Confirm Suspend message appears asking you to confirm that you want to suspend the survey.

2 Click the Yes button to confirm suspending the survey.

The status changes to Suspended and the Delivery Status section displays the number of audience members the survey was already sent and delivered to.

Canceling transactional surveys

You can cancel a survey invitation message at any time. When you cancel a survey invitation message, the survey is saved and you can still view survey results. However, the survey invitation message cannot be launched again.

Important By default, a canceled survey can no longer be modified or sent. This ensures that you can accurately track the content you send your customers. You can, however, copy a canceled survey and then modify and send the copied survey.

Alternately, you can enable the RNM_MOD_SENT_DOCS configuration setting (Outreach and Feedback > General > Miscellaneous) to allow edits to documents that have been used in sent messages. Just be aware when you enable this setting, you will no longer be able to view the original content sent to your customers, and your reporting will not be as accurate.

To cancel a survey invitation message

1 From the Delivery tab of an open survey, click the Cancel Invitation Message button. The Confirm Cancel Invitation Message window opens asking you to confirm that you want to cancel the invitation message.

2 Click the Yes button to cancel the survey. The delivery status changes to Canceled.

Creating website link surveys

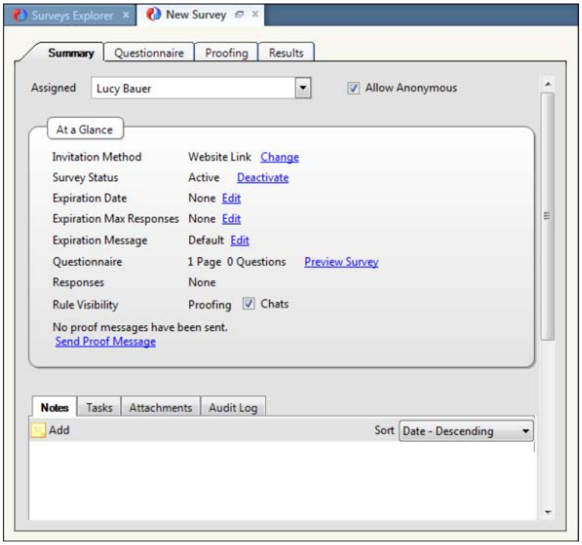
You can create website link surveys when you do not need to email a link to the survey or target a specific set of contacts. Website link surveys are published as a web page and can be linked to from any source. For example, you could create a survey that is linked to from the shopping cart on your website. Because website link surveys are posted as a web page, you do not need to define an audience or invitation message, or send or launch the survey. Once you save the survey, it is available on the web and can be linked to from your outside source.

To create a website link survey

1 From the Surveys explorer, click the New button on the ribbon. A new survey opens on the content pane.

Tip You can also create surveys from an open survey by clicking the New button. Additionally, if your navigation set is configured to add surveys from the file menu, click File and select Surveys > Survey. See To configure the file menu.

2 Click Website Link.



By default, the Summary tab is active when creating a website link survey. From here, you can review general information about the survey in the At a Glance section, as well as manage the survey's notes, tasks, and attachments (see Managing surveys). As you create the survey, you move through each tab to complete the survey's elements.

3 To assign the survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

a To search for a staff member, type the staff member's name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

4 To remove the ability of customers to answer the survey anonymously, clear the Allow Anonymous check box.

Note Selecting Allow Anonymous in your survey does not mean that all responses are anonymous. If a survey invitation is sent to a contact or an Oracle Service Cloud cookie is detected on the contact's computer, or the survey itself contains an email address field, Feedback attempts to use that information to identify the contact.

5 Click the text in the At a Glance section described in the following table to perform common survey functions.

Table 530: At a Glance Section Description

Field	Description
Invitation Method	This field displays the invitation method currently selected for the survey. Click Change to change the method and refer to To change the invitation method of a survey.
Survey Status	This field displays whether the survey is active or inactive. Customers cannot submit responses to an inactive survey and receive a warning message when attempting to access the survey URL. See To deactivate a survey.
Expiration Date	This field displays the survey's expiration date and time. By default, no expiration date is set. See To set an absolute expiration date.
Expiration Max Responses	This field displays the number of responses a survey can accept. If set, this field also displays the number of responses received, as well as the number of surveys that are still allowed. The maximum number of survey responses you can define is one million. See To set expiration based on maximum number of responses.

Table 530: At a Glance Section Description (Continued)

Field	Description
Expiration Message	Click Edit to customize the survey's expiration message. See To customize the expiration message. **Note:** If you do not define your own survey expiration message, the system's default message is used.
Questionnaire	This field displays how many pages and questions are in the survey. Click Preview Survey to preview the survey.
Responses	This field displays how many surveys were started and completed by customers.
Proofing	This field displays the number of proofs that have been sent, approved, and rejected. Click Send Proof Message to send a proof. See Sending a proof survey.
Rule Visibility	Clear the Chats check box to make this survey unavailable as an action in a chat rule. **Note:** Rule Visibility only displays if Chat is enabled.

6 Click the Questionnaire tab to add questions and HTML content to the survey. See Creating questionnaires in basic mode.

7 Click the Proofing tab to send a proof of the survey for internal review before sending it to the entire audience. See Sending a proof survey.

Tip The email that is sent from the Proofing tab for website link surveys uses the Survey Proof message template. You can customize this message template from the Message Templates editor. For complete details and procedures about customizing templates, see Message Templates.

8 To view the reports associated with the survey, click the Results tab. See Viewing survey results.

9 To preview the survey as it would be viewed on a standard web device, such as a desktop or a laptop, click the Standard button on the ribbon. The survey preview opens in a web browser.

10 To preview the survey as it would be viewed from a mobile device, click the Mobile button on the ribbon. See Mobile surveys.

Note Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.

11 To copy the URL of the survey to your clipboard, click the Survey URL button on the ribbon. The Survey URL message opens.

The system automatically assigns a URL to the survey. This is the URL that you link to from outside of Oracle Service Cloud. From this window, you can view the URL and it is automatically copied to your workstation's clipboard.

a Click the OK button when you are finished viewing the URL to close the window.

12 Click the Save and Close button to save the survey.

Creating polling surveys

Polling surveys display as a question on a **customer portal** page or any page that is external to the customer portal, such as a "Poll of the Day." Polling surveys offer a unique way to engage your customers by asking them a single question, and then using their responses to gauge your business activities.

After customers submit their response, they see a poll results chart or a thank-you message, depending on the question type used in the polling survey. Question types include **text**, **choice**, and **matrix**. Any of these question types can be used, although the choice question type may be the most useful in a polling survey. It is also the only question type that presents customers with a results chart.

Customers are presented with only a single question. If you activate more than one question in a polling survey, then one active question is randomly selected to display to customers for a one-hour time period. Every customer who is offered the poll during that hour sees the same question. At the end of an hour, a new active question is selected at random.

Since polling surveys allow anonymous responses, if customers are not logged in, they can still respond to the survey. If customers are logged in, their responses to the survey question are associated with their contact record.

Because polling surveys are posted to a customer portal page or an external web page, you do not need to define an audience or invitation message, or send or launch the polling survey.

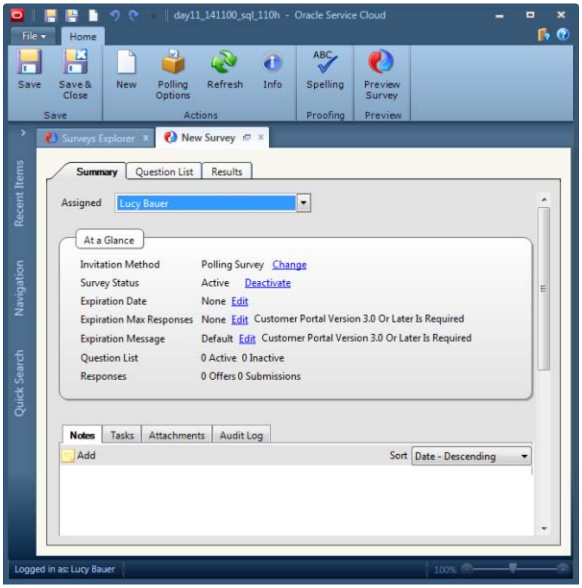
Note Polling surveys are associated with polling **widgets**—either a Polling widget or a PollingSyndication widget. Widget attributes and styling options are defined in the customer portal. See Offering customers a survey.

To create a polling survey

1 From the Surveys explorer, click the New button on the ribbon. A new survey opens on the content pane.

Tip You can also create surveys from an open survey by clicking the New button. Additionally, if your navigation set is configured to add surveys from the file menu, click File and select Surveys > Survey. See To configure the file menu.

2 Click Polling Survey.



By default, the Summary tab is active. From here, you can review general information about the polling survey in the At a Glance section, as well as manage the polling survey's notes, tasks, attachments, and audit log. As you create the polling survey, you move through each tab to complete the polling survey's elements.

3 To assign the polling survey to another staff member (by default, the survey is assigned to the staff member who creates it), click the Assigned drop-down menu and select the staff member.

   a To search for a staff member, type the staff member's name in the Find field.

Tip Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.

4 Click the text in the At a Glance section described in the following table to perform common polling survey functions.

Table 531: At a Glance Section Description

Field	Description
Invitation Method	This field displays the invitation method currently selected for the survey. Click Change to change the method. See To change the invitation method of a survey. **Note:** Once a polling survey is submitted by a customer, you cannot change the method.
Survey Status	This field displays whether the polling survey is active or inactive. See To deactivate a survey.
Expiration Date	This field displays the polling survey's expiration date and time. By default, no expiration date is set. See To set an absolute expiration date.

Table 531: At a Glance Section Description (Continued)

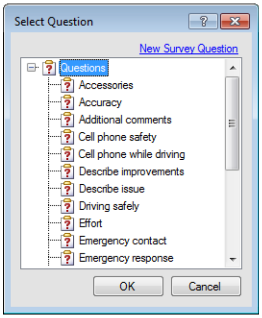
Field	Description
Expiration Max Responses	This field displays the number of responses a survey can accept. If set, this field also displays the number of responses received, as well as the number of surveys that are still allowed. The maximum number of survey responses you can define is one million. See To set expiration based on maximum number of responses. **Important:** This field works only on sites using Customer Portal Framework Version 3.0 or later.
Expiration Message	Click Edit to customize the survey's expiration message. See To customize the expiration message. If you do not define your own survey expiration message, the system's default message is used. **Important:** This field works only on sites using Customer Portal Framework Version 3.0 or later.
Question List	This field displays how many active and inactive questions are in the polling survey. The system supports a maximum of 100 questions. **Note:** There must be at least one active question in the polling survey.
Responses	This field displays how many polling surveys were offered to and submitted by customers.

5 Click the Question List tab to add questions to the polling survey.

You can either add existing questions or create new questions. Keep in mind, if more than one question is used in a polling survey, one question is randomly selected to display to customers for a one-hour time period. Every customer who is offered the poll during that hour sees the same question. At the end of an hour, a new question is selected at random.

Tip Since all questions are stored in the same place, questions are shared across the different survey types.

6 Click the Add Question button. The Select Question window opens.



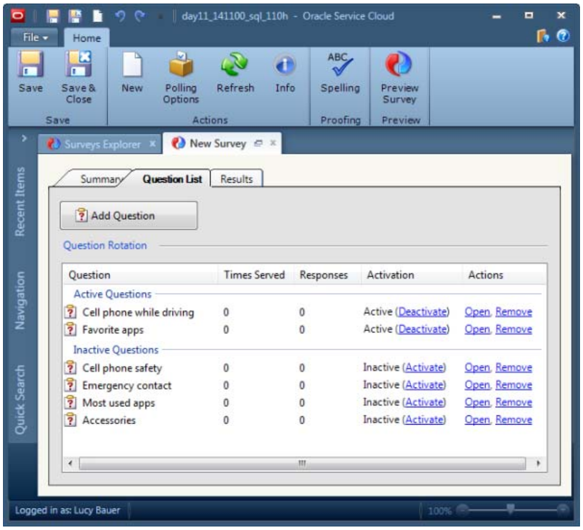
7 To add an existing question, double-click the question you want to add. The question appears in the Active Questions list.

8 To add a new question, click the Add Question button, and then click New Survey Question.

a To create a text question, complete steps 2–11 in To create a text question.
b To create a choice question, complete steps 2–12 in To create a choice question.
c To create a matrix question, complete steps 2–11 in To create a matrix question.

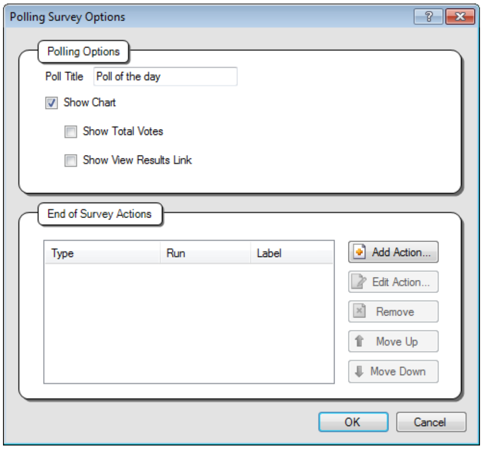
Important The Display Options button, which lets you define HTML properties for all question types, may be affected by widget styling attributes defined in the customer portal. See HTML properties in polling surveys.

You can also activate and deactivate questions, open questions for editing, and remove questions from the questions list. Questions with results cannot be removed, but they can be deactivated.



Important Questions can be edited after they have been created, even if they have been used in a polling survey. Keep in mind that if you edit a question, those changes appear immediately in any polling survey that uses the question. For this reason, if you want to preserve the integrity of the data returned by the original question, we recommend creating a new question rather than editing the existing question.

9 To define polling survey options, click the Polling Options button on the ribbon.



- **a** To define the polling survey title that displays on the web page, type it in the Poll Title field.
- **b** To let respondents see the polling survey's results chart on the web page, select the Show Chart check box.
- **c** To display the polling survey's total number of votes on the web page, select the Show Total Votes check box.
- **d** To display polling survey results to all web page visitors, even if they have not responded to the poll, select the Show View Results Link check box.
- **e** To define what happens after customers submit a polling survey, click the Add Action button in the End of Survey Actions section. You can also edit, remove, and reorder actions. End of survey actions are handled the same way as end of survey options in broadcast and transactional surveys. See Specifying end of survey options.

Important In order for an end of survey action to work from an external page, the customer portal needs to associate the customer with a contact record. Therefore, the customer must be logged in to the customer portal site, or you must implement open login or pass-through authentication (PTA) functionality. See Customer portal open login.

10 To spell check the polling survey, click the Spelling button on the ribbon.

11 To preview the polling survey, click the Preview Survey button on the ribbon.

The polling survey preview lets you see specific questions and switch between views. See Enabling and configuring modal polls.

Tip Since polling surveys are not accessible through a link, you can't send a proof of your polling survey to anyone. So previewing and spell checking your polling survey are important steps in your process.

12 Click the Results tab to view the reports associated with the polling survey.

a Select a question and click the Go button. The question's results display in a web browser.

Tip If your polling survey uses a text question, you can use **topic monitoring** to group the text responses containing similar content so that you can look for emerging themes. See Topic monitoring.

13 Click the Save and Close button to save the polling survey.

When you save the polling survey, a survey ID is assigned that must be associated to the polling widget in the customer portal. See Configuring polling widgets.

❖ Offering customers a survey

❖ Configuring polling widgets

HTML properties in polling surveys

While the steps for defining HTML properties for a polling survey are the same as all other survey types, there is one exception that you need to be aware of. Style precedence depends on the HTML tags defined in the customer portal. If the customer portal web designer uses the `!Important` tag in the **widget** styling attributes, those styles take precedence over the HTML properties you define in the polling survey by clicking the Display Options button on the ribbon of the New Question window. For customer portal widget styling attributes, see Chart attributes.

- To define HTML properties for a text question, see steps 5–7 in To create a text question.
- To define HTML properties for a choice question, see steps 6–8 in To create a choice question.
- To define HTML properties for a matrix question, see steps 5–7 in To create a matrix question.

❖ Chart attributes

Creating questionnaires in basic mode

The questionnaire is the main part of a **broadcast**, **transactional**, and **website link** survey. It consists of a set of questions you want your customers to answer. You must create a questionnaire for these types of surveys. From the Questionnaire tab, you have all the tools you need to create a dynamic HTML survey. You can add your own content, along with new and previously created questions.

In your survey, you can add multiple pages to your questionnaire. This can help break up the survey into manageable chunks. Customers see only questions on one page before proceeding to the next page.

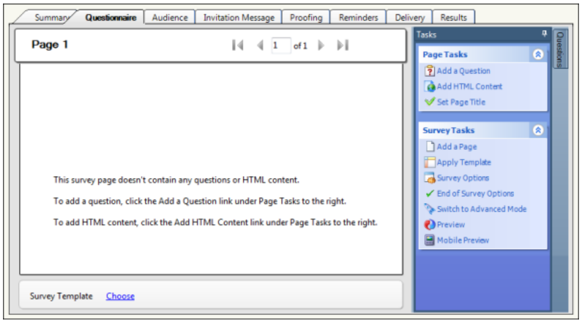
You can create the questionnaire in either basic or advanced mode. In basic mode, you can design multi-page questionnaires in a straightforward interface focused mainly on your survey presentation. In advanced mode, you can design a flow diagram to present questionnaires, set criteria for survey branches, and trigger automated actions such as sending notifications, setting fields, and creating opportunities and incidents.

The following procedure describes how you can create a questionnaire in basic mode. See Creating questionnaires in advanced mode for the procedure for creating a questionnaire in advanced mode.

Note Questionnaires do not apply to **polling surveys** because polling surveys use a list of questions instead of questionnaires. See Creating polling surveys.

To create a questionnaire in basic mode

1 In an open survey, click the Questionnaire tab.



The Questionnaire tab is divided into sections. The main section shows the page you are editing and displays the current content and questions in the questionnaire. When you create a questionnaire, this section is blank. If there is more than one page in the questionnaire, you can scroll through the pages using the arrows at the top of this section.

On the right side are buttons for the tasks you can perform on the questionnaire, such as adding a question. The Survey Tasks section contains buttons for the tasks you can perform on the entire survey. The Page Tasks section contains buttons for the tasks you can perform on the specific page of the questionnaire you are working on. You can also right-click in the main section to select from the most common tasks.

2 Click a button in the Page Tasks section described in the following table.

Table 532: Page Tasks Description

Button	Description
Add a Question	Click this button to add a question to the questionnaire. See Adding questions.
Add HTML Content	Click this button to add HTML content to the questionnaire. See Using the HTML editor.
Set Page Title	Click this button to change the title of the page from the default "Page <page number>." See Setting the page title.
Delete Page	**Caution:** Deleting a page cannot be undone. Click this button to delete the page you are on and all of its content. **Note:** This button is available only when the questionnaire contains more than one page.

3 Click a button in the Survey Tasks section described in the following table.

Table 533: Survey Tasks Description

Button	Description
Add a Page	Click this button to add a page to the questionnaire. Customers see only one page at a time when responding to the survey. When a page is added, the arrows at the top of the main section are activated and you can scroll through the pages of your questionnaire to add questions and content.

Table 533: Survey Tasks Description (Continued)

Button	Description
Organize Pages	Click this button to organize pages in the questionnaire. See Organizing pages. **Note:** This button is available only when the questionnaire contains more than one page.
Apply Template	Click this button to select a template to form the HTML in the questionnaire. See Selecting a template. **Note:** Templates are created through the **Content Library**. See Creating templates.
Survey Options	Click this button to set survey options, such as font attributes, progress indicators, button properties, cookie options, and optimization for mobile devices. See Specifying survey options.
End of Survey Options	Click this button to set options that determine what happens when the survey is submitted. See Specifying end of survey options.
Switch to Advanced Mode	Click this button to create your questionnaire in advanced mode. See Creating questionnaires in advanced mode. **Note:** You must save the survey before you can switch to advanced mode. If you do not save the survey before you click this button, a message prompts you to save.
Preview	Click this button to preview your survey in a web browser.
Mobile Preview	Click this button to see how your survey looks on a mobile device. **Note:** Mobile preview is a limited, browser-based preview that gives you a general idea of how your survey might look on a smaller device when you are designing your survey from your desktop. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.

4 To select a template to use in the questionnaire, click Choose next to Survey Template at the bottom of the content pane. See Selecting a template.

Note If a template is already being used in the questionnaire, its name displays in this section. You can change templates or clear the content of the template from the questionnaire.

Basic mode ribbon

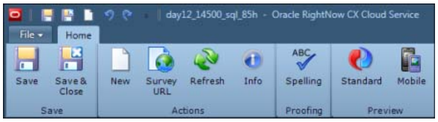


Table 534: Basic Survey Ribbon Description

Group/Button	Description
Save	
Save	Click this button to save the survey and keep it open for editing.
Save and Close	Click this button to save the survey and close it.
Actions	
New	Click this button to create a new survey.
Survey URL	Click this button to view the survey's URL. The URL is automatically copied to your clipboard so you can easily paste it into your browser.
Refresh	Click this button to reload the survey reports.
Info	Click this button to view identifying data about the survey, including the survey ID, date the survey was created and updated, staff member who created and updated the survey, interface ID, flow ID, and mailing ID.
Proofing	
Spelling	Click this button to spell check the survey invitation message.
Preview	
Standard	Click this button to preview your survey in a web browser as it would be viewed from a standard web device, such as a desktop or a laptop.

Table 534: Basic Survey Ribbon Description (Continued)

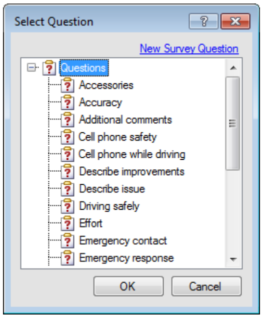
Group/Button	Description
Mobile	Click this button to see how your survey looks on a mobile device. **Note:** Mobile preview is a limited browser-based preview that gives you a general idea of how your survey might look on a smaller device. With that in mind, always test your surveys on applicable mobile devices and browsers before you launch them.

Adding questions

Adding questions is the most important part of creating your survey. You can add any questions already in Feedback or create questions as needed.

To add a question to a survey

1 Click the Add a Question button in the Page Tasks section. The Select Question window opens.



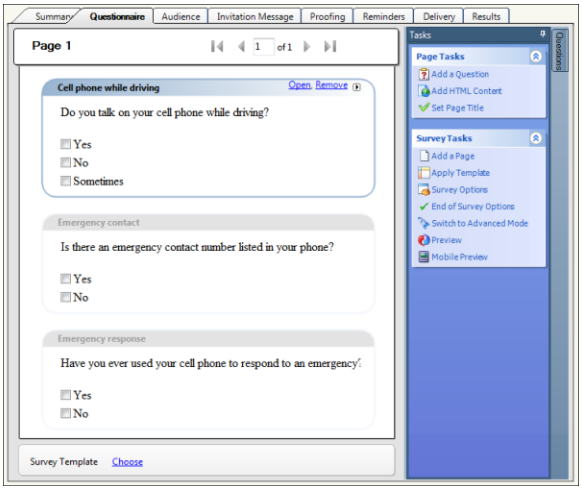
Tip You can also add questions by hovering over the Questions tab to the right of the Page Tasks section and then dragging a question from the list to the survey page.

To make the Questions section easier to access, you can dock it to the Questionnaire tab by clicking the Auto Hide button at the top of the Questions section.

2 To add an existing question, select it from the list and click OK or double-click the question.

Tip To add multiple questions at once, press the **Ctrl** key while selecting each question you want to add. When you drag multiple questions to the survey page, they are added in the order in which they were selected.

3 To create a new question, click New Survey Question. A window opens where you can create a question. Once you save the new question, it appears in the questions list. See Creating questions.

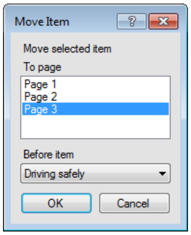


4 To reorder questions on the page, drag each question to its new position.

5 To open a question for editing, click Open.

6 To remove a question from the survey page, click Remove.

7 To move the question to another page of a multi-page questionnaire, click the arrow next to Remove and select Move. The Move Item window opens.



a Select a destination page from the list.
b Click the Before Item drop-down menu to select the question you want the moved question to come before.
c Click the OK button to move the question to the specified location.

Setting the page title

You can change the title of the page you are editing from the default “Page <page number>.” The page title displays in the title bar of the web browser when the survey is taken.

To set the page title

1 In your open questionnaire, click the Set Page Title button in the Page Tasks section. The Set Page Title window opens.

2 Type the name of the page in the Title field. This field must contain a value.

3 Click the OK button to save the page title and close the window.

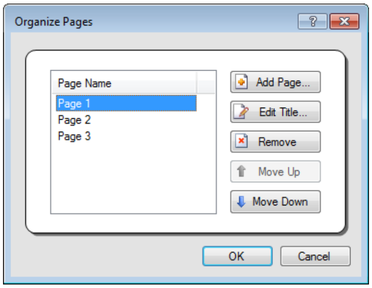
Organizing pages

If you have more than one page in your questionnaire, you can organize the pages by reordering, deleting, or adding pages. You can also edit the page titles to change what displays to customers in the title bar of their web browser.

Note The system automatically creates a document for each page created in a questionnaire and stores it in the Automatically Generated folder in the Documents explorer. When you update a page in the questionnaire, those changes are also made to the automatically generated copy. See Automatically generated folders.

To organize questionnaire pages

1 In your open questionnaire, click the Organize Pages button in the Survey Tasks section. The Organize Pages window opens and displays a list of the pages in your questionnaire.



2 To add a page, click the Add Page button. A page is added to the bottom of the list.

3 To edit a page title, select the page you want to edit and click the Edit Title button. See Setting the page title.

4 To delete a page from the questionnaire, select the page you want to delete and click the Remove button. The page and all of its contents are deleted.

Caution Deleting a page cannot be undone.

5 To move a page up one position, select the page and click the Move Up button.

6 To move a page down one position, select the page and click the Move Down button.

Tip You can also drag and drop pages to adjust their position.

7 Click the OK button to save your changes and close the window.

Selecting a template

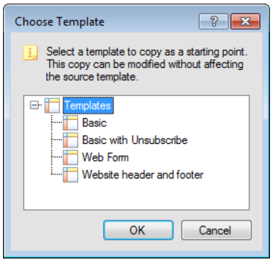
You can use a template to add HTML above and below the content and questions in your questionnaire. Templates are created through the **Content Library**. See Creating templates.

To select a template

1 In your open questionnaire, click the Apply Template button in the Survey Tasks section.

Or

Click Choose next to Survey Template at the bottom of the content pane. The Choose Template window opens.



2 Select the template you want to use and click the OK button. The template is applied to your questionnaire and the name of the template appears in the Survey Template section.

Note To clear a template from your survey, click the Clear Template button on the Choose Template window, or click Clear next to Survey Template on the bottom of the content pane.

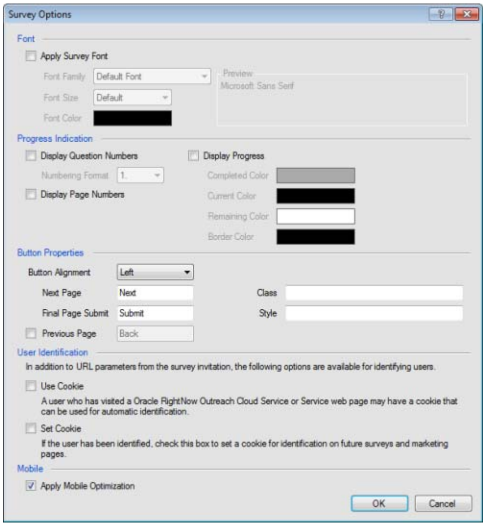
Specifying survey options

Specifying survey options lets you customize your questionnaire. You can set font attributes, choose how to notify customers of their progress through your survey, and specify how you identify customers. You can also add back buttons to multiple-page surveys and change the default text of the button labels. Any questions that respondents answer are saved, making it easy to review or change answers from a previous page or to come back at a later date to finish a survey.

Additionally, mobile optimization is applied, by default, from your survey options. Mobile optimization makes your surveys user-friendly when taken on mobile devices. See Mobile surveys.

To specify survey options

1 In your open questionnaire, click the Survey Options button in the Survey Tasks section. The Survey Options window opens.



2 Enter the following field information.

Table 535: Survey Options Window Description

Field	Description
Font	Enter field information in this section to define the font attributes for the survey.
Apply Survey Font	Select this check box to set the font attributes in the survey. **Note:** If you used a template to create the survey and then set the font attributes for the survey, the header and footer fonts defined in the template do not change to the new font attributes.
Font Family	Click this drop-down menu to select the font family.
Font Size	Click this drop-down menu to select the font size.
Font Color	Click this box to open the Color window and set the font color in the survey. You can select a color from the Basic colors or click Define Custom Colors to define a color.
Preview	Displays the font as it appears in the survey.

Table 535: Survey Options Window Description (Continued)

Field	Description
Progress Indication	Enter field information in this section to determine how customers can see their progress in the survey.
Display Question Numbers	Select this check box to display a number before each question. If cleared, questions appear unnumbered.
Numbering Format	Click this drop-down menu to select the number format you want to appear before each question. **Note:** This drop-down menu is available only when the Display Question Numbers check box is selected.
Display Page Numbers	Select this check box to display page numbers at the top of each page of the survey (for example, Page 1 of 3). **Note:** When this option is active, each question in a matrix is numbered in sequence with any surrounding questions. For example, if a four-row matrix is added below two text questions on the questionnaire, its rows are numbered 3, 4, 5, and 6. This option is not available in **advanced mode**.
Display Progress	Select this check box to display a progress bar that shows customers how much of the survey they have completed. **Note:** This option is not available in advanced mode.
Completed Color	Click this color box to select a color to designate the completed portion of the survey in the progress bar.
Current Color	Click this color box to select a color to designate the current portion of the survey in the progress bar.
Remaining Color	Click this color box to select a color to designate the remaining portion of the survey in the progress bar.
Border Color	Click this color box to select a color as the border of the progress bar.
Button Properties	Enter field information in this section to change the properties of buttons used in the survey.
Button Alignment	Click this drop-down menu to select left, center, or right alignment. Left is selected by default.
Next Page	To change the label of the next page button, which is set to Next by default, type the name of the label as you want it to display.

Table 535: Survey Options Window Description (Continued)

Field	Description
Final Page Submit	To change the label of the submit button, which is set to Submit by default, type the name of the label as you want it to display.
Previous Page	Select this check box to add a back button to your multiple-page survey. To change the label of the back button, which is set to Back by default, type the name of the label as you want it to display.
Class	Type any class name you want to assign to the default buttons. You must define the class in your document's HTML by either using the `<style>` tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the `<link>` tag.
Style	Type any style attributes you want to assign to the default buttons. Style attributes define how the buttons appear, such as color and font. For example, color: yellow; font-weight: bold; background: blue; border: 2px outset red.
User Identification	Specify cookie settings in this section.
Use Cookie	Select this check box to identify customers completing the survey by the Oracle Service Cloud cookie set on their computer. The customer is first identified through URL parameters in the email link to the survey, and, if none exist, the cookie is used.
Set Cookie	Select this check box to set a cookie for customers who are identified through the email link to the survey.
Mobile	Set mobile optimization for surveys taken on mobile devices.
Apply Mobile Optimization	**Caution:** By clearing this check box, surveys will not be optimized for readability or touchscreen compatibility on mobile devices. While the survey will still display on any device, the questions may not be easy to read and responding may be difficult when a mobile device is used. Clear this check box to disable optimization for mobile devices.

3 Click the OK button to save your settings and close the window.

Specifying end of survey options

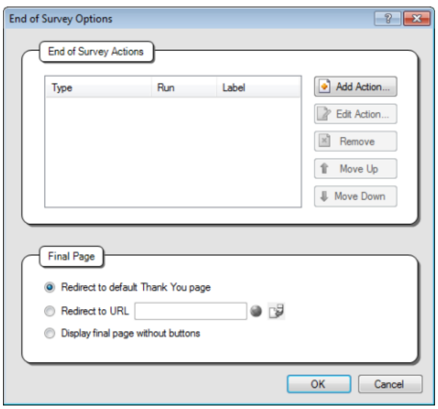
You can also determine what happens after customers submit a survey. For example, you can add the contact to a list, create an opportunity, or send the customer an email. A wizard helps step you through the process of the final actions performed after a survey is submitted. In addition, you can specify where customers are routed, such as the default Thank You page or your own website.

Note When a survey is responded to anonymously, survey actions that require contact identification are disregarded. Feedback cannot create an incident or opportunity for an anonymous responder, add them to a list, or send them a transactional mailing or survey.

To specify end of survey options

1 In your open questionnaire, click the End of Survey Options button in the Survey Tasks section. The End of Survey Options window opens.

Note Step 1 in a polling survey is slightly different. In your open question list, click the Polling Options button on the ribbon to open the Polling Survey Options window, where the End of Survey Actions section displays. Continue with step 2.



2 Click the Add Action button to add an action that is performed when the survey is submitted. The Survey Final Action wizard opens. See [Adding actions with the Survey Final Action wizard](#).

3 To edit an action, select the action and click the Edit Action button.

4 To delete an action, select the action and click the Remove button.

5 To move an action up one position, select the action and click the Move Up button. The actions execute in the order they are listed.

6 To move an action down one position, select the action and click the Move Down button.

Tip You can also drag and drop actions to adjust their position.

7 Select the page you want to display after the survey is submitted from the radio buttons described in the following table.

Table 536: Final Page Description

Radio Button	Description
Redirect to default Thank You page	Select this radio button to use the default final page. Customers are redirected to a Oracle Service Cloud page that thanks them for their feedback. **Note:** You can edit this page through the File Manager using the *cci/top.phph*, *head.phph*, and *bottom.phph* files. See Managing files. To learn more about customizing Outreach and Feedback pages, see Answer ID 2477 on our support site.
Redirect to URL	Select this radio button and type a URL to redirect customers to a specific website. See Editing Redirect to URL attributes.
Open URL	Click this button to open the URL.
Add	Click this button to add a contact, incident, opportunity, or tracked link **merge field** to the URL. See Inserting merge fields.
Display final page without buttons	Select this radio button to display the final page of the survey without a Submit button. **Note:** If you select this option, your survey should have more than one page with no questions on the last page, since answers cannot be submitted.

8 Click the OK button to save your settings and close the window.

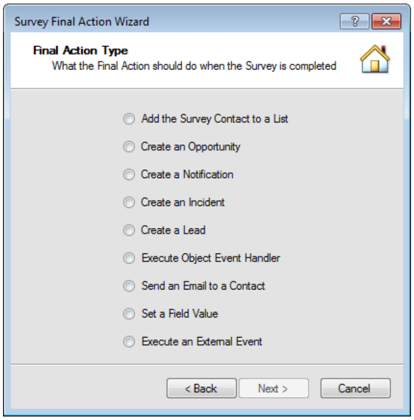
Adding actions with the Survey Final Action wizard

When setting end of survey options (see Specifying end of survey options), the Survey Final Action wizard steps you through the process of adding an action to the end of your survey. You can choose from several actions and also specify whether the action occurs at the end of all survey submissions or just when a survey **score** has been met.

To add an action

1 From the End of Survey Options window, click the Add Action button. The Survey Final Action wizard opens.

2 Click the Next button.



3 Select which action you want to perform from the radio buttons described in the following table.

Table 537: Final Action Types

Action Type	Description
Add the Survey Contact to a List	Select this radio button to add the customer to a contact list after submitting the survey.
Create an Opportunity	Select this radio button to create an opportunity in Oracle Right-Now Opportunity Tracking Cloud Service (Opportunity Tracking) using the customer information.

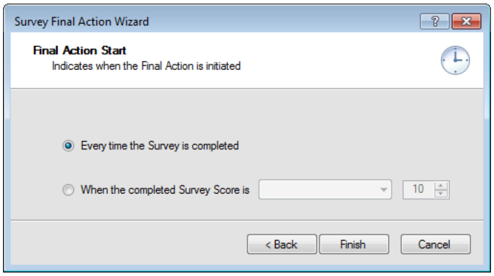
Table 537: Final Action Types (Continued)

Action Type	Description
Create a Notification	Select this radio button to send an email to staff members notifying them that the survey has been submitted.
Create an Incident	Select this radio button to create an incident in Service using the customer information.
Create a Lead	Select this radio button to create a lead in Opportunity Tracking using the customer information.
Execute Object Event Handler	Select this radio button to create a contact-related object event handler using customer information.
Send an Email to a Contact	Select this radio button to send a transactional mailing to the customer.
Set a Field Value	Select this radio button to set a field in the contact record for the customer.
Execute an External Event	Select this radio button to execute an **external event** after the survey is submitted.

4 Click the Next button. The next page that displays depends on the action you selected in the previous step. On this page of the wizard, you can set details for the action.

- **Add the Survey Contact to a List**—See Editing Add to List attributes.
- **Create an Opportunity**—See Editing Opportunity attributes.
- **Create a Notification**—See Editing Notification attributes.
- **Create an Incident**—See Editing Incident attributes.
- **Create a Lead**—See Editing Lead attributes.
- **Execute Object Event Handler**—See Editing Execute Object Event Handler attributes.
- **Send an Email to a Contact**—See Editing Transactional Mailing attributes.
- **Set a Field Value**—See Editing Set Field attributes.
- **Execute an External Event**—See Editing External Event attributes.

5 Click the Next button.



6 Select when the action should be performed from the radio buttons described in the following table .

Table 538: Final Action Start Description

Radio Button	Description
Every time the survey is completed	Select this radio button to perform the action every time the survey is submitted.
When the completed survey score is	Select this radio button and enter a survey score to send the survey only when the survey is equal to, less than, greater than, or between certain scores. For information about question scores, see To create a choice question.

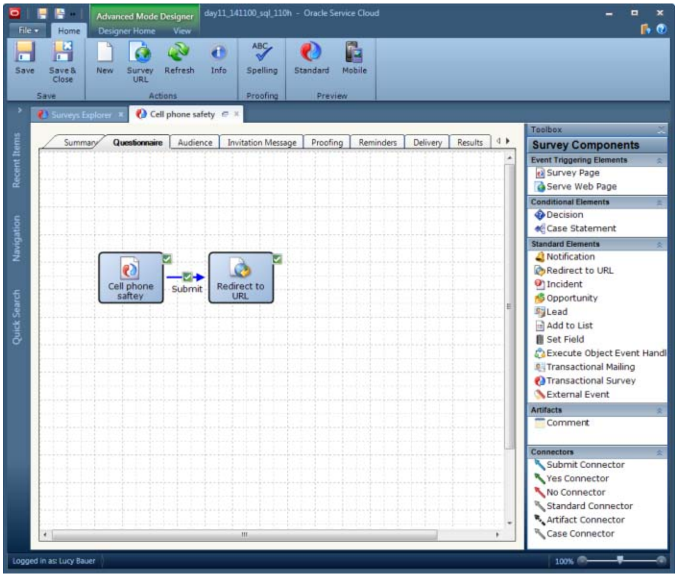
7 Click the Finish button to add the action.

8 Click OK to close the End of Survey Options window.

Note The actions available in the Survey Final Action Wizard are also available as standards elements when editing in **advanced mode**.

Creating questionnaires in advanced mode

If you want to create more detailed questionnaires, you can do so in advanced mode. Feedback provides an intuitive graphical interface for creating and editing advanced surveys. For example, to add survey branching, you can use the Decision element or the Case Statement element (see Editing Decision attributes and Editing Case Statement attributes). When creating and editing an advanced survey, you perform most tasks using the ribbon, canvas, and survey components. These resources provide all of the tools and elements you need to design an advanced survey.



To switch to advanced mode

Click Switch to Advanced Mode in the Survey Tasks section.

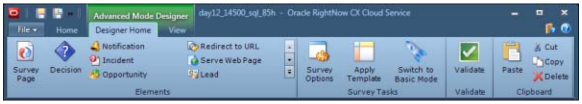
Note When you switch to advanced mode, the default questionnaire displays a survey page element, a Submit connector, and a Redirect to URL element that is defined (by default) to display a thank you page when the contact clicks the Submit button. This flow represents the simplest form of an advanced survey that you can send. Editing Redirect to URL attributes.

Advanced mode ribbon

The advanced mode ribbon features two additional tabs, Designer Home and View, from which you can access options to create or edit an advanced survey. Each tab on the ribbon has one or more groups containing buttons you can use to modify the survey or elements on the canvas.

Designer Home tab

The Designer Home tab gives you access to basic editing functions, survey components, and attributes that impact the entire survey.



The groups and buttons on the Designer Home tab are described in the following table.

Table 539: Designer Home Tab Description

Group/Button	Description
Elements	The buttons in this group let you add survey components to your flow diagram. For a description of available components, see Designing flow diagrams in surveys. **Note:** Components can also be accessed from the toolbox.
Survey Tasks	The buttons in this group provide options to change the overall appearance of the survey.
Survey Options	Click this button to access settings for default font formatting, question numbering, and user identification.
Apply Template	Click this button to select or clear a survey template. See Selecting a template.
Switch to Basic Mode	**Caution:** Switching to Basic mode cannot be undone and any changes made in advanced mode are lost. Click this button to switch the survey to Basic mode.
Validate	Click this button to check the survey workflow for errors. See Validating surveys.
Clipboard	The buttons in this group provide access to basic editing commands when working with components on the canvas.
Paste	Click this button to paste the contents of the clipboard.
Cut	Click this button to cut selected components from the canvas to the clipboard.
Copy	Click this button to copy selected components from the canvas to the clipboard.

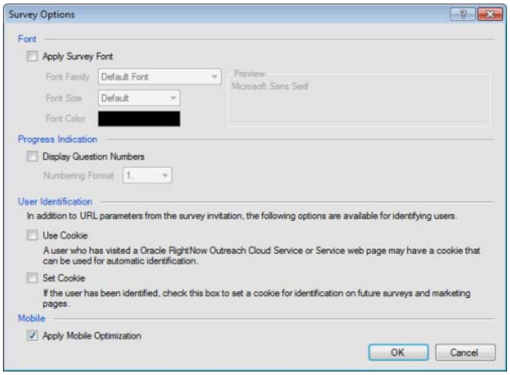
Table 539: Designer Home Tab Description (Continued)

Group/Button	Description
Delete	Click this button to delete selected components from the canvas.

From the Designer Home tab, you can specify certain survey options to customize your questionnaire. You can set the font attributes and choose how to notify customers of their progress through your survey. You can also specify how the system identifies contacts.

To specify survey options in advanced mode

1 Click the Survey Options button on the Designer Home tab. The Survey Options window opens.



2 Enter the following field information.

Table 540: Survey Options in Advanced Mode Description

Field	Description
Font	Enter field information in this section to define the font attributes for the survey.
Apply Survey Font	Select this check box to set the font attributes in the survey. **Note:** If you used a template to create the survey and then set the font attributes for the survey, the header and footer fonts defined in the template do not change to the new font attributes.
Font Family	Click this drop-down menu to select the font family.
Font Size	Click this drop-down menu to select the font size.
Font Color	Click this box to open the Color window and set the font color in the survey. You can select a color from the Basic colors or click Define Custom Colors to define a color.
Preview	Displays the font as it appears in the survey.
Progress Indication	Enter field information in this section to determine how customers can see their progress in the survey.
Display Question Numbers	Select this check box to display a number before each question. If cleared, questions appear unnumbered.
Numbering Format	Click this drop-down menu to select the number format you want to appear before each question. **Note:** This drop-down menu is available only when the Display Question Numbers check box is selected.
User Identification	Specify cookie settings in this section.
Use Cookie	Select this check box to identify customers completing the survey by the Oracle Service Cloud cookie set on their computer. The customer is first identified through URL parameters in the email link to the survey, and, if none exist, the cookie is used.
Set Cookie	Select this check box to set a cookie for customers who are identified through the email link to the survey.
Mobile	Set mobile optimization for surveys taken on mobile devices.

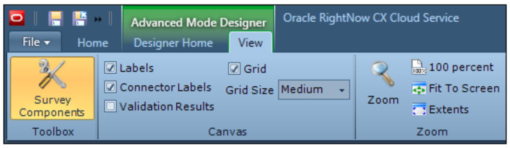
Table 540: Survey Options in Advanced Mode Description (Continued)

Field	Description
Apply Mobile Optimization	**Caution:** By clearing this check box, surveys will not be optimized for readability or touchscreen compatibility on mobile devices. While the survey will still display on any device, the questions may not be easy to read and responding may be difficult when a mobile device is used. Clear this check box to disable optimization for mobile devices. See Mobile surveys.

3 Click the OK button to save your settings and close the window.

View tab

The View tab provides access to the toolbox and options for changing your view of the design canvas.



The groups and buttons on the View tab are described in the following table.

Table 541: View Tab Description

Group/Button	Description
Survey Components Toolbox	Click this button to display the toolbox.
Canvas	The check boxes in this group let you select canvas options.
Labels	Select this check box to display labels for elements in the diagram. Labels display by default.
Connector Labels	Select this check box to display labels for connectors in the diagram. Connector labels display by default.
Validation Results	Select this check box to display validation icons in the diagram.

Table 541: View Tab Description (Continued)

Group/Button	Description
Grid	Select this check box to display the canvas grid. The canvas grid displays by default.
Grid Size	Click this drop-down menu to select the size of the canvas grid. The canvas grid is set to Medium by default.
Zoom	The buttons in this group let you select a zoom level for the canvas.
Zoom	Click this button to access the Zoom Options window. See To select zoom options.
100 percent	Click this button to view the canvas at its normal size.
Fit To Screen	Click this button to adjust the zoom level to show all elements.
Extents	Click this button to show the entire canvas.

As described in the table above, you can change the view of the design canvas from the View tab, including displaying design grid elements and adjusting the zoom level. These options make it easier to review and edit your flow diagram.

To select canvas options

1 To display labels for connectors on the canvas, select the Connector Labels check box.

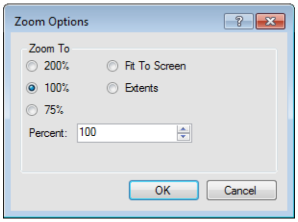
2 To display validation results on the canvas, select the Validation Results check box. See Validating surveys.

3 To display the canvas grid, select the Grid check box.

4 To change the size of the canvas grid, click the Grid Size drop-down menu and select from Small, Medium, or Large.

To select zoom options

1 Click the Zoom button on the View tab. The Zoom Options window opens.



2 To specify a desired zoom level, select a radio button in the Zoom To section.

 a To adjust the zoom level to show all components, select the Fit to Screen radio button.

 b To show the entire canvas, select the Extents radio button.

3 Type a zoom percentage in the Percent field. Click the up or down arrow to increase or decrease the value.

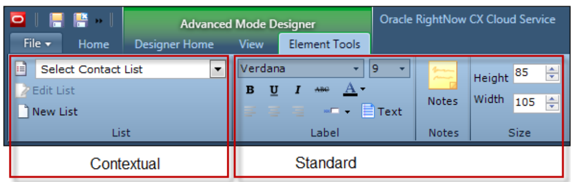
Tip You can also change the magnification of the canvas using the zoom slider located on the bottom right corner of the Service Console.

4 Click the OK button to close the window.

Contextual tabs

When you select an element or connector on the canvas, the ribbon displays a third contextual tab. When an element is selected, the Element Tools tab appears. This tab is divided into two sections. On the left are contextual groups and buttons, meaning they change depending on the element selected. On the right are standard groups and buttons, meaning they display no matter what element is selected.

The following figure displays the Element Tools tab and shows the contextual group of buttons for the Add to List element on the left and the standard group of buttons on the right.

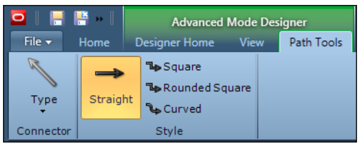


The standard groups and buttons on the Element Tools tab are described in the following table.

Table 542: Element Tools Tab Description

Group/Button	Description
Label	The buttons in this group let you change the font style, size, and color. You can select font attributes, such as bold and italic, and change the text's alignment.
 (Label Position)	Click this button to select the position of the label relative to the element.
	Click this button to type the text of the element label. **Note:** You can also edit the label text inline by clicking the element label.
Notes	Click this button to type notes about the element.
Size	The buttons in this group let you change the height and width of the element.

Another contextual tab that displays on the ribbon is the Path Tools tab. This tab displays when you select a connector. The buttons on this tab let you format the connector and change the connector type.



The standard groups and buttons on the Path Tools tab are described in the following table. Refer also to Creating connectors in surveys.

Table 543: Path Tools Tab Description

Group/Button	Description
Connector Type	Click this button to change the type of the selected connector. **Note:** A connector's type can be changed only when it is not connected to a standard or event-triggering element.

Table 543: Path Tools Tab Description (Continued)

Group/Button	Description
Style	The buttons in this group let you change the line style of the selected connector.
Straight	Click this button to set the connector line style to straight.
Square	Click this button to set the connector line style to square.
Rounded Square	Click this button to set the connector line style to rounded square.
Curved	Click this button to set the connector line style to curved.

Designing flow diagrams in surveys

The first step in creating a survey in **advanced mode** is to design a flow diagram. The flow diagram is a graphical representation of the survey's "flow," the actions and decisions your survey will perform, and the order in which it will perform them. Your flow diagram can be as simple as a single path connecting a few actions, or it can be complex, routing your audience through dozens of actions, paths, and decision points. With its simplified graphical interface, Feedback makes creating even a complex workflow as easy as clicking and dragging components into a logical order.

Whether your business needs are simple or complex, you should start by reviewing the elements available in the toolbox and consider how each might help accomplish your survey's key objectives. Once you have a clear idea which elements will be useful, you can create the flow diagram by dragging them from the toolbox to the canvas, inserting each element in a logical position, and connecting them to define the sequence of actions. Once an element has been inserted, you can double-click it to open a window where you can edit its attributes.

Tip When explaining attributes that can be edited on a window or the ribbon, we describe the procedure using the window. However, keep in mind that the ribbon provides easy access to most of the same attributes available on windows, without the need to double-click. Survey components can also be dragged to your flow diagram from the Elements groups on the Designer Home tab.

When a survey is launched and a contact performs the first **action**, the decisions and actions in the survey are evaluated and executed in the sequence you have specified. For example, when a contact submits a web form, your campaign evaluates the information provided and executes the next action, such as creating a sales lead and sending a follow-up message to the contact.

Note When a survey is responded to anonymously, survey actions that require contact identification are disregarded. Feedback cannot create an incident or opportunity for an anonymous responder, add them to a list, or send them a transactional mailing or survey.

If you switch to advanced mode before adding anything to the questionnaire, the canvas initially displays the components of a basic survey: a blank web form with a submit button that redirects to Feedback's standard Thank You page. These elements serve as the starting point for your design. You can add, edit, or remove elements to customize the questionnaire to fit your needs.

To customize a questionnaire in advanced mode

1 Drag and drop an element from the toolbox onto the canvas. See the following table for a description of the available components.

Table 544: Elements Description

Element	Description
Event Triggering Elements	Event-triggering elements serve as starting points for questionnaires.
Survey Page	Drag and drop this element to add a survey page to the questionnaire. After adding this element, double-click it to add content to the page. See Editing Survey Page attributes.
Serve Web Page	Drag and drop this element to serve a web page. After adding this element, double-click it to define its attributes. See Editing Serve Web Page attributes.

Table 544: Elements Description (Continued)

Element	Description
Conditional Elements	Conditional elements produce multiple path outcomes based on decisions.
Decision	Drag and drop this element to add a decision point. A decision lets you specify conditions the contact must meet to advance in the workflow. You can create two outgoing paths from a decision: Yes (contact meets the criteria) and No (contact does not meet the criteria). See Creating connectors in surveys. After adding the decision, double-click it to define its attributes. See Editing Decision attributes.
Case Statement	Drag and drop this element to add a case statement to the survey. A case statement is a type of conditional element that lets you add multiple choice decisions. This give you an easy way to add diverse branching capabilities to your surveys based on conditions defined in the workflow. Case statements are unique because they have an outgoing path for every condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated. See Creating connectors in surveys. After adding the case statement, double-click it to define its attributes. See Editing Case Statement attributes.
Standard Elements	Standard items perform actions when specified criteria are met.
Notification	Drag and drop this element to send a notification to one or more staff members. After adding this element, double-click it to define its attributes. See Editing Notification attributes.
Redirect to URL	Drag and drop this element to redirect the contact to a URL. After adding this element, double-click it to define its attributes. See Editing Redirect to URL attributes.
Incident	Drag and drop this element to create an incident from the contact record. After adding this element, double-click it to define its attributes. See Editing Incident attributes.
Opportunity	Drag and drop this element to create an opportunity from the contact record. After adding this element, double-click it to define its attributes. See Editing Opportunity attributes.

Table 544: Elements Description (Continued)

Element	Description
Lead	Drag and drop this element to create a lead from the contact record. After adding this element, double-click it to define its attributes. See Editing Lead attributes.
Add to List	Drag and drop this element to add the contact to a list. After adding this element, double-click it to define its attributes. See Editing Add to List attributes.
Set Field	Drag and drop this element to set a value for one of the fields in the contact record. After adding this element, double-click it to define its attributes. See Editing Set Field attributes.
Execute Object Event Handler	Drag and drop this element to add a contact-related object event handler that will trigger an external event action. See Editing Execute Object Event Handler attributes.
Transactional Mailing	Drag and drop this element to send a transactional mailing to the contact. After adding this element, double-click it to define its attributes. See Editing Transactional Mailing attributes.
Transactional Survey	Drag and drop this element to send a transactional survey to the contact. After adding this element, double-click it to define its attributes. See Editing Transactional Survey attributes.
External Event	Drag and drop this element to run an external event. External events are scripts that run outside of Oracle Service Cloud After adding this element, double-click it to define its attributes. See Editing External Event attributes.
Artifacts	Artifact elements let you make comments about your survey. They do not affect the outcome of your flow diagram.
Comment	Drag and drop this artifact to add comments about your flow diagram or a specific survey component. A comment artifact does not require a connector, but if your comment is about a specific element, use the Artifact connector type. See Creating connectors in surveys.

2 To edit the attributes of an element on the canvas, double-click the element. See Editing element attributes.

3 To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. See Creating connectors in surveys.

4 To cut, copy, or paste one or more components, click the appropriate button on the Clipboard group of the Designer Home tab.

5 To export an image of the canvas to your workstation, click File and select Export Image.

6 To change the formatting of an element, select the element and see the following table. See Element Tools Tab Description.

Tip To select multiple elements at once, press **Ctrl** and select each component.

Creating connectors in surveys

Connectors are components used to link elements and indicate flow direction. Elements can be connected to other elements depending on their type. The type of connector is indicated by its color, as described in the following table.

Table 545: Types of Connectors

Path	Color	Description
Submit	Blue	This type of connector submits an element's web form fields to the database and then links to another element. A web form can be a document with a web form or survey questions. **Note:** In order for the submit connector to work, there must be a submit action on the web form that's used in the campaign. See Inserting survey results links.
Yes	Green	This type of connector links a decision element to another element. The path is taken if the contact meets the criteria specified in the decision.
No	Red	This type of connector links a decision element to another element. The path is taken if the contact does not meet the criteria specified in the decision.
Standard	Gray	This type of connector links one element to another element. The second action is performed immediately after the first.

Table 545: Types of Connectors (Continued)

Path	Color	Description
Artifact	Black (Dashed)	This type of connector links a comment to an element.
Case	Gray	This type of connector links a case statement element to another element. The path is taken if the contact meets the criteria specified in the case statement.

Each element can have a specific number of incoming and outgoing connectors. See the following table for a list of the number of connectors allowed in each element.

Table 546: Connectors Allowed for Element Types

Element	Connectors Allowed
Add to List	• Unlimited incoming connectors • 1 outgoing standard connector
Case Statement	• Unlimited incoming connectors • 1 outgoing connector for each choice.
Decision	• Unlimited incoming connectors • 1 outgoing Yes connector • 1 outgoing No connector
Execute Object Event Handler	• Unlimited incoming connectors • 1 outgoing standard connector
External Event	• Unlimited incoming connectors • 1 outgoing standard connector
Incident	• Unlimited incoming connectors • 1 outgoing standard connector
Lead	• Unlimited incoming connectors • 1 outgoing standard connector
Notification	• Unlimited incoming connectors • 1 outgoing standard connector
Opportunity	• Unlimited incoming connectors • 1 outgoing standard connector

Table 546: Connectors Allowed for Element Types (Continued)

Element	Connectors Allowed
Redirect to URL	• Unlimited incoming connectors • 1 outgoing standard connector
Serve Web Page	• Unlimited incoming connectors • 1 outgoing standard connector • 1 outgoing submit connector
Survey Page	• Unlimited incoming connectors • 1 outgoing standard connector • 1 outgoing submit connector
Set Field	• Unlimited incoming connectors • 1 outgoing standard connector
Transactional Mailing	• Unlimited incoming connectors • 1 outgoing standard connector • 1 outgoing submit connector
Transactional Survey	• Unlimited incoming connectors • 1 outgoing standard connector • 1 outgoing submit connector

To connect an element

To connect one element to another, click an anchor on the first element and drag the connector to an anchor on the second element. The anchor is highlighted when the connector is able to link to it. The connector arrow points from the first element to the second. When you connect your element types this way, the system automatically applies the correct connector type.

Note If you use the wrong connector type, the element anchor will not be highlighted. See Connectors Allowed for Element Types.

Other ways to connect elements include:

- Hover over the first element and click a blue arrow to link to an adjoining element.
- Drag one element over another, hover over its blue arrow until it turns dark blue, and then drop to connect the elements. Connecting your elements this way auto-links them with the correct connector type.

- Click an element from the toolbox, and then hover over an element on the canvas and click its blue arrow to drop and auto-link the new element.
- Drag and drop a connector from the toolbox to the canvas, and then drag the ends of the connector to anchors on the elements you want to link.

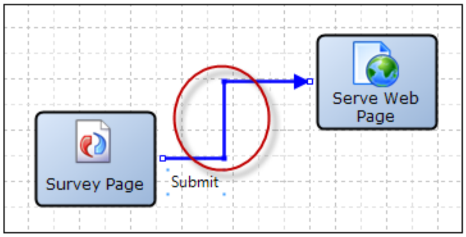
Tip To auto-link your elements, drag your connector over both elements until they are highlighted, and then drop to connect them. Remember, if you select the wrong connector type, your elements will not be highlighted.

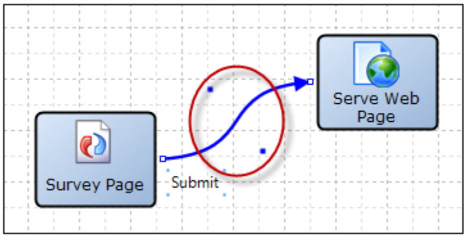
To connect to a different element

Click a midpoint on the connector to select it and drag one of its ends to an anchor on a different element to create a different connection.

To edit a square or curved connector

Click a midpoint on a square or curved connector to select it and drag the calibration points to adjust the shape of the connection. The following figures show the calibration points on square and curved connectors.





To delete a connector

Click a midpoint on the connector to select it and press **Delete**.

Editing element attributes

Once you have added an element to the canvas, you must edit its attributes to make it functional. For example, if you add a survey page to the canvas, you need to edit it and add the questions that will appear on that page.

Important You must define attributes for each component added or a validation error occurs when attempting to save the survey. See Validating surveys.

Editing Survey Page attributes

Once you add a Survey Page element to your flow diagram, you can edit its attributes to add questions and HTML content, set the page title, and define the buttons you want to use on your page.

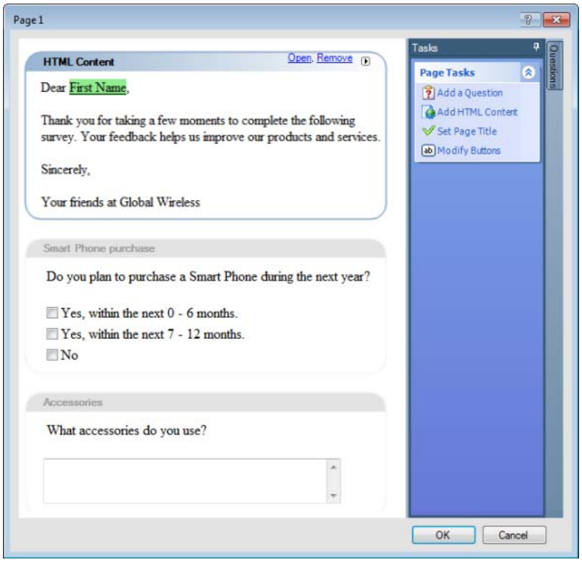
For multiple-page surveys, you can add next and previous buttons to your pages. Because the next button performs a submit function when it is clicked, once respondents finish a page and perform a submit, answers from that page are saved so they can easily go back and forth between pages. This makes it easy to review or change answers from a previous page or to come back at a later date to finish a survey. You can also customize the appearance of the button text and style attributes to make it more applicable for each survey page.

Standard element placement when using next and back buttons

When you use next and back buttons with standard elements, we recommend adding those elements to the end rather than to the middle of your flow. For example, suppose you add an Incident element to the second page of a survey, and then you add next and back buttons on subsequent pages. This scenario could cause two incidents to be created if respondents go back to the first page, because once they are ready to move forward, clicking the next button will resubmit the incident. Therefore, to avoid the possibility of triggering duplicate actions, we recommend adding standard elements (such as an Incident element) to the end of your surveys.

To edit a survey page

1 Double-click the Survey Page element. The New Survey Page window opens.



2 Click a button in the Page Tasks section described in the following table.

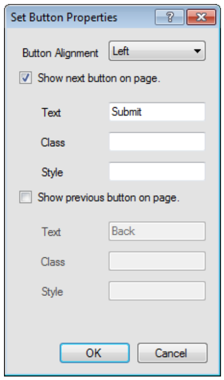
Table 547: Page Tasks Description

Button	Description
Add a Question	Click this button to add a question to the questionnaire. See Adding questions.
Add HTML Content	Click this button to add HTML content to the questionnaire. See Using the HTML editor.
Set Page Title	Click this button to change the title of the page from the default “Page <page number>.” See Setting the page title.
Modify Buttons	Click this button to modify the text of the buttons or remove buttons from a page. See the procedure that follows to modify buttons.

To modify buttons

Caution Because the next button performs a submit function for each page, do not remove the next button from survey pages that have questions on them. Otherwise, responders cannot submit their answers.

1 Click the Modify Buttons button in the Page Tasks section. The Set Button Properties window opens.



2 Enter the following field information.

Table 548: Set Button Properties Window Description

Field	Description
Button Alignment	Click this drop-down menu to select left, center, or right alignment. Left is selected by default.
Show next button on page	**Caution:** Because the next button performs a submit function for each page, do not remove the next button from survey pages that have questions on them. Otherwise, responders cannot submit their answers. This check box, which is selected by default, displays a next button and performs a submit function when you add subsequent pages to your survey. If you clear this check box, the remaining fields are disabled.
Text	To change the label of the next button, which is set to Submit by default, type the name of the label as you want it to display.

Table 548: Set Button Properties Window Description (Continued)

Field	Description
Class	Type any class name you want to assign to the button. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag.
Style	Type any style attributes you want to assign to the button. Style attributes define how the button appears, such as color, font, and alignment (for example, font-family: arial, sans-serif; font-weight: bold; background: #99ff00; margin-left: 20px).
Show previous button on page	Select this check box to display a previous button on your page.
Text	To change the label of the previous button, which is set to Back by default, type the name of the label as you want it to display.
Class	Type any class name you want to assign to the button. You must define the class in your document's HTML by either using the <style> tag to define the class inline, or posting the class in a CSS file on your web server and referencing it with the <link> tag.
Style	Type any style attributes you want to assign to the button. Style attributes define how the button appears, such as color, font, and alignment (for example, font-family: arial, sans-serif; font-weight: bold; background: #99ff00; margin-left: 20px).

3 Click the OK button to save your changes and close the window.

Editing Serve Web Page attributes

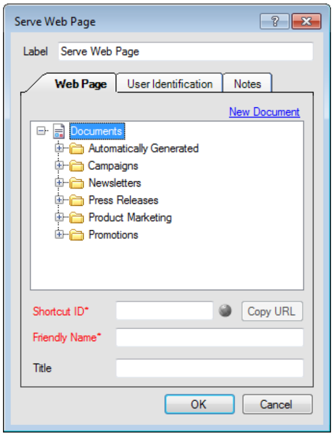
Once you add a Serve Web Page element to your flow diagram, you can edit its attributes to select a document to serve as a web page through Oracle Service Cloud. You can specify the shortcut ID used to generate the URL and choose whether to prefill the web form in the document with contact fields stored in the contact's cookies or passed as parameters in the URL. In addition, you can customize the title of the page you are editing. The page title displays in the title bar of the web browser when the survey is taken. See Creating documents.

Tip

- Use a submit connector to connect this action to the next action when the web page contains a web form or survey questions.
- You can add a back button to a web page that contains a web form. See To add a back button to a Serve Web Page attribute.

To edit Serve Web Page attributes

1 Double-click the Serve Web Page element to open the Serve Web Page window.



2 Type the name of the element in the Label field.

3 Enter the following field information on the Web Page tab.

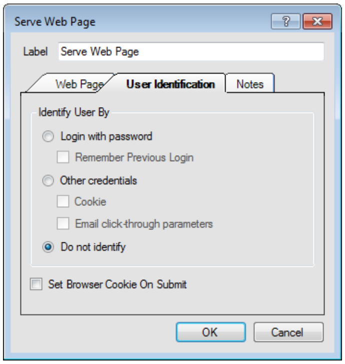
Table 549: Serve Web Page Window Description

Field	Description
***Document**	Select the document you want to use as a web page from this list. To search for a document, right-click the list and select Search. Then type the document name in the Find field.
New Document	Click this text to create a document. See To create a document.

Table 549: Serve Web Page Window Description (Continued)

Field	Description
***Shortcut ID**	Type the shortcut ID that is used to format the URL in this field. The URL for the document is: http://<your_domain>/ci/documents/detail/2/<shortcut_ID> **Note:** This shortcut ID must be unique for all Serve Web Page elements in all surveys and campaigns.
(View Web Page)	Click this button to open the web page in a browser. **Note:** The button is not active until the questionnaire is set to the Launched status and saved.
Copy URL	Click this button to copy the URL generated for the web page to the clipboard. **Note:** The URL is not valid until the questionnaire is set to the Launched status and saved.
***Friendly Name**	Type the name of your web page. This name is used when linking to the web form from another document.
Title	Type the name of the page as you want it to display in the title bar of the web browser when the survey is taken. **Note:** If you leave this field blank, either the document or template title will display in the web browser title bar. If a template has been applied to the document the survey uses, then the template title is used.

4 Click the User Identification tab.



Note You can specify default values for the settings on the User Identification tab by editing optional configuration settings. See Customizing Feedback configuration settings.

5 Enter the following field information.

Table 550: User Identification Tab Description

Field	Description
Identify User By	Select from the following options to prefill a web form (if one is included in your document).
Login with Password	Select this radio button to require the contact to log in to the Service **customer portal** before viewing the web form.
Remember Previous Login	Select this check box to identify the contact through the contact's Service login cookie. If a login cookie does not exist, the contact is redirected to the login page on the customer portal. If this check box is cleared, the contact is always required to log in through the customer portal before viewing the web form.
Other Credentials	Select this radio button to identify the contact by a cookie or through URL parameters.
Cookie	Select this radio button if you want to use the contact's browser cookie to prefill the web form. The contact's record is updated with the form submission.

Table 550: User Identification Tab Description (Continued)

Field	Description
Email Click-Through Parameters	Select this radio button if you want to use parameters passed in the URL to prefill the web form. **Note:** If using this option to prefill a web form from a link in a mailing, be sure to use a web page link instead of a **tracked link**. Because tracked links are used to redirect to external sites, they do not support click-through parameters.
Do Not Identify	Select this radio button if you never want the web form to be pre-filled. **Note:** A contact record is updated through the web form if the email address field is included and can be matched to an existing record.
Set Browser Cookie on Submit	Select this check box if you want to set the contact's browser cookie upon submitting the form. If they access any form later, the form is prefilled, if the Cookie radio button is selected for that form.

Tip You can set default values for the user identification fields by editing the configuration settings located at Outreach and Feedback > General > Campaigns. Note that default values specified by these settings impact both new campaigns and new advanced surveys.

6 To add any notes associated with the element, click the Notes tab and type the notes.

7 Click the OK button.

To add a back button to a Serve Web Page attribute

1 From an advanced survey, double-click the Serve Web Page element to open the Serve Web page window.

2 Click the New Document link.

3 From the HTML tab of your document, click Begin With Blank Content. The HTML editor opens.

4 Click the Web Form button under the Forms section to add a web form to your document. See Inserting survey results links.

Note Form fields cannot be added outside of a web form.

5 Click the Submit button to add the Submit button to your web form.

Note Web forms must contain a Submit button.

6 To add a back button to your content, click the Back Button button under the Forms section.

7 To edit the label of the back button, double-click the button and type the label as you want it to display.

Editing Decision attributes

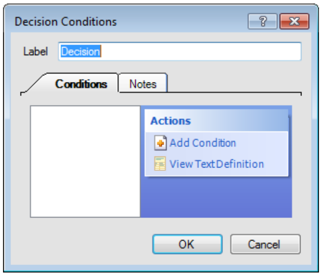
Decision elements let you branch your workflow based on two outgoing paths you define. Once you add a Decision element to your flow diagram, you can edit its attributes to require contacts to meet certain criteria before moving down the Yes path. Contacts who do not meet the criteria are moved down the No path (if one exists). When you edit the decision, you can define conditions based on contact fields or question responses and a logical expression based on the conditions.

When you create decisions in advanced questionnaires, you can create branches in your survey based on customer response. For example, you could serve a document with survey questions as a web page, then create a decision based on a response to send them to one of two documents containing additional questions.

Also, when a matrix question is added to an advanced questionnaire, each question from the matrix can be filtered by decision elements. In this way, you can direct the survey's flow based on a specific contact response to an individual question in the matrix.

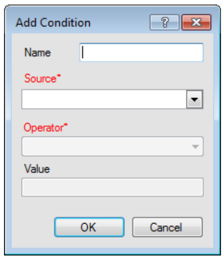
To edit Decision attributes

1 Double-click the Decision element to open the Decision Conditions window.



2 Type the name of the decision in the Label field.

3 Click the Add Condition button to create a condition for the Yes path. The Add Condition window opens.



a Type the name of the condition in the Name field.

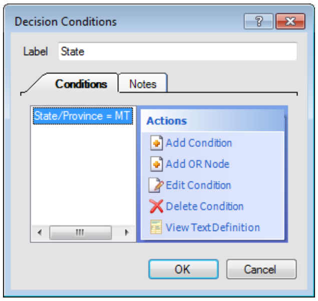
b Click the Source drop-down menu and select a contact field, survey question, or survey score.

Note When adding a text field to a decision, the Source drop-down menu displays an additional item as “<text field name> SmartSense.” Selecting the **SmartSense** item lets you evaluate the customer’s emotional state or attitude based on the words or language the customer used when responding to the question. You can then specify values from Very Happy to Very Angry as criteria for your decision logic.

c Click the Operator drop-down menu and select the logical symbol that completes the condition.

d Type the value of the field or click the drop-down menu and select the value in the Value field.

This expression determines which contacts meet the condition (for example, State/Province=MT or <menu question>=<specified answer>).



By default, multiple conditions are joined by AND. When the AND operator is used, contacts are moved down the Yes path when all the conditions are met. You can further limit your data set by using the Boolean operators OR and NOT. When the OR operator is used, contacts are moved down the Yes path when any of the conditions are met.

4 To add an OR to your expression, click the Add OR Node button. Conditions attached to the OR node are joined by OR.

5 To edit a condition, select the condition and click the Edit Condition button.

6 To delete a condition, select the condition and click the Delete Condition button.

Note The Add OR Node, Edit Condition, and Delete Condition buttons display only after you have added a condition.

7 Click the View Text Definition button to see your conditions as a logical expression.

8 To add any notes associated with the decision, click the Notes tab and type the notes.

9 Click the OK button.

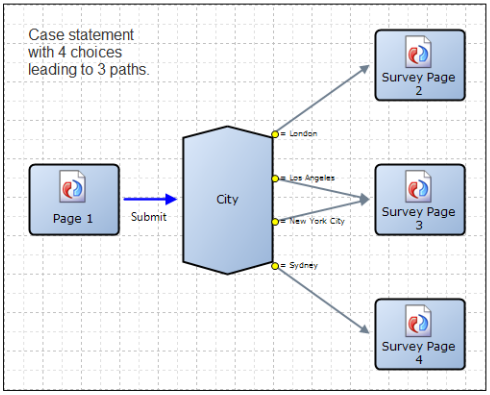
Editing Case Statement attributes

Case statements help you branch your workflow based on multiple conditions that you define. They are unique because you define an outgoing path for each condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated.

Once you add a case statement element to your flow diagram, you can edit its attributes to branch your flow to different paths based on whether contacts meet certain conditions. When you edit the case statement, you can define multiple conditions using a contact field in the database, a question, or a score.

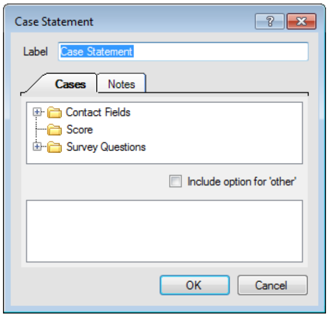
Score pertains to the cumulative score from all preceding survey question responses. Score always displays on the Cases tab.

Case statements differ from decisions because they let you add multiple paths to your flow.



To edit Case Statement attributes

1 Double-click the Case Statement element to open the Case Statement window.

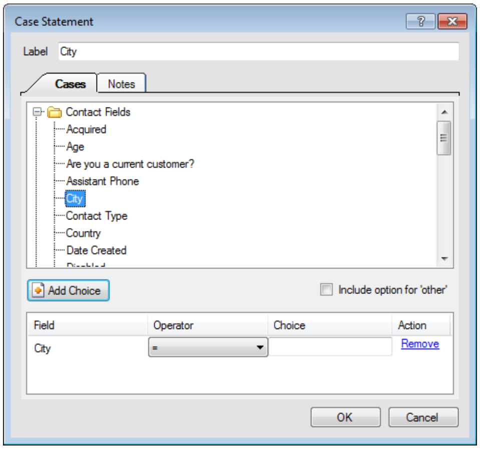


2 Select a contact field, survey question, or score from the Cases tab.

Note Keep in mind that depending on the item you select, choices are either already defined by default or you must define them.

3 If you want to add an “other” path to your case statement, select the Include Option for Other check box.

4 To add a choice that is not defined by default, click the Add Choice button. The bottom section of the Case Statement window displays options to define logical expressions for your choices.



Note The Add Choice button does not display if choices have already been defined by default. For example, Contact Type or Global Opt-in under Default Contact Fields have choices defined. Therefore, the Add Choice button does not display when these fields are selected.

5 Click the Operator drop-down menu to select the logical symbol that completes your expression.

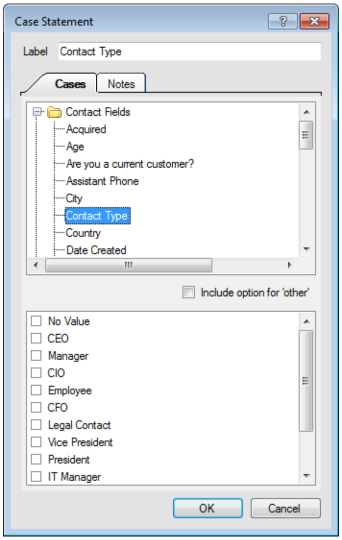
6 Type the field’s value in the Choice field.

7 To add another choice that is not defined by default, repeat steps 4 through 6.

8 To delete a choice, select the choice and click Remove.

9 To add a choice that is defined by default, select the check boxes next to the choices you want to include in your case statement.

Note Cases with menu, yes/no, and opt-in items present you with default choices defined by the database.



10 To add any notes associated with the element, click the Notes tab and type the notes.

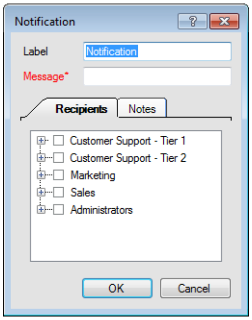
11 Click the OK button to add the case statement to the flow.

Editing Notification attributes

Once you add a Notification element to your flow diagram, you can edit its attributes to define which staff members to notify. You can select multiple staff accounts and customize the notification message. Details about the questionnaire and contact record, and any incident or opportunity that originated the survey, are automatically included in the notification email.

To edit Notification attributes

1 Double-click the Notification element to open the Notification window.



2 Type the name of the element in the Label field.

3 Type the message you want to appear in the subject line of the notification in the Message field.

4 Select the check boxes of the staff members you want to notify.

5 To add any notes associated with the element, click the Notes tab and type the notes.

6 Click the OK button.

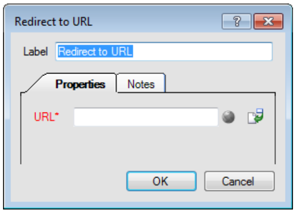
Editing Redirect to URL attributes

Redirect to URL elements let you define a web page that your customers are redirected to once they complete the previous action in the workflow. After you add a Redirect to URL element to your flow diagram, you can edit its attributes to specify the URL to which you want to send the contact.

Note The Redirect to URL element that displays when you switch to advanced mode is defined (by default) to display a thank you page when the contact clicks the Submit button on the survey page (which is also defined by default).

To edit Redirect to URL attributes

1 Double-click the element to open the Redirect to URL window.



2 Type the name of the element in the Label field.

3 Type the URL of the website you want to redirect the contact to in the URL text box. The protocol must be specified. The following protocols are supported:

- file:///
- ftp://
- gopher://
- http://
- https://
- mailto:
- nntp:
- news:

4 To open the URL in a browser, click the Open URL button (to the right of the URL field).

5 To add a contact, incident, opportunity, or tracked link field to the URL as a parameter, click the Merge Field button (to the right of the Open URL button). See Inserting merge fields.

6 To add any notes associated with the element, click the Notes tab and type the notes.

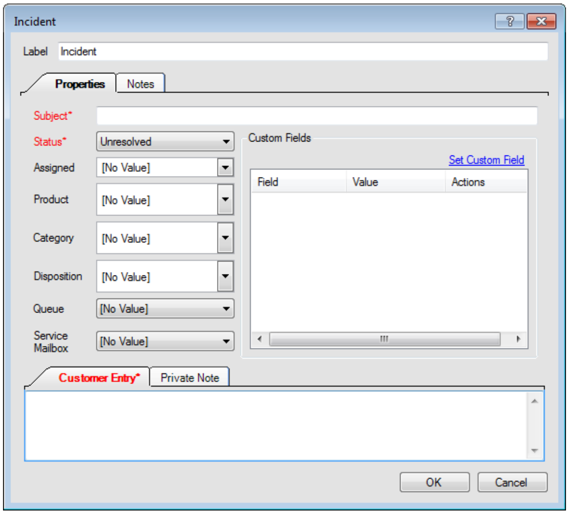
7 Click the OK button.

Editing Incident attributes

Once you add an Incident element to your flow diagram, you can edit its attributes to define the subject, status, and other elements of the created incident. See Incidents overview.

To edit Incident attributes

1 Double-click the Incident element to open the Incident window.



2 Type the name of the element in the Label field.

3 Enter the following field information.

Table 551: Incident Window Description

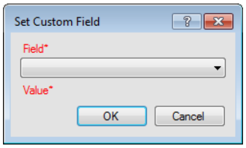
Field	Description
*Subject	Type the subject of the incident in this text box.
*Status	Click this drop-down menu to select a status to assign to the incident. The default status is Unresolved.
Assigned	Click this drop-down menu to select a group or staff member to assign to the incident.
Product	Click this drop-down menu to select a product to assign to the incident.
Category	Click this drop-down menu to select a category to assign to the incident.
Disposition	Click this drop-down menu to select a disposition to assign to the incident.
Queue	Click this drop-down menu to select a queue to assign the incident to.

Table 551: Incident Window Description (Continued)

Field	Description
Service Mailbox	Click this drop-down menu to select a mailbox to associate with the incident.
*Customer Entry	Type a default value for the customer thread in this text box.
Private Note	Click this tab to type a default value for the notes thread.

4 Click Set Custom Field to set custom fields for the incident. The Set Custom Field window opens.

Note You must define custom fields in the Custom Fields editor before you can set a custom field for an incident. See Adding and editing custom fields.



a Click the Field drop-down menu to select the custom field you want to set.
b Enter the value of the custom field in the Value field.
c Click the OK button. The custom field and its value appear in the Custom Fields grid.

5 To edit the value of a custom field, click Edit next to the custom field.

6 To remove the set value of a custom field, click Delete next to the custom field.

7 To add any notes associated with the element, click the Notes tab and type the notes.

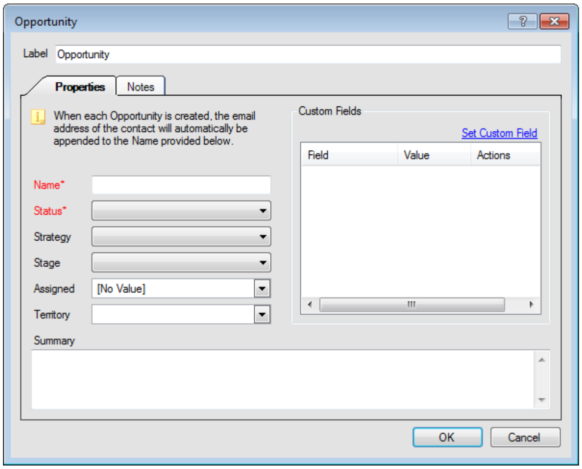
8 Click the OK button.

Editing Opportunity attributes

Once you add an Opportunity element to your flow diagram, you can edit its attributes to define fields of the opportunity created by this element. You can specify the opportunity’s name, status, strategy, stage, assigned sales representative, and territory. See Opportunities overview.

To edit Opportunity attributes

1 Double-click the Opportunity element to open the Opportunity window.



2 Type the name of the element in the Label field.

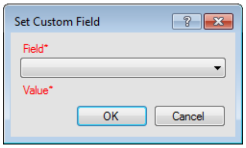
3 Enter the following field information.

Table 552: Opportunity Window Description

Field	Description
*Name	Type the name of the opportunity in this field. **Note:** The contact's email address is appended to the opportunity name.
*Status	Click this drop-down menu to assign a status to the opportunity.
Strategy	Click this drop-down menu to assign the opportunity to a strategy.
Stage	Click this drop-down menu to assign the opportunity to a stage. The options in this menu depend on the strategy selected.
Assigned	Click this drop-down menu to assign the opportunity to a sales representative.
Territory	Click this drop-down menu to assign the opportunity to a territory.
Summary	Type a summary of the opportunity in this field.

4 Click Set Custom Field to set custom fields for the opportunity. The Set Custom Field window opens.

Note You must define custom fields in the Custom Fields editor before you can set a custom field for an opportunity. See Adding and editing custom fields.



a Click the Field drop-down menu to select the custom field you want to set.
b Enter the value of the custom field in the Value field.
c Click the OK button. The custom field and its value appear in the Custom Fields grid.

5 To edit the value of a custom field, click Edit next to the custom field.

6 To remove the set value of a custom field, click Delete next to the custom field.

7 To add any notes associated with the element, click the Notes tab and type the notes.

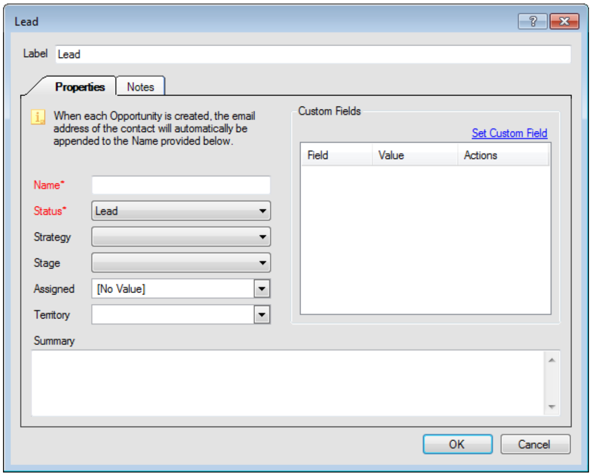
8 Click the OK button.

Editing Lead attributes

Once you add a Lead element to your flow diagram, you can edit its attributes to define fields of the lead created by this element. You can specify the lead's status, strategy, stage, assigned sales representative, and territory. See Accepting and rejecting leads.

To edit Lead attributes

1 Double-click the Lead element to open the Create Lead window.



2 Type the name of the element in the Label field.

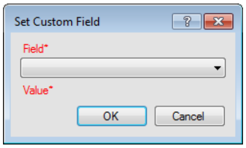
3 Enter the following field information.

Table 553: Create Lead Window Description

Field	Description
*Name	Type the name of the lead in this field. **Note:** The contact's email address is appended to the lead name.
*Status	Click this drop-down menu to assign a status to the lead. Only statuses with a Lead status type display.
Strategy	Click this drop-down menu to assign the lead to a strategy.
Stage	Click this drop-down menu to assign the lead to a stage. The options in this menu depend on the strategy selected.
Assigned	Click this drop-down menu to assign the lead to a sales representative.
Territory	Click this drop-down menu to assign the lead to a territory.
Summary	Type a summary of the lead in this field.

4 Click Set Custom Field to set custom fields for the lead. The Set Custom Field window opens.

Note You must define custom fields in the Custom Fields editor before you can set a custom field for a lead. See Adding and editing custom fields.



a Click the Field drop-down menu to select the custom field you want to set.
b Enter the value of the custom field in the Value field.
c Click the OK button. The custom field and its value appear in the Custom Fields grid.

5 To edit the value of a custom field, click Edit next to the custom field.

6 To remove the set value of a custom field, click Delete next to the custom field.

7 To add any notes associated with the element, click the Notes tab and type the notes.

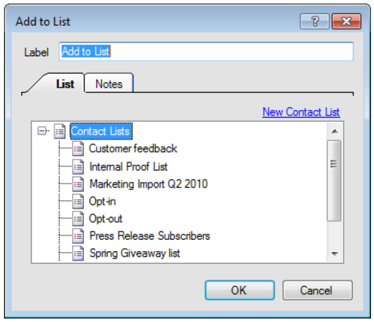
8 Click the OK button.

Editing Add to List attributes

Once you add an Add to List element to your flow diagram, you can edit its attributes to define which list the contact is added to. You can select from predefined lists in your system or create a list. See Adding contact lists.

To edit Add to List attributes

1 Double-click the Add to List element to open the Add to List window.



2 Type the name of the element in the Label field.

3 Select a contact list from the List menu.

  a To search for a contact list, right-click the list and select Search. Then type the list name in the Find field.

4 To create a contact list, click New Contact List and refer to [To add a contact list](#).

5 To add any notes associated with the element, click the Notes tab and type the notes.

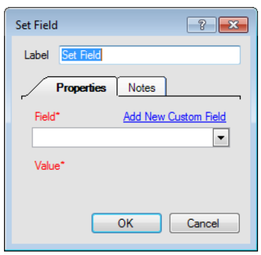
6 Click the OK button.

Editing Set Field attributes

Once you add a Set Field element to your flow diagram, you can edit its attributes to specify the value of contact fields. You can specify a number of contact record fields, including opt-in status, state, survey score, or any contact custom fields defined in your system.

To edit Set Field attributes

1 Double-click the Set Field element to open the Set Field window.



2 Type the name of the element in the Label field.

3 Click the Field drop-down menu and select the contact field you want to set the value of.

4 To add a new contact custom field, click Add New Custom Field and refer to Adding and editing custom fields.

5 Enter a value for the contact field you selected.

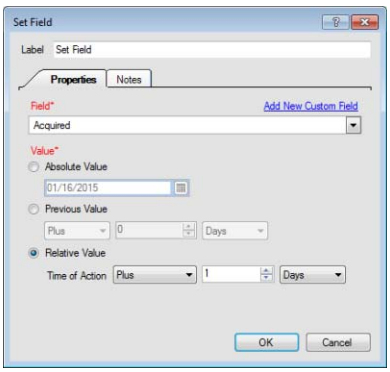
Note In addition to setting explicit (absolute) values, you can set null values for text and text area fields as well as relative values for some field types. Relative values are defined by adding or subtracting (or appending or prepending) a value to the field's previous value. See Setting relative field values.

6 To add any notes associated with the element, click the Notes tab and type the notes.

7 Click the OK button.

Setting relative field values

In addition to setting absolute field values for date, date/time, integer, text, and text area fields, you can set relative values. When setting a value for one of these field types, clicking the Value drop-down menu presents additional options for adding or subtracting (or appending or prepending) a value to the field's previous value. For example, you can increment the value of an integer field by 1 or append text to a contact text field. For date and date/time fields, you can also set a value relative to the time of action, such as adding one day to the current date and time, as shown in the following figure.



Options for setting relative field values vary by field type and are described in the following table.

Table 554: Relative Field Value Options

Field Type	Value Options
Date	Add or subtract a number of days or weeks to or from the previous value or the current date.
Date/Time	Add or subtract a number of minutes, hours, days, or weeks to or from the previous value or the current date and time.
Integer	Add or subtract an integer value to or from the current value. **Note:** The resulting value cannot be greater than the maximum value defined for the field or less than the minimum. Therefore, the maximum value you can add or subtract is the field's maximum value minus the field's minimum value. For example, if the field maximum is 8 and the field minimum is -8, the maximum value you can add or subtract from the current value is 16.
Text Field	Prepend or append a text value to the current text value.
Text Area	Prepend or append a text value to the current text value.

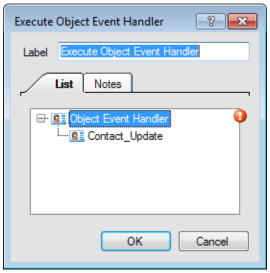
Editing Execute Object Event Handler attributes

You can add contact-related object event handlers to your survey that can be associated with create and update operations on contact objects. Object event handlers are added and managed on the process designer in a virtual container called the **process model**. Once you add your object event handlers on the process designer and deploy the process model, you can add an Execute Object Event Handler element to your flow diagram and then associate it with one of your object event handlers to trigger an action. See Adding object event handlers.

Note Only synchronous object event handlers are applicable to surveys.

To edit Execute Object Event Handler attributes

1 Double-click the Execute Object Event Handler element. The Execute Object Event Handler window opens.



Note Contact objects must be added on the process designer and then the process model must be deployed for objects to display on the List tab.

2 Type the name of the element in the Label field.

3 Select an object event handler from the List tab.

4 To add notes about the object event handler, click the Notes tab and type your notes.

5 Click the OK button to add the object event handler to the flow.

Editing Transactional Mailing attributes

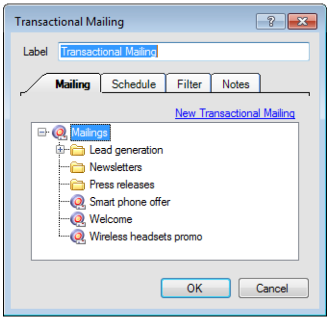
Once you add a Transactional Mailing element to your flow diagram, you can edit its attributes to define which mailing to send to a contact. In addition, you can choose to send the mailing immediately, at an exact time, or at a certain interval. If the mailing is scheduled to be sent at a certain interval, the mailing is stored until sent by the **mailer daemon**. By default, the mailer daemon sends scheduled transactional mailings every fifteen minutes. If you want the utility to send mailings more frequently, you must edit the site-wide configuration setting RNMD_EVENT_PROC_INTERVAL (Outreach and Feedback > General > RNM Daemon).

Note The Transactional Mailing element simply schedules a mailing to be sent. It does not pause the processing of the flow until the mailing is sent. Therefore, any elements following this element in the flow continue to be processed immediately, even if the mailing is scheduled to be sent in the future.

This element can be filtered using segments. If you choose to filter a transactional mailing, you can select whether contacts who are in or not in the segment are sent an email. See Creating transactional mailings.

To edit Transactional Mailing attributes

1 Double-click the Transactional Mailing element to open the Transactional Mailing window.



2 Type the name of the element in the Label field.

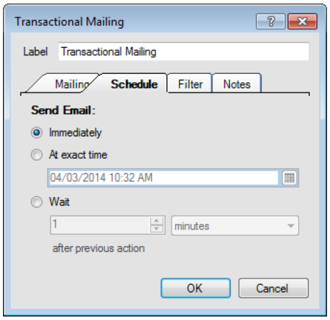
3 Select the mailing you want to send.

 a To search for a mailing, right-click the list and select Search. Then type the mailing name in the Find field.

Note In order to be sent, the transactional mailing you select must be in a launched state. If you select a transactional mailing that has not been launched, it is not sent and the system advances to the next element in your flow diagram.

4 To create a transactional mailing, click New Transactional Mailing and refer to [To create a transactional mailing](#).

5 Click the Schedule tab.

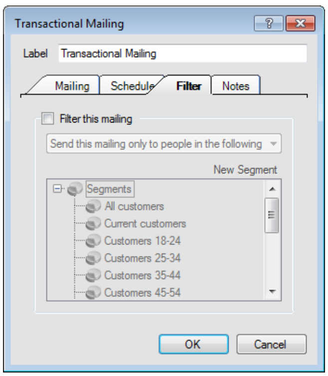


6 Enter the following field information.

Table 555: Schedule Tab Description

Field	Description
Immediately	Select this radio button to send the email immediately after this action occurs.
At exact time	Select this radio button and click the calendar (to the right of the At Exact Time field) to select a specific date and time to send the email. **Note:** If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a time has been scheduled for this mailing.
Wait	Select this radio button to send the mailing a specified amount of time after this action is triggered in the flow. Use the up and down arrows to select the number of units, and click the drop-down menu to select the interval (minutes, hours, days, or weeks). **Note:** If this option is selected, a clock icon appears on the Transactional Mailing element to indicate that a time has been scheduled for this mailing.

7 Click the Filter tab and select the Filter This Mailing check box to select whether contacts should be included or not included in the segment to be filtered from the mailing. The default is Send This Mailing Only to People in the Following Segment.



If you leave the default, only contacts who meet the criteria in the segment receive the mailing.

8 To send the mailing to all contacts except those who meet the criteria in the segment, click the drop-down menu and select Send This Mailing Only to People in the Following Segment.

9 Select a segment for the mailing.

10 To add a segment, click New Segment and refer to [To create a segment](#).

11 To add any notes associated with the element, click the Notes tab and type the notes.

12 Click the OK button.

Editing Transactional Survey attributes

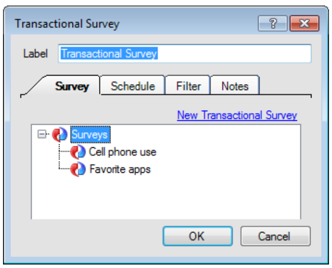
Once you add a Transactional Survey element to your flow diagram, you can edit its attributes to define which survey to send to a contact. In addition, you can choose to send the survey immediately, at an exact time, or at a certain interval. If the survey is scheduled to be sent at a certain interval, the survey is stored until sent by the **mailer daemon**. By default, the mailer daemon is scheduled to send scheduled transactional surveys every fifteen minutes.

Note The Transactional Survey element simply schedules a survey to be sent. It does not pause the processing of the flow until the survey is sent. Therefore, any elements following this element in the flow continue to process immediately, even if the survey is scheduled to be sent in the future.

This element can be filtered using segments. If you choose to filter a transactional survey, you can select whether contacts who are in or not in the segment are sent an email. See [Creating transactional surveys](#).

To edit Transactional Survey attributes

1 Double-click the Transactional Survey element to open the Transactional Survey window.



2 Type the name of the element in the Label field.

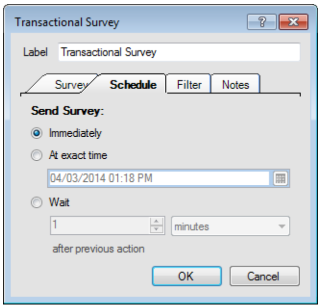
3 Select the survey you want to send.

a To search for a survey, right-click the list and select Search. Then type the survey name in the Find field.

Note In order to be sent, the transactional survey you select must be in a launched state. If you select a transactional survey that has not been launched, it is not sent and the system advances to the next element in your flow diagram.

4 To create a transactional survey, click New Transactional Survey and refer to [To create a transactional survey](#).

5 Click the Schedule tab.



6 Enter the following field information.

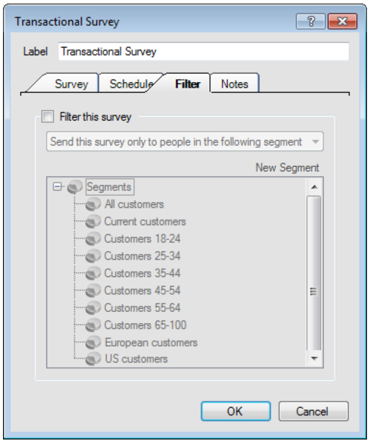
Table 556: Schedule Tab Description

Field	Description
Immediately	Select this radio button to send the survey's invitation message immediately after this action occurs.
At exact time	Select this radio button and click the calendar (to the right of the At Exact Time field) to select a specific date and time to send the invitation message. **Note:** If this option is selected, a clock icon appears on the Transactional Survey element to indicate that a time has been scheduled for this invitation message.

Table 556: Schedule Tab Description (Continued)

Field	Description
Wait	Select this radio button to send the survey's invitation message a specified amount of time after this action is triggered in the flow. Use the up and down arrows to select the number of units, and click the drop-down menu to select the interval (minutes, hours, days, or weeks). **Note:** If this option is selected, a clock icon appears on the Transactional Survey element to indicate that a time has been scheduled for this invitation message.

7 Click the Filter tab and select the Filter This Survey check box to select whether contacts should be included or not included in the segment to be filtered from the survey. The default is Send This Survey Only to People in the Following Segment.



If you leave the default, only contacts who meet the criteria in the segment receive the survey.

8 To send the survey to all contacts except those who meet the criteria in the segment, click the drop-down menu and select Send This Mailing to Everyone Not in the Following Segment.

9 Select a segment for the survey.

10 To add a segment, click New Segment.

11 To add any notes associated with the element, click the Notes tab and type the notes.

12 Click the OK button.

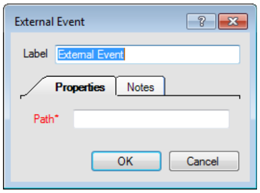
Editing External Event attributes

Once you add an External Event element to your flow diagram, you can edit its attributes to specify the path to your external event. In order to pass contact data to the external event, you must create a template file specifying the data format. For information about external events or assistance in creating external event template files, contact your Oracle account manager.

Important External events have been deprecated and may be permanently removed in a future release. Instead, you can use contact-related object event handlers to trigger actions. See Editing Execute Object Event Handler attributes.

To edit External Event attributes

1 Double-click the External Event element to open the External Event window.



2 Type the name of the element in the Label field.

3 Type the full path name of a script or program used to externally process the event in the Path field.

4 To add any notes associated with the element, click the Notes tab and type the notes.

5 Click the OK button.

Adding Comment artifacts

The toolbox also provides a Comment artifact that lets you enter comments in your diagram without impeding the survey flow. Comments are added to the canvas in the same way elements are and can be linked to elements using the Artifact connector type.

To add a comment

1 Drag and drop a Comment artifact from the toolbox onto the canvas.

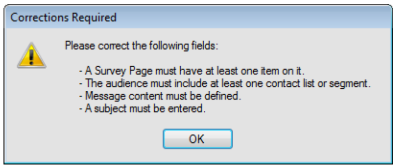
2 Click the artifact to type your comments.

3 To connect the artifact to an element, click an anchor on the artifact and drag to an anchor on the element. The anchor is highlighted when the connector is able to link to it.

Validating surveys

As you create a flow diagram for your survey, Feedback validates all flow components to ensure all required attributes have been specified. Although validation occurs in real time as you add and update the components, you can also force validation manually at any time by clicking the Validate button on the Designer Home tab.

You can choose to display validation flags by selecting the Validation Results check box on the View tab (see View tab). This way, valid components are flagged with a green check mark, while those found to be invalid are flagged with a red exclamation point and a small button you can click to view the validation error. If you attempt to send a survey without first addressing its validation errors, the flags automatically display (even if you have not selected the Validation Results option) along with a message summarizing the errors, as shown in the following figure.



CAN-SPAM compliance in surveys

Legal definitions and penalties for spam vary among countries. Therefore, it is important to stay abreast of current and pending legislation in the United States and other countries. There are many sites that you can check to stay current with the laws and to make sure your site is compliant.

The CAN-SPAM Act of 2003 (CAN-SPAM) requires that organizations adhere to certain rules when sending commercial emails. Included in the requirements are the following conditions:

- Email does not contain false or misleading header information.
- Email does not use a deceptive subject line.
- Email contains a way for recipients to opt out of all emails, not just specific types.

- Email does not send to contacts that have previously opted out.
- Email must be identified as an advertisement in the subject line.
- Email includes the sender’s physical mailing address, which must display in ASCII text.
- Email that contains adult content is identified as such in the subject line.
- Email does not send to harvested or generated email addresses.
- Email does not send to domains in the Federal Communications Commission (FCC) wireless domain list.

Oracle Service Cloud helps you identify CAN-SPAM compliance issues. When creating a survey with an invitation message, the system automatically checks that the message contains a physical address and an unsubscribe link, and honors global opt-in preferences. The remaining requirements must be manually verified by the staff member saving the survey.

For information about the CAN-SPAM Act, refer to the Federal Trade Commission (FTC) website.

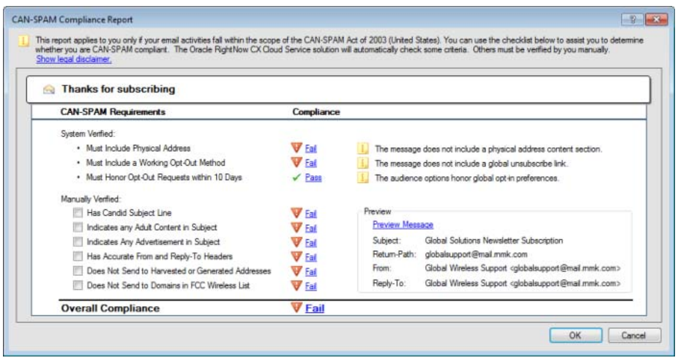
Important The checklist is used to gauge your compliance with CAN-SPAM. You should use this checklist in conjunction with and not as a replacement for legal counsel.

The following procedures describe the methods for checking for CAN-SPAM compliance from the Invitation Message tab and the Delivery tab of a survey.

To check compliance from the Invitation Message tab

1 Open a survey and click the Invitation Message tab.

2 Click the Test CAN-SPAM button in the Content section of the HTML editor. The CAN-SPAM Compliance Report opens.



The report shows whether each system-verified requirement passed or failed. The manually verified requirements can be selected or cleared based on your manual verifications. The following table describes the fields on the window.

Table 557: CAN-SPAM Compliance Report Description

Field	Description
System Verified	This section shows whether the following system-verified requirements passed or failed.
Must Include Physical Address	The system automatically verifies that a physical address is included in the message. For this requirement to pass, you must have inserted a physical address using the Insert Address button on the HTML editor. See Inserting physical addresses. If a text address has not been inserted using the Insert Address button, the requirement fails.
Must Include a Working Opt-Out Method	The system automatically verifies that a global unsubscribe link is included in the message. The unsubscribe link can be added by using the Unsubscribe Link button in the toolbox of the HTML editor. When this button is clicked, a window opens for selecting the opt-in field. If Global Opt-In is selected, the requirement passes when CAN-SPAM compliance is checked.
Must Honor Opt-Out Requests within 10 Days	The system automatically verifies whether the global opt-in setting is honored by the survey. By default, the Honor Global Opt-In check box is selected on the Audience tab, which prevents messages from sending to contacts who have globally opted out of receiving communications. If this check box is not selected, the requirement fails when compliance is checked. Since contacts are instantly unsubscribed when they globally opt out of surveys, any global opt-out requests are automatically met within 10 days.
Manually Verified	This section lets you select whether the following requirements passed or failed.
Has Candid Subject Line	You must manually verify that the message uses a candid subject line. CAN-SPAM compliance requires that the subject line of an email accurately reflects its contents. To pass this requirement, you should ensure that the subject line is not deceptive to the email recipient. You can view the subject line in the Preview section.

Table 557: CAN-SPAM Compliance Report Description (Continued)

Field	Description
Indicates any Adult Content in Subject	You must manually verify that the subject identifies adult content in the message. The CAN-SPAM Act requires that a message containing adult content must contain the text "SEXUALLY EXPLICIT" in the subject line of the email. You can view the subject line in the Preview section.
Indicates Any Advertisement in Subject	You must manually verify that the subject identifies the message as an advertisement, when applicable. The CAN-SPAM Act requires that the message contains clear and conspicuous notice that the message is an advertisement or solicitation. To pass this requirement, you should ensure that the subject line accurately reflects the message's content. You can view the subject line in the Preview section.
Has Accurate From and Reply-To Headers	You must manually verify that the From and Reply-To headers contain accurate information. CAN-SPAM compliance requires that the From and Reply-To headers and routing information, including the originating name and email address, must accurately identify your organization. You can view the From and Reply-To headers and the return path in the Preview section.
Does Not Send to Harvested or Generated Addresses	You must manually verify that you are not sending the message to harvested or generated addresses. Harvested email addresses are gathered from websites or web services that have published a notice prohibiting the transfer of email addresses for the purpose of sending email. Generated email addresses are formed by using a "dictionary attack," by combining names, letters, or numbers into multiple permutations.
Does Not Send to Domains in FCC Wireless List	You must manually verify that you are not sending the message to email addresses that contain domains in the FCC wireless list. The CAN-SPAM Act prevents the sending of messages to wireless devices, such as mobile phones. The FCC publishes a downloadable list of domain names used by cellular companies.
Overall Compliance	This section indicates whether the email is entirely CAN-SPAM compliant. If any of the compliance criteria in this table fails, overall compliance fails.

Table 557: CAN-SPAM Compliance Report Description (Continued)

Field	Description
Preview	This section lets you preview the following parts of a message.
Preview Message	Click this text to preview the message.
Subject	Displays the subject of the message.
Return-Path	Displays the mailbox address the message is being sent from.
From	Displays the From address of the message.
Reply-To	Displays the Reply-To address of the message.

3 Select the check box next to the manually verified items that you have verified.

4 Click the OK button.

To check compliance from the Delivery tab

1 Open a survey and click the Delivery tab.

2 Click Test CAN-SPAM next to CAN-SPAM Compliance in the Delivery Checklist section. The CAN-SPAM Compliance Report opens (see the table in the previous procedure).

3 To view a read-only copy of the results from the last time CAN-SPAM compliance was tested, click Details next to CAN-SPAM Compliance.

Improving your email marketing

In addition to anti-spam legislation, many other external factors can negatively impact the efficiency and success of your surveys. As a Feedback user, it is important that you follow industry-accepted best practices to protect your reputation, optimize your audience, and produce well-formed content. While these best practices do not guarantee that your emails will always be accepted, they can improve the chances that your messages are delivered to the intended recipients with minimal interference from content monitors and filters. Since these practices are focused on improving the quality of your contact data as well as your messages, your survey conversion rates will most likely improve as well. For a list of best practices, see *Best Practices for Email Marketing*.

Survey session recovery

When a contact loads a survey in a web browser, a cookie is placed on the contact's computer and updated to track which survey pages have been submitted. If a contact attempts to access a survey that the contact has abandoned, the system detects this from information in the survey cookie and then loads the first page in the survey's page sequence that has not yet been submitted. This ensures that the contact does not have to answer all questions again from the first page of the survey. This cookie is separate from the session cookie placed when a contact logs in to the **customer portal** and does not affect login status.

Note By default, the survey cookie does not expire and is cleared only when the survey is completed. Therefore, contacts are not able to start over or access previously submitted pages unless the cookie is first cleared from their browser. You can disable the survey cookie or define an expiration interval by editing the RNM_RESUME_SURVEY_COOKIE_EXP setting (Outreach and Feedback > General > Miscellaneous). However, upon clearing the cookie and reloading the survey, all questions revert to a blank state. At no time can contacts see answers that they previously submitted.

Customizing Feedback configuration settings

Feedback provides many options that can be activated by editing configuration settings. These settings are used to set cookie expiration times, define default values for Serve Web Page element properties, and specify whether documents can be edited after having been sent in a survey. You can also define the subject line of Forward to Friend emails and specify a default URL to load in cases where a blank page would have been displayed.

To access Feedback settings

1 Double-click Configuration Settings under Site Configuration. The Search window opens, where you can filter your search results.

2 Clear the Select All check box under the Folders field and then select the Outreach and Feedback check box.

3 To search for a specific configuration setting in the Outreach and Feedback folder, type the setting name in the Key field.

Tip You can search part of a configuration setting name by appending a wildcard (either an asterisk or a percentage sign) to the end of your search term.

4 Click the Search button. The Configuration Settings editor displays the settings in the Outreach and Feedback folder that match your search criteria.

Tip To display configuration settings in alphabetical order, click in the Key column header.

5 Expand the folders under Outreach and Feedback > General.

6 Customize the settings under the specific Campaigns and Miscellaneous folders.

For information about a setting, see the description that appears on the Configuration Settings editor. For complete details about the Configuration Settings editor, including searching, editing, and creating new configuration settings, see Site Configuration.

Social Experience

The following sections are intended for administrators and staff members. They contain information and procedures for configuring and using Oracle RightNow Social Experience.

75

Social Overview

Oracle RightNow Social Experience (Social Experience) is your organization's gateway to providing exceptional service on the social cloud. It is comprised of a set of complementary features, each representing a different, powerful way of interacting with customers using social media. While each component serves a distinct purpose, they can be used together to create a wide-ranging social web presence. By engaging with your customers using leading social channels or providing a targeted social channel of your own, you can foster dynamic customer relationships, deliver powerful support offerings, and build brand loyalty.

To make the most effective use of social media, be sure to review each feature and consider its benefits to your service initiatives. Together, the major components summarized here provide a comprehensive solution for organizations looking to expand and solidify their social media presence.

Social Experience consists of the following major features.

	**Communities**—Social Experience communities are complete social web solutions consisting of customizable **hives**, **members**, **groups**, and custom pages. Communities can galvanize your customer base and help you promote a unique culture around your brand. By opening your own dynamic social channel tailored to your products and services, you can harness the power of social media for the direct benefit of your customers. Helping your customers meet and interact can help reduce your service costs, build brand loyalty, and capture valuable insight into customer needs and preferences. Refer to Communities.

Channels—An extensive variety of methods by which your staff can communicate with your customers. Channels refer to all of the available sources of social messaging, incoming incidents, and outgoing responses that are monitored and processed by Oracle Service Cloud. In addition to traditional sources such as Service and Outreach mailboxes, chat, and the Ask a Question page, channels support leading social media such as Facebook, Twitter, YouTube, Community, and RSS feeds. Refer to Channels.

Social Monitor—With Oracle RightNow Social Monitor Cloud Service, you can monitor and participate in conversations on the social web. You can also interact with your customers by searching leading social media services, create **incidents** in **Oracle Service Cloud**, and include social media in your **Oracle RightNow Outreach Cloud Service** and **Oracle RightNow Feedback Cloud Service** messages. You can improve customer experiences by identifying trends in customer issues and opinions, and proactively communicate with customers through social channels using incidents. Refer to Social Monitoring.

Self Service for Facebook—Oracle RightNow Self Service for Facebook Cloud Service is a social web solution you can use to embed a set of Oracle Service Cloud service and community features directly on your organization's Facebook page. As a result, your organization can deliver a consistent experience to customers and fans on Facebook while maintaining a unified view of customer interactions across channels. Refer to Self Service for Facebook.

For in-depth best practices and strategies for defining a comprehensive social strategy for your organization, refer to Answer ID 4647 on our support site.

76

Communities

The social web has changed the nature of customer experiences. Not long ago, word-of-mouth messaging was constrained to a limited set of channels such as email, phone, and interpersonal conversations. Today, those conversations have grown dramatically in scope. With little effort, your customers are able to broadcast and discuss their experiences through a disparate array of blogs, message boards, and social media. While monitoring and responding to issues through social media channels is critical, attempting to promote your brand in this environment is often hit-or-miss and can fragment your core message.

For a more stable social media platform, a better approach is to provide your customers with a branded **community**. By creating a dedicated social channel tailored to your own products and services, you can harness the power of social media to galvanize your customer base and promote an unconstrained conversation and unique culture around your brand. Providing a dedicated space for customers to meet and interact can help reduce service requests, all the while capturing valuable insight about needs, tastes, and preferences.

With a wide range of uses, flexible tools, and solid analytics, Oracle RightNow Support Community Cloud Service and Oracle RightNow Innovation Community Cloud Service (communities) can help your organization provide your customers with an unparalleled social experience.

For in-depth best practice information about getting the most out of your community, refer to Answer ID 4647 on our support site.

Community types

Communities may exist as standalone resources for fostering conversations and relationships, or supplement other resources such as an Oracle Service Cloud application or company website. A standard, out-of-the-box community can be customized to fulfill a broad range of activities, including:

- Social interaction
- Peer support
- Product innovation
- Blogging or journal entries
- Forums
- Managing account information
- Question and answer dialogues
- Media sharing
- Wiki-style collaborative authoring
- Corporate intranet resource

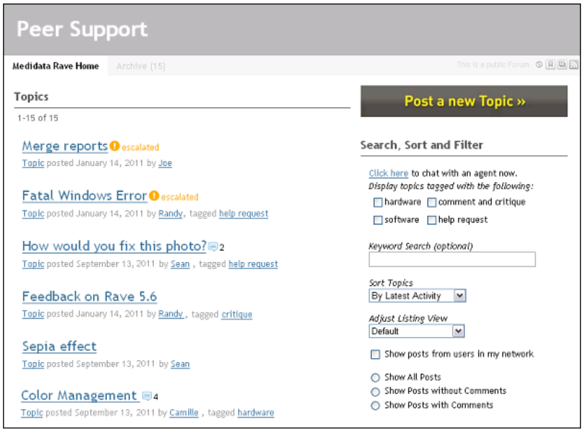
In addition to its basic configuration, the community solution is available in two specialized configurations to offer your users support from their peers in your customer base, or to help drive product innovation. Refer to Support Communities and Innovation Communities.

Whether you use a prebuilt solution or start from scratch with your own design, your community can be tailored to meet the needs of your organization.

For in-depth best practices and guidance in building and managing support and innovation communities, refer to Answer ID 4647 on our support site.

Support Communities

Oracle RightNow Support Community Cloud Service is a specialized, preconfigured **community** that can provide your customers with the opportunity to help you deliver exceptional support. By allowing them to ask questions and find answers in an online community, you can help customers feel valued without adding a single call or email to your contact center's workload, and perhaps even lighten it. In the process, your customers' contributions will transform them into loyal community experts and generate reusable content for your knowledge base.



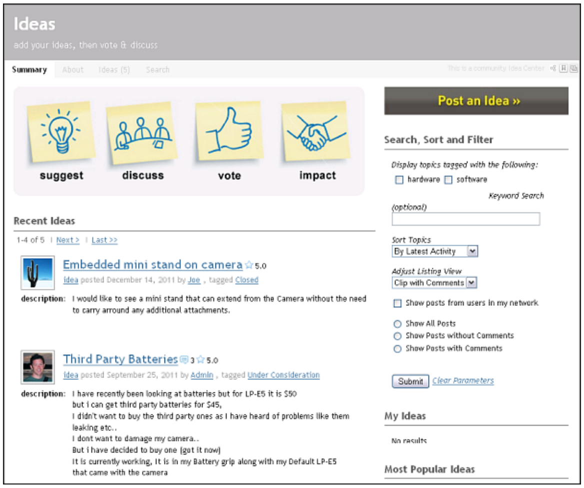
A support community provides:

- Discussion forums to encourage customers to talk about your products and services, share tips, and answer each other's questions.
- Q&A pairs to let customer pose questions to the online customer community and then mark the best answer—with escalation to your contact center if needed.
- A resource library for maintaining a searchable repository of useful information, including both company and user-generated content.
- Member reputation-tracking management to reward customer participation and expertise.
- Extensive integration with Oracle Service Cloud for incident escalation, syndicated widgets, single sign-on, knowledge access, mailings, and surveys.

For more information, contact your Oracle account manager.

Innovation Communities

Oracle RightNow Innovation Community Cloud Service helps you connect with customers who have strong opinions and great ideas for growing and improving your product and service offerings. This specialized, preconfigured **community** is designed to give your customers a voice in your product innovation processes so they can help you identify new business opportunities, guide your product road map, prioritize and refine ideas, and develop your next breakthrough product.



An innovation community provides:

- An innovation message board that invites customers to submit ideas and vote for their favorites.
- A method for capturing feedback to improve the quality of your product, packaging, ads, and more.
- A discussion board that customers can use to share their experiences to stimulate creativity and foster personal relationships.
- Member reputation-tracking management to reward customer participation and expertise.
- Extensive integration with Oracle Service Cloud for knowledge access, mailings, and surveys.

For more information, contact your Oracle account manager.

Community overview

Communities are broad entities constructed using a few highly configurable elements, each associated with a specific type of community data.

	**Hives** are resource entities, such as blogs, forums, photo shares, and message boards. Each hive can support various forms of **posts** and **comments**, which house the core content that the hive presents. Communities can contain any number of hives of varying purposes and privacy levels. Hives are also sometimes referred to as resources. Refer to Hives.
	**Members** are users of the community and can have varying permissions for actions within the community and within different hives, based on their role. Refer to Members.
	**Groups** are used to formalize member relationships based on a common interest, cause, or organization. Groups can also be associated with hives. Communities can contain any number of groups of varying purposes and privacy levels. Refer to Groups.
	**Custom pages** can be developed to “fill in” areas of the community that require further resources or exposition. Several types of **panels** are available to add community functionality to custom pages. Refer to Customizing pages.

These elements can be configured in many ways to produce a unique community environment for your customers. For example, a consumer products community could contain a hive for every major product line and perhaps an additional hive for general discussion. Each hive could accept different types of posts (such as blog entries, forum posts, or multimedia files) unique to the product it supports. The ability to read, post, and comment on the content of each hive could be restricted to specific members or groups based on their role in the community. A custom page could be added to one of the hives to extend the information it presents, such as links to other company resources. Another standalone page might serve to tie several hives together under one easily referenced landing page.

In addition to the base set of major elements, a variety of administration options exist to specify how these pieces interact with each other, such as the amount of member information stored, levels of privacy, member reputation and content moderation, and the ownership and management of hives and groups.

Taken together, these tools and functions provide vast flexibility for creating dynamic, active communities to support the unique needs of your organization.

Configuring community access

As you begin creating the content and membership that will form your **community**, it is important to understand how to govern access to the variety of user functions, exposing only the appropriate level of access to each **member** or **group**. Access to community administration functions is granted by a combination of **community privacy** settings, **hive permissions**, and **user types**. These are described in detail in the following sections.

- Community privacy levels
- Hive privacy levels
- User types

Note Because the appearance of content and configuration settings varies by the level of access provided, all procedures in this documentation assume that you are logged in as a member of the Admin–All user type (the highest level of access and visibility), unless otherwise indicated. Refer to User types for a description of the access this user type provides.

All users (members and administrators) log in to a community in the same way. However, the procedures for logging in will vary slightly based on whether your community is integrated with Oracle Service Cloud or if it exists as a standalone community.

A standalone community provides its own sign-in page as part of the community page set. When a community is integrated with Oracle Service Cloud, users log in through the customer portal. Their credentials are then passed through a single sign-on integration, logging them in to the community. For this reason, staff must have a customer account and access to the customer portal in order to log in to an integrated community. Refer to Adding contacts.

Important Communities use cookies to identify members and support community functions. Browser privacy settings that restrict or prevent the acceptance of cookies are not supported by the application.

When you first log in to a community, you will be taken to the community home page at http://<your_community_site>/pages/home. In new communities, the home page is not configured with content. Refer to Community page structure and navigation.

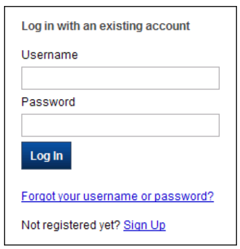
To set a different default page for new users, refer to Enabling common user features.

To log in to a community integrated with Oracle Service Cloud

1 Open your web browser and type the following URL.

```
http://<your_community_site>/signin
```

The page redirects to the customer portal login screen.



Important Staff must have a contact record and access to the customer portal in order to log in to an integrated community. Refer to Adding contacts.

2 Type your user name in the Username field.

3 Type your password in the Password field.

Note If you have forgotten your user name or password, click Forgot Your Username or Password for account assistance. If you do not yet have an account, click Sign Up to register.

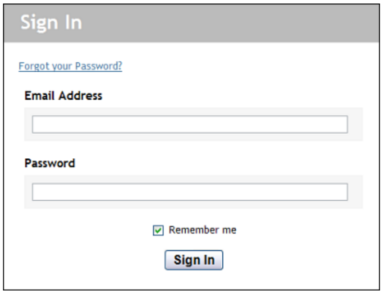
4 Click the Log In button. Your browser will redirect to the community default page.

Important Although they are associated, community user accounts are separate and distinct from contact records in Oracle Service Cloud. For this reason, creating a contact record in Oracle Service Cloud does not automatically create a user account in the community. As a result, new users may be prompted to complete additional profile fields for their community account before they are redirected to the community default page.

To log in to a standalone community

1 Open your web browser and type the following URL.

```
http://<your_community_site>/signin
```



2 Type your account email address or login ID in the Email Address field. Refer to [Creating member accounts](#).

3 Type your password in the Password field.

Note If you have forgotten your password, click Forgot Your Password and submit your email address. The community will send you a message containing a link to a password reset form.

4 To have the community remember your login credentials the next time you access the site, select the Remember Me check box.

5 Click the Sign In button.

Community privacy levels

At its highest tier of security, communities support three privacy levels that control overall access and visibility for the entire **community**.

- **Community**—The community is accessible only to registered logged-in users.
- **Public Preview**—The community is accessible only to registered users, but you can set content and **hive permissions** to Public in preparation for a public launch.
- **Public**—The community is accessible to everyone on the web with no login required.

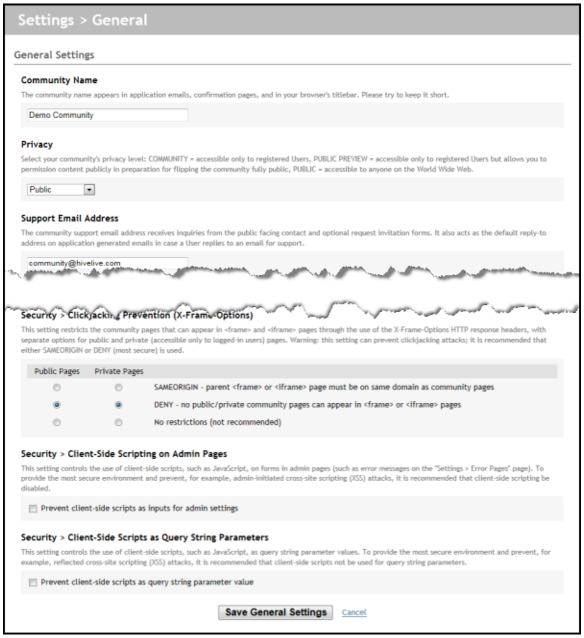
A community's privacy setting is available in the general administration settings, where you can also specify the community name, default time zone, friendly time preference, and a service email address.

It is important to consider potential security risks and learn how you can limit these risks on your community pages. See Communities and Social Monitor.

To access a community's general settings

1 Click the Admin **user link** to display community administration settings.

2 Click General Settings.



3 Type a name for your community in the Community Name field.

4 Click the Privacy drop-down menu to select a community privacy setting.

5 Type a support email address in the Support Email Address field. This address will be used as a reply-to address for all email messages sent by the community.

6 Click the Default Time Zone drop-down menu to select a default time zone for the community.

Note The default time zone is applied only to **members** who have JavaScript disabled in their browser. Members with JavaScript-enabled browsers will see times represented in their own time zone.

7 To always display time stamps in a formal date/time format instead of a friendly value (such as "yesterday"), clear the Enable Friendly Time check box.

8 To specify the default for the Email Me When Others Post a New Comment subscription notification, select or clear the Auto-check the Subscription Checkbox for New Comments check box. Refer to Post and comment subscriptions and notifications.

9 To restrict specific file types from being uploaded by users as attachments to posts and comments, select the Do Not Allow Files With the Following Extensions as Attachments check box, and add or delete file types to complete the list.

10 To allow admins to export post and comment data, select the Show the Icons for Exporting Content as a CSV File check box.

11 To display threads with unread content by logged-in users in bold, select the Highlight Unread Threads (Based on the Initial Post) to Logged-in User check box.

12 To disable Search Engine Optimization (SEO) No Follow, clear the Enable No Follow check box.

13 To send users of supported mobile devices to a mobile-optimized page when replying to a thread from a subscription notification email, select the Enable Mobile-optimized Pages check box.

14 To set the clickjacking prevention security level for public and private pages, select the SameOrigin, Deny, or No Restrictions radio buttons. The security level is set, by default, to Deny, which is the most secure level.

15 To prevent the use of client-side scripts on forms in admin pages, select the Prevent Client-side Scripts as Inputs for Admin Settings check box. This check box is cleared, by default. To provide the most secure environment, it is recommended this check box be selected. .

Note When the Prevent Client-side Scripts as Inputs for Admin Settings check box is changed from selected to cleared, a message is displayed to warn of the security risk.

16 To prevent executable client-side scripts from being passed as query string parameter values, select the Prevent Client-side Scripts as Query Sting Parameter Value check box. This check box is cleared, by default. To provide the most secure environment, it is recommended this check box be selected.

17 Click the Save General Settings button.

Hive privacy levels

In addition to setting a privacy level for the entire **community**, each **hive** is set to one of four privacy levels, determined by the **community privacy level** and the granting of **hive permissions**. Refer to Hive permissions.

Hives associated to a **group** are also restricted by the group privacy level. Refer to Editing group attributes.

Table 558: Hive Privacy Levels

Privacy Level	Description
Private	Hive visibility is restricted to the hive **owner** when all of the following conditions have been met: • The community privacy level has been set to Community or Public Preview. • Hive permissions have been granted only to the hive owner. • The hive is associated with a group of any group privacy level. **Note:** New hives are private by default until additional hive permissions are granted. Hives created from templates inherit the privacy level of the copied template.
Restricted	Hive visibility is restricted to groups or members that you explicitly define when all of the following conditions have been met: • The community privacy level has been set to Community or Public Preview. • Hive permissions have been granted to specific groups or members, but not to all registered users or **guest** users. • If the hive is associated with a group, the group's privacy level is set to Restricted, Community, or Public.
Community	Hive visibility is restricted to any member who is registered and logged in to the community when all of the following conditions have been met: • The community privacy level has been set to Community or Public Preview. • Hive permissions have been granted to all registered users, but not to guest users. • If the hive is associated with a group, the group's privacy level is set to Community or Public.

Table 558: Hive Privacy Levels (Continued)

Privacy Level	Description
Public	Hive visibility is enabled for everyone on the web, with no registration or login required, when all of the following conditions have been met: • The community privacy level has been set to Public. • Hive permissions are granted to guest users (visitors to the community who are not members or are not logged in). • If the hive is associated with a group, the group's privacy level is set to Public.

User types

While general access to communities and **hives** is governed by privacy settings and permissions, higher-level member functions are governed by user types that define their roles in the community.

As part of their profile, all **members** are assigned a user type that determines the actions they can perform. For example, in a common default scenario, you can choose from two administrator types, two **builder** types, and a basic member type. Each user type establishes a level of access that determines what features and settings are accessible to members. Note that the default user types in a given community may be different from what is shown here.

- **Admin–All**—This user type provides the highest level of access and visibility, bypassing all permission restrictions. Members of this user type can perform any administrative task and view all community content, regardless of privacy settings. This user type should be reserved only for members who require full administrative access. Members of this type are sometimes referred to as super admins, as they have access to certain settings that community admins do not.
- **Admin–Community**—This user type is the next highest level of community access. Members of this user type can access the Admin user link to access community administration settings, such as those that manage community structure and memberships. Refer to Accessing community administration settings.
- **Builder–Custom**—This user type is the higher level of the two builder types. Members of this user type can create custom hives and **groups** from scratch, and customize other design elements such as pages or navigation.
- **Builder–Template**—This user type can create hives and groups from **templates** only. Members of this user type cannot customize hives and groups once they have been created.

- **Member**—This user type has the most basic level of access and visibility. This user type has no access to administration or building functions and is generally used to access the community's content.

The following figure provides more detail about the permissions granted to each user type.

User Types and Permissions

Permission	Member	Builder-Template	Builder-Custom	Admin-Community	Admin-All (Super Admin)
Edit own account email	•	•	•	•	•
Edit own account login ID	•	•	•	•	•
Create hives from templates		•	•	•	•
Publish hives		•	•	•	•
Create custom hives			•	•	•
Customize hives			•	•	•
Edit content flags				•	•
Create groups				•	•
Customize groups				•	•
Edit account names				•	•
Create users				•	•
Edit users' account information and content				•	•
Invite users				•	•
Edit all aspects of the community (Admin link)				•	•
Bypass all permissions and privacy settings					•

Important While the user types shown here reflect a common distribution of user permissions, community user types are often highly customized and tailored to the specific business needs of the site. If you want to customize user types with permission sets different than those available on your site, contact your Oracle account manager.

In addition to setting a user type, you can define a user status for each member. A member's status reflects the current disposition of the account—whether it is active or inactive, or has been suspended. Members must be active to log in to a community. User type and status can be edited by accessing the administration settings in their profile. Refer to Managing member accounts.

Accessing community administration settings

Members with Admin-All and Admin-Community **user types** can access community administration settings by clicking the Admin **user link** that appears at the top right of every page. The community administration settings are used to configure all aspects of the community, including its members, **hives**, and content.

Important These settings are available only to members whose profiles have been set to a user type of Admin–Community or Admin–All. Refer to User types.

To access community administration settings

1 Click the Admin user link.

2 Click an option to access community administration settings. Settings available for each option are described in the following table.

Table 559: Community Administration Settings

Option	Description
General Settings	Set the community name, privacy level, default time zone, and the support email address. Refer to Community privacy levels.
Users	Configure settings for private messaging, profile pop-ups, and the default landing page for new users. You can also create additional fields for user profiles. Refer to Enabling common user features and Defining member profile fields.
Hives	Create hives and **hive types**, access **hive templates**, and transfer hive **ownership**. Refer to Hives.
Groups	Create new **groups**, access group **templates**, and transfer group ownership. Refer to Groups.
Posts	Create new **post types** and view **posts** associated with a hive or post type. Refer to Posts.
Comments	Create comment types and view **comments** associated with a hive or post type. Refer to Comments.
Custom Pages	Create and manage **custom pages** for your community. Refer to Customizing pages.

Table 559: Community Administration Settings (Continued)

Option	Description
Master Template	Customize elements used by every page in the community, such as navigation bars, fine print and footer content, and the URL of the logo. Refer to Community page structure and navigation.
Join Codes	Create special codes for allowing and tracking how users join your community. Refer to Join codes.
Invitations	Enable users to invite others to join the community and define default text to be used in invitation emails. Refer to Community invitations.
Moderation	Configure community moderation features, such as post and comment flagging, disruptive user filtering, and a CAPTCHA threshold. Refer to Content moderation.
Reputation	Define reputation levels and set scoring points for reputation actions. Refer to Member reputation levels.
Search	Manage search settings, such as the default search interface, parent group label visibility in hive filters, and filter visibility and sorting. Refer to Searching for content.
Analytics and Reporting	View community statistics, such as posts viewed, content created, and user activity. Refer to Community analytics.
Languages	View and modify labels and select default and supported languages.
Error Pages	Customize the content of error pages returned by the community.
Emails	Customize messages sent by the community, such as account activation messages and new content notifications. Refer to Post and comment subscriptions and notifications. **Note:** This section is available only to members with the Admin–All user type.

Community page structure and navigation

Communities feature several standard pages that are often made available from the community navigation links or set as default landing pages.

Table 560: Community Standard Pages

Page	Description
Community Home	The default community landing page that displays summary information about the community. `http://<your_site>/pages/home` **Note:** The content of this page can be customized by clicking Edit Page in the upper right corner of its content area. Refer to Adding panels to pages.
People	Displays information about **members** of the community. `http://<your_site>/people`
Groups	Displays information about **groups** in the community. `http://<your_site>/groups`
Group Summary	The default landing page for a group page set that displays summary information about the group. Refer to Group pages. `http://<your_site>/groups/<group_hash>/summary` **Note:** The content of this page can be customized by clicking the group's Settings tab and clicking Customize Summary Page. Refer to Adding panels to pages.
Hives	Displays information about **hives** in the community. `http://<your_site>/hives`
Hive Summary	The default landing page for the hive page set that displays summary information about the hive. Refer to Hive pages. `http://<your_site>/hives/<hive_hash>/summary` **Note:** The content of this page can be customized by clicking the hive's Settings tab and clicking Edit Panels page in the Summary Page section. Refer to Adding panels to pages.
Posts	Displays information about **posts** in the community. http://<your_site>/posts
Comments	Displays information about **comment** in the community. `http://<your_site>/comments`

Table 560: Community Standard Pages (Continued)

Page	Description
My [Objects]	Lists all community objects of a specific type (such as posts, comments, hives, and groups) that are associated with your account. `http://<your_site>/my/<object_type>`

Community pages are assembled using a common set of navigation elements defined by a master template. The master template contains settings that define basic page structure and navigation. You can add and remove navigation links by editing the hive's master template settings.

When defining a link, you can enter a full URL to a page outside of the community, or a relative path to a page within the community. For example, entering a relative path of /example will create a link that points to a **custom page** located at http://<your_site>.com/example. Refer to Customizing pages.

You can also add fine print and custom footer content that will appear on each page. This can be useful for adding legal text, copyright information, and other navigational elements that should always be accessible to your members.

The following figure shows a simplified representation of a basic community page layout.

The design elements shown here are described in the following table.

Table 561: Community Navigation Elements

Element	Description
Top Links	A navigation element at the upper left corner containing custom links. Refer to To add top and bottom links.
User Links	A navigation element at the upper right corner containing links to the logged-in user's profile, inbox, favorites, subscriptions, and a sign-out option. Admin-level members will also see a link to community administration settings. Refer to Member experience.
Logo	An image that appears at the top of every community page. This image can also be configured as a clickable link. Refer to To edit miscellaneous master template settings.
Community Navigation	The community's main navigation element containing links to community home, members, groups, and hives. This element can also be configured with custom links. Refer to To customize the community links.
Community Search	A basic keyword search field that members can use to search community content. This element also provides a link to the advanced search option. Refer to Searching for content. **Note:** Search terms must contain a minimum of three characters.
History	Breadcrumb-style links that members can click to return to pages recently visited.
Content Area	The content section used to display community data elements such as pages, hives, groups, and members. These elements are customizable and often contain a navigation tab set of their own. Refer to Adding panels to pages.
Bottom Links	A navigation element at the lower left corner containing custom links. Refer to To add top and bottom links.
Fine Print	A text element at the lower right corner used to display fine print. Refer to To edit miscellaneous master template settings.
Custom Footer	A content element used to display a custom footer at the bottom of all community pages. Refer to To edit miscellaneous master template settings.

To customize the community links

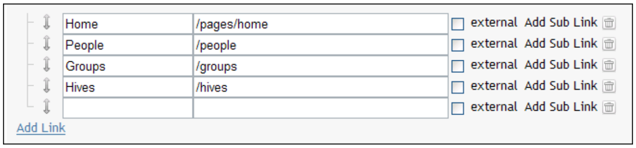
1 Click the Admin **user link** to display community administration settings.

2 Click Master Template.

3 To add a community link, click Add Link in the Community Links section. A new row is added to the link configuration grid.

Or

To create a sublink for an existing link, click Add Sub Link.



a Type the link text.
b Type a full URL or relative path for the link.
c To create a link that opens in a new window, select the External check box.

4 To change the position of a community link, click the arrow next to the link and drag it up or down in the grid. Links will appear in the order they are listed.

5 To remove a community link, click the Delete button.

6 Click the Save Navigation Settings button.

To add top and bottom links

1 Click the Admin **user link** to display community administration settings.

2 Click Master Template.

3 To add a top link, click Add Link in the Top Links section.

Or

To add a bottom link, click Add Link in the Bottom Links section.

4 Type the link text in the Text field.

5 Type a full URL or relative path for the link in the URL field.

6 To remove a link, remove its text and URL values.

7 Click the Save Navigation Settings button.

To edit miscellaneous master template settings

1 Click the Admin **user link** to display community administration settings.

2 Click Master Template.

3 Scroll down to the Misc Settings section.

4 To turn the community logo image into a link, type a full URL or relative path in the Logo Link field.

5 To add fine print content to the lower right corner of the page, type the content in the Fine Print Item HTML field.

6 To add custom footer content to the bottom of the page, type the content in the Custom Footer HTML field.

7 Click the Save Misc Settings button.

Searching for content

Members can search for content using a keyword search field generally located at the top right corner of every page. The search algorithm is enhanced with Boolean logic, so members can use the following operators when performing searches.

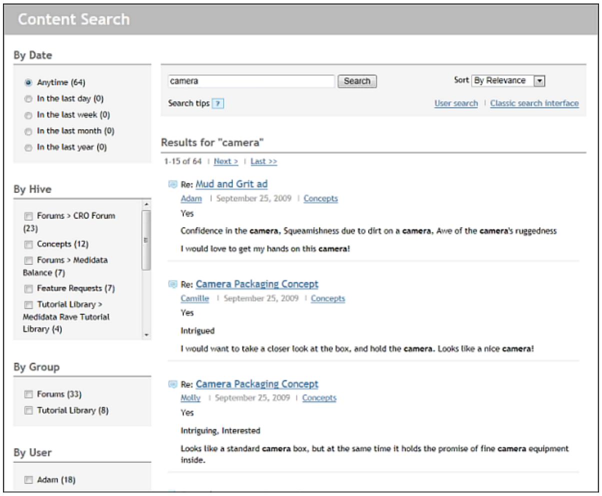
Table 562: Search Operators

Operator	Description
+	A leading plus sign indicates a word is required. For example, searching for `+John Doe` returns all results containing John and, optionally, those containing Doe. Searching for `+John +Doe` returns results that contain only both John and Doe.
–	A leading minus sign indicates a word must not be present. For example, searching for `+John -Doe` returns results that contain John but do not contain Doe.
( )	Parentheses can be used to group words into subexpressions. For example, searching for `+(John Jane)+Doe` returns results that contain Doe and either John or Jane.

Table 562: Search Operators (Continued)

Operator	Description
*	Append an asterisk to use a wildcard in your search term to match exact strings. For example, searching for `Jane*` returns results that start with Jane, such as Janet.
%	Append a percent sign to use a wildcard in your search term to match like terms. For example, searching for `hut%` returns results that are similar to hut, such as shutter.
" "	Enclose two or more words in double quotes to match a literal phrase. For example, searching for `"John Doe"` returns results containing only the exact phrase, John Doe.

Performing a search will take community members to the Content Search page at http://<your_community_site>/search.



This page includes the community search element, the search results, and a group of filters along the left. You can access a set of search configuration settings to display filters differently on global search, group search, and hive search pages.

Filtered search results display immediately as you select filters. Community members can sort search results by relevance, date posted, or rating. Posts and comments that contain file attachments display a file type indicator that you can click to view the file.

Members can also search for other community members from User Search. This is a useful option to search for a post or group of a known author.

Important The default keyword search requires JavaScript to be enabled in the member's web browser. When selecting one or more filters on the left, the search results refresh dynamically using AJAX without requiring the page to reload. If a member attempts to access the keyword search without JavaScript enabled, they will be prompted to enable JavaScript or to follow a link to use the classic search interface. Experienced community users may be accustomed to searching for content using our classic search form. Refer to Classic search interface.

To perform a search

1 Type a term in the Search field. Refer to the table above for a list of valid search operators.

2 Click the Search button. A list of search results displays. To sort by relevance, date posted, or rating, click the Sort drop-down menu in the upper right of the Content Search page and select the sort you want.

3 To narrow your search by activity date when searching posts, comments, or hives, select a By Date filter on the left. Available options include anytime, last day, last week, last month, or last year.

4 To narrow your search by hive, select one or more hives in the By Hive filter.

5 To narrow your search by group, select one or more groups in the By Group filter.

6 To narrow your search by user name when searching posts and comments, select one or more names in the By User filter.

7 To clear multiple selected filter values at once, click the Clear link beneath the filter header.

To search for a specific community user

1 Click the User Search link.

2 Type the display name of the user you are searching for.

3 Click the Search button. A list of matching users displays in the search results.

To access search configuration settings

1 Click the Admin **user link** to display community administration settings.

2 Click the Search link.

3 To change the default search interface, click the radio button next to the interface you want. Here you may choose from the new search interface (introduced in the November 2013 release) or the original classic search interface. Refer to Classic search interface.

4 To hide the parent group from hive filter labels, clear the Display Parent Group check box. By default, parent groups are included when hive filters are displayed, in the format of Group Name > Hive Name.

5 To disable the visibility of the Hive, Group, or User filter on global, group, or hive search pages, clear the filter's check box in the column for the search page type.

Note Date filters cannot be hidden from any search page.

6 Click the Save Search Settings button.

Classic search interface

Though the new search interface is the default, the classic search interface may be used to perform content searches across the community or within a single hive or group. The classic form lacks the dynamic search functionality that is available with the new search form. Classic search results display in separate categories, including posts, comments, hives, people, and groups.

Note We recommend that community members use the new search interface. Refer to Searching for content.

To switch between the classic and new search forms

1 On the Content Search Page, click the Classic Search Interface link. The classic search form displays.

2 To return to the new search interface, click the New Search Interface link in the Search form.

Or

Click the Advanced link in the upper right corner of the community interface.

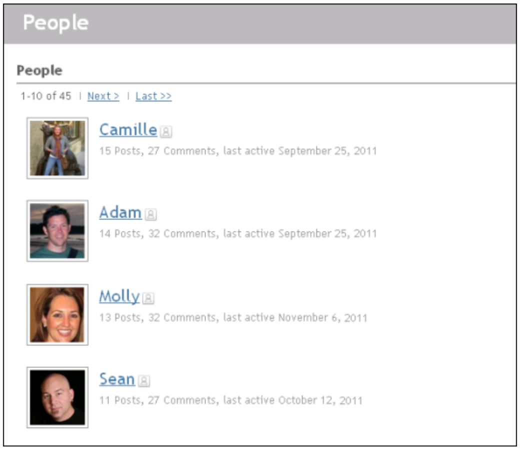
To perform a search using the classic search interface

1. To narrow your search to a specific type of data, click the area you want to search from the links above the search form. Available options are All, Posts, Comments, KB Articles, Hives, People, and Groups. By default, all forms of content are searched.
2. Type a search term in the Keywords field. Search terms must contain a minimum of three characters. Refer to the Search Operators table for a list of search operators.
3. To narrow your search by activity date when searching posts, comments, or hives, select a date range from the Last Activity drop-down menu.
4. To narrow your search by author name when searching posts and comments, type the author name in the Author field.
5. To narrow your search to a profile field when searching people, click the Profile Field drop-down menu and select a field to search.
   a. To search additional profile fields, click Add Field.
6. Click the Search All button.

Members

The foundation of a **community** is its membership, the people who congregate to produce the content and conversations that give the community its value. A list of the people that comprise your community's membership is available at the following location.

```
http://<your_site>/people
```



While you can make your community content publicly available to guests (users who do not have community accounts), it is usually better to require member accounts for your users so you can track their profile and activity. For example, when users have member accounts, you can store pertinent information about them in profile fields, moderate their content, and manage their community reputation. Refer to Managing member accounts.

Members can be assigned different levels of access, allowing them to perform different roles in the community. Some may have only a basic level of access for **posting** or **commenting** on a **hive**. Others may help manage and moderate the community's content and membership. A few may have complete authority to design new hives and manage other high-level administration tasks. Accounts can also be used to grant members access to restricted hives, either individually or based on **group** memberships. Refer to Hive permissions.

Depending on the community settings and permissions you define, member accounts can be created manually by administrators, selectively by invitation, or openly by your **guests** themselves. You can also create join codes to help you track promotions that result in community membership. Refer to Creating member accounts.

- ❖ Group ownership and delegation
- ❖ Hive ownership and delegation

Member experience

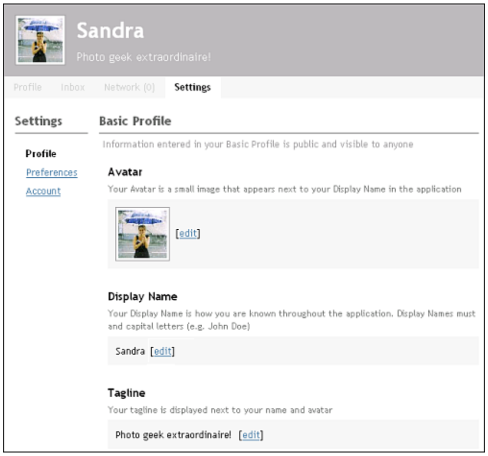
Your community provides a unique social experience tailored to the needs of your business and customer base. While the community interface can be highly customized, the basic features available to users are consistent between communities. Understanding how your community appears and functions from your users' viewpoint is essential to maintaining a compelling social environment.

Basic member features—such as the user profile, inbox, favorites, and subscriptions—can be accessed by clicking the user links that appear at the top right of all community pages.

Tip In addition to the features described here, if your community is integrated with Oracle Service Cloud, you can add widgets to your customer portal pages to extend the member experience to your support site. These widgets allow your users to search, display, and submit posts right from the support site. Refer to [Community integration widgets].

Profiles

Member profiles are used to track basic user information, such as a display name, email address, login credentials, and any profile fields defined by the community administrators. Members can also select an avatar image and set their network privacy level. Refer to [Managing member accounts].

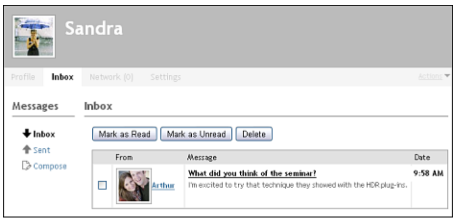


Members can access their profile page at any time by clicking the Logged In As user link. To edit their information, members can click the Edit Profile link on the profile page, or click the Settings tab on any My [Object] page, such as the My Posts page available at the following location.

```
http://<your_site>/my/posts
```

Messaging

Occasionally, members may want to exchange private messages instead of exchanging comments in a public forum. By clicking the Inbox user link, members can send messages directly to other members, subject to the recipient's Network Privacy settings (refer to Member Preferences). Messages are visible only to the sending and receiving members and are not associated with a specific hive or post. Refer to Member Preferences.



From this area, you can click options in the Messages column to check your personal inbox, view messages you have sent, and compose new messages to people in your network.

Note You can send messages to members who are not in your network by clicking the Send <Member Name> a Message link on their member profile pages.

Favorites

In a fast-growing community, it can be challenging for members to search and browse for resources they have found useful in the past. To make this easier, your members can keep track of their favorite hives, pages, and posts by clicking the Add To Favorites link above the header, or by clicking the favorites button wherever it appears.

Members can view a list of their favorites at any time by clicking the Favorites user link.

Subscriptions and RSS feeds

While favorites are a great way to track frequently accessed content, members may find it useful to simply be notified when an infrequently used resource has been updated. When viewing a hive, page, or post, members can choose to be notified of new comments by clicking the Subscribe link above the header, or by clicking the subscribe button wherever it appears. When a subscribed item is updated, a notification email is sent to all subscribed members informing them of the update. Refer to Post and comment subscriptions and notifications.

Members can view a list of their subscriptions at any time by clicking the Subscriptions user link. They can also add a hive's RSS feed URL to a third-party RSS reader application for external review of community feeds. The feed is accessed by clicking the RSS button.

Note Private or restricted hives cannot be accessed through the RSS feed. For public hives, anyone who has the feed URL will be able to access the feed.

Networks

To develop strong relationships within the community, customers must be able to easily track and access a list of favorite past acquaintances. Your community provides a networking feature that allows members to maintain those important contacts, share ideas, and track their posts and comments. To add someone to their personal network, members can simply click the Add <Member Name> to Network link on that person's profile.

To view their network, members can click the Network link on their own profile page.

Note By default, member profiles are visible to everyone, but members can adjust their Network Privacy settings to make their profile visible only to themselves or people within their network. Refer to Member Preferences.

Creating member accounts

A community **member** account is created by entering basic account information such as the member's display name, password, email address, and **user type**. In addition, a member's user status can be set to reflect whether the account is active or inactive or has been suspended. Active members can log in to the community and click their name in the Signed In As **user link** to further update their profile, set personal preferences, and access account information.

Communities also provide you with the following additional options for managing the account creation process.

- **Invitations**—Invitation emails can be sent to prospective members to invite them to join your community. Refer to Community invitations.
- **Invitation requests**—When the Request Invitation page is enabled, guests can complete a form requesting an invitation to join the community, subject to approval by a community administrator. To enable this page, contact your Oracle account manager.
- **Join codes**—You can create join codes that nonmembers can enter when creating an account. Join codes can be used to target prospective members and track the results, or to automatically associate new members with **user types** and **groups**. Refer to Join codes.
- **Open joins**— In public communities, site visitors can click the Join user link to create their own member account without an invitation or administrator approval. Refer to Community privacy levels.

Tip You can enable CAPTCHA verification on the Join form to prevent abuse of this form by automated spam systems. Refer to Enabling common user features.

The following procedure describes the process of a community administrator manually creating a new member account.

To create a new member account

1. Click the Admin **user link** to display community administration settings.
2. Click Users.
3. In the Related Tasks section, click Create a New User.
4. Enter the following field information.

Table 563: Create Account Description

Field	Description
User Type	Click the User Type drop-down menu and select a user type. Refer to User types.
Display Name	Type the member's name as you want it to appear throughout the community.

Table 563: Create Account Description (Continued)

Field	Description
Password	Type a password for the member to use when logging in to the community. To generate a random password, click the Generate button.
Email	Type the email address that the member will use to log in to the community and receive community notifications.
Status	Click the Status drop-down menu and select a user status. Available user statuses include the following: • **Active**—The account is active and currently in use by approved members. • **Inactive**—The account is no longer in use or is currently on hold. • **Suspended**—The account has been suspended for abusive activity or posting inappropriate content. Refer to Content moderation. • **Disruptive**—The account has been deactivated for disruptive behavior and its content has been hidden from the community. This status is used to track accounts that submit excessive amounts of content, such as web robots, and is available only when the disruptive user filter is enabled. Refer to Content moderation. • **Template**—The account is a template used for creating other new accounts. **Note:** Members must be active to log in to the community.

5 Click the Create User Account button.

Enabling common user features

When creating accounts for your community visitors, you are granting them access to a variety of content and features based on their **user type** and **group** associations. To further enhance their experience, you can also enable a few helpful features for all **members**.

To enable common user features

1 Click the Admin **user link** to display community administration settings.

2 Click Users.

3 Enter the following field information.

Table 564: Common User Features Description

Field	Description
Enable CAPTCHA on Join Form	Select this check box to require CAPTCHA authentication when users create member accounts using the Join user link. Refer to Creating member accounts.
Enable Private Messaging	Select this check box to enable private messaging. Enabling this option adds an Inbox user link that members can click to exchange messages with other members of the community, using a basic inbox, sent folder, and compose message function. Refer to Messaging.
Enable User Profile Popup	Select this check box to enable profile pop-ups. Profile pop-ups are small windows that appear when hovering over a user's avatar in a community, displaying a portion of the user's profile information. **Note:** You can specify the fields that appear in profile pop-ups when configuring profile fields. Refer to Defining member profile fields.
New User Account First Page	Type the relative URL of the page you want new members to see when they first log in to the community.

4 Click the Save Settings button.

Managing member accounts

All **members** can easily access the settings that control their account so they can manage their own profile and preferences. Members can also view their alternate login (user **hash** ID) and the email address associated with their account, or even delete their account.

Administrators can also access these settings for any member, as well as update the account status and **user type**. For instance, you may sometimes need to modify an account manually if the member's role in the community has changed, such as promoting a member to Admin-Community to manage and moderate the community, or suspending a user for posting inappropriate content. You can also update the number of invitations the member is allowed to provide to others.

To edit member settings

1 Click a member's name anywhere in the community to view the user's profile.

Note You can also type a member's name in the Search field and click the Go button. Then click the user in the People section of the search results to view the user's profile.

2 Click Edit Profile.

3 To edit the user's profile settings, enter the following field information.

Table 565: Member Profile Settings

Field	Description
Basic Profile	The following settings define the appearance of the member's profile throughout the community.
Avatar	Click Edit to select an avatar from a gallery of default images, or to upload or link to your own image. **Note:** If profile pop-ups are enabled, hovering over a user's avatar in the community will display a small window containing a portion of the user's profile information. Refer to Enabling common user features.
Display Name	Click Edit to change the member's name as it appears throughout the community.
Tagline	Click Edit to enter a tagline for the member's profile.
Extended Profile	Enter field information for any profile fields that have been added to the community. The privacy level of each profile field displays to its right. Click Edit to change a field's privacy level. Refer to Defining member profile fields.

a Click the Save Profile button.

4 To edit the user's administration settings, click Admin Only and enter the following field information. Member administration settings are available to administrators only.

Table 566: Member Admin Settings

Field	**Description**
User Type	Click the User Type drop-down menu and select a user type. Refer to User types.
Status	Click the Status drop-down menu and select a user status. Available user statuses include the following: • **Active**—The account is active and currently in use by approved members. • **Inactive**—The account is no longer in use or is currently on hold. • **Suspended**—The account has been suspended for abusive activity or posting inappropriate content. Refer to Content moderation. • **Disruptive**—The account has been deactivated for disruptive behavior and its content has been hidden from the community. This status is used to track accounts that submit excessive amounts of content, such as web robots, and is available only when the disruptive user filter is enabled. Refer to Content moderation. • **Template**—The account is a template used for creating other new accounts. **Note:** Members must be active to log in to the community.
Number of Invitations	Type the number of invitations you want to provide to the member. Refer to Community invitations.

a Click the Save Admin Settings button.

5 To edit the member's preferences, click Preferences and enter the following field information.

Table 567: Member Preferences

Field	Description
Email Notifications	Select this check box to email the member by email when the member receives a message from another member. Refer to Messaging.
Tips	Select the On radio button to enable contextual tips for the member. Select the Off radio button to disable tips. **Note:** Tips are displayed when hovering over some community controls.
Network Privacy	Select a radio button to set network privacy for the member. Refer to Networks. The following options are available. • **Only Admin**—The member profile will be visible only to administrators. • **People in Network**—The member profile will be visible only to administrators and users in the member's network. • **All Registered Users**—The member profile will be visible to all logged-in members. **Note:** Some profile information can also be restricted based on the configuration of the profile fields. Refer to Defining member profile fields.

a Click the Save Preferences button.

6 To view the login ID and email address associated with the member's account, click Account.

Defining member profile fields

To get the most value from and provide the best service to your community, it can be helpful to collect and track pertinent information about your **members**. By default, member accounts contain only basic information, such as each member's name and role in the community (**user type**). To deepen your knowledge of your members, it is helpful to add custom profile fields. Members can edit these fields in the Extended Profile section of their profile.

Profile fields can take a variety of forms such as text boxes, menus and multi-select fields, postal addresses, file attachments, or embedded media. Depending on your need, profile fields can be made required, included in profile pop-ups, or restricted from view by certain privacy levels.

Note All communities must contain at least one user profile field. However, if you do not want to display a user profile field to other members, you can set its Privacy setting to Private.

To create and manage user profile fields

1. Click the Admin **user link** to display community administration settings.
2. Click Users.
3. In the User Profile Fields section, click Add Field and enter the following field information.

Table 568: User Profile Fields Description

Field	Description
Order	Click the arrow to drag a field to a new position in the display sequence of profile fields.
Field Name	Type the name of the field as you want it to appear in the member profile.
Field Description	Type a text description that will be visible to members when they complete the field.
Field Type	Click this drop-down menu to select the type of field you want to add. For a description of available field types, refer to Profile field types.
Field Data	Type the field data parameters that define the field type. For a description of the parameters used for each field type, refer to Profile field types. **Note:** Field data may be required, optional, or not applicable, based on the field type.
Popup	Select this check box to make the field visible in profile pop-ups. Refer to Enabling common user features.

Table 568: User Profile Fields Description (Continued)

Field	Description
Privacy	Click this drop-down menu to select a privacy level for the field. • **Public**—The field's content will be visible to everyone, including **guest** users. • **Community**—The field's content will be visible to all logged-in members. • **Network**—The field's content will be visible only to members of the user's personal network. • **Private**—The field's content will be visible only to the profile owner and community administrators.
Required	Select this check box to make the field required. **Note:** Once you add a new required profile field, existing members will be prompted to complete the field when they next log in to the community.
Uses	This column displays the number of members that have values in this field. **Tip:** This is useful for identifying fields that should be modified or removed due to low usage.
 Delete	Click this button to delete the profile field. **Note:** Deleting a field cannot be undone and its data will be permanently discarded.

4 Click the Save Fields button.

Profile field types

The following fields and controls are available when creating and editing user profiles.

Table 569: Profile Field Types Description

Field	Description
Text	The following elements allow members to enter text when adding a **post**.

Table 569: Profile Field Types Description (Continued)

Field	Description
Textbox	Select this option to add a text field for a single line of text. To set parameters for field size and maximum number of characters allowed, type them in the Field Data field in the format `[small|medium|large], [1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small, 24`.
Textarea (WYSIWYG/ HTML)	Select this option to add a text box featuring a WYSIWYG/HTML editor (1-4,000 characters). To specify text box height (in text rows) and whether to resize it fluidly based on the text it contains, type the parameters in the Field Data field in the format `[2-50],[fixed|fluid]`. For example, to make the text box ten rows high and automatically resize it based on its contents, type the value `10,fluid`.
Textarea (Plain Text)	Select this option to add a text box for entering plain text (1-4,000 characters). To specify field size and maximum number of characters allowed, type the parameters in the Field Data field in the format `[size|medium|large],[1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small, 24`.
Textarea (Textile)	Select this option to add a text box that supports Textile formatting (1-4,000 characters). Refer to Textile (markup language). To specify field size and maximum number of characters allowed, type the parameters in the Field Data field in the format `[size|medium|large],[1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small, 24`.

Table 569: Profile Field Types Description (Continued)

Field	Description
Code	Select this option to add an element that members can use to display code or preformatted text when adding a post. Code formatting, including tabs and spaces, is retained and displayed when added to a post in this field. To specify field size and maximum number of characters allowed, type the parameters in the Field Data field in the format `[size|medium|large],[1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small,24`. **Note:** Code entered in this field will not be rendered and does not impact the security of the community.
Embedded Media	The following elements allow members to embed multimedia content when adding a post.
Image	Select this option to allow members to upload or embed linked image files.
Flash	Select this option to allow members to embed linked Flash *(.swf)* files. **Note:** Although Flash is a supported field type, it can introduce potential misuse by malicious users. Use this field type with caution. Refer to Cross-site flashing.
Video	Select this option to allow members to upload or embed linked video files.
Form Controls	The following elements allow members to select options from form controls when adding a post.
Select	Select this option to add a drop-down menu that members can select a single option from. Type options for the menu in the Field Data field in comma-separated format. For example, `High, Medium, Low`.
Multi-select	Select this option to add a multi-select field that members can select one or more options from. Type options for the field in the Field Data field in comma-separated format. For example, `France, Germany, Italy, Portugal, Spain`.

Table 569: Profile Field Types Description (Continued)

Field	Description
Radio Buttons	Select this option to add radio buttons that members can select a single option from. Type options for the radio buttons in the Field Data field in comma-separated format. For example, `Yes, No, Maybe`.
Checkboxes	Select this option to add check boxes that members can select one or more options from. Type options for the check boxes in the Field Data field in comma-separated format. For example, `Baseball, Basketball, Football, Golf, Tennis`.
Dates and Times	The following elements allow members to enter date values when adding a post.
Date	Select this option to add a date field to the post. Members can type the date in any of the following formats: • `MM/DD/YY` • `Mon DD, YYYY` • `DD Month YYYY` • `Next Day` The community will display the date in the format Month DD, YYYY.
Event Date	Adds a date field to the post or comment that can be used with calendar events and the RSVP feature.
Files	Select this option to allow members to attach files to the post.
Special	The following elements allow members to enter special values.
Link	Adds a drop-down menu containing links. By default, links open in a new browser window. To open them in a parent window instead, type `internal` in the Field Data field.
Postal Address	Adds a postal address field. **Note:** Content displayed in this field is used to automatically create a link to the address in Google Maps.
Email Address	Adds an email address field.
Instant Messenger	Adds contact ID fields for several leading instant messenger services.

Table 569: Profile Field Types Description (Continued)

Field	Description
Fixed Value	Select this option and type a text value in the Field Data field to add that text to the post form.
Ratings (Deprecated)	The following elements allow members to enter rating values. **Note:** These elements have been deprecated and will be removed in future releases.
Icon Rating	Select this option to add a drop-down menu that members can use to enter a rating value. By default, values entered in this field will appear as stars, but fork and dollar icons are also available. To specify the scale for the ratings from one to five, type the parameters in the Field Data field in the format `[star|fork|dollar],[1-5]`. For example, to define a rating scale of one to four forks, type the value `fork,4`.
Thumbs Up/Down	Select this option to add a drop-down menu members can use to enter a thumbs up/down rating value.

Community invitations

In addition to manually creating new member accounts, you can help prospective members join your community by enabling and sending email invitations. When you send an invitation, your prospect will receive an email containing a link to an account creation form. Once the form is completed and submitted, the new member will receive a second email containing an account activation link.

To provide invitations to a single member, refer to Managing member accounts.

To configure community invitation settings

1 Click the Admin **user link** to display community administration settings.

2 Click Invitations.

3 Enter the following field information.

Table 570: Invitation Settings Description

Field	Description
Enable/Disable Invitations	The following settings enable the sending of invitations for communities and **hives**.
Enable Invitations	Select this check box to enable community invitations.
Enable Invitations Directly to Hives	Select this check box to enable hive invitations for administrators.
New User Invitations	Type the number of invitations you want to automatically provide to new members.
Invitation Request	The following settings define the default text that appears in the invitation request form.
Default Subject	Type the subject for the invitation request form.
Default Body	Type the body text for the invitation request form.
Default Tip	Type the tip text for the invitation request form.

4 Click the Update Settings button.

To provide invitations to all members

1 Click the Admin **user link** to display community administration settings.

2 Click Invitations.

3 Type the number of invitations you want to provide to each member in the Provision Invitations to All Users section.

4 Click the Provision Invitations button.

Note When you provide invitations to all members, all members will have only the number of invitations you specify, regardless of how many they had previously.

Join codes

You can create join codes to be used when prospective members create an account. A join code is a simple alphanumeric code that can be appended to the join page URL in the following format:

```
http://<your_site>/join/<join_code>
```

When a prospective member loads this URL, they are redirected to the join form and their activity is tracked and associated with the code for reporting purposes. Join codes can be used to track the success of special promotions or when targeting prospective members. They can also be used to automatically associate new members with **user types** and **groups**.

You can distribute the join code URL to prospective members using whatever method you like, such as mailings, website links, or advertisements. Once a join code has been implemented, you can edit its settings, view its results and statistics, or retire it from use.

To create a join code

1 Click the Admin **user link** to display community administration settings.

2 Click Join Codes.

3 Click Create a New Join Code and enter the following field information.

Table 571: Create Join Code Description

Field	**Description**
Code	Type the join code you want to define. Join codes can contain lowercase letters, numbers, and hyphens (–). For example, if you type `mypromotionalcode`, the following URL will redirect to the join page and use the code to track the account. `http://<your site>/join/mypromotionalcode`
Number of Uses	Type the maximum number of members that can join using this code.
User Type	Click the User Type drop-down menu and select a user type for the joining members. Refer to User types.
Groups	Select one or more groups from this field to associate joining members with the group. **Note:** To select more than one group, press **Ctrl** while selecting the groups you want to associate.

Table 571: Create Join Code Description (Continued)

Field	Description
Redirect	Type the URL you want to redirect new members to once they join. By default, the join page redirects new members to the community home page at `/pages/home`.

4 Click the Create Join Code button.

To edit or expire a join code or view code statistics

1 Click the Admin **user link** to display community administration settings.

2 Click Join Codes.

3 In the list of join codes, click the code that you want to edit or expire. The page refreshes to display the join code settings and statistics, including the number of code submissions yet to be redeemed and a list of members who have joined using the code.

4 To edit the code's settings, enter the following field information in the Edit Code section.

Table 572: Edit Code Description

Field	Description
Code	Type the join code you want to define. Join codes can contain lowercase letters, numbers, and hyphens (–). For example, if you type `mypromotionalcode`, the following URL will load the join page and use the code to track the account. `http://<your site>/join/mypromotionalcode`
Remaining Uses	Type the remaining number of members that can join using this code.
User Type	Click the User Type drop-down menu and select a user type for the joining members. Refer to User types.
Groups	Select one or more groups from this field to associate with joining members. **Note:** To select more than one group, press **Ctrl** while selecting the groups you want to associate.

Table 572: Edit Code Description (Continued)

Field	Description
Redirect	Type the URL you want to redirect new members to once they join. By default, the join page redirects new members to the community home page at `/pages/home`.

a Click the Update Join Code button.

5 To change the code status, select an option from the Status field in the Expire/Unexpire Code section.

a To expire the code, select the Expired radio button.

b To activate the code, select the Active radio button.

c Click the Set Status button.

Groups

In communities, users may interact informally through **posts**, **comments**, and messages. You can also formalize their relationships through community groups, which can be accessed at the following location.

```
http://<your_site>/groups
```

Groups are used to associate **members** of a common interest, cause, or organization and provide a resource with which those members can interact. Groups feature their own page sets and member roles and can manage their own **hives**. Administrators can use groups to simplify the process of extending hive access across different user segments using **hive permissions**. Refer to Hive permissions.

Since groups are often used for different purposes, they can be organized and searched by **group type**. To define member roles within a group, administrators can assign different **member types**.

- Creating groups
- Editing group attributes
- Adding group members

Creating groups

New **groups** can be created from scratch or from a group **template** or copied from an existing group. When a group is created, it is initially owned and administered by its creator, who can then add **members**, moderators, and even other administrators who can share in the management duties of the group. Group **ownership** can also be transferred to another member when needed. Refer to Group ownership and delegation.

Copying a group also copies and associates the group's hives, but does not copy the group's memberships. Only the basic configuration and structure of the group is transferred to the group copy. However, hive associations are transferred as well.

Groups can also be classified by **group type**—such as department or fan base—for easy reference when organizing and searching members and content. Refer to To access group settings.

Note Many configuration labels that refer to a group are updated based on the hive's type. For example, if a group is set to a group type called Fan Club, the label Group Name may be updated to Fan Club Name. For simplicity, this documentation most often refers to labels using the default group type, Group.

To create or copy a group

1 Click the Admin **user link** to display community administration settings.

2 Click Groups.

3 To create a group type for the new group, click Create a New Group Type.
  a Type a name for the group type in the Name field.
  b Click the Create Group Type button.

4 Click Create a New Group.

5 To create a group by copying an existing group, click Browse Groups.
  a Click the name of the group you want to copy.
  b Click the About tab.
  c Click Create a Group Like This One and skip to step 7.

6 Click Create a Custom Group.

7 Click the Group Type drop-down menu to select a group type for the group.

8 Click the Group Language Tag drop-down menu to select a primary language for the group.

9 Type the group name in the Group Name field. This will be the name used for the group throughout the community, including the headers of group pages.

10 In the Group Tagline field, type a one-line summary for the group. The tagline will appear below the group name on group page headers.

11 In the About field, type a description of the group. This description will appear on the Group's About page.

Note The About field contains the same basic word processing functions available in the WYSIWYG/HTML **panel** type. For information about the HTML toolbar functions, refer to Editing WYSIWYG/HTML panel properties.

12 Click the Create Group button. The settings page of your new group opens. Refer to Editing group attributes.

Important By default, group pages display only the Summary tab and, to administrators, the Settings tab. To display additional tabs, such as About, Members, Hives, and Search, refer to Group pages.

To create a group from a group template

1 Click the Admin **user link** to display community administration settings.

2 Click Groups.

3 Click Create a New Group.

4 In the Create a Group from a Template section, click Create <Template Name> for the template you want to use.

5 Click the Group Type drop-down menu to select a group type.

6 Type the group name in the Name field. This will be the name used for the group throughout the community, including the headers of group pages.

7 In the tagline field, type a one-line summary for the group. The tagline will appear below the group name on group page headers.

8 In the About field, type a description of the group. This description will appear on the group's About page.

Note The About field contains the same basic word processing functions available in the WYSIWYG/HTML panel type. For information about the HTML toolbar functions, refer to Editing WYSIWYG/HTML panel properties.

9 Click the Create Group button. The settings page of your new group opens. Refer to Editing hive attributes.

Group pages

Each **group** consists of a set of pages that define its content. These pages are generally accessible from a navigation tab set that appears below the header of each group page. The standard group page set includes the following pages.

- **Summary**—The default landing page of a group. This page displays a customizable overview of the group. For example, the summary page of a discussion forum could be configured to display a list of recently active **members**, a few recent **posts**, and options for creating new posts. To customize this page, click the Settings tab and click Customize Summary Page. Refer to Adding panels to pages.
- **About**—Displays general information about the group such as its theme or goal. Refer to To create or copy a group.
- **Members**—Displays information about members of the group and an option to add or remove members. Refer to Adding group members.
- **Hives**—Displays information about hives associated with the group. Refer to Hive ownership and delegation.
- **Search**—Provides a keyword search capability for the group's content. Refer to Searching for content.

- **Settings**—Provides access to settings for configuring the group's functionality and content. This page is visible only to administrators. Refer to Editing group attributes.

Note These pages can be made accessible or hidden from view by enabling or disabling their tabs in the advanced hive settings. When a tab is disabled, you can still access its page by entering the group **hash** ID in the page URL in the following format.

```
http://<your_site>.com/groups/<group_hash_id>/<page_name>
```

For example, if the group hash ID were bbe47d0d5e, you could access the Summary page at http://<your_site>.com/groups/bbe47d0d5e/summary. Note that the hash and page name are in lowercase characters.

You can also edit the tabs' label text and designate the page that will serve as your group's landing page. Refer to To edit advanced group settings.

Editing group attributes

While a community can contain many **groups**, each group can be configured and customized separately to meet its own unique needs. The settings described in the following procedures define the group's page set appearance, privacy, members, and **hives**.

To access group settings

1. From the group pages, click the Settings tab.
2. Click a configuration option to access the settings you want to edit. The following table describes the available options.

Table 573: Group Configuration Options

Section	Description
Admin Only	Click Edit Admin Settings to edit the group's type and status. Refer to To edit group admin settings.
General	Click Change Avatar to upload, link to, or activate an avatar image. Click Edit General Settings to edit the **group type**, language, name, tagline, and About page description text. Refer to To create or copy a group.

Table 573: Group Configuration Options (Continued)

Section	Description
Privacy	Click Edit Privacy settings to select a group privacy level and related join and invitation options. Refer to To edit group privacy settings.
Members	Click Add or Remove Members to add or remove group members. Refer to Adding group members.
Hives	Click Create a New Hive to create a hive associated to the group. Refer to Hives. **Note:** To add or edit group association for an existing hive, refer to To edit hive admin settings.
Summary Page	Click Customize Summary Page to edit the layout of the group's summary page. Refer to Adding panels to pages.
Advanced	Click Edit Advanced Settings to access advanced group settings for defining the group's landing page, displaying tabs, and editing tab labels. Refer to To edit advanced group settings.
Delete	**Caution!** The deletion of a group and its content cannot be undone. To permanently delete the group and its content, click Continue in the Delete section. You must confirm that you want to delete the hive before it will be deleted.

To edit group admin settings

1 From the group pages, click the Settings tab.

2 Click Edit Admin Settings.

3 Click the Status drop-down menu to select a group state.

- **Active**—The group is active and available.
- **Template**—The group is not editable or searchable by members, but is available as a design template for creating other groups. Refer to Hives.

4 Click the Save Admin Settings button.

To edit group privacy settings

1 From the group pages, click the Settings tab.

2 Click Edit Privacy Settings.

3 Select the radio button for the privacy level you want the group to have. By default, groups are set to the Private privacy level.

- **Public**—The group's content will be visible to everyone, including **guest** users.
- **Community**—Only registered members can see the group.
- **Restricted**—Only group members can see the group.
- **Private**—Only group administrators can see the group.

4 To administer join permissions for groups with the Public or Community privacy level, select the radio button for the permissions you want to allow. Refer to Adding group members.

- **Open Join**—Any community member can join the group by viewing the Members page and clicking Join Group.
- **Request Membership**—Any community member can request membership by viewing the Members page and clicking Request Membership.
- **Owner Select**—Only group administrators can add new members to the group.

5 To allow group members to invite other users, select the Allow Group Members to Invite Others check box.

Note The Allow Group Members to Invite Others check box is not available for groups set to the Private privacy level.

6 To manage the group whitelist when using independent groups, refer to Group independence and member access restrictions.

7 Click the Save Privacy Settings button.

To edit advanced group settings

1 From the group pages, click the Settings tab.

2 Click Edit Advanced Settings.

3 To select a landing page for the group, click the Landing Page drop-down menu and select the page you want. By default, the Summary tab will serve as the group's landing page.

4 To add a tab to the group tab set, select the check box in the Tabs section next to the tab you want to display. Refer to Group pages.

5 To change a tab's label, type a new label in its text box.

6 To remove a tab from the group tab set, clear its check box.

7 Click the Save Advanced Settings button.

Adding group members

While general access to **groups** is governed by the group's privacy settings, specific member functions are governed by **member types** that define member roles in the group. When adding **members** to a group, you must decide what role the members will play within the group so that appropriate permissions can be assigned to them.

Depending on the group privacy settings, members may be able to join the group (or request an invitation to join) by clicking Join This Group (or Request Membership) on the group's Members page. Members can also be invited by group members or administrators, or permitted to join a group on their own. Refer to To edit group privacy settings.

By default, a community provides four member types—Administrator, **Builder**, Moderator, and Member—based on the degree of member involvement. Each member type establishes a level of access that determines what features and settings are accessible to members. The following figure provides additional detail about the permissions granted to each member type.

Group Member Types and Permissions

Permission	Group Member	Group Builder	Group Moderator	Group Admin
Have no default special permissions within the group	•		•	
Acquire other permissions on a per-hive basis	•	•	•	
Create new hives within the group		•		
Administer hives they create		•		
Moderate the group's hives			•	
Administer the group				•
Administer the group's hives				•

To add or remove group members

1 From the group pages, click the Members tab.

2 Click Add or Remove Members. A list of current members displays, organized in sections by role.

Note You can also access group member settings by clicking Add or Remove Members on the group's Members tab.

3 To add a member with a specific group member type, type any part of the user's name in the Add User by Name field in the Add Members with Member Type section.

- **a** Click the Search button to return a list of matching users.
- **b** Select the radio button for the user you want to add to the group.
- **c** Select a group member type for the member.
- **d** Click the Add button. The user is added with the specified group type.

4 To search for a user to add as a member, type three or more letters of the user's name in the Add Members section.

- **a** Click the Search button to return a list of matching users.

Note Users who are already members of the group are noted as added.

- **b** Click Add next to the user you want to add to the group. The user is added as a member.

5 To remove a member from the group, click Remove next to the member name listed under the member's role.

Group ownership and delegation

By default, a **group** is owned by the member who created it. The owner of a group has complete administrative permissions for the group. Depending on the size of a group, it is often helpful to delegate certain administration functions to other members so they can assist with the management and configuration of the group. Refer to Editing group attributes.

In some cases, the owner of a group may want to transfer ownership to another member. This can be accomplished using the following procedure.

To transfer group ownership

1 Click the Admin **user link** to display community administration settings.

2 Click Groups.

3 In the Transfer Ownership of a Group section, type the **hash** ID of the group in the Group Hash field.

Note The group's hash is found in the URL of its pages. For example, if a group's summary page is located at http://<your_site>.com/groups/bbe47d0d5e/summary, the group hash is bbe47d0d5e.

4 Type the name of the new owner in the New Owner field and click Search.

5 Select the new owner from the search results.

6 Click the Transfer Ownership button.

Group independence and member access restrictions

In some situations, you may have an important business need to carefully control the way that members of different groups interact in your community. For example, if you manage a community serving both resellers and customers, it may be critical to bar resellers from messaging or interacting with customers of yours (or those of other resellers), to prevent them from poaching accounts.

Using your community's independent groups features, you can limit interactions between members of groups, restricting access to member profile information, personal network connections, and private message functions. Independent groups allow your community to interact with distinct audiences while maintaining a private separation between them.

When enabled, the following restrictions are put into effect:

- Community members can message, network, and view extended profile information only for members with whom they have at least one group in common. For instance, members of distinct Group A can send private messages to each other, but not to members of distinct Group B. However, if a member of Group A and a member of Group B are also both members of Group C, they can send private messages to each other on that basis.
- Access to member functions—including extended profiles, private messaging, and networking—can still be provided based on user type, so administrators have full permissions regardless of their own group memberships.
- Group-level administrators can manage a whitelist that provides access to their group for any other group. However, granting access to a group does not automatically provide you with reciprocal access to that group. Your group must be granted access in the other group's whitelist in order to establish reciprocal access.

- Members who are not associated with any group are fully accessible to any group or member.

Important Private messages can be sent to a group only by a group that has access to it. In cases where group access is provided in one direction only, private messaging functions are restricted accordingly. In such a case, the recipient will be able to read the message, but will not be able to reply.

Access to group content is not governed by the Independent Groups setting, but by group and hive permissions.

To enable independent groups

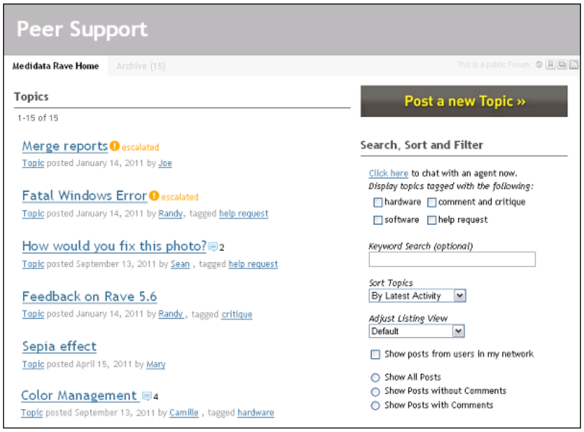
1. Click the Admin **user link** to display community administration settings.
2. Click Groups.
3. Select the Enable Independent Groups check box.
4. Click the Save button.

To manage group whitelists

1. From the group pages, click the Settings tab.
2. Click Edit Privacy Settings.
3. To add a group to the whitelist, type the group name in the Add Groups to Whitelist field and click the Search button.
   a. Click Add next to the group name.
4. To remove a group from the whitelist, click Remove next to the group name.

Hives

Communities can contain one or more hives. A hive is a community resource where people gather to communicate about a central topic, theme, or goal. Hives can be customized to take any of a number of forms based on their function and subject, such as blogs, forums, event calendars, and job boards.



Hives can be owned privately by **members** or **groups**, or stand alone for full community or public web access. As your community grows, you can add hives to accommodate new projects, services, and groups, and support the natural evolution of your community's content. The hives configured for your community can be accessed at the following location.

```
http://<your_site>/hives
```

Creating hives

Hives can be created from scratch or from a **hive template**, or copied from an existing hive. When a hive is created, it is initially owned and administered by its creator, who can then provide appropriate levels of access to other **members**. Also, hive **ownership** can be completely transferred to another member. Refer to Hive ownership and delegation.

Copying a hive does not copy its **group** association, if one exists, or content such as posts and comments. Only the basic configuration and structure of the hive is transferred to the hive copy, such as the hive's standard permissions (excluding those that were explicitly defined for users and groups), **post types**, and tags.

Hives can also be classified by **hive type**—such as blog or forum—for easy reference when organizing and searching content. Refer to To access hive settings.

Note Throughout the community interface, many labels, fields, and controls that refer to a hive (such as Hive Name) are labeled based on the hive's type. For example, if a hive is set to a hive type called Blog, the label Hive Name may be displayed as Blog Name when you view the hive or its settings. For clarity, this documentation most often refers to these labels using the hive type, Hive.

To create a hive

1 Click the Admin **user link** to display community administration settings.

2 Click Hives.

3 To create a hive type to classify your new hive, click Create a New Hive Type.

   a Type a name for the hive type in the Name field.
   b Click the Create Hive Type button.

4 In the Related Tasks section, click Create a New Hive.

5 Click Create a Custom Hive.

6 Click the Hive Type drop-down menu to select a hive type for the hive.

7 Click the Language Tag drop-down menu to select a primary language for the hive.

8 Type the hive name in the Name field. This will be the name used for the hive throughout the community, including the headers of hive pages.

9 To display a one-line summary below the hive name on hive page headers, type the summary text in the Tagline field.

10 To display a description of the hive on the About page, type the description text in the About field.

Note The About field contains the same basic word processing functions available in the WYSIWYG/HTML **panel** type. For information about the HTML toolbar functions, refer to Editing WYSIWYG/HTML panel properties. The contents of the About field can be indexed by search engines, subject to hive permissions.

11 To add the hive to your favorites, select the Add to Favorites check box.

12 Click the Create a Custom Hive button. The settings page of your new hive opens. Refer to Editing hive attributes.

Tip To view the hive as it appears to your users, click the hive name. The panels will display an edit link visible only to those who have the ability to edit the hive.

To copy a hive

1 Click the Admin **user link** to display community administration settings.

2 Click Hives.

3 Click the name of the hive you want to copy.

4 Click the About tab.

Note If the hive's About tab is hidden, you can access the About page by entering hive's **hash** ID in the page URL in the format http://<your_site>.com/hives/bbe47d0d5e/about, where the hive hash is bbe47d0d5e.

5 Click Create a Hive Like This One.

6 Type a new name for the hive in the Hive Name field. This will be the name used for the hive throughout the community, including the headers of hive pages.

7 Type a new tagline for the hive in the Tagline field. The tagline is a one-line summary for the hive that appears below the hive name on hive page headers.

Note Permissions, post types, and tags from the source hive are displayed for your review and will be copied as they appear. Note that only standard permissions will be copied. Customized user and group permissions will not be copied.

8 Click Create Hive. The settings page of your new hive opens. Refer to Editing hive attributes.

Tip To view the hive as it appears to your users, click the hive name. The panels will display an edit link visible only to those who have the ability to edit the hive.

To create a hive from a hive template

1 Click the Admin **user link** to display community administration settings.

2 Click Hives.

3 In the Related Tasks section, click Create a New Hive.

4 In the Create a Hive from a Template section, click the Create link for the template you want to use.

5 Type a new name for the hive in the Hive Name field. This will be the name used for the hive throughout the community, including the headers of hive pages.

6 Type a new tagline for the hive in the Tagline field. The tagline is a one-line summary for the hive that appears below the hive name on hive page headers.

Note Permissions, post types, and tags from the source hive are displayed for your review and will be copied as they appear. Note that only standard permissions will be copied. Customized user and group permissions will not be.

7 Click the Create Hive button. The settings page of your new hive opens. Refer to Editing hive attributes.

Tip To view the hive as it appears to your users, click the hive name. The panels will display an edit link visible only to those who have the ability to edit the hive.

Hive pages

Each **hive** consists of a set of pages that define its content. These pages are generally accessible from a navigation tab set that appears below the header of each hive page. The standard hive page set includes the following pages.

- **Summary**—The default landing page of a hive. This page displays a customizable overview of the hive's content. For example, the summary page can be configured to display a few recent **posts** from the hive as well as a list of subjects from a related blog. To customize this page, click the Settings tab and click Edit Panels in the Summary Page section. Refer to Adding panels to pages.
- **About**—Displays general information about the hive, such as its topic, theme, or goal. Refer to To create a hive.
- **Posts**—Displays a list of posts contained by the hive as well as options to create or filter by different types of posts. Refer to Posts.
- **Comments**—Displays comments contained by the hive. Refer to Comments.
- **Members**—Displays information about members of the hive. Refer to Members.
- **Search**—Provides a keyword search capability for the hive's content. Refer to Searching for content.

- **Settings**—Provides access to settings for configuring the hive's functionality and content. This page is visible only to hive administrators. Refer to Editing group attributes.

Note These pages can be made accessible or hidden from view by enabling or disabling their tabs in the advanced hive settings. When a tab is disabled, you can still access its page by entering the hive **hash** ID in the page URL in the following format.

```
http://<your_site>.com/hives/<hive_hash_id>/<page_name>
```

For example, if the hive hash ID were bbe47d0d5e, you could access the Summary page at http://<your_site>.com/hives/bbe47d0d5e/summary. Note that the hash and page name are in lowercase characters.

You can also edit the tabs' label text and designate the page that will serve as your hive's landing page. Refer to To edit advanced hive settings.

Editing hive attributes

While a community can contain many **hives**, each hive can be configured and customized separately to meet its own unique needs. The settings described in the following procedures define the hive's general appearance and available features.

Note Most of the settings described in this procedure are available only to members who have a **user type** of Admin–Community or higher. Refer to User types. To provide member access to a hive, including basic and administration functions, refer to Hive privacy levels.

To access hive settings

1 On the hive pages, click the Settings tab.

2 Click a configuration option to access the settings you want to edit. The following table describes the available options.

Table 574: Hive Configuration Options

Section	Description
Admin Only	Click Edit Admin Settings to edit the hive's status and parent group. Refer to To edit hive admin settings.

Table 574: Hive Configuration Options (Continued)

Section	Description
General	This section displays the current **hive type**, language, name, tag-line, and About page description text. To edit these settings, click Edit General Settings and refer to To create a hive. **Note:** A user type of Admin–Community or higher is required to set the hive type. Refer to User types.
Members and Permission	This section displays the hive's current privacy level. Click Edit Members and Permissions to add groups and members for the hive and grant permission for site actions. Refer to Hive privacy levels and Hive permissions.
Tags	Click Edit Tags to define tags for identifying related **posts** in the hive. Refer to Tagging content.
Post Types	Click Edit Post Types to select the **post types** you want to allow on the hive. Refer to Posts.
Summary Page	Click Edit Panels to edit the layout of the hive's summary page. Refer to Adding panels to pages. Click Edit Meta Tags to define the meta tags used by the site for search engine optimization.
Advanced	Click Edit Advanced Settings to access advanced hive settings, such as those defining the landing page, displaying tabs and post panels, selecting a ratings scale, and enabling an RSS feed for the hive. Refer to To edit advanced hive settings.
Delete	**Caution!** The deletion of a hive and its content cannot be undone. To permanently delete the hive and its content, click Continue in the Delete section. You must confirm that you want to delete the hive before it will be deleted.

To edit hive admin settings

1 From the hive settings, click Edit Admin Settings.

2 Click the Status drop-down menu to select a hive state.

- **Active**—The hive is active and available.
- **Template**—The hive is not editable or searchable by members, but is available as a design template for creating other hives. Refer to Hives.

3 Click the Parent Group drop-down menu to select a parent group for the hive.

Note Groups that have more restrictive privacy settings than the hive are not available for selection. Refer to Community privacy levels.

To edit advanced hive settings

1 From the hive pages, click the Settings tab.

2 Click Edit Advanced Settings.

3 Enter the following field information.

Table 575: Advanced Hive Settings Description

Setting	Description
Landing Page	Click this drop-down menu to select the hive's landing page from the list of hive pages. By default, the Summary tab will serve as the hive's landing page.
Feed	Select this check box to enable an RSS 2.0 feed for the hive. When active, the RSS feed is available at: `http://<your_community_site>/hives/<hive_hash>/feed`
Tabs	Select the check boxes next to the tabs you want to display on the hive tab set. To change a tab's label, type a new label in its text box. To remove a tab from the hive tab set, clear its check box.
Ratings	The following settings define the ratings scales used for posts and comments submitted to the hive.
Posts	Click this drop-down menu to select a rating scale for posts.
Comments	Click this drop-down menu to select a rating scale for comments.
Automatically Subscribe All Group Members	Select the Subscribe All Members check box to automatically subscribe all group members to new posts in the hive. **Note:** This option is available only to hives that are owned by a group.
Posts – Default List Settings	Click these drop-down menus to select filter values that will be applied by default on the Posts page.

Table 575: Advanced Hive Settings Description (Continued)

Setting	Description
Posts – Show/Hide Panels	Select the check boxes next to the **panels** you want to appear on the Posts page.
Comments	The following settings define the style and content of comments submitted to the hive.
Display Style	Select the radio button next to the ordering style you want comments to use. • **Chronological**—Orders comments by date created, from oldest to newest. Comments can be added to posts but not to other comments. • **Threaded**—Groups comments by thread. This option enables the Reply To This Comment link, allowing members to comment on comments. Related comments are grouped.
Comment Type	Select the comment type you want the hive to use. Refer to Comments.
Answers	Select this check box to allow a comment to be selected as a post's best answer. Click the drop-down menu to select the users who are allowed to select a best answer, either Admins and Authors or Admins Only. Comments that are selected as best are highlighted and displayed prominently, directly below the post.
Concept Tester	Select these check boxes to alter the display of the post and comment submission forms. The following options are available: • Defining a custom comment type for each post. • Allowing only one primary comment per user per post. • Hiding a post's comments from users until they have added their own.
Post Page Badge Type	Click this drop-down menu to select the style of badge to display to the left of post titles on the Posts page. • **Avatar**—Displays the member's avatar. • **Event Date**—Displays the date the post was added. • **Rating**—Displays the rating control defined by the Ratings > Posts advanced setting. • **Off**—Displays no badge.

4 Click the Save Advanced Settings button.

Hive permissions

Hive permissions are explicitly defined sets of privileges that permit **members** to perform specific actions in the **hive**, such as adding members, posting content, or commenting on posts. Permissions are checked before any hive content is displayed.

The hive **owner** always has full permission to access and edit the hive. Different permission sets can be defined for all registered members, and for specific **groups** and members, in various combinations. This provides the flexibility to ensure that all members have only those permissions appropriate for their role.

Hive permissions are also used with **community privacy levels** to determine a hive's privacy level. Users who attempt to access a private hive will be prompted to log in before they are allowed access. Information can be public only if the community itself is public. Refer to Hive privacy levels.

Note Hive permissions apply only to the hive they are configured for. If a community contains more than one hive, members can be assigned different permissions for each hive.

When adding permissions for specific members and groups, there can be some overlap between permissions, as well as those defined for all registered users. To resolve the overlap, member permissions are evaluated based on the following order of priority.

1 **Member permissions**—When permissions are explicitly granted to a specific member, those permissions will be given priority over any other permissions or restrictions resulting from their inclusion in a group or as a registered user.

Note Though member permissions are often used to provide rights exceeding those granted to groups or all users, they can also be used to restrict rights that would otherwise be granted. For example, if the Edit permission is enabled for All Registered Members, but disabled for a specific member, that member will not be able to edit content.

2 **Group permissions**—If permissions are not specifically granted to a member, but are granted to a group that member belongs to, the permissions and restrictions defined for the group are given priority over any permissions or restrictions specified for registered users.

Note If a member belongs to more than one group that has permissions defined, the member will receive all permissions enabled in each group, without restriction. For example, if Group A has only the Post permission enabled and Group B has only the Comment permission enabled, a member belonging to both groups will be able to both post and comment.

3 **Registered users**—Members who are not granted permissions specifically by name or by group are granted the permissions defined for registered users.

4 **Guest users**—When the community privacy level is set to Public, you can grant the Read permission to **guest** users. (Other permissions require being logged in as at least a registered user.)

To access and edit hive permissions

1 Click the Admin **user link** to display community administration settings.

2 Click Hives.

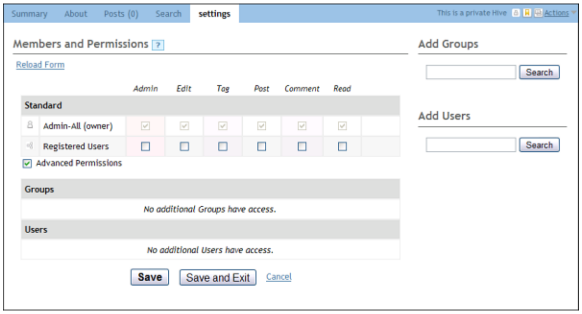
3 Click Browse All Hives in the Related Tasks section.

Or

Click Search For Hives to search for a specific hive. Refer to Searching for content.

4 Click Settings next to the hive you want to edit permissions for.

5 Click Edit Members and Permissions. By default, the Members and Permissions form displays the current permissions settings for the hive owner and all registered users.



Note If the hive is associated to a group, you can set permissions based on group roles. Refer to Editing group attributes.

If the hive is public, you can also set read permissions for **guest** users.

6 To access permission options for individual users and groups, select the Advanced Permissions check box.

7 To add a group to the form, type the name of the group name in the Add Groups field and click the Search button to return all matching groups.

   a Click Add next to the group you want to add to the permissions form.

8 To add a specific member to the form, type the member name in the Add Users field and click the Search button to return all matching members.

   a Click Add next to the member you want to add to the permissions form.

9 To edit hive permissions for a member or group listed on the form, select the appropriate check boxes described in the following table.

Table 576: Hive Permissions Description

Action	Description
Admin	Select this check box to grant access to the Settings tab for adjusting the structure of the hive, including adding and removing members, **post types**, and tags. This also gives moderator permissions, so the user can modify posts and comments, and leave moderator notes. Refer to Editing hive attributes. **Note:** Selecting this check box also enables permissions for edit, tag, post, comment, and read actions.

Table 576: Hive Permissions Description (Continued)

Action	Description
Edit	Select this check box to grant users permission to edit and tag posts and edit comments in the hive, including those of other members. Refer to Posts. You can enable Edit permissions to provide members with a simplified wiki-style environment for collaborative authoring. **Note:** Selecting this check box also enables permissions for tag, post, comment, and read actions.
Tag	Select this check box to grant users permission to view and tag their own posts. Refer to Tagging content.
Post	Select this check box to grant users permission to create, view, and edit their own posts.
Comment	Select this check box to grant users permission to comment on all posts and view and edit their own comments. **Note:** Selecting this check box also enables read permission.
Read	Select this check box to grant permission to view all posts and comments in the hive. Refer to Posts. **Note:** In public communities, read permissions can also be granted to **guest** users.

Note When enabling or disabling permissions for registered users, Oracle Service Cloud automatically applies the same permissions for groups and individual members that have been added to the form. This is done to avoid unintentionally granting members fewer permissions than their group membership or registered user status would normally allow. To override this function, clear the Auto-check Columns check box, or simply update the group and user permissions once registered user permissions have been updated.

10 Click the Save and Exit button.

Hive ownership and delegation

By default, a **hive** is owned by the member who created it. The owner of a hive has complete administrative permissions for the hive, as well as the ability to extend permissions to other members. Depending on the size of a hive, it is often helpful to delegate certain duties to other members so they can assist with the management and configuration of the hive. Refer to Hive privacy levels.

Note A hive can also be associated to a **group** and group members can be assigned permissions to manage or moderate the group's hive. Refer to Editing hive attributes.

In some cases, the owner of a hive may want to transfer ownership to another member. This can be accomplished using the following procedure.

To transfer hive ownership

1 Click the Admin **user link** to display community administration settings.

2 Click Hives.

3 In the Transfer Ownership of a Hive section, type the **hash** ID of the hive in the Hive Hash field.

Note The hive's hash is found in the URL of its pages. For example, if a hive's summary page is located at http://<your_site>.com/hives/bbe47d0d5e/summary, the hive hash is bbe47d0d5e.

4 Click the New Owner drop-down menu to select the method by which you want to identify the new owner of the hive. Available options include Name or Hash.

Note The user's hash is found in the URL of its pages. For example, if a user's summary page is located at http://<your_site>.com/people/bbe47d0d5e, the user's hash is bbe47d0d5e.

5 Type the selected value for the new owner.

6 Click the Transfer Ownership button.

Content management and moderation

While a **group** is defined by its membership, **hives** are defined by the content produced for and by its **members**. Communities provide a great deal of flexibility for the creation and presentation of that content. You can draw from a wide range of form elements and organize them to produce different types of **posts** and **comments** from your membership. As your community grows, you can moderate the content your members are submitting and suspend inappropriate posts, comments, or even members, as needed. In addition, you can promote positive activity by monitoring and rewarding your most valued members with reputation levels.

Note Communities frequently contain a vast amount of user-generated content that often includes links to other external sites. Links between web pages typically carry a certain degree of weight for search engine optimization. Search engines usually consider the number and type of links into and out of a page when ranking the relevancy of a particular page. For example, a link to your site from the page of a large, established company might be considered more valuable than a similar link from a relatively unknown site.

Communities can be configured to encourage or discourage search engines from considering links contained in user-generated content in your community by adding or removing "no-follow" code for all user-generated links. Contact your Oracle account manager or Customer Success Manager if you want to change the search engine optimization setting for your community.

Posts

Central to each **hive** are its posts, the content created and commented on by its users. Often, posts are listed on a **panel** on the hive's Summary page for efficient access. However, posts are also listed on the hive's standard Posts page. Simply click a post link to view it, or click Post a [Post Type] to create a new post.

Clicking a post in the list displays it in your browser along with its associated **comments**. The appearance and structure of a post—the sequence of fields and controls used to create its content—are defined by its **post type**. A variety of form elements are available to support a wide range of post types, and different sets can be used based on the hive's theme or purpose, such as sharing blog entries, photos, recipes, or video clips. For example, in a blog-style hive, a basic post might provide fields for entering text descriptions and tracking the time of entry as well as controls for embedding multimedia content.

Once a post has been configured, it must be enabled in a hive to be available for creating posts in that hive. A single hive can use multiple post types and, once defined, a post type can be used by any hive in the community.

To add or edit post types

1. Click the Admin **user link** to display community administration settings.
2. Click Posts. The following field information is displayed for existing post types in the Post Types section.

Table 577: Post Types Description

Field	Description
Name	Displays the name of the post type. Click this link to view details such as the description and field types used by the post type.
Fields	Lists the fields used by the post type.
Posts	Displays the number of posts that have used this post type. Click this link to view all posts associated with the post type.
Hives	Displays the number of hives that have used this post type. Click this link to view all hives associated with the post type.

3 To edit an existing post type, click Edit next to the post type and refer to step 5.

4 To add a post type, click Create a New Post Type.

5 Type a name for the post type in the Name field.

6 Type a description for the post type in the Description field.

Tip Compose your description to help members understand what kind of information the post type is intended to support. For example, a post form containing an image upload control for a photo-sharing hive might offer a description such as "Select a favorite photo to share with the group."

By default, the Fields section lists four rows representing undefined post fields. You can add post fields by clicking Add Field, or remove post fields by clicking the Delete button that appears at the end of each row.

7 Enter the following field information.

Table 578: Post Fields Description

Field	Description
 Order	Click the arrow to drag a post field to a new position in the field display sequence.
Field Name	Type the name of the field as you want it to appear to members on the post form.
Field Description	Type a text description that will be visible to members when they complete the field.
Field Type	Click this drop-down menu to select the type of field or control you want to add. For a description of available field types, refer to Post and comment fields.
Field Data	Type the field data parameters that define the field type. For a description of the parameters used for each field type, refer to Post and comment fields. **Note:** Field data may be required, optional, or not applicable, based on the field type.
Clip View	Select this check box to make the field visible in clip view.

Table 578: Post Fields Description (Continued)

Field	Description
Uses	When creating a post type, this column indicates it is new. When editing a post type that is already in use, this column displays the number of posts that have used this field. **Tip:** This is useful for identifying fields that should be modified or removed due to low usage.
Delete	Click this button to delete the post field. **Note:** Deleting a field cannot be undone and its data will be permanently discarded.
Metadata	Select this check box to display the value of the post field prominently beneath the post title in post lists. **Note:** This option applies only to certain list views. Refer to To edit Posts panel properties.
Add Field	Click this text to add post fields to the Fields section.

8 To display all post field names in the clip view, select the Show Field Names in Clip View check box.

9 Click the Create Post Type button.

To enable a post type for a hive

1 Click the Admin **user link** to display community administration settings.

2 Click Hives.

3 Click Browse All Hives.

4 Click Settings next to the hive you want to enable post types for.

Note You can also access post types by clicking the Settings tab on the hive itself.

5 Click Edit Post Types in the Post Types section.

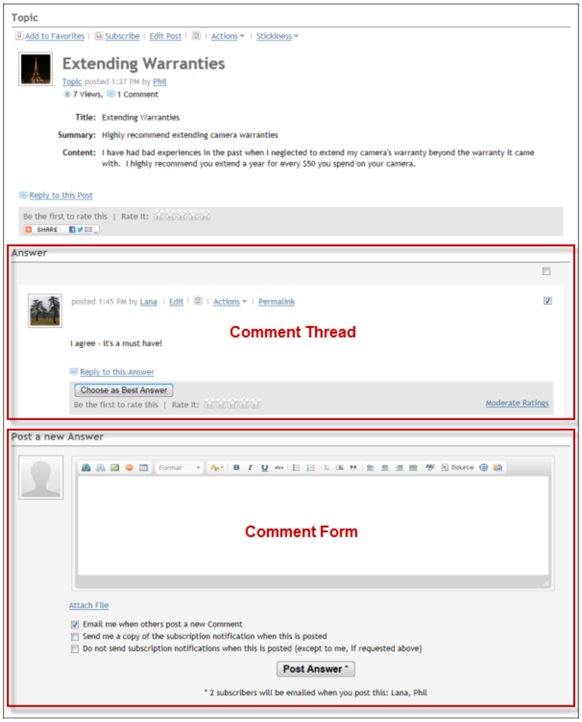
6 Select the check box next to each post type you want to enable for the hive.

7 To disable a post type, clear the check box next to its name.

8 Click the Save Post Type Settings button.

Comments

Expanding on the usefulness of **posts**, communities can provide users with the ability to comment on posts. Comments are commonly displayed beneath posts in the form of a discussion thread, allowing users to discuss the topic at hand and provide their own insight to add greater context.



At the bottom of the comments section is a form members can use to add their own comments to the thread and enable notifications for thread updates. Refer to <u>Post and comment subscriptions and notifications</u>.

Because any number of comments may be added to a post, it can be useful in some cases to call out the comment most relevant to the post. You can enable a “best answer” option so that administrators and authors can designate a comment as the best answer to a question posed in the post. Refer to <u>To edit advanced hive settings</u>.

To make threads more scalable and easier to read for posts containing a large number of comments, you can adjust pagination options. For instance, you can specify whether comments nested below other comments should be collapsed or expanded in the thread by default. You can also change the maximum number of comments displayed to customers on each page. Comments exceeding this limit will flow to additional pages with links to each page to easily navigate the thread. Also, each comment includes a permalink that can be used to ensure that links from external locations (such as web pages or blogs) will continue to work if the comment's location changes due to pagination or moderator action. Refer to Managing discussions.

The appearance and structure of a comment are defined by its comment type. Like a **post type**, a comment type must be enabled in a **hive** to be available for creating comments in that hive. A comment type may be set to primary (used for top-level replies to a post), threaded (used for replies to other comments), or both. Once defined, a comment type can be used by any hive in the community.

Tip While comments are most often displayed beneath their related posts, you can also enable a hive's Comments page to display comments associated with that hive. Refer to Hive pages.

To add or edit comment types

1 Click the Admin **user link** to display community administration settings.

2 Click Comments.

3 To edit an existing comment type, enter the following field information in the Edit Comment Types section.

Table 579: Edit Comment Types Description

Field	Description
Primary	Select this radio button to use the comment type for top-level replies to a post. **Note:** The primary comment type can be overridden at the hive level.
Threaded	Select this radio button to use the comment type for replies to other comments.

Table 579: Edit Comment Types Description (Continued)

Field	Description
Name	Click this link to view details such as the name, description, and field types used by the comment type.
Fields	Lists the fields used by the comment type.
# Hives	Displays the number of hives that have used this comment type.
# Comments	Displays the number of comments that have used this comment type.
Edit	Click this link to edit the comment type. Refer to step 5.
Delete	Select this check box to delete the comment type. **Note:** Comment types that have been used or set to primary or threaded cannot be deleted.

4 To add a comment type, click Create a New Comment Type.

5 Type a name for the comment type in the Name field.

6 Type a description for the comment type in the Description field.

Note By default, the Fields section lists four blank comment fields that you can define. You can add more comment fields by clicking Add Field, or remove comment fields by clicking the Delete button that appears at the end of each row.

7 Enter the following field information.

Table 580: Comment Fields Description

Field	Description
Order	Click the arrow to drag a comment field to a new position in the display sequence of fields.
Field Name	Type the name of the field as you want it to appear to members on the comment form.

Table 580: Comment Fields Description (Continued)

Field	Description
Field Description	Type a text description that will be visible to members when they complete the field.
Field Type	Click this drop-down menu to select the type of field or control you want to add. For a description of available field types, refer to Post and comment fields.
Field Data	Type the field data parameters that define the field type. For a description of the parameters used for each field type, refer to Post and comment fields. **Note:** Field data may be required, optional, or not applicable, based on the field type.
Uses	When creating a comment type, this column indicates it is new. When editing a comment type that is already in use, this column displays the number of comments that have used this field. **Tip:** This is useful for identifying fields that should be modified or removed due to low usage.
Delete	Click this button to delete the comment field. **Note:** Deleting a field cannot be undone and its data will be permanently discarded.
Add Field	Click this text to add comment fields to the Fields section.

8 To display all comment field names in the clip view, select the Show Field Names check box.

9 Click the Create Comment Type button.

To edit comment pagination options

1 Click the Admin **user link** to display community administration settings.

2 Click Comments.

3 To change the maximum number of comments displayed per page, type the number in the Comments Per Page. The default maximum number is 15.

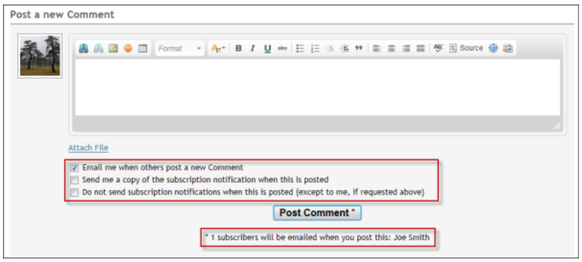
4 To expand nested comments by default, select the No radio button under Collapse Comments by Default. Comments are collapsed by default.

5 Click the Set Pagination Option button.

Post and comment subscriptions and notifications

Subscription notifications help thread participants stay abreast of community activity and participate more easily in ongoing conversations. When adding a post or comment, the following subscription notification check boxes are available.

- Email Me When Others Post a New Comment—Select this check box to be notified by email when subsequent comments are posted by others. Refer to step 8 in To access a community's general settings. (If the user is already subscribed, the check box is replaced with the message You are Already Subscribed by Email to All Comments in This Hive.)
- Send Me a Copy of the Subscription Notification When This is Posted—Select this check box to be notified by email when the user's own content is posted.
- Do Not Send Subscription Notifications When This is Posted (Except to Me, if Requested Above)—Select this check box to prevent subscription notifications from being sent when this content is posted. This check box is available only to users of type Admin–Community.



Users who have subscribed to receive notifications are listed at the bottom of the comment form for the submitting user to review. When 20 or more members are subscribed, the approximate total of subscribers is displayed and up to 1,000 subscriber names can be displayed by clicking the View Subscribers link. In addition, the system checks member statuses to ensure that update notifications are sent only to active members, excluding those marked inactive or disruptive. Refer to Moderating member content.

Notifications also provide special features for power users and moderators who interact with the community using mobile devices. For example, notification emails contain a Reply To This Post By Web link that allows users to reply to posts from a web browser. Though this page works well when accessed from workstations, it is also optimized for mobile devices.

In addition, you can enable a Reply To This Post By Email link, which allows users to compose an email reply from a mobile mail client. The contents of the reply email will be processed and added to the post as a new comment.

Both links default to one allowed use and expire in 72 hours. However, you can change these expiration parameters to customize the expiration time and maximum number of uses.

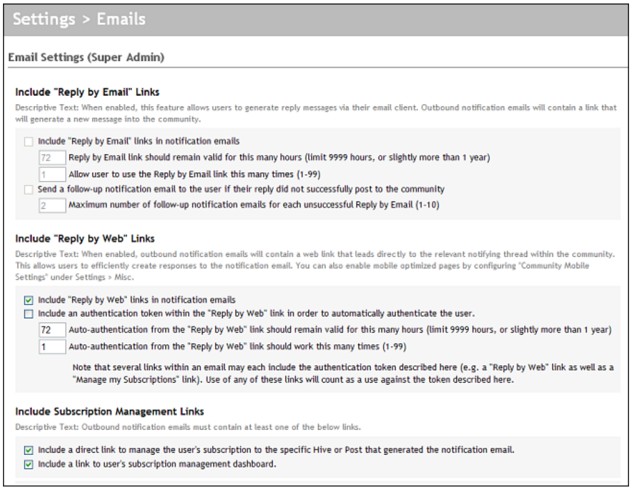
Note Mobile thread update pages are supported only for communities that use a single sign-on through the customer portal for Oracle Service Cloud. However, they are not part of the customer portal's mobile page set.

You can also modify the text content of the notifications used throughout your community, including the messages for new content, forgotten passwords, change email requests, invitations, account activations, private messages, and joined groups and networks.

Important Email administration settings are available only to users of the Admin–All user type.

To configure notification links

1. Click the Admin **user link** to display community administration settings.
2. Click Emails.



3 To include a link for replying by email, select the Include Reply by Email Links in Notification Emails check box.

  a Type the number of hours the Reply by Email link should remain valid.
  b Type the maximum number of uses for the link.
  c To notify users of mail processing issues, select the Send a Follow-up Notification Email to the User check box.
  d Type the number of follow-up notifications sent for each unsuccessful email reply.

Important Before Reply by Email settings take effect, a dedicated reply-to mailbox must be enabled for your community. To enable a reply-to mailbox, contact your Oracle account manager.

4 To include a link for replying by web browser, select the Include Reply by Web Links in Notification Emails check box. This option is enabled by default.

  a To automatically log users in when they click the Reply by Web link, select the Include an Authentication Token Within the Reply by Web link check box.
  b Type the number of hours the Reply by Web link should remain valid.
  c Type the maximum number of uses for the link.

5 To remove the link for managing the subscription for the notifying hive or post, clear the Include a Direct Link to Manage the User's Subscription to the Specific Hive or Post check box.

6 To remove the link configuring all subscriptions, clear the Include a Link to User's Subscription Management Dashboard check box.

7 Scroll to the bottom of the page and click the Save Email Settings button.

To edit the text of notification messages

1 Click the Admin **user link** to display community administration settings.

2 Click Emails.

3 To modify the signature included in all notification messages, type the new signature in the Default Signature field.

4 Locate the notification message you want to modify and type your changes in its field.

Tip The notification messages use tokens to automatically insert values such as post name, user name, group name, and comment content. Tokens supported by each message are listed below the message name. In addition, the group avatar token can be used in the body of subscription notification emails.

5 Click the Save Email Settings button.

Answer commenting on the customer portal

In addition to commenting on posts viewed on the community, your customers can comment on answers presented on the customer portal when you add the AnswerComments widget to the answer details page, shown here.

Answer commenting provides customers with a dedicated space beneath each answer for discussing its content with other customers, whether they are seeking clarity and context or sharing their own knowledge and expertise on the topic at hand. It is also a useful method for gathering feedback on the content you have provided so that you can respond or make adjustments accordingly. To enable answer commenting on your site, refer to Adding the Answer-Comments widget to the answer details page.

Note Oracle Service Cloud provides widgets that extend other community functions to the customer portal as well, such as presenting or submitting posts or displaying a customer's name and picture. For more information about enabling community functions on your customer portal, refer to Community integration widgets.

Post and comment fields

Communities provide a variety of form elements to support different types of posts and comments. The following fields and controls are available when creating and editing post and comment types.

Table 581: Post Fields Description

Post Type	Description
Text	The following elements allow members to enter text when adding a post or comment.
Textbox	Adds a text field to the post or comment form. You can also set parameters for field size and maximum number of characters allowed by typing them in the Field Data field in the format `[small|medium|large],[1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small,24`.
Textarea (WYSIWYG/ HTML)	Adds a text box featuring a WYSIWYG/HTML editor (1-4,000 characters). You can also set the text box height (in text rows) and specify whether to resize it fluidly based on the text it contains. Type these parameters in the Field Data field in the format `[2-50],[fixed|fluid]`. For example, to make the text box ten rows high and automatically resize it based on its contents, type the value `10,fixed`.

Table 581: Post Fields Description (Continued)

Post Type	Description
Textarea (Plain Text)	Adds a text box for entering plain text (1-4,000 characters). You can also specify field size and maximum number of characters allowed in the Field Data field in the format `[size|medium|large],[1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small,24`.
Textarea (Textile)	Adds a text box that supports Textile formatting (1-4,000 characters). Refer to Textile (markup language). You can also specify field size and maximum number of characters allowed in the Field Data field in the format `[size|medium|large],[1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small,24`.
Code	Adds a text box that members can use to display code or preformatted text when adding a post. Code formatting, including tabs and spaces, is retained and displayed when added to a post in this field. You can also specify field size and maximum number of characters allowed in the Field Data field in the format `[size|medium|large],[1-255]`. For example, to add a small field allowing twenty-four maximum characters, type the value `small,24`. **Note:** Code entered in this field will not be rendered and does not impact the security of the community.
Embedded Media	The following elements allow members to embed multimedia content when adding a post or comment.
Image	Select this option to allow members to upload or embed linked image files.
Flash	Select this option to allow members to embed linked Flash *(.swf)* files. **Note:** Although Flash is a supported field type, it can introduce potential misuse by malicious users. Use this field type with caution. Refer to Cross-site flashing.
Video	Select this option to allow members to upload or embed linked video files.

Table 581: Post Fields Description (Continued)

Post Type	Description
Form Controls	The following elements allow members to select options from form controls when adding a post or comment.
Select	Adds a drop-down menu that members can select a single option from. Type options for the menu in the Field Data field in comma-separated format. For example, `High, Medium, Low`.
Multi-select	Adds a multi-select field that members can select one or more options from. Type options for the field in the Field Data field in comma-separated format. For example, `France, Germany, Italy, Portugal, Spain`.
Radio Buttons	Adds radio buttons that members can select a single option from. Type options for the radio buttons in the Field Data field in comma-separated format. For example, `Yes, No, Maybe`.
Checkboxes	Adds check boxes that members can select one or more options from. Type options for the check boxes in the Field Data field in comma-separated format. For example, `Baseball, Basketball, Football, Golf, Tennis`.
Dates and Times	The following elements allow members to enter date values when adding a post or comment.
Date	Adds a date field to the post. Members can type the date in any of the following formats: • `MM/DD/YY` • `Mon DD, YYYY` • `DD Month YYYY` • `Next Day` The community will display the date in the format Month DD, YYYY.
Event Date	Adds a date field to the post or comment that can be used with calendar events and the RSVP feature.
Files	Select this option to allow members to attach files to the post or comment.
Special	The following elements allow members to enter special values when adding a post or comment.

Table 581: Post Fields Description (Continued)

Post Type	Description
Link	Adds a drop-down menu containing links. By default, links open in a new browser window. To open them in a parent window instead, type `internal` in the Field Data field.
Postal Address	Adds a postal address field. **Note:** Content displayed in this field is used to automatically create a link to the address in Google Maps.
Email Address	Adds an email address field.
Instant Messenger	Adds contact ID fields for several leading instant messenger services.
Fixed Value	Select this option and type a text value in the Field Data field to add that text to the post form.
Ratings (Deprecated)	The following elements allow members to enter rating values. **Note:** These elements have been deprecated and will be removed in future releases.
Icon Rating	Adds a drop-down menu that members can use to enter a rating value. By default, values entered in this field will appear as stars, but fork and dollar icons are also available. You can also set the scale for the ratings from one to five. Type these parameters in the Field Data field in the format `[star|fork|dollar], [1-5]`. For example, to define a rating scale of one to four forks, type the value `fork, 4`.
Thumbs Up/Down	Adds a drop-down menu members can use to enter a thumbs up/down rating value.

Sticky posts

To increase the visibility of important and timely information, admins can specify that a post should be "sticky," or always returned at the top of the results list when members view a Posts page or panel. When viewing a post, simply click the Stickiness drop-down menu and select whether you want the post to be sticky on a permanent or temporary basis using the available intervals.

Once a post is made sticky, it will appear at the top of post search results with a pin icon next to its title. For permanently sticky items, the pin will display with a lock, signifying that its sort order will not change.

In cases where multiple sticky posts are returned, posts that are permanently sticky will be sorted above those that are temporarily sticky. Temporary sticky posts are sorted by expiration interval (from shortest to longest) and will automatically revert to normal sorting at the beginning of the expiration date. Each post's expiration date is displayed below its header, visible to admins only.

Note Post stickiness applies only to items displayed on the Posts pages and panels. When posts marked as sticky are displayed on post widgets, they are sorted normally.

Tagging content

Posts can be tagged with simple keyword attributes that can be used to reference and quickly find related information throughout the community. You can add tags to any hive to make them available when members add or edit posts for that hive. Posts that have been tagged with a specific tag can be listed by clicking the tag link wherever it appears, or by appending the *tagName* parameter to the posts page URL, as follows.

```
http://<your_site>/posts?tagName=<tag_name>
```

To add tags to a hive

1 Click the Admin **user link** to display community administration settings.

2 Click Hives.

3 Click Browse All Hives in the Related Tasks section.

Or

Click Search For Hives to search for a specific hive. Refer to Searching for content.

4 Click Settings next to the hive you want to edit permissions for.

5 Click Edit Tags to display a list of tags that are currently configured for the hive.

Table 582: Tags List Description

Column	Description
Name	Displays the name of the tag.
# Posts	Displays the number of posts in the hive that contain the tag. Click the number link to view the posts.
Edit	Click this link to edit the tag name.
Delete	**Caution!** Deleting a tag from its hive will remove all references of the tag in existing posts. This action cannot be undone. Click this button to delete the tag from the hive.

6 Type the tag you want to add in the text field and click the Create Tag button.

7 To view all of the posts in the hive that contain a specific tag, click the # Posts link next to the tag.

8 To edit a tag name, click Edit next to the tag.

Content moderation

Providing a positive, constructive experience for your **members** is essential to the well being of your community. Users should feel welcome and excited about the content you are providing and their own role in producing and consuming it. Setting and maintaining a proper tone and atmosphere for your community can help promote participation.

Communities offer a variety of moderator functions for reporting abusive behavior and suspending inappropriate content. In addition, there may be cases where a member's **post** would simply be more suitable posted to another **hive**. Moderators can easily move posts and associated comments from one hive to another. They can also create incidents from posts, close posts to further commenting, or add notes about the content, such as why it was moved, suspended, or restored to the community.

To protect the member experience, it is vital to quickly detect any inappropriate content that can harm or detract from the value of your community. A number of useful tools are available to help monitor your site.

- **Content flagging**—When members come across a **post** or **comment** they feel is inappropriate, they can flag it for moderator review. If a certain flagging threshold is reached (for instance, if an item is flagged five times), the item is automatically suspended and hidden from community members and searches. Flagged and suspended content can also be tracked and manually suspended by a moderator. Moderators can view and manage suspended and flagged content by clicking an option in the Related Tasks section or clicking the Moderation user link on any page of the community. Refer to Moderating member content.
- **Disruptive user filtering**—To identify users who are engaging in disruptive behavior, your community can monitor the number of flags members have received relative to the number of posts and comments they have submitted. When disruptive users are identified, the system can automatically set their status to Disruptive, hiding them and their content from the community. Users can also be manually set to the Disruptive status by administrators.
- **CAPTCHA threshold**—Communities can also monitor a user's daily submission and private messaging attempts and, upon reaching a specified threshold, present a CAPTCHA challenge-response test on future submission attempts. This is designed to prevent instances of community forms from being submitted by web robots.
- **SmartSense thresholds**—Communities integrated with Oracle Service Cloud can also be configured to evaluate the emotive qualities of member content using the **SmartSense** function (refer to How SmartSense works). Content that exceeds a certain rating threshold will be automatically set to a pending status. Pending content is displayed in the community with an indication that it is pending review, and is automatically added to the Pending queue on the moderation dashboard. Refer to Moderating member content.

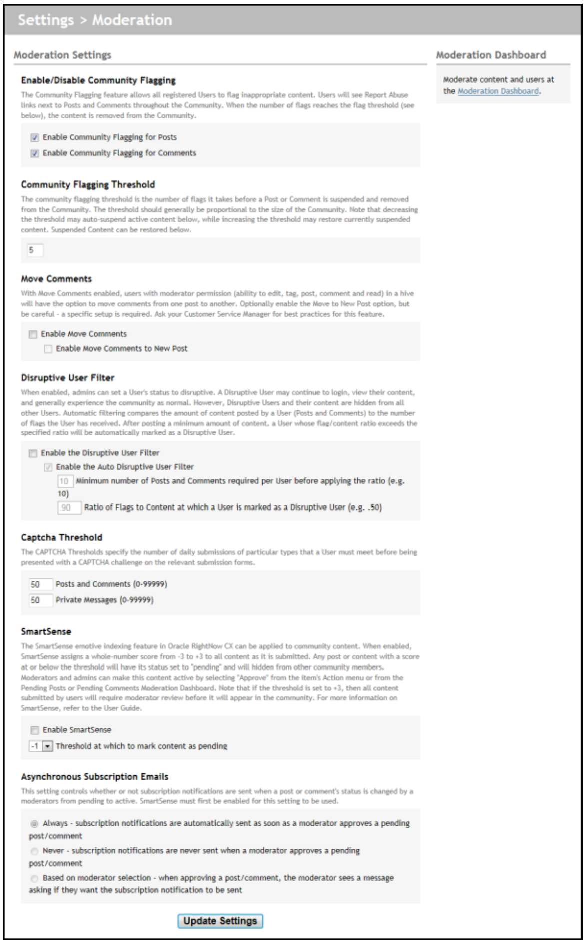
Note When SmartSense is enabled for communities, the Asynchronous Subscription Emails setting controls if subscription notifications are sent when the status of a post or comment is changed from pending to active by a moderator. For example, if a post has been in pending status for several weeks before the moderator approves it, the moderator may not want subscription emails to be sent, since members may assume the post or comment was submitted recently.

- **Profanity filtering**—Communities automatically filter profane words from content entered into the database. The filtered word list can be updated as needed to screen out terms that may be offensive or otherwise cause disruption to your community.

To enable community moderation

1 Click the Admin **user link** to display community administration settings.

2 Click Moderation to display moderation settings.



3 Enter the following field information.

Table 583: Moderation Settings Description

Field	Description
Enable/Disable Community Flagging	The following fields are used to enable or disable content flagging for the entire community.
Enable Community Flagging for Posts	Select this check box to enable content flagging for posts. Post flagging is enabled by default.
Enable Community Flagging for Comments	Select this check box to enable content flagging for comments. Comment flagging is enabled by default.
Community Flagging Threshold	Type the maximum number of flags that you want a post or comment to receive before it is automatically suspended and removed from the community. **Important!** The flagging threshold should be set proportionally to the size of the community, with larger communities having a larger threshold. Because adjustments to the threshold are applied immediately to all community content, decreasing the threshold may restore currently suspended content and increasing the threshold may immediately suspend content that exceeds it.
Move Comments	The following settings are used to enable the discussion management feature, allowing moderators to move comments among posts and to delete multiple comments at once. Refer to Managing discussions. **Note:** Enabling these settings makes this feature available to all moderators across all hives in the community.
Enable Move Comments	Select this check box to allow moderators to move comments from a post to another existing post. This setting is disabled by default.
Enable Move Comments to New Post	Select this check box to allow moderators to move comments from a post to a new post. This setting is disabled by default.
Disruptive User Filter	The following settings are used to enable and adjust automatic detection of disruptive user behavior.
Enable the Disruptive User Filter	Select this check box to allow administrators to manually set a user's status to Disruptive. Refer to Managing member accounts. **Note:** The disruptive user filter is disabled by default.

Table 583: Moderation Settings Description (Continued)

Field	Description
Enable the Auto Disruptive User Filter	Select this check box to enable the automatic filtering of disruptive users based on an appropriate ratio of flags to content. **Note:** This option is enabled by default but is available only when the disruptive user filter is enabled.
Minimum Number of Posts and Comments	Type the minimum number of posts and comments that users must create before the flag-to-content ratio is applied. The default minimum is 10.
Ratio of Flags to Content	Type the minimum ratio of flags to content that must be achieved for a user to be considered disruptive. By default, the ratio is set to .90.
Captcha Threshold	The following settings are used to set the threshold for daily form submissions upon which CAPTCHA challenge-response tests will be presented.
Posts and Comments	Type the maximum number of posts and comments (combined) that a user can submit each day before CAPTCHA challenge-response tests are presented upon form submits. By default, the threshold is set to 50.
Private Messages	Type the maximum number of private messages that a user is allowed to submit each day before CAPTCHA challenge-response tests are presented with the message field. By default, the threshold is set to 50.
SmartSense	The following settings are used to enable the SmartSense emotive indexing feature and to set the SmartSense rating threshold at which content is automatically set to pending status. Refer to SmartSense Emotive Rating.
Enable SmartSense	Select this check box to enable the SmartSense feature.

Table 583: Moderation Settings Description (Continued)

Field	Description
Threshold at Which to Mark Content as Pending	Use this dropdown field to select the SmartSense rating threshold value indicating when a post or comment will be placed in pending status, requiring moderator action to move it to active status. Any post or comment with a score at or below the threshold value will be placed in pending status. **Note:** Negative values correspond to negative SmartSense ratings, while positive values correspond to positive ratings. For example, if the threshold value is set at +3, all posts and comments will require moderator review, while if the value is set to -3, posts and comments with only the most negative SmartSense rating will require moderator review.
Asynchronous Subscription Emails	Select one of the following radio buttons to determine when subscription emails are sent to community members when a moderator changes the status of a post or comment from pending to active. **Note:** The Enable SmartSense check box must be selected for these radio buttons to be active.
Always	Select this radio button to send subscription notifications when a moderator approves a pending post or comment by changing its status to active.
Never	Select this radio button to never send subscription notificiations when a moderator approves a pending post or comment by changing its status to active.
Based on Moderator Selection	Select this radio button to give the moderator direct control of whether or not subscription notifications will be sent when the status of a pending post or comment is changed to active. When this option is selected, the moderator will see a pop-up message asking if subscription notifications should be sent. Refer to Moderating member content.

4 Click the Update Settings button.

To enable the profanity content filter

1 Click the Admin **user link** to display community administration settings.

2 Click Moderation to display moderation settings.

3 In the Profanity Filter Settings section, select the Enable Filtered Word List check box.

4 To filter additional words from community content, add them to the Filtered Word List field. Each word must appear on its own line followed by a return.

Caution The filtered word list contains numerous terms that are patently offensive and is accessible to any user associated with the Admin–All user type. Discretion is advised when viewing and modifying the contents of this list.

5 Click the Save Profanity Filter Settings button.

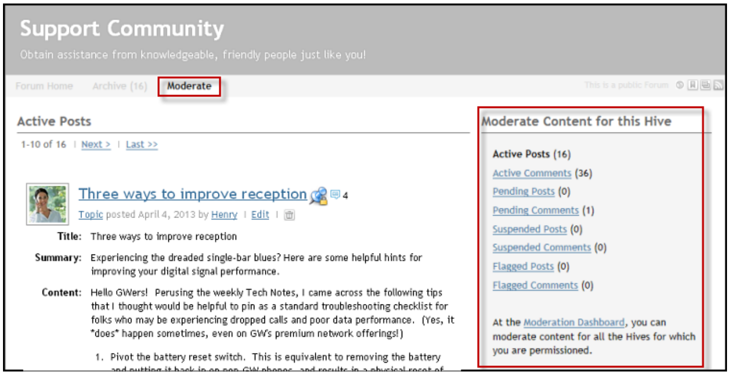
Moderating member content

Communities provide several moderation options for content, including ways to suspend posts and comments and remove ratings. As members review posts and comments on your site, they can flag inappropriate content by selecting Report Abuse from the Actions link appearing above each entry. If an item reaches a specified number of flags, it is automatically suspended and hidden from view.

The Actions link also contains a few options visible only to moderators and administrators, such as the ability to add private moderator notes or suspend content outright. In addition, administrators can edit metadata or suspend members who engage in repeated abusive behavior by editing their account and setting their status to Suspended. Refer to Managing member accounts.

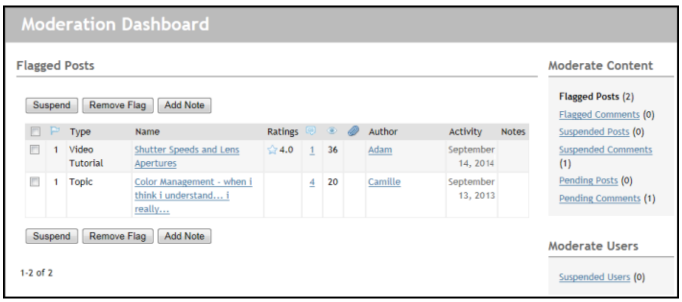
Communities connected to or merged with Oracle Service Cloud can be enabled with SmartSense content rating to automatically set posts and comments to a status of Pending when they exceed the defined SmartSense threshold.

Flagged, suspended, and pending content is listed on a special dashboard for review by moderators. Members permitted to moderate a specific hive can click the hive's Moderate tab to review flagged, suspended, and pending content associated with that hive.



Click the Moderation Dashboard link to access the expanded dashboard where you can moderate content from all the hives you are permitted to moderate. Users with more extensive moderation privileges throughout the community can click the Moderation **user link** on any community page to access the expanded dashboard.

The expanded moderation dashboard displays flagged, suspended, and pending posts and comments from all of the hives that you have permission to see throughout the entire community.



Links on the right provide access to alternate moderator queues, including flagged, suspended, and pending posts and comments. The dashboard provides information about items in the displayed queue, such as ratings, number of comments, number of views, activity time, and the author name. Posts and comments that contain file attachments display a file type indicator that you can click to view the file. Select any check box and click an available option to unflag, suspend, approve (set to Active status), or restore the content, or add a moderator note. Hovering over a post's link will reveal its first 150 characters, while hovering over a moderator note reveals its first 20 characters. Click on the number of comments item to go to the most recent comment.

Administrators can also click the Suspended Users queue, where they can edit, restore, or add moderator notes to members that are currently set to the Suspended status.

To moderate content as a hive moderator

1 On any hive page, click the Moderate tab of the tab set. The page refreshes with a list of active posts.

2 To display only active, pending, suspended, or flagged posts and comments, click an option in the Moderate Content section.

3 Click a post or comment title to view its content.

4 Hover over the content's Actions link and select from the following actions. The page refreshes with confirmation that the action was successful.

Table 584: Moderation Actions

Action	Description
Apply Tags	Select this action to apply tags to a post. **Note:** This option is available only when tags have been added to the hive.
Move Post	Select this action on a post to move it to a different hive.
Close Comments	Select this action on a post to prevent further comments.
Escalate	Select this action on a post to submit its content as an incident. Refer to Escalating a post to an incident.
Edit Metadata	Select this action on a post to edit its created and created by attributes. Refer to To edit post metadata.
Report Abuse	Select this action on a post or comment to flag its content for moderator review.

Table 584: Moderation Actions (Continued)

Action	Description
Resolve	Select this action on an escalated post to indicate that the question has been resolved. Refer to Escalating a post to an incident. **Note:** This action affects only the post. You must still edit the incident if you want to set it to the Solved status.
Approve	Select this action to change the status of a pending post or comment to active, making it visible to community members.
Suspend	Select this action on a post or comment to hide it from community members and searches.
Restore	Select this action to restore a suspended post or comment to the community.
Moderator Notes	Select this action to enter moderator notes. Refer to To add moderator notes.

Tip Use the expanded moderation dashboard to select multiple posts or comments and take a specified action on all of them with a single click.

5 To moderate the ratings of a post or comment, click Moderate Ratings. All current ratings for the post or comment are listed by member.
   a Select the check box next to one or more ratings that you want to remove.
   b Click the Delete Ratings button.

To add moderator notes

1 View a post or comment.

2 Hover over the content's Actions link and select Moderator Notes.

3 Type your note in the text field.

4 Click the Add Note button to add your note to the moderator notes thread.

To edit post metadata

1 From any open post, hover over the post's Actions link and select Edit Metadata.

2 To change the member that the post is attributed to, type the new member name in the Created By field.

3 To change the post's creation date, select an option from the Created radio buttons.
   - Current: <date and time>—Keep the post's creation date set to its current value.
   - Now—Set the creation date to the current date and time.
   - Custom—Type a new value for the creation date and time in this field.

4 Click the Update Metadata button to save your changes.

Managing discussions

An essential way to ensure that community content is relevant and useful is to encourage your members to keep comment threads consistent with the topic of each post. Often, it is helpful to identify conversations that are drifting off topic and move them to new or existing discussions elsewhere in the community. When the discussion management feature is enabled, staff members who have moderation rights for a hive (including Edit, Tag, Post, Comment, and Read privileges) can move comments from one post to another, as follows:

- Comments can be moved to a new post of the *same* post type in the *same* hive. The first selected comment will be used for the content of the new post, with the remaining selected comments (if any) added as comments to that post.
- Comments can also be moved to an existing post of *any* post type and *any* comment type in *any* hive across your community. All moved comments will be appended to the post's existing comment thread in chronological order. If the discussion is non-threaded, the comments will simply appear in their chronological position. In threaded discussions, the original structure will be maintained as much as possible. That is, the top-most comments will become top-level comments, and any child comments moved along with their parents will remain under their parents in the destination thread.

Note In order to move comments to a post in another hive, you must have moderation privileges for the destination hive as well as the hive you are moving comments from.

Due to the variety of content objects available in a community, it is typically much easier for moderators to use the Move to Existing Post option when moving comments between posts, even if moving content to a new post. This is because the Move to a New Post option strictly requires the destination post type to have identical field names, field types, and field data settings as the migrating comment type.

For this reason, we recommend that moderators use the Move to Existing Post option even when moving comments to a new post, as follows:

1 Create a new post in the destination hive.

2 Add a relevant title and body summarizing the content of the comments you will be moving.

3 Move the comments to the new post you've just created using the Move to Existing Post option.

In this way, you can avoid the strict requirements of the Move to New Post options while achieving the same result.

Comments that are moved will retain their ratings, flags, and attachments, but comments marked as Best Answer must be unmarked as such before they can be moved. Members who have subscribed to comments that are later moved will not be notified.

Once a comment has been migrated to a separate post, it is replaced in the original thread with a link to the content's new location. Comments containing these links are assigned to the moderator so they may be moved or edited for context.

Moderators can also, at their own discretion, delete one or more comments from a thread that do not contribute value or detract from the discussion.

Note To enable the discussion management feature for moderators, refer to Content moderation.

To move comments to another post

1 View a post with comments.

2 Select the check box at the upper right of each comment you want to move.

3 Hover over the content's Manage Discussion link in the footer of the discussion thread and select Move Comments. The Move Comments window opens.

4 To move the selected comments to a new post in the current hive, select the Move to a New Post radio button.

Tip Once a comment has been moved to a new post, that post can be moved to a different hive as a separate action. Refer to Moderating member content.

5 To move the selected comments to an existing post elsewhere in the community, select the Move To Existing Post radio button and type the URL of the post you want to move the comments to.

Note When you click the Move Comments button, the destination URL will be verified by Oracle Service Cloud to ensure it is valid. If the URL is invalid, an error will be returned.

6 Click the Move Comments button. The destination post displays in edit mode with the moved comments in place below it.

To delete multiple comments from a post

1 View a post with comments.

2 Select the check box at the upper right of each comment you want to delete.

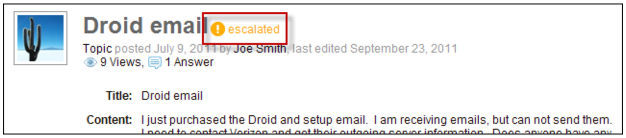
3 Hover over the content's Manage Discussion link in the footer of the discussion thread and select Delete Comments. A confirmation window opens.

4 Click the Delete Comments button.

Escalating a post to an incident

Occasionally, when reviewing a post, you may encounter a service issue that requires assistance from a support agent. When **Oracle RightNow Cloud Service (Service)** is enabled, you can use the Escalate moderation action to create an **incident** containing the post's title, summary, URL, and an excerpt of content in the incident Subject field. You can also add a private note to the incident thread to provide context to the issue you're submitting.

Escalated posts are marked with a yellow indicator next to the post title, as shown here. Once the issue is resolved, you can use the Resolve moderation action to clear the indicator.



Note To make the escalation indicator visible to administrators only, submit an incident on our support site.

Posts can be escalated multiple times. However, once a post is escalated, it cannot be escalated again until it has been marked as resolved. Each escalation will create a new incident in the system.

Note Incidents can also be created automatically for posts that do not receive a comment or best answer within a specified number of hours. To enable this function on a site that has Service enabled, submit an incident on our support site.

To enable Service, contact your Oracle account manager.

To escalate a post to an incident

1. While viewing a post, hover over the content's Actions link and select Escalate. The Escalate Post window opens.
2. To enter a private note in the incident thread, type the note in the Note field.
3. Click the Create Incident button. An incident is created and the post title is marked as escalated.

To clear a post escalation

While viewing an escalated post, hover over the content's Actions link and select Resolve. The escalation indicator is cleared.

Note Selecting the Resolve moderation action will not solve the incident, and setting an incident to the Solved status on the agent desktop will not clear the escalation indicator from the post. These actions must be performed separately.

To change an incident's status, refer to Incident statuses.

Member reputation levels

While moderation is important for protecting **members** from abusive behavior, your community can also help you track and promote positive user activity. Recognizing and rewarding users who are experienced, prolific, or helpful to others adds value to your community because it fosters meaningful relationships and encourages active participation.

To help identify your most valued members, you can create custom reputation levels, such as Expert, Mentor, and Advanced Member. Reputation levels are automatically assigned to members based on their level of activity within the community, represented by a point system.

When you create a reputation level, you define the number of points a member must accrue to reach that level. Then you assign point values to a variety of member actions within the community, such as 50 points for creating a **post**. Reputation actions can be assigned any point value from -100 to 100. A negative point value will decrease the number of member reputation points accrued.

While each of the monitored actions benefits your community to some degree, you can decide which actions you value more highly and assign them more points. You can also upload images for each reputation level that will be displayed along with profile information when members add posts and comments to the community.

Once configured, the process of identifying and rewarding your most valued members is completely automated. Member reputation levels are displayed for the benefit of the community, indicating their status as valued members.

Note The following procedures can also be used to edit reputation levels and actions. If you change the point values assigned to existing reputation levels or actions, the system will automatically recalculate all member reputations based on the new scoring you have defined. In most cases, this update will occur immediately, but in a few instances, such as sorts and filters based on reputation, the process may require up to fifteen minutes to complete.

To create member reputation levels

1 Click the Admin **user link** to display community administration settings.

2 Click Reputation to display reputation settings.

3 In the Reputation Levels section, click Add Level.

4 Type a name for the level in the Name field.

5 Type the number of points that must be accrued by members to achieve the level in the Points field.

6 To add an image for a reputation level, click Edit.
   - a Click the Browse button. A window opens and displays the files and folders on your workstation.
   - b Select the file to attach.
   - c Click the Open button to attach the file to the record.

Note Because images are not automatically resized when they are displayed, we recommend that you upload only small images approximately 20x20 pixels.

7 Repeat steps 3 through 6 for each reputation level you want to add.

8 To delete a reputation level, select the Delete check box for that level.

9 To change the name of the default Member level, type a new name in its Name field.

Note The default Member level cannot be deleted but it can be renamed.

10 Click the Save Reputation Levels button.

To assign reputation point values for user actions

1 Click the Admin **user link** to display community administration settings.

2 Click Reputation to display reputation settings.

3 In the Reputation Actions section, type a point value in the Points field next to each action to indicate its impact on member reputation.

Table 585: Member Reputation Actions

Action	Description
Create Post	A member creates a post.
Create Comment	A member comments on a post.
Rate Post	A member submits a rating for a post.
Rate Comment	A member submits a rating for a comment.
Invite Member	A member invites someone to join a group.
Comment Selected as Best	A member's comment is selected as the best answer to a question submitted in a post.
Comment on My Post	A member's post is commented on by another member.
Rating on My Post	A member's post receives a rating from another member.
Rating on My Comment	A member's comment receives a rating from another member.

Note Points received for post and comment ratings are proportional to the value of the rating. For example, if you assign 10 points to the Rating on My Posts action, thumbs up and thumbs down ratings will receive 10 and -10 points, respectively, while 1-5 star ratings will receive 10, 5, 0, -5, and -10 points, respectively.

4 Click the Save Reputation Actions button.

Customizing pages

In addition to your community's standard page sets (refer to Community page structure and navigation), you can create custom pages, defining design elements such as the page title and tagline, meta tags for search engine optimization, as well as tabs and **panels**. These options provide you with great flexibility for the appearance and function of your pages, tailoring your community to serve a wide variety of business needs.

You can create two types of custom pages: content and category. Content pages are used to add and edit design elements, including panels, that define the layout of a page. Category pages serve as landing pages for grouping and accessing sets of content pages and can be made available as links in the community navigation set. Refer to Community page structure and navigation.

Note While your community's standard and custom page sets provide extensive flexibility for the appearance and function of your site, access to high-level design elements (such as community style sheets) is restricted. Look and feel assets are stored on Oracle servers to ensure that your site's appearance remains consistent after upgrades and updates. To discuss high-level customization options, contact your Oracle account manager.

To create a custom page

1 Click the Admin **user link** to display community administration settings.

2 Click Custom Pages.

3 In the Create a Page section, select the type of page you want to create from the Page Type radio buttons. Options include Content and Category.

Note A page's type cannot be changed once it has been created.

4 Type a name for the page in the Page Name field.

5 Click the Create Page button. The page is added to the list of available pages in the Pages section.

To edit a custom page

1 Click the Admin **user link** to display community administration settings.

2 Click Custom Pages.

3 In the Pages section, click Edit next to the page you want to customize.

Note You can also edit a page you are viewing by clicking Edit Page on the right side of the page header.

4 To edit the page name or tagline, click Edit General Settings.

  a To change the page name that appears in the page heading, type a new page name in the Page Name field.
  b To add a one-line description of the page, type the description in the Tagline field.
  c Click the Update Settings button.

5 To define the meta tag of a content page, click Edit Meta Tags.

  a Type a title for the browser's title bar in the Title field.
  b Type a description for the meta tag in the Description field.
  c Type keywords for the meta tag in the Keywords field.

6 To add content panels to a custom page, click Edit Panels and refer to Adding panels to pages.

7 To add tabs to a category page, click Edit Tabs.

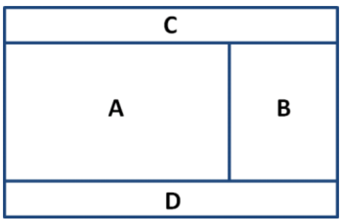
  a In the Tabs section, click Add Tab.
  b Type the text of the tab in the Text field.
  c Type a relative path for the tab in the URL field.

Note When defining a tab, you must enter a relative path to a page on the community, such as /pages/86ad8a11dc. The URL field does not support full URLs to pages outside of the community.

  d Click the Update Tabs button.

Adding panels to pages

The center area of most pages is used to display some form of content. This content section is structured as a simple table containing four content frames.



These frames are identified in the page layout by letters A through D. Each has a fixed width designed to present a different portion of the layout.

- **A**—Main content frame with a fixed width of 595 pixels.
- **B**—Related content frame with a fixed width of 305 pixels.
- **C**—Header frame with a fixed width of 920 pixels.
- **D**—Footer frame with a fixed width of 920 pixels.

The content of each frame is defined by adding panels, widget-like objects that display dynamic content from the **community**. You can select, position, and configure a variety of useful panels to meet your design objectives. Some panels display lists of community objects like users, **groups**, **hives**, or **posts**. Others are used to embed more specialized information like community statistics, custom HTML, or images. Panels can be customized using properties you define such as title text, sources and filters (for lists), privacy, and style attributes.

The following panels are available for adding to page frames.

Table 586: Panels Available for Community Pages

Type/Panel	Description
Community Content	The following panels are used to display community content on custom pages.
Users	Displays a list of **members** in various formats, such as a list of member names and statistics or a grid of member avatars. Refer to Editing Users panel properties.
Groups	Displays a list of groups in various formats, such as a list of group names and statistics or a grid of group avatars. Refer to Editing Groups panel properties.
Hives	Displays a list of hives in various formats, such as a list of hive names and statistics. Refer to Editing Hives panel properties.
Posts	Displays a list of posts in various formats, such as a list of post titles or summaries. Refer to Editing Posts panel properties.
Comments	Displays a list of comments in various formats, such as a list of comment summaries. Refer to Editing Comments panel properties.
Calendar Filter	Displays a calendar for filtering post panel content by date. Refer to Editing Calendar panel properties.

Table 586: Panels Available for Community Pages (Continued)

Type/Panel	Description
Search	Displays a basic keyword search box and advanced search link using properties you define for title, privacy, and style. Refer to Editing Search panel properties.
Community Stats	Displays community statistics using properties you define for title, privacy, and style. Refer to Editing Community Stats panel properties.
Hive Only	The following panels are available only when editing a hive summary page by clicking the hive's Settings tab and clicking Edit Panels page in the Summary Page section.
New Post	Displays options for creating new posts of available post types. Refer to Editing New Post panel properties.
Hive Stats	Displays statistics about the hive, including privacy level, owner, dates of creation and last activity, and the number of posts and comments created in the hive. Refer to Editing Hive Stats panel properties.
Media/Embed	The following panels are used to display media content on custom pages.
WYSIWYG/HTML	Displays custom HTML content that you define using a WYSIWYG editor. Refer to Editing WYSIWYG/HTML panel properties.
Image	Displays a web-hosted image that you specify by URL. Refer to Editing Image panel properties.
Flash (SWF)	Displays a web-hosted Flash *(.swf)* file that you specify by URL. Refer to Editing Flash panel properties. **Note:** Although Flash is a supported panel type, it can introduce potential misuse by malicious users. Use this panel type with caution. Refer to Cross-site flashing.
RSS Reader	Displays one or more RSS feeds using properties you define for feed view and URLs. Refer to Editing RSS Reader panel properties.
Admin Only	The following panels are used to display custom design elements, including HTML and iFrame content.

Table 586: Panels Available for Community Pages (Continued)

Type/Panel	Description
HTML	Displays custom HTML content using code that you define. Refer to Editing HTML panel properties.
iFrame	Displays an iFrame containing a web page that you specify by URL. Refer to Editing iFrame panel properties.

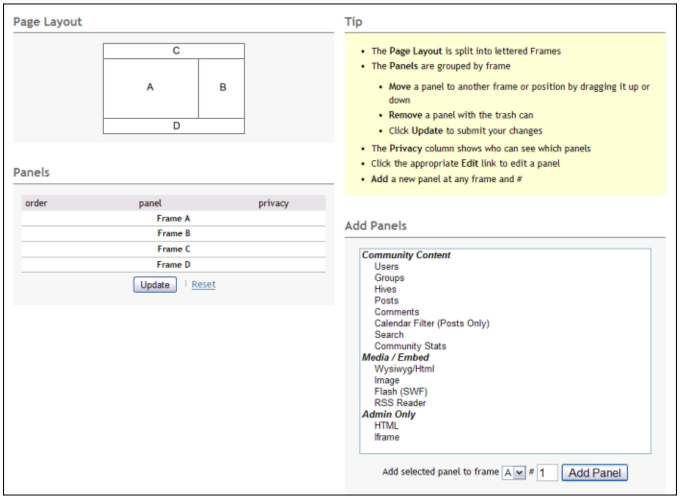
Panels can be customized in many ways according to their type. In addition to defining a panel header, source, and filters, most panels provide access and visibility properties. For instance, you can set a panel to be visible only to logged-in members or to members of a specific group. If a member doesn't have the attributes required to view a panel, that panel will not appear when the member views the page. Because visibility can also be defined by content sources, each member may experience a unique view of the same custom page, accessing only the content appropriate for them.

Panels can also define how content is presented, such as how much of each item displays and in what order.

To add a panel to a page

1 Open a page for editing by going to Admin > Custom Pages and clicking Edit next to the page you want to edit.

2 Click Edit Panels to display page layout editing options.



3 Select the panel you want to add from the Add Panels section.

4 Click the Add Selected Panel to Frame drop-down menu and select the frame you want to add the panel to.

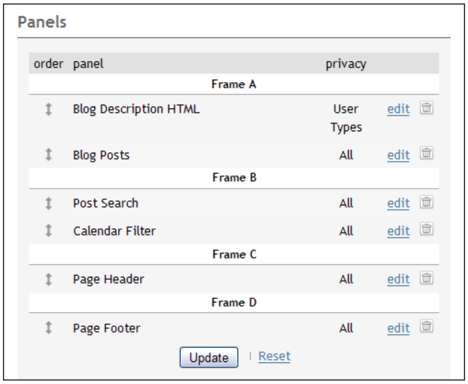
5 To customize the position of the panel when it is added to a frame with multiple panels, type an order number in the text field to the right of the drop-down menu.

6 Click the Add Panel button to edit properties for the panel you are adding. Refer to Editing Users panel properties.

7 Click the Save Panel button. The panel is added to the page layout and the panel name is listed in the Panels section.

To edit or remove a panel

1 From the page containing the panel, click Edit in the upper right corner of the panel you want to edit. A list of the panels on the page displays.



2 To move a panel, click the arrow next to the panel you want to move.

   a Drag and drop the panel to its new position.

Note You can drag panels to a different position in the same frame or a completely different frame.

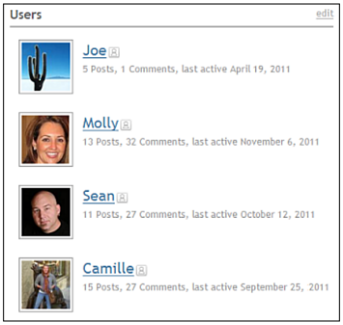
3 To edit panel properties, click Edit to the right of the panel and refer to Editing Users panel properties.

4 To remove a panel from the page, click the Delete button to the right of the panel.

5 Click the Update button to save your changes.

Editing Users panel properties

The Users panel displays a list of **members** in various formats, such as a list of member names and statistics or a grid of member avatars.



Once you add this panel to a page frame, you must edit its properties to define the list source and filters. You can also adjust the list's display, style, and privacy attributes.

To edit Users panel properties

1 Enter the following field information.

Table 587: Users Panel Properties

Property	Description
General	The following setting specifies the title displayed by the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
List Source	The following settings specify the source of the list data displayed by the panel.
Group	Type a group **hash** to list only members of a certain group. **Note:** The group's hash is found in the URL of its pages. For example, if a group's summary page is located at http://<your_site>.com/groups/bbe47d0d5e/summary, the group hash is bbe47d0d5e.
Active User	Click this drop-down menu and select In the Active User's Network to list only members in the logged-in user's network. This option provides a personalized panel view for each member.

Table 587: Users Panel Properties (Continued)

Property	Description
Hive Contributors	Select the List Users check box and type a hive hash to list only members who have contributed to that hive. Click the Contribution drop-down menu to select the type of contribution (post, comment, or both). **Note:** The hive's hash is found in the URL of its pages. For example, if a hive's summary page is located at http://<your_site>.com/hives/bbe47d0d5e/summary, the hive hash is bbe47d0d5e.
List Filters	The following settings are used to filter the list displayed by the panel. **Note:** List filters can be used instead of, or in addition to, a list source.
User Type Filter	Click this drop-down menu to select a **user type** to filter on. By default, members of all user types are listed. Refer to User types.
Reputation Level Filter	Click this drop-down menu to select a reputation level to filter on. By default, members of all reputation levels are listed. Refer to Member reputation levels.
Status Filter	Click this drop-down menu to select a user status to filter on. By default, the panel will filter for active members. Refer to Managing member accounts.
Advanced	Click these drop-down menus to select filters on members associated with comments, hives, posts, friends, or avatars. By default, all members with or without these associations will be listed.
List Options	The following settings define how the list is presented, including the details displayed, sort order, the number of records shown, and toolbar appearance.

Table 587: Users Panel Properties (Continued)

Property	Description
View	Click this drop-down menu to select the display type for the list. Options include the following: • **Title**—Displays each member's name only. • **Summary**—Displays each member's avatar, name, number of posts and comments, and the date last active. • **Summary without props**—Displays each member's avatar and name. • **Summary with points**—Displays each member's avatar, name, date last active, and number of points. Refer to Member reputation levels. • **Cloud**—Displays member names in various font sizes based on their level of activity. • **Grid**—Displays member avatars and names in grid form. • **Grid without name**—Displays member avatars in grid form.
Sort	Click this drop-down menu to select a sort order for the list. Options include sorting alphabetically, by date of last activity, number of posts, or date joined.
Count	Type the number of results you want the panel to return.
Toolbar	The following settings are used to specify the appearance of the toolbar beneath the panel header.
No Toolbar	Select this radio button to display no toolbar below the panel header.

Table 587: Users Panel Properties (Continued)

Property	Description
Pagination	Select this radio button to display pagination links. Selecting this option also causes the following settings to appear. • **Link Text**—Click this drop-down menu and select Custom Text to enter custom text for the pagination link. By default, the link text displays the total number of members returned and links to the next page and last page of the result set. • **Link URL**—Click this drop-down menu to select an alternate link URL such as the current page or a custom URL. By default, the link URL is based on the list source. When Current Page is selected, the Query String Override property should be set to Allow Query String Override. • **Which Panel Settings**—Click this drop-down menu to select the settings that are passed to the URL. Options include all settings, only start, and no settings. By default, all settings are passed.
Custom Links/Text	Select this radio button to display one or more custom links or text, defined as follows. • To define a link, type the link text in the first field and the URL in the second field. • To define only text, type the text value in the first field. • To add more links or text, click Add Link.
Query String Override	To allow the panel's settings to be overridden by parameters in the browser's query string, select Allow Query String Override from this drop-down menu. By default, the panel properties will define the display of the panel.
Hide Empty	Select this check box to hide the panel when no results are returned.
Privacy	The following setting defines privacy properties for the panel.

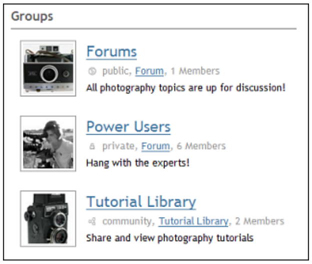
Table 587: Users Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member’s view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Groups panel properties

The Groups panel displays a list of groups in various formats, such as a list of group names and statistics or a grid of group avatars.



Once you add this panel to a page frame, you must edit its properties to define the list source and filters. You can also adjust the list's display, style, and privacy attributes.

To edit Groups panel properties

1 Enter the following field information.

Table 588: Groups Panel Properties

Property	Description
General	The following setting specifies the title displayed by the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
List Source	The following settings specify the source of the list data displayed by the panel.
Group	Type a group hash to list only information from a certain group. Separate multiple hashes with commas. If you want to include a large number of groups, it may be easier to use list filters. See List Filters in this table. **Note:** The group's hash is found in the URL of its pages. For example, if a group's summary page is located at http://<your_site>.com/groups/bbe47d0d5e/summary, the group hash is bbe47d0d5e.

Table 588: Groups Panel Properties (Continued)

Property	Description
Active User	Click this drop-down menu and select one of the following options to provide a personalized panel view for each member. • **None**—Do not return groups based on the active user. • **By the Active User**—Return only groups created by the logged-in member. • **In Groups the Active Member is a Member Of**—Return only groups the logged-in member is associated with.
List Filters	The following settings are used to filter the list displayed by the panel. **Note:** List filters can be used instead of, or in addition to, a list source.
Group Type Filter	Click this drop-down menu to select a group type to filter on. By default, members of all groups are listed. Refer to Groups.
Advanced	Click these drop-down menus to select filters on groups associated with hives or avatars. By default, all groups with or without these associations will be listed.
List Options	The following settings define how the list is presented, including the details displayed, sort order, the number of records shown, and toolbar appearance.
View	Click this drop-down menu to select the display type for the list. Options include the following: • **Title**—Displays each group's name only. • **Summary**—Displays each group's avatar, name, number of posts and comments, and the date last active. • **Summary without props**—Displays each group's avatar and name. • **Cloud**—Displays group names in various font sizes based on their level of activity. • **Grid**—Displays group avatars and names in grid form. • **Grid without name**—Displays group avatars in grid form.
Sort	Click this drop-down menu to select a sort order for the list. Options include sorting alphabetically, by number of members, date created, or privacy.
Count	Type the number of results you want the panel to return.

Table 588: Groups Panel Properties (Continued)

Property	Description
Toolbar	The following settings are used to specify the appearance of the toolbar beneath the panel header.
No Toolbar	Select this radio button to display no toolbar below the panel header.
Pagination	Select this radio button to display pagination links. Selecting this option also causes the following settings to appear. • **Link Text**—Click this drop-down menu and select Custom Text to enter custom text for the pagination link. By default, the link text displays the total number of members returned and links to the next page and last page of the result set. • **Link URL**—Click this drop-down menu to select an alternate link URL such as the current page or a custom URL. By default, the link URL is based on the list source. When Current Page is selected, the Query String Override property should be set to Allow query string override. • **Which Panel Settings**—Click this drop-down menu to select the settings that are passed to the URL. Options include all settings, only start, and no settings. By default, all settings are passed.
Custom Links/Text	Select this radio button to display one or more custom links or text, defined as follows. • To define a link, type the link text in the first field and the URL in the second field. • To define only text, type the text value in the first field. • To add more links or text, click Add Link.
Query String Override	To allow the panel's settings to be overridden by parameters in the browser's query string, select Allow Query String Override from this drop-down menu. By default, the panel properties will define the display of the panel.
Hide Empty	Select this check box to hide the panel when no results are returned.
Privacy	The following setting defines privacy properties for the panel.

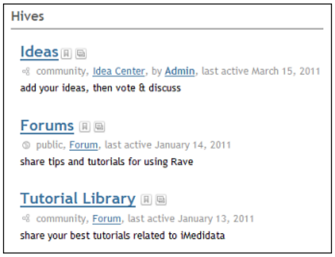
Table 588: Groups Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Hives panel properties

The Hives panel displays a list of hives in various formats, such as a list of hive names and statistics.



Once you add this panel to a page frame, you must edit its properties to define the list source and filters. You can also adjust the list's display, style, and privacy attributes.

To edit Hives panel properties

1 Enter the following field information.

Table 589: Hives Panel Properties

Property	Description
General	The following setting specifies the title displayed by the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
List Source	The following settings specify the source of the list data displayed by the panel.
Group	Type a group hash to list only information from a certain group. **Note:** The group's hash is found in the URL of its pages. For example, if a group's summary page is located at http://<your_site>.com/groups/bbe47d0d5e/summary, the group hash is bbe47d0d5e.
Hives	Type a hive hash to list only information from a certain hive. Separate multiple hashes with commas. If you want to include a large number of hives, it may be easier to use list filters. See List Filters in this table. **Note:** The hive's hash is found in the URL of its pages. For example, if a hive's summary page is located at http://<your_site>.com/hives/bbe47d0d5e/summary, the hive hash is bbe47d0d5e.

Table 589: Hives Panel Properties (Continued)

Property	Description
Active User	Click this drop-down menu and select one of the following options to provide a personalized panel view for each member. • **None**—Do not return hives based on the active user. • **By the Active User**—Return only hives created by the logged-in member. • **In the Active User's Favorites**—Return only hives that have been added as favorites by the logged-in member. • **In Groups the Active Member is a Member Of**—Return only hives from groups the logged-in member is associated with.
List Filters	The following settings are used to filter the list displayed by the panel. **Note:** List filters can be used instead of, or in addition to, a list source.
Group Type Filter	Click this drop-down menu to select a group type to filter on. By default, hives are not filtered by group. Refer to Groups.
Hive Type Filter	Click this drop-down menu to select a hive type to filter on. By default, hives of all types are listed. Refer to Hives.
Advanced	Click these drop-down menus to select filters on hives associated with posts or comments. By default, all hives with or without these associations will be listed.
List Options	The following settings define how the list is presented, including the details displayed, sort order, the number of records shown, and toolbar appearance.
View	Click this drop-down menu to select the display type for the list. Options include the following: • **Title**—Displays each hive's name only. • **Summary**—Displays each hive's avatar, name, number of posts and comments, and the date last active. • **Summary without props**—Displays each hive's avatar and name. • **Cloud**—Displays hive names in various font sizes based on their level of activity. • **Table**—Displays hive avatars and names in table form.

Table 589: Hives Panel Properties (Continued)

Property	Description
Sort	Click this drop-down menu to select a sort order for the list. Options include sorting alphabetically, by date of last activity, number of posts, date created, or privacy.
Count	Type the number of results you want the panel to return.
Toolbar	The following settings are used to specify the appearance of the toolbar beneath the panel header.
No Toolbar	Select this radio button to display no toolbar below the panel header.
Pagination	Select this radio button to display pagination links. Selecting this option also causes the following settings to appear. • **Link Text**—Click this drop-down menu and select Custom Text to enter custom text for the pagination link. By default, the link text displays the total number of members returned and links to the next page and last page of the result set. • **Link URL**—Click this drop-down menu to select an alternate link URL such as the current page or a custom URL. By default, the link URL is based on the list source. Options include all settings, only start, and no settings. By default, all settings are passed.
Custom Links/Text	Select this radio button to display one or more custom links or text, defined as follows. • To define a link, type the link text in the first field and the URL in the second field. • To define only text, type the text value in the first field. • To add more links or text, click Add Link.
Query String Override	To allow the panel's settings to be overridden by parameters in the browser's query string, select Allow Query String Override from this drop-down menu. By default, the panel properties will define the display of the panel.

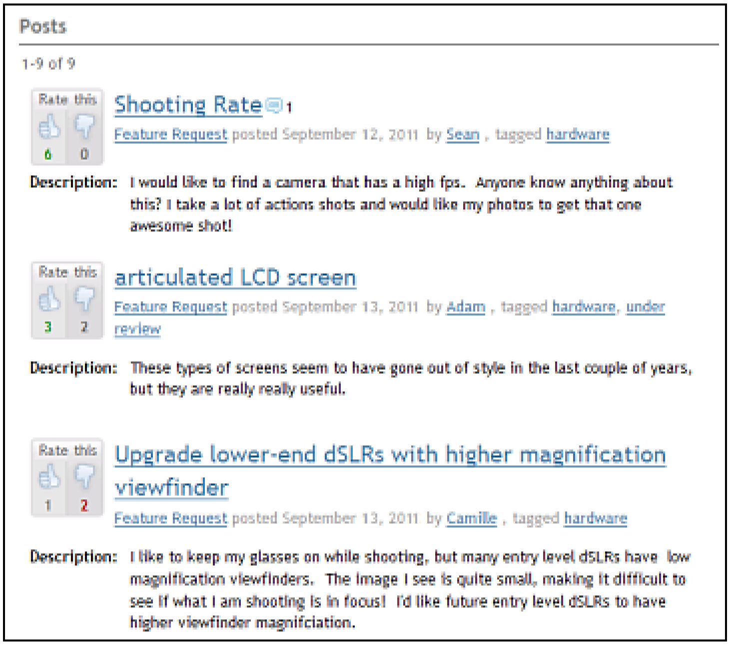
Table 589: Hives Panel Properties (Continued)

Property	Description
Hide Empty	Select this check box to hide the panel when no results are returned.
Privacy	The following setting defines privacy properties for the panel.
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Posts panel properties

The Posts panel displays a list of posts in various formats, such as a list of post titles or summaries.



Once you add this panel to a page frame, you must edit its properties to define the list source and filters. You can also adjust the list's display, style, and privacy attributes.

To edit Posts panel properties

1 Enter the following field information.

Table 590: Posts Panel Properties

Property	Description
General	The following setting specifies the title displayed by the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
List Source	The following settings specify the source of the list data displayed by the panel.

Table 590: Posts Panel Properties (Continued)

Property	Description
Group	Type a group hash to list only posts from a certain group. **Note:** The group's hash is found in the URL of its pages. For example, if a group's summary page is located at http://<your_site>.com/groups/bbe47d0d5e/summary, the group hash is bbe47d0d5e.
Hives	Type a hive hash to list only posts from a certain hive. Separate multiple hashes with commas. If adding the panel to a hive page, type `[[self]]` to list posts from the current hive. If you want to include posts from a large number of hives, it may be easier to use list filters. See List Filters in this table. **Note:** The hive's hash is found in the URL of its pages. For example, if a hive's summary page is located at http://<your_site>.com/hives/bbe47d0d5e/summary, the hive hash is bbe47d0d5e.
Posts	Type a post hash to list only information from a certain post. Separate multiple hashes with commas. If you want to include a large number of posts, it may be easier to use list filters. See List Filters in this table. **Note:** The post's hash is found in the URL of its pages. For example, if a post is located at http://<your_site>.com/posts/bbe47d0d5e, the post hash is bbe47d0d5e.
User	Type a user hash to list only posts from a certain user. **Note:** The user's hash is found in the URL of its pages. For example, if a user's summary page is located at http://<your_site>.com/people/bbe47d0d5e, the user's hash is bbe47d0d5e.

Table 590: Posts Panel Properties (Continued)

Property	Description
Active User	Click this drop-down menu and select one of the following options to provide a personalized panel view for each member. • **None**—Do not return posts based on the active user. • **By the Active User**—Return only posts created by the logged-in member. • **In the Active User's Network**—Return only posts by members in the logged-in user's network. • **In the Active User's Favorites**—Return only posts that have been added as favorites by the logged-in member. • **In Groups the Active Member is a Member Of**—Return only posts from groups the logged-in member is associated with.
List Filters	The following settings are used to filter the list displayed by the panel. **Note:** List filters can be used instead of, or in addition to, a list source.
Group Type Filter	Click this drop-down menu to select a group type to filter on. By default, posts are not filtered by group type. Refer to Groups.
Hive Type Filter	Click this drop-down menu to select a hive type to filter on. By default, posts are not filtered by hive type. Refer to Hives.
Post Type Filter	Type the name of a **post type** to filter on. By default, posts of all types are listed. Refer to Posts.
Tag Filter	Type the name of a tag to filter on. Separate multiple tags with a tilde (~) to use OR logic or a bar (|) to use AND logic. By default, posts are not filtered by tag.
Created Date Filter	Click this drop-down menu and select a time range to filter by post creation date. By default, posts are not filtered by creation date.
Event Date Filter	Click this drop-down menu and select a time range to filter by the date of any events associated with a post. By default, posts are not filtered by event date.
Stickiness Filter	Click this drop-down menu and select a stickiness type to filter by the type of stickiness associated with a post. By default, posts are not filtered by stickiness type. Refer to Sticky posts.

Table 590: Posts Panel Properties (Continued)

Property	**Description**
Advanced	Click these drop-down menus to select advanced filters for the list. Options include the following: • Posts with or without comments • Posts with or without answers • Posts that have been or have not been read (updated) by the logged-in member • Posts with or without file attachments By default, posts are not filtered by comments, answers, attachments or read status.
List Options	The following settings define how the list is presented, including the details displayed, sort order, the number of records shown, and toolbar appearance.

Table 590: Posts Panel Properties (Continued)

Property	Description
View	Click this drop-down menu to select the display type for the list. Options include the following: • **Title**—Displays each post's name only. • **Summary**—Displays each post's avatar, name, number of posts and comments, and the date last active. • **Summary without props**—Displays each post's avatar and name. • **Cloud**—Displays post names in various font sizes based on their level of activity. • **Date**—Displays posts in chronological order, starting with the most recent. • **Rating**—Displays posts with a rating indicator. • **Table**—Displays post avatars and names in table form. • **Forum**—Displays each post in a forum-style table with columns for name, rating, total comments, total views, author, and date last active. • **Field #1–x**—Displays a field from the post based on field order. The value is displayed as non-linked text. • **Clip**—Displays a truncated view of each post, generally including avatar, title, comments, with as many additional fields as will fit in the panel's allowed space. • **Clip without pic**—Displays the Clip view without avatars. • **Clip fields only**—Displays the Clip view without comments. • **Clip and comments**—Displays the Clip view with comment excerpts. • **Full**—Displays each post's data in its entirety, including all visible fields.
Sort	Click this drop-down menu to select a sort order for the list. Options include sorting alphabetically, by date of last activity, date posted, rating, or number of comments.
Consider stickiness when ordering	Select this check box to consider the post stickiness attribute when ordering search results.
Count	Type the number of results you want the panel to return.
Toolbar	The following settings are used to specify the appearance of the toolbar beneath the panel header.

Table 590: Posts Panel Properties (Continued)

Property	Description
No Toolbar	Select this radio button to display no toolbar below the panel header.
Pagination	Select this radio button to display pagination links. Selecting this option also causes the following settings to appear. • **Link Text**—Click this drop-down menu and select Custom Text to enter custom text for the pagination link. By default, the link text displays the total number of posts returned and links to the next page and last page of the result set. • **Link URL**—Click this drop-down menu to select an alternate link URL such as the current page or a custom URL. By default, the link URL is based on the list source. When Current Page is selected, the Query String Override property should be set to Allow Query String Override. • **Which Panel Settings**—Click this drop-down menu to select the settings that are passed to the URL. Options include all settings, only start, and no settings. By default, all settings are passed.
Custom Links/Text	Select this radio button to display one or more custom links or text, defined as follows. • To define a link, type the link text in the first field and the URL in the second field. • To define only text, type the text value in the first field. • To add more links or text, click Add Link.
Query String Override	To allow the panel's settings to be overridden by parameters in the browser's query string, select Allow Query String Override from this drop-down menu. By default, the panel properties will define the display of the panel.
Hide Empty	Select this check box to hide the panel when no results are returned.
Privacy	The following setting defines privacy properties for the panel.

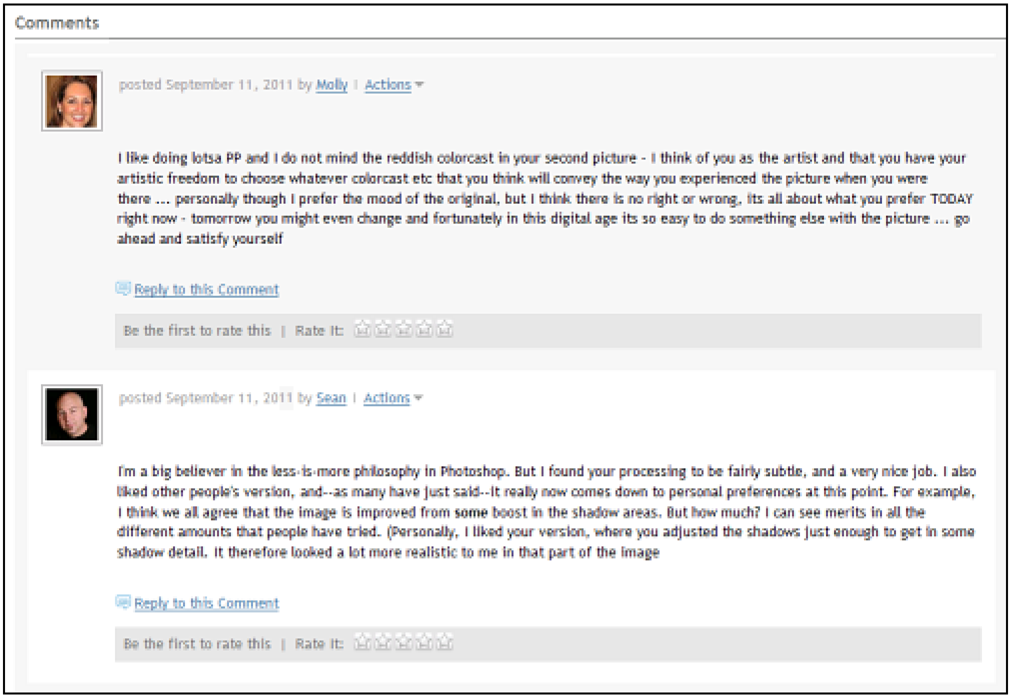
Table 590: Posts Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Comments panel properties

The Comments panel displays a list of comments in various formats, such as a list of comment summaries.



Once you add this panel to a page frame, you must edit its properties to define the list source and filters. You can also adjust the list's display, style, and privacy attributes.

To edit Comments panel properties

1 Enter the following field information.

Table 591: Comments Panel Properties

Property	Description
General	The following setting specifies the title displayed by the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
List Source	The following settings specify the source of the list data displayed by the panel.

Table 591: Comments Panel Properties (Continued)

Property	Description
Hives	Type a hive hash to list only comments from a certain hive. Separate multiple hashes with commas. If adding the panel to a hive page, type `[[self]]` to list comments from the current hive. If you want to include comments from a large number of hives, it may be easier to use list filters. See List Filters in this table. **Note:** The hive's hash is found in the URL of its pages. For example, if a hive's summary page is located at http://<your_site>.com/hives/bbe47d0d5e/summary, the hive hash is bbe47d0d5e.
Group	Type a group hash to list only comments from a certain group. **Note:** The group's hash is found in the URL of its pages. For example, if a group's summary page is located at http://<your_site>.com/groups/bbe47d0d5e/summary, the group hash is bbe47d0d5e.
User	Type a user hash to list only comments from a certain user. **Note:** The user's hash is found in the URL of its pages. For example, if a user's summary page is located at http://<your_site>.com/people/bbe47d0d5e, the user's hash is bbe47d0d5e.
Active User	Click this drop-down menu and select one of the following options to provide a personalized panel view for each member. • **None**—Do not return comments based on the active user. • **By the Active User**—Return only comments created by the logged-in member. • **In the Active User's Network**—Return only comments by members in the logged-in user's network. • **In the Active User's Favorites**—Return only comments from the logged-in member's favorite hives, groups, and posts. • **In Groups the Active Member is a Member Of**—Return only comments from groups the logged-in member is associated with.
List Filters	The following settings are used to filter the list displayed by the panel. **Note:** List filters can be used instead of, or in addition to, a list source.

Table 591: Comments Panel Properties (Continued)

Property	Description
Hive Type Filter	Click this drop-down menu to select a hive type to filter on. By default, comments are not filtered by hive type. Refer to Hives.
Group Type Filter	Click this drop-down menu to select a group type to filter on. By default, comments are not filtered by group type. Refer to Groups.
Created Date Filter	Click this drop-down menu and select a time range to filter by comment creation date. By default, comments are not filtered by creation date.
Advanced	Click these drop-down menus to filter on whether a comment is an answer or whether it contains a file attachment. By default, comments are not filtered on either of these criteria.
List Options	The following settings define how the list is presented, including the details displayed, sort order, the number of records shown, and toolbar appearance.
View	Click this drop-down menu to select the display type for the list. Options include the following: • **Title**—Displays each comment's name only. • **Summary**—Displays each comment's avatar, name, number of posts and comments, and the date last active. • **Summary without props**—Displays each comment's avatar and name. • **Full**—Displays each comment's data in its entirety, including all visible fields.
Sort	Click this drop-down menu to select a sort order for the list. Options include sorting by date posted, rating, or privacy.
Count	Type the number of results you want the panel to return.
Toolbar	The following settings are used to specify the appearance of the toolbar beneath the panel header.
No Toolbar	Select this radio button to display no toolbar below the panel header.

Table 591: Comments Panel Properties (Continued)

Property	Description
Pagination	Select this radio button to display pagination links. Selecting this option also causes the following settings to appear. • **Link Text**—Click this drop-down menu and select Custom Text to enter custom text for the pagination link. By default, the link text displays the total number of comments returned and links to the next page and last page of the result set. • **Link URL**—Click this drop-down menu to select an alternate link URL such as the current page or a custom URL. By default, the link URL is based on the list source. When Current Page is selected, the Query String Override property should be set to Allow Query String Override. • **Which Panel Settings**—Click this drop-down menu to select the settings that are passed to the URL. Options include all settings, only start, and no settings. By default, all settings are passed.
Custom Links/Text	Select this radio button to display one or more custom links or text, defined as follows. • To define a link, type the link text in the first field and the URL in the second field. • To define only text, type the text value in the first field. • To add more links or text, click Add Link.
Query String Override	To allow the panel's settings to be overridden by parameters in the browser's query string, select Allow Query String Override from this drop-down menu. By default, the panel properties will define the display of the panel.
Hide Empty	Select this check box to hide the panel when no results are returned.
Privacy	The following setting defines privacy properties for the panel.

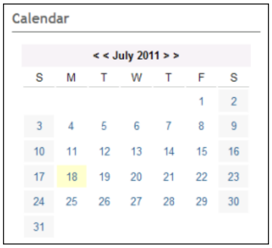
Table 591: Comments Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Calendar panel properties

The Calendar panel displays a calendar for filtering post panel content by date.



Once you add this panel to a page frame, you must edit its properties to define the list source and filters. You can also adjust the list's display, style, and privacy attributes.

To edit Calendar Filter panel properties

1 Enter the following field information.

Table 592: Calendar Filter Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
Target URL	Type an alternate URL for the panel to link to. Leave the field blank to link to the current page.
Date Type	Click this drop-down menu to select the type of date to filter on. Options include date created or event date. **Note:** The event date option applies only to posts that include an Event Date field.
Month	Type the calendar month that you want to display, using the format YYYY-MM. For example, to display January 2011, type the value `2011-01`. Leave the field blank to display the current month.
List Source	The following settings specify the source of the list data displayed by the panel.

Table 592: Calendar Filter Panel Properties (Continued)

Property	Description
Group	Type a group hash to list only event posts from a certain group. **Note:** The group's hash is found in the URL of its pages. For example, if a group's summary page is located at http://<your_site>.com/groups/bbe47d0d5e/summary, the group hash is bbe47d0d5e.
Hives	Type a hive hash to list only event posts from a certain hive. Separate multiple hashes with commas. If you want to include comments from a large number of hives, it may be easier to use list filters. See List Filters in this table. **Note:** The hive's hash is found in the URL of its pages. For example, if a hive's summary page is located at http://<your_site>.com/hives/bbe47d0d5e/summary, the hive hash is bbe47d0d5e.
User	Type a user hash to list only event posts from a certain user. **Note:** The user's hash is found in the URL of its pages. For example, if a user's summary page is located at http://<your_site>.com/people/bbe47d0d5e, the user's hash is bbe47d0d5e.
Active User	Click this drop-down menu and select one of the following options to provide a personalized panel view for each member. • **None**—Do not return event posts based on the active user. • **By the Active User**—Return only event posts created by the logged-in member. • **In the Active User's Network**—Return only event posts by members in the logged-in user's network. • **In the Active User's Favorites**—Return only event posts that have been added as favorites by the logged-in member.
List Filters	The following settings are used to filter the list displayed by the panel. **Note:** List filters can be used instead of, or in addition to, a list source.
Group Type Filter	Click this drop-down menu to select a group type to filter on. By default, event posts are not filtered by group type. Refer to Groups.

Table 592: Calendar Filter Panel Properties (Continued)

Property	Description
Hive Type Filter	Click this drop-down menu to select a hive type to filter on. By default, event posts are not filtered by hive type. Refer to Hives.
Post Type Filter	Type the name of a post type to filter on. By default, posts of all types are listed. Refer to Posts.
Tag Filter	Type the name of a tag to filter on. Separate multiple tags with a tilde (~) to use OR logic or a bar (|) to use AND logic. By default, posts are not filtered by tag.
List Options	The following setting defines how results are affected by parameters in the browser's query string.
Query String Override	To allow the panel's settings to be overridden by parameters in the browser's query string, select Allow Query String Override from this drop-down menu. By default, the panel properties will define the display of the panel.
Privacy	The following setting defines privacy properties for the panel.
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.

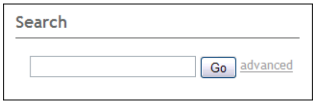
Table 592: Calendar Filter Panel Properties (Continued)

Property	Description
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Search panel properties

The Search panel displays a basic keyword search box and advanced search link.



Once you add this panel to a page frame, you must edit its properties to define its style and privacy attributes.

To edit Search panel properties

1 Enter the following field information.

Table 593: Search Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
Search Scope	Type the URL of any community search page to override the contextual behavior of the search function. Leave the field blank to search the context the panel is used in.

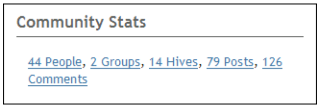
Table 593: Search Panel Properties (Continued)

Property	Description
Button Label	Type the text of the search button label in this field.
Misc Settings	Select the Show Advanced Link check box to display an advanced search link next to the search form.
Privacy	The following setting defines privacy properties for the panel.
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Community Stats panel properties

The Community Stats panel displays community statistics.



Once you add this panel to a page frame, you must edit its properties to define the search scope, and you can also adjust style and privacy attributes.

To edit Community Stats panel properties

1 Enter the following field information.

Table 594: Community Stats Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
View	Click this drop-down menu to select a view style for the panel. The following options are available. • **Row**—Displays statistics in single-line format. • **Column**—Displays statistics in column format. This option is suitable for site panels.
Privacy	The following setting defines privacy properties for the panel.

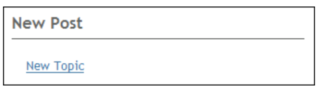
Table 594: Community Stats Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member’s view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing New Post panel properties

The New Post panel displays options for creating new posts of available post types.



Once you add this panel to a page frame, you can adjust style and privacy attributes.

To edit New Post panel properties

1 Enter the following field information.

Table 595: New Post Panel Properties

Property	Description
General	The following setting specifies the title displayed by the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
Privacy	The following setting defines privacy properties for the panel.
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`

Table 595: New Post Panel Properties (Continued)

Property	Description
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Hive Stats panel properties

The Hive Stats panel displays statistics about the hive, including privacy level, owner, dates of creation and last activity, and the number of posts and comments created in the hive.

Once you add this panel to a page frame, you can adjust style and privacy attributes.

To edit Hive stats panel properties

1 Enter the following field information.

Table 596: Hive Stats Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
View	Click this drop-down menu to select a view style for the panel. The following options are available. • **Row**—Displays statistics in single-line format. • **Column**—Displays statistics in column format. This option is suitable for site panels.
Privacy	The following setting defines privacy properties for the panel.

Table 596: Hive Stats Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing WYSIWYG/HTML panel properties

The WYSIWYG/HTML panel displays custom HTML content that you define using a WYSIWYIG editor. Once you add this panel to a page frame, you must edit its properties to define the content, and you can also adjust style and privacy attributes. Using the editor toolbar, you can create HTML using many of the same options available in basic word processing applications.

Available toolbar functions include:

- Add or remove hyperlinks
- Add an image
- Add an emotive icon
- Add a table
- Select a text style and color
- Apply font style attributes (including bold, italic, underline, and strikethrough)
- Format text in bulleted or numbered lists
- Adjust indentation
- Apply quoted text formatting
- Left-justify, center, right-justify, or force-justify text and images
- Spell check text in different languages
- Edit the HTML source
- Maximize the text editor to the full size of the browser window
- Paste content from Microsoft Word

To edit WYSIWYG/HTML panel properties

1 Enter the following field information.

Table 597: WYSIWYG/HTML Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
*Text	Type the content you want to appear in the panel. **Note:** You can format the content using the editor controls and add elements such as hyperlinks, images, and tables.
Privacy	The following setting defines privacy properties for the panel.

Table 597: WYSIWYG/HTML Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Image panel properties

The Image panel displays a web-hosted image that can optionally serve as a hyperlink. Once you add this panel to a page frame, you must edit its properties to define the image location, and you can also adjust link, style, and privacy attributes.

To edit Image panel properties

1 Enter the following field information.

Table 598: Image Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
Image Properties	Type the URL and dimensions of the image you want the panel to display.
Link Properties	Type a URL in this field to make the image a hyperlink. To open the URL in a new window, click the Target drop-down menu and select New Window. By default, the URL will open in the same window.
Privacy	The following setting defines privacy properties for the panel.
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.

Table 598: Image Panel Properties (Continued)

Property	Description
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing Flash panel properties

The Image panel displays a web-hosted Flash *(.swf)* file. Once you add this panel to a page frame, you must edit its properties to define the image location, and you can also adjust style and privacy attributes.

To edit Flash panel properties

1 Enter the following field information.

Table 599: Flash Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
Flash (SWF)	Enter the following field information to define the attributes of the Flash file you want to display in the panel. • **Flash URL**—Type the URL of the Flash *(.swf)* file. • **Width/Height/Version**—Type the dimensions and version of Flash supported by the file. • **Window Mode**—Click this drop-down menu to select a window mode. Options include transparent, window, and opaque.

Table 599: Flash Panel Properties (Continued)

Property	Description
Privacy	The following setting defines privacy properties for the panel.
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing RSS Reader panel properties

The RSS Reader panel displays one or more RSS feeds. Once you add this panel to a page frame, you must edit its properties to define the feed view and URLs, and you can also adjust style and privacy attributes.

To edit RSS Reader panel properties

1 Enter the following field information.

Table 600: RSS Reader Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
RSS View	The following settings are used to specify the attributes of the RSS view displayed by the panel.
View Layout	Click this drop-down menu and select a layout for feed results. • **Full View**—Select this layout to display the full text of feed results. • **Title View**—Select this layout to display only the titles of feed results.
Show Media	Select this check box to display any media included in the feed results. **Note:** This option is available only when the Full View layout is selected.
Number of Posts Per Feed	Type the number of feed results you want the panel to display. To remove a feed, clear its Feed URL field. By default, five results are shown.
RSS Feeds	Type the URLs of up to three RSS feeds to use as content sources for the panel. To specify additional feeds, click Add Feed.
Privacy	The following setting defines privacy properties for the panel.

Table 600: RSS Reader Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing HTML panel properties

The HTML panel displays custom HTML content. Once you add this panel to a page frame, you must edit its properties to define the custom HTML code, and you can also adjust style and privacy attributes.

To edit HTML panel properties

1 Enter the following field information.

Table 601: HTML Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
Text/HTML	Type or paste the HTML or text content you want the panel to display. For information about the HTML toolbar functions, refer to Editing WYSIWYG/HTML panel properties.
Privacy	The following setting defines privacy properties for the panel.
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`

Table 601: HTML Panel Properties (Continued)

Property	Description
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Editing iFrame panel properties

The iFrame panel displays an iFrame containing a web page. Once you add this panel to a page frame, you must edit its properties to define the URL of the page you want to display, and you can also adjust style and privacy attributes.

To edit iFrame panel properties

1 Enter the following field information.

Table 602: iFrame Panel Properties

Property	Description
General	The following settings specify basic attributes for the panel.
Title	Type a header for the panel in this field. Leave the field blank for a panel without a header.
URL	Type the URL and dimensions of the web page you want to display in the iFrame.
Height	Type the height of the iFrame in pixels. **Note:** The width of the frame is fixed and based on the frame you are adding the panel to. Refer to Adding panels to pages.
Scrollbars	Click this drop-down menu to select a scroll bar display option. • **Auto**—Display scroll bars only when the web page exceeds the size of the iFrame. • **On**—Always display scroll bars. • **Off**—Do not display scroll bars.
Privacy	The following setting defines privacy properties for the panel.

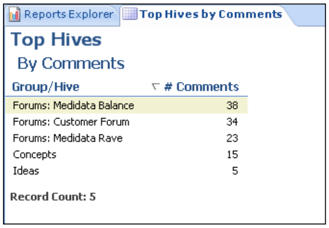
Table 602: iFrame Panel Properties (Continued)

Property	Description
Privacy	Select a radio button to set a privacy level for the panel. The following options are available. • **Anyone**—The panel will be visible to all site visitors. • **All registered users**—The panel will be visible to all registered logged-in members. • **User types**—The panel will be visible to members of selected user types. Click Show/Hide to select a user type from a multi-select field. • **Groups**—The panel will be visible to members of selected groups. Click Show/Hide to select a group from a multi-select field. • **No one**—The panel will be hidden from everyone. For options that have multi-select fields, press **Ctrl** when selecting multiple items. **Note:** Because content visibility can also be defined by sources, each member's view of panel content may vary accordingly.
Style	The following settings define the appearance of the panel.
Background Color	Type a color value in this field to set a background color for the panel using one of the following formats. • `rgb(255,255,255)` • `#FFFFFF` • `#FFF`
Custom Styles	To specify custom style attributes for the panel, header, or content, type them in the appropriate field. **Note:** Refer to the setting description for a list of supported attributes.

2 Click the Save Panel button to save your changes.

Community analytics

Community analytics are available in the Reports explorer under Public Reports > Community (refer to Reports explorer). An extensive collection of standard reports provides information about activity, users, and content quality in your community. Many of these reports display information about content that has been created, edited, or viewed in the community during certain intervals over a specified date range. For example, the Top Hives by Comments report displays the number of comments created for each hive over a specified period, ordered by volume.



In some cases, the data is **rolled up** by an attribute—such as Hive, Hive Type, Group, Group Type, or User Type—providing for greater granularity and insight into community trends. In many cases, you can drill down to view a list of records created for the selected interval and click a record to view it in a web browser.

In addition to content, you can report on many aspects of community membership, including registrations, profiles, statuses, group memberships, reputation, top performance, and account inactivity. Other reports provide information about community responsiveness, record details, content ratings, hive and content activity, and best answers given.

Tip For a complete list of Community report names, locations, and descriptions, generate the View Report Descriptions report in the Report Management component and filter on Community reports. Refer to Producing a catalog of reports.

Channels

Channels are the forms of communication by which your staff members listen and respond to your customers. In Oracle Service Cloud, channels refer to all of the available sources of social messaging, incoming incidents, and outgoing responses that are monitored and processed by your site. Oracle Service Cloud supports a broad range of channels that fall into two main categories:

- **Standard channels**—Traditional channels through which incidents are created and responded to. These include CSS Email (email submitted to a Service mailbox), MA Email (email submitted to an Outreach mailbox), Phone, Fax, Post, CSS Web (Ask a Question), MA Web (created by a campaign or advanced survey), Chat, and Email (responses sent to customers by email). Standard channels are most commonly used to reference incident thread sources that are configured in Oracle Service Cloud and Oracle RightNow Outreach Cloud Service, such as mailboxes, chat sessions, and campaign flow actions. Refer to Responding to incidents.
- **Social channels**—Channels used by **Oracle RightNow Social Monitor Cloud Service** (also known as the social monitor) to search the social web for comments, opinions, and issues related to your organization and its products. These channels include a variety of social media such as **communities**, Facebook, Twitter, YouTube, and **RSS** feeds. Social channels are most commonly used when performing cloud searches and to indicate the sources of incident thread entries. Social channels can be configured in a variety of ways based on the unique blend of services that each social media source provides. Refer to Social channels overview.

Channels are also helpful for routing new incidents to the agent desktop using business rules. Incidents created from standard and social channels can be routed using the Incident.Channel field as a rule condition. Refer to Choosing conditions.

You can edit the name of each channel to suit your business needs. However, the default names are appropriate for most implementations.

❖ Social Monitoring

To edit a channel name

1 Click the Configuration button on the navigation pane.

2 Double-click Channels under Service in the configuration list. The Channels tree displays on the content pane.

3 Click the down arrow containing the channel that you want to edit and select the channel. The channel's settings display on the Channels editor.

4 Type a new name for the channel in the Name field.

5 Click the Save and Close button to save your changes.

Social channels overview

Social channels are used with the social monitor to search the social web for posts and comments related to your organization and its products. These channels include a variety of social media such as **communities**, Facebook, Twitter, YouTube, and RSS feeds. While most social channels feature default channels that can be used to monitor public feeds, Oracle Service Cloud supports additional functions based on the services each social media source provides.

- **Custom channels** are used to define and extend the range of sources that your organization can monitor. For example, if your organization maintains a Facebook page, you can create a custom channel to focus your cloud searches on the posts and comments on that page. Custom channels can be created for communities, Facebook, and RSS feeds using the Channels editor.
- **Channel accounts** enable your staff members to monitor and respond to incidents from your organization's social media accounts. A channel account is a shared credential that allows designated **staff accounts** to perform service functions through a single social media account that requires login and password authentication. In this way, you can provide agents with the access they need to assist customers while maintaining the confidentiality of your social media account logins. Because channel accounts can be associated with specific staff members and groups, they can be used to govern access to different custom channels from the same social media site. This is helpful if, for example, your product teams maintain separate Twitter accounts for different purposes. Channel accounts can be created for communities, Facebook, and Twitter using the Channel Accounts editor. Refer to Responding through social channels.

- **Channel types** can be used with Facebook, Twitter, and YouTube to associate social monitor incidents with contacts based on their social media user names. Refer to Storing social media user names.

Because most social media services are external to Oracle Service Cloud, it is important to consider potential security risks and take the appropriate precautions associated with third-party login information, customer data, and application code. Refer to Social Experience security.

- ❖ YouTube channel

Adding Facebook channels

Facebook is a popular social media network on which users can post personal profile information, submit status updates, exchange messages, and participate in groups and events. Oracle Service Cloud provides a default Facebook channel that you can access through the **social monitor** to perform searches of Facebook's public feed. Refer to Searching the social cloud.

In addition, you can add custom channels to focus your searches to specific Facebook pages. Facebook pages—also known as fan pages—are public web pages on Facebook that you can use to share your organization and its products and services. By adding a custom Facebook channel, you can perform cloud searches that are confined to the posts on your organization's Facebook page.

If you want your staff to be able to interact with customers on Facebook, you can also define a **channel account** to permit specific staff members to monitor your Facebook pages and send responses. When agents reply to Facebook posts, their replies appear to come from the fan page and not from individual personas. Refer to Responding to Facebook posts.

Note Because each Facebook page is associated with a specific Facebook account, each custom Facebook channel can have only one channel account per fan page. For this reason, Facebook account credentials are configured on the Channels editor and the Channel Accounts editor is used to specify which staff accounts have access.

You can also configure Oracle Service Cloud to store Facebook user names in contact records. Refer to Storing social media user names.

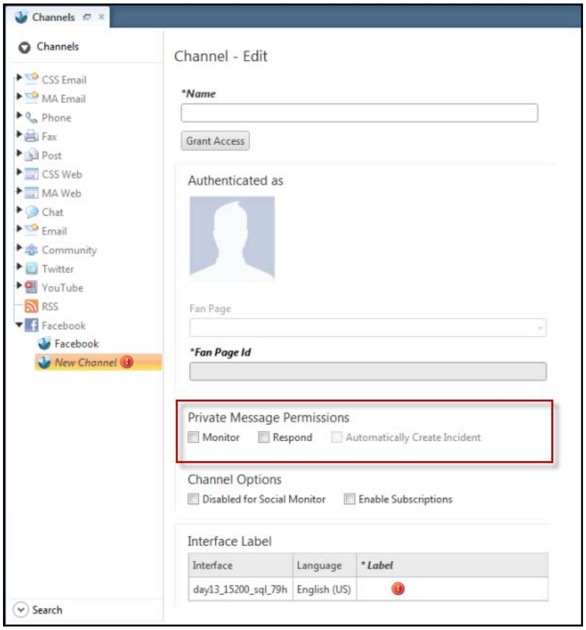
Tip Oracle RightNow Self Service for Facebook Cloud Service is a powerful complement to Facebook channels. With this special Facebook application, you can embed a set of Service and community features directly on your organization's Facebook page. In this way, your organization can deliver a consistent experience to customers and fans on Facebook while maintaining a unified view of customer interactions across channels. Refer to Self Service for Facebook.

To add a custom Facebook channel

1 Click the Configuration button on the navigation pane.

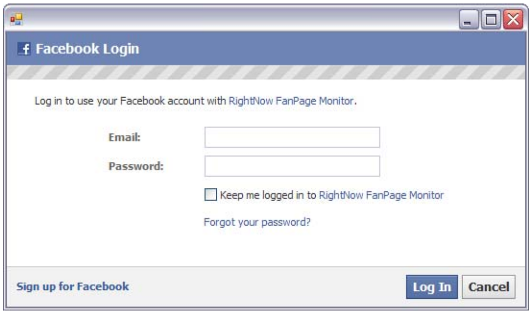
2 Double-click Channels under Service in the configuration list. The Channels tree displays on the content pane.

3 Click Facebook and then click the New button on the ribbon to display the editor.



4 Type a name for the custom channel in the Name field.

5 Click the Grant Access button. The Facebook Login window displays.



Note If you are already logged in to Facebook in Internet Explorer, access may be granted automatically without prompting for authentication so you can proceed to step 8.

6 Type the email address and password for the Facebook account associated with the page you want to monitor.

Important If you are using a Facebook account other than the one used to administer the page, the person who administers the Facebook page must add your account as an admin for the page through Facebook.

7 Click the Log In button to sync the account with the channel you are creating. Once this process is complete, the profile name and image of the authenticated account is displayed on the Channels editor and a message informs you that you have been granted access.

8 Click the OK button.

9 Enter the following field information.

Table 603: Facebook Channel Editor Description

Field	Description
Fan Page	Click this drop-down menu to select the page that you want to monitor. Available options include all pages administered by the Facebook account you are using. To enter a different fan page ID, select Advanced: Custom Fan Page ID. If you do not want to indicate a specific fan page at this time, select None. **Note:** When you select an existing page, its fan page ID is automatically populated in the Fan Page ID field.
***Fan Page ID**	Type the Facebook page ID. **Note:** This field is editable only when you select Advanced: Custom Fan Page ID from the Fan Page menu. To manually obtain a Facebook page ID, navigate to your organization's fan page in Facebook. The Facebook page ID is the 15-digit number visible near the end of the URL in the browser address bar.
Private Messaging Permissions	These options define define how private messages received by this account will be processed by Oracle Service Cloud.
Monitor	Select this check box to allow staff members to monitor the account's private messages. Private messages will be reflected on the Social Monitor dashboard and will appear in search results.
Respond	Select this check box to allow staff members to send incident responses to a customer's private messages using the channel account. Responses to a customer's private message will default to a private message response, although the agent can specifically mark it as a public message. Private message conversations must be initiated by a customer.
Automatically Create Incident	Select this check box to automatically create new incidents from all private messages received by the channel account. **Note:** This check box is available only when the Monitor option is selected.
Channel Options	These options are used to manage monitoring of the channel
Disabled for Social Monitor	Select this check box to disable the channel, which will prevent staff members from using it.

Table 603: Facebook Channel Editor Description (Continued)

Field	Description
Enable Subscriptions	Select this check box to make the channel available for monitoring on a **subscription** basis. Refer to Searching the social cloud.
Interface Label	This section contains the names of all available **interfaces**, the languages they are implemented in, and the language-specific label of the channel. Refer to Overview of multiple interfaces. **Note:** By default, the Label field is populated with the name you typed in the Name field. When using multiple-language interfaces, you must type the label in the Label field in the language of the interface.

Note Once the channel is saved and has been used to perform cloud searches, the Search Manager button on the Channels editor ribbon will become active. This function provides access to a utility for managing cloud searches by channel. Refer to Managing cloud searches by channel.

10 Click the Save and Close button on the ribbon.

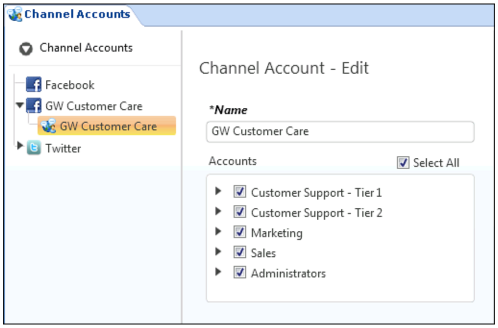
To provide staff access to a Facebook channel account

1 Click the Configuration button on the navigation pane.

2 Double-click Channel Accounts under Service. The Channel Accounts tree displays on the content pane.

Note The social monitor must be enabled in order to use channel accounts with your application. To enable the social monitor, contact your Oracle account manager. Refer to Social Monitoring.

3 Click the arrow next to a Facebook custom channel to expand it and then click its contained channel account to display it on the editor.



4 Enter the following field information.

Table 604: Facebook Channel Accounts Editor Description

Field	Description
*Name	Type a name for the Facebook channel account in this field.
Accounts	Select a group check box to associate all staff members in the group with the channel account or expand the group to select staff members individually. To select all groups, select the Select All check box. **Note:** You can also assign a staff member to a channel account from the Staff Accounts editor. Refer to Granting agent access to channel accounts.

5 Click the Save and Close button on the ribbon.

- ❖ Responding through social channels
- ❖ Self Service for Facebook

Adding community channels

Communities are comprehensive, highly customizable social solutions that enable customers to meet, communicate, and collaborate through a variety of forum types (hives). When a community is enabled on your site, Oracle Service Cloud provides a default Community channel that you can access through the social monitor to perform searches of your community feed. Refer to Searching the social cloud.

In addition, you can add custom channels to focus your searches to the posts and comments on specific hive types. If you want your staff to be able to interact with (not just monitor) members of your community, you can also define a **channel account** to permit specific staff members to monitor the community and send responses.

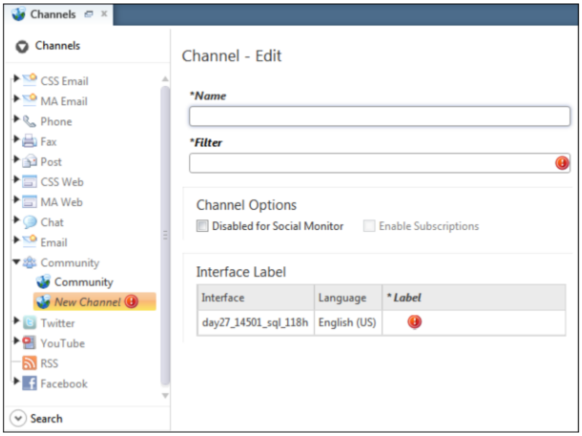
Community channels can be associated with multiple channel accounts. For instance, your product teams may maintain separate hives for different purposes. Channel accounts allow you to extend authentication to these different sources for different staff members or groups.

To add a custom Community channel

1 Click the Configuration button on the navigation pane.

2 Double-click Channels under Service in the configuration list. The Channels tree displays on the content pane.

3 Click Community and then click the New button on the ribbon to display the editor.



4 Enter the following field information.

Table 605: Community Channel Editor Description

Field	Description
*Name	Type a name for the custom channel in this field. **Note:** When you move to another field, the Label field in the Interface Label section is populated with the name you typed in the Name field.
*Filter	Type the **hive type** (such as `forum` or `blog`) to filter on when monitoring the community. Contact your administrator for a list of available hive types for your application.
Disabled for Social Monitor	Select this check box to disable the channel, which will prevent staff members from using it in the social monitor.
Interface Label	This section contains the names of all available **interfaces**, the languages they are implemented in, and the language-specific label of the channel. Refer to Overview of multiple interfaces. **Note:** When using multiple-language interfaces, you must type the label in the Label field in the language of the interface.

Note Because community channels do not support social monitor subscriptions, the Enable Subscriptions check box is inactive for this channel.

5 Click the Save and Close button on the ribbon.

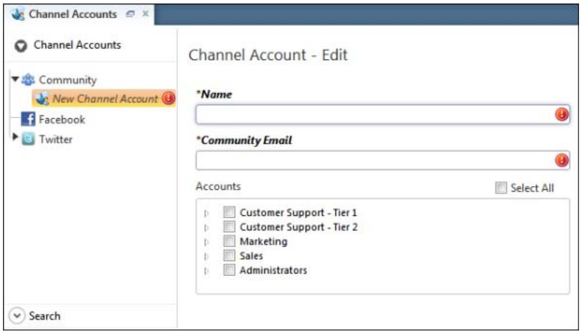
To add a Community channel account

Note To display Community in the Channel Accounts tree, a community must be enabled. Contact your Oracle account manager.

1 Click the Configuration button on the navigation pane.

2 Double-click Channel Accounts under Service. The Channel Accounts tree displays on the content pane.

3 Click Community and then click the New button on the ribbon to display the editor.



4 Enter the following field information.

Table 606: Community Channel Accounts Editor Description

Field	Description
*Name	Type a name for the Community channel account in this field.
*Community Email	Type the email address of the community account you are providing access to in this field.
Accounts	Select a group check box to associate all staff members in the group with the channel account or expand the group to select staff members individually. To select all groups, select the Select All check box. **Note:** You can also assign a staff member to a channel account from the Staff Accounts editor. Refer to Granting agent access to channel accounts.

5 Click the Save and Close button on the ribbon.

- ❖ Monitoring social channels
- ❖ Responding through social channels

Adding Twitter channel accounts

Twitter is a popular social media site on which users can post short messages (tweets) and follow similar posts from other users. Oracle Service Cloud provides a default Twitter channel that you can access through the social monitor to perform searches of Twitter's public feed. Refer to Searching the social cloud.

In order to monitor the public feed, you must first create a Twitter **channel account** and then select it from the Twitter channel editor. Channel accounts enable staff members to monitor the account and send responses. They also provide the option to monitor and automatically create incidents from private messages sent to your organization's Twitter account.

Important When you add a channel account, your agents can respond to Twitter messages publicly or privately from the agent desktop. However, because handling customer issues publicly can be problematic, you should always encourage your customers to communicate privately when resolving support issues through the Twitter channel. Refer to Responding to Twitter posts.

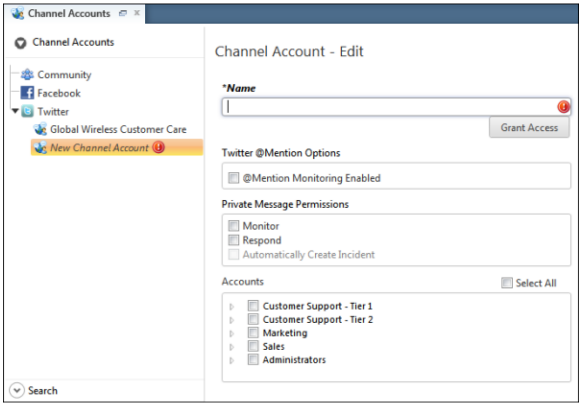
Access to Twitter channel accounts can be restricted to specific groups and accounts. For instance, your product teams may maintain separate Twitter accounts for different purposes. Channel accounts allow you to extend authentication to these different channels for different staff members or groups.

You can also configure Oracle Service Cloud to store Twitter user names in contact records. Refer to Storing social media user names.

Note The social monitor must be enabled in order to use channel accounts with your application. To enable the social monitor, contact your Oracle account manager. Refer to Social Monitoring.

To add a channel account for Twitter

1. Click the Configuration button on the navigation pane.
2. Double-click Channel Accounts under Service. The Channel Accounts tree displays on the content pane.
3. Click Twitter and then click the New button on the ribbon to display the editor.



4 Enter the following field information.

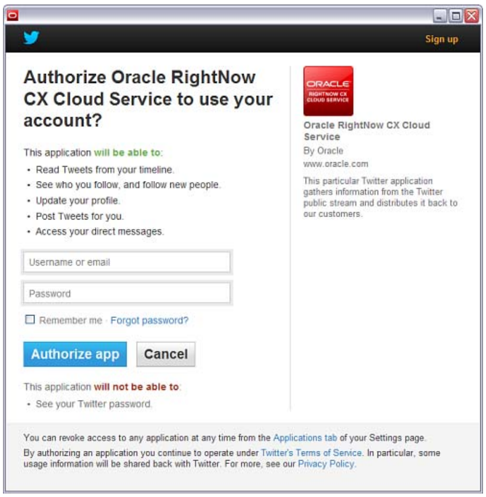
Table 607: Twitter Channel Accounts Editor Description

Field	Description
***Name**	Type a name for the Twitter channel account in this field.
Twitter Mention Options	Select the @Mention Monitoring Enabled check box to allow staff members to perform cloud searches for mentions of this Twitter channel account in the Twitter public stream. Refer to Searching the social cloud.
Private Message Permissions	The following permissions define how private messages received by this account will be processed by Oracle Service Cloud. **Note:** Unlike public messages, Twitter allows private messages to be sent only to accounts that are following the sending account. For this reason, you can receive private messages only from Twitter accounts that your account is following. For more information about this restriction, refer to Twitter.
Monitor	Select this check box to create a new cloud search option, allowing staff members to monitor the account’s private messages. Private message search results will be displayed in the social monitor when you click the new Private Messages button on the ribbon. Refer to Monitoring private messages from Twitter.

Table 607: Twitter Channel Accounts Editor Description (Continued)

Field	Description
Respond	Select this check box to allow staff members to send incident responses using this channel account. Refer to Responding to Twitter posts.
Automatically Create Incident	Select this check box to automatically create new incidents from all private messages received by the channel account. **Note:** This option is available only when the Monitor option is selected.
Accounts	Select a group check box to associate all staff members in the group with the channel account or expand the group to select staff members individually. To select all groups, select the Select All check box. **Note:** You can also assign a staff member to a channel account from the Staff Accounts editor. Refer to Granting agent access to channel accounts.

5 Click the Grant Access button on the Channel Accounts editor. The Twitter Login window displays.



6 Type the user name and password of the Twitter account.

7 Click the Authorize App button. A message informs you that you have been granted access.

8 Click the OK button.

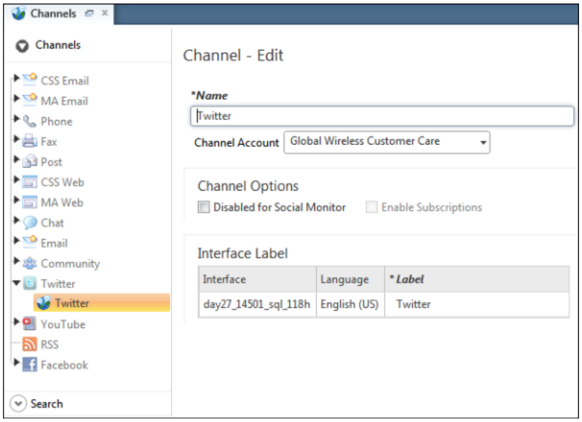
9 Click the Save and Close button on the ribbon.

To enable the public Twitter channel for social monitoring

1 Click the Configuration button on the navigation pane.

2 Double-click Channels under Service in the configuration list. The Channels tree displays on the content pane.

3 Click the Twitter down arrow and then select the Twitter channel to display the editor.



4 Enter the following field information.

Table 608: Facebook Channel Editor Description

Field	Description
*Name	Type a name for the channel in this field. **Note:** When you move to another field, the Label field in the Interface Label section is populated with the name you typed in the Name field.

Table 608: Facebook Channel Editor Description (Continued)

Field	Description
Channel Account	Click this drop-down menu to select the channel account you want to use to authenticate cloud searches. **Note:** You must select a channel account in order for the public Twitter channel to be available for monitoring.
Disabled for Social Monitor	Select this check box to disable the channel, which will prevent staff members from using it.
Interface Label	This section contains the names of all available **interfaces**, the languages they are implemented in, and the language-specific label of the channel. Refer to Overview of multiple interfaces. **Note:** By default, the Label field is populated with the name you typed in the Name field. When using multiple-language interfaces, you must type the label in the Label field in the language of the interface.

Note Because Twitter channels do not support social monitor subscriptions, the Enable Subscriptions check box is inactive for this channel.

Once the channel is saved and has been used to perform cloud searches, the Search Manager button on the Channels editor ribbon will become active. This function provides access to a utility for managing cloud searches by channel. Refer to Managing cloud searches by channel.

5 Click the Save and Close button on the ribbon.

❖ Monitoring social channels

❖ Responding through social channels

Adding RSS channels

In addition to monitoring leading social media services, you can define custom RSS channels to monitor content posted in publicly accessible RSS feeds. Oracle Service Cloud supports feeds that conform to the RSS 2.0, ATOM, and RSS (RDF) 1.0/.90 standards.

With custom RSS channels, staff members can monitor RSS feeds (such as news headlines) for content. For example, if your organization releases a new product or service, you can search for your product or service using an RSS channel to see what the media are reporting. Because you are generally searching news headlines with RSS channels, it is not possible to respond to RSS feeds.

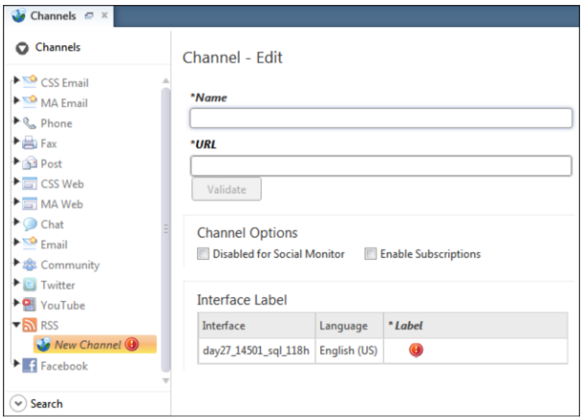
Note RSS channels do not support channel accounts because agents cannot respond to customers through RSS.

To add a custom RSS channel

1 Click the Configuration button on the navigation pane.

2 Double-click Channels under Service in the configuration list. The Channels tree displays on the content pane.

3 Click RSS and then click the New button on the ribbon to display the editor.



4 Enter the following field information.

Table 609: RSS Channel Editor Description

Field	Description
*Name	Type a name for the custom channel in this field. **Note:** When you move to another field, the Label field in the Interface Label section is populated with the name you typed in the Name field.
*URL	Type the URL of the RSS feed. The URL must begin with http:// or https://. **Note:** Oracle Service Cloud supports RSS 2.0, ATOM, and RSS (RDF) 1.0/.90 feeds.
Validate	Click this button to verify that the feed's URL and format are valid. A message will appear next to the button indicating that the feed is valid or invalid.
Disabled for Social Monitor	Select this check box to disable the channel, which will prevent staff members from using it.
Enable Subscriptions	Select this check box to make the channel available for monitoring on a subscription basis. Refer to Searching the social cloud.
Interface Label	This section contains the names of all available **interfaces**, the languages they are implemented in, and the language-specific label of the channel. Refer to Overview of multiple interfaces. **Note:** When using multiple-language interfaces, you must type the label in the Label field in the language of the interface.

5 Click the Save and Close button on the ribbon.

❖ Monitoring social channels

YouTube channel

YouTube is a popular social media site on which users can view and share videos. Oracle Service Cloud provides a default YouTube channel that you can access through the social monitor to perform searches of YouTube's public feed. Refer to Searching the social cloud.

You can also configure Oracle Service Cloud to store YouTube user names in contact records. Refer to Storing social media user names.

Note The YouTube channel does not support custom channels or channel accounts because agents cannot respond to customers through YouTube. In this case, the channel is provided strictly for monitoring purposes so that you can see what YouTube users are saying about your products or services.

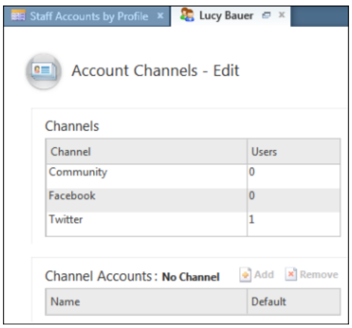
❖ Monitoring social channels

Granting agent access to channel accounts

In order to respond to incidents created through a social channel, agents must first be granted access to a **channel account** configured for that channel. You can grant channel account access to groups and agents through the Channel Accounts editor (refer to Social channels overview), or you can provide access to specific agents by editing their **staff accounts** using the following procedure.

To grant channel account access to a staff account

1. Click the Configuration button on the navigation pane.
2. Double-click Staff Accounts by Profile under Staff Management. The report opens on the content pane.
3. Double-click the account that you want to edit. The Staff Accounts editor opens.
4. Click the Channels button on the ribbon. The Channel Accounts page opens.

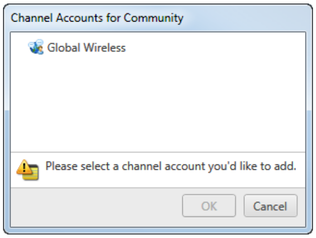


The Channels section lists the default and custom social channels configured in Oracle Service Cloud and the number of associated channel accounts for which the staff account has been granted access. The Channel Accounts section is not populated until a channel is selected from the list.

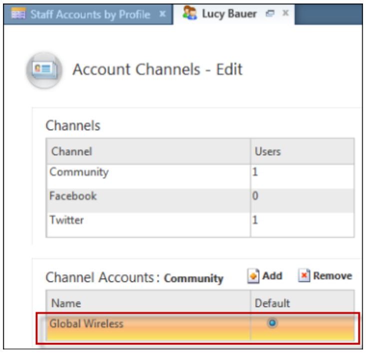
Note The Users column total includes any channel account for which the agent has been granted access, whether access was granted with this editor or through the Configuration > Service > Channel Accounts editor.

5 Click the channel that you want to provide access for. The Channel Accounts section lists any channel accounts that are currently associated with the staff account for the selected channel.

6 Click the Add button. The Channel Accounts window displays all of the channel accounts associated with the channel you selected that are not restricted from or already associated to the staff account.



7 Double-click the channel account you want to add. The Channel Accounts window closes and the channel is added to the Channel Accounts section on the Channel Accounts page.



Note If no other channel accounts are listed under the Name column, the channel account is automatically selected as the default channel account. The default channel account is the channel account that staff members will use when responding to incidents. However, if they have been granted access to more than one channel account, they will have the option to select another channel account at that time. Refer to Responding through social channels.

8 Click the Save and Close button on the ribbon.

- Adding and editing staff accounts
- Social channels overview
- Responding through social channels

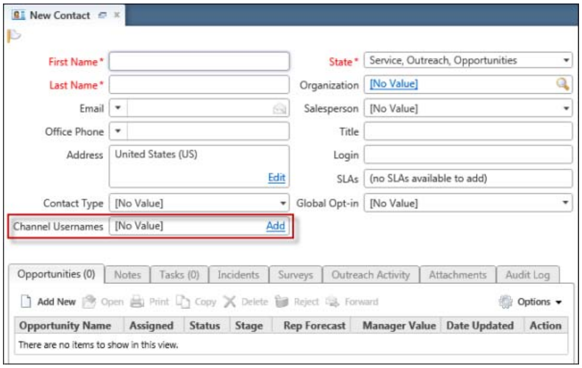
Storing social media user names

When monitoring certain **channel types**, Oracle Service Cloud can store your customers' social media user names in their contact records. Tracking this identifying information allows you to associate incoming social monitor incidents with contacts based on their social media accounts.

When an incident is created through Facebook, Twitter, or YouTube, Oracle Service Cloud searches all contacts for an instance of the associated social media user name. If a matching user name is located, the incident is automatically associated with the contact. If no matching user name is found, a new contact containing the user name is created for the incident. Once user names have been defined in a contact record, they can be used to help agents identify where posts originate.

In addition to this automated process, contacts and staff members can be permitted to add and edit user names for each channel type, based on the visibility settings on the Channel Types editor and the configuration of the customer portal and agent workspace.

- Contacts can add, edit, and view their Facebook, Twitter, and YouTube user names through the ChannelAllInput and ChannelAllDisplay **widgets** on the customer portal. Refer to Input and output widgets.
- Staff members can add and edit Facebook, Twitter, and YouTube user names for contacts from a custom contact **workspace**. Before staff members can add and edit channel types, the Channel Usernames field must be added. Refer to Creating custom workspaces.



Important Channel types are not interface specific and cannot be deleted.

To edit a channel type

1 Click the Configuration button on the navigation pane.

2 Double-click Customizable Menus under Application Appearance. The Customizable Menus tree opens on the content pane.

3 Click Channel Types under System Menus to display the editor.

4 To rename a channel, click it in the Label column. The Interface Visibility section displays.

Note The Interface Visibility section contains the names of all available interfaces, the languages they are implemented in, and the language-specific label of the channel. When using multiple-language interfaces, type the label in the Label field in the language of the interface.

a Type the name of the channel type. When you move to another field, the Label field in the Interface Visibility section is populated with the name you typed in the Name field.

5 To remove channel type visibility for staff members and contacts, clear the Contact Visible check box next to the applicable channel type. This removes staff member visibility for the channel type in the Channel Usernames field on custom contact **workspaces**. In addition, visibility is removed from the applicable **widget** on the customer portal.

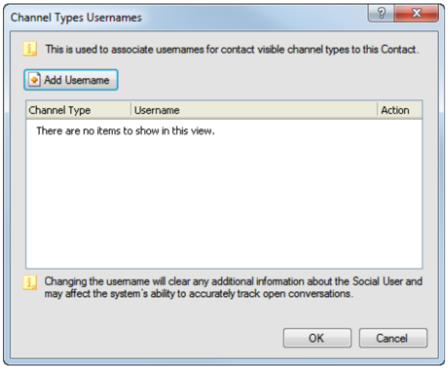
6 To change the display sequence of channel types on the custom contact workspace and the customer portal, click the up or down arrow next to the Contact Visible column.

7 Click the Save and Close button on the ribbon.

To add a social media user name for a contact

Note The following procedure must be performed from a custom contact workspace in which the Channel Usernames field has been added. Refer to Editing workspaces.

1 While editing a contact record, click Add in the Channel Usernames field. The Channel Types Usernames window opens.



2 Click the Add Username button. A drop-down menu displays under the Channel Type column.

3 Click the Channel Type drop-down menu and select Facebook, Twitter, or YouTube.

4 Type the contact's user name in the Username column.

5 Click the OK button.

6 Click the Save and Close button on the ribbon.

❖ Editing workspaces

❖ Input and output widgets

Managing cloud searches by channel

The Channels editor provides a Cloud Search Manager utility for viewing and managing cloud searches that have been added for each channel. With this utility, you can view and manage the list of agents who have selected each search as a favorite as well as remove searches that were entered incorrectly or are no longer needed.

To manage cloud searches for a channel

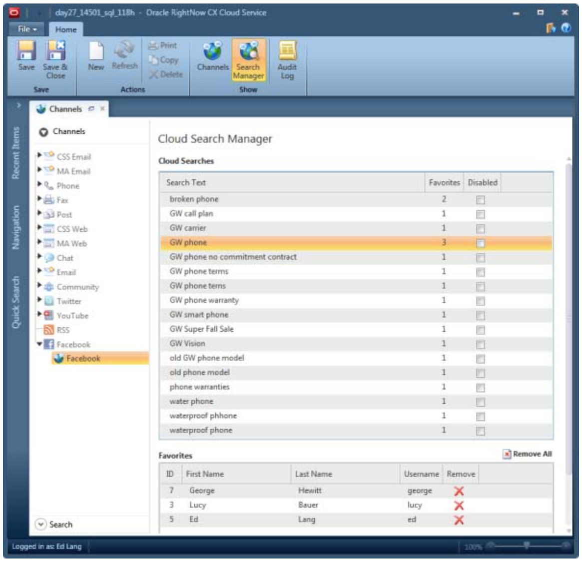
1 Click the Configuration button on the navigation pane.

2 Double-click Channels under Service in the configuration list. The Channels tree displays on the content pane.

3 Click a channel to display it on the editor.

4 Click the Search Manager button on the ribbon.

Note The Search Manager button is active only when a cloud search has been added to the channel using the social monitor.



The Cloud Searches section displays a list of cloud searches that have been added for the channel, including the search text and the number of instances that each search has been set as a favorite.

5 Select a cloud search from the list to populate the Favorites panel with a list of all agents who have set that search as a favorite.

6 To remove the search from an agent's list of favorites, click the Remove button next to the agent name.

7 To remove the search from all favorite lists, click the Remove All button.

8 To hide a cloud search from all standard reports and remove it from all agent favorite lists, select the Disabled check box next to the search.

Caution Removing cloud searches from all agent favorites cannot be undone. If you disable a search in error, close the Channels editor without saving your changes.

9 Click the Save and Close button to save your changes to the channel's cloud searches.

78

Social Monitoring

With a growing portion of the world's population now depending on social media like Twitter and Facebook for communicating with friends and colleagues, it has become crucial for organizations to monitor the dialogue about their products and services that is taking place on the social web. The power of customer perspectives multiplied through social channels can have a dramatic impact, be it harmful or helpful, on business revenue. To extend great customer experiences across these emerging channels and protect your organization's valued reputation, it is essential to employ a social media strategy that includes monitoring, and sometimes participating in, conversations in the cloud.

Using Oracle RightNow Social Monitor Cloud Service (also known as the social monitor), you can interact with your customers by searching social media services, create **incidents** in **Oracle Service Cloud**, and include social media in your **Oracle RightNow Outreach Cloud Service** and **Oracle RightNow Feedback Cloud Service** messages. You can improve customer experiences by identifying trends in customer issues and opinions, and proactively communicate with customers through social channels using incidents. Refer to Responding through social channels.

Important The social media services described here are not provided by or affiliated with Oracle. To obtain support or information about terms and conditions for any of the services mentioned, contact the service provider.

- Channels

Configuring social monitoring

Before you can monitor the social cloud to search for information related to your organization, you need to configure your application to provide access to the tools used to manage **cloud searches** and respond to customer **posts**.

Note These configuration options will not be available until social monitoring is enabled for your site. To enable social monitoring, contact your Oracle account manager.

To provide access to the social monitor

1 Add the Social Monitor navigation button and component to navigation sets. Refer to Adding social monitor to navigation sets.

2 Add or update **profiles** to include social monitor permission. Refer to Adding social monitor permission to profiles.

3 Add or update **staff accounts** to use profiles that include social monitor permission. Refer to Managing staff accounts.

❖ Adding social monitor to navigation sets
❖ Adding social monitor permission to profiles
❖ Managing staff accounts

Adding social monitor to navigation sets

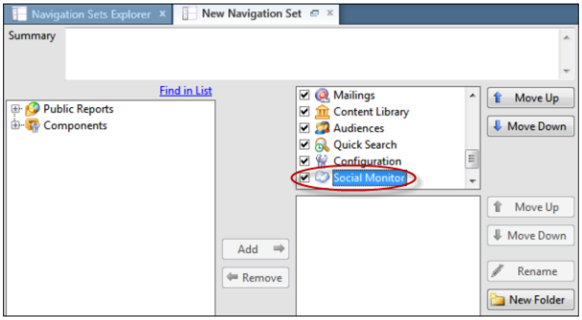
In order for staff members to monitor the social cloud, you must first add the Social Monitor component to one or more navigation sets. Refer to Modifying navigation sets.

To add the Social Monitor component to a navigation set

1 Click the Configuration button on the navigation pane.

2 Double-click Navigation Sets under Application Appearance. The Navigation Sets explorer displays on the content pane.

3 Double-click the navigation set that you want to add the Social Monitor component to. The Navigation Sets editor displays on the content pane.



4 On the right side of the content pane, select the Social Monitor check box.

5 On the left side of the content pane, click the plus sign next to Components > Service.

6 Drag the Social Monitor component from the left column and drop it in the lower portion of the right column to add it to the Social Monitor navigation button.

Note The Social Monitor component is not available unless social monitoring is enabled for your site. To enable social monitoring, contact your Oracle account manager.

7 Click the Save and Close button on the ribbon.

Now, you need to assign this navigation set to one or more profiles and also assign social monitor permission in the profiles.

❖ Modifying navigation sets

Adding social monitor permission to profiles

Social monitoring is not fully available until social monitor permission has been added to one or more profiles. Refer to Customizing profiles.

To add social monitor permission to a profile

1 Click the Configuration button on the navigation pane.

2 Double-click Profiles under Staff Management. The Profiles report displays on the content pane.

3 Double-click the profile you want to add permission to. The Profiles editor displays on the content pane.

4 If the Navigation Set field in the Interfaces section does not display the navigation set that you added the Social Monitor component to, click the Search button and select it. Refer to Adding social monitor to navigation sets.

5 Click the Permissions button on the ribbon.

6 Click the Service tab.

7 Select the Social Monitor–Search check box under Social Monitor.

8 Click the Save and Close button on the ribbon.

Now, when staff members with this profile run any of the social monitoring reports, they can schedule **cloud searches**, ignore results, respond to **posts**, and manage favorites.

Note Before staff members can search the social cloud, you must update their staff account to use a profile containing social monitor permission. Refer to Adding and editing staff accounts.

- Customizing profiles
- Adding and editing staff accounts

Social monitoring overview

To monitor the social cloud, you will add, execute, and analyze **cloud searches** for any of the available social channels. As each new cloud search is added, it is listed on the content pane along with information about who added it, what social channel is searched, what text is searched for, the time it was last executed, and how many results have been returned. A search can also be designated as a favorite, which prevents it from being deleted and enables it to be scheduled on a recurring basis. Refer to Managing favorites.

To view the results of a cloud search, simply click a total listed in the New Results or Total Results column. The content pane will display a report based on the social channel you chose when searching. Twitter, Facebook, **Oracle RightNow Social Experience communities**, and RSS searches can return a maximum of 100 new results per search instance, while YouTube searches are limited to 50 new results. Results returned over multiple searches are combined in the Total Results statistic.

Note Social monitoring reports can also be accessed directly at Public Reports > Common > Social Monitor. Refer to Reports explorer.

For a complete list of social monitoring report names, locations, and descriptions, generate the View Report Descriptions report in the Report Management component and filter on Common > Social Monitor reports. Refer to Producing a catalog of reports.

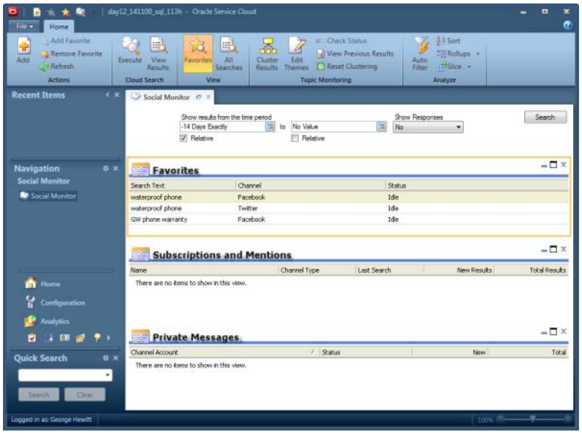
The social channels available for cloud searches are configured through the Channels editor. Refer to Social channels overview.

In addition, the Channels editor provides a utility for viewing and managing cloud searches that have been added for each channel. With the Cloud Search Manager, you can view and manage the list of agents who have selected each search as a favorite as well as remove searches that were entered incorrectly or are no longer needed. Refer to Managing cloud searches by channel.

To access the social monitor

1. Click the Social Monitor button on the navigation pane.
2. Double-click Social Monitor in the navigation list. The social monitor opens on the content pane.

Note Search results do not display on the content pane until you perform a cloud search. Refer to Searching the social cloud.



The **docked filters** at the top of the content pane are used to search for information that is displayed in the Social Monitor dashboard. The filters include start and end dates—in relative or absolute format—and whether responses to social incidents should be shown in the results.

The Social Monitor dashboard results are divided into three sections.

- **Favorites**—Contains a list of previous cloud searches. Each time you perform a new cloud search, it is automatically marked as a favorite and added to this section. Refer to Managing favorites.
- **Subscriptions and Mentions**—Contains a list of cloud searches that have been added on a **subscription** basis and mentions of Twitter channel accounts in customer tweets. Refer to Searching the social cloud.
- **Private Messages**—Contains messages received through Facebook and Twitter private messages. Refer to Responding to Facebook posts and Responding to Twitter posts.

The following table describes the buttons on the social monitor ribbon.

Table 610: Social Monitor Ribbon Description

Group/Button	Description
Actions	
Add	Click this button to add a cloud search. Refer to Searching the social cloud.

Table 610: Social Monitor Ribbon Description (Continued)

Group/Button	Description
Add Favorite	Click this button to add the selected cloud search as a favorite. Refer to Managing favorites.
Remove Favorite	Click this button to remove the selected cloud search as a favorite. Refer to Managing favorites.
Refresh	Click this button to refresh the social monitor and update any rows that have been acted upon in the associated report.
Cloud Search	
Execute	Click this button to execute all selected cloud searches. **Note:** The data in the New Results and Total Results columns may change as a result of this action.
Get More Results	Click this button to retrieve additional results based on your initial search. This button is disabled unless additional search results are available.
View Results	Click this button to view search results from the selected cloud search. **Note:** If more than one cloud search is selected, this button is disabled as results can be viewed for only one search.
View	
Favorites	Click this button to list only the cloud searches that you have selected as favorites. Refer to Managing favorites.
All Searches	Click this button to list all cloud searches. Refer to Searching the social cloud.
Topic Monitoring	
Cluster Results	Click this button to cluster the selected cloud search results. **Note:** If **themes** are specified, they are used during the clustering process. Refer to Topic monitoring for cloud searches.
Edit Themes	Click this button to edit the themes used in clustering. Refer to Editing and adding themes for clustering.

Table 610: Social Monitor Ribbon Description (Continued)

Group/Button	Description
Check Status	Click this button to check the status of clustering. Refer to Topic monitoring for cloud searches.
View Previous Results	Click this button to open the Topic Monitoring for Cloud Results report, where you can view previous clustering results.
Reset Clustering	Click this button to recluster the cloud search results without using themes. Refer to Editing and adding themes for clustering.
Analyze	
Auto Filter	Click this button to enable auto-filtering in the report. Auto-filtering provides column filtering after the report has been generated. Refer to Using Auto Filter.
Sort	Click this button to open the Sort window and select which output columns to sort by and the sort method. Refer to Changing sort options.
Rollups	Click this button to select **rollup** options and open the Rollups window. Refer to Displaying rollup levels.
Slice	Click this button to select slice options and open the Slice window. Slicing groups data so you can view only the subset of records you are interested in. Refer to Slicing report data.

Note Cluster Results, Edit Themes, Check Status, and Reset Clustering require the Marketing daemon to be running before buttons are active on the ribbon.

- Working with the ribbon
- Displaying shortcut keys on the ribbon

Monitoring social channels

Monitoring social channels consists of searching the social cloud to track your organization's reputation for the products or services it offers. You can manage your favorite **cloud searches** and **subscriptions**, schedule cloud searches, ignore or respond to **posts**, and create incidents from posts. You can also append posts to existing incidents as note thread entries.

Note The CLOUD_INCIDENT_REOPEN_DEADLINE configuration setting controls the timeframe in which a solved incident will reopen to allow a post to be appended to the incident thread.

Important By default, cloud search results that are not responded to, ignored, or added to an incident within seven days are automatically deleted from the system. To change this frequency, modify the PURGE_CLOUD_RESULTS configuration setting.

Searching the social cloud

The first step to monitoring the social cloud is to add **cloud searches** so you can search for **posts** mentioning your organization, products, services, or anything else related to your organization that you are interested in. You can also add **subscriptions** to monitor all content from an entire Facebook page or RSS feed, or select a Twitter channel account to monitor all tweets and public replies sent from your customers through Twitter.

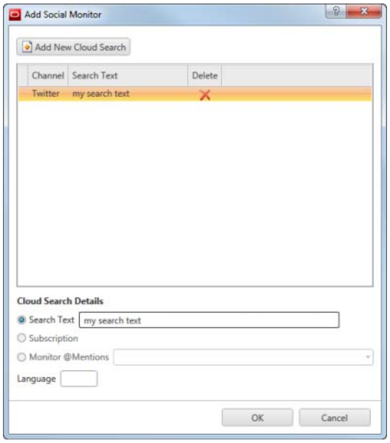
To add a cloud search

1 Click the Social Monitor button on the navigation pane.

2 Double-click Social Monitor in the navigation list. The social monitor displays on the content pane. Refer to Social monitoring overview.

3 Click the Add button. The Add Social Monitor window opens.

4 Click the Add New Cloud Search button and select the social channel you want to search. The channel is added to the list of cloud searches.



The following information displays for each cloud search in the list.

Table 611: Add Social Monitor Window—Cloud Search List

Field	Description
Channel	The name of the social channel that the cloud search will be performed on.
Search Text	The text that the social monitor will search the social channel for.
Delete	Click this button to remove the cloud search from the table.

5 Type a search term, such as your organization name or product name, in the Search Text field.

Note With the exception of Adding RSS channels, all search terms are controlled by the social media service you are searching. Since RSS feeds do not have a search function, the feed content is retrieved and stored in the *cloud_results* table. The following three search rules apply when searching RSS data.

- **Exact match searching**—When performing an exact match search, the first and last characters of the search string must be double quotes.
- **Multiple keyword searching**—When performing a search with multiple search words, an OR operator is assumed. Do not use double quotes when performing a multiple keyword search.
- **Regular expression searching**—Any search that is not an exact match search or multiple keyword search is treated as a regular expression search. This search feature is for advanced users only. Refer to Regular Expressions.

6 To add a **subscription** for a custom Facebook or RSS channel, select the Subscription radio button.

Note Because subscriptions pull all available channel content every fifteen minutes, you cannot enter search text or a recurrence schedule for a subscription.

7 To search for all tweets and public replies sent from your customers to your Twitter channel account, select the Monitor @Mentions radio button and select the channel account.

8 To filter and return search results for a specific language, type the two-letter ISO-639-1 language code. English (en) is the default language code.

Note Language filters apply only to cloud searches for Twitter and YouTube.

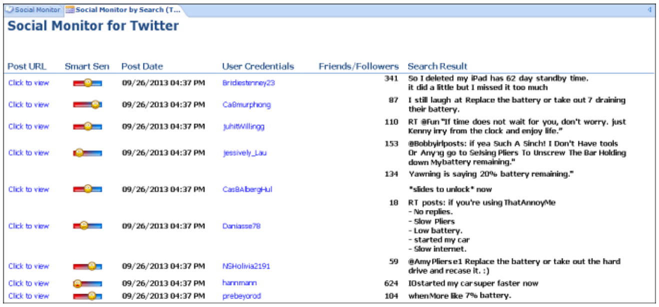
9 To filter and return Facebook search results for a specific language locale, type a five-letter locale code in the Language field. For example, the locale code for United States English is en_US. A list of case-sensitive locale codes can be found here.

Tip You can click the Add New Cloud Search button again and repeat these steps to add multiple searches before closing the Add Social Monitor window.

10 Click the OK button. The Add Social Monitor window closes and the cloud search is added to the social monitor. Text searches are added to the Favorites section, while subscriptions are added to the Subscriptions section.

Note Your new search can now be accessed by other staff members when they click the All Searches button on the ribbon.

11 Click a link under the New Results or Total Results column to open the search report. Results for searches you select are displayed on a separate content pane tab.



Tip To view a more user-friendly social media display name than the user's social media handle, right-click the Friends/Followers column heading, select Insert Hidden Column, and then select Display Name. The hidden column will display as the last column in the report.

Note Depending on your search terms, searching the social cloud may take a few minutes. During this time, buttons on the ribbon are disabled.

The appearance of cloud search results may vary based the channel you have selected. For example, while most search results are sorted by post date, clicking a Total Results link for a Facebook search will display results grouped by conversation, making it easier to follow comment threads from Facebook posts.

Cloud results for Twitter and Facebook include additional social profile information about post authors, including the number of friends or followers of each post author and a link to the author's social media user page. You can add other helpful information, such as whether the user has a contact record or open incident, by right-clicking the column headings and selecting Insert Hidden Column. For Twitter users, you can also display columns for author location and total number of posts.

Social profile attributes can also be viewed on a contact workspace by adding the Contact Social Profile report to the workspace. Refer to Adding reports and relationship items to custom workspaces and scripts.

12 To view a post in a web browser, click the Click To View link in the Post URL column.

13 To view a user's social media profile, click the user's ID in the User Credentials column.

14 To respond to a post, refer to Responding through social channels.

15 To mark a post as read, select the post and click the Mark Read button on the ribbon.

16 To remove a post from the search results, refer to Ignoring posts in search results.

17 To create an incident from a post, select the post and click the Create Incident button.

Tip Once an incident has been created for a post, it can be assigned to a staff member from the cloud search report by selecting the post and clicking the Assign button on the ribbon. To send an incident response, refer to Responding through social channels.

18 To exclude retweets from Twitter report search results, click the Search button on the ribbon, click the Include Retweets drop-down menu and select No, and click the Search button.

19 To filter the list of posts by the number of followers per social media user name, click the Search button on the ribbon, type a number in the Number of Friends/Followers field, and click the Search button.

Ignoring posts in search results

With the large number of new **posts** appearing in the social cloud each day, it is inevitable that some of the search results returned by the social monitor will not be relevant to your purposes. You can ignore any posts that do not apply and focus on the ones that do. This function is enabled by default and can be disabled by profile, giving you the option to reserve its use for your most reliable or experienced agents.

This section shows you how to ignore search results and also control and monitor which profiles should have permission to ignore results.

Note The Social Monitor Daily Trend, Social Monitor Hourly Trend, and Social Monitor Monthly Trend reports (Common > Social Monitor > Trend) help you track ignored results by specific intervals. In addition, you can monitor how often specific agents are using the Ignore Results function with the Social Monitor Ignored Posts report (Common > Social Monitor) and Social Monitor Ignored Post Trend report (Common > Social Monitor > Trend).

To ignore search results

1. From an open cloud search report, select the posting you want to remove from the search results list. To remove multiple postings, press **Ctrl** while selecting each posting.
2. Click the Ignore Result button on the ribbon.

To remove Ignore Results permission by profile

1. Click the Configuration button on the navigation pane.
2. Double-click Profiles under Staff Management. The Profiles report displays on the content pane.
3. Double-click the profile you want to remove the permission from. The Profiles editor displays on the content pane.
4. Click the Permissions button on the ribbon.
5. Click the Service tab.

6 Clear the Ignore Results check box under Social Monitor.

7 Click the Save and Close button on the ribbon.

Now, when staff members with this profile run any of the social monitoring reports, they will no longer see the Ignore Results button on the ribbon.

❖ Click here

Managing favorites

When you add a **cloud search**, it is automatically marked as a favorite, indicated by a gold star when you view all searches. Just as browser bookmarks provide easy access to your favorite web pages, cloud search favorites provide easy access to cloud searches and **subscriptions** you want to keep track of. You can also view cloud searches and subscriptions added by other staff members, but they are not marked as favorites unless you manually add them to your favorites. When you add someone else's search as a favorite, a copy of the search is created and added to the end of your favorites list.

Although searches cannot be deleted from the social monitor, you can remove them from your favorites and hide them from view. To display only searches that are marked as favorites, simply click the Favorites button.

Note You can use the Cloud Search Manager on the Channels editor to view and manage the list of agents who have selected each search as a favorite as well as remove searches and subscriptions that were entered incorrectly or are no longer needed. Refer to Managing cloud searches by channel.

To add a cloud search to favorites

1 On the social monitor, click the All Searches button on the ribbon.

2 Select a cloud search or subscription that is not marked as a favorite. To add multiple cloud searches as favorites, press **Ctrl** while selecting each search.

3 Click the Add Favorite button.

To remove a cloud search from favorites

1 Select a cloud search or subscription that is marked as a favorite. To remove multiple cloud searches from favorites, press the **Ctrl** key while selecting each search.

2 Click the Remove Favorite button.

Monitoring private messages from Twitter

In addition to posting public messages, Twitter users can send private messages directly to other Twitter accounts. With social monitoring, you can view and respond to private messages received by your organization's Twitter account.

Once you have enabled private message permissions in a Twitter **channel account** (refer to Adding Twitter channel accounts), the **Dbstatus** utility automatically checks for private messages every fifteen minutes and displays them on the social monitor. Private message search results function like other cloud search results—you can create incidents from them, append them to existing incidents, mark them read, or ignore them.

To monitor private messages from Twitter

1 On the social monitor, click the Favorites button on the ribbon. The Private Messages section of the dashboard lists each channel account monitored, its status, and the number of new and total private messages retrieved.

Note In order for private messages to appear in the monitor, you must first enable the Monitor private message permission in your Twitter channel account. Refer to Granting agent access to channel accounts.

2 Click a link under the New or Total column next to a channel account to view its private messages. Results for the channel account you select are displayed on a separate content pane tab.

3 To respond to a private message, select the message from the search results list and click the Respond button on the ribbon. Refer to Responding to Twitter posts.

Tip You can configure each Twitter channel account to automatically create incidents from all private messages it receives. Refer to Adding Twitter channel accounts.

Monitoring private messages from Facebook

In addition to posting public messages on your custom Facebook channels (fan pages), Facebook users can send private messages that you view and respond to with social monitoring. A Facebook user can provide sensitive information related to an incident (such as account information) by transitioning to using a Facebook private message without leaving the Facebook channel. Incidents will be updated with both public and private customer replies, allowing agents to monitor the entire conversation in the incident response thread.

To set up Facebook channels to monitor private messages, see Adding Facebook channels.

To monitor private messages from Facebook

1. On the social monitor, click the Favorites button on the ribbon. The Private Messages section of the dashboard lists each channel account monitored, its status, and the number of new and total private messages retrieved.

2. Click a link under the New or Total column next to a channel account to view its private messages. Results for the channel account you select are displayed on a separate content pane tab.

3. To respond to a private message, select the message from the search results list and click the Respond button on the ribbon. Refer to Responding to Facebook posts.

Tip You can configure each Facebook channel to automatically create incidents from all private messages it receives. Refer to Adding Facebook channels.

Topic monitoring for cloud searches

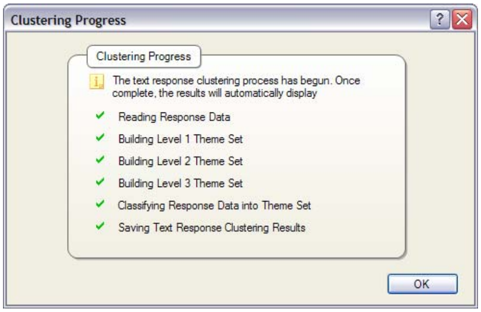
Posts in the social cloud can often provide valuable business intelligence about issues experienced by large segments of your customer base. However, reviewing a large number of posts can be time-consuming and tedious. To make this easier, the social monitor provides a topic monitoring process called “clustering” that you can use to quickly analyze the results of large cloud searches and identify posts that contain similar themes. This analysis is then available in a special report that organizes the cloud search results by theme to help you identify emerging issues.

To cluster cloud search results

1 On the social monitor, select a search and click the Cluster Results button on the ribbon.

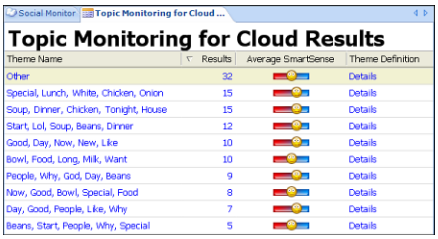
Note If any themes are specified in the Themes to Include section of the Edit Themes window, they will be used during the clustering process. Refer to [Editing and adding themes for clustering](#).

2 To check the status of the clustering process while it is running, click the Check Status button. The Clustering Progress window opens.



a After clustering has finished, click the OK button.

3 To view the Topic Monitoring for Cloud Results report, click the View Previous Results button. This report enables you to view clustering results from previous cloud searches, including theme information, result counts, and **SmartSense** ratings.



Social Monitor | Topic Monitoring for Cloud ...

Topic Monitoring for Cloud Results

Theme Name	Results	Average SmartSense	Theme Definition
Other	32		Details
Special, Lunch, White, Chicken, Onion	15		Details
Soup, Dinner, Chicken, Tonight, House	15		Details
Start, Lol, Soup, Beans, Dinner	12		Details
Good, Day, Now, New, Like	10		Details
Bowl, Food, Long, Milk, Want	10		Details
People, Why, God, Day, Beans	9		Details
Now, Good, Bowl, Special, Food	8		Details
Day, Good, People, Like, Why	7		Details
Beans, Start, People, Why, Special	5		Details

4 To recluster the cloud search results without using themes, click the Reset Clustering button.

Note If the Topic Monitoring for Cloud Results report is open, you must close it and click the View Previous Results button again in order to see new or reset cluster results.

❖ Editing and adding themes for clustering

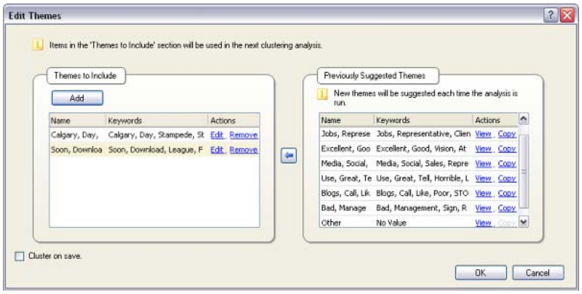
Editing and adding themes for clustering

A theme is comprised of a group of keywords used to identify and group related content items. In the social monitor, themes are automatically generated during the clustering process by processing cloud search results and identifying common keywords. Refer to Topic monitoring for cloud searches.

If you want to add your own keywords for clustering, you can edit the themes generated by Oracle Service Cloud or you can create your own themes. During the clustering process, the themes you create manually are given greater emphasis than automatically generated themes.

To edit a theme for clustering

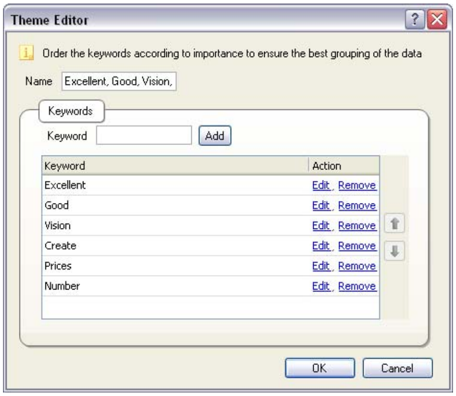
1 On the social monitor, select a search result row and click the Edit Themes button on the ribbon. The Edit Themes window opens.



The Edit Themes window is divided into two sections: the Themes to Include and Previously Suggested Themes sections. The Themes to Include section displays a list of themes that will be used in clustering. You can also add themes from this section. Refer to To add a theme for clustering.

The Previously Suggested Themes section displays a list of themes that were created by Oracle Service Cloud during the clustering process. Suggested themes change each time cloud searches are clustered. However, you can manually edit a suggested theme or prevent it from being automatically modified by moving it to the Themes to Include section.

2 Click Edit next to the theme you want to edit in the Themes to Include section. The Theme Editor opens.



3 To edit a keyword, click Edit next to the keyword.

4 To remove a keyword from the list, click Remove next to the keyword.

5 To move a keyword up or down in the list, use the up or down arrow to the right of the keyword list.

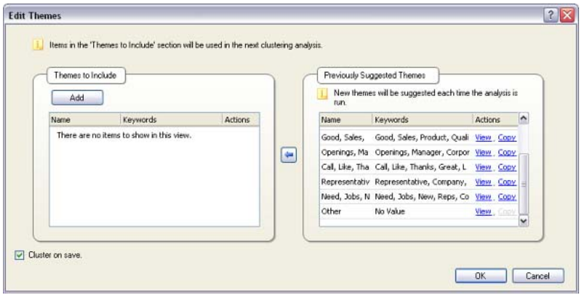
Note When cloud search results are clustered, the keywords at the top of the list are given more consideration than the keywords at the bottom of the list.

6 To cluster results upon saving your edits, select the Cluster On Save check box.

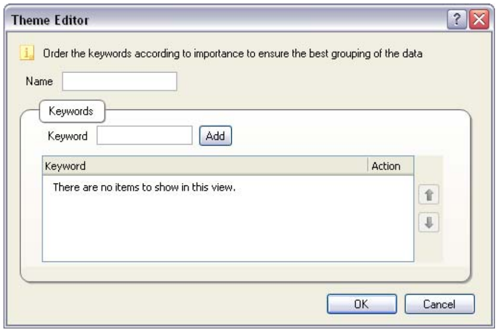
7 Click the OK button to save your edits.

To add a theme for clustering

1 On the social monitor, select a search result row and click the Edit Themes button on the ribbon. The Edit Themes window opens.



2 Click the Add button in the Themes to Include section. The Theme Editor opens.



3 Type a name for the theme in the Name field.

4 In the Keyword field, type a keyword that you want associated with this theme and click the Add button. The keyword displays in the Keyword list.

Note Multiword keywords are not supported by the topic monitor. If multiple words are entered for a single keyword value, only the first word will be used. If the resulting outcome produces too many matches that are irrelevant to your search, try adding other keywords that relate to an appropriate subset of your topic. For example, adding the multiword phrase “customer experience” as a keyword will produce the same effect as adding the single keyword “customer,” and the word “experience” will be ignored. For a more accurate result set, add keywords “customer” and “experience” separately instead.

5 To edit a keyword, click Edit next to the keyword.

6 To remove a keyword from the list, click Remove next to the keyword.

7 To move a keyword up or down in the list, use the up or down arrow to the right of the keyword.

Note When cloud search results are clustered, the keywords at the top of the list are considered more important than the keywords at the bottom of the list.

8 To cluster results upon saving your theme, select the Cluster On Save check box.

9 Click the OK button to save your theme.

❖ Topic monitoring for cloud searches

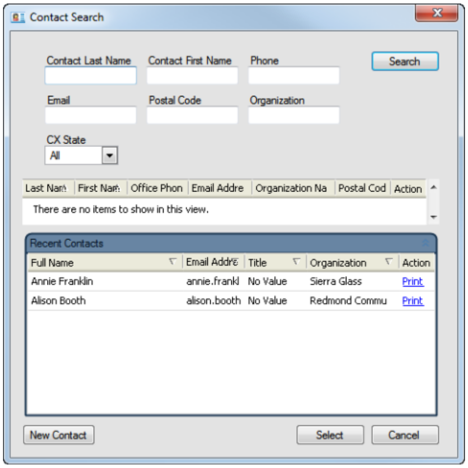
Responding through social channels

When monitoring social media, you can add **posts** from Facebook, Twitter, and **Oracle RightNow Social Experience communities** to new or existing incidents so they can be processed on the agent desktop. In this way, you can document the customer interaction and provide the customer with assistance or follow-up contact. This is useful for helping customers who have a question, thanking customers for positive comments, or participating in a discussion about your products and services.

Note You cannot respond to **RSS** feeds or YouTube posts through Oracle Service Cloud. However, you can create incidents from them, which can be helpful for other business purposes. To do so, simply right-click a post and select Create Incident. These incidents will be associated with a common generic contact (such as rss@rss.invalid).

When you create an incident from a social channel, the content of the post is added as a customer thread entry. By default, the incident's subject field will contain the name of the channel and the leading text of the post, together exceeding no more than 240 characters. However, you can customize the subject field contents by editing the CLOUD_INC_SUBJECT_TEXT configuration setting. Refer to Searching configuration settings.

The method used to associate incoming social incidents with contacts varies by channel. Incidents created from community posts are associated with contacts based on contact email address. Incidents created from Facebook, Twitter, and YouTube posts are associated with a contact based on social media user name. If you create an incident for a Twitter or Facebook user who is not associated with a contact, and the system identifies one or more contacts whose display name is close to that of the user, you will be prompted to associate an existing contact or create a new one. If no matching contact is found, a new contact record is created and associated with the incident.



Note Contact social media user names are stored in the *sm_user.username* field and can be displayed by adding the Channel Usernames field to a custom contact **work-space**.

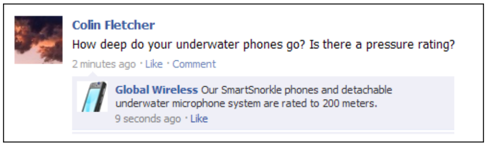
The way you respond to social incidents also varies by channel. Oracle Service Cloud tracks each incident's originating channel in the *incidents.channel_id* field and selects the same channel by default when you send a response. Each response is posted back to the contact using the unique messaging conventions of the originating media service. For example, when an agent responds to a Facebook or Twitter post and leaves the incident set to a non-Solved status, and the customer replies publicly through the same channel, the reply is automatically appended to the incident thread. (However, automatic thread updates are not applied for Twitter private messages.) Refer to the following sections for more about responding in supported social media channels.

Important Because social media contacts often have no email address, before you can respond to them, you must customize your incident workspace to make the Email field on the Contacts tab non-required, either by modifying the field's Required attribute or by creating a workspace rule to set the attribute based on incident channel. Refer to Creating custom workspaces and Overview of workspace rules.

- Editing incidents
- Responding through social channels

Responding to Facebook posts

In Facebook, social conversations take the form of **posts** and comments on pages. While the social monitor allows you to monitor (but not respond to) posts from the public Facebook feed, you can respond to incidents created from customer posts on your organization's Facebook fan page. When you respond to a post on your organization's Facebook page, the response appears as a comment beneath the post, as shown here.



The post is attributed to the name of the Facebook page designated by the **channel account**, rather than the agent's name. For information about configuring a channel account, refer to Adding Facebook channels.

To respond to a Facebook post

1 Perform a cloud search on a custom Facebook channel and view your search results. Refer to Searching the social cloud.

2 From the open cloud search report, select the post you want to create an incident from in the search results list.

3 Click the Respond button on the ribbon. A new incident opens on the content pane containing the details of the post.

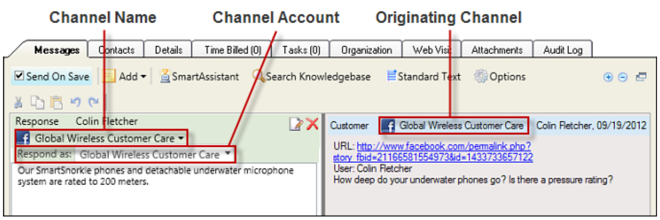
Note If your profile allows you to create incidents, the Respond button and the Create Incident button (both located on the ribbon) provide the same functionality. Clicking either of them results in a new incident opening on the content pane. Only one incident can be created from a post.

If the contact's social account user name is associated with previous cloud incidents, you will be prompted to select from a list of existing incidents or create a new incident.

Alternately, you can append the post to the thread of an existing incident by clicking the Append Incident button and selecting an incident from the contact's incident history or recent incidents that you have opened.

If your profile does not allow you to create incidents, the Create Incident button is disabled. Clicking the Respond button results in a warning message indicating that you do not have the permissions required to create incidents. Refer to [Service permissions](#).

4 Select the Send On Save check box. The incident thread expands to reveal Facebook channel response options. The thread displays the name of the post's originating channel and automatically selects the same channel for the response. The default channel account associated with the responding agent is also displayed.



In this example, Global Wireless Customer Care is the name of the originating channel, the response channel, and the default channel account.

Note When you reply to a private Facebook message, your reply will be sent as a private message unless you clear the Send Private check box. A private conversation must be initiated by the Facebook user.

5 If your site has more than one Facebook channel account, click the Respond As drop-down menu in the header of the response thread.

Note If enabled, the Cc, Bcc, and Attach buttons and the email encryption fields will not display since you are bypassing email and responding directly to the Facebook post.

6 Fill in any remaining details for the incident. Refer to Editing incidents.

7 Click the Save and Close button on the ribbon.

❖ Granting agent access to channel accounts

Responding to Twitter posts

Twitter is among the world's most popular social media, but its architecture is different than most other services. Twitter **posts**, called "tweets," are short messages designed mainly for public, one-way communication to a group of followers. Tweets are posted publicly to Twitter's vast global feed, where they can be accessed by anyone. In a sense, this function more closely resembles a public message board than a conventional messaging service. Because tweets are public and indirect, using Twitter as a channel for business communication presents a significant challenge. Although the social monitor can track customer replies to your messages and append them to an incident as an ongoing conversation, those back-and-forth communications can be read, reposted, and replied to by any other Twitter user. For this reason, using tweets to resolve sensitive service issues can be risky.

To more successfully engage with customers using the Twitter channel, you should advise them to use Twitter's private messaging feature, which is also supported by the social monitor. Private messaging is an alternate, direct messaging feature that makes interactions more secure by keeping them out of Twitter's public feed.

Important In order to control spam, Twitter will deliver private messages only to an account that follows the sending account. This means that you cannot send a private message to a customer unless the customer's Twitter account is following your organization's account. And in order for your customer to reply privately, your organization's account must be following the customer's account. In other words, both Twitter accounts must follow each other before they can engage in a private, back-and-forth conversation.

For this reason, your initial response will be a public tweet because the customer will not yet be following your organization's Twitter account. However, you should strongly encourage the customer to reply by private message, and to follow your organization's account so that you can communicate with them privately. This step is essential to ensure the best customer experience and minimize the potential for interference from other Twitter users.

Also note that Oracle Service Cloud can create incidents automatically from private Twitter messages when you select the Automatically Create Incident option in the Twitter channel accounts editor. Refer to Adding Twitter channel accounts.

To respond to a Twitter post

1 Perform a cloud search on a Twitter channel and view your search results. Refer to Searching the social cloud.

2 From the open cloud search report, select the post you want to create an incident from in the search results list.

3 Click the Respond button on the ribbon. A new incident opens on the content pane containing the details of the post.

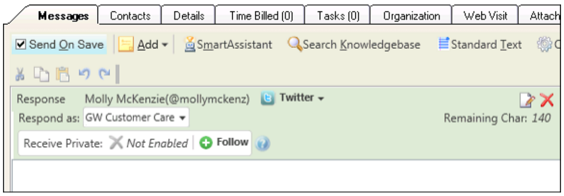
Note If your profile allows you to create incidents, the Respond button and the Create Incident button (both located on the ribbon) provide the same functionality. Clicking either of them results in a new incident opening on the content pane. Only one incident can be created from a post.

If the contact's Twitter account user name is associated with previous cloud incidents, you will be prompted to select from a list of existing incidents or create a new incident.

Alternately, you can append the post to the thread of an existing incident by clicking the Append Incident button and selecting an incident from the contact's incident history or recent incidents that you have opened.

If your profile does not allow you to create incidents, the Create Incident button is disabled. Clicking the Respond button results in a warning message indicating that you do not have the permissions required to create incidents. Refer to Service permissions.

4 Select the Send on Save check box. The response thread header expands to reveal Twitter channel response options.



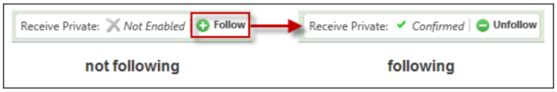
5 If your site has more than one Twitter channel account, click the Respond As drop-down menu and select the account you want to respond from.

Important To ensure the best customer experiences, the channel account you respond from must include Private Message Response permissions. Refer to To add a channel account for Twitter.

If the customer's Twitter account is following your organization's Twitter account, the Send Private check box will be visible and selected by default. You can clear this check box to post the message to the public feed. However, for the reasons mentioned above, you should always send messages privately whenever the option is available.

If the customer's account is *not* following your organization's account, the Send Private check box will not be shown and all sent messages will be public.

6 If your organization's Twitter account is not yet following your customer's Twitter account, click the Follow button.



Note Following the customer's account will allow the customer to send private messages to your organization's account.

7 Type your response in the response thread. Remember to limit each response to 140 characters, the maximum number allowed by Twitter.

8 Fill in any remaining details for the incident. Refer to Editing incidents.

9 Click the Save and Close button on the ribbon to send the response through Twitter.

79

Self Service for Facebook

In the age of the social web, your organization can no longer dictate when, where, and how it interacts with customers—you must engage customers in their channels of choice. With more than a half billion active users spending more than three billion hours per month sharing information, Facebook's global social network has emerged as a critical interaction point.

Oracle RightNow Self Service for Facebook Cloud Service (Self Service for Facebook) is a special Facebook application served by Oracle Service Cloud that provides your customers with access to features from **Oracle RightNow Cloud Service** and **Oracle RightNow Social Experience communities** right from your organization's Facebook page, in both its standard and mobile web interfaces. Using Self Service for Facebook, customers can:

- Search the Oracle Service Cloud knowledge base, including results from your community and natural language search using **Oracle RightNow Virtual Assistant Cloud Service (Virtual Assistant)**, if enabled.
- Submit questions privately to your support team or publicly to your community.
- Rate and comment on answers.
- Browse community discussions.
- Submit and track community posts and comments.
- Share service and community experiences on Facebook.

As needed, your agents can field and respond to Facebook incidents right from their agent desktop. In this way, your customers can receive the same exceptional support they receive from your other service channels without having to leave Facebook. As a result, your organization can deliver a consistent experience to customers and fans on Facebook while maintaining a unified view of customer interactions across all service channels.

In addition to the Self Service for Facebook application, Oracle Service Cloud provides tools for monitoring and responding to comments submitted to your organization's Facebook fan page. Refer to Social channels overview.

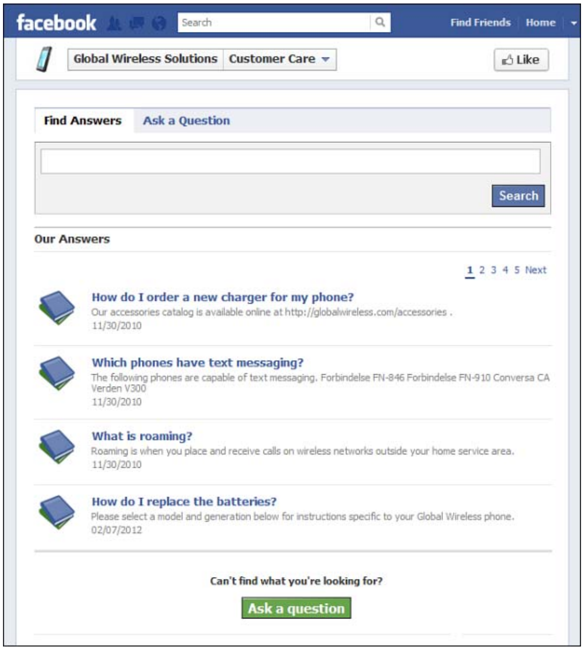
For in-depth best practices and strategies for defining a comprehensive social strategy for your organization, refer to Answer ID 4647 on our support site.

Self service features in Facebook

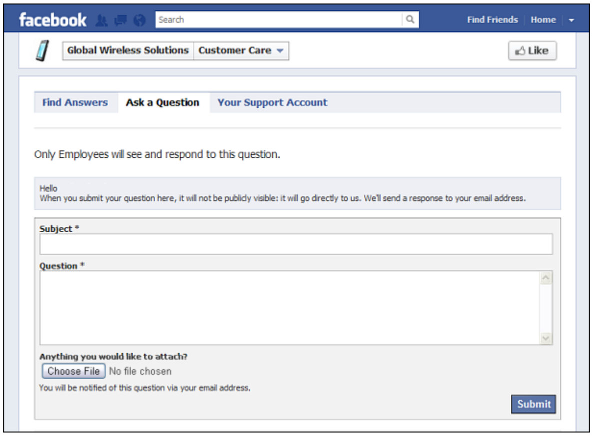
Self Service for Facebook helps customers find the information they need by browsing or searching your knowledge base from the Facebook social networking site. Once connected, the Find Answers tab displayed in Facebook presents the same answers that are visible in the answer search report defined for your **customer portal**.

Note The report will also include results from your **community** and **Virtual Assistant**, if enabled.

The following figure shows the Self Service for Facebook application connected to a consumer products support site.



Similar to visiting the customer portal, customers can click an answer to view its contents, including **guides**, without leaving Facebook. They can also click the Ask a Question tab to submit questions to your Oracle Service Cloud. Incidents submitted in this manner are processed by your system just like incidents submitted through the **customer portal**, and can then be accessed by your staff using the **agent desktop**.



Note Self Service for Facebook will create or update contact records on your site as needed, regardless of your site's pass-through authentication (PTA) settings.

When customers attempt to use the Ask a Question feature for the first time, they will be prompted to log in to Facebook (if they haven't already) and grant application access to basic account information. This data will be used to link their Facebook account to their contact record in Oracle Service Cloud. Facebook accounts will be associated with existing contacts that share the same email address (whether primary or alternate). In a case where no matching contact is found, a new contact will be created and automatically associated using the email address from the Facebook account. Agent responses to incidents submitted through Facebook are sent by email to that address.

When **email address sharing** is enabled in Oracle Service Cloud, Facebook account association is subject to a contact-matching process. Refer to Email address sharing.

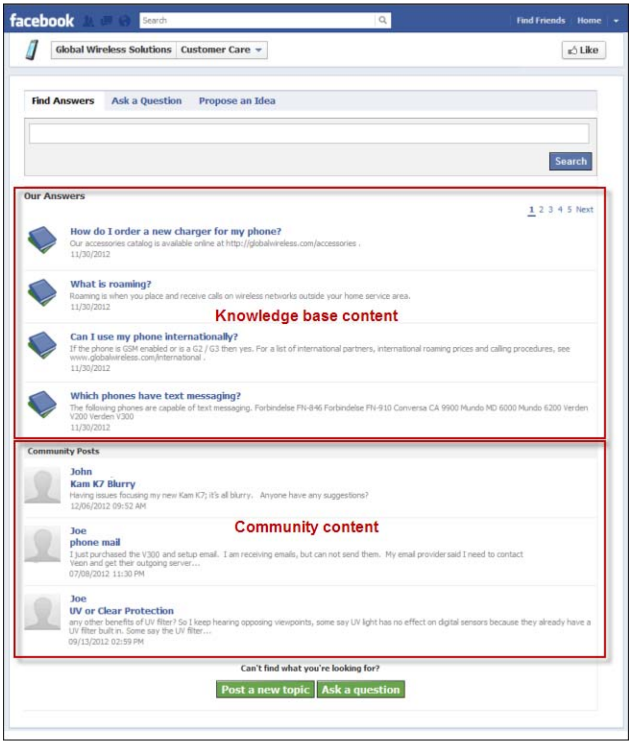
Customers can also click the Your Support Account tab to view and update incidents from their recent support history.

Incidents created through Self Service for Facebook will be processed through whatever business rules and escalation paths you have configured for your site. If a SmartAssistant rule is active, suggested answers will be displayed when questions are submitted, just as they are in the customer portal. If you want to route these incidents through a distinct set of rule actions, you can do so by using "Incident.Channel equals Facebook" as a business rule condition. Refer to Choosing conditions.

Note In addition to responding to incidents submitted by Facebook users, your staff can proactively monitor and respond to Facebook wall posts using the social monitor. Although complementary, the social monitor is separate and distinct from the Self Service for Facebook application and is configured and managed separately in Oracle Service Cloud. Refer to Monitoring social channels.

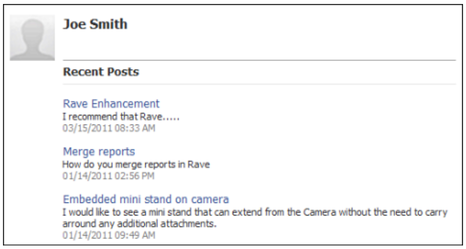
Community features in Facebook

When a **community** is enabled for your site, your customers can search your knowledge base and community at the same time. Content from both sources is presented together in one set of search results for easy review.



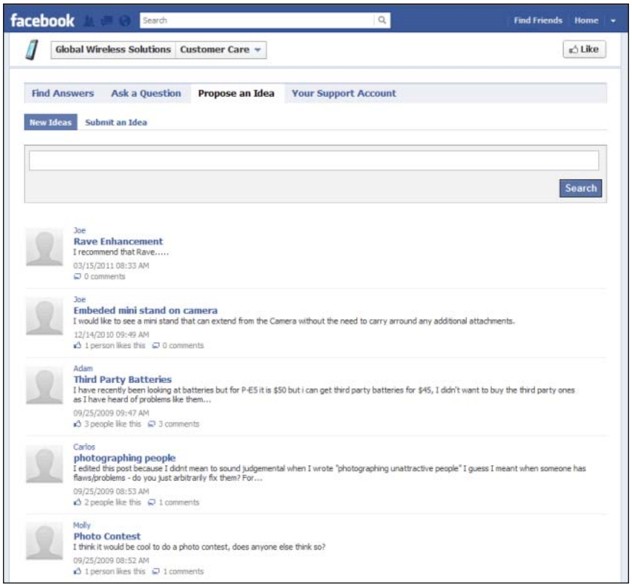
Clicking the subject line of any answer or post will display its details within Facebook. Here, customers can rate and comment on the content to discuss it with other customers and provide feedback valuable to your knowledge maintenance processes.

Also, when posts are returned in the search results, customers can click the name of a post's author to display a list of that author's recent posts.



In addition to searching community content, Self Service for Facebook can display the contents of a specific **hive** in a separate tab and accept new posts for that hive. With Support Communities enabled, customers accessing the Ask a Question tab are given a choice between submitting a post publicly (to the support community) or privately (as an incident).

The following figure shows Self Service for Facebook connected to a support site with Innovation Communities enabled. Here, customers can review new product innovation ideas and submit their own.



Note Community support features are available in Self Service for Facebook only when a community is enabled on your site. To enable a community, contact your Oracle account manager.

Configuring Self Service for Facebook

Self Service for Facebook is a component of your Oracle Service Cloud application that can be embedded in a Facebook fan page. To enable it on your site, you must configure its settings in both Facebook and Oracle Service Cloud.

Because Facebook often revises the development environment used to manage applications, the procedures for configuring Self Service for Facebook are subject to frequent changes. For current procedures, refer to Answer ID 4193 on our support site.

When working with social media, it is important to consider potential security risks and take the appropriate precautions associated with third-party login information, customer data, and application code. Refer to Social Experience security.

To maintain the integrity and security of your Self Service for Facebook application, refer to Self Service for Facebook authentication.

Opportunity Tracking

The following sections are intended for administrators and staff members. They contain information and procedures for configuring and using areas that are specific to Oracle Right-Now Opportunity Tracking Cloud Service.

- Sales Process
- Quote Templates
- Opportunities
- Quotes

80

Sales Process

You can customize Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking) to fit your organization's selling process. To track **opportunities**, you can define sales **strategies**, including the stages within each strategy and the **tasks** required to complete each stage. When you define **sales periods**, sales managers can monitor and measure goals for each sales representative throughout that time frame. Adding territories can help organize and assign opportunities to the appropriate **sales representatives**.

Adding and editing strategies

A strategy is a series of stages that an opportunity moves through in the sales pipeline on its way to becoming a final sale. Each stage of a strategy includes tasks that must be completed before the opportunity can move to the next stage.

You probably want different strategies for different kinds of opportunities. For example, you might have one strategy to sell a high volume of products to government organizations and a different one to sell single products to individual consumers.

When staff members select a strategy for an opportunity they are working on, the first stage of that strategy automatically populates the Stage field. All tasks associated with the strategy (including those associated with other stages) are also added to the opportunity.

To add or edit a strategy

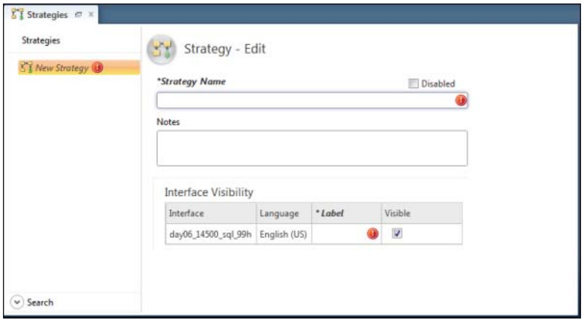
1 Click the Configuration button on the navigation pane.

2 Double-click Strategies under Opportunity Tracking. The Strategies tree displays on the content pane.

3 To add a strategy, click the New button on the ribbon. The editor displays on the content pane.

Or

To edit a strategy, click it in the tree.

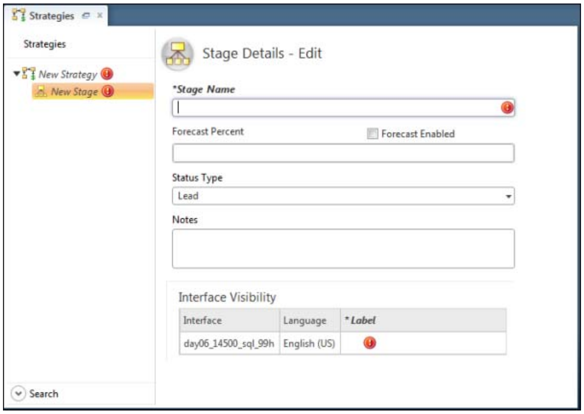


4 Enter the following field information.

Table 612: Strategies Editor Description

Field	Description
*Strategy Name	Type the name of the strategy. The item name in the Strategies tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.
Disabled	Select this check box to prevent sales representatives from selecting or viewing the sales strategy.
Notes	Type any comments about the sales strategy.
Visible	Clear this check box if you do not want the strategy to be visible on the interface.

5 Because you cannot save the strategy without adding at least one stage to it, click the arrow on the New button and select Add a New Stage to the Selected Strategy. The Stage Details editor displays on the content pane.



6 Enter the following field information.

Table 613: Stage Details Editor Description

Field	Description
*Stage Name	Type the name of the stage. The stage details item name in the Strategies tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.
Forecast Percent	To enable this field, first select the Forecast Enabled check box. The forecast percentage is an estimate of how far an opportunity has progressed in the sales strategy when it is at this stage. For example, you might be only 5% confident that an opportunity will close when it is in an Initial Contact stage, but 100% confident at a Sale Complete stage. Type a value in the field.
Forecast Enabled	Select this check box to enable **forecasts** for the stage. **Note:** You must select this check box to activate the Forecast Percent field.
Status Type	Select a status type from this drop-down menu to associate with the stage. Refer to Adding and editing opportunity statuses.
Notes	Type any comments about the stage.

7 To add another stage to the strategy, repeat steps 5 and 6.

8 Click the Save and Close button on the ribbon.

Adding tasks to stages

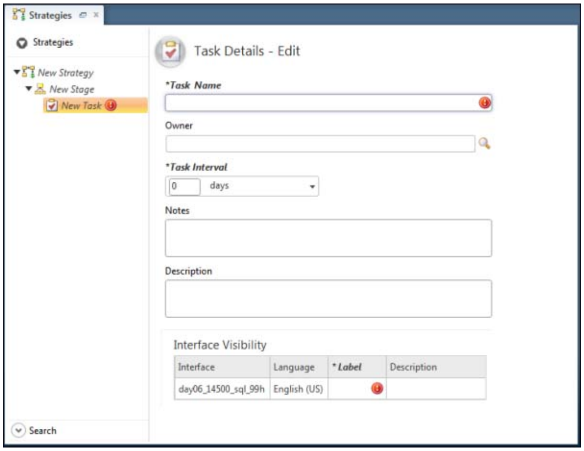
Just as strategies contain stages, each stage can contain multiple **tasks** that are required to complete each stage. After you have added a stage to a strategy, you can then add tasks to the stage. When staff members select strategies and stages for an opportunity, the opportunity's Tasks tab lists the tasks associated with the selected stage. Refer to Tasks overview to learn about tasks.

To add or edit a task

1. Click the Configuration button on the navigation pane.
2. Double-click Strategies under Opportunity Tracking. The Strategies tree displays on the content pane.
3. Locate the strategy you want and click the arrow to the left of the strategy to expand it, displaying the stages associated with the strategy.
4. Click the stage where you want to add or edit tasks. The Stage Details editor displays on the content pane.
5. To add a task, click the arrow on the New button and select Add a New Task to the Selected Stage. The Task Details editor displays on the content pane.

   Or

   To edit a task, click the arrow to the left of the stage to display the tasks associated with it, and click the task you want to edit.



6 Enter the following field information.

Table 614: Task Details Editor Description

Field	Description
*Task Name	Type the name of the task. The task details item name in the Strategies tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.
Owner	Click the Search button in the field to display staff accounts grouped by manager. Select the task owner from the list and click the OK button to close the window and populate the field.
Task Interval	Enter the amount of time estimated to complete the task. Select days, hours, or minutes from the drop-down menu and then type a value in the field. **Note:** This value is used to calculate the task due date. When a strategy is selected for an opportunity, the associated tasks are added to the opportunity, and due dates are calculated by adding the task interval to the current date and time.
Notes	Type any comments about the task.
Description	Type a description of the task.

7 To add another task to the stage, repeat steps 4 through 6.

8 Click the Save and Close button on the ribbon.

Note When you delete a strategy, the strategy is removed from the Strategy field of all associated opportunities and replaced with No Value. However, tasks that were associated with the strategy (and therefore with opportunities that had the strategy assigned to them) remain associated with the opportunities.

Adding and editing sales periods

A sales quota is defined as a specific number of dollars in sales that staff must produce over a specific time frame, or sales period. Opportunity Tracking lets you define sales periods on an annual, semi-annual, quarterly, monthly, or weekly basis. You can define each period's start and end dates, the total revenue goal, head count, goal for the number of closed opportunities, and quotas for each sales representative. When you define quotas for each salesperson, you can review that information in reports throughout the sales period.

To add or edit a sales period

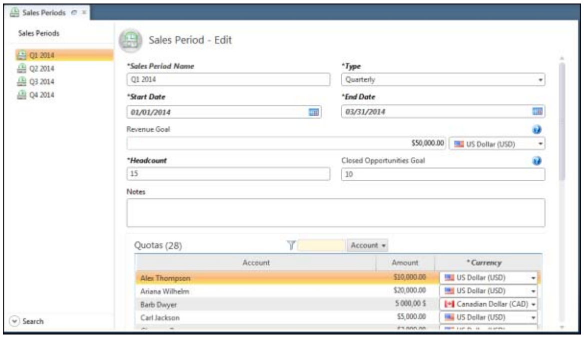
1 Click the Configuration button on the navigation pane.

2 Double-click Sales Periods under Opportunity Tracking. The Sales Periods tree displays on the content pane.

3 To add a sales period, click the New button on the ribbon to display the editor.

Or

To edit a sales period, click it in the tree.



4 Enter the following field information.

Table 615: Sales Periods Editor Description

Field	Description
***Sales Period Name**	Type the name of the sales period.
***Type**	Click this drop-down menu to select a sales period type. Your options include Annual, Monthly, Quarterly, Semi-Annual, and Weekly.
***Start Date**	Click the calendar and select the start date of the sales period. The default is today's date.
***End Date**	Click the calendar and select the end date of the sales period. The default is tomorrow's date.
Revenue Goal	Type the revenue goal for the sales period and, if necessary, select a different currency from the drop-down menu. This is the target level of revenue for the sales period displayed in the selected currency, regardless of the local currency of the transactions.
Headcount	Type the number of assigned staff persons for the sales period.
Closed Opportunities Goal	Type the goal number of closed opportunities for the sales period. This is the number of opportunities targeted to close during the sales period expressed as a positive whole number.
Notes	Type any comments about the sales period.
Quotas	Add sales quotas for each sales representative during the sales period. Refer to Adding sales quotas to sales periods.
Filter	Select Account, Amount, or Currency from the drop-down menu to filter the staff accounts that display in the Quotas section. Refer to Adding sales quotas to sales periods.

5 Click the Save and Close button on the ribbon.

Caution Deleting a sales period deletes all quotas associated with it.

You can add sales quotas when you add a sales period or at a later date. Refer to Adding sales quotas to sales periods.

Adding sales quotas to sales periods

When you define a sales period, you can also add a sales quota for each staff member. When you add sales quotas, managers can generate reports to track productivity for individual sales representatives or the entire sales team.

Note Sales managers must have Edit Sales Period permission in their profile to edit sales quotas. Refer to Opportunity Tracking permissions.

To add or edit a sales quota

1. Click the Configuration button on the navigation pane.
2. Double-click Sales Periods under Opportunity Tracking. The Sales Periods tree displays on the content pane.
3. Click the sales period where you want to add or edit sales quotas. The Quotas section of the editor displays all staff accounts with profiles that have the Appear in Menus permission selected on the Opportunity Tracking tab.
4. Click the Amount field for the account whose quota you want to add or edit, and type the value in the field. If necessary, select a different currency from the drop-down menu.
5. Repeat step 4 for each sales quota you want to add or edit.
6. Click the Save and Close button on the ribbon.

Adding and editing territories

Opportunity Tracking uses territories and sub-territories to define sales regions based on geography. Staff members can be assigned to a territory or sub-territory for reporting purposes.

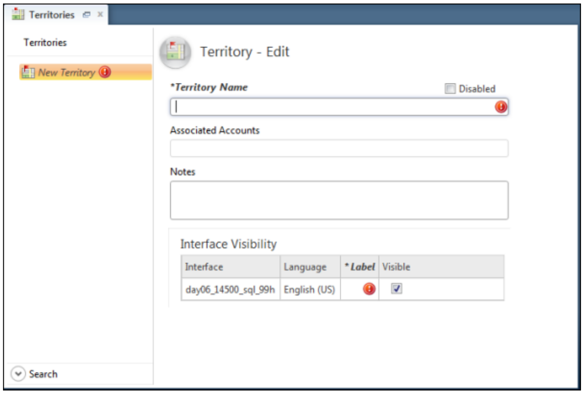
To add or edit a territory or sub-territory

1. Click the Configuration button on the navigation pane.
2. Double-click Territories under Opportunity Tracking. The Territories tree displays on the content pane.
3. To add a territory, click the New button on the ribbon.

Or

To edit a territory, click it in the tree.

Tip To add multiple parent territories in the same session, you must first press **Ctrl** and click the highlighted territory in the tree before clicking the New button.



4 Enter the following field information.

Table 616: Territories Editor Description

Field	Description
*Territory Name	Type the name of the territory. The item name in the Territories tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type.
Disabled	Select this check box to prevent sales representatives from selecting or viewing the territory when adding an opportunity.
Associated Accounts	This read-only field lists the staff members assigned to the territory in their staff account. **Note:** This field is blank if you are adding a territory.
Notes	Type any comments about the territory.

Table 616: Territories Editor Description (Continued)

Field	Description
Visible	Clear this check box if you do not want the territory to be visible on the interface. **Note:** If you clear a territory's visibility, you cannot move a visible territory to be subordinate to one that does not have visibility on the interface.

5 To add a sub-territory to a territory, click the territory in the Territories tree, click the New button on the ribbon, and complete the fields.

Or

To edit a sub-territory, click it in the tree and edit the fields.

6 Click the Save and Close button on the ribbon.

81

Quote Templates

As sales representatives work to convert **opportunities** to sales, much of their time is spent generating and sending price **quotes** to prospective customers. You can save them time by creating quote templates that automate and standardize the quote generation process.

Because your organization may need several types of quotes, you can add as many quote templates as you want. For example, your quote template for government customers is probably different than the one used for commercial customers. When sales representatives prepare a quote, they simply select the template that is appropriate for their needs. Then they merge the information from the opportunity into the quote template to generate a quote for the customer.

Adding and editing quote templates

When you add or edit a quote template, you use Microsoft Word to format the document. In addition to using standard Word functions, you can insert merge fields into the quote template. The merge fields serve as variables for opportunity data. When a sales representative merges the opportunity data into the quote template, the appropriate fields are completed automatically. For example, an organization name merge field on the quote template populates the field on the quote. This simplifies the data entry required to generate the quote and ensures accuracy and consistency.

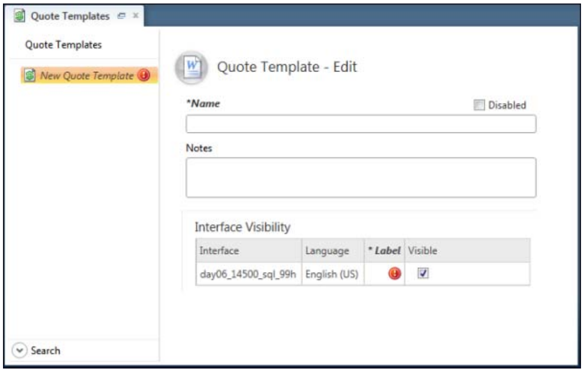
Note Before sales representatives can generate quotes using quote templates, you must add price schedules and sales products to Oracle Service Cloud. Refer to Adding and editing price schedules and Adding and editing sales products.

To add or edit a quote template

1 Click the Configuration button on the navigation pane.

2 Double-click Quote Templates under Opportunity Tracking. The Quote Templates tree displays on the content pane.

3 To add a quote template, click the New button on the ribbon to display the editor.
Or
To edit a quote template, click it in the tree.

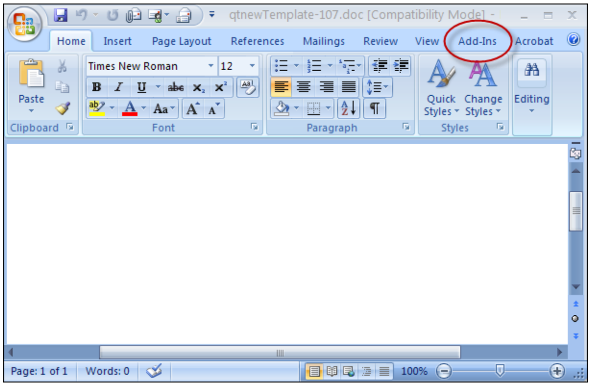


4 Enter the following field information.

Table 617: Quote Templates Editor Description

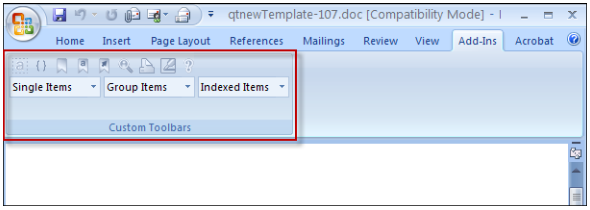
Field	Description
*Name	Type the name of the quote template. The item name in the Quotes Templates tree on the left side of the content pane and the Label field in the Interface Visibility section are populated or revised as you type. **Note:** Use a descriptive name that helps sales representatives select the appropriate quote template for generating a quote.
Disabled	Select this check box to prevent sales representatives from selecting or viewing the quote template.
Notes	Type any comments about the quote template.
Visible	Clear this check box if you do not want the quote template to be visible on this interface.

5 Click the Word Editor button on the ribbon. An instance of Microsoft Word opens in the Quote Templates editor with an Add-Ins tab for merge fields.



6 Click the Add-Ins tab to display the Quote Template ribbon.

Important Because the Add-Ins tab does not exist in Word 2003, the Quote Template toolbar is a standard toolbar instead of a ribbon.



7 Format the Word document based on your organizational policies and standards. If you have an existing Microsoft Word template, you can copy and paste it into the Word document.

8 To insert a merge field, place your cursor in the quote template document where you want to insert the field.

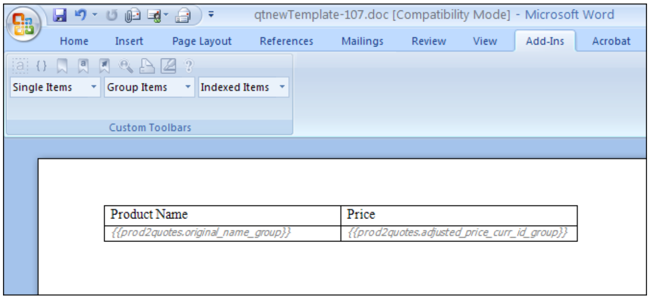
a Click one of the drop-down menus in the Custom Toolbars section on the Quote Template ribbon and select a merge field to add to the quote template.

Tip For a complete list of merge fields and their associated descriptions, double-click Data Dictionary under Database. Refer to Viewing the data dictionary.

The following table describes the drop-down menus on the Quote Template ribbon.

Table 618: Quote Template Ribbon Description

Drop-Down Menu	Description
Single Items	Click this drop-down menu to select merge fields that have a one-to-one relationship with opportunities. For example, because an opportunity can be associated with only one organization, organization fields are listed in the Single Items drop-down menu.
Group Items	Click this drop-down menu to select merge fields that have a many-to-one relationship with opportunities. For example, because a quote can be associated with many sales products, sales product fields are listed in the Group Items drop-down menu. **Note:** You must create a table with column headers before using merge fields from the Group Items drop-down menu. After the table is created with column headers, a merge field from the Group Items drop-down menu must be inserted into a single cell in the table. Word automatically adds rows to the table based on how many values are in the group. The font of the column headers determines the font of the merge fields in the table.
Indexed Items	Click this drop-down menu to select merge fields that have a many-to-one relationship with opportunities and are indexed in the database. For example, because an opportunity can be associated with many contacts, contact fields are listed in the Indexed Items drop-down menu. **Note:** You must replace the "N" with a numeric value. While using a field from the Group Items drop-down menu returns all of the contacts associated with an opportunity, using a field from the Indexed Items drop-down menu returns only the contact you specify according to "N" (the number one is always associated with the primary field in a database table). For example, to return the email address of the primary contact who is associated with an opportunity, *contacts.email1* should be added to the quote template.



b Repeat step a until you have added all merge fields to the quote template.

Caution If you close the instance of Microsoft Word by clicking X inside the Quote Template editor, the Oracle Service Cloud application closes and any unsaved changes are lost. To save your quote template without closing the application, you must click the Save and Close button on the ribbon.

9 Click the Save and Close button on the ribbon to save the quote template.

82

Opportunities

An opportunity is a record in Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking) containing information about a specific sale or a pending deal. In essence, opportunities are the building blocks of your sales operation for collecting general sales information, following sales **strategies**, setting **forecasts**, and preparing and sending **quotes** to customers. The information that is collected during the sales cycle can be processed by Oracle RightNow Analytics Cloud Service (Analytics) to help managers identify trends and forecast sales periods and to help you meet or exceed your quota.

Opportunities overview

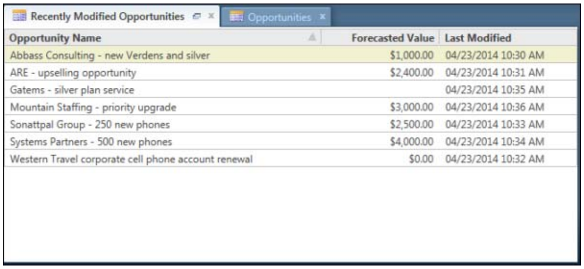
Before you start working on your assigned opportunities, you'll want to know how to access opportunities and how opportunity information is organized. The following sections explain the layout you'll be working with and show you where the details of each opportunity are located.

Opportunities reports

When you click the Opportunities button on the navigation pane, the **navigation list** displays all of the reports and items added to this button by your administrator. The Opportunities button, plus all the other buttons you have access to, are part of the **navigation set** defined in your profile.

Opportunities reports can also be placed in other navigation lists, not just the Opportunities list. And if you have permission to customize your navigation set, you can add other items, including any reports you have permission to access, to your Opportunities navigation list or any of your lists.

Double-clicking any opportunities report displays the list of opportunities in the report on the content pane. The following figure shows an example of the Recently Modified Opportunities report.



Opportunity Name	Forecasted Value	Last Modified
Abbass Consulting - new Verdens and silver	$1,000.00	04/23/2014 10:30 AM
ARE - upselling opportunity	$2,400.00	04/23/2014 10:31 AM
Gatems - silver plan service		04/23/2014 10:35 AM
Mountain Staffing - priority upgrade	$3,000.00	04/23/2014 10:36 AM
Sonattpal Group - 250 new phones	$2,500.00	04/23/2014 10:33 AM
Systems Partners - 500 new phones	$4,000.00	04/23/2014 10:34 AM
Western Travel corporate cell phone account renewal	$0.00	04/23/2014 10:32 AM

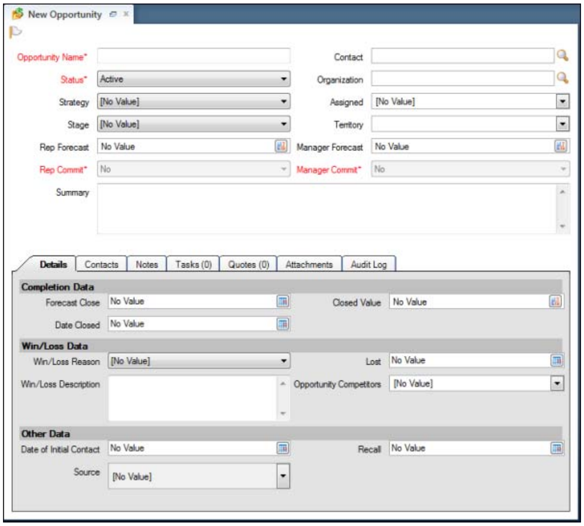
The information displayed on the content pane depends on the opportunities report you select and which fields were defined when the report was created. The Recently Modified Opportunities report, for example, displays the opportunity's name, forecasted value, and date it was last modified.

Using buttons on the ribbon, you can open, add, copy, delete, print, forward, assign, and reject opportunities and email the contact. You can also search for opportunities, refresh the report, and reset the search criteria from the ribbon. Right-clicking any opportunity displays the same functions as those on the ribbon.

Tip Besides searching for opportunities from a report, you can also use Quick Search to find a specific opportunity from anywhere in the product. Refer to Searching for records.

Standard workspace for opportunities

Your Oracle Service Cloud application contains a standard workspace for working with opportunities. The workspace defines which fields you see and how the information is organized on the content pane. The following figure is an example of the standard opportunity workspace.



Note Your organization may use the standard workspace, or your administrator may have created one or more customized workspaces. Your profile defines the workspace you see when you work with opportunities, whether it is the standard workspace or a customized workspace. For documentation purposes, we use the standard opportunity workspace to describe how to work with opportunities.

Ribbon

The following table describes the buttons on the ribbon of the standard opportunity workspace. For more information about the ribbon and Quick Access toolbar, refer to Working with the ribbon.

Table 619: Opportunity Ribbon Description

Group/Button	Description
Save	
Save	Click this button to save the opportunity you are currently editing or adding. The opportunity remains open. **Note:** When you save an opportunity, it is evaluated by the rules engine. If your administrator added opportunity rules and the opportunity matches one or more of those rules, it is possible that the opportunity can be modified by rule actions when you save it.
Save and Close	Click this button to save the opportunity you are currently editing or adding. The opportunity closes.
Actions **Note:** With the exception of the New button, the buttons in this group are not active until after you save the opportunity you are adding.	
New	Click this button to add an opportunity. See Adding opportunities.
Refresh	Click this button to refresh the opportunity.
Forward	Click this button to forward the opportunity.
Print	Click this button to print the opportunity.
Copy	Click this button to copy the opportunity.
Delete	Click this button to delete the opportunity. See Deleting opportunities.
Proofing	
Spell Check	Click this button to spell check the opportunity.

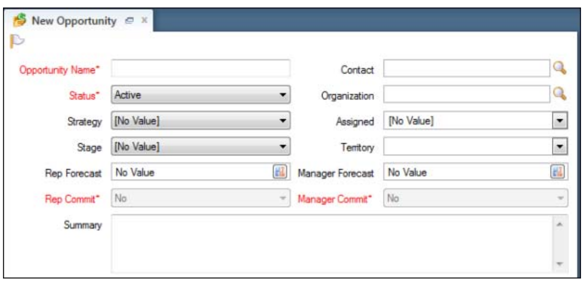
Table 619: Opportunity Ribbon Description (Continued)

Group/Button	Description
Related Activities	
Reject	Click this button to reject the lead. Refer to Accepting and rejecting leads.
Appointment	Click this button to create an appointment in Microsoft Outlook. Refer to Adding Outlook appointments.
Links and Info	
Links	Click this button to select a URL from the list of links added by your administrator.
Info	Click this button to see details about the opportunity, including its ID, when it was created and by whom, and the date it was last updated and by whom. If the opportunity is in a rules state or has an escalation level, that information also appears.

Key opportunity fields

When you open an opportunity, you see fields on the top of the content pane and record tabs on the bottom. The opportunity fields store the opportunity's name, status, strategy, stage, rep forecast, contact association, organization association, manager forecast, and other information that describes the properties of the opportunity.

Some of the opportunity fields are required by default, and your administrator may require that other fields also be completed. You must complete any field set in red text and marked with a red asterisk before you can save the opportunity.



Refer to Editing key opportunity fields.

Opportunity record tabs

The remaining information about the opportunity is organized in record tabs, which group similar details. For instance, all of the contacts associated with the opportunity are listed on the Contacts tab and all tasks associated with the opportunity appear on the Tasks tab.

Note If you make changes on any windows accessed from the opportunity record tabs, you must save the opportunity in order for your changes on the record tabs to take effect. If you close the record without saving changes, your changes are lost.

Opportunities include the following record tabs. Click a tab to see what information is listed and what your options are.

- **Details tab**—Contains fields related to opportunity competitor data, completion data, win/loss data, and other general data. Use the fields on this tab to collect additional information about an opportunity, which is beneficial for reporting purposes. Refer to Adding and editing Details tab information.
- **Contacts tab**—Lists the contacts associated with the opportunity, including the primary contact and all secondary contacts. From the Contacts tab, you can add a new or existing contact to the opportunity, open a contact for editing, copy a contact, print contact information, remove a contact, send email to the contact, or set the contact's role in the opportunity. The Contacts tab displays a number in parentheses to show how many contacts are associated with the opportunity. Refer to Adding and editing contact information.
- **Notes tab**—Stores internal information about the opportunity. Notes are never sent to customers. You can add, edit, or remove notes that originated by phone, fax, post, web form, or email for any opportunity based on the type of correspondence you had with a contact or organization. And you can view the notes by opportunity, contact, organization, or by any combination of the three. Refer to Adding and editing opportunity notes.
- **Tasks tab**—Lists all of the tasks associated with an opportunity. You can add, open, copy, delete, print, and forward tasks and mark tasks complete. Tasks can be assigned to an opportunity based on the opportunity's sales stage, or they can be manually assigned and associated with an opportunity by another staff member. The Tasks tab displays a number in parentheses to show how many tasks are associated with the opportunity. Refer to Adding and editing tasks.

- **Quotes tab**—Contains all quotes associated with the opportunity. From this tab you can open, create, copy, delete, print, and send quotes to prospective and current customers. (An opportunity can contain multiple quotes, but all of the quotes are directly associated with the opportunity you are currently editing.) The Quotes tab displays a number in parentheses to show how many quotes are associated with the opportunity. Refer to Adding quotes to opportunities.
- **Attachments tab**—Lists all files attached to the opportunity. For instance, if a customer forwards you a document that is associated with the opportunity, the Attachments tab provides a convenient location where you can store the document for retrieval. You can add, open, download, delete, and view the properties of file attachments from this tab. Refer to Attaching files to records.
- **Audit Log tab**—Contains a permanent list of all actions associated with an opportunity, including the date of the action, who performed the action, what the action was, and a description of the action. This information is valuable for tracking interactions with customers, especially if more than one staff member works on the same opportunity. Refer to Audit logs.

Working with opportunities

When staff members in your marketing, service, or sales department discover a potential buyer for your organization's products or services, they can generate a lead (a prequalified opportunity) and assign it to you. Most of the time, you work with these existing opportunities that have been created by someone else. For this reason, the structure of this section emphasizes working with existing opportunities rather than adding new opportunities.

ORACLE SERVICE CLOUD Watch Tutorial

At other times, however, you can add opportunities to the knowledge base. For instance, when an existing customer contacts you by phone, fax, or email, you may want to add an opportunity to create a record of the customer's inquiry. Refer to Adding opportunities.

Regardless of how opportunities are assigned to you or where they originate, there are benefits from understanding what certain field properties mean and how they can impact opportunities during the sales cycle. This knowledge can help you effectively move your opportunities toward a sale.

Opportunity statuses

Opportunity statuses represent the current state of your opportunities. The seven default opportunity statuses are Lead, Reject, Active, Inactive, Closed, Dead, and Lost. Your administrator can also define additional opportunity statuses to show a more complete representation of the opportunities in your knowledge base. The following table describes the default opportunity statuses in Opportunity Tracking.

Table 620: Default Opportunity Statuses

Opportunity Status	Description
Lead	A lead is a prequalified opportunity that has not been accepted.
Reject	A rejected lead is a prequalified opportunity that has been rejected.
Active	An opportunity with the Active status is no longer a lead and is advancing in the system toward a sale.
Closed	An opportunity with the Closed status resulted in a sale.
Lost	An opportunity with the Lost status has been lost, for example, to a competitor.
Inactive	An opportunity with the Inactive status is no longer being pursued but could be activated at a later date.
Dead	An opportunity with the Dead status is no longer being pursued.

Accepting and rejecting leads

Leads are opportunities that are prequalified by your marketing, service, or sales department and are assigned the Lead status. Since leads are prequalified versions of opportunities, they appear as opportunities on the content pane. You are assigned leads based on your organization’s processes, but you can also manually create leads and assign them to yourself.

Note A lead assigned to a status that is *not* Lead or Reject is considered to be an opportunity.

Many of the opportunity fields for leads are populated. For instance, when you receive a lead, it already has an organization or contact association and a description of the product or service the organization or contact is interested in purchasing.

To accept a lead

1 From an open opportunity, click the Status drop-down menu.

2 Select the Active status to convert the lead into an active opportunity.

3 Click the Save and Close button to save and close the opportunity.

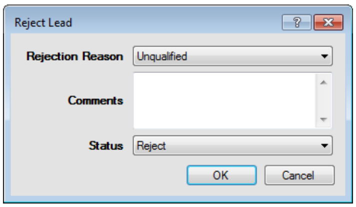
Tip To represent the movement of leads to opportunities and vice versa, all actions are recorded to the **audit log** and display on the Audit Log tab.

There may be times when a lead is assigned to you by mistake or when you are not interested in pursuing it. In these cases, you can reject the lead and document your reason for rejecting it.

To reject a lead

1 From an open opportunity, click the Reject button. The Reject Lead window opens.

Note If your profile does not allow you to reject leads, the Reject button is not active.



2 Click the Rejection Reason drop-down menu and select a rejection reason.

3 To provide additional information, type a comment in the Comments field.

4 Click the OK button to close the Reject Lead window.

5 Click the Save and Close button to reject the lead and save and close the opportunity.

Note Because rejected leads are associated with the Reject status, you must filter on the Reject status when searching for leads that have been rejected. You can convert a rejected lead into an active opportunity by changing its status to Active.

Strategies

Sales strategies are plans defined by your organization that include associated stages and tasks that should be completed as you work your opportunities. Your organization may have multiple sales strategies based on your business processes. Strategies ensure that best practices, policies, and procedures are followed during the sales cycle.

When you select a strategy while editing an opportunity, the Stage field populates with the first stage of the strategy. Any tasks associated with the strategy (including those associated with other stages) populate the Tasks tab.

Note If you change a sales strategy for an opportunity, all tasks associated with the previous strategy are deleted from the Tasks tab, and all tasks associated with the new strategy populate the Tasks tab.

Forecasting opportunities

A forecast is a projection of sales revenue for an opportunity that may close in a given sales period. Each opportunity contains fields for a manager forecast and a sales representative forecast. A manager forecast is a projection of sales revenue for an opportunity from a manager's point of view, whereas a sales representative forecast is a projection of sales revenue for an opportunity from a sales representative's point of view. Sales forecasts play an important role in helping management determine realistic sales projections for a sales period.

To forecast an opportunity

1 If you are a manager, click the Manager Forecast field.

  Or

  If you are a sales representative, click the Rep Forecast field.

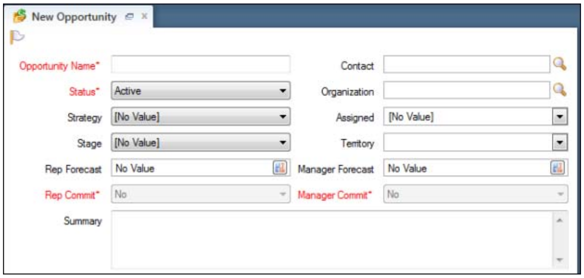
2 Enter the revenue amount that you forecast to be generated by the sale.

3 Click the Save and Close button to save and close the opportunity.

Note When a quote is associated with the opportunity and the Forecast check box is selected for the quote, the Rep Forecast field automatically reflects the amount specified in the quote. Refer to Adding quotes to opportunities.

Editing key opportunity fields

Now that you understand the role of statuses, strategies, and forecasts, you can complete the opportunity fields to update your opportunities. Required fields are labeled in red and have a red asterisk next to them. Remember that you can't save an opportunity without completing all of the required fields.



Note The fields you see when adding or editing an opportunity are defined in a workspace that is assigned to your profile by your administrator.

To edit key opportunity fields

From an open opportunity, enter field information described in the following table.

Table 621: Opportunity Fields Description

Field	Description
Flag	Click this button to add or change the priority notifications for the opportunity. Refer to Flagging records.
*Opportunity Name	Type the name of the opportunity in this field.
*Status	Click this drop-down menu and make a selection to change the opportunity's status. Refer to Opportunity statuses.
Strategy	Click this drop-down menu and make a selection to change the opportunity's strategy. Refer to Strategies.

Table 621: Opportunity Fields Description (Continued)

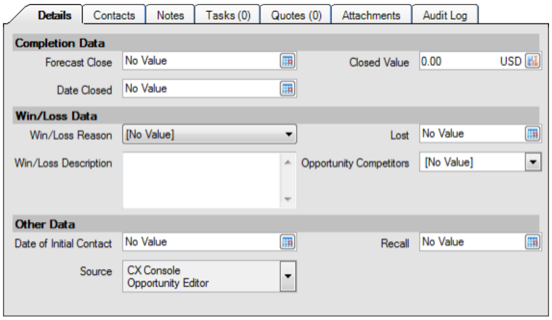
Field	Description
*Stage	Click this drop-down menu and make a selection to change the opportunity's stage. Refer to Strategies. **Note:** The options in this field depend on the strategy assigned to the opportunity.
Rep Forecast	Type a new value to change your monetary forecast for the opportunity. Refer to Forecasting opportunities. **Note:** The Rep Forecast field is associated with the Exchange Rates calendar. After you select a date within a specific exchange period, the calendar defaults to the start date of the specific exchange period after you close the calendar. The type of currency that appears in the Rep Forecast field depends on the default currency defined in your staff account. However, you can change the default from the Personal Settings option on the Oracle Service Cloud Options window. See Changing your personal settings.
*Rep Commit	Click this drop-down menu and select Yes to commit to closing the opportunity in the defined sales period. **Note:** This drop-down menu is not active until a value is entered in the Rep Forecast field.
Summary	Type a summary about the opportunity.
Contact	Click this button to add a primary contact to the opportunity. If a primary contact is not associated with an opportunity, an organization must be associated. Although many contacts can be associated with an opportunity, only one of them can be designated as the primary contact. Refer to Contacts overview. **Caution:** If you use the Search button on the Contact field to add a contact to the opportunity when a primary contact for the opportunity already exists, the existing primary contact is removed from the opportunity and replaced with the new primary contact.
Organization	Click this field to add an organization to the opportunity. If an organization is not associated with an opportunity, a primary contact must be associated. Refer to Organizations overview. **Note:** Only one organization can be associated with an opportunity.

Table 621: Opportunity Fields Description (Continued)

Field	Description
Assigned	Click this drop-down menu to re-assign the opportunity to another sales representative. The list of staff members that displays in the drop-down menu is the same list that displays in the Salesperson field of the contact record. Refer to To add or edit contact information. Also be aware that because of the account hierarchy in Opportunity Tracking, if a manager account is disabled, that manager's name continues to display as read-only in the Assigned drop-down menu of the opportunity workspace. This allows staff members who reported to that manager to display underneath the former manager until another manager is designated. Refer to Organizing staff accounts by manager. **Tip:** Use the Find field at the bottom of the Assigned drop-down menu to quickly locate staff members. Wildcards are supported when searching staff members. You can search strings that include a space by typing `%+Space+character`, which is helpful when searching last names. For example, typing `%+Space+b` returns all last names starting with the letter b. There is also an implied wildcard when searching, so typing `b` in the Find field returns all items containing the letter b.
Territory	Click this drop-down menu to re-assign the opportunity to another territory.
Manager Forecast	Type a new value to change the manager forecast for the opportunity. Refer to Forecasting opportunities. **Note:** The Manager Forecast field is associated with the Exchange Rates calendar. After you select a date within a specific exchange period, the calendar defaults to the start date of the specific exchange period after you close the calendar. The type of currency that appears in the Manager Forecast field depends on the default currency defined in your staff account. However, you can change the default from the Personal Settings option on the Oracle Service Cloud Options window. See Changing your personal settings.
*Manager Commit	Click this drop-down menu and select Yes to commit to closing the opportunity in the defined sales period. **Note:** This drop-down menu won't be active until a value is entered in the Manager Forecast field.

Adding and editing Details tab information

By default, opportunities open with the Details tab active. Fields on this tab are used to collect additional completion and win/loss information for your opportunities and are useful for reporting purposes.



To edit Details tab information

1 From an open opportunity, enter field information described in the following table.

Table 622: Details Tab Description

Field	Description
Completion Data	This section contains fields for selecting forecast close information and completion dates for the opportunity.
Forecast Close	To change the date the opportunity is forecasted to close, type a date or click the calendar and select a new date from the calendar.
Date Closed	To change the date an opportunity closes, type a date or click the calendar and select a new date from the calendar.

Table 622: Details Tab Description (Continued)

Field	Description
Closed Value	To change the closed value for the opportunity, type a new value in this field. **Note:** The Closed Value field is associated with the Exchange Rates calendar. After you select a date within a specific exchange period, the calendar defaults to the start date of the specific exchange period after you close the calendar. The type of currency that appears in the Closed Value field depends on the default currency defined in your staff account. However, you can change the default from the Personal Settings option on the Oracle Service Cloud Options window. See Changing your personal settings.
Win/Loss Data	This section contains fields for selecting win/loss reasons for the opportunity.
Win/Loss Reason	To change the reason an opportunity was won or lost, click this drop-down menu and make a selection.
Win/Loss Description	This field lets you provide additional information about why an opportunity was won or lost. If you need to change it (for example, to make the description more specific), type your changes in this field.
Lost	To change the date that an opportunity was lost, type a date or click the calendar and select a new date from the calendar.
Opportunity Competitors	Click this drop-down menu and select the competitors that were also pursuing the opportunity. **Note:** A check box and a radio button appear next to each competitor in the drop-down menu. You can select multiple check boxes to show that multiple competitors are involved, but you can select only one radio button to designate the primary competitor.
Other Data	This section contains fields for entering miscellaneous data about the opportunity.
Date of Initial Contact	To change the date that initial contact was made with the customer, type a date or click the calendar and select a new date from the calendar.
Source	This field displays the source of the opportunity's creation in Oracle Service Cloud. **Note:** This is a read-only field.

Table 622: Details Tab Description (Continued)

Field	Description
Recall	To change the reminder date that you should contact the customer, type a date or click the calendar and select a new date from the calendar.

2 Click the Save and Close button to save and close the opportunity.

Adding and editing contact information

When an opportunity is assigned to you in the form of a lead, the contact information is often present. Sometimes, however, only an organization is associated with the opportunity, so you must add contact information. Refer to Contacts overview.

The Contacts tab contains a toolbar for working with the contacts associated with the opportunity.

The following table describes the Contacts tab toolbar buttons.

Table 623: Contacts Tab Toolbar Description

Button	Description
Add	Click this button and select one of the following options to add a new or existing contact to the opportunity.
Add New	Select this option to display the New Contact window. After creating and saving the new contact, the contact is added to the contact list for the opportunity.
Add Existing	Select this option to display the Contact Search window. After finding and selecting the existing contact, the contact is added to the contact list for the opportunity. **Note:** Your administrator can add a secondary report to the Contact Search window. This feature is especially useful for displaying all contacts associated with an organization when you add a contact to an organization's opportunities.
Open	Click this button to open the selected contact.
Print	Click this button to print the selected contact.
Copy	Click this button to copy the selected contact.

Table 623: Contacts Tab Toolbar Description (Continued)

Button	Description
Delete	Click this button to permanently delete the selected contact.
Remove	Click this button to remove the selected contact from the opportunity (without deleting the contact). **Note:** This does not delete the contact from the knowledge base. It just disassociates the contact from the opportunity.
Email	Click this button to send an email to the selected contact.
Set Contact Role	Click this button to open the Set Contact Role window. To add a contact role, follow these steps: 1. Click the Contact Role drop-down menu and select the role the contact has in this opportunity. 2. Click the OK button to close the Set Contact Role window. The contact role displays in the Contact Role column on the contact list. **Note:** Because contact roles are specific to Opportunity Tracking, you can add or edit a contact role only while adding or editing an opportunity.
Options	Click this drop-down menu to choose report options.

To add or edit contact information

1 From an open opportunity, click the Contacts tab.

2 Click the Add button on the Contacts tab toolbar and select Add New. The New Contact window opens.

Or

To edit a contact for the opportunity, right-click the contact and select Open. A window containing the contact's information opens. (The contact edit window contains the same fields as the New Contact window.)

3 Enter field information described in the following table.

Table 624: New Contact Window Description

Field	Description
Flag	Click this button to add or change the priority notifications for the opportunity. Refer to Flagging records.
*First Name	Type the contact's first name.
*Last Name	Type the contact's last name.
Email	Type the contact's primary email address. **Note:** If the contact has multiple email addresses, click the drop-down menu and select Email Alt1 or Email Alt2 and add the contact's alternative email addresses.
Office Phone	Type the contact's office phone number. **Note:** If the contact has multiple phone numbers, click the drop-down menu and select Mobile Phone, Fax Phone, Assistant Phone, or Home Phone and add the contact's other phone numbers.
Address	Click Edit to open a window for entering the contact's address. Type information in the Street, City, and Postal Code fields, and make selections from the Country and State/Prov. fields drop-down menus. When you select the country, the associated states or provinces appear in the States/Prov. menu. Close the window to display the address you entered.
Contact Type	Click this drop-down menu and select the type of contact you are working with.
*State	Click this drop-down menu and select one or more of the following check boxes: Service, Outreach, or Opportunities.
Organization	Click the Search button to open the Organization Search window and search for an organization to associate with the contact. If you need information about searching for an organization from the New Contact window, refer to Searching from open records.
Salesperson	Click this drop-down menu and select the salesperson who is associated with the contact. **Note:** This field defaults to the staff member who created the contact record.

Table 624: New Contact Window Description (Continued)

Field	Description
Title	Type the contact's job title in this field.
Login	Type a login for the customer to use when logging in to the customer portal. If the customer created an account on the customer portal, this field displays the login selected by the customer. **Note:** This field applies only to Oracle Service Cloud.
SLA	Click this field to add an SLA instance. For the steps to add an SLA instance, refer to Applying SLAs.
Global Opt-in	Click this drop-down menu and select Yes if the contact wants to receive Oracle Service Cloud mailings and surveys. Select No if the contact does not want to receive Oracle Service Cloud mailings and surveys.

4 Click the OK button to add the new contact record and associate it with the opportunity.

Adding and editing opportunity notes

From the Notes tab, you can add opportunity-related details to an opportunity. You can also choose the origin of the **note** you're adding (phone, fax, post, web form, or email) to accurately document the origin of the note information. And you can edit notes once you add them.

Note Notes are internal and are never sent to customers.

By default, the Notes tab opens with only opportunity notes displayed. If there's a contact or organization associated with the opportunity, and the Notes tab of the contact or organization record has notes associated with it, those notes can also be displayed.

To add or edit a note for an opportunity

1 From an open opportunity, click the Notes tab.

2 To add a note, click the Add button. An Opportunity Note header and a text area display.

Or

To edit a note, click Edit on the right side of the header bar.

3 Click the Opportunity Note drop-down menu and select one of the following channels where the opportunity note information originated:

- **No Channel**—The note information originated as something other than a phone call, fax, postal mail, web form, or email.
- **Phone**—The note information originated as a phone call.
- **Fax**—The note information originated as a fax.
- **Post**—The note information originated as postal mail.
- **CSS Web**—The note information originated from a web form.
- **Email**—The note information originated as email.

Note If Outlook integration is activated, Outlook email can be appended to opportunities, contacts, organizations, and incidents in the Email format. See Outlook Integration for complete details and procedures about integrating Microsoft Outlook with Oracle Service Cloud.

4 Click in the text area and type the note.

5 Click the Save and Close button to save your changes and close the opportunity.

To view contact and organization notes while editing an opportunity

Note To edit a contact or organization note, you must edit the contact or organization record.

1 From an open opportunity, click the Notes tab.

2 Click the View drop-down menu and select from the check boxes described in the following table.

Table 625: Notes View Description

Check Box	Description
Opportunity Notes	Select this check box to view all associated opportunity notes. **Note:** This check box is selected by default.
Contact Notes	Select this check box to view all associated contact notes. **Note:** A contact must be associated with the opportunity for the contact notes to display.

Table 625: Notes View Description (Continued)

Check Box	Description
Organization Notes	Select this check box to view all associated organization notes. **Note:** An organization must be associated with the opportunity for the organization notes to display.

Adding and editing tasks

You can view all **tasks** associated with an opportunity by clicking the opportunity's Tasks tab. Although you can manually add tasks, most tasks are added automatically to the Tasks tab when a sales strategy is selected for the opportunity. Refer to Tasks and Strategies.

The Tasks tab contains a toolbar for working with the tasks associated with the opportunity. The following table describes the Tasks tab toolbar buttons.

Table 626: Tasks Tab Toolbar Description

Button	Description
Add	Click this button and select one of the following options to add a new or existing task.
Add New	Select this option to add a new task to associate with the opportunity.
Add Existing	Select this option to search for an existing task to associate with the opportunity.
Open	Click this button to open the task for viewing or editing.
Print	Click this button to print the task.
Copy	Click this button to copy the task.
Delete	Click this button to permanently delete the task.
Remove	Click this button to remove the selected task from the opportunity (without deleting the task).
Complete	Click this button to complete the task.
Forward	Click this button to forward the task to the selected recipient.

Table 626: Tasks Tab Toolbar Description (Continued)

Button	Description
Options	Click this drop-down menu to choose report options. Refer to Changing output options.

To add or edit a task for an opportunity

1 From an open opportunity, click the Tasks tab.

2 Click the Add button and select Add New to open the New Task window.

Or

Right-click a task on the Tasks tab and select Open.

Note The New Task window opens with your name displaying in the Assigned field and the opportunity name displaying in the Opportunity field. The Task type field displays Opportunities because the task was created while editing an opportunity.

3 Enter field information described in the following table.

Table 627: Task Window Description

Field	Description
*Name	Type the name of the task.
Assigned	Click this drop-down menu and select a staff account. **Tip:** To quickly find and select a name in the list of staff members that displays in the drop-down menu, type the letters of the staff member's name in rapid succession until the name is highlighted, then press **Enter**. If you make an error in your typing, you can start over after waiting a few seconds.
*Status	Click this drop-down menu and select a status (Not Started, In Progress, Completed, Waiting, or Deferred).
Percent Complete	Type a value for the percentage of the task that is complete.
Priority	Click this drop-down menu and select a priority (Low, Normal, or High).

Table 627: Task Window Description (Continued)

Field	Description
Due Date	Click this calendar menu and select a due date.
Planned Completion	Click this calendar menu and select a planned completion date.
Date Completed	Click this calendar menu and select the task's actual completion date.
Task Type	This field contains Opportunities and is not active since the task type is determined by the type of record you add the task from. **Note:** If you were adding a standalone task, the field would be empty, and if you were adding a task from any other type of record, the field would contain that record type.
Notes	Type any notes about the task in this field. **Note:** You may need to scroll down to see this field.
*Opportunity	Click the Search button to open the Opportunity Search window, where you can associate an opportunity with the task.
Organization	Click the Search button to open the Organization Search window, where you can associate an organization with the task.
Contact	Click the Search button to open the Contact Search window, where you can associate a contact with the task.
Incident	Click the Search button to open the Incident Search window, where you can associate an incident with the task.
Answer	Click the Search button to open the Answer Search window, where you can associate an answer with the task.
Campaign	Click the Search button to open the Campaign Search window, where you can associate a campaign with the task.
Mailing	Click the Search button to open the Mailing Search window, where you can associate a mailing with the task.
Survey	Click the Survey button to open the Survey Search window, where you can associate a survey with the task.
Document	Click the Search button to open the Document Search window, where you can associate a document with the task.

4 After completing the required fields, click the OK button to associate the task with the opportunity.

Deleting opportunities

If your profile gives you permission to delete opportunities, the Delete button is available on the ribbon. When you delete an opportunity, you permanently remove it from the knowledge base.

To delete an opportunity

Caution Deleting an opportunity is permanent and cannot be undone.

1 With the opportunity open, click the Delete button. A message asks you to confirm the deletion.

2 Click the Yes button to delete the opportunity.

Adding opportunities

While most of your opportunities are assigned to you, undoubtedly there are times when you need to add an opportunity to create a record of a customer's inquiry. When adding an opportunity, all required fields must be filled in before you can save it, including any required fields configured by your administrator. The remaining fields on all tabs can be filled in at a later time.

To add an opportunity

1 Click File and select Opportunity.

2 Complete opportunity fields as described in To edit key opportunity fields.

3 To add detailed information to the opportunity, click the Details tab and complete the information as described in To edit Details tab information.

4 To add or edit **contact** information for the opportunity, click the Contacts tab and complete the information as described in To add or edit contact information.

5 To add or edit **note** information for the opportunity, click the Notes tab and complete the information as described in To add or edit a note for an opportunity.

6 To add or edit **task** information for the opportunity, click the Tasks tab and complete the information as described in To add or edit a task for an opportunity.

7 To add **quote** information to the opportunity, click the Quotes tab and complete the information as described in Adding quotes to opportunities.

8 To attach one or more files to the opportunity, click the Attachments tab and complete the information as described in Attaching files to records.

9 To view the **audit log** for the opportunity, click the Audit Log tab and refer to Audit logs.

10 Click the Save and Close button to save and close the opportunity.

Closing opportunities

Your ultimate goal with an opportunity is to close it, since an opportunity with a Closed status signifies an opportunity that has resulted in a sale.

To close an opportunity

1 From the opportunity, click the Quotes tab.

2 If a quote is associated with the opportunity, select the quote that resulted in a sale. If a quote is not associated with the opportunity, skip to step 4.

3 Select the Forecast check box under the Forecast column. The Rep Forecast field automatically updates to the value of the quote that was selected.

4 Click the Status drop-down menu and select Closed.

5 Click the Stage drop-down menu and select the appropriate stage.

6 If necessary, edit the Rep Forecast field so that it displays the correct value.

7 Click the Rep Commit field and select Yes.

8 Click the Tasks tab and make sure the appropriate tasks are completed.

9 Click the Details tab and complete the appropriate fields under Completion Data, Win/ Loss Data, and Other Data. Refer to Adding and editing Details tab information.

10 Click the Save and Close button to save and close the opportunity.

Note Upon changing the status from Active to Closed and saving the opportunity, the Date Closed field on the Details tab populates with the current date. The opportunity no longer appears in most of your reports unless you filter on the Closed status type when searching.

Other opportunity actions

Besides editing and adding opportunities, you may have other opportunity management duties as well. You might, for example, want to forward opportunities to others within or outside your organization, copy an opportunity, or make the same change to multiple opportunities.

- **Forwarding opportunities**—You can send a copy of an opportunity to other recipients. For instance, your manager may want to see all opportunities related to a particular inquiry, or you might want another sales representative to review your opportunity data before sending a quote to a customer. Refer to Forwarding records.
- **Copying opportunities**—There may be times when you need to create an opportunity that is similar to an existing one. Rather than entering all field information from scratch, just copy the existing opportunity and use it as a base for the new one. Refer to Copying records.
- **Updating multiple opportunities**—You can update, forward, and delete multiple opportunities at one time rather than performing the same action on each opportunity individually. This saves time when you have several opportunities that apply to the same sales product or service. Refer to Updating multiple records.

83

Quotes

A big part of your role as a sales representative is preparing quotes for customers. Your administrator can create **quote templates**, which are then available for you to use to generate quotes. When you work on an **opportunity**, you complete quote information that defines products, quantities, and discounts. You select a quote template and merge it with the data you have entered into the opportunity to create a customized quote you can send to your customer.

Preparing quotes

Before you can send a quote to a customer, you must add the quote to the **opportunity**, add **sales products** to the quote, and merge the opportunity and quote information into a **quote template**. Only then can you send the quote.

Note A quote must always be associated with an opportunity. In order to create or edit a quote, you must first open the opportunity that is associated with the quote.

Quotes toolbar

The Quotes tab on an opportunity workspace contains a toolbar for working with quotes for the opportunity. The following table describes the default buttons on the Quotes toolbar.

Table 628: Quotes Toolbar Description

Button	Description
Add New	Click this button to add a quote to the opportunity. Refer to Adding quotes to opportunities.
Open	Click this button to open the selected quote. Refer to To edit a quote.

Table 628: Quotes Toolbar Description (Continued)

Button	Description
Print	Click this button to print the selected quote. Refer to To print a quote.
Copy	Click this button to copy the selected quote. Refer to To copy a quote.
Delete	Click this button to delete the selected quote. Refer to To delete a quote.
Send	Click this button to send the selected quote to the customer. Refer to Sending quotes.
Options	Click this drop-down menu to choose report options.

Adding quotes to opportunities

Adding a quote to an opportunity is the first step in preparing a quote. After you add a quote to an opportunity, you complete the quote fields, add **sales products** to the quote, and merge the quote data into a **quote template**.

To add a quote to an opportunity

1 While adding or editing an opportunity, click the Quotes tab.

2 Click the Add New button. The New Quote window opens.

3 Enter field information described in the following table.

Table 629: New Quote Window Description

Field	Description
***Name**	Type the name of the quote in this field.
Status	Click this drop-down menu to select the status of the quote. Default statuses are Unsent, Sent, Queued, Accepted, and Returned.
Unsent	Select this status for quotes that have been created but not yet sent. **Note:** This is the default status for new quotes.

Table 629: New Quote Window Description (Continued)

Field	Description
Sent	This status is automatically selected when a quote is sent to a customer. **Note:** If a quote has already been sent to a customer, you cannot edit the quote again unless your profile gives you permission.
Queued	Select this status if the quote is waiting to be reviewed.
Accepted	Select this status if the quote has been sent and the customer has accepted it.
Returned	Select this status if the quote has been returned because it needs to be renegotiated or because it was rejected by the customer.
Schedule	Click this drop-down menu to select a price schedule to associate with the quote. (Your administrator has added different price schedules based on your organization's needs.)
Product list	When you select a price schedule, all sales products that are associated with the schedule appear in the product list below the Schedule field. If the products are organized in folders, click the plus sign next to a folder to expand it and show the products within that folder. You can then double-click or drag and drop products to add them to the quote.
Sales product grid	After you select a schedule and add one or more sales products from the product list, the sales product grid displays details about the added sales products. Refer to Adding sales products to quotes. **Note:** Working with sales products in the grid modifies the products only for the quote you are editing and does not change the sales product in the product catalog. If, for example, you discount the product in the sales product grid for a particular quote, the original price is unchanged in the product catalog.
Adjusted Name	This column displays the product's name.
Original Price	This column displays the product's price as it is defined in the product catalog for the price schedule you selected.
Adjusted Price	This column displays the adjusted price of the product, which you can edit by selecting a product in the sales product grid and opening it.

Table 629: New Quote Window Description (Continued)

Field	Description
Quantity	This column displays the quantity of the product included in the quote.
Discount	This column displays the discount percentage applied to the sales product.
Total	This column displays the total adjusted price for the sales product, taking into account the quantity selected and the discount applied to that specific product.
Action	After a sales product has been added to the list, choose one of the following actions: • **Open**—Click Open to open the quote product editor and make changes to the product. • **Delete**—Click Delete to delete the sales product from the quote.
Quote Total	This read-only field displays the sum of product totals for all the products in the quote. It includes the discounts applied to the specific products in the quote, but it does not include the discount for the entire quote, which you can enter in the % Discount field.
% Discount	Type the percent discount to be applied to the entire quote, or use the arrows to increase or decrease the value.
Grand Total	This field displays the total price for the quote after the quote discount has been applied.
Offer Start Date	Click this calendar to select the start date for the quote from the current month's calendar. If necessary, use the arrows at the top of the calendar to move backward or forward by month.
Offer End Date	Click this calendar to select the end date for the quote.
Quote Document	If the quote information has not been merged into a quote template yet, Attach Quote is active. Click Attach Quote to merge the quote with a quote template. Refer to Merging opportunity and quote data into a quote template. **Note:** After quote information has been merged into a quote template, this section displays the name of the quote as well as options to edit and delete the quote.

Table 629: New Quote Window Description (Continued)

Field	Description
Notes	Type a description of the quote in this field.

4 Click the OK button on the ribbon to close the New Quote window and add the quote to the opportunity.

5 Click the Save button to save the quote you just added to the opportunity.

Adding sales products to quotes

When you add a quote to an opportunity, you must select a **price schedule** in the Schedule drop-down menu on the New Quote window. Your administrator added the price schedules, and each price schedule corresponds to a specific set of **sales products**. When you select a price schedule, the associated products appear in a product list below the Schedule field.

You use the product list to select the products you want to add to the quote. Once they appear in the sales product grid on the right, you can adjust quantities and specific discounts for each product for this quote.

Note Editing a product for this quote does not change its price in any other quote, nor does it change the price in the product catalog.

The following procedure assumes that you have already added a quote to an opportunity, but have not yet selected a price schedule or added sales products to the quote.

To add a sales product to a quote

1 While editing an opportunity, click the Quotes tab.

2 Right-click the quote you want to open and select Open. The quote editor opens.

3 Click the Schedule drop-down menu and select a price schedule for the quote.

Note When you select a price schedule, all sales products associated with the price schedule populate the product list below the Schedule field. You can click the plus sign next to folders to expand them. The sales product grid is located next to the product list.

4 Double-click a sales product in the product list to move the product to the sales product grid. Information about the sales product appears in the grid.

Or

Drag a sales product from the product list to the sales product grid.

Note To select multiple products before dragging, press **Ctrl** while making your selections.

5 To edit a selected sales product in the sales product grid, right-click the product and select Open. The quote product editor opens.

a Enter field information described in the following table.

Table 630: Quote Product Editor Description

Field	Description
Original ID	This read-only field displays the product ID.
Original Name	This read-only field displays the product name.
Original Price	This read-only field displays the price assigned to the product in the price schedule you selected for the quote.
Original Description	This read-only field displays the product's description.
Adjusted ID	Type a product ID in this field if you want to modify the original ID.
Adjusted Name	Type a product name in this field if you want to change the product's name in the quote.
Adjusted Price	Type a price in this field if you want to change the original price of the product for this quote. The value you enter appears in the Adjusted Price column on the sales product grid.
*Quantity	Type a quantity in this field if you want to change the default value of 1. **Note:** Changing this field affects the value of the Total column on the sales product grid.
*Discount	Type a percent discount in this field if you want to change the default value of 0. **Note:** Changing this field affects the value of the Total column on the sales product grid.

Table 630: Quote Product Editor Description (Continued)

Field	Description
Adjusted Description	Type a description in this field if you want a description other than the original description.
Notes	Type any notes about the product quote in this field.

b Click the OK button to save your changes, close the quote product editor, and return to the open quote.

6 Click the OK button to save your changes to the quote, close the quote, and return to the opportunity.

7 Click the Save button to save the opportunity with your changes to the quote.

Now you can merge opportunity and quote data into a quote template to generate a quote you can send to the customer.

Merging opportunity and quote data into a quote template

Now that you have added a quote to the opportunity and then added sales products to the quote, you have defined all the information necessary to generate the quote for the customer. Next, you can merge the opportunity and quote data with a **quote template**. When you select a quote template from the available options, Opportunity Tracking generates a quote you can save and send to the customer.

Note When you add a quote to an opportunity, Opportunity Tracking calculates the value of the quote based on the product quantities and the discounts you entered. As a result, you already have all the information you need to present the quote to the customer verbally. If, for some reason, you do not want to use Opportunity Tracking to send the quote to the customer, it is not necessary to merge the data into a quote template.

To merge opportunity and quote data into a quote template

1 While editing an opportunity, click the Quotes tab.

2 Right-click the quote you want to merge into a quote template and select Open. The quote editor opens.

3 Click Attach Quote on the bottom left of the quote editor. The Select Template window opens, providing a list of available quote templates that have been defined by your administrator.

Note If Attach Quote is not enabled, there are no available quote templates. Contact your administrator for help.

4 Select a quote template and click the OK button. The opportunity and quote data are merged into the quote template, and the Quote Viewer window opens with the quote displaying as a Word document.

5 To edit the document, make changes using Microsoft Word.

Note You can make any changes you need to customize the quote document, but your changes do not modify the quote template.

6 To merge the same opportunity data into a different quote template, click the Merge button and select a new template from the Select Template window.

7 Type a name for the quote in the Custom Document Name field to ensure that the name of the quote is unique for the customer receiving it.

8 Click the Save button to save the quote and return to the quote editor. The quote document name appears at the bottom left of the window.

9 Click the OK button to close the window and add your quote to the opportunity. A paper clip icon appears on the Quotes tab and in the first column of the quotes list.

10 If you want to forecast the quote to close within the specified sales period, select the Forecast check box in the Forecast column.

Note If you select the Forecast check box, the quote amount appears in the Rep Forecast field of the opportunity. Refer to Forecasting opportunities.

11 Click the Save button to save the quote to the opportunity.

After saving the opportunity, you can view the quote audit log, which contains all activities related to the quote. Refer to Viewing the quote audit log.

Sending quotes

After merging all necessary information about the opportunity into the quote template, you should print and review the quote to be sure all the information is correct. (Refer to To print a quote.) Then, when you are ready, send the quote to your customer.

To send a quote to a customer

1 From the Quotes tab of the opportunity, right-click the quote you want to send and select Send. The Send Quote window opens.

Note The Send button is not active unless all opportunity and quote data have been successfully merged into a quote template. Refer to Merging opportunity and quote data into a quote template.

2 Enter field information described in the following table.

Table 631: Send Quote Window Description

Field	Description
To	Type the email address of the contact or staff member you are sending the quote to, or click this button to open the Select Names window. Refer to Selecting recipients. **Note:** This field populates with the primary contact's email address from the Contacts tab.
Cc	Type an email address in the Cc field to send the quote to, or click this button to open the Select Names window. **Note:** All recipients can see the email addresses in the Cc field.
Bcc	Type an email address in the Bcc field to send the quote to, or click this button to open the Select Names window. **Note:** No other recipients can see the email addresses in the Bcc field.
Subject	Type the subject for the quote in this field.
Comment	Type any comments in this field.
Opportunity Files	Any files that are permanently attached to the opportunity are listed in this section. Select the check box next to any file attachments you want to send with the quote.

Table 631: Send Quote Window Description (Continued)

Field	Description
Temporary Files	Click the Add Files button to select a file to send with the quote. This action does not permanently attach the file to the opportunity.
Send as PDF	Select this check box if you want to send the quote as a PDF attachment instead of the default Word attachment. **Note:** If this check box does not appear, your administrator has not configured Opportunity Tracking to send quotes as PDF documents.

3 Click the Send button to send the quote to the recipients listed on the Send Quote window.

Note After a quote has been sent to a customer, the details of the quote (From, To, Cc, Bcc, Format, Attachments, Subject, and Comments) are recorded as a note to the opportunity the quote is associated with. In addition, the status of the quote is automatically set to Sent.

Managing quotes

In addition to adding and sending quotes, the toolbar on the Quotes tab lets you open a quote for editing as well as print, copy, and delete a quote. These options are also available when you right-click a quote. When a quote is open, you can view the audit log that lists all activities related to the quote.

Once a quote has been sent, you cannot edit it unless your profile gives you permission to do so. However, you can make a copy of the quote, edit the copy, and then send the copied quote to a customer.

To edit a quote

1 While editing an opportunity, click the Quotes tab.

2 Right-click the quote you want to edit and select Open. The quote editor opens.

Note You can edit only one quote at a time.

3 Modify fields as needed. Click here for field descriptions.

4 Click the OK button to save your changes to the quote.

5 Click the Save and Close button to save the quote and close the opportunity.

To copy a quote

1 While editing an opportunity, click the Quotes tab.

2 Right-click the quote you want to copy and select Copy. The copied quote appears in the quote list with a name of "Copy of <quote>" and its status is set to Unsent.

3 Right-click the copied quote and select Open to edit as necessary. Click here for field descriptions.

4 Click the OK button on the quote editor to save your changes to the copied quote.

5 Click the Save and Close button to save the copied quote and close the opportunity.

To delete a quote

1 While editing an opportunity, click the Quotes tab.

2 Right-click the quote you want to delete and select Delete. A confirmation message opens.

3 Click Yes to delete the quote from the opportunity.

4 Click the Save and Close button to save your changes on the Quotes tab and close the opportunity.

To print a quote

1 While editing an opportunity, click the Quotes tab.

2 Right-click the quote you want to print and select Print. The Print Dialog window opens.

3 Click File on the menu and select Print. The Print window opens.

4 Click the Print button to print the quote.

Viewing the quote audit log

All actions related to a quote are recorded to the quote audit log, which is located next to the Attachments tab on the quote editor. Information in the audit log includes when the quote was created and updated, by whom, and the actions taken.

Note Before you can see any recent actions in the audit log, you must save the opportunity the quote is associated with.

The following table describes the columns in the quote audit log.

Table 632: Quote Audit Log Columns Description

Column	Description
When	This column lists the date and time of the actions.
Who	This column lists the name of the sales rep who acted on the quote.
What	This column lists the actions related to the quote. • **Created**—The first time a quote is added to the opportunity and the opportunity is saved. • **Assigned—**The staff member the quote is assigned to. • **Edited**—The quote is edited and the opportunity is saved. • **Forecasted/Unforecasted**—The quote Forecast check box is selected or cleared and the opportunity is saved. • **Changed Status**—The quote status is changed and the opportunity is saved. • **Changed Price Schedule**—The quote price schedule is changed and the opportunity is saved. • **Quote Template Merged/Updated/Deleted**—The quote document is merged, edited, re-merged, or deleted and the opportunity is saved. • **Quote Sent**—The quote has been sent.
Description	This column displays more information about the action (for example, the editor used to save or edit the quote or the email address the quote was sent to).

Security Practices

The following sections are intended for administrators using Oracle Service Cloud. They contain information, benefits, and recommendations for securely implementing Oracle Service Cloud.

- Overview
- Developing a Security Plan
- Configuring the Administration Interface
- Email Security
- Abuse Detection Security
- Security-Related Configuration Settings
- Recommendations for Security-Related Configuration Settings

84

Overview

Security is a changing landscape with new attack methods continuously developing, many of which are based on social engineering that takes advantage of user trust. An important constituent in product security is your diligence in configuring Oracle Service Cloud and your vigilance in its use. This document discusses important security issues and provides specific information about configuration settings that address product security.

Oracle Service Cloud security and compliance

The protection of our customers' assets is a high priority at Oracle. We strive to make your Oracle Service Cloud experience secure by holding ourselves to industry-standard security and privacy requirements in our software development practices and operational methods. For added protection, Oracle Service Cloud can be hosted within our community cloud environments that align with well-known regulatory control frameworks. Depending on the cloud environment you purchased, accreditations, attestations, and certifications may include:

- DIACAP—Department of Defense Information Assurance Certification and Accreditation Process
- DISA ATO—Defense Information Systems Agency–Authority to Operate
- FedRAMP pATO—Federal Risk and Authorization Management Program - Provisional Authority to Operate
- HIPAA—Health Insurance Portability and Accountability Act
- NIST 800-53—National Institute of Standards and Technology
- PCI-DSS—Payment Card Industry Security Standards Council
- SSAE 16 Type II
- SOC2 Type II

Network and hosting infrastructure

Oracle uses "defense in depth" with multiple levels of security crafted to protect everything in the hosted environment from the network infrastructure to the software.

Oracle Service Cloud sites are hosted in security-hardened pods where each is protected by redundant firewalls and a demilitarized zone architecture. All major services, which include web, database, and mail services, are separately hosted and load balanced. The pods are audited daily, both internally and externally, and every quarterly software release is subjected to a third-party audit. In addition, a dedicated security staff monitors all systems for events that could jeopardize system reliability or data integrity.

85

Developing a Security Plan

When configuring your Oracle Service Cloud site, your goal is to obtain the maximum effectiveness for your staff and your customers, while ensuring that your site is safe from threats. Although Oracle Service Cloud is designed and implemented with the highest levels of security, we recognize that our customers' needs vary. Therefore, we offer configuration options that let you accept various levels of risk. Your sensitivity to those risks should dictate the configuration and management options you use in your site.

Important Never assume that your security system is foolproof. New attacks are designed every day, so you should expect that any weakness will eventually be exploited. Ongoing vigilance and process improvement are required to minimize risk.

Common security threats

Risks to using a web-facing software product like Oracle Service Cloud to collect and store data include but are not limited to:

- Data leaks to unauthorized persons.
- Attacks to subvert security measures.
- Vandalism of the host site.
- Attacks against site users.

Security considerations

To start developing your security plan, we've compiled a list of questions and considerations that relate to the use of Oracle Service Cloud. Your answers should help determine the content of your security plan.

The following list is a minimal set of considerations that relate to the use of Oracle Service Cloud.

- What type of data will you collect and store?

- ▷ Is personal information such as name, address, telephone number, and email address collected?
- ▷ Is medical or financial information collected and stored?
- ▷ Are there required data security standards or certifications, such as HIPAA or PCI?

- What methods will be used to obtain the data?
  - ▷ Does information come over the Internet or a private intranet?
  - ▷ Does information come from a voice-based system?
- What is the access method for the data?
  - ▷ Are users required to provide credentials, such as a user name and password, or is data openly available?
- What are the risks associated with compromised data?
  - ▷ What is the monetary cost?
  - ▷ What is the non-monetary cost, such as loss of reputation?
  - ▷ Are there legal ramifications?
- Who are your user groups?
- What authentication methods are available and which should be used for each type of user?
- For each type of data, which types of users should have access and how should the authorization be accomplished?
- What communication methods will be used and what efforts should be made to protect communication from being compromised?

While there are many resources available that can help you develop security policies and procedures, keep in mind that you should rely only on those resources that you find reliable and trustworthy. The following is a list of suggested reading on security topics.

- *Writing Information Security Policies* by Scott Barman
- *Information Security Policies and Procedures* by Thomas Peltier
- SANS Institute for information about security training and security certification
- OWASP—A nonprofit organization focused on improving software security

86

Configuring the Administration Interface

Properly configuring the **administration interface** is critical to your site security because staff members can be granted permission to view and modify virtually everything in an Oracle Service Cloud site, including your site controls and data. Oracle Service Cloud uses role-based access control through profile permissions, navigation sets, and workspaces that you define. All staff members are assigned a profile that is associated with a navigation set and one or more workspaces.

- **Navigation sets**—A navigation set is a combination of navigation buttons and their associated navigation lists. Each navigation list contains unique reports and items based on staff member responsibilities, and every profile must include a navigation set that all staff members with that profile use when working in Oracle Service Cloud. By carefully examining staff member responsibilities before you create navigation sets, you can grant access to functionality to only those individuals who require it.
- **Workspaces**—Workspaces define the appearance of the agent desktop when staff members add, view, and edit records in Oracle Service Cloud. Each profile has one or more workspaces that can be designed to provide only the functionality that is needed by the staff member. Along with navigation sets, workspaces provide macro-level control over access rights.
- **Profile permissions**—Profiles let you control what areas of Oracle Service Cloud your staff members can access and what specific actions they can perform in those areas.

Note You must create navigation sets before profiles in order for staff members to have access to reports and other components. In addition, if you use custom workspaces, we recommend creating them before creating profiles so you can assign the workspaces to specific profiles.

Using role access to define permissions

Setting permissions carefully and thoughtfully greatly enhances the security of your site. This is particularly true regarding administrator permissions, which typically let staff members edit **configuration settings** and administrative controls.

One method for determining the permissions you grant is to use a role-access method. The following table is not a complete list of all the permissions available, but an abbreviated set representing those permissions with direct security ramifications. While no contrived set of roles will represent any organization perfectly, the four job types used here demonstrate a general scenario of how permissions might be set up.

- **Administrator**—Staff member with access to all functionality.
- **Supervisor**—Staff member with supervisory responsibilities but no responsibility for configuring your site.
- **Staff member**—Staff member with access to data but no administrative controls.
- **Developer**—Staff member with access to development and integration interfaces.

Note Communities in Oracle RightNow Social Experience have their own set of user types that are different from those listed in the scenario described here.

Table 633: Role-Access Scenario

Setting	Functionality	Roles
Administration		
Administration	Create and edit the following items: • Custom Fields • Messages • Mailboxes • Currencies and Exchange Rates • Service Level Agreements • Response Requirements • Chat Hours • Quote Templates • Territories • Promotions • Strategies • Sales Periods • External Suppression List • Thread Type Correction	Administrator
Groups/Accounts/Distribution Lists	Access staff accounts and distribution lists.	Administrator Supervisor
System Error Log	Access log files under Site Configuration.	Administrator Supervisor
Workspace Designer	Access Workspaces and Workflows explorers and designers.	Administrator Supervisor
Scripting	Create and edit agent scripts.	Administrator Developer
Object Designer	Create custom objects.	Administrator Developer
Message Templates	Customize administrator notifications, administrator emails, and contact emails.	Administrator
CP Promote	Promote customer portal pages from the staging area to the production area.	Administrator Developer
CP Stage	Copy customer portal development files to the staging area.	Administrator Developer

Table 633: Role-Access Scenario (Continued)

Setting	Functionality	Roles
CP Edit	Access the Customer Portal Administration site and edit customer portal pages in the development area using WebDAV.	Administrator Developer
Rules View	View business rules.	Administrator Supervisor Staff member
Data Import	Import data, including answers, contacts, incidents, organizations, and custom objects.	Administrator Supervisor
Process Designer	Create custom processes.	Administrator Developer Supervisor Staff member
Virtual Assistant Edit	Access to configuration of the virtual assistant.	Administrator
Broadcast Notifications	Send messages to other staff members.	Administrator Supervisor
Configuration	Access to the following areas and functionality: • Password Configuration • Configuration Settings • Configuration Wizard • Message Bases • File Manager • Interfaces • Add-In Manager • Email Address Sharing	Administrator

Table 633: Role-Access Scenario (Continued)

Setting	Functionality	Roles
Business Process Settings	Define interface appearance and functionality, including: • Navigation Sets • Customizable Menus • Countries • Products/Categories/Dispositions • Standard Text • Variables • Holidays • Product Catalog • Price Schedules • Tracked Link Categories	Administrator Supervisor
Rules Edit	Edit business rules.	Administrator Supervisor
Profiles	Add and edit profiles.	Administrator
SSO Login (SAML 2.0)	Allows login only through an identity provider, that is, using a single sign-on process. **Note:** Oracle Service Cloud uses the SAML 2.0 protocol for single sign-on.	Administrator
Skill Edit	Access to configuration of advanced routing.	Administrator Supervisor
Agent Browser User Interface	Access to the Oracle Service Cloud using the Agent Browser UI through account authentication.	Administrator Supervisor Staff member
Public SOAP API	Access the public SOAP API through account or session authentication.	Administrator Developer
Public Knowledge Foundation API	Access the public Knowledge Foundation API through account or session authentication.	Administrator Developer Supervisor Staff member
Mobile Agent App	Access Oracle Service Cloud on a mobile device through account authentication.	Administrator Supervisor Staff member

Table 633: Role-Access Scenario (Continued)

Setting	Functionality	Roles
Organizations		
	Add, edit, delete, and view organizations.	Administrator
	Edit and view organizations.	Supervisor
	View organizations.	Staff member
Contacts		
	Add, edit, delete, view, and move contacts.	Administrator
	Add, email, edit, delete, and view contacts.	Supervisor
	Email, edit, and view contacts.	Staff member
Service		
Incidents	Add, edit, view, and delete incidents; propose incidents as answers; respond to incidents.	Administrator Supervisor
	Add, edit, and respond to incidents.	Staff member
Answers	Add, edit, and delete answers; set answers to public status.	Administrator Supervisor
	Add and edit answers.	Staff member
Asset	Add, edit, delete, and view assets.	Administrator Supervisor
	View and edit assets.	Staff member
Opportunities		
	Create, edit, delete, view, respond to leads, and send quotes.	Administrator
	Create, edit, and view leads, and send quotes.	Supervisor
	View leads and send quotes.	Staff member

Table 633: Role-Access Scenario (Continued)

Setting	Functionality	Roles
Outreach		
	Create, edit, delete, and view mailings, campaigns, documents, templates, snippets, file attachments, tracked links, segments, and contact lists.	Administrator
	Edit and view mailings, campaigns, documents, templates, snippets, file attachments, tracked links, segments, and contact lists.	Supervisor
	View mailings, campaigns, documents, templates, snippets, file attachments, tracked links, segments, and contact lists.	Staff member
Feedback		
	Create, edit, delete, and view surveys, questions, documents, templates, snippets, file attachments, tracked links, segments, and contact lists.	Administrator
	Edit and view surveys, questions, documents, templates, snippets, file attachments, tracked links, segments, and contact lists.	Supervisor
	View surveys, questions, documents, templates, snippets, file attachments, tracked links, segments, and contact lists.	Staff member
Tasks		
	Create, edit, delete, and view tasks.	Administrator
	Edit, view, and delete tasks.	Supervisor
	View tasks.	Staff member
Analytics		
	Create, edit, view, customize, print, export, and forward reports.	Administrator

Table 633: Role-Access Scenario (Continued)

Setting	Functionality	Roles
	Edit, view, customize, print, export, and forward reports.	Supervisor
	View, edit, print, export, and forward reports.	Staff member

87

Email Security

Most email sent over networks is not encrypted. However, we recommend encrypting all data that you deem sensitive. Oracle Service Cloud is designed to prevent the inadvertent release of information, but there are also a number of configuration settings related to email that you can use to increase your protection.

Certificates

Secure sockets layer (SSL) protocol provides encryption services for client-server communication security. To accomplish this, digital **certificates** are used to convey identification information and encryption keys. Since all agent desktop communication is over SSL, your site already uses a certificate issued by Oracle. This certificate can be used for other secure communication links, including staff member and customer access and email.

For a discussion about the configuration settings you can use to protect your site and improve your security, see Customer Portal Settings for Site Protection.

Emailing links to answers

You can email links to answers from the **customer portal** or the **administration interface**. If a login is required for customers to access an answer, a user name and password will be required.

Answer visibility depends on who is trying to access the answer—a customer or a staff member—and where they are accessing it from—the customer portal or the administration interface. From the customer portal, visibility is controlled by a number of fields, including the Status field, which is defined on the administration interface. For example, if an answer status has been set to Private, then that answer is not visible to customers. For customers accessing answers from the customer portal, each answer link is protected by a security token with a limited lifetime that is defined in the configuration setting SEC_EU_EMAIL_LINK_EXPIRE. The default value is eight hours, meaning that a customer has eight hours to click the link and read the information published in the answer. We recommend using this security token to limit the time answers are available to customers. Because attackers need time to build phishing sites (for luring a user into clicking a link), the smaller the window of time you allow for access to your answers, the more secure your site will be.

For example, if an email with an answer link is copied by an attacker, access to the security token and the link has been compromised. If your site requires customers to log in to see an answer, the answer itself is safe, but the attacker can create a phishing scenario using a modified link that takes customers to an external site where their login credentials are stolen. It takes time to accomplish this, so the shorter the window of opportunity, the lower the likelihood of success. Setting the security token expiration in SEC_EU_EMAIL_LINK_EXPIRE helps discourage attackers. See Customer Portal Settings for Passwords.

From the administration interface, **profile** permissions control staff members' access to answers. Permissions of the staff member who sends an email link to an answer do not transfer to the receiver, so data security is maintained.

88

Abuse Detection Security

A potential threat to any website is a "denial of service" (DoS) attack where the attacker issues a large number of requests for service. Perpetrators of DoS attacks typically target sites or services hosted on high-profile web servers such as banks and credit card payment gateways. These attacks can slow the response time to legitimate visitors, overwhelm the database server, and generate excessive emails that interfere with normal operation.

To prevent these attacks, Oracle Service Cloud provides web form and survey security through CAPTCHA, which automatically requires human validation when abuse is suspected. CAPTCHA validation is typically triggered only if there appears to be active abuse of a website. However, you can customize CAPTCHA requirements from the **customer portal**.

89

Security-Related Configuration Settings

Certain configuration settings have a direct effect on security. Some affect the administration side of Oracle Service Cloud and others affect the customer portal or an external website. By making a conscious decision to determine the appropriate level of security that fits your business, you can define configuration settings to reflect a suitable security level.

This section lists configuration settings that specifically impact security. Paths to each setting in the Configuration Settings editor, descriptions, and default values are also listed. Configuration settings in this section are grouped into the following categories.

- Site protection
- Session data
- Password protection
- File attachments
- Chat
- Social Experience

For a complete list of security-related configuration settings by security level and significance, see Recommendations for Security-Related Configuration Settings.

Note Depending on your site's configuration, some settings may be hidden. If you cannot find a certain configuration setting, contact your Oracle account manager.

Site protection

One of the most important steps you can take to protect your site is to limit access to the greatest extent possible while still meeting the requirements of your staff members and customers. By restricting access to your site or certain functionality within your site, you can reduce opportunities for unwanted visitors with malicious intent to gain access to your assets. Configuration setting descriptions that affect your site's protection are listed in the following two tables.

Table 634: Administration Interface Settings for Site Protection

Configuration Setting	Description	Default Value
Common > General > Security		
SEC_VALID_ADMIN_HOSTS	Defines which hosts can access the administration interface.	Blank
SEC_VALID_INTEG_HOSTS	Defines which hosts can access the integration interface. Only staff members who log in from the listed IP addresses, including network groups, can access the API interface.	Blank
RightNow User Interface > General > Security		
CLIENT_SESSION_EXP	Requires staff members to log in again after a specified period of inactivity on the **Service Console**. To reduce the risk of a misappropriated agent session, we recommend keeping the default value of 15. **Note:** This setting is not used strictly for security. It is also used in the desktop usage administration feature.	15
RightNow User Interface > Tool Bar > General		
LOGIN_SECURITY_MSG	Defines a message to display after staff members click the Login button on the Login window. **Tip:** You can use this setting to issue a security statement, distribute terms of a use agreement, or any login message you want staff members to agree to before the Service Console opens.	Blank

Table 635: Customer Portal Settings for Site Protection

Configuration Setting	Description	Default Value
Common > General > Security		
CP_REDIRECT_HOSTS	Defines which hosts are allowed as redirect targets from the customer portal. The default setting (blank) prevents all redirects outside of your interface domain. If you have more than one interface that you need to redirect to, each interface domain name must be specified in CP_REDIRECT_HOSTS. • Blank = Prevents all redirects outside of your interface domain. • * = Allows all redirects, including redirects to external sites. (Not recommended.) **Important:** Redirects within your interface domain, as well as hosts specified in related configuration settings are implicitly allowed. Therefore, those domains do not need to be listed in the CP_REDIRECT_HOSTS setting.	Blank
SEC_VALID_ENDUSER_ HOSTS	**Important:** This setting applies only to PHP pages. It does **not** block access to static assets such as URLs, images, JavaScript, folders, or files. For more information, contact your Oracle account manager. Defines which hosts can access the customer portal. Only customers coming from a host in the valid list are allowed access to the customer portal. **Tip:** The valid list is practical only if the set of allowed hosts is confined to 10 or fewer domains.	Blank

Table 635: Customer Portal Settings for Site Protection (Continued)

Configuration Setting	Description	Default Value
SEC_INVALID_ENDUSER_HOSTS	Defines which hosts are not allowed access to the customer portal. The invalid list is used to prevent spiders from known locations.	Blank
RightNow User Interface > General > Security		
SUBMIT_TOKEN_EXP	Defines the amount of time, in minutes, that the submit token used for token verification is valid.	30

Clickjacking protection

Clickjacking is an attack on browser security that can mislead your customers into clicking a concealed link. On a clickjacked page, attackers load another page in a transparent layer over your original page. Users think they are clicking visible buttons, while they are actually performing actions on the hidden page. The hidden page may even be an authentic one, such as a page from a well-known, reputable business. This makes it possible for attackers to trick your customers into performing unintended actions.

A common defense against clickjacking is to attempt to block the site you are trying to protect from being loaded into a frame.

Customer Portal

The ClickjackPrevention widget, included by default in the standard, mobile, and basic templates, ensures that your customer portal cannot be viewed inside a frame or iFrame.

Note If your site must run in frames, you will need to remove the ClickjackPrevention widget from the template.

If you do not use frames, you can edit the *standard.php* file of your template file to minimize the risk of clickjacking.

Community

If Community is enabled on your site, X-Frame-Options can be used to implement restrictions for both public and private pages. These settings restrict the Community pages that can appear in frames.

The X-Frame-Options setting is set, by default, to DENY for both public and private pages. The DENY setting prevents any domain from framing your content. This setting can be accessed on the community's General Settings page.

For more information on clickjacking, including definitions for X-Frame-Options setting values, search for the Clickjacking Defense Cheat Sheet on the OWASP website.

Cross-site request forgery

Cross-site request forgery (CSRF) causes a user's browser to load pages (including forms) that typically require authentication in an attempt to perform actions on behalf of the user. If the user has a valid authenticated session for the site the attacker is causing to load into the browser, those requests will succeed. If proper protections are not in place, this may let the attacker perform unintended actions on behalf of the user.

Submit tokens ensure that the contact who opened the page is the only contact who can submit the form. The SUBMIT_TOKEN_EXP configuration setting lets you define the amount of time the submit token is valid and is set, by default, to expire 30 minutes from the time the token was sent. After 30 minutes, the contact will receive a new token. The expiration process is invisible to the contact making for a seamless user experience.

For more information about CSRF vulnerabilities, search for the CSRF Prevention Cheat Sheet on the OWASP website.

Specifying valid redirect domains

Linking from one page to another is also a security risk you should consider. For example, to redirect users to different locations within your site, you may have placed a link in your URL. Typically, these are links to other files on your site but they can also be links to another interface, either on your site or on an external site.

Attackers can take advantage of redirects by creating URL links containing a redirect to a page that exploits users in some way. Those links could be placed in the following locations:

- Questions on your page
- Uploaded files
- Emails

In each of these scenarios, an attacker bets that users will click the link they create and be redirected to an external site where data can be maliciously harvested.

To protect your site from this type of attack, you can set the value of CP_REDIRECT_HOSTS to a list of interface domains that are legitimate redirect targets. The default value is blank, which limits redirects to pages only within your interface domain. Keep in mind that redirects to domains specified in related configuration settings are implicitly allowed.

Table 636: Sample Values for CP_REDIRECT_HOSTS

Value	Meaning
Blank	Prevents all redirects outside of your interface. (Default)
*	Allows all redirects. (Not recommended.)
*.example.com	Allows redirects to all sites in the example.com domain.
one.example.com, two.example.com	Allows redirects to sites one and two in the example.com domain.
example.custhelp.com, *.test.com	Allows redirects to example.custhelp.com and any interface in the test.com domain.

For information about securely publishing answer links on your site, see Emailing links to answers.

Session data

To maintain state information about staff members and customers, we use session data that is passed between the staff member's or customer's system and the web server. When an individual is logged in, data from the session can provide the necessary authentication for accessing your data that would not otherwise be available.

Session data security prevents attacks that stem from the trust the system has in authenticated users. Without session data security, attackers may be able to capture session data and reuse it. These are commonly referred to as "replay" attacks or "man-in-the-middle" attacks.

The SESSION_HARD_TIMEOUT configuration setting helps reduce session exploitation by forcing staff members to reauthenticate after a specified period of time. Set to twelve hours by default, this setting creates a new session while destroying the previous session each time the staff member reauthenticates.

The CP_FORCE_PASSWORDS_OVER_HTTPS configuration setting is enabled by default and helps protect staff members and customers from malicious activity such as password theft. This setting requires that all login operations, such as login name and password, be performed over HTTPS. Therefore, logged-in users interact entirely on HTTPS.

Note Pages that use passwords within standard widgets are automatically redirected to HTTPS.

If your site is password protected, you should require customers to log in to the customer portal. Even if only your answer pages are password protected, we recommend requiring that customers log in. The CP_CONTACT_LOGIN_REQUIRED configuration setting enables customer access to your pages and controls on the customer portal. Oracle Service Cloud offers different session management schemes for the administration interface and the customer portal. However, for both interfaces, we perform the following actions:

- Encrypt session data stored in cookies.
- Set the Secure flag and the HTTP Only flag on cookies.
- Make session data difficult to use from a different computer system.
- Require staff members to reauthenticate after twelve hours. See the SESSION_HARD_TIMEOUT setting description in the following table.
- Require staff members to reauthenticate after a specified period of inactivity. See the CLIENT_SESSION_EXP setting description in the following table.
- Require all login operations to be performed over HTTPS. See the CP_FORCE_PASSWORDS_OVER_HTTPS setting description in Customer Portal Settings for Session Data.

Table 637: Administration Interface Settings for Session Data

Configuration Setting	Description	Default Value
RightNow User Interface > General > Security		
CLIENT_SESSION_EXP	Requires staff members to reauthenticate after a specified period of inactivity on the Service Console. **Note:** This setting is not used strictly for security. It is also used in the desktop usage administration feature.	15 minutes

Table 637: Administration Interface Settings for Session Data (Continued)

Configuration Setting	Description	Default Value
SESSION_HARD_TIMEOUT	Requires staff members to reauthenticate after a specified period of time. **Note:** This setting creates a new session each time the staff member reauthenticates. The previous session is destroyed.	12 hours

Table 638: Customer Portal Settings for Session Data

Configuration Setting	Description	Default Value
RightNow User Interface > General > Security		
CP_LOGIN_MAX_TIME	Defines the time (in minutes) a customer can be logged in without needing to log in again. If a session goes past the defined setting, the customer is required to log in again. **Note:** The default is 0, which means that the time is set by CP_LOGIN_COOKIE_EXP.	0
RightNow User Interface > Customer Portal > Login		
CP_CONTACT_LOGIN_REQUIRED	Defines whether the customer portal requires a customer to be logged in when accessing most pages or controls. **Note:** This setting does not apply to the login, password recovery, and account creation pages, or pass-through authentication (PTA). PTA is described in the *Pass-Through Authentication Guide*. If you do not have this guide, contact your Oracle account manager.	No
CP_COOKIES_ENABLED	Defines whether the customer portal tries to set cookies on a visitor's browser.	Yes

Table 638: Customer Portal Settings for Session Data (Continued)

Configuration Setting	Description	Default Value
CP_FORCE_PASSWORDS_OVER_HTTPS	Requires all login operations to be performed over HTTPS. **Note:** Pages that use passwords within standard widgets are automatically redirected to HTTPS.	Yes
CP_LOGIN_COOKIE_EXP	The time (in minutes) before the customer portal login cookie expires. Set the value to -1 if you want the cookie to expire when the browser is closed. Set the value to 0 if you never want the cookie to expire.	60
CP_MAX_LOGINS	Defines the total number of concurrent users that can be logged in to your support site at any given time. **Important:** A value of 0 means there is no limit. If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.	0
CP_MAX_LOGINS_PER_CONTACT	Defines the total number of active, concurrent logins a single user can be logged in with. A value of 0 means there is no limit. **Important:** If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.	0

Password protection

If the data protected by a password is not critical or subject to privacy legislation, the default values in Oracle Service Cloud may be acceptable. The most compromising dangers to passwords include:

- Password cracking by brute-force attack or an exhaustive key search.
- Nefarious activities, such as phishing and other social engineering attacks.

- Inadvertent release by users (staff members or customers) who write down their passwords, send them in emails, or expose them to the public in other ways.

The choice of password controls depends on your security situation. For example, if users do not log in often, setting password expiration parameters can result in unnecessary locked accounts and frustrated users. While locking accounts can prevent some brute-force and denial-of-service attacks, it can also increase administrative overhead.

If you require your users to change their passwords regularly, you need to save history data to prevent reuse (at least five previous passwords). It is common for users to make a minor change to their password and eventually cycle back to the original, so it is difficult to assess the value of this strategy.

If you are concerned that passwords could be compromised by poor user-handling (writing passwords down) or by some form of attack, consider requiring regular changes. However, mandating frequent password changes in an environment where they are strong and are not shared does not enhance security and may actually hamper it by creating an environment that causes people to store passwords in electronic or written media.

No matter your security situation, you have considerable flexibility in setting up passwords for your staff and your customers. The following sections describe your configuration options and identify some tips for configuring secure passwords throughout your system.

Staff member passwords

You configure passwords for your staff from the configuration list on the navigation pane (Configuration > Staff Management > Password Configuration).

You can strengthen passwords by defining requirements such as minimum password length, maximum number of character repetitions and occurrences, and the minimum number of upper and lowercase characters, numbers, and special characters allowed.

The options available to you in setting up password requirements can enhance security on your site as well as help protect your customers' information.

Table 639: Password Security Benefits

Password Configuration	Security Benefit
Number of Invalid Logins	Locking accounts after a designated number of consecutive login failures makes it more difficult, but not impossible, for attackers to use brute-force password cracking. If an attacker is able to obtain an encrypted password, they can guess the algorithm used to encrypt it and simply run different strings looking for a match. While time-consuming, current computing technology makes it possible to guess up to - million passwords per second (and this number increases by 10 percent per year). **Note:** In Oracle Service Cloud, the default is 5 invalid login attempts before the account is locked.
Expiration Interval	The password expiration interval helps mitigate risk for accounts that have been compromised or accounts that have not been used for long periods of time. By setting a conservative value for the number of days a password stays in effect, you can help lower the risk of attack. (Default = 90.) **Important:** PCI-compliance requires expiration interval to be 90 days or less.
Password Length	While it is helpful to use case changes and special characters to enlarge the character set, enforcing longer passwords is an easy way to improve password strength. (Default = 8.) For example, if 76 characters are used randomly, it takes no more than 12 hours to crack a 6-character password. Cracking time increases to 6 years for an 8-character password, and it would take 230 million years to crack a 12-character password. Of course, password cracking typically takes advantage of the tendency to use common words in passwords so dictionary attacks can break passwords more quickly. For maximum security, even longer passwords (no less than 10 characters) are necessary. For example, a 12-character password composed of 3 words from a 100,000 word dictionary could take more than 7 years to crack. Add a small amount of randomness to the password, and the cracking time rapidly increases to 230 million years.

Table 639: Password Security Benefits (Continued)

Password Configuration	Security Benefit
Numbers and Special Characters	Requiring numbers and characters can add to the random factor of a password. They also make it easier for a user to come up with a password that is easy to remember, but still unique. For example, MaryhaddaL1tlelam. (Default = 0.)
Uppercase and Lowercase Characters	Requiring a mix of upper and lowercase characters can add to the random factor of a password. They also make it easier for a user to come up with a password that is easy to remember, but still unique. For example, 2BeOrNot2Bee?.(Defaults = 1.)
Number of Previous Passwords	Password history prevents the repetition of passwords when a staff member changes a password that is set to expire. Enforcing password expiration without setting the number of previous passwords allowed makes password expiration less effective. We recommend allowing 6 to 10 previous passwords. (Default = 10.)

Customer passwords

You have two ways to configure customer passwords in Oracle Service Cloud.

Configuration settings

The configuration setting EU_CUST_PASSWD_ENABLED controls the visibility of the Password field on the customer portal Log In page. This setting is enabled by default because it offers significant protection for your organization and your customers. However, if your organization does not require customer passwords, you can remove the Password field from the Log In page by disabling this setting.

Table 640: Customer Portal Settings for Passwords

Configuration Setting	Description	Default Value
Common > General > Security		
SEC_EU_EMAIL_LINK_EXPIRE	Defines the duration in hours that a temporary link to reset a customer's password is valid. This setting also defines the length of time a customer has access to answers on your site. See Emailing links to answers.	8

Table 640: Customer Portal Settings for Passwords (Continued)

Configuration Setting	Description	Default Value
RightNow User Interface > General > End-User		
EU_CUST_PASSWD_ENABLED	Displays the password field on the customer portal page.	Yes

Password requirements

As with staff member passwords, you can define requirements to strengthen passwords on your customer portal. The editor for configuring customer passwords contains the same fields as those for staff passwords (see Staff member passwords). The only differences between the two editors are the default values.

Forgotten passwords

There's no way around it—user names and passwords can be forgotten. For administrators, there is no way to recover forgotten credentials other than to contact their Oracle account manager. Other staff members can recover both their user name and password by using the Oracle Service Cloud account self-service feature. You can also use this functionality as a tool to maintain the integrity of your organization's login policies for all staff members.

The account self-service feature, accessed by clicking Login Help on the Login window, can be set up to open the login procedure in online help or send staff an email if they have forgotten their user name or password. This functionality is also available if your site has single sign-on (SSO) enabled. See the configuration settings descriptions in the following table for your options.

Table 641: Account Self-Service Settings for Passwords

Configuration Setting	Description	Default Value
RightNow User Interface > Tool Bar > General		
ACCT_RECOVER_STATUS	Specifies the functionality of the Login Help link on the Login window. See • 0 = Opens the login procedure in online help. • 1 = Sends an email containing user name or a link to the Password Reset page for entering a new password (default). • 2 = Changes the email message staff members receive when they click Login Help. The alternate message is defined in ACCT_RECOVER_ALT.	1
ACCT_RECOVER_ALT	Specifies the alternate email message to send when the configuration setting ACCT_RECOVER_STATUS is set to 2.	Blank

Customers can also recover user names and passwords from the Log In page on the customer portal. In both cases, if the password is forgotten, the correct user name must be entered, and then a link to the Password Reset page is emailed to the address associated with that user name. The password is reset when the link is sent and login is not allowed until the process is completed. Customers must do this within the time frame contained in SEC_EU_EMAIL_LINK_EXPIRE. See Customer Portal Settings for Passwords and Emailing links to answers.

Secure password recommendations

After assessing your specific security situation, you may want to consider enforcing the following password requirements.

- Lock staff accounts after three to five invalid login attempts. (The default is 5 in Oracle Service Cloud.)
- Set password length to a minimum of 10 characters.
- Require special characters and numbers.
- Require both uppercase and lowercase characters.
- Avoid using words or phrases that can be identified with a person, such as their name, address, telephone number, job title, type of car, and so on.
- Encourage users to choose passwords that are easy to remember and to type. For example, common words, song lyrics, poems and so on, with slightly misspelled words, go a long way toward security.
  - ▷ 2BeOrNot2Bee?
  - ▷ MaryhadaL1ttlelam
  - ▷ JollyBARN+be4Cow
- Stress the importance of keeping passwords secure by memorizing them and keeping them secret.

File attachment security

Oracle Service Cloud allows for attachments to incidents and answers as well as documents, templates, and snippets that are used in mailings and surveys. Attachments are a security concern because they can contain malicious code (malware) or data that is part of an attack on your site. All incoming attachments are scanned for malware, but you should always consider the possibility that attackers could evade detection.

Uploaded files containing HTML are a particular problem because they can provide links to sites that can harvest private data from unsuspecting people. For example, an attacker could upload a file that appears to be a link to an incident, but is actually a link to the attacker's site, which prompts the receiver to enter user name and password credentials. Staff members should never follow a link unless they are confident that it is safe, and no data should ever be entered to a linked site. If it is necessary to access a referenced site, instead of clicking a link, look at the web address and verify that it goes where you think it should. Then type the correct web address into your browser.

The other problem with HTML files is that they may contain executable code in the form of JavaScript or ActiveX controls that potentially can have a significant impact on your system. If browser security works properly, this should not happen. However, browsers are one of the least secure types of software. You can disable some of this functionality, but you may need it for many complex sites or applications, including Oracle Service Cloud. Therefore, be careful when working with data from untrusted sources and educate your users about the risks associated with improper handling of uploaded files.

As an additional precaution, you can prevent attachment viewing by requiring that users download file attachments in order to be viewed. This protects the Oracle Service Cloud application as well as the associated data, and it also allows additional levels of scanning to be applied. The configuration setting FATTACH_OPEN_ENABLED lets staff members view attachments on the **agent desktop**. As a preventative measure, this setting is disabled. Disabling FATTACH_OPEN_ENABLED does not change the display of attachments for customers, so attachments from external sources can be verified as safe before they are placed in answers.

Even so, it is possible for a malicious user to create incidents with very large attachments that could be used to attack site. To prevent this, the configuration setting FATTACH_MAX_-SIZE controls the maximum allowable attachment. The default (and the maximum allowable limit) is approximately twenty megabytes per attachment.

Important Regardless of the file attachment limits you define, file upload will fail if the upload takes more than five minutes.

Table 642: Settings for File Attachments

Configuration Setting	Description	Default Value
RightNow User Interface > General > File Attach		
FATTACH_MAX_SIZE	Defines the maximum file size in bytes that can be uploaded to the server as an attachment. File upload will fail if the upload takes more than five minutes. **Tip:** Too much available disk space can make your site vulnerable to DoS attacks. Consider the types of attachments that will be uploaded to your site, and then set this value to as small as practical for your needs. As far as security goes, the more disk space you can fill, the better.	20971520 (20 MB) **Note:** The maximum allowable limit is 20 MB.
FATTACH_OPEN_ENABLED	Lets staff members open file attachments on the agent desktop.	No

Chat security

Oracle RightNow Chat Cloud Service (Chat) lets customers experience interactive, real-time conversations with agents. There are a number of configuration options that protect these exchanges of information and the underlying services that make them possible.

Table 643: Settings for Chat

Configuration Setting	Description	Default Value
CHAT_WS_API_IP_HOST	Defines the list of IP addresses and subnet masks to make requests to the Chat API. If this setting is enabled and left blank, all hosts are allowed. **Important:** To enable this hidden setting and define your allowed IP addresses and subnet masks, submit an incident to our support site.	Blank
Common > General > Security		
SEC_VALID_CHAT_API_HOSTS	Defines which hosts and subnet masks of hosts are allowed to access the Chat SOAP interface from any chat-related request coming from a customer to the server. **Important:** If this setting is left blank, the server accepts requests from all hosts.	Blank
Chat > General > Server		
CHAT_CORS_WHITELIST	Defines the list of origins allowed to make cross-origin requests through the Chat server. **Important:** If this setting is left blank, the server accepts requests from all origins.	Blank
Chat > General > Create Incident		
INC_PRIVATE_TRANSCRIPT_ONLY	Allows chat transcripts to be added to incidents as private notes. **Note:** If enabled, customers cannot see past chats.	No

Server protection

The Chat SOAP interface can be protected from potential threats by restricting access to valid chat servers. The configuration setting SEC_VALID_CHAT_API_HOSTS defines the list of IP addresses and subnet masks specifying the legal chat servers that are allowed to access the Chat SOAP interface. If this setting is left blank, all hosts are allowed.

Additionally, users can be protected from cross-origin resource sharing (CORS) attacks by defining the origins allowed to make CORS requests in CHAT_CORS_WHITELIST.

Chat API

The Oracle Service Cloud supports a Chat API that must be enabled by Oracle. When enabled, the API is protected by a configuration setting that specifies the IP addresses and subnet masks to make requests to the Chat API. If this setting is enabled and left blank, all hosts are allowed.

Important Access to the Chat API is defined by the hidden configuration setting CHAT_WS_API_IP_HOST. To enable this setting and specify the IP addresses and subnet masks you want to allow, submit an incident to our support site.

User protection

By enabling INC_PRIVATE_TRANSCRIPT_ONLY, you can change the privacy of the information in a Chat exchange. Instead of being added to an incident as public information, it is added as a private note, which restricts access to the data. If there is a chance that staff members will enter sensitive information during a chat session, this setting should be enabled.

It is also possible to configure Chat to allow off-the-record chats in which the exchanged data is not recorded and can be seen only in real time by the agent.

Cross-origin resource sharing protection

Cross-origin resource sharing (CORS) lets client-side code make requests from one origin to another origin. This functionality can be abused by an attacker to retrieve information from your site or to perform actions as a valid user. You can protect your site from potential threats by restricting access to valid requests. The CHAT_CORS_WHITELIST configuration setting defines the list of hosts or IP addresses allowed to make cross-origin domain requests. If this setting is left blank, all origins are allowed.

Important Keep in mind that restricting cross-origin resource sharing does not prevent cross-site request forgery (CSRF). For information about CSRF protection, see Cross-site request forgery and Social Experience security.

For more information about testing for CORS vulnerabilities, search "Test cross origin resource sharing" on the OWASP website.

External queues

External chat queues allow sites outside of Oracle Service Cloud that use the Chat API to access Oracle Service Cloud chat data. Since external queues may be subject to more risk, we recommend allowing only those external queues that are operationally necessary. To prevent potential misuse, you must add the chat queues that you deem acceptable from the Chat Session Queue editor on the Customizable Menus page. Then, you must designate those queues for use with third-party-initiated chat requests as external. Chat requests pre-routed to the external queues you define will be routed to agent desktops by an external routing system. The chat server and the external routing system exchange data through the third-party queue API.

Social Experience security

Oracle RightNow Social Experience (Social Experience) is your organization's gateway to the social cloud and includes the following features.

- **Communities**
- **Channels**
- **Social Monitor**
- **Self Service for Facebook**

When providing service through social media, it is essential to maintain the security and confidentiality of your organization's social account logins. For this reason, Oracle Service Cloud lets you define channel accounts, which are shared credentials that allow designated agents to perform service functions through your social media accounts by securely storing the account logins and passing authentication parameters on behalf of your agents. If you are currently providing service through social media channels directly through the web, we strongly recommend considering the security benefits of managing those efforts within Oracle Service Cloud instead.

When monitoring certain **channel types**, Oracle Service Cloud can store your customers' social media user names in their contact records. By tracking this identifying information, Oracle Service Cloud can associate incoming social monitor incidents with contacts based on their social media accounts. However, unlike channel accounts, channel types do not store passwords—they are used only to track the social identities of your customers across different services.You may also want to consider **SSL** encryption options for social media services. Then traffic between Oracle Service Cloud and the social media site is encrypted. See Certificates.

Important Social Experience includes several APIs so you can access major social features from custom code. APIs offer tremendous flexibility, but it is important to recognize that accessing any part of Oracle Service Cloud through an API moves a significant part of the security responsibility to the external code.

Communities and Social Monitor

There are also opportunities to access external data and code from within Social Experience, such as Oracle RightNow Social Experience communities (communities) and Oracle RightNow Social Monitor Cloud Service (Social Monitor). Consequently, these features may not have the same level of security as Oracle Service Cloud and the exchange of data may not be secure. Configuring your site in a high-security environment requires special care when implementing social features. Private and public keys are used to encrypt data between Oracle Service Cloud and the communities. For COMMUNITY_PRIVATE_KEY and COMMUNITY_PUBLIC_KEY setting descriptions, see Settings for Social Experience.

Community administration settings are used to configure all aspects of the community, including its members, hives, and content. Several of these settings can be used to reduce the vulnerability of your site.

Token verification

Token verification is enabled on your community pages to protect your site from cross-site request forgery (CSRF). Cross-site request forgery causes a user's browser to load pages that typically require authentication in an attempt to perform actions on behalf of the user. If the user has a valid, authenticated session for the site the attacker is causing to load into the browser, those requests will succeed. If proper protections are not in place, this may let the attacker perform unintended actions on behalf of the user, such as changing an email address, home address, password, or making a purchase. For more information about CSRF vulnerabilities, search for the CSRF Prevention Cheat Sheet on the OWASP website.

Cross-site scripting

Another community administration setting worth noting can be used to mitigate the risk of malicious code introduced by a community administrator, such as a cross-site scripting attack. While administrators are trusted users and administrator-initiated attacks are rare, we recommend selecting the Prevent Client-Side Scripts as Inputs for Admin Settings check box. To help prevent reflected cross-site scripting, select the Prevent Client-Side Scripts as Query String Parameter Value check box. Both of these check boxes are accessed on the community's General Settings page.

Cross-site flashing

In a cross-site flashing attack, a malicious user causes code to be executed within other users' browsers by linking to an off-site Flash application. (It is considered "off-site" because the URL that calls the Flash application can live on an unrelated server in the cloud.) This allows malicious users to control the content other users see and, potentially, to steal user data such as session cookies, user names, and passwords.

Community administrators can create post and comment types, user profile fields, and page panels that allow users to link to off-site Flash files through the community Flash File field in the post or comment type. If a user submits a post or comment that links to a Flash file through such a field or panel, the Flash file executes in the browser of any user that views the post. If the Flash file is malicious, a cross-site flashing attack can result.

Cross-site flashing can be prevented by not including a Flash File field in a comment or post type, a user profile field, or a panel. Because of potential misuse by malicious users, we recommend Flash field types be used with caution or not at all.

Self Service for Facebook authentication

Oracle RightNow Self Service for Facebook Cloud Service (Self Service for Facebook) lets you embed a set of Oracle Service Cloud service and community features directly on your organization's Facebook page. After you create a Facebook page, you must enable Facebook on the Configuration Settings editor (FACEBOOK_ENABLED).

When the Self Service for Facebook application is installed on your Facebook page, it provides two values—your application ID and your secret key. You must assign these values to their respective configuration settings (FACEBOOK_APPLICATION_ID and FACE-

BOOK_APPLICATION_SECRET) in order to authenticate the link between Facebook and Oracle Service Cloud. To ensure the integrity and security of your connection, you should keep these values confidential.

In addition, incidents can be created from your Facebook page. This functionality is enabled by default (FACEBOOK_INCIDENTS_ENABLED) so your customers can submit questions without leaving Facebook. If you do not want incidents to be created from your Facebook page, then you must disable this setting. See Settings for Social Experience.

Twitter security

When you add Twitter **channel accounts**, designated agents can respond to Twitter messages publicly or privately from the agent desktop. Due to Twitter's unique functional design, we recommend that you encourage your customers to communicate privately when resolving support issues through the Twitter channel. Because your organization's tweets can be read, reposted, and replied to by any other Twitter user, using public tweets to resolve sensitive service issues can be risky. For this reason, it is vital that your agents follow the best practices for using Twitter's private messaging feature.

If you prefer that all Twitter searches be done securely over an **SSL** channel, contact your Oracle account manager.

Open login credentials for social accounts

Oracle Service Cloud supports two open login standards, OAuth and OpenID. Both allow easy integration of sites that support either one of those open login standards from the **customer portal**.

When your Facebook page or your Twitter account is created, they provide two values—your application ID and your secret key. To allow single sign-on, these values must be assigned to their respective configuration settings in Oracle Service Cloud:

- FACEBOOK_OAUTH_APP_ID and FACEBOOK_OAUTH_APP_SECRET

- TWITTER_OAUTH_APP_ID and TWITTER_OAUTH_APP_SECRET

Table 644: Settings for Social Experience

Configuration Setting	Description	Default Value
RightNow Common > RightNow Social		
COMMUNITY_PRIVATE_KEY	Defines the private key to be used to encrypt data between Oracle Service Cloud and communities in Social Experience.	Blank
COMMUNITY_PUBLIC_KEY	Defines the public key to be used to encrypt data between Oracle Service Cloud and the communities in Social Experience.	Blank
RightNow Common > 3rd-Party Applications > Facebook		
FACEBOOK_APPLICATION_ID	Specifies the Facebook application ID used to host Facebook for Oracle Service Cloud.	Blank
FACEBOOK_APPLICATION_SECRET	Specifies the Facebook application secret key used to host Facebook for Oracle Service Cloud. This setting is also used to authenticate staff members and customers who use Self Service for Facebook.	Blank
FACEBOOK_INCIDENTS_ENABLED	Lets customers and staff members create private incidents from your Facebook page.	Yes
RightNow User Interface > Open Login > OAuth Apps		
FACEBOOK_OAUTH_APP_ID	Specifies the Facebook application ID used to request the customer's or staff member's credentials for open login with Self Service for Facebook.	Blank
FACEBOOK_OAUTH_APP_SECRET	Specifies the Facebook secret key used to request the user's credentials for open login with Self Service for Facebook.	Blank

Table 644: Settings for Social Experience (Continued)

Configuration Setting	Description	Default Value
TWITTER_OAUTH_APP_ID	Specifies the Twitter application ID used to request the customer's or staff member's credentials for open login with the Oracle Service Cloud channel, Twitter.	Blank
TWITTER_OAUTH_APP_SECRET	Specifies the Twitter secret key used to request the customer's or staff member's credentials for open login with the Oracle Service Cloud channel, Twitter.	Blank

Recommendations for Security-Related Configuration Settings

The tables in this section can help you look at configuration settings in a logical way as they pertain to security. The settings are categorized by security levels—high, medium, and low. Once you've evaluated your security requirements, you can use these recommendations to achieve the level of security that fits your organization's needs.

Important To make an accurate determination of your organization's security needs, you must have a comprehensive knowledge of your site and its use.

Security level

The following list represents configuration settings that you should consider using or setting to achieve your designated level of security—high, medium, or low. To make the settings easy to find, the list is ordered alphabetically with each setting's respective path on the Configuration Settings editor.

Table 645: Recommended Security-Related Settings

Path/Configuration Setting	For high-security environment	For medium-security environment	For low-security environment
CHAT_WS_API_IP_HOST	Set to allowed IP addresses and subnet masks. **Important:** To enable this hidden setting and define your allowed IP addresses and subnet masks, submit an incident to our support site.		

Table 645: Recommended Security-Related Settings (Continued)

Path/Configuration Setting	For high-security environment	For medium-security environment	For low-security environment
Chat > General > Server			
CHAT_CORS_WHITELIST	Set to allowed origins.	Set to allowed origins.	Blank (default)
RightNow User Interface > General > Security			
CLIENT_SESSION_EXP **Note:** This setting is also used in the desktop usage administration feature.	15 (default)	16 to 45	0
RightNow User Interface > Customer Portal > Login			
CP_CONTACT_LOGIN_REQUIRED	Yes	Yes	No (default)
CP_COOKIES_ENABLED	Yes (default) for all security environments.		
CP_FORCE_PASSWORDS_OVER_HTTPS	Yes (default)	Yes	Yes
CP_LOGIN_COOKIE_EXP	5 to 30	31 to 60 (default = 60)	-1
RightNow User Interface > General > Security			
CP_LOGIN_MAX_TIME	As needed for all security environments (default = 0).		
RightNow User Interface > Customer Portal > Login			
CP_MAX_LOGINS **Important:** If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.	As needed for all security environments (default = 0).		
CP_MAX_LOGINS_PER_CONTACT **Important:** If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.	0 (default)	0	0

Table 645: Recommended Security-Related Settings (Continued)

Path/Configuration Setting	For high-security environment	For medium-security environment	For low-security environment
Common > General > Security			
CP_REDIRECT_HOSTS	As needed for all security environments (default = blank).		
RightNow User Interface > General > End-User			
EU_CUST_PASSWD_ENABLED	Yes (default)	Yes (default)	No
RightNow Common > Service Modules > Oracle Email			
EGW_PASSWD_CREATE	Yes (default)	Yes (default)	No
EGW_SECURE_UPDATE_ENABLED	Yes (default)	Yes (default)	No
RightNow Common > 3rd-Party Applications > Facebook			
FACEBOOK_INCIDENTS_ENABLED	No (default = Yes)	As needed.	As needed.
RightNow User Interface > Open Login > Oauth Apps			
FACEBOOK_OAUTH_APP_ID	Facebook application ID for all security environments (if Facebook is enabled).		
FACEBOOK_OAUTH _APP_SECRET	Facebook secret key for all security environments (if Facebook is enabled).		
RightNow User Interface > General > File Attach			
FATTACH_MAX_SIZE **Tip:** Consider the types of attachments that will be uploaded to your site, and then set this value to allow the minimum disk space that you need. As far as security goes, the more disk space you can fill, the better.	As small as practical for your needs. Applies to all security environments (default and maximum allowable limit = 20 MB). **Note:** File upload fails if the upload takes more than 5 minutes.		
FATTACH_OPEN_ENABLED	No (default)	No	As needed.

Table 645: Recommended Security-Related Settings (Continued)

Path/Configuration Setting	For high-security environment	For medium-security environment	For low-security environment
Chat > General > Create Incident			
INC_PRIVATE_TRANSCRIPT_ONLY	Yes	Yes	No (default)
RightNow User Interface > Tool Bar > General			
LOGIN_SECURITY_MSG	As needed for all security environments (default = blank).		
RightNow User Interface > Contact Services > Security			
MYSEC_AUTO_CUST_CREATE	No (default = Yes)	No	As needed.
Common > General > Security			
SEC_BROWSER_USER_AGENT	Set to allowed user agent strings.	Blank (default)	Blank (default)
SEC_EU_EMAIL_LINK_EXPIRE	8 (default)	12	24
SEC_INVALID_ENDUSER_HOSTS	Set to allowed IP addresses.	Blank (default)	Blank (default)
SEC_INVALID_USER_AGENT	Set to user agent strings that are **not** allowed.	Blank (default)	Blank (default)
SEC_SPIDER_USER_AGENT	Set to list of known web spider user agent strings.	Blank (default)	Blank (default)
SEC_VALID_ADMIN_HOSTS	Set to allowed IP addresses.	Set to allowed IP addresses.	Blank (default)
SEC_VALID_CHAT_API_HOSTS	Set to allowed hosts and subnet masks for all security environments (default = blank).		
SEC_VALID_ENDUSER_HOSTS	Set to allowed IP addresses.	Set to allowed IP addresses.	Blank (default)

Table 645: Recommended Security-Related Settings (Continued)

Path/Configuration Setting	For high-security environment	For medium-security environment	For low-security environment
SEC_VALID_INTEG_HOSTS	Set to allowed IP addresses.	Blank (default)	Blank (default)
SESSION_HARD_TIMEOUT	12 (default)	12-24	As needed.
RightNow User Interface > General > Security			
SUBMIT_TOKEN_EXP	30 to 60 (default = 30)	30 to 300	30 to 1000
RightNow User Interface > Open Login > Oauth Apps			
TWITTER_OAUTH_APP_ID	Twitter application ID for all security environments (if Twitter is enabled).		
TWITTER_OAUTH_APP_SECRET	Twitter secret key for all security environments (if Twitter is enabled).		
Outreach and Feedback > General > Campaigns			
WEBFORM_ID_BY_COOKIE_ DEFAULT	As needed for all security environments (default = No).		
WEBFORM_ID_BY_LOGIN_ DEFAULT	As needed for all security environments (default = No).		
WEBFORM_ID_BY_LOGIN_ REQUIRED_DEFAULT	As needed for all security environments (default = No).		
WEBFORM_ID_BY_URL_PARAM_ DEFAULT	As needed.	As needed.	No (default)
WEBFORM_SET_COOKIE_DEFAULT	As needed.	As needed.	No (default)
RightNow User Interface > Customer Portal > Syndicated Widgets			
WIDGET_INSTALLATION_HOSTS	As needed.	As needed.	Blank (default)

Security significance

In the following list, the configuration settings are grouped by high, medium, and low in security significance.

Table 646: Recommended Security-Related Settings By Significance

Significance	Configuration Setting	Recommended Setting
High	CHAT_WS_API_IP_HOST	Set to allowed IP addresses and subnet masks. **Important:** To enable this hidden setting and define your allowed IP addresses and subnet masks, submit an incident to our support site.
	CLIENT_SESSION_EXP	15 **Note:** This setting is also used in the desktop usage administration feature.
	CP_FORCE_PASSWORDS_OVER_HTTPS	Yes
	CP_LOGIN_COOKIE_EXP	As needed.
	CP_REDIRECT_HOSTS	Set to allowed hosts or leave default setting (blank) to prevent all redirects outside of the interface domain, including external sites.
	EU_CUST_PASSWD_ENABLED	Yes
	SEC_VALID_ADMIN_HOSTS	Set to allowed IP addresses.
	SEC_VALID_CHAT_API_HOSTS	Set to allowed hosts and subnet masks.
	SESSION_HARD_TIMEOUT	12

Table 646: Recommended Security-Related Settings By Significance (Continued)

Significance	Configuration Setting	Recommended Setting
Medium	CHAT_CORS_WHITELIST	Set to allowed origins.
	CP_CONTACT_LOGIN_REQUIRED	As needed.
	CP_LOGIN_MAX_TIME	As needed.
	EGW_PASSWD_CREATE	Yes
	EGW_SECURE_UPDATE_ENABLED	Yes
	FACEBOOK_INCIDENTS_ENABLED	Yes
	FATTACH_OPEN_ENABLED	Yes
	INC_PRIVATE_TRANSCRIPT_ONLY	Yes
	SEC_EU_EMAIL_LINK_EXPIRE	8
	SUBMIT_TOKEN_EXP	30
	WEBFORM_ID_BY_COOKIE_ DEFAULT	As needed.
	WEBFORM_ID_BY_LOGIN_ DEFAULT	As needed.
	WEBFORM_ID_BY_LOGIN_ REQUIRED_DEFAULT	As needed.
	WEBFORM_ID_BY_URL_PARAM_ DEFAULT	As needed.
	WEBFORM_SET_COOKIE_DEFAULT	As needed.
	WIDGET_INSTALLATION_HOSTS	Set to allowed domain names.

Table 646: Recommended Security-Related Settings By Significance (Continued)

Significance	Configuration Setting	Recommended Setting
Low	CP_COOKIES_ENABLED	As needed.
	CP_MAX_LOGINS	As needed.
	CP_MAX_LOGINS_PER_CONTACT	As needed. **Important:** If you set a value for this setting, you must also set a non-zero value for CP_LOGIN_MAX_TIME.
	FACEBOOK_OAUTH_APP_ID	As needed.
	FACEBOOK_OAUTH _APP_SECRET	As needed.
	FATTACH_MAX_SIZE	As small as practical for your needs. **Note:** Regardless of the file attachment limits you define, file upload will fail if the upload takes more than 5 minutes.
	LOGIN_SECURITY_MSG	As needed.
	MYSEC_AUTO_CUST_CREATE	As needed.
	SEC_BROWSER_USER_AGENT	As needed.
	SEC_INVALID_ENDUSER_HOSTS	As needed.
	SEC_INVALID_USER_AGENT	As needed.
	SEC_SPIDER_USER_AGENT	As needed.
	SEC_VALID_ENDUSER_HOSTS	As needed.
	SEC_VALID_INTEG_HOSTS	As needed.
	TWITTER_OAUTH_APP_ID	As needed.
	TWITTER_OAUTH_APP_SECRET	As needed.

Glossary

A | B | C | D | E | F | G | H | I | K |L | M |
N | O | P | Q | R | S | T | U | V | W | Y |

A

Absolute time—An exact date and time defined in an escalation action for business rules or a comparison period for custom reports. In standard reports, absolute time is the amount of time passed based on a 24-hour clock.
See also Relative time.

Access level conditional section—A method of controlling the visibility of a portion of an answer. Only those customers with permission to view the access level assigned to the answer section can view it.

Accessibility—The characteristics of a website that allow all users, regardless of disability, to have complete access to the information and features of the site.

Accessibility interface—A non-graphical interface in Oracle Service Cloud that allows staff members to add and edit incidents, answers, contacts, and organizations. The interface is accessible to blind and limited-sight staff members through keystroke functionality, screen magnification, and the ability to be read aloud by screen-reading software.

Account self-service—A feature for staff members to get help when logging in to the administration interface. If staff members forget their login information, they can request their user name or password by clicking Login Help on the Login window. Account self-service can also be set up to open the login procedure in online help or to convey an alternate message.

Action—The part of a business rule that defines what happens when an object (answer, contact, incident, chat session, opportunity, organization, target, or task) meets the rule's conditions. Actions are also a part of script and workspace rules, and a component of campaigns that can perform one of several functions.

Action arrow—An arrow on a workspace field or control that displays available editing options.

Activate—A process that is manually run after making changes to a state, function, or rule in a rule base to check for errors, archive the current rule base, and convert the edited rule base to the active rule base.
See also Business rules *and* Rule base.

Active—One of the default opportunity statuses and status types. An opportunity with the Active status is currently advancing in the system toward a sale.

Add-in—A custom .NET component that is loaded and activated by Oracle Service Cloud to add new features and integration capabilities.

Add-In Manager—A utility for adding, updating, and deleting add-ins in Oracle Service Cloud. The Add-In Manager is also used to set add-in permissions for each interface.
See also Add-in.

Administration interface—The graphical user interface that staff members use to configure and manage Oracle Service Cloud.
See also Agent desktop *and* Service Console.

Administrator—A staff member who configures, customizes, and maintains an Oracle Service Cloud application.

Administrator login—The default login used by the administrator to download Oracle Service Cloud and log in the first time. This special login is not a defined staff account and has no navigation set or profile associated with it. Using this login, the administrator must create a navigation set, profile, and staff account in order to access all functionality.
See also Navigation set, Profile, *and* Staff account.

Administration site—*See* Customer Portal Administration site.

Advanced mode—A survey editing mode for creating detailed questionnaires using an extended feature set that includes survey branching and automation elements.

Agedatabase—A scheduled utility that operates on the knowledge base data to maintain dynamic answers and make searching more efficient for staff members and customers.

Agent—A staff member who may be assigned incidents and chats with customers, and who may also maintain contact and organization records.

Agent desktop—The graphical user interface that staff members use when working with records, mailings, surveys, campaigns, and standard and custom reports. Agent desktop also refers to a set of complementary features in Oracle Service Cloud, including workspaces, workspace rules, guides, agent scripts, script rules, workflows, and add-ins, each representing a different, powerful way of interacting with records in the knowledge base. While each component serves a distinct purpose, they can be used together to create a highly adaptive work environment.
See also Administration interface, Service Console, *and* Workspace.

Agent scripting—A feature that helps guide staff members as they enter information into records on workspaces.
See also Script.

Aging—An automatic process that reduces an answer's solved count as the frequency with which the answer is viewed by customers declines. As the solved count is lowered, the answer will move down the list of answers and be less visible to customers.

Alias—A word that represents another word or phrase. Aliases and the words or phrases they represent can be added to the synonym list to enhance customer searching.
See also Wordlist file.

Anchor—A node on an action or decision in a campaign used to create a path. Actions and decisions have anchors for incoming and outgoing paths. Anchor also refers to a destination for hyperlinks placed at locations within documents for use in mailings and questionnaires for surveys and in answers when linking to other answers.

Answer—Any knowledge base information that provides solutions to common customer support questions.

Answer access level—A method of controlling what information is visible to customers. The default answer access levels are Help and Everyone, and custom access levels can be added.

Answer custom field—A field for gathering and displaying additional information about answers. Answer custom fields appear when adding or editing an answer and on the Answers and answer details pages.

Answer relationship—The relationship between two or more related answers. Answer relationship types include sibling, manually related, and learned link. Sibling and manually related answer relationships are defined by staff members. Learned link answers are automatically defined through customer activity.
See also Learned link, Manually related answer, *and* Sibling answer.

Answer status—A method of controlling the visibility of an answer. The default answer statuses are Public, Private, Proposed, and Review, and custom answer statuses can be added.

Answer status type—The status of an answer that determines whether it can be viewed by customers. The default answer status types are Public and Private.

Answer type—The format in which answers are displayed to customers. Answer types include HTML, URL, and file attachment.
See also File attachment answer, HTML answer, *and* URL answer.

Answer update notification—A way for customers to sign up to be notified whenever a particular answer is updated. Customers can also sign up for notification whenever any answer associated with a specific product or category is updated.

Answers page—A page on the customer portal where customers can view answers and search the knowledge base. Customers can view individual answers or search the knowledge base using selection criteria to narrow their search. If additional elements are enabled, customers can also search documents, websites, and communities.
See also Web Indexer *and* Oracle RightNow Social Experience communities.

API (application program interface)—An interface that enables programmers to communicate with the Oracle database. The API includes functionality to create, update, delete, and retrieve answers, contacts, hierarchical menus, incidents, opportunities, organizations, quotes, SLA instances, staff accounts, and tasks.

Ask a Question—A page on the customer portal where customers can submit a question when they cannot find an answer in the knowledge base.

Asset—Any product or service associated with an organization's customers. Assets can require serial numbers or not and can be registered by customers on the customer portal or by agents on the agent desktop.

Asset product—Any product or service sold or provided by an organization that can be tracked in Oracle Service Cloud. Asset products are configured using the product catalog.

Asset record—Information about a specific product or service provided to a specific customer that is tracked and maintained in Oracle Service Cloud.

Audience—All of the contacts belonging to the lists and segments associated with a mailing or survey.
See also Contact list *and* Segment.

Audit log—A list of all the actions performed on a report, record, or item in the knowledge base, including who performed the action, what the action was, and the date and time of the action.

Auto filter—A control added to report columns for filtering report data by values in the columns.

Automatic logout—A way of managing desktop user sessions by automatically logging out inactive sessions after a specified time of inactivity. Automatic logout is part of desktop usage administration, which assists organizations in lowering seat usage for licensing compliance.
See also Desktop usage administration *and* Manual logout.

B

Backup directory—The directory that contains all the backup files created by the File Manager.

Backup file—A file that is automatically saved each time a file is edited through the File Manager. Before the file is overwritten, the backup file is saved. The restore function can be used to revert to the backup file.

Basic page set—The template and set of customer portal pages that have been optimized for display on browsers with limited or no JavaScript capabilities.

Billable task—A way of classifying and recording the amount of time agents spend working on incidents. The default billable task is Miscellaneous, and custom billable tasks can be added.

Block—A section of widget code that can be customized to extend the view of a standard widget. Widget code that is not within a block cannot be modified.
See also Extend.

Block quotes—A symbol or HTML tag that designates a section of text that is not part of the most current email reply, such as previous entries in the email conversation.
See also Checksum *and* Techmail.

Boolean searching—A knowledge base search that allows customers to connect multiple keywords using & (AND) and |(OR) operators.

Bounced email—Email that is undeliverable. Emails can be bounced when email accounts are not functioning properly or are full at the time the mailing is sent. Outreach and Feedback track bounced emails.
See also Email management.

Broadcast mailing—A mailing sent to one or more contact lists or segments. Broadcast mailings can be sent at a scheduled time and can also be used in campaigns.
See also Contact list *and* Segment.

Broadcast survey—A survey sent as a broadcast mailing in which the message, audience, and mailing options are defined in the survey.

Builder—A community member whose primary role is to create hives and groups for a community. Access to builder functions is provided by the Builder–Custom and Builder–Template user types.
See also User type.

Bulkdel—A utility for deleting several incidents at once.

Business objects—The page of the Customer Portal Administration site that defines the set of answer, contact, and incident fields that can be used to define input and output fields on the customer portal.

Business rules—A component for defining processes to automate workflow, notification, and escalation. Business rules can automatically route incidents, opportunities, and chat sessions; send email and Outreach messages; escalate answers, incidents, opportunities, and tasks; update records; assigns SLAs; and create Offer Advisor targets.
See also Script rules, Target rules, *and* Workspace rules.

C

Cached data—Report data that has been temporarily stored in the database for quicker report generation. This data is cached nightly by the Agedatabase utility and can be purged regularly. Cached data also refers to local cache files stored on a staff member's workstation. This includes all option lists data (any data accessed from a drop-down menu or menu list such as customizable menu items) plus additional data such as report and workspace definitions, questions, documents, and standard text.

Campaign—A multiple-step marketing process based on business logic. Campaigns can contain any number of actions and decisions and move contacts through a series of steps when specified criteria have been met.

Canceled—A mailing and survey status that indicates a mailing or survey has been manually canceled before being completed.

Case section—A logical group of conditional sections where one, and only one, conditional section displays to the customer. As soon as the first conditional section is matched, the content for that conditional section is added, and no other conditional sections within the case section are evaluated. Case sections make content more relevant and targeted to a specific audience than independent conditional statements.
See also Condition *and* Conditional section.

Case statement—A type of conditional element used for multiple-choice decisions that allows more diverse branching capabilities to be added to campaigns and surveys based on conditions defined in the workflow. Case statements are unique because they have an outgoing path for every condition. As soon as the first choice (condition) is matched, the path for that choice is followed, and no other conditions within the case statement are evaluated.

Category—An option for grouping answers and incidents that allows more precise organization in the knowledge base. Staff members can classify answers and incidents by category and up to five additional levels of sub-categories, allowing more refined searching by customers and staff members.
See also Product.

Category page—A custom page that serves as a landing page for grouping and accessing custom content pages in a community.
See also Content page *and* Custom page.

Certificate—A digital piece of information for email and Internet security that includes the name of the certification authority, the holder of the certificate, the certificate holder's public key, the dates the certificate is valid, the serial number, and the digital signature of the certification authority. Certificates are also called *public certificates* and *public key certificates*.

Certificate revocation list—A list of certificates that have been suspended or revoked before they have expired. The certification authority maintains, updates, and publishes the certificate revocation list at regular intervals.

Certification authority—A third party authorized to issue certificates and authenticate the identity of the holder of the certificate.

Channel—The source of an incoming incident or outgoing response. Channels are grouped as standard email channels (Service Email, Outreach Email, Phone, Fax, Post, Service Web, Outreach Web, Chat, and Email) and social channels (Community, Twitter, YouTube, RSS feeds, and Facebook). Channels are also used to indicate the source of information for incident notes on the accessibility interface and contact, opportunity, and organization notes.

Channel account—A shared credential that permits one or more designated staff accounts to pass through a social media site when login and password authentication is required. Channel accounts can be created for communities, Facebook, and Twitter.

Channel type—The social channels tracked in contact records when storing social account user names and associating social monitor incidents to contacts. Channel types include Facebook, Twitter, and YouTube.

Chart style—A collection of display settings that can quickly be applied to charts used in reports. Chart styles control most of the graphical configuration of charts.

Chat agent status—A method of tracking an agent's availability to chat. The default chat agent statuses are Unrestricted, Unqualified, Unspecified, In Meeting, and On Break, and custom statuses can be added.

Chat agent status type—The status of an agent's availability to chat. Default chat agent status types are Available, Unavailable, and Logged Out.

Chat session—A real-time, two-way dialog between a customer and one or more chat agents.
See also Oracle RightNow Chat Cloud Service.

Chat session queue—A sequence of unassigned requests for chat sessions. The default chat session queue is Default Chat Queue, and custom queues can be added. Requests are added to chat session queues automatically by business rules.

Chat session routing—A process of routing customer requests for a chat to a specific queue based on rules in the Chat rule base.
See also Chat session queue.

Checksum—A calculated value that represents the content of a block of quoted text. This value is sent within the block quote tags of the email message and is used to determine if text has been added to the original message.
See also Block quotes *and* Techmail.

Choice question—A question type that allows customers to choose their answer from a menu, radio button, check box, or list.

Click-Once installer—A utility used to install the Oracle Service Cloud Smart Client on staff members' workstations.
See also Oracle Service Cloud Smart Client.

Client—The interface that displays on a customer's computer when submitting a request to chat with an agent.

Clone—To create an exact copy of an existing site or interface.

Closed—One of the default opportunity statuses and status types. An opportunity with the Closed status has resulted in a sale.

Cloud search—A search of social networking sites in order to track customer reaction to an organization's products, services, and overall reputation. In addition to searching the social cloud, staff members can schedule cloud searches, ignore or respond to posts, and create incidents from posts.

Clustering—An automatic process that groups the knowledge base into clusters of related answers and labels each cluster group with keywords that define those answers.
See also Data mining *and* Topic browsing.

Co-browse—A feature in Chat that enables agents to guide customers through web pages using their mouse or other pointing device to demonstrate actions. Co-browsing may also be available on incident workspaces to let customers share their desktop with agents when they are on the phone.
See also Oracle RightNow Chat Cloud Service.

Code Assistant—A Customer Portal tool to aid migration of custom code from earlier framework versions to a newer version. The tool offers code suggestions for migrating widgets, converting to a new YUI version, and removing features that are no longer supported.

Color scheme—A collection of colors that can be applied to chart styles. Multiple colors can be defined and combined into one color scheme. Charts that use the same scheme use the same set of colors.

Comment—A form of content created by members when responding to posts in a community.
See also Post.

Community—A social web solution consisting of customizable hives, members, groups, and custom pages.
See also Hive.

Community privacy level—The level of privacy that determines whether a login is required to access community content.

Comparison period—A reporting parameter used to compare a report's time period to an identical length of time in the past. Comparison periods are defined when creating or editing a custom report and can be included in standard reports.

Compatibility set—A set of Customer Portal widgets designed to be used together. Best practice recommends using widgets from the same compatibility set on any given customer portal page rather than combining them from different compatibility sets.

Competitor—An option for identifying other parties pursuing the same opportunity.

Compile—A process that runs the compiler engine to check states, functions, and rules within a rule base to ensure there are no errors.
See also Rule base *and* Activate.

Completed—A mailing and survey status that indicates a broadcast mailing or broadcast survey has been sent. The system automatically sets the status to Completed from the Sending status.

Complex expression—A search technique that enables customers and staff to search for a broader set of content. This technique allows wildcard searching using an asterisk (*) at the end of a word or partial word and a tilde (~) before a word to perform a similar phrases search on that word only. Word stemming and logical operators are also supported. This technique is available on the administration interface and the customer portal.
See also Logical operators *and* Word stemming.

Computed field—A column whose value is derived from calculations performed on database fields. Computed fields can be added to output levels in custom reports.

Condition—The part of a business rule that determines whether an answer, contact, incident, chat session, opportunity, organization, target, or task matches a business rule. Rules can contain multiple conditions. Conditions are also a part of script and workspace rules.

Conditional formatting—A method of highlighting specific information in report columns that does not require creating data exceptions.

Conditional section—A section of text in a document that appears only to those contacts meeting certain criteria. Conditional sections can also be placed in answers and tagged with specific answer access levels. In message templates, conditional sections can be used to filter content by contact, profile, runtime variable, or record type.
See also Access level conditional section *and* Document.

Conference—A feature in Chat that enables an agent to conference another agent into a chat session with a customer.

Configuration button—The button in a staff member's navigation set containing a list of all the configuration items necessary to configure and customize an organization's application. Items can be added to or removed from this button from the Navigation Sets editor or, with the Customize Navigation Sets profile permission, the Customize List window.
See also Configuration list.

Configuration Settings editor—The interface element used to customize the functionality and features of the administration interface and the customer portal.

Configuration list—All of the configuration items associated with the Configuration button in a staff member's navigation set. The configuration list is organized in a tree on the navigation pane.
See also Configuration button.

Configuration settings—All of the settings accessed from the Configuration Settings editor to configure and customize the administration interface and the customer portal in Oracle Service Cloud.

Configuration Wizard—An interactive utility for configuring web indexing on the customer portal. Web indexing allows customers to search the knowledge base along with web pages and other web-accessible documents within a specified domain.
See also Web Indexer.

Connect Object Explorer—A ROQL query interface that helps Customer Portal developers become familiar with the Connect for PHP API and explore Connect objects and metadata.

Contact—Any individual with a contact record in the knowledge base. Contact records can be added by staff members on the Service Console and by customers on the customer portal. Contact records are also added automatically when a customer without a record submits a question on the Ask a Question page of the customer portal.
See also Primary contact.

Contact custom field—A field for gathering and displaying additional information about contacts. Contact custom fields appear when adding or editing a contact record and on the Your Account page of the customer portal.

Contact list—A static or fixed group of contacts that is used to choose the contacts who receive a broadcast mailing or survey. Contacts can be added to lists.

Contact role—An option for classifying contacts by their roles in opportunities.

Contact type—An option for classifying contacts by types, such as job positions or decision-making roles.

Content Library—A component for creating content that can be used in mailings, web pages, and surveys. Content includes documents, tracked links, files, templates, and snippets.

Content page—A type of custom page to which community content and functions can be added using panels.
See also Category page, Custom page, *and* Panel.

Content pane—The area on the console where staff members work with items selected from the navigation pane or the file menu.

Content pane tabs—An interface element for switching between the items currently open on the Service Console. Content pane tabs display at the top of the content pane by default. Staff members can click a tab to return to a report or item or right-click a tab and select from a number of options.

Context-sensitive answers—A subset of SmartAssistant that allows organizations to construct special Related Answer links from any web page to provide additional information to their customers.
See also Help access level.

Control—A tool for placing titles, spacers, reports, and other advanced features on a workspace.

Cross tab—A method of displaying report data in a table format.

CSV (comma-separated value)—A file format with commas separating one column value from the next. Each row is delineated by a hard return. Also called *comma-delimited.*

Cultures—A predefined set of attributes, such as decimal symbols and display formats, used to populate fields on the Currencies editor. Cultures are comparable to regions in Microsoft Windows.
See also Currency.

Currency—A monetary denotation based on country of origin. Currencies can be defined for each country or province in which an organization does business.
See also Exchange rate.

Custom field—A field for gathering and displaying additional information about answers, contacts, incidents, opportunities, organizations, quotes, sales products, staff accounts, and tasks. Custom fields appear when adding and editing records. Depending on the type and visibility, they may also appear on the customer portal.

Custom object—Any custom table created or managed from the object designer. Custom objects can be added to Oracle Service Cloud to integrate organization-specific data with the database. Although custom objects are not native to Oracle Service Cloud, they can be tied to standard objects and added to workspaces, workflows, custom reports, and navigation sets.
See also Object *and* Oracle Service Cloud standard object.

Custom page—A category or content page that can be fully customized to extend areas of a community in need of additional resources or exposition.
See also Category page *and* Content page.

Custom report—A report that is created by copying and editing one of the standard reports in Oracle Service Cloud and saving it as a new report, or by combining data from selected tables in the database to create a new report. Custom reports can include customized output, data computation, and scheduling.
See also Standard reports.

Customer—A contact or organization that has a service or purchase history in the knowledge base.

Customer account—Information consisting of a user ID and password that allows customers to access certain functions on the customer portal, such as the Account Overview page. Customers can create an account by clicking the Sign Up link or the Your Account tab on the customer portal. Customer accounts are also automatically created when a customer without an account submits a question, which adds a contact record to the knowledge base.

Customer Portal Administration site—The site where administrative tasks, such as selecting the page set, viewing widget definitions and logs, and defining page set mapping, are performed.

D

Dashboard—Any combination of individual reports shown together in one report. Using dashboards, staff members can search for and view a wide range of data from different reports without opening each report individually. The customer portal also includes a dashboard on the Customer Portal Administration site.

Data dictionary—A list of all the tables in the Oracle database that can be accessed from the Service Console. Data dictionary also refers to the list of available tables and fields that can be used in custom reports and is accessed from the report design center. Functions, output variables, and computed fields can also be selected from the data dictionary when working with a custom report.

Data import template—A saved format used by the Data Import Wizard to map columns in a CSV file to columns in the database.
See also Data Import Wizard.

Data Import Wizard—An interactive utility used for importing records into the database.

Data mining—The exploration and analysis of large quantities of data to discover meaningful patterns and rules. Data mining enables organizations to turn raw data into information they can use to gain a marketplace advantage.

Data set—The database tables and table joins that determine what data can be returned in a report. Data set also consists of the database columns a segment (dynamic list in Outreach and Feedback) will have access to and what filters will be used to determine the final data set.

Data type—A set of data having predefined characteristics such as strings, integers, or dates. Each column in a database table is assigned a data type. Data type also refers to the type of custom field specified when adding answer, contact, incident, opportunity, organization, quote, sales product, staff account, and task custom fields. Data types for custom fields consist of menu, radio, integer, date, date/time, text field, and text area fields.

Database—The tables that store information that is retrieved, edited, and added in an Oracle Service Cloud application.
See also Data dictionary.

Dbaudit—A utility that builds and populates the schema and performs the database portion of the Oracle Service Cloud upgrade. Dbaudit can also be used to view the database schema.

Dbstatus—A scheduled utility that escalates incidents, answers, tasks, and opportunities based on business rules. Dbstatus also sends emails to those customers who have requested to be notified when a particular answer has been updated, and processes private Twitter messages for the social monitor.
See also Answer update notification, Business rules, *and* Social monitor.

Dead—One of the default opportunity statuses and status types. An opportunity with the Dead status is no longer being pursued by a sales representative.

Decision—A component of a campaign. Decisions filter contacts by specified criteria and can have Yes and No paths.

Decryption—The process of converting encrypted text into readable text using private keys assigned to authorized persons.

Default directory—The directory containing original default copies of all the files customizable through the File Manager. During an upgrade, any files that have changed will also be updated in the default directory. Using the restore function, a file can be restored to the original configuration.
See also File Manager.

Deliverability—The degree to which an email message aligns with industry-accepted practices to ensure delivery to an intended recipient. Emails with low deliverability are often blocked by ISPs and spam filters.

Dependency—A relationship or association between items in the database in which the use of one item impacts the functionality of the other item. When a dependent item is deleted, such as deleting a contact list used in a mailing, all items that use the dependent item become invalid and must be manually updated.

Deploy—To stage customer portal pages from the development folder and then promote the staged files into production.
See also Stage *and* Promote.

Deployment log—The record of actions taken on customer portal files, including staging, promoting, rolling back, and updating through upgrades and service packs.

Deprecated—A condition that indicates a feature or widget has been replaced with different functionality or a newer widget.

Design space—The section of the workspace designer where fields and controls are added, edited, moved, and removed to create a workspace.

Desktop usage administration—Functionality for managing desktop user sessions to help organizations lower seat usage for licensing compliance and reduce costs. The administrator can manage both active and inactive sessions using manual and automatic logout options.
See also Automatic logout, Manual logout, *and* Session hard timeout.

Desktop workflow—A sequence of workspaces, scripts, decisions, and actions presented to staff members as a dynamic interface to support complex business processes.

Development area—The set of customer portal files that can be edited and viewed without being available to customers. Designers and developers can work on these files and test their changes until they are satisfied that the files can be made publicly available to their customers, at which point the development files are staged and promoted to the production area.
See also Production area.

Display position—The position where a new answer appears on the Answers page. Options include Historical Usefulness; Place at Top, Middle, or Bottom; Fix at Top, Middle, or Bottom. The display position is selected from the answer's Display Position drop-down menu.

Disposition—An option for classifying and recording how incidents are ultimately resolved. Up to six levels of dispositions are available.

Distribution list—A mailing list of non-staff member email addresses used for scheduling reports or any mailing event.

Docked filter—A run-time selectable filter or output variable that is added to the top of a report. Docked filters let report users select different run-time filter values and output variables in the report, bypassing the Search window.

Document—The material used in a survey or mailing, or served as a web page that can contain text, snippets, conditional sections based on contact filters, merge fields, links, and web forms.

DomainKeys (DK)—A form of email authentication that uses a cryptographic signature to verify that an email message originated from a specific organization. DomainKeys differs from DKIM authentication primarily by the email headers used to generate the signature.

DomainKeys Identified Mail (DKIM)—A form of email authentication that uses a cryptographic signature to verify that an email message originated from a specific organization. DKIM differs from DomainKeys authentication primarily by the email headers used to generate the signature.

Dormant incident—An incident that is not returned when performing word- or phrase-based searches. After remaining in the Solved status for a specified time, incidents become dormant to ensure that the knowledge base is populated with the most useful and timely information.

Draft—The preliminary status of a mailing or survey. When a mailing or survey is created, it is set to the Draft status. The status will also return to Draft if the mailing or survey's schedule is canceled.

Drill down—To start at a top or general level and become more specific at each lower level. The drill-down feature enables access to additional output levels in reports.

Drill-down filter—The fields in an output level used to filter the data returned when drilling down to another output level. This impacts what data is returned in the drill-down level.

Drill-down link—The field in an output level that is used as a link to drill down to the next output level.

Dynamic form—A form that hides or displays fields based on a customer's response to other fields on the form.

E

Editor—A layout format on the content pane when working with records and configuration items. Editors contain the fields for adding and editing records and items.

Else clause—The clause that follows the Then clause of a business rule. If the conditions of a rule are met, the actions in the Then clause are invoked. If the rule's conditions are not met, the actions in the Else clause are invoked.

Email address sharing—Functionality that allows a single email address to be shared by multiple contacts, such as members of a family or team. When enabled, a contact-matching process is used to associate records and transactions initiated by a shared email address.

Email answer—A feature that enables customers to email answers they are viewing to a specific email address.

Email management—Functionality that sends and receives email messages, processes bounced messages, intelligently routes incoming inquiries based on business rules, and automatically suggests answers to inquiries.

Email message—An email that is automatically sent to customers or staff members. The process of sending email messages is triggered by events in Oracle Service Cloud. For instance, when a customer submits a question, the Question Receipt message will be sent to the customer's email address. Using the Message Templates editor, staff members can customize each message and standardize their design to give them all the same look and feel.
See also Global template *and* Message templates.

Encryption—The process of translating a text message into unreadable text to ensure security. Encrypted messages may be read only by authorized persons with access to a private key that allows them to convert the message back into readable text.

Escalation—A means of tracking answers, incidents, opportunities, and tasks using business rules. When a rule's conditions are met, the rules engine schedules escalation to the new level. When the scheduled time (based on absolute or relative time) arrives, the rules engine sets the escalation level and takes the action specified by the rule, such as sending an email, notifying a manager, or following up with a customer.
See also Business rules.

Even split mode—A market testing option that sends test messages to equal portions of an audience for broadcast mailings and surveys.
See also Market testing.

Event (Named/Exit/Finish)—An action defined in a script rule or workspace rule that can be used to trigger other rules or workflow connectors. Events are defined by adding event fire actions, such as the Fire a Named Event action.

Everyone access level—An access level designed to allow answers to be visible to all customers depending on the answer status.

Exception—A method of highlighting report data that meets certain criteria. Data exceptions also allow email alerts to be sent when data in a scheduled report meets the exception criteria.

Exchange rate—A scale of monetary conversion from one currency to another.
See also Currency.

Explorer—A layout format on the content pane that displays a tree on the left, containing folders and other items, and a detailed list of the selected folder's contents (subfolders and files) on the right. Explorers are available for certain configuration items and components in Oracle Service Cloud.

Expression—A component of fixed and run-time selectable filters that defines a function, database column, value, or any combination of the three.

Extend—Using the widget builder to create a new widget by modifying the behavior and attributes of an existing widget.

External event—A program or script that runs as the result of an event occurring in Oracle Service Cloud, an action specified in a business rule, or an action in a marketing campaign.

External suppression list—An email delivery filter used to exclude an explicit set of email addresses from all mailings and surveys. When a mailing or survey is launched, contacts with email addresses in the list are filtered from the audience by default.

F

FCRR (first contact resolution rate)—A statistic that reports how often staff members or groups solve incidents with only one response. This number is displayed as the percentage of incidents solved with only one staff response.

File—A file that is uploaded to Outreach for attaching as a link in a document or snippet. From the Content Library, files can be uploaded and their characteristics can be defined.

File attachment—A file that is attached to an answer, contact, incident, opportunity, organization, or task, or sent with an incident response or quote. Files that are permanently attached to an incident or answer can be viewed by customers who view the record. Files that are sent with an incident response can be opened with the customer's email client and are not permanently attached to the record.

File attachment answer—A type of answer that appears as a file attachment.

File link—A clickable link to a file attachment that is inserted in a snippet or a document.

File Manager—The interface used to modify files for Oracle Service Cloud products. Administrators can modify files used to customize a site's Chat images, custom scripts, wordlist files, dictionary files, and certificate directories.

File menu—An interface element containing a list of options for working in Oracle Service Cloud, including access to other areas of the product and shortcuts for adding records and items to the knowledge base. The records and items available to staff are added to the File Menu component in navigation sets. This menu also contains options for changing personal settings and password and customizing the content pane and navigation pane display. Staff members can also exit the application from this menu.
See also File tab.

File tab—The interface element used to access the file menu. The File tab is located to the left of the Home tab on the ribbon.
See also File menu.

Final message—A mailing format used to send the mailing as final. In broadcast mailings and surveys, final messages are sent to all audience members who have not yet received a test message.

First due—A queuing pull policy that uses the incident due date or longest wait to determine which incidents or chats to retrieve from the queue.

Fixed filter—A component of Analytics and Outreach and Feedback segments used to define the data set available in the report or segment. Fixed filters are statements constructed from expressions, functions, and operators, and cannot be altered when using a segment or when running a report.
See also Custom report and Segment.

Flag—A method for defining the priority of a record. A flag displays at the top of records and staff members can add text to the flag and change the flag importance (red=high, blue=medium, green=low, white=no importance).

Flow diagram—A graphical representation of a campaign, survey, or desktop workflow. Flow diagrams allow staff members to diagram the events and decisions of a campaign, survey, or business process. When a campaign or survey is launched, contacts are automatically moved through the flow based on the specified criteria. When a desktop workflow is associated with a record editor in a profile, staff members with that profile will move through the flow when opening a record of the corresponding type.
See also Desktop workflow.

Forecast—A projection of revenue for an opportunity that may close in a given sales period.

Foreign key—A column or columns that contain values found in a primary key of another table. Foreign keys are used to ensure relational integrity and are rarely primary keys.
See also Primary key.

Forward to Friend link—A link that enables contacts to forward the message to another email address. This type of link can be added to documents, templates, and snippets for use in mailings, surveys, or web pages.

Framework—The underlying code structure of the Customer Portal, which offers a standard reference implementation as well as the ability to customize code for particular applications.

Function—A mathematical operator that can be applied to data from database fields to modify the data that is returned in an output column. Function also refers to a container for business rules. Functions are used anywhere in a business process that dictates doing the same thing in more than one place. Functions reduce the number of rules needed by allowing the same rules to be evaluated from multiple states.
See also Business rules *and* Rule state.

G

Give Feedback—A link on the sidebar on the Customer Portal template that customers can click to submit feedback about an organization's website, customer service, or product satisfaction.

Global template—An element of message templates functionality containing the content that frames the message-specific content in each system-generated notification and email message. The global template is used to standardize the design of outgoing messages to give them the same look and feel.
See also Message templates.

Group—A way to organize staff accounts in Oracle Service Cloud. In communities, group refers to a collection of members based on a common interest, cause, or organization.

Group type—A classification used to organize groups in a community and expand searching of related members and content.

Grouping—A method for grouping data in a segment. Filters can be used when grouping and are applied to the data after the grouping is completed.

Guest—Any community visitor who is not logged in with a community account.

Guide—A collection of branching questions, responses, answers, and text explanations used in guided assistance. Guide also refers to information about a promotion generated by a marketing staff member. This information appears on the Offer Advisor window to help agents present the promotion to customers.
See also Guided assistance *and* Offer Advisor.

Guided assistance—A component that helps agents quickly locate answers and text explanations using branching questions to guide them to the answers they need. The answers and explanations agents find can be sent to customers in incident responses or relayed to customers over the phone. Guides can also be made available to customers on the customer portal to help them find their own answers to questions.

H

Hash—A ten-digit alphanumeric string used to identify a specific hive, page, group, or member for certain community functions.

Help access level—An answer access level for context-sensitive answers. Help answers are not visible to customers except through special hyperlinks.
See also Context-sensitive answers.

Hive—A resource entity, such as a blog or message board, used by community members to communicate about a central topic, theme, or goal. Hives are sometimes referred to as resources.

Hive permissions—The set of permissions that allow members to perform specific actions in the hive, such as adding members, posting content, or commenting on posts.

Hive privacy level—The hive access status determined by the community privacy level and hive permissions.
See also Community privacy level *and* Hive permissions.

Hive template—A hive that is set to the Template status, making it accessible as a design template but not editable or searchable by the community.
See also Hive.

Hive type—A classification used to organize hives and expand searching of related content.

HTML answer—A type of answer that appears to customers as standard HTML on the customer portal.

HTML editor—A WYSIWYG (what you see is what you get) editor for formatting and editing answers, mailings, campaigns, documents, questionnaires, invitation messages, and message templates in HTML without previous HTML experience.

I

Identity provider—A third party that authenticates user information and sends verification to a service provider, such as Oracle Service Cloud, allowing single sign-on for the user.
See also SAML 2.0 open login.

IMP (import) file—A data file with an extension of *.imp* that is used by the Kimport utility to map values in the CSV file to columns in the database.

In Meeting—One of the default chat agent statuses. This status indicates that the agent is in a meeting and is unavailable to chat. The In Meeting chat agent status has an Unavailable status type.

Inactive—One of the default opportunity statuses and status types. An opportunity with the Inactive status is no longer being pursued but could be activated at a later date.

Inbox—An agent's personal queue consisting of all the incidents that have been assigned to the agent.

Inbox limit—The maximum number of incidents in an agent's inbox that cannot be exceeded when pulling from a queue. The inbox limit is set in the profile to which the agent is assigned.

Incident—Any question or request for help submitted by a customer through the Ask a Question page, email, a chat session, site or answer feedback, or from an external source using the API. Incidents can also be added by agents when they work with customers by phone, fax, or mail, and when responding to a private Twitter message.

Incident archiving—A process that permanently removes incidents from the database. Archived incidents are then stored in searchable data files. Staff members can access archived incidents once the Archived Incidents component has been added to their navigation set.

Incident custom field—A field for gathering and displaying additional information about incidents. Incident custom fields appear when adding or editing an incident and on the Ask a Question and Support History pages on the customer portal.

Incident thread masking—A method of protecting sensitive customer information, such as social security and credit card numbers, from displaying in incident threads. Three default system masks are available and custom masks can be created.

Incident queue—A sequence of unassigned, unresolved incidents. When an incident queue is added, it can be defined as the default queue. Incidents are added to queues automatically by business rules or manually by re-queuing and are handled in a first-in, first-out manner.

Incident severity—An option for classifying and recording an incident's importance and urgency.

Incident status—A method of tracking an incident's state. The default incident statuses are Solved, Unresolved, Updated, and Waiting, and custom statuses can be added.

Incident status type—The status of an incident as it moves through the system. Default incident status types are Solved, Unresolved, and Waiting.

Incident thread—The list of all activity on an incident, including the original question, agent responses and updates, customer updates, records of conversations, and internal notes about the incident (which are not visible to customers). The incident thread lists activity in chronological order and can be filtered by thread type.

Index—A database item that can be added to a database field to speed up searches for information in the field. Adding an index to a field increases the amount of time it takes to write information to the field, and indexing a large number of fields decreases the overall responsiveness of the database. Generally, only fields containing a large amount of information that are regularly searched on should be indexed. In Oracle Service Cloud, indices can be added to most custom fields and custom objects.
See also Custom field *and* Custom object.

Indexing—A process in which the text of an answer or incident is stemmed and indexed into keywords and phrases. These keywords and phrases are used to build the answer and incident phrases tables that are used during text searching. When an answer is added or updated, the Keywords, Summary, Question, and Answer fields are stemmed and indexed to create one-, two-, and three-word phrases. When an incident is added or edited, the Subject field and incident thread are stemmed and indexed to create one-word phrases.

Industry type—An option for classifying organizations by type of industry.

Information gaps—A report that clusters incidents and compares the topics to answer clusters, allowing organizations to pinpoint those areas (or gaps) in the knowledge base needing additional answers.

Initial state—A required state in every rule base. The rules engine evaluates a new or updated object using all rules in the initial state. Unless one or more rules in the initial state transition the object to a function or different state, the rules engine stops after all the rules in the initial state have been processed.
See also Rule state.

Inline—A method of displaying output definitions and filter definitions as lines of text in the report.
See also Output definition.

Inline editing—A feature for editing values directly on a report without having to open each record to make changes. Staff members can edit individual values in one record or select several rows to change values in multiple records. Staff members must have permission in their profile to edit the specific record type, and inline editing must be enabled in the report.

Inner join—A relational database operation that selects rows from two tables on the condition that the value in the specified column of the primary table is equal to the value in the specified column of the secondary table.
See also Outer join.

Interface—The console, windows, and pages used by staff members and customers to access an Oracle Service Cloud application and interact with a single knowledge base. The interface name determines the URL for the website, the name of the executable, and the *.cfg* directory name.
See also Administration interface *and* Agent desktop.

Interface Manager—A utility for managing multiple interfaces using one knowledge base.

Invitation method—A way of distributing a broadcast survey, transactional survey, or website link survey.

K

Kexport—A utility for exporting either single tables or an entire database from an Oracle Service Cloud application.

Keywordindexer—A utility that creates an index of the keywords found in incidents, answers, file attachments, and documents indexed by the Web Indexer. The keyword indexes are used when searching incidents, answers, file attachments, and other indexed documents.
See also Web Indexer.

Kimport—A utility for importing data, either single tables or an entire external database, into the database.

Knowledge base—All information (such as answers, assets, incidents, contacts, organizations, opportunities, products, staff accounts, tasks, mailings, and campaigns) maintained and presented by Oracle Service Cloud in a meaningful way. Knowledge base also refers to the interrelationships among the pieces of information.

Knowledge engineer—The staff member responsible for populating and maintaining the answers in the knowledge base. Responsibilities may include identifying when answers should be added, editing proposed answers, and reviewing existing answers to keep them current.

L

Langcvt—A utility for changing the language pack in Oracle Service Cloud from English to an alternative language pack. This utility converts the message bases and prepopulated knowledge base to the new language.

Language—The language for a specific interface that determines, in part, what answers are visible for viewing by customers.

Launched—A mailing and survey status that indicates a transactional mailing or transactional survey has been launched and can be included in a rule or campaign.

Layout—A predefined format that can be used in custom reports to apply fonts, colors, and other display options. Layouts can also be used in dashboards to apply a predefined structure for inserting reports.

Lead—A potential opportunity. A lead is a contact discovered through a marketing campaign and forwarded to a sales representative through Opportunity Tracking.
See also Opportunity *and* Oracle RightNow Opportunity Tracking Cloud Service.

Lead rejection type—An option for classifying and recording the reasons for rejecting a lead.

Leaf level—A level of product, category, or disposition that does not contain any sub-levels.
See also Product linking.

Learned link—Related answers that have a learned relationship as a result of customer activity.

Live Chat—A link on the sidebar on the Customer Portal template that customers can click to submit a request to chat with a chat agent.

Live Media bar—The toolbar that displays when Chat is enabled. The Live Media bar allows agents to log in, log out, set their status, and manage chats.
See also Oracle RightNow Chat Cloud Service.

Local settings—Customizations made by staff members to dialog and tool window sizes and locations, as well as content pane and navigation pane settings, console color and tint, toast notifications, and report appearance, including display and data settings and column formatting. Changes made by staff members to customize these settings affect only their workstation. In addition, staff members can return to the system defaults at anytime.

Logical expression—An expression that defines the relationship between report filters or business rule conditions. The components of a logical expression are joined using Boolean logic and can be grouped and joined with AND, OR, and NOT operators.

Logical operators—The symbols, (+) and (–), that can be used in most search techniques in Service to explicitly find answers that have a word (+) or that do not have a word (–).

Login window—A dialog box for entering user name, password (if required), and site information to access the administration interface of an Oracle Service Cloud application.

Lookup field—A field in a custom object designated to store values that are used as the names of the object's records. These names display on editor tabs and the navigation pane's Recent Items list. For instance, the Recent Items list displays incident reference numbers since the Reference # field is designated as the lookup field for incidents. Values in lookup fields are also displayed in reports instead of the ID values from fields in other tables that link to the lookup field's table. For instance, while the *incidents* table's Assigned Account field stores account ID numbers, the values displayed for this field in reports are from the *accounts* table's Full Name field.

Lost—One of the default opportunity statuses and status types. An opportunity with the Lost status has been lost, for example, to a competitor.

M

Mailbox—An email box specified in Oracle Service Cloud and dedicated to collecting email inquiries sent by customers, responses to mailings, and bounced messages. Incoming emails are processed by the Techmail utility.
See also Oracle-managed Service mailbox *and* Techmail.

Mailer daemon (rnmd)—A utility that monitors Outreach and Feedback, listening for requests from other components to start the email process. The mailer daemon is installed during the initial installation and can be configured to send messages in the most efficient manner for an organization.

Mailing—A collection of one or more messages sent to one or more contacts. A mailing can contain multiple messages for testing purposes.

Mailing status—A method of tracking the state of a mailing. The default mailing statuses include Draft, Launched, Scheduled, Preparing to Send, Sending, Suspended, Suspended by Error, Canceled, and Completed.

Manual logout—A way of managing desktop user sessions by manually logging out staff accounts who are currently logged in. Manual logout is part of desktop usage administration, which assists organizations in lowering seat usage for licensing compliance.
See also Automatic logout *and* Desktop usage administration.

Manual policy—A pull policy that enables agents to manually pull incidents into their inbox from any queue designated in their profile.

Manually related answer—A relationship between two or more answers manually defined by a staff member.

Market testing—A method for testing different message formats in mailings and surveys on a percentage of the audience before launching a final email. Market testing is available in even split and random sampling modes.
See also Even split mode *and* Random sampling mode.

Mask—A defined pattern that determines the format of information that can be typed in a field.

Master template—The settings that define a community's navigation elements, footer content, and fine print text.

Matrix question—A question type for displaying a series of survey questions in a table. Matrix questions are useful when a group of questions can be responded to with the same set of answer choices.

Member—A community user who has a login and can be associated with one or more groups in the community.

Member type—A classification for community group members that defines their role and provides access to certain group functions.

Merge field—A variable field that looks up account, contact, incident, opportunity, organization, or tracked link information and inserts it in the text of a document, snippet, document template, message template, quote template, or the message content and mail attributes of mailings and surveys.

Merge report—A report that can be included in marketing and survey content that dynamically limits the data returned so that customers see only their own information. For instance, if the report lists contacts and their open incidents, customers see only their own open incidents.

Message—An email consisting of a collection of HTML, text, and images in a particular format.

Message base—An editable text string that allows international language support and customization of headings, labels, buttons, and other text on the administration interface and customer portal and in email messages and notifications.

Message Bases editor—The interface element used to customize the message bases, including all the headings, labels, buttons, and other text, on the administration interface and customer portal.

Message templates—A component for customizing and standardizing the content of administrator notifications, administrator emails, and contact emails. Message templates consist of a global template, which is used to standardize the design of outgoing messages, and a set of system-generated messages.
See also Global template.

Migration—The process of moving from one version of the Customer Portal framework to a newer one. Migration can occur independently of upgrading to a newer version of Oracle Service Cloud.
See also Upgrading.

Mobile agent app—Functionality for managing incidents, tasks, and contacts using an Apple iPad or iPhone device, the Oracle Tap application, and Oracle Service Cloud credentials.

Mobile customer portal—The template and set of customer portal pages that have been optimized for display on mobile devices such as iPhones, Androids, and Palms.
See also Reference implementation *and* Template.

Model question—The associated question and answer that reside in the Virtual Assistant database. Model questions are linked to answers in the knowledge base and are displayed as similar questions on the Answers page of the customer portal. *See also* Oracle RightNow Virtual Assistant Cloud Service.

Monitor—A feature in Chat that allows a supervising agent to monitor the chat sessions of other agents and to intervene when necessary.

Msgtool—A utility for creating a configuration report for an Oracle Service Cloud site, or for changing configuration settings when an error has been made in one of the settings that subsequently locks staff members out of the Configuration Settings editor.

Multi-select—A feature for updating more than one record at a time.

Multiline—A method of displaying report data grouped under headings based on common values in report columns.

N

Natural language—Any approach that accepts and correctly handles human language. For example, English, French, and Japanese are natural languages, while computer languages, such as FORTRAN and C, are not. The knowledge base can be searched using natural language technology.

Navigation buttons—The buttons on the navigation pane associated with record types and components. Clicking a button displays that record type or component's navigation list.

Navigation list—All the reports, folders, and items associated with a specific record type or component in Oracle Service Cloud. Navigation lists are organized in a tree on the navigation pane.

Navigation pane—The area on the left and right side of the console where staff members work with navigation lists, select items to open on the content pane, and search the knowledge base. In the default configuration, the left navigation pane contains Recent Items and Navigation tool windows; the right navigation pane contains the Quick Search tool window. What appears on the navigation pane depends on the navigation set assigned in each staff member's profile and the permissions assigned in the profile. Each navigation pane can also be customized by staff members.
See also Configuration button, Navigation buttons, *and* Tool window.

Navigation set—Any combination of navigation buttons and their associated navigation lists. The Configuration button can also be added to navigation sets. Staff members are assigned a default navigation set in their profile.

Normalized URL—A URL that has been reformatted to ensure that documents that are referred to by multiple URLs will be indexed only once. Normalization may include reformatting domain names (for example, removing capital letters) or removing query parameters.

Note—Information that can be added to campaigns, contacts, documents, mailings, opportunities, organizations, and surveys for internal reference. Notes can also be added to incidents in the incident thread.

Notification—A message that notifies appropriate staff members about incidents, answers, mailings, campaigns, opportunities, and system errors. *See also* Answer update notification.

O

Object—Any standard or custom table in the Oracle database. Object also refers to the specific answer, contact, incident, chat session, opportunity, organization, target, or task that is evaluated by the rules in the object's rule base.
See also Custom object, Oracle Service Cloud standard object, *and* Rule base.

Object event handler—A PHP script with an integrated test harness (automated test script) that executes as the result of an event occurring on a standard or custom object in Oracle Service Cloud. *See also* Custom object, Oracle Service Cloud standard object, *and* Process model.

Offer—A promotion developed by marketing personnel or a product suggestion generated automatically by Offer Advisor that is presented to a customer by an agent.

Offer Advisor—Functionality for creating and presenting promotions to customers and for making automatic recommendations based on customer attributes and purchase history.

On Break—One of the default chat agent statuses. This status indicates that the agent is on break and is not available to chat. The On Break chat agent status has an Unavailable status type.

Open login—The ability to log in to the customer portal using an already established external account, such as Facebook, Twitter, or Google. When the external site validates the customer and the customer approves the transfer of information to Oracle Service Cloud, a contact record is created using the email address and the customer is automatically logged in to the customer portal.

Operating system—The program that, after being initially loaded onto the computer by a bootstrap program, manages all other programs in a computer. UNIX, Windows, VMS, OS/2, and AIX are all examples of operating systems.

Operational database—The database that contains the live data that is viewed, retrieved, and edited in an Oracle Service Cloud application. While reports that are run on the operational database can access real-time data, the reports cannot process as much information as reports that are run on the report database.
See also Report database.

Operator—A symbol or word that represents a mathematical or logical action that can be applied to a condition or value.

Opportunity—Information about a specific sale or a pending deal that is tracked and maintained in the knowledge base.

Opportunity custom field—A field for gathering and displaying additional information about opportunities. Opportunity custom fields appear when adding or editing an opportunity.

Opportunity status—A method of tracking an opportunity's state. The default opportunity statuses are Lead, Reject, Active, Closed, Lost, Inactive, and Dead. Custom statuses can also be added.

Opt-in—The explicit granting of permission by a contact to receive email communications from an organization. Opt-ins can be specific to certain mailing lists or applied globally across all mailing lists.

Opt-out—An explicit request by a contact to be removed from a specific mailing list or from all lists, most often communicated by email or web form. Also called *Unsubscribe*.

Oracle-managed Service mailbox—The recommended type of Service mailbox created by Oracle. Oracle configures the initial mailbox setup, including enabling incoming email and defining the Pop Server, POP Account, and Password fields. Administrators can also create general Service and Outreach mailboxes for their application.

Oracle RightNow Analytics Cloud Service (Analytics)—A business reporting solution that enables organizations to capture, organize, present, and disseminate real-time actionable knowledge with speed and ease. Using Analytics, organizations can increase insights by identifying customers based on previous interactions across all channels.

Oracle RightNow Chat Cloud Service (Chat)—A component that provides customers with access to chat agents for questions and issues that require human interaction.

Oracle RightNow Connect Desktop Integration (JavaScript API)—A public API that enables customers and partners to integrate data contained on a workspace with a web page that is contained on the workspace. If external information is presented about the current record in a web page, this API can be used to update or read workspace data from the web page.
See also Workspace.

Oracle RightNow Connect PHP API Cloud Service (Connect PHP API)—A backward-compatible, public API that enables customers and partners to integrate with the Oracle Service Cloud platform using PHP scripts. Connect PHP API is primarily used to integrate with the customer portal, but it can also be accessed through the File Manager, process designer, and analytics. Connect PHP API leverages the Connect Common Object Model, which is also leveraged by Connect Web Services.
See also Oracle RightNow Connect Web Services for SOAP.

Oracle RightNow Connect Web Services for SOAP (Connect Web Services)—A backward compatible, public API that enables customers and partners to integrate with the Oracle Service Cloud platform using industry leading standards such as WSDL 1.1 and SOAP 1.1. It provides broad support for a wide variety of languages, platforms, and tools. Connect Web Services leverages the Connect Common Object Model, which is also leveraged by Connect PHP API.
See also Oracle RightNow Connect PHP API Cloud Service.

Oracle RightNow Customer Portal Cloud Service (Customer Portal)—The website interface that customers access for customer support. The customer portal is integrated with Service so customers can query the knowledge base for answers, ask questions, provide feedback, manage their customer account, and request chat sessions. It consists of a standard set of files that can be customized, uploaded, staged, and promoted to make the site available to customers.
See also Mobile customer portal.

Oracle RightNow Cloud Service (Service)—A customer service and support solution that intelligently assists both customers and agents with inquiry resolution across standard and social channels. Service assists customer service and support organizations that need to easily capture, respond to, manage, and track all service interactions in one consolidated application.

Oracle RightNow Desktop Add-Ins Cloud Service (desktop add-ins)—An add-in framework for the Oracle Service Cloud platform that enables customers and partners to build custom .NET components, controls, and applications for the agent desktop.
See also Agent desktop.

Oracle RightNow Feedback Cloud Service (Feedback)—A customer survey tool for gathering information about customers' experiences with an organization. With a wide range of customization and formatting options, questions types, and full analytics for efficient reporting, surveys provide organizations with a flexible method of tracking customer satisfaction.

Oracle RightNow Opportunity Tracking Cloud Service (Opportunity Tracking)—A sales automation solution that enables staff members to easily manage all opportunity, organization, and contact information and track all quote interactions in one consolidated application.

Oracle RightNow Outreach Cloud Service (Outreach)—An email and campaign solution for delivering personalized, richly formatted email communications to targeted segments of customers and prospects and for launching full-scale marketing campaigns.

Oracle RightNow Professional Services—Services provided by Oracle, including training, support, and consulting.

Oracle RightNow Self Service for Facebook Cloud Service (Self Service for Facebook)—A Facebook application that provides access to customer-facing features of Oracle Service Cloud, such as Find Answers and Ask a Question, directly from Facebook's web and mobile interfaces.

Oracle RightNow Social Experience (Social Experience)—A set of complementary components, including Communities, Channels, Social Monitor, and Self Service for Facebook, each representing a different, powerful way of interacting with customers using social media. While each component serves a distinct purpose, they can be used together to create a wide-ranging social web presence.

Oracle RightNow Social Experience communities—A comprehensive social web solution consisting of Oracle RightNow Support Community Cloud Service and Oracle RightNow Innovation Community Cloud Service that lets customers connect, discuss, and contribute through forum discussions, question-and-answer sessions, resource libraries, and suggestions for service improvements.

Oracle RightNow Social Monitor Cloud Service (Social Monitor)—A monitoring tool for gathering and acting on information about an organization and its products that appears on social networking services such as Twitter and YouTube.

Oracle RightNow Virtual Assistant Cloud Service (Virtual Assistant)—A solution for identifying the intention behind a customer's question using semantic search technology and linguistic dictionaries to return highly relevant search results and provide virtual assistant chats.

Oracle RightNow Wireless—The interface for accessing Service from a wireless phone or any device with a WAP (wireless application protocol) browser, such as a PDA (personal digital assistant).

Oracle Service Cloud—A customer experience suite combining web, social, and contact center experiences for a unified, cross-channel service solution in the cloud.

Oracle Service Cloud Smart Client—The web-based software that allows local applications to interact with the server-based applications. The smart client can be installed on staff workstations using the Click-Once installer.
See also Click-Once installer.

Oracle Service Cloud standard object—Any standard table that is native to Oracle Service Cloud. Standard objects store data, including record types such as answer, contact, incident, opportunity, organization, and task. Other standard objects include accounts (staff accounts), assets, quotes, and sales products.
See also Custom object *and* Object.

Organization—Any company, business unit of a large company, or government agency that has an organization record in the knowledge base.

Organization address type—A way of storing multiple addresses for a single organization. The default organization address types are Billing and Shipping, and custom address types can be added.

Organization association—A feature for associating a contact with a specific organization. Organization association links the incident and opportunity history of the contact and organization.

Organization custom field—A field for gathering and displaying additional information about organizations. Organization custom fields appear when adding or editing an organization.

Organization hierarchy—A feature for creating or changing the hierarchy of organizations. A hierarchy can be created by making one or more organizations subordinate to another organization. Twelve hierarchy levels can be used.

Outer join—A relational database operation that selects rows from two tables regardless of whether the specified columns contain corresponding values. An outer join will return all rows from the primary table and any rows from the secondary table where the value in the specified column of the primary table is equal to the value in the specified column of the secondary table.
See also Inner join.

Output definition—A description of a report that can be viewed when generating a report or when hovering over the report title and columns. Output definitions are predefined for all standard reports and can be defined when creating a custom report.

Output level—A distinct section of a report that outputs report data. Reports can have multiple output levels, each of which can have their own filters, groupings, data exceptions, headers, footers, and descriptions. Output levels in a report are related through drill-down links and drill-down filters.

Owner—The member who holds complete authority over a community group or hive. A member who creates a group or hive is designated as its owner unless ownership is transferred.

P

Page—A web page or a customer portal page in an Oracle Service Cloud application.

Page set mapping—The customer portal functionality that allows a specific page set to be mapped to a specific user agent. Customers are then directed to the most appropriate page set as determined by the browser or user agent accessing the customer portal.

Panel—A customizable object used to display dynamic content on community pages. Panels can be added to custom pages and some standard pages.
See also Custom page.

Path—The connector between items in a campaign flow diagram. A path can be one of four types (Standard, Submit, Yes, or No) and can connect two actions or an action and a decision in campaigns.
See also Action *and* Decision.

Personal settings—An application option that lets staff members override settings in their staff account and customize settings that apply to the interface defaults in Oracle Service Cloud. Settings defined in staff accounts that can be changed include default currency, default country, time zone, and email notifications. The staff account settings changed from the Personal Settings option will also be made to the corresponding settings in the staff account.

Pipeline—Calculated revenue that has not yet been acquired but is forecasted to close in a specified time period.

Polling survey—A survey that displays as a single question on a customer portal page or any page external to the customer portal. After customers submit their response, they see a poll results chart or a thank-you message.
See also Oracle RightNow Customer Portal Cloud Service.

Post—Content added by users of a social media site, such as a Facebook status update or a text entry in Social Experience communities.
See also Oracle RightNow Social Experience communities.

Post type—The structure of a post as defined by the sequence of fields and controls used to create its content.

Preliminary screen pop—The toast notification that displays when an incoming chat request is received. The preliminary screen pop displays as a two-column table, and agents can view information about the chat request before accepting or declining the request.

Preparing to Send—A mailing and survey status that indicates a broadcast mailing or broadcast survey is about to be sent.

Price schedule—An option for creating various pricing levels that can be assigned to sales products. Price schedules allow the same product to have different prices, such as wholesale and retail prices.

Primary contact—The main individual associated with an incident or opportunity. All primary contacts have an associated contact record in the knowledge base. In Service, a primary contact must be associated with an incident for agent responses. In Opportunity Tracking, either a primary contact or an organization must be associated with an opportunity to serve as a point of contact for sales representatives during the sales process.
See also Contact.

Primary key—A database table column that is indexed to enforce a unique constraint, meaning that a given value cannot appear more than once in the column. This column is used to uniquely identify each record in the table. Primary keys are often the target of a foreign key in a different table.
See also Foreign key.

Priority—A ranking that defines the order in which incidents are pulled from multiple queues. The priority ranking also identifies which queues agents can retrieve incidents from.

Private—One of two default answer status types. Answers marked Private are never visible to customers.
See also Answer status type.

Private key—A password-protected key used by the holder to create digital email signatures and decrypt messages that were encrypted using the holder's associated public key.

Privileged access answers—Answers that are assigned a custom access level for viewing by certain contacts and organizations assigned to the appropriate service level agreement (SLA).
See also SLA.

Process model—The virtual container that encompasses all event handlers (standard and custom) in Oracle Service Cloud. Using the process designer, a process model can be exported, imported, deployed, and rolled back.
See also Custom object, Object event handler, *and* Oracle Service Cloud standard object.

Product—An option for grouping answers and incidents that allows more precise organization in the knowledge base. Staff members can classify answers and incidents by product and up to five additional levels of sub-products, allowing more refined searching by customers and staff members.
See also Category.

Product catalog—The list for organizing sales and asset products.
See also Asset product *and* Sales product.

Product linking—An option for linking products to categories and products to dispositions so that category and disposition choices are narrowed to only those associated with the selected product for staff members working with incidents and customers searching on the customer portal.

Production area—The set of publicly available customer portal files and pages. The production area is updated when files in the development folder are staged and promoted.
See also Development area.

Profile—A mechanism for controlling access to administration functions and for assigning staff members specific permissions, default workspaces, a default navigation set, and report access.

Promote—To copy all customer portal pages from the staging area into the production folder, where they become publicly available on an organization's website.

Promotion—A specific message (for example, a discount, renewal notice, or announcement) delivered to a specific group of customers using Offer Advisor. Promotions are generally created by marketing staff members and presented to customers by agents.
See also Offer Advisor.

Proof—A way to review the content of a mailing or survey to ensure the message is approved by the necessary contacts and staff members and as a final check for any mistakes. Proofs can be sent to a proof list or group of staff members who, in turn, can accept or reject the proof. Proof messages can also be sent to staff members when changes have been made to message templates.
See also Message templates.

Proof list—A contact list that is available to receive proof messages, enabling its contacts to review mailings and surveys before they are finalized.

Propose answer—A function for proposing that an incident's solution be added to the answers available to customers. The proposed answer is reviewed by the knowledge engineer, who determines if it should be made public and, if so, its access level, status, language, and visibility.

Proposed—One of the default answer statuses. This answer status indicates that the answer has been proposed by a staff member from an incident. Answers with a Proposed status are not visible to customers.
See also Answer status.

Public—One of the default answer statuses and status types. Answers marked Public may be visible to customers depending on their access level and language.
See also Answer status *and* Answer status type.

Public certificate—*See* Certificate.

Public key—Public information that may be attached to email messages to allow those who reply to the message to encrypt their response. The public key also verifies that the digital signature was created with the associated private key, thereby ensuring the integrity and authenticity of the message. Public keys are often referred to as public certificates, although certificates hold additional information besides the public key.

Public key certificate—*See* Certificate.

Publish report—A method of preserving a report's graphical and tabular output as a snapshot. Once a report is published, it cannot be modified and the report data will remain unchanged even as the knowledge base is updated.

Pull policy—The method for determining which queues agents can retrieve incidents or receive chat requests from and in what order. Pull policies include Strict Priority, Manual, and First Due.

Pull quantity—The specified number of incidents to be retrieved from the queue at one time when an agent pulls incidents.

Q

Question—The main element in a survey. Text, choice, and matrix question types can be created. Questions can be used in multiple surveys, mixing and matching as necessary.
See also Choice question, Matrix question, *and* Text question.

Questionnaire—The complete set of questions and all the pages in a survey. Using the HTML editor, staff members can create dynamic surveys using a graphical interface to add questions and create survey branches based on how customers answer. A questionnaire must be created for each survey.

Queue—*See* Chat session queue *and* Incident queue.

Queued report—A report that has been manually or automatically scheduled to run in the background after entering the report's search criteria. When a queued report has been generated, a toast notification displays with a link to open the report.

Quick Access toolbar (QAT)—One or more buttons used as shortcuts to commands on the ribbon. The initial set of buttons on the Quick Access toolbar is specified by what is displayed on the content pane, but staff members can customize the toolbar to add frequently used buttons. By default, the Quick Access toolbar appears above the ribbon.

Quick Search—A component used to search for records and files when only limited information is known. Quick Search can be used to search the knowledge base no matter what navigation list is displayed or what is open on the content pane. Oracle Service Cloud contains a number of default Quick Search reports, and other reports can be added to the Quick Search button in navigation sets.

Quota—The revenue goal assigned to a sales representative during a specified time period, such as month or quarter.

Quote—A formal price assigned to a sales product for a particular customer during a sales period. Quotes also include any discounts applied as well as the valid dates for the quote.

Quote custom field—A field for gathering and displaying additional information about quotes. Quotes custom fields appear when sending a quote with an opportunity.

Quote template—A template defined for a specific type of quote. Quote templates are used when generating a quote for an opportunity.
See also Quote.

R

Random sampling mode—A market testing option that sends test messages to a specified percentage of the audience. After determining the most effective message, a final message can be sent to any audience members who did not receive a test message.
See also Market testing.

Record—Any individual answer, asset, contact, incident, opportunity, organization, or task in the knowledge base. Records can also be created for custom objects, which can be added to Oracle Service Cloud to integrate organization-specific data with the Oracle database.
See also Custom object, Oracle Service Cloud standard object, *and* Record type.

Record type—A database table that stores all records of the same type, such as answers and incidents.
See also Record.

Record pool—The memory space used to temporarily store all records loaded in a single desktop workflow session.
See also Desktop workflow.

Record tabs—The layout of information contained in a record. Each tab contains specific fields and options related to the record that can be viewed and updated as necessary.

Recurrence—A scheduling method used to send or initiate the same report, mailing, survey invitation, campaign, or cloud search on a regular daily, weekly, monthly, or annual basis.

Reference implementation—The standard set of files used to create the default customer portal as it exists without customization.

Regular expression—A combination of operators and character strings used to define a search field or a condition statement in a business rule.

Reject—One of the default opportunity statuses and status types. A lead with the Reject status has been rejected by a staff member.

Related answers—A feature that assists customers in finding answers to questions related to the current web visit. Related answers appear on the answer details page and are sorted by relatedness—those answers that appear at the top of the list are most related to the answer being viewed.

Relationship item—A control used to create workspaces. Relationship items can include lists of records as well as other information such as audit logs and file attachments.

Relative time—The number of hours from a specific event or time, such as two hours from the time an incident was created. Relative time is used in business rules and custom reports. In standard reports, relative time is the amount of time passed based on an organization's work hours.
See also Absolute time.

Relative value—A field value set by a workflow, script rule, or workspace rule that adds or subtracts, or appends or prepends, a value to the field's previous value (for instance, increasing the value of an integer field by 1).

Report—Any standard report, custom report, or list of records accessed from a navigation list on the navigation pane. Standard and custom reports can also be accessed from the Reports explorer. Reports are also used to display lists of answers or a customer's incidents on the customer portal.

Report database—A copy of the operational database that is used for reporting purposes. Reports that are run on the report database can process more information than reports run on the operational database. The data in the report database is copied from the operational database at scheduled intervals and therefore may not be as current as the data in the operational database. Also called *replication database*.
See also Operational database.

Report control—A control that inserts a report into a workspace.
See also Workspace.

Report linking—A feature for creating links between reports. Linked reports and dashboards can be seamlessly opened from other reports, just as report levels can be opened from other levels in the same report. Both conditional and unconditional links can be created.

Report schedule—An option for subscribing to a standard or custom report. Staff members can schedule the report to be sent to an individual staff member, a group of staff members, a distribution list, an external email address, or any combination of these options.

Report section—A section of an output level that contains a component of the report's output, such as a title, chart, or tabular data.

Report variable—An item added to a report that is used to return different data or data in different formats in the same column. For example, a single report can be created that displays the number of incidents by staff member, group, queue, or status. When running a report, the variable value is selected from the Search window or from docked filters.

Reportgen—A scheduled utility that sends out scheduled reports.
See also Report schedule *and* Scheduled report.

Re-queuing—The action of moving an incident from an agent's inbox into a queue.

Resolution time—The maximum allowable time (in minutes) set by a service organization for resolving incidents.
See also Response requirements.

Response interval—The days of the week and times when a service organization makes itself available to respond to and solve incidents on a daily basis. Days and hours can be specified.
See also Response requirements.

Response requirements—The maximum time allowed (in minutes) for incident response and resolution within the operating hours defined by the organization. The response requirements are used to measure agent performance in responding to and solving incidents and can also be used for SLAs that do not have customized response requirements.
See also SLA *and* Response interval.

Response time—The maximum allowable time (in minutes) set by a service organization for initially responding to new incidents.
See also Response requirements.

Result grouping—A feature in a report definition for selecting fields to group data by. Result grouping provides a more organized view of a report. Multiple levels can be defined for result grouping. The more levels used, the finer the detail will be.

Review—One of the default answer statuses. This status can be used to notify the knowledge engineer when a public answer needs to be reviewed.
See also Answer status.

Ribbon—All the tabs and buttons for performing actions and functions on an entire report, individual records in a report, or items in an explorer tree or list. The buttons on each tab are grouped by related functions, and each group is labeled. The tabs and buttons on the ribbon change based on what is displayed on the content pane.

Rollover—A method of displaying additional report details by hovering over data described in the report's output definition.

Rollup—A method of displaying report data that groups records together by specific fields. The grouped records are displayed under headings that can be expanded or collapsed to display or hide the records under the heading.

Root certificate—A self-signed certificate generated by a party that signs other public certificates. Certification authorities may authorize other entities to issue certificates. The root certificate belongs to the top-level certification authority.

Round-robin queue—A type of incident queue in which unresolved incidents are automatically assigned to agents in a rotating fashion.

RPA (responses per assignment)—A statistic that calculates the average number of times a staff member or group responded to each incident.

RSS (Really Simple Syndication)—The primary standard used for the syndication of web content. RSS is an XML-based format used primarily for distributing news headlines on the Internet. Oracle Service Cloud contains an RSS channel so staff members can monitor RSS feeds for content. *See also* Oracle RightNow Social Monitor Cloud Service.

Rule—*See* Business rule.

Rule base—All rules, states, functions, and variables associated with a particular object type (answers, contacts, incidents, chat sessions, opportunities, organizations, targets, and tasks) in business rules.

Rule log—A feature for viewing the rule or rules that have fired against a specific answer, contact, incident, opportunity, organization, or task. *See also* Business rules.

Rule state—A container for business rules. Every rule base must contain an initial state, and states can be added to handle all stages of object processing. Rules in the initial state can transition objects to other states in the rule base. *See also* Initial state.

Rules engine—The software that evaluates objects to determine if they meet the conditions of any rules in the rule base and then executes the actions defined in the rules.

Run-time selectable filter—A component that defines the initial data set available in a report and allows staff members and customers to customize the data returned. Run-time selectable filters are statements constructed from expressions, functions, and operators, and can be customized when running a report.

S

S/MIME (Secure Multipurpose Internet Mail Extensions)—A standard for sending secure email messages that can verify the sender's identity. S/MIME emails can be encrypted for security and signed to verify authenticity.

Safe mode—A login method that allows staff members to log in to Oracle Service Cloud without activating add-ins. Safe mode is available after malfunctioning add-ins have prevented administrators and staff members from logging in.
See also Add-in.

Sales period—The period of time used to track the revenue goals assigned to each sales representative. The default sales periods are annual, semiannual, quarterly, monthly, and weekly.

Sales product—An option for identifying items or services sold by an organization. Sales products can be added to quotes and promotions.

Sales products custom field—A field for gathering and displaying additional information about sales products. Sales products custom fields appear on the Custom Fields page of the Product Details editor.

Sales representative—A staff member who may be assigned opportunities and who may also maintain contact and organization records.

SAML (Security Assertion Markup Language)—An XML-based protocol in which an identity provider authenticates a user's identity and passes that information to a service provider, which can then decide to allow the user access to the service without requiring an additional login procedure.
See also Identity provider, SAML 2.0 open login, *and* Single sign-on.

SAML 2.0 open login—A type of single sign-on that uses Security Assertion Markup Language and is the protocol that Oracle Service Cloud uses for its single sign-on feature.
See also SAML *and* Single sign-on.

Scheduled—A mailing and survey status that indicates a broadcast mailing or broadcast survey is ready to be sent and will be emailed at the scheduled send date and time.

Scheduled report—A report that is sent as an HTML email or HTML email attachment to staff members, distribution lists, or external email addresses at specified times. Scheduled reports can also be sent when alerts defined in data exceptions are triggered.
See also Exception.

Schema—The structure of a database system described in a formal language supported by the database management system. In a relational database, the schema defines the tables, the fields in each table, and the relationships between fields and tables.

Score—A calculated value that ranks the order of displayed answers. An answer's score is determined by its solved count and any display position that was set when the answer was added or updated. Score also refers to the relative weight assigned to each choice in a choice question for surveys. Score values can be used for survey calculations to trigger rules or campaign actions based on a contact's answers and also for reporting purposes.

Screen pop—*See* Third-party screen pop.

Script—A control that can be added to a custom workspace to help staff members enter record information in a logical order. Scripts can contain multiple pages with fields and other controls as well as branching logic to guide staff members to different pages based on actions they take on a script page.

Script rules—A type of rule used to trigger actions, such as setting the value of a field, on script pages when specified conditions are met.

Search and selection criteria—The run-time selectable filters and sorting options that can be defined when searching for a particular record. *See also* Run-time selectable filter.

Search index—A matrix that includes a list of important words within a document and their document of origin, allowing efficient searching. In some cases, the matrix is a database table. In other instances, the matrix is a file stored on a hard drive. For a word or phrase to be searchable within an incident, answer, file attachment, or external document, it must first be indexed.

Search priority word—A word that is associated with an answer or document. The associated answer or document will always be displayed to customers when the search priority word is included in their search text.

Secure email—Incoming and outgoing email that has authenticity (the sender is who it appears to be), integrity (content has not changed during transmission), and privacy (only the intended recipient can read it).

Seeding—The initial set of answers in the knowledge base.

Segment—The criteria for creating dynamic lists of contacts based on user-defined filters. Multiple filters can be created and logical expressions can be used to create the exact data set needed to target contacts. Once a segment is created, it can be used in broadcast mailings and surveys and the group of contacts will be constantly adjusted and updated as they meet or fall outside of the segment's requirements.

Self-learning knowledge base—The automatic generation of self-service content based on customer interactions so that the most pertinent information is presented.
See also Knowledge base.

Sender ID—A form of email authentication that identifies IP addresses authorized to send mail on behalf of a specific organization. Sender ID differs from SPF authentication primarily by the components of the email used to authenticate the message.

Sender Policy Framework (SPF)—A form of email authentication that identifies IP addresses authorized to send mail on behalf of a specific organization. SPF differs from Sender ID authentication primarily by the components of the email used to authenticate the message.

Sending—A mailing and survey status that indicates the broadcast mailing or broadcast survey is currently being sent to contacts. The system automatically sets the status to Sending after the mailing or survey is done being prepared to send or at the scheduled date and time.

Service Console—The user interface where staff members work in Oracle Service Cloud. Staff can add and edit records and items, generate standard reports and create custom reports, access their notifications, and chat with customers from this console. Administrators can also configure and customize their application from the console. Also called *administration interface* or *agent desktop*.

Service level agreement—*See* SLA.

Session hard timeout—Functionality for automatically expiring sessions to help reduce session exploitation. Oracle Service Cloud is set up to automatically expire sessions so organizations can control the length of time before staff sessions expire and staff members must reauthenticate to continue working.

Sharing—The process of sharing contacts, tasks, or both between Microsoft Outlook and Oracle Service Cloud. All sharing functions are initiated from Outlook.

Sibling answer—Related answers that share the same product or category. Sibling answers may also contain the same file attachments.

Single sign-on—A method for a user (in Oracle Service Cloud, a staff member or customer) to log in to one application, known as an identity provider, and then be authenticated and logged in to another application, such as Oracle Service Cloud, without being required to log in separately to the second application.
See also Identity provider *and* SAML 2.0 open login.

SLA (service level agreement)—A contract that is applied to contacts and organizations specifying the level and type of customer service they are eligible to receive. Generic SLAs are created by administrators, and SLA instances are applied to specific customers, either automatically through business rules or manually by staff members. SLA instances are called service contracts on the customer portal and can be accessed from the Account Overview page.
See also Response requirements.

SLA instance—A customer's individual copy of an SLA. An SLA is a generic contract that has not been applied to a specific customer. An SLA instance is a copy of the generic SLA applied to a specific customer.

Slicing—A method of grouping tabular report data by a common element. When slicing, a common value in a field can be chosen and only those rows that have that value will be returned in the report. Other slice groups can be selected from links or a tree element.

Smart Interaction Hub (SIH)—Functionality for directing customer interactions to the most qualified source for resolution by leveraging agent skills.

Smart merge—A feature that allows staff members to merge similar answers in the knowledge base to provide more meaningful answers to customers and to reduce answer duplication.

SmartAssistant—Oracle technology that uses business rules to automatically suggest possible answers to customers' email questions and Ask a Question queries. Staff members can use SmartAssistant to search for answers in the knowledge base that are related to an open incident or a current chat session.
See also Suggested answers.

SmartSense—Oracle technology that estimates a customer's emotional state or attitude based on the words and language the customer uses when submitting a question in Service. SmartSense also rates the incident responses sent by agents. The SmartSense ratings for both customer and agent appear wherever they have been placed on the workspace. In Feedback, SmartSense evaluates text questions submitted by customers in surveys. In social monitoring, SmartSense evaluates posts returned from cloud searches.

Snippet—Any text or part of a document that can be used in more than one document. Snippets can be added to documents from the Content Library component.

Social monitor—A component for searching social networking sites to monitor and act on conversations about an organization and its products. *See also* Oracle RightNow Social Monitor Cloud Service.

Solved—One of the default incident status types and incident statuses. An incident marked Solved has been resolved.

Solved count—The method for determining where an answer will display in the list of answers. The most useful answers (those with the highest solved count) are pushed to the top of the list, while those with the lowest ratings are moved down on the list. When a customer clicks one of the options in "Was this answer helpful?" on the answer details page, it directly affects the solved count. The solved count is increased for answers that are viewed, and the last answer viewed has a higher solved count than answers viewed earlier in the same web visit. The solved count is also increased when an agent uses a SmartAssistant suggested answer when responding to a customer's question.

Sort order—The sort order of a report's output columns. The default sort order is defined when generating a report and can be modified when running the report.

Spacer—A control that is manually added to a workspace to maintain the row and column arrangement when fields and controls are moved and removed or to create white space in a workspace.

Spider—*See* Web spider.

SSL (secure sockets layer)—An industry standard for secure Internet-based transfer of information.

Staff account—The settings for a staff member authorized to access an Oracle Service Cloud application, including user name, password, profile, group assignment, and email information.

Staff account custom field—A field for gathering and displaying additional information about staff members. Staff account custom fields appear on the Custom Fields page of the Staff Accounts editor.

Staff member—Any employee with a staff account and profile authorized to access an Oracle Service Cloud application.

Stage—To compile and optimize all the customer portal pages from the development folder, where they are created and tested, into the staging folder, where they appear exactly as they will when the staged files are promoted into production. Stage also refers to the level of completion of a particular opportunity within a specific strategy. Tasks can be defined within a stage and can be required to be completed before the opportunity can move to the next stage.
See also Promote, Strategy, *and* Task.

Standard reports—The complete set of predefined reports available in Oracle Service Cloud. Standard reports can be copied and used to create custom reports.

Standard text—Any text prepared in advance that can be sent to customers when responding to incidents, appended to responses by a business rule, or sent by an agent during a chat session. Also called *standard response*.

State—A field that classifies how contacts and organizations were added and what actions have occurred since their creation. The State field is automatically populated when a contact or organization record is added or updated, and staff members can also manually update the State field. State field options include Service, Outreach, Opportunities, and any combination of the three. State also refers to the current stage of an object in rules processing.
See also Rule state.

Status—The current state of an answer, incident, mailing, opportunity, survey, or task.
See also Answer status, Incident status, Mailing status, Opportunity status, Survey status, *and* Task status.

Status type—The current state of an answer, incident, or opportunity. Default answer status types are Public and Private. Default incident status types are Unresolved, Solved, and Waiting. Default opportunity status types are Active, Closed, Dead, Inactive, Lead, Lost, and Reject.

Stopword—A word that is not included in the keyword indexes in Service and is not searchable as a result. Pronouns, articles, and adverbs are common stopwords.

Strategy—A sales plan defined by an organization that includes stages and associated tasks that must be completed in order for opportunities to move through each stage. Strategies allow organizations to define multiple sales plans based on their business processes and help ensure that policies and procedures are enforced.

Strict priority—A pull policy that defines the order in which the system pulls incidents or chats from multiple queues. The strict priority ranking also identifies from which queues agents can retrieve incidents.

Style—All of the specifications that can be defined for presenting graphical and tabular data in a report, including fonts, colors, and borders.

Subscription—A type of cloud search that pulls all available thread content from a custom Facebook or RSS channel account at regular intervals.
See also Cloud search.

Suggested answers—The list of answers from the knowledge base that is returned when SmartAssistant is invoked, either by staff members working on incidents or engaged in chat sessions or through business rules that append answers to email questions and Ask a Question queries from customers.
See also SmartAssistant.

Suggestion—A product recommendation automatically generated by Offer Advisor using a predictive model based on customer purchase history.

Support Home—The entry page on the customer portal. This page provides customers with quick access to the tools they need to answer their questions and receive immediate customer service.

Survey—A method of gathering customer responses and feedback. Surveys can be sent as mailings, served as a web page, or sent as events triggered by a campaign or business rule.
See also Oracle RightNow Feedback Cloud Service.

Survey status—A method of tracking the state of a survey. The default survey delivery statuses include Draft, Scheduled, Launched, Recurrence Scheduled, Preparing to Send, Sending, Suspended, Expired, Suspended by Error, Canceled, and Completed.

Suspended—A mailing and survey status that indicates a mailing or survey has been temporarily suspended from the Sending or Launched status.

Suspended by Error—A mailing and survey status that indicates a transactional mailing or transactional survey encountered an error and has been temporarily suspended.

Synchronization—The process of collecting and combining contact and task records in Oracle Service Cloud and Microsoft Outlook to ensure data is consistent between applications. Also called *sync*.

Syndicated widget—A Customer Portal widget that can access the Oracle Service Cloud database from any external web page. The code used to place the syndicated widget on a web page is available under tag documentation on the Customer Portal Administration site.

System attribute—A customized field that can be added to account (staff account), answer, asset, contact, incident, opportunity, organization, quote, sales product, and task standard objects. System attributes can be displayed in reports and workspaces, and can be used when defining relationships between standard and custom objects.
See also Custom object *and* Oracle Service Cloud standard object.

T

Table instance—A component of a data set that specifies the database tables that data can be selected from and how database tables are joined in a report or segment.

Target—A specific group of customers sharing common characteristics to whom a promotion is presented. A customer may belong to more than one target.

Target rule—A type of business rule that has the sole purpose of creating a target consisting of contacts who meet the conditions established by the rule.

Task—An action or activity scheduled to be completed within a specified time. Tasks can be standalone, or they can be associated with answers, campaigns, contacts, documents, incidents, mailings, opportunities, organizations, surveys, and stages in a sales strategy.

Task custom field—A field for gathering and displaying additional information about tasks. Task custom fields appear when adding or editing a task.

Task inheritance—A feature for linking a task's assigned staff member, contact, or organization to the equivalent value in a record associated with the task.

Task status—A method of tracking a task's state. The default task statuses are Not Started, In Progress, Completed, Waiting, and Deferred.

Techmail—A scheduled utility that retrieves mail from specified POP3 mailboxes. Service processes some of the mail into new incidents and routes the incidents using business rules (depending on settings). Outreach and Feedback process bounced messages to assist in tracking incorrect email addresses.

Template—A structured format used in a document in which specified sections are locked and cannot be edited and a section is open for customized content. The customer portal also uses templates to apply a uniform style to individual pages of the support site. Templates are also available as a starting point for creating a workflow's flow diagram, and templates can be added for community groups and hives.

Territory—A specific geographical sales region configured in Opportunity Tracking. Sales representatives can be assigned specific territories for opportunity assignment. Up to twelve levels of territories can be defined.

Test message—A mailing message that can be sent to small cross-sections of an audience to test a response before launching a final message.

Text explanation—A text field that can be associated with a response in a guided assistance guide. The text explanation is displayed after an agent selects the associated response from a question in the guide.
See also Guided assistance.

Text field—A customizable field containing text that is commonly added to reports. Once a text field is created, it can be added to any custom report and then adjusted as necessary.

Text matching—A feature in Offer Advisor that enables agents to search for specific terms that best express the customer's interests. After a search, the list of promotions and suggestions on the Offer Advisor window will be reordered, and the ranking of each will reflect its relevance to the terms entered by the agent.
See also Offer Advisor.

Text question—A question type that allows customers to type their answer to a question.

Theme—A group of related text responses to a survey question. Themes are created by topic monitoring and identified by common keywords. Themes are also used in social monitoring to group related cloud search results and in the customer portal to apply CSS styling to multiple elements of a support site by applying a single theme.
See also Oracle RightNow Customer Portal Cloud Service, Oracle RightNow Social Monitor Cloud Service, *and* Topic monitoring.

Third-party screen pop—A feature that lets staff members open a Service Console or report from a third-party application.
See also Service Console.

Time billed—A way to track the time spent responding to incidents. Data from the Time Billed field can be used for customer billing and for determining average incident resolution time.

Tool window—A default interface control on the Service Console for accessing reports, records, and items, and for searching the knowledge base. Recent Items and Navigation tool windows appear on the left navigation pane, and the Quick Search tool window appears on the right navigation pane. Tool windows can be put in any order, displayed in separate, floating windows, or removed from the console.

Topic browsing—A feature that provides clustering and guided browse functionality on the customer portal so customers can browse specific topics to find related answers.

Topic monitoring—A process that groups survey text responses into clusters of related responses called themes and labels each theme with keywords that define the responses. Topic monitoring is also used in social monitoring to group related cloud search results.
See also Data mining *and* Themes.

Tracked link—A link that can be tracked by Outreach and reported on for statistical purposes.

Tracked link category—An option for classifying tracked links for reporting purposes. A tracked link category can have one sub-category level.

Transactional mailing—A mailing that is sent only when an event occurs. Transactional mailings are sent to a contact when the contact meets specified criteria in a campaign and can be scheduled to be sent immediately, on a specific date, or at an interval in the future.

Transactional survey—A survey that is sent only when an event occurs. Transactional surveys are sent to a contact when the contact meets specified criteria in a campaign or business rule and can be scheduled to be sent immediately, on a specific date, or at an interval in the future.

Transfer—A feature in Chat that enables an agent to transfer a customer to another agent during a chat session.

Trending—A method of predicting a trend for a specified date range in the future based on a report's current data. Trending periods are defined when creating or editing a custom report and can be included in standard reports.

Trigger—The part of a script or workspace rule that defines the event that causes the rule conditions to be evaluated and (if matched) the rule action to occur.

U

Unqualified—One of the default chat agent statuses. This status indicates that the agent is not available to chat. The Unqualified chat agent status has an Unavailable status type.

Unresolved—One of the default incident status types and statuses. Incidents with an Unresolved status have recently entered the system, either by a customer or agent.

Unrestricted—One of the default chat agent statuses. This status indicates that there are no restrictions to the agent's availability to chat. The Unrestricted chat agent status has an Available status type.

Unspecified—One of the default chat agent statuses. This status indicates that the agent is logged out of Chat. The Unspecified chat agent status has a Logged Out status type and is displayed to agents by default.

Unsubscribe link—A link in a mailing that contacts can click to opt out of future mailings or surveys.

Updated—One of the default incident statuses. An incident marked Updated has been updated by a customer from Your Account. Updated incidents have an Unresolved status type.

Upgrading—The process of moving from one release of Oracle Service Cloud to a newer release.
See also Migration.

URL answer—A type of answer that consists of a link to an external URL. The URL address and the content of the web page are displayed.

User agent settings—The shortcut on the customer portal administration dashboard that allows page set mapping.
See also Page set mapping.

User link—A navigation element on community pages containing links to the logged-in user's profile, inbox, favorites, and subscriptions, and a sign-out option.

User type—The community role of a member account as defined by the nature of actions that the member is permitted to take.

Utility—Any of a number of programs in Oracle Service Cloud to help manage and configure an installation. Utilities include Agedatabase, Bulkdel, Dbaudit, Dbstatus, Kexport, Kimport, Langcvt, Msgtool, Reportgen, Techmail, and Wltool.

V

Validation—The process of error-checking items such as desktop workflows, scripts, rules, advanced surveys, and campaigns. Items are validated to ensure that all required properties have been completed and that the configuration is functional. Oracle Service Cloud also validates email addresses for industry-accepted formatting.

Variable—A temporary data item in a rule base. The variable is assigned an initial value that can be modified through rule actions, used as a rule condition to trigger other actions, and restored to its initial value for the next round of rules processing. Variables also refer to shortcuts defined for a larger string that can be inserted in the body of an answer or inserted inline during a chat session. When the variable is inserted in the body of the answer or in a chat response, it is replaced with the value specified in the variable.

Versioning—The system of numbering the Customer Portal framework and widgets to denote varying levels of changes. Major and minor changes are not backward compatible, while nano changes are applied automatically to all Customer Portal installations.

View partial—A reusable segment of code for common functionality that can be called from widget views to avoid duplicating the same code in multiple widget view files.

Virtual assistant—A process of routing incoming chats to a simulated agent that uses knowledge base data to respond to customer questions. Virtual assistant chats can ease the volume of chats requiring an agent.
See also Oracle RightNow Virtual Assistant Cloud Service.

Visibility—A setting that determines where a custom field or customizable menu item will appear. Visibility settings specify the interfaces in a multiple-interface installation where these fields appear. The settings can also define whether the fields appear on the administration interface and customer portal and whether certain custom fields with customer visibility can be edited.

Visit—*See* Web visit.

W

Waiting—One of the default incident status types and incident statuses. An incident marked Waiting has been responded to by a staff member and is waiting for a response from the incident creator.

Web form—A document in Outreach that allows contacts to input information that can be submitted to the database. Web forms are served as web pages by Oracle Service Cloud.

Web Indexer—A search method that lets customers simultaneously search the knowledge base along with web pages and other web-accessible documents within a specified domain.

Web spider—A software application that reads web pages and other documents and indexes the content for a search engine, often following hyperlinks from one web page to another.

Web visit—The period of time a customer spends looking for a satisfactory answer to a question. The end of a web visit generally occurs when a customer closes the browser or leaves the interface or when a specified time period elapses.

Web visit tracking—A feature that tracks information about a customer's current web visit. That is, it tracks the pages on the customer portal that the customer clicked before submitting a question.

Website link survey—A type of survey that is published as a web page and can be linked to from any source.

Weight—A displayed value given to resulting answers of a text search. The value is equal to the sum of the weights (for indexed words) of all the matched words from the text search. Weight also refers to an internal value given to each indexed keyword for an answer or incident. The value is relative to a constant and is based on number of occurrences, capitalization, and location of the word (ranked high to low: Keywords, Summary, Question, and Answer field for answers; Subject field and incident thread for incidents).

Widget—A collection of files that generates a specific function when it is placed on a page of the customer portal. Widgets can be buttons, fields, reports, or other elements that can access the Oracle Service Cloud database and communicate with other widgets through events or to the server through AJAX requests.

Widget builder—A tool that generates custom widget code, including placeholders to allow additional editing of the code. The widget builder, accessed on the Customer Portal Administration site, can extend an existing widget or create a new one.

Win/loss reason—An option for classifying and recording reasons for winning or losing an opportunity.

Wltool—A utility that is manually run after making changes to one of the wordlist files.
See also Wordlist file.

Word stemming—A feature used in keyword indexing and text searching that finds the root of each word and stores the stemmed root instead of the whole word, thereby saving large amounts of space while making a search broader and more appropriate.

Wordlist file—Any of the files that can be modified to customize indexing, text searching, and SmartSense emotive ratings.
See also File Manager.

Workflow—*See* Desktop workflow.

Workgroup—All of a record's open, associated records (for instance, an incident's contact, organization, and tasks) that are docked to the Service Console. All records in a workgroup are saved and closed in a single operation. When another non-associated record is opened, the records in the workgroup are collapsed on a single content pane tab.

Working record—The record being evaluated or acted upon by a workflow element or connector. For instance, a workspace element can display the first or last record opened in the workflow or a record named elsewhere in the workflow.
See also Desktop workflow.

Workspace—The configuration of the content pane when working with answers, contacts, incidents, opportunities, organizations, and tasks; when working in Chat; and when working with quotes, quote products, and service opportunities. Standard workspaces exist for each type of workspace, and custom workspaces can be created. The workspaces staff members use depend on the workspaces selected in their profile.

Workspace rules—A type of rule used to dynamically adjust the display, behavior, and values of fields and controls on a workspace based on staff member actions. Each rule is triggered by one or more events and conditions.

Workspace designer—The tool used to create and edit custom workspaces.

WYSIWYG (what you see is what you get)—*See* HTML editor.

Y

Your Account—A tab on the customer portal that opens the Account Overview page where customers can view and update all the questions they have previously submitted and view any answer or product/category notifications to which they are subscribed. They can also view their service contracts, edit their account information, and change their password. This component is restricted and requires a customer account.
See also Customer account.
