Getting Started with the Oracle HCM Cloud Adapter

Review the following conceptual topics to learn about the Oracle HCM Cloud Adapter and how to use it as a connection in integrations in Oracle Integration Cloud Service. A typical workflow of adapter and integration tasks is also provided.

Topics

• Oracle HCM Cloud Capabilities
• What Application Version Does the Oracle HCM Cloud Adapter Support
• About Oracle Integration Cloud Service
• About Oracle Integration Cloud Service Connections
• About Oracle Integration Cloud Service Integrations
• Typical Workflow for Creating and Including an Adapter Connection in an Integration

Oracle HCM Cloud Capabilities

The Oracle HCM Cloud Adapter enables you to create an integration with Oracle Human Capital Management (HCM) Cloud applications. You select business objects that an integration receives from Oracle HCM Cloud as a request and as a response.

The Oracle HCM Cloud Adapter enables customers to easily integrate their on-premises or SaaS applications with Oracle HCM Cloud without having to know about the specific details involved in the integration.

The Oracle HCM Cloud Adapter provides the following benefits:

• Integrates easily with the Oracle HCM Cloud application’s WSDL file to produce a simplified, integration-centric WSDL.

• Generates automatic mapping to the exposed business object or event subscription that you select during adapter configuration:

  – Business object: Represents a self-contained business document that can be acted upon by the integration. An integration can send requests to create a new record for that business object. They can send a request either to update or delete an existing record for a business object. Integrations can also send requests to retrieve information about one or more records representing that business object.

  – Event subscription: Represents an event document to which you subscribe. The event subscription is raised by the Oracle HCM Cloud application.
• Automatically handles security policy details required to connect to the Oracle HCM Cloud application.

• Provides standard error handling capabilities.

• Enables you to map business objects that have polymorphic data structures.

What Application Version Does the Oracle HCM Cloud Adapter Support
The Oracle HCM Cloud Adapter is compatible with Oracle HCM Cloud Application release 9.2 or higher.

About Oracle Integration Cloud Service
Oracle Integration Cloud Service is a complete, secure, but lightweight integration solution that enables you to connect your applications in the cloud. It simplifies connectivity between your applications and connects both your applications that live in the cloud and your applications that still live on premises. Oracle Integration Cloud Service provides secure, enterprise-grade connectivity regardless of the applications you are connecting or where they reside.

Oracle Integration Cloud Service provides native connectivity to Oracle Software as a Service (SaaS) applications, such as Oracle Sales Cloud, Oracle RightNow Cloud, and so on. Oracle Integration Cloud Service adapters simplify connectivity by handling the underlying complexities of connecting to applications using industry-wide best practices. You only need to create a connection that provides minimal connectivity information for each system. Oracle Integration Cloud Service lookups map the different codes or terms used by the applications you are integrating to describe similar items (such as country or gender codes). Finally, the visual data mapper enables you to quickly create direct mappings between the trigger and invoke data structures. From the mapper, you can also access lookup tables and use standard XPath functions to map data between your applications.

Once you integrate your applications and activate the integrations to the runtime environment, the dashboard displays information about the running integrations so you can monitor the status and processing statistics for each integration. The dashboard measures and tracks the performance of your transactions by capturing and reporting key information, such as throughput, the number of messages processed successfully, and the number of messages that failed processing. You can also manage business identifiers that track fields in messages and manage errors by integrations, connections, or specific integration instances.

About Oracle Integration Cloud Service Connections
Connections define information about the instances of each configuration you are integrating. Oracle Integration Cloud Service includes a set of predefined adapters, which are the types of applications on which you can base your connections, such as Oracle Sales Cloud, Oracle Eloqua Cloud, Oracle RightNow Cloud, and others. A connection is based on an adapter. A connection includes the additional information required by the adapter to communicate with a specific instance of an application (this can be referred to as metadata or as connection details). For example, to create a connection to a specific RightNow Cloud application instance, you must select the Oracle RightNow adapter and then specify the WSDL URL, security policy, and security credentials to connect to it.
About Oracle Integration Cloud Service Integrations

Integrations are the main ingredient of Oracle Integration Cloud Service. An integration includes at least a trigger (source) connection (for requests sent to Oracle Integration Cloud Service) and invoke (target) connection (for requests sent from Oracle Integration Cloud Service to the target) and the field mapping between those two connections.

When you create your integrations, you build on the connections you already created by defining how to process the data for the trigger (source) and invoke (target) connections. This can include defining the type of operations to perform on the data, the business objects and fields against which to perform those operations, required schemas, and so on. To make this easier, the most complex configuration tasks are handled by Oracle Integration Cloud Service. Once your trigger (source) and invoke (target) connections are configured, the mappers between the two are enabled so you can define how the information is transferred between the trigger (source) and invoke (target) data structures for both the request and response messages.

Video

Typical Workflow for Creating and Including an Adapter Connection in an Integration

You follow a very simple workflow to create a connection with an adapter and include the connection in an integration in Integration Cloud Service.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create the adapter connections for the applications you want to integrate. The connections can be reused in multiple integrations and are typically created by the administrator.</td>
<td>Creating an Oracle HCM Cloud Adapter Connection</td>

</tbody>
</table>
Creating an Oracle HCM Cloud Adapter Connection

A connection is based on an adapter. You define connections to the specific cloud applications that you want to integrate. The following topics describe how to define connections.

Topics

• Prerequisites for Creating a Connection
• Uploading an SSL Certificate
• Creating a Connection
• Editing a Connection
• Cloning a Connection
• Deleting a Connection
• Refreshing Integration Metadata

Prerequisites for Creating a Connection

You must satisfy the following prerequisites to create a connection with the Oracle HCM Cloud Adapter:

• Subscribe to Oracle HCM Cloud. This action enables you to create an Oracle HCM Cloud user account with the correct privileges. You specify this user account when creating an Oracle HCM Cloud Adapter connection on the Connections page. For information about specifying these credentials on the Connections page, see Configuring Connection Security. For information about subscribing, see Oracle HCM Cloud.

• Obtain the necessary Oracle HCM Cloud service catalog service WSDL URL or event catalog URL. For information, see Specifying the Oracle HCM Cloud Service Catalog Service WSDL or Event Catalog URL.

• During bidirectional account and contact synchronization, echoes are generated. Oracle Integration Cloud Service-based integrations use echo suppression to prevent unwanted update or create events (the echoes) from returning to the source application.
Specifying the Oracle HCM Cloud Service Catalog Service WSDL or Event Catalog URL

You must specify a mandatory Oracle HCM Cloud service catalog service WSDL (for accessing business objects) and optionally an event catalog URL (for accessing event subscriptions).

Obtaining the Service Cloud Service WSDL

<table>
<thead>
<tr>
<th>WSDL Requirements</th>
<th>Where Do You Get the WSDL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The URL must be that of a service catalog service WSDL. The service catalog service enables clients to retrieve information about all public Oracle Fusion Application service endpoints available for that instance. The information it returns is specific to the particular cloud instance and also reflects the new services that may have been introduced in patches applied to the instance. This service is used to programmatically discover the SOAP services available on the cloud instance and retrieve the necessary metadata to invoke the SOAP services to manage business objects.</td>
<td>The developer creating an Oracle HCM Cloud connection must work with the Oracle HCM Cloud service administrator to get the concrete WSDL URL for the service catalog service provisioned for the specific SaaS application. The concrete WSDL URL must be supplied while creating the connection.</td>
</tr>
</tbody>
</table>

Prerequisites

This section describes how to derive the external virtual host and port for a tokenized service WSDL. The topology information in the Topology Registration setup task contains the external virtual host and port for the domains and applications. The following instructions describe the steps for deriving the values using the service catalog service WSDL URL as an example: https://atf_server:port/fndAppCoreServices/ServiceCatalogService.

To access the Review Topology page, the ASM_REVIEW_TOPOLOGY_HIERARCHY_PRIV entitlement must be granted to the user's job role. The entitlement is granted to the ASM_APPLICATION_DEPLOYER_DUTY duty role, which is inherited by the duty roles ASM_APPLICATION_DEVELOPER_DUTY and ASM_APPLICATION_ADMIN_DUTY.

If the menu items and tasks described in the following procedure are not available in your cloud instance, your user account is missing the required role. Contact your cloud instance security administrator for assistance.

1. Log in to the cloud instance.
2. Click the Navigator icon in the global area in the top part of the window, then chose Setup and Maintenance under the Tools heading.
3. Select Review Topology under the Topology Registration section in the Tasks regional area on the left side of the window.
4. Click the Detailed tab in the middle of the window.

The tab shows the list of domains configured in the cloud instance.
5. Map the token name for the service path value to the domain name in the Topology Manager:

<table>
<thead>
<tr>
<th>Token Name in Service Path</th>
<th>Domain Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>atf_server</td>
<td>CommonDomain</td>
</tr>
<tr>
<td>crm_server</td>
<td>CRMDomain</td>
</tr>
<tr>
<td>fin_server</td>
<td>FinancialDomain</td>
</tr>
<tr>
<td>hcm_server</td>
<td>HCMDomain</td>
</tr>
<tr>
<td>ic_server</td>
<td>ICDomain</td>
</tr>
<tr>
<td>prc_server</td>
<td>ProcurementDomain</td>
</tr>
<tr>
<td>prj_server</td>
<td>ProjectsDomain</td>
</tr>
<tr>
<td>scm_server</td>
<td>SCMDomain</td>
</tr>
</tbody>
</table>

6. Expand the domain name and select any external virtual host and port for the J2EE applications that are deployed on the domain. In the sample window, the values for this particular instance are fs-your-cloud-hostname and 443, respectively.
7. Replace the `domainName_server:PortNumber` with the external virtual host and port identified in the previous step. For example:

   https://fs-your-cloud-hostname:port/fndAppCoreServices/ServiceCatalogService?wsdl

Obtaining the Event Catalog URL

You must know the CRM URL format to access the CRM application user interface. Follow the URL format to determine the event catalog URL. For example, if the CRM URL format is:

   https://fusxxxxx-crm-ext.us.oracle.com/customer/faces/CrmFusionHome

Then the event catalog URL is:

   https://fusxxxxx-crm-ext.us.oracle.com/soa-infra

Uploading an SSL Certificate

Certificates are used to validate outbound SSL connections. If you make an SSL connection in which the root certificate does not exist in Oracle Integration Cloud Service, an exception is thrown. In that case, you must upload the appropriate certificate. A certificate enables Oracle Integration Cloud Service to connect with external services. If the external endpoint requires a specific certificate, request the certificate and then upload it into Oracle Integration Cloud Service.

To upload a certificate:

1. From the Oracle Integration Cloud Service home page, click the **Administration** tab in the upper right corner.

   All certificates currently uploaded to the trust store are displayed in the Certificates dialog. The **Filter By > Type** list displays the following details:
• **Preinstalled**: Displays the certificates automatically installed in Oracle Integration Cloud Service. These certificates cannot be deleted.

• **Uploaded**: Displays the certificates uploaded by individual users. These certificates can be deleted and updated.

You can also search for certificates in the **Search** field. The search results are limited to a maximum of ten records sorted by name for performance and usability reasons. To ensure that your search results are more granular, enter as much of the certificate name as possible.

2. Click **Upload** at the top of the page.

3. In the Upload Certificate dialog box, enter a unique identifier for the certificate.
   
   This is a name you can use to identify the certificate.

4. Click **Browse** to locate the certificate file (.cer).

5. Click **Upload**.

6. Click the certificate name to view details such as the subject of the certificate, the issuer of the certificate, the date the certificate was issued, and the date the certificate expires.

## Creating a Connection

The first step in creating an integration is to create the connections to the applications with which you want to share data.

1. In the Integration Cloud Service toolbar, click **Designer**.

2. On the Designer Portal, click **Connections**.

3. Click **New Connection**.
   
   The Create Connection — Select Adapter dialog is displayed.

4. Select an adapter from the dialog. You can also search for the type of adapter to use by entering a partial or full name in the Search field, and clicking **Search**.
   
   The New Connection — Information dialog is displayed.

5. Enter the information to describe the connection.

   • Enter a meaningful name to help others find your connection when they begin to create their own integrations. The name you enter is automatically added in capital letters to the **Identifier** field. If you modify the identifier name, do not include a blank space (for example, OSC Inbound).

   • Select the role (direction) in which to use this connection (trigger, invoke, or both). Only the roles supported by this adapter are displayed for selection. When you select a role, only the connection properties and security policies appropriate to that role are displayed on the Connections page. If you select an adapter that supports both invoke and trigger, but select only one of those roles, then try to drag the adapter into the section you did not select, you receive an error (for example, configure an Oracle RightNow Cloud Adapter as only an invoke, but drag the adapter to the trigger section).

   • Enter an optional description of the connection.
6. Click Create.

Your connection is created and you are now ready to configure connection details, such as email contact, connection properties, security policies, and connection login credentials.

Adding a Contact Email

From the Connection Administrator section of the connection, you can add a contact email address for notifications.

1. In the Email Address field, enter an email address to receive email notifications when problems occur.

2. In the upper right corner, click Save.

Configuring Connection Properties

Enter connection information so your application can process requests.

1. Click Configure Connectivity.

   The Connection Properties dialog is displayed.

2. In the HCM Services Catalog WSDL URL field, specify the URL to use in this integration.

3. Click OK.

4. Configure connection security.

Configuring Connection Security

Configure security for your Oracle HCM Cloud Adapter connection by selecting the security policy and security token.
1. Click **Configure Credentials**.

2. Enter your login credentials:
   a. Select the security policy. Only the Username Password Token policy is supported. It cannot be deselected.
   b. Enter the username and password.
   c. Reenter the password a second time.

3. Click **OK**.

**Testing the Connection**

Test your connection to ensure that it is successfully configured.

1. In the upper right corner of the page, click **Test**.

   If successful, the following message is displayed and the progress indicator shows 100%.
   
   *The connection test was successful!*

2. If your connection was unsuccessful, an error message is displayed with details. Verify that the configuration details you entered are correct.

3. When complete, click **Save**.

**Editing a Connection**

You can edit connection settings after creating a new connection.

1. In the Oracle Integration Cloud Service toolbar, click **Designer**.

2. On the Designer Portal, click **Connections**.

3. On the Connections page, search for the connection name.

4. Select **Edit** from the connection **Actions** menu or click the connection name.

The Connection page is displayed.

5. To edit the notification email contact, change the email address in the **Email Address** field.

6. To edit the connection properties, click **Configure Connectivity**. Note that some connections do not include this button. If your connector does not include a **Configure Connectivity** button, then click the **Configure Credentials** button.

**Cloning a Connection**

You can clone a copy of an existing connection. It is a quick way to create a new connection.
1. In the Oracle Integration Cloud Service toolbar, click **Designer**.

2. On the Designer Portal, click **Connections**.

3. On the Connections page, search for the connection name.

4. Select **Clone** from the connection **Actions** menu.

The Clone Connection dialog is displayed.

5. Enter the connection information.

6. Click **Clone**.

7. Click **Edit** to configure the credentials of your cloned connection. Cloning a connection does not copy the credentials.

See **Editing a Connection** for instructions.

## Deleting a Connection

You can delete a connection from the connection menu.

1. In the Oracle Integration Cloud Service toolbar, click **Designer**.

2. On the Designer Portal, click **Connections**.

3. On the Connections page, search for the connection name.

4. Click **Delete** from the connection **Actions** menu.

The Delete Connection dialog is displayed if the connection is not used in an integration.

5. Click **Yes** to confirm deletion.

## Refreshing Integration Metadata

You can manually refresh the currently-cached metadata available to adapters that have implemented metadata caching. Metadata changes typically relate to customizations of integrations, such as adding custom objects and attributes to integrations. There may also be cases in which integrations have been patched, which results in additional custom objects and attributes being added. This option is similar to clearing the cache in your browser. Without a manual refresh, a staleness check is only performed when you drag a connection into an integration. This is typically
sufficient, but in some cases you may know that a refresh is required. For these cases, the **Refresh Metadata** menu option is provided.

To refresh integration metadata:

**Note:** The **Refresh Metadata** menu option is only available with adapters that have implemented metadata caching.

1. In the Integration Cloud Service toolbar, click **Designer**.
2. In the Designer Portal, click **Connections**.
3. Locate the connection to refresh.
4. From the menu at the right, select **Refresh Metadata**.

A message is displayed indicating that the refresh was successful.

Metadata refresh for connection "connection_type" has been initiated successfully.
Creating an Integration

Integrations use the adapter connections you created to your applications, and define how information is shared between those applications. You can create, import, modify, or delete integrations; create integrations to publish or subscribe to messages; add and remove request and response enrichment triggers; and create routing paths for different invoke endpoints in integrations. Click the following topics for more information.

**Topic**
- Creating Integrations (in *Using Oracle Integration Cloud Service*)
Adding the Oracle HCM Cloud Adapter Connection to an Integration

When you drag the Oracle HCM Cloud Adapter into the trigger and invoke areas of an integration, the Adapter Endpoint Configuration Wizard is invoked. This wizard guides you through configuration of the Oracle HCM Cloud Adapter endpoint properties.

The following sections describe the wizard pages that guide you through configuration of the Oracle HCM Cloud Adapter as a trigger or invoke in an integration.

**Topics**
- Configuring Basic Information Properties
- Configuring Oracle HCM Cloud Trigger Request Properties
- Configuring Oracle HCM Cloud Trigger Response Properties
- Configuring Oracle HCM Cloud Invoke Operation Properties
- Reviewing Configuration Values on the Summary Page

For more information about the Oracle HCM Cloud Adapter, see Oracle HCM Cloud Capabilities.

**Configuring Basic Information Properties**

You can enter a name and description on the Basic Info page of each adapter in your integration.

**Topics**
- What You Can Do from the Basic Info Page
- What You See on the Basic Info Page

**What You Can Do from the Basic Info Page**

You can specify the following values on the Basic Info page. The Basic Info page is the initial wizard page that is displayed whenever you drag an adapter to the section of the integration canvas supported by your adapter.

- Specify a meaningful name.
- Specify a description of the responsibilities.
What You See on the Basic Info Page

The following table describes the key information on the Basic Info page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>What do you want to call your endpoint?</td>
<td>Provide a meaningful name so that others can understand the responsibilities of this connection. You can include English alphabetic characters, numbers, underscores, and dashes in the name. You cannot include the following:</td>
</tr>
<tr>
<td></td>
<td>• Blank spaces (for example, My Inbound Connection)</td>
</tr>
<tr>
<td></td>
<td>• Special characters (for example, #;83&amp; or righ(t)now4)</td>
</tr>
<tr>
<td></td>
<td>• Multibyte characters</td>
</tr>
<tr>
<td>What does this endpoint do?</td>
<td>Enter an optional description of the connection’s responsibilities. For example: This connection receives an inbound request to synchronize account information with the cloud application.</td>
</tr>
</tbody>
</table>

Configuring Oracle HCM Cloud Trigger Request Properties

Enter the Oracle HCM Cloud trigger request values for your integration. The values you specify start the integration.

Topics

• What You Can Do from the Oracle HCM Cloud Source Request Page

• What You See on the Oracle HCM Cloud Source Request Page

What You Can Do from the Oracle HCM Cloud Source Request Page

You can select to receive a business object as a request from Oracle HCM Cloud. This selection invokes the integration.

What You See on the Oracle HCM Cloud Source Request Page

The following table describes the key information on the Oracle HCM Cloud source Request page.
## Configuring Oracle HCM Cloud Trigger Response Properties

Enter the Oracle HCM Cloud trigger response values for your integration.

### Topics

- What You Can Do from the Oracle HCM Cloud Source Response Page
- What You See on the Oracle HCM Cloud Source Response Page

### What You Can Do from the Oracle HCM Cloud Trigger Response Page

You can configure the operation and business object that comprise the response type for Oracle HCM Cloud.

- Immediate (synchronous) response: A response business object is immediately returned as output. You select **Immediate** as the response type on the Response page and select the business object as part of the response to the client.
• Delayed (asynchronous) response: A callback service to which to route the callback is exposed. You select Delayed as the response type on the Response page and select the operation and business object that comprise a successful callback response, a failed callback response, or both.

• No response is required: You select None on the Response page because a response is not required.

The Response page looks as follows:

![Response page screenshot](image)

**What You See on the Oracle HCM Cloud Trigger Response Page**

Select the business object for the integration to send as a response document to the Oracle HCM Cloud application.

The following types of responses are available.

• Immediate: A synchronous response is required (See Table 4-1 for instructions)

• Delayed: An asynchronous response is required (See Table 4-2 for instructions)

• None: No response is required (See Table 4-3 for instructions)

The following table describes the fields available if an immediate (synchronous) response is required.

<table>
<thead>
<tr>
<th>Table 4-1 Response Type — Immediate (Synchronous) Response is Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Element</strong></td>
</tr>
<tr>
<td>Response Type</td>
</tr>
</tbody>
</table>

### Configuring Oracle HCM Cloud Invoke Operation Properties

Enter the Oracle HCM Cloud invoke operation values for your integration.

**Topics**

- [What You Can Do from the Oracle HCM Cloud Target Operations Page](#)
- [What You See on the Oracle HCM Cloud Target Operations Page](#)

**What You Can Do from the Oracle HCM Cloud Invoke Operations Page**

You can configure the following invoke operation values for the Oracle HCM Cloud.

- Select the business object or service.
- Select the operation to perform on the selected business object or service.

**What You See on the Oracle HCM Cloud Invoke Operations Page**

The following table describes the key information on the Oracle HCM Cloud invoke Operations page.
**Element** | **Description**  
---|---  
**Browse by** | Select to browse by business object or service. There is a one-to-one correspondence between the business object and service. The service acts on the business document.  
• Business Objects: Select to browse a list of available business objects.  
• Services: Select to browse a list of available services.  
  
**Filter by object name**  
(displayed if Business Objects is selected) | Type the initial letters to filter the display of business objects.  
  
**Select a Business Object**  
(displayed if Business Objects is selected) | Select the business object to use.  
  
**Filter by service**  
(displayed if Services is selected) | Type the initial letters to filter the display of services.  
  
**Select a Service**  
(displayed if Services is selected) | Select the service to use.  
  
**Select the operation to perform on the business object or service** | Select the operation to perform on the selected business object or service.  
  
**Life Cycle** | Displays the state of the selected business object or service. Deprecated indicates the business document is nearing the end of use and must be used with caution.  
  
**Name** | Displays the name of the selected business object or service.  
  
**Description** | Displays the description of the selected business object or service.  

### Reviewing Configuration Values on the Summary Page

You can review the specified adapter configuration values on the Summary page.

#### Topics

- What You Can Do from the Summary Page
- What You See on the Summary Page

#### What You Can Do from the Summary Page

You can review configuration details from the Summary page. The Summary page is the final wizard page for each adapter after you have completed your configuration.

- View the configuration details you defined for the adapter. For example, if you have defined an inbound trigger (source) adapter with a request business object
and immediate response business object, specific details about this configuration are displayed on the Summary page.

- Click **Done** if you want to save your configuration details.
- Click a specific tab in the left panel or click **Back** to access a specific page to update your configuration definitions.
- Click **Cancel** to cancel your configuration details.

**What You See on the Summary Page**

The following table describes the key information on the Summary page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>Displays a summary of the configuration values you defined on previous pages of the wizard. The information that is displayed can vary by adapter. For some adapters, the selected business objects and operation name are displayed. For adapters for which a generated XSD file is provided, click the XSD link to view a read-only version of the file. To return to a previous page to update any values, click the appropriate tab in the left panel or click <strong>Back</strong>.</td>
</tr>
</tbody>
</table>
Creating Mappings and Lookups in Integrations

You must map data between trigger connections and invoke connections in integrations. You can also optionally create lookups in integrations.
