6 Administering Integrations

7 Troubleshooting the Oracle Sales Cloud Adapter
Preface

Using the Oracle Sales Cloud Adapter describes how to configure the Oracle Sales Cloud Adapter as a connection in an integration in Oracle Integration Cloud Service.

Topics:

• Audience
• Related Resources
• Conventions

Audience

Using the Oracle Sales Cloud Adapter is intended for developers who want to use the Oracle Sales Cloud Adapter in integrations in Oracle Integration Cloud Service.

Related Resources

For more information, see these Oracle resources:

Getting Started with the Oracle Sales Cloud Adapter

Review the following conceptual topics to learn about the Oracle Sales Cloud Adapter and how to use it as a connection in integrations in Oracle Integration Cloud Service. A typical workflow of adapter and integration tasks is also provided.

Topics

• Oracle Sales Cloud Adapter Capabilities
• What Application Version Does the Oracle Sales Cloud Adapter Support
• About Oracle Integration Cloud Service
• About Oracle Integration Cloud Service Connections
• About Oracle Integration Cloud Service Integrations
• About Oracle Sales Cloud Adapter Use Cases
• Typical Workflow for Creating and Including an Adapter Connection in an Integration

Oracle Sales Cloud Adapter Capabilities

Oracle Sales Cloud Adapter enables modern selling with tools that are easy to deploy and use, completely mobile, packed with powerful analytics, and built for collaborative selling and revenue generation. Oracle Sales Cloud includes a set of features for creating and tracking sales campaigns, developing leads into business opportunities, and pursuing opportunities to generate revenue. Sales accounts, leads, and opportunities can be automatically assigned to territories and sales teams.

The Oracle Sales Cloud Adapter enables you to create an integration with an Oracle Sales Cloud application.

The Oracle Sales Cloud Adapter enables customers to easily integrate their on-premises or SaaS applications with Oracle Sales Cloud without having to know the specific details involved in the integration.

The Oracle Sales Cloud Adapter provides the following capabilities:

• Generates a local integration-centric WSDL that is an abstract WSDL. It defines strongly-typed message structures (request and response types) for the selected objects and the name of operations. It provides a simplified user experience in terms of creating data mappings at design time while constructing integrations with Fusion Application services. This WSDL also exposes the generic custom objects as named objects.
• Generates automatic mapping to the exposed business object, event, or Oracle Fusion Applications REST API resource that you select during adapter configuration:

  – Business object: Represents a self-contained business document that can be acted upon by the integration. An integration can send requests to create a new record for that business object. They can send a request either to update or delete an existing record for a business object. Integrations can also send requests to retrieve information about one or more records representing that business object.

  – Event: Represents an event document to which you subscribe. The event is raised by the Oracle Sales Cloud application. For information about supported events, see Supported Business Event-Enabled Objects.

  – Business (REST) API: Represents an Oracle Fusion Applications REST API resource. Support is provided in the invoke (outbound) direction.

**Note:** The Oracle Sales Cloud Adapter currently pulls in all resources exposed by the interface catalog and displays them for selection, including private resources. Private resources are not supported. For information about the public resources that are supported, see the Resource Types section of REST API for Oracle Sales Cloud Release 11.

• Enables you to view annotations on Oracle Sales Cloud Adapter elements in the mapper. For information about viewing annotations in the mapper, see About Mappings in Using the Oracle Mapper.

• Automatically handles security policy details required to connect to the Oracle Sales Cloud application.

• Provides standard error handling capabilities.

• Enables you to map business objects that have polymorphic data structures.

**Support for Calling Integrations with Concrete Values of Custom Objects from the Groovy Script Editor**

The Oracle Sales Cloud Adapter inbound endpoint WSDL interface supports the use of concrete values for custom business objects in the WSDL in place of xsd:anyType parameters. This feature enables you to use the groovy script editor to create scripts to invoke integrations. The groovy script editor is unable to recognize xsd:anyType parameters.

For instructions on integrating a groovy script, see Integrating Groovy Scripts.

**Supported Business Event-Enabled Objects**

The following business event-enabled objects to which you can subscribe during adapter configuration in the Adapter Endpoint Configuration Wizard are supported.

<table>
<thead>
<tr>
<th>Supported Outbound Event-Enabled Objects and Supported Operations</th>
<th>Supported Inbound Event-Enabled Objects</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Object:</strong> Accounts</td>
<td>All top level objects.</td>
</tr>
<tr>
<td><strong>Operations:</strong> create, update, and delete</td>
<td></td>
</tr>
<tr>
<td>Supported Outbound Event-Enabled Objects and Supported Operations</td>
<td>Supported Inbound Event-Enabled Objects</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
</tbody>
</table>
| **Object** Contacts  
**Operations:** create, update, and delete operations |  
| **Object** Partner  
**Operations:** create, update, and delete operations  
**Note:** Supported in Release 11 through a backport. |  
| **Object** Deal Registration  
**Operations:** create, update, and delete operations  
**Note:** Supported in Release 11 through a backport. |  
| **Object** Opportunities  
**Operations:** create, update, and delete operations  
**Note:** Supported in Release 11 through a backport. |  
| **Object** Leads  
**Operations:** create, update, and delete operations  
**Note:** Supported in Release 11 through a backport. |  

**What Application Version Does the Oracle Sales Cloud Adapter Support**

The Oracle Sales Cloud Adapter is compatible with Oracle Sales Cloud release 9.2. It is also compatible with release 10, which includes certification for accounts and contacts events.

**About Oracle Integration Cloud Service**

Oracle Integration Cloud Service is a complete, secure, but lightweight integration solution that enables you to connect your applications in the cloud. It simplifies connectivity between your applications and connects both your applications that live in the cloud and your applications that still live on premises. Oracle Integration Cloud Service provides secure, enterprise-grade connectivity regardless of the applications you are connecting or where they reside.

Oracle Integration Cloud Service provides native connectivity to Oracle Software as a Service (SaaS) applications, such as Oracle Sales Cloud, Oracle RightNow Cloud, and so on. Oracle Integration Cloud Service *adapters* simplify connectivity by handling the underlying complexities of connecting to applications using industry-wide best practices. You only need to create a *connection* that provides minimal connectivity information for each system. Oracle Integration Cloud Service *lookups* map the different codes or terms used by the applications you are integrating to describe similar items (such as country or gender codes). Finally, the visual data mapper enables you to quickly create direct mappings between the trigger and invoke data.
structures. From the mapper, you can also access lookup tables and use standard XPath functions to map data between your applications.

Once you integrate your applications and activate the integrations to the runtime environment, the dashboard displays information about the running integrations so you can monitor the status and processing statistics for each integration. The dashboard measures and tracks the performance of your transactions by capturing and reporting key information, such as throughput, the number of messages processed successfully, and the number of messages that failed processing. You can also manage business identifiers that track fields in messages and manage errors by integrations, connections, or specific integration instances.

About Oracle Integration Cloud Service Connections
Connections define information about the instances of each configuration you are integrating. Oracle Integration Cloud Service includes a set of predefined adapters, which are the types of applications on which you can base your connections, such as Oracle Sales Cloud, Oracle Eloqua Cloud, Oracle RightNow Cloud, and others. A connection is based on an adapter. A connection includes the additional information required by the adapter to communicate with a specific instance of an application (this can be referred to as metadata or as connection details). For example, to create a connection to a specific RightNow Cloud application instance, you must select the Oracle RightNow adapter and then specify the WSDL URL, security policy, and security credentials to connect to it.

About Oracle Integration Cloud Service Integrations
Integrations are the main ingredient of Oracle Integration Cloud Service. An integration includes at least a trigger (source) connection (for requests sent to Oracle Integration Cloud Service) and invoke (target) connection (for requests sent from Oracle Integration Cloud Service to the target) and the field mapping between those two connections.

When you create your integrations, you build on the connections you already created by defining how to process the data for the trigger (source) and invoke (target) connections. This can include defining the type of operations to perform on the data, the business objects and fields against which to perform those operations, required schemas, and so on. To make this easier, the most complex configuration tasks are handled by Oracle Integration Cloud Service. Once your trigger (source) and invoke (target) connections are configured, the mappers between the two are enabled so you can define how the information is transferred between the trigger (source) and invoke (target) data structures for both the request and response messages.

About Oracle Sales Cloud Adapter Use Cases
The Oracle Sales Cloud Adapter can be used in scenarios such as the following:
**Typical Workflow for Creating and Including an Adapter Connection in an Integration**

You follow a very simple workflow to create a connection with an adapter and include the connection in an integration in Oracle Integration Cloud Service.

This table lists the workflow steps for both adapter tasks and overall integration tasks, and provides links to instructions for each step.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>More Information</th>
</tr>

Creating an Oracle Sales Cloud Adapter Connection

A connection is based on an adapter. You define connections to the specific cloud applications that you want to integrate. The following topics describe how to define connections.

Topics
- Prerequisites for Creating a Connection
- Uploading an SSL Certificate
- Creating a Connection
- Editing a Connection
- Cloning a Connection
- Deleting a Connection
- Refreshing Integration Metadata

Prerequisites for Creating a Connection
You must satisfy the following prerequisites to create a connection with the Oracle Sales Cloud Adapter:

- Subscribe to Oracle Sales Cloud. This action enables you to create an Oracle Sales Cloud user account with the correct privileges. You specify this user account when creating an Oracle Sales Cloud Adapter connection on the Connections page. For information, see Configuring Connection Security.

For information about subscribing, see Oracle Sales Cloud.

- Upload a security certificate. For information, see Uploading an SSL Certificate.

- Obtain the necessary Oracle Sales Cloud service catalog service WSDL URL, event catalog URL, or interface catalog URL. For information, see Obtaining the Oracle Sales Cloud Adapter Service Catalog Service WSDL, Event Catalog URL, or Interface Catalog URL.

- To subscribe to events with Oracle Sales Cloud, you must perform a number of configuration steps. For information, see Enabling Event Subscriptions in Oracle Sales Cloud.

- During bidirectional object synchronization (for example, of account, contact, or any other object), echoes are generated. Oracle Integration Cloud Service-based integrations use echo suppression to prevent unwanted update or create events
(the echoes) from returning to the source application. See Enabling Echo Suppression Filters.

- To use groovy scripts in integrations, see Integrating Groovy Scripts.

**Obtaining the Oracle Sales Cloud Adapter Service Catalog Service WSDL, Event Catalog URL, or Interface Catalog URL**

You must obtain a mandatory Oracle Sales Cloud Adapter service catalog service WSDL (for accessing business objects) and optionally an event catalog URL (for accessing event subscriptions) or interface catalog URL (for accessing Oracle Fusion Applications REST API resources). You specify the necessary WSDL and URLs in the Connection Properties dialog.

A mandatory Oracle Sales Cloud Adapter service catalog service WSDL is required to configure the adapter for both inbound and outbound endpoints using either business objects or business services. You can also optionally specify the following:

- An event catalog URL for accessing and configuring the inbound adapter to use event subscriptions.
- An interface catalog URL for accessing and configuring the outbound adapter to use Oracle Fusion Applications REST API resources.

You specify the appropriate property values in the Oracle Sales Cloud Adapter Connection Properties dialog on the Connections page.
Obtaining the Service Catalog Service WSDL

<table>
<thead>
<tr>
<th>WSDL Requirements</th>
<th>Where Do You Get the WSDL?</th>
</tr>
</thead>
<tbody>
<tr>
<td>The URL must be that of a service catalog service WSDL. The service catalog service is a Fusion Application service that returns a list of external services available for integration. It allows clients to retrieve information about all public Fusion Application service endpoints available for that instance. The service catalog service enables clients to retrieve information about all public Oracle Fusion Application service endpoints available for that instance. The information it returns is specific to the particular cloud instance and also reflects the new services that may have been introduced in patches applied to the instance. This service is used to programmatically discover the SOAP services available on the cloud instance and retrieve the necessary metadata to invoke the SOAP services to manage business objects.</td>
<td>The developer creating an Oracle Sales Cloud connection must work with the Oracle Sales Cloud service administrator to get the concrete WSDL URL for the service catalog service provisioned for the specific SaaS application.</td>
</tr>
</tbody>
</table>

This section describes how to derive the external virtual host and port for a tokenized service catalog service WSDL. The topology information in the Topology Registration setup task contains the external virtual host and port for the domains and applications. The following instructions describe the steps for deriving the values using the service catalog service WSDL URL as an example: https://atf_server:port/fndAppCoreServices/ServiceCatalogService.

To access the Review Topology page, the ASM_REVIEW_TOPOLOGY_HIERARCHY_PRIV entitlement must be granted to the user’s job role. The entitlement is granted to the ASM_APPLICATION_DEPLOYER_DUTY duty role, which is inherited by the duty roles ASM_APPLICATION_DEVELOPER_DUTY and ASM_APPLICATION_ADMIN_DUTY.

If the menu items and tasks described in the following procedure are not available in your cloud instance, your user account is missing the required role. Contact your cloud instance security administrator for assistance.

1. Log in to the cloud instance.
2. Click the Navigator icon in the global area in the top part of the window, then chose Setup and Maintenance under the Tools heading.
3. Select Review Topology under the Topology Registration section in the Tasks regional area on the left side of the window.
4. Click the Detailed tab in the middle of the window.
   The tab shows the list of domains configured in the cloud instance.
5. Map the token name for the service path value to the domain name in the Topology Manager:

<table>
<thead>
<tr>
<th>Token Name in Service Path</th>
<th>Domain Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>atf_server</td>
<td>CommonDomain</td>
</tr>
<tr>
<td>crm_server</td>
<td>CRMDomain</td>
</tr>
<tr>
<td>fin_server</td>
<td>FinancialDomain</td>
</tr>
<tr>
<td>hcm_server</td>
<td>HCMDomain</td>
</tr>
<tr>
<td>ic_server</td>
<td>ICDomain</td>
</tr>
<tr>
<td>prc_server</td>
<td>ProcurementDomain</td>
</tr>
<tr>
<td>prj_server</td>
<td>ProjectsDomain</td>
</tr>
<tr>
<td>scm_server</td>
<td>SCMDomain</td>
</tr>
</tbody>
</table>

6. Expand the domain name and select any external virtual host and port for the J2EE applications that are deployed on the domain. In the sample window, the values for this particular instance are fs-your-cloud-hostname and 443, respectively.
7. Replace the `domainName_server:PortNumber` with the external virtual host and port identified in the previous step. For example:

   https://fs-your-cloud-hostname:port/fndAppCoreServices/ServiceCatalogService?wsdl

**Obtaining the Event Catalog URL**

You must know the customer relationship management (CRM) URL format to access the CRM application user interface. Follow the URL format to determine the event catalog URL. For example, if the CRM URL format is:

https://fusxxxxx-crm-ext.us.oracle.com:port/customer/faces/CrmFusionHome

Then the event catalog URL is:

https://fusxxxxx-crm-ext.us.oracle.com:port/soa-infra

**Obtaining the Interface Catalog URL**

The interface catalog URL is formatted as follows. Obtain the host name in the same way as you obtained the host for the service catalog service WSDL.

https://host/port_for_the_common_domain/helpPortalApi/otherResources/latest/interfaceCatalogs

**Enabling Event Subscriptions in Oracle Sales Cloud**

Before you can subscribe to events with the Oracle Sales Cloud Adapter, you must perform a series of configuration tasks. For this example, Oracle RightNow Cloud is the other connection with which Oracle Sales Cloud is communicating.
Verifying the Source System Record in Oracle Sales Cloud

The integration is designed to work with Oracle Sales Cloud Release 10.

To verify the source system record in Oracle Sales Cloud:

1. Log in to an Oracle Sales Cloud instance with a user with system administrator privileges.
2. Navigate to the Setup and Maintenance page.
3. Select the All Tasks tab.
4. Enter *Manage Trading community Source System* in the *Name* field, and click Search.
5. In the Search Results section, click the icon under Go to Task.
The Manage Trading Community Source Systems page is displayed.
6. Select Starts with from the Code drop-down menu.
7. To the right of Starts with, enter a value in the field, then click Search. For this example, RNOW is entered.
8. In the Search Results section, verify the value you entered (for this example, RNOW) is displayed in the Code column and ensure the Enable for Trading Community Members checkbox is selected. If the Enable for Trading Community Members check box is not selected, then perform the following steps:
   a. Select the RNOW row.
   b. Click the Edit icon.
   c. Select the Enable for Trading Community Members checkbox.

Creating the Source System Record in Sales Cloud

To create the Source System Record in Sales Cloud:

If the Source System definition RNOW record is not found in the Sales Cloud instance, then follow the steps below to create one:

1. Log in to the Oracle Sales Cloud instance with a user with system administrator privileges.
2. Navigate to the Setup and Maintenance page.
3. Select the All Tasks tab.
4. Enter *Manage Trading community Source System* in the *Name* field, and click Search.
5. In the Search Results section, click the icon under Go to Task.
The Manage Trading Community Source Systems page is displayed.
6. Select Starts with from the Code drop-down menu.
7. Enter RNOW in the field, then click Search. For this example, Oracle RightNow Cloud is the other connection with which Oracle Sales Cloud is communicating.
8. Under Search Results, click the New icon.

9. On the Create Source System page, fill in the values as follows. For this example,
Oracle RightNow Cloud is the other connection with which Oracle Sales Cloud is
communicating.
   - **Code** field: Enter RNOW.
   - **Name** field: Enter RightNow Service Cloud.
   - **Description** field: Enter a description. For example:
     Maintains cross references between the Oracle Fusion Applications database
     and records imported using comma-separated files.
   - **Enable for Trading Community Members** checkbox: Select the checkbox.

10. Click Save, then click Close.

Verifying Source System Entities

To verify source system entities:

1. Navigate to the Setup and Maintenance page.

2. Select the All Tasks tab.

3. Enter Manage Source System Entities in the Name field, and click Search.

4. In the Search Results section, click the icon under Go to Task.
   The Manage Source System Entities page is displayed.

5. From the Source Systems for Trading Community Members list, select
   RightNow Service. For this example, Oracle RightNow Cloud is the other
   connection with which Oracle Sales Cloud is communicating.

6. In the RightNow Service Cloud: Entities section, ensure that the Address,
   Contact Points, and Parties checkboxes are selected.

Enabling the Trading Community Events Profile Option

To enable the trading community events profile option:

1. Navigate to the Setup and Maintenance page.

2. Select the All Tasks tab.

3. Enter Manage Trading Community Common Profile Options in the Name field, and click Search.

4. In the Search Results section, click the icon under Go to Task.
   The Manage Trading Community Common Profile Options page is displayed.

5. Select HZ_ENABLE_EVENT_TRACKING.
   The Manage Trading Community Common Profile Options page for
   HZ_ENABLE_EVENT_TRACKING page is displayed.

6. In the HZ_ENABLE_EVENT_TRACKING:Profile Values section, set the Site
   level Profile Value to Yes.
7. Click **Save**, then click **Close**.

8. On the Manage Trading Community Common Profile Options page, select **HZ_INVOKE_OBJ_WF_ON_TRACKING**.
   
The Manage Trading Community Common Profile Options page for HZ_INVOKE_OBJ_WF_ON_TRACKING page is displayed.

9. In the **HZ_INVOKE_OBJ_WF_ON_TRACKING: Profile Values** section, set the **Site** level **Profile Value** to **Yes**.

10. Click **Save**, then click **Close**.

**Creating an Integration User Account**

To invoke an Oracle Sales Cloud service catalog or event catalog web service from Oracle Integration Cloud Service, you create a separate user.

To create the integration user account:

1. Log in to Oracle Sales Cloud with a user with system administrator privileges.

2. Navigate to **Navigator > My Team > Manage Users**.
   
The Manage Users page is displayed.

3. Click **Manage Users**.

4. Click the **Create New User** icon beside **Show Photo**.

5. Enter the following information, and click **Save**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Name</td>
<td>Enter FUSION_APPS_ICS_APPID</td>
</tr>
<tr>
<td>Email</td>
<td>Enter a valid email address.</td>
</tr>
<tr>
<td>Hire Date</td>
<td>Enter the date.</td>
</tr>
<tr>
<td>User Name</td>
<td>Enter FUSION_APPS_ICS_APPID.</td>
</tr>
<tr>
<td>Person Type</td>
<td>Enter Employee.</td>
</tr>
<tr>
<td>Legal Employer</td>
<td>Select a valid legal organization.</td>
</tr>
<tr>
<td>Business Unit</td>
<td>Select a valid business unit.</td>
</tr>
<tr>
<td>Send user name and password</td>
<td>Select this checkbox.</td>
</tr>
<tr>
<td>User Login</td>
<td>Enter FUSION_APPS_ICS_APPID.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter a password for the username.</td>
</tr>
</tbody>
</table>

A notification email is sent to the email address after the user is created.

7. Log in to the Oracle Sales Cloud instance with FUSION_APPS_ICS_APPID and the temporary password provided in the notification email.
8. Change the password after logging in initially.

   The Oracle Sales Cloud page appears.

Assigning Integration Roles

You associate a user with the following roles and privileges in Oracle Authorization Policy Manager on the Oracle Entitlements Server.

You can configure an Oracle Integration Cloud Service instance to use the Username Password Token security policy to access the resources in an Oracle Sales Cloud instance.

Oracle Sales Cloud instance exposes service catalogs and event catalogs to Oracle Integration Cloud Service. These resources are secured in Oracle Sales Cloud. You need to assign the required roles and privileges to the FUSION_APPS_ICS_APPID user.

You associate the user FUSION_APPS_ICS_APPID with the following roles and privileges.

- ALL_INTEGRATION_POINTS_ALL_DATA
- SOA Operator
- FND_MANAGE_CATALOG_SERVICE_PRIV

**Note:** You must have administrator privileges in Oracle Authorization Policy Manager to perform the following steps.

To assign integration roles:

1. Log in to Oracle Authorization Policy Manager.
2. Under Search, select Users from the For dropdown list.
3. Enter FUSION_APPS_ICS_APPID in the Search field, then click the Search icon.
4. Select FUSION_APPS_ICS_APPID in the search results, then click the View icon.
5. On the FUSION_APPS_ICS_APPID tab, click the Application Role Assignments subtab.
6. Click Map.
7. In the Map Application Roles to User dialog:
   a. Select crm from the Application Name dropdown list.
   b. Select Contains from the Role Name dropdown list, enter ALL_INTEGRATION_POINTS_ALL_DATA in the Role Name field, and then click Search.
   c. Select ALL_INTEGRATION_POINTS_ALL_DATA in the search results, then click Map Roles.

The role is mapped for the user under crm.
8. Click Map.

9. Perform the following steps in the Map Application Roles to User dialog.
   a. Select hcm from the Application Name dropdown list, and repeat steps 7.b, and 7.c.
   b. The role is mapped for the user under hcm.

10. Click Map.

11. Perform the following steps in the Map Application Roles to User dialog.
    a. Select fscm from the Application Name dropdown list, and repeat steps 7.b, 7.c.
       The role is mapped for the user under fscm.

12. Click Map.

13. Perform the following steps in the Map Application Roles to User dialog.
    a. Select soa-infra from the Application Name dropdown list
    b. Select Contains from the dropdown menu next to Display Name.
    c. Enter SOA Operator in the Display Name field, and then click Search.
    d. Select the SOA Operator role in the search results, then click Map Roles.
       The role is mapped to the user under soa-infra.

14. On FUSION_APPS_ICS_APPID tab, click Find Policies at the top-right corner of the page

15. In the Choose an Application dialog, select fscm and click OK.
    The Search Authorization Policies tab is displayed.

17. On the Untitled tab, enter Policy for manage services catalog in the Name field.

18. Ensure FUSION_APPS_ICS_APPID is listed under Principals. If the use is not listed under Principals, then click + next to Principals.

19. Perform the following steps in the Search Principal dialog.
    a. Select the Users tab.
    b. Select Starts With from the User Name dropdown list, enter FUSION_APPS_ICS_APPID in the User Name field, and then click Search.
    c. Select FUSION_APPS_ICS_APPID in the search results, then click Add Selected.
    d. Click Add Principals.

20. Select All next to Match under Principals.
21. Click + next to Targets.

22. In the Search Target dialog, click the Entitlements tab, then select Starts With from the Name dropdown list.

23. Enter FND_MANAGE_CATALOG_SERVICE_PRIV, then click Search.

24. Select Manage WEbservices catalog in the search results, then click Add Selected.

25. Ensure Manage WEbservices catalog is added onto Selected Targets.

26. Click Add Targets.

A new Policy for manage services catalog is added to the user.

27. Click Save on the Untitled tab.

Logging an Oracle Service Request to Create a CSF Key for Event Subscriptions

To successfully subscribe to events, a CSF key is required. This key must be created by Oracle Support Services on the Oracle Sales Cloud side.

Note: The CSF key name must be the same as your Oracle Integration Cloud Service domain.

The CSF key provides the following benefits:

- The Oracle Integration Cloud Service user name and password credentials are used at run time to add the credentials to the security header of the outgoing SOAP document sent to Oracle Integration Cloud Service.

- The Oracle Sales Cloud Adapter uses these credentials to perform authentication.

Log an Oracle service request for Oracle to create the CSF key and include the Oracle Integration Cloud Service domain and Oracle Sales Cloud instance. Provide the identity domain information (for example, icssvc.identity.domain= idm2152) for both the Oracle Integration Cloud Service domain and Oracle Sales Cloud subscriptions in the service request.

If you do not file a service request, you receive the following error when testing the connection:

Unable to test connection "ITEMSEVENT_CLOUDERPCONNECTI".[Cause: CASDK-0005]:
CASDK-0005: A connector specific exception was raised by the application.
java.net.ProtocolException: Server redirected too many times (20)
Server redirected too many times (20)

Enabling Echo Suppression Filters

During bidirectional object synchronization, echoes are generated. For example, an event triggered in Oracle Sales Cloud is synchronized through Oracle Integration Cloud Service to Oracle Service Cloud (with the Oracle RightNow Adapter), which then triggers an event in Oracle Service Cloud and then back to Oracle Sales Cloud, and so on. Oracle Integration Cloud Service-based integrations use echo suppression to prevent unwanted update or create events (the echoes) from returning to the source application.
Filtering is used at the source application together with a LastUpdatedBy attribute in the record payload. Oracle Integration Cloud Service uses the account FUSION_APPS_ICS_APPID to invoke each application’s API. This means the payload of the echo event being raised after synchronization contains the Oracle Integration Cloud Service user FUSION_APPS_ICS_APPID as the LastUpdatedBy account. Therefore, each synchronization flow implements filtering at the source based on the account Oracle Integration Cloud Service uses to invoke that application's API.

While the filtering is defined in Oracle Integration Cloud Service, the filters are passed to the Oracle Sales Cloud event handler framework at activation/subscription time so that run-time filtering occurs in Oracle Sales Cloud.

The Oracle Sales Cloud event handler framework evaluates the echo suppression expression after the internal event has been enriched to prevent the echo payload push to Oracle Integration Cloud Service.

- Echo suppression expression for account create/update flows is as follows:

- Echo suppression expression for contact create/update flows is as follows:

  `<xpathExpr xmlns:ns_0='http://xmlns.oracle.com/adf/svc/types/' xmlns:ns_5='http://xmlns.oracle.com/apps/crmCommon/salesParties/contactService/'>$eventPayload/ns_1:result/ns_0:Value/ns_5:LastUpdatedBy'!= 'FUSION_APPS_ICS_APPID';</xpathExpr>

**Integrating Groovy Scripts**

The Oracle Sales Cloud Adapter inbound endpoint WSDL interface supports the use of concrete values for custom business objects in the WSDL in place of xsd:anyType parameters. This feature enables you to use the groovy script editor to create scripts to invoke integrations. The groovy script editor is unable to recognize xsd:anyType parameters.

Perform the following high level steps from the CRM Fusion Home page (that is, the Fuse user interface) to integrate the groovy script.

---

**Note:** If you have existing integrations with inbound endpoints (with custom business objects having xsd:anyType) generated using an Oracle Integration Cloud Service version prior to 16.3.3 and want to use groovy scripts, the integration must be re-edited and all artifacts must be generated again.

---

1. Create a sandbox environment in Oracle Sales Cloud.
   a. In the upper right corner, select **Settings > Manage Sandboxes**.
   b. Create a sandbox.
   c. Select **Set as Active** to activate the sandbox.
2. On the desktop, click **Tools > Application Composer**.
3. Register the Oracle Integration Cloud Service web service.
   a. Click Web Services.
   b. Click the icon to create a new web service connection.
   c. Enter the name and WSDL URL, then click Read WSDL.
   d. Complete the other fields on the page, then save and close the page.

4. Create the object function to invoke the process method of the web service.
   a. In the left navigation pane, click Object Workflows.
   b. Expand Objects > Custom Objects > CommonObject > common_object_name, then select Server Scripts.
   c. From the Actions dropdown list, select Add.
   d. Enter a function name and select a return value (for example, void).
   e. On the right side of the page, click Show/Hide Function Palette.
   f. Click Web Services.
   g. With the process function selected, click Insert.
      The Edit Script field is partially populated with the code for invoking the process method of the web service.
   h. Complete the script to create the object function. For example:

   ```java
   def ICSI_CrmCommonRefCO =
   [[
     RecordName : 'CustomObjectTest_1DUDev_3',
   ]]
   def newObj = adf.webServices.GSCDemo.process(ICSI_CrmCommonRefCO)
   ```
   i. Click Validate.
   j. Save and close.
5. Create the action to execute the function and expose the action as a button in the user interface.
   a. In the left navigation pane, click **Actions and Links**.
   b. From the **Actions** dropdown list, select **Create**.
   c. Enter a display label and name.
   d. From the **Method Name** dropdown list, select the method to use.
   e. On the right side of the page, select **Script** from the **Source** dropdown list.
   f. In the left navigation pane, click **Pages**.
   g. Click **Desktop Pages**.
   h. Click **Edit Creation Page**.
   i. In the **Configure Detail Form: Buttons and Actions** section, move the button you created to the **Selected Buttons** section.
   j. Save and close.
   k. Click the **Home** icon at the top of the page.

6. Execute the action by clicking the button.

### Uploading an SSL Certificate

Certificates are used to validate outbound SSL connections. If you make an SSL connection in which the root certificate does not exist in Oracle Integration Cloud Service, an exception is thrown. In that case, you must upload the appropriate certificate. A certificate enables Oracle Integration Cloud Service to connect with external services. If the external endpoint requires a specific certificate, request the certificate and then upload it into Oracle Integration Cloud Service.

To upload a certificate:

1. From the Oracle Integration Cloud Service home page, click the **Administration** tab in the upper right corner.

   All certificates currently uploaded to the trust store are displayed in the Certificates dialog. The **Filter By > Type** list displays the following details:

   - **Preinstalled**: Displays the certificates automatically installed in Oracle Integration Cloud Service. These certificates cannot be deleted.
   - **Uploaded**: Displays the certificates uploaded by individual users. These certificates can be deleted and updated.

   You can also search for certificates in the **Search** field. The search results are limited to a maximum of ten records sorted by name for performance and usability reasons. To ensure that your search results are more granular, enter as much of the certificate name as possible.

2. Click **Upload** at the top of the page.

3. In the Upload Certificate dialog box, enter a unique identifier for the certificate.

   This is a name you can use to identify the certificate.
4. Click **Browse** to locate the certificate file (.cer).

5. Click **Upload**.

6. Click the certificate name to view details such as the subject of the certificate, the issuer of the certificate, the date the certificate was issued, and the date the certificate expires.

**Creating a Connection**

The first step in creating an integration is to create the connections to the applications with which you want to share data.

1. In the Integration Cloud Service toolbar, click **Designer**.

2. On the Designer Portal, click **Connections**.

3. Click **New Connection**.

   The Create Connection — Select Adapter dialog is displayed.

4. Select an adapter from the dialog. You can also search for the type of adapter to use by entering a partial or full name in the Search field, and clicking **Search**.

   The New Connection — Information dialog is displayed.

5. Enter the information to describe the connection.

   - Enter a meaningful name to help others find your connection when they begin to create their own integrations. The name you enter is automatically added in capital letters to the **Identifier** field. If you modify the identifier name, do not include a blank space (for example, **OSC Inbound**).

   - Select the role (direction) in which to use this connection (trigger, invoke, or both). Only the roles supported by this adapter are displayed for selection. When you select a role, only the connection properties and security policies appropriate to that role are displayed on the Connections page. If you select an adapter that supports both invoke and trigger, but select only one of those roles, then try to drag the adapter into the section you did not select, you receive an error (for example, configure an Oracle RightNow Cloud Adapter as only an invoke, but drag the adapter to the trigger section).

   - Enter an optional description of the connection.
6. Click Create.

Your connection is created and you are now ready to configure connection details, such as email contact, connection properties, security policies, and connection login credentials.

Adding a Contact Email

From the Connection Administrator section of the connection, you can add a contact email address for notifications.

1. In the Email Address field, enter an email address to receive email notifications when problems occur.
2. In the upper right corner, click Save.

Configuring Connection Properties

Enter connection information so your application can process requests.

1. Click Configure Connectivity.

The Connection Properties dialog is displayed.

2. In the WSDL URL field, specify the URL to use in this integration:
   - OSC Services Catalog WSDL URL
   - OSC Events Catalog URL (optional)
   - Interface Catalog URL (optional)

For information about obtaining the URL, see Obtaining the Oracle Sales Cloud Adapter Service Catalog Service WSDL, Event Catalog URL, or Interface Catalog URL.

3. Click OK.

**Configuring Connection Security**

Configure security for your Update Adapter Product Name connection by selecting the security policy and security token.

1. Click **Configure Security**.
2. Enter your login credentials:
   a. Select the security policy. Only the Username Password Token policy is supported. It cannot be deselected.
   b. Enter a username and password.
   c. Reenter the password a second time.
3. Click **OK**.

**Testing the Connection**

Test your connection to ensure that it is successfully configured.

1. In the upper right corner of the page, click **Test**.
   - If successful, the following message is displayed and the progress indicator shows 100%.
     
     The connection test was successful!
   
   2. If your connection was unsuccessful, an error message is displayed with details. Verify that the configuration details you entered are correct.
   
   3. When complete, click **Save**.

**Editing a Connection**

You can edit connection settings after creating a new connection.

1. In the Oracle Integration Cloud Service toolbar, click **Designer**.
2. On the Designer Portal, click **Connections**.
3. On the Connections page, search for the connection name.
4. Select **Edit** from the connection **Actions** menu or click the connection name.
   
   The Connection page is displayed.
5. To edit the notification email contact, change the email address in the **Email Address** field.
6. To edit the connection properties, click **Configure Connectivity**. Note that some connections do not include this button. If your connector does not include a **Configure Connectivity** button, then click the **Configure Credentials** button.

### Cloning a Connection
You can clone a copy of an existing connection. It is a quick way to create a new connection.

1. In the Oracle Integration Cloud Service toolbar, click **Designer**.
2. On the Designer Portal, click **Connections**.
3. On the Connections page, search for the connection name.
4. Select **Clone** from the connection **Actions** menu.

The Clone Connection dialog is displayed.

5. Enter the connection information.
6. Click **Clone**.
7. Click **Edit** to configure the credentials of your cloned connection. Cloning a connection does not copy the credentials.

See [Editing a Connection](#) for instructions.

### Deleting a Connection
You can delete a connection from the connection menu.

1. In the Oracle Integration Cloud Service toolbar, click **Designer**.
2. On the Designer Portal, click **Connections**.
3. On the Connections page, search for the connection name.
4. Click **Delete** from the connection **Actions** menu.

The Delete Connection dialog is displayed if the connection is not used in an integration.

5. Click **Yes** to confirm deletion.
Refreshing Integration Metadata

You can manually refresh the currently-cached metadata available to adapters that have implemented metadata caching. Metadata changes typically relate to customizations of integrations, such as adding custom objects and attributes to integrations. There may also be cases in which integrations have been patched, which results in additional custom objects and attributes being added. This option is similar to clearing the cache in your browser. Without a manual refresh, a staleness check is only performed when you drag a connection into an integration. This is typically sufficient, but in some cases you may know that a refresh is required. For these cases, the \textit{Refresh Metadata} menu option is provided.

To refresh integration metadata:

\begin{itemize}
\item \textbf{Note:} The \textit{Refresh Metadata} menu option is only available with adapters that have implemented metadata caching.
\end{itemize}

1. In the Integration Cloud Service toolbar, click \textbf{Designer}.

2. In the Designer Portal, click \textbf{Connections}.

3. Locate the connection to refresh.

4. From the menu at the right, select \textit{Refresh Metadata}.

A message is displayed indicating that the refresh was successful.

\begin{quote}
\textit{Metadata refresh for connection "connection_type" has been initiated successfully.}
\end{quote}
Creating an Integration

Integrations use the adapter connections you created to your applications, and define how information is shared between those applications. You can view, export, create, import, edit, or delete integrations; create integrations to publish or subscribe to messages; add and remove request and response enrichment triggers; and create routing paths for different target endpoints in integrations. Click the following topics for more information.

**Topic**

- Creating Integrations (in *Using Oracle Integration Cloud Service*)
Adding the Oracle Sales Cloud Adapter Connection to an Integration

When you drag the Oracle Sales Cloud Adapter into the trigger and invoke area of an integration, the Cloud Endpoint Configuration Wizard is invoked. This wizard guides you through configuration of the Oracle Sales Cloud Adapter endpoint properties.

The following sections describe the wizard pages that guide you through configuration of the Oracle Sales Cloud Adapter as a trigger or invoke in an integration.

Topics

- Configuring Basic Information Properties
- Configuring Oracle Sales Cloud Trigger Request Properties
- Configuring Oracle Sales Cloud Trigger Response Properties
- Configuring Oracle Sales Cloud Invoke Operation Properties
- Reviewing Configuration Values on the Summary Page

For more information about the Oracle Sales Cloud Adapter, see Oracle Sales Cloud Adapter Capabilities.

Configuring Basic Information Properties

You can enter a name and description on the Basic Info page of each adapter in your integration.

Topics

- What You Can Do from the Basic Info Page
- What You See on the Basic Info Page

What You Can Do from the Basic Info Page

You can specify the following values on the Basic Info page. The Basic Info page is the initial wizard page that is displayed whenever you drag an adapter to the section of the integration canvas supported by your adapter.

- Specify a meaningful name.
- Specify a description of the responsibilities.
**What You See on the Basic Info Page**

The following table describes the key information on the Basic Info page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| What do you want to call your endpoint?   | Provide a meaningful name so that others can understand the responsibilities of this connection. You can include English alphabetic characters, numbers, underscores, and dashes in the name. You cannot include the following:  
  • Blank spaces (for example, My Inbound Connection)  
  • Special characters (for example, #:83& or right(now4)  
  • Multibyte characters                                                                 |
| What does this endpoint do?               | Enter an optional description of the connection's responsibilities. For example:  
  This connection receives an inbound request to synchronize account information with the cloud application. |

**Configuring Oracle Sales Cloud Trigger Request Properties**

Enter the Oracle Sales Cloud connection trigger request values for your integration. The values you specify start the integration.

**Topics**

- What You Can Do from the Oracle Sales Cloud Source Request Page
- What You See on the Oracle Sales Cloud Source Request Page

**What You Can Do from the Oracle Sales Cloud Trigger Request Page**

You can select the following trigger request values for the Oracle Sales Cloud application.

Select the specific type to receive as a request from Oracle Sales Cloud. Your ability to select either a business object or event subscription is based on the content of the WSDL file (for business objects) or event catalog URL (for event subscriptions) you specified during Oracle Sales Cloud Adapter configuration.

- Select to receive a business object as a request from Oracle Sales Cloud. This selection invokes the integration.
- Select to receive an event subscription raised by the Oracle Sales Cloud application as a request from Oracle Sales Cloud. This selection invokes the integration.
Note: If the options for selecting business objects and events are missing, that indicates that the event catalog URL was not supplied on the Connections page.

What You See on the Oracle Sales Cloud Trigger Request Page

The following table describes the key information on the Oracle Sales Cloud Adapter trigger Request page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure a Request</td>
<td>Select the request type appropriate to your integration. The fields that are displayed below are based on the request type that you select.</td>
</tr>
<tr>
<td></td>
<td>• <strong>With Business Objects</strong>: Select to display a list of business objects.</td>
</tr>
<tr>
<td></td>
<td>• <strong>With Business Events</strong>: Select to display a list of event subscriptions.</td>
</tr>
<tr>
<td>Select a Business Object</td>
<td>Select the business object from the Oracle Sales Cloud application to receive as a request that starts the integration.</td>
</tr>
<tr>
<td>(is displayed if <strong>With Business Objects</strong> is</td>
<td></td>
</tr>
<tr>
<td>selected)</td>
<td></td>
</tr>
<tr>
<td>Business Event For Subscription</td>
<td>Select the event subscription from the Oracle Sales Cloud application to which to subscribe. This event is received as a request that starts the integration. Only events that can be subscribed to are displayed.</td>
</tr>
<tr>
<td>(is displayed if <strong>With Business Events</strong> is</td>
<td></td>
</tr>
<tr>
<td>selected)</td>
<td></td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **Filter Expr for Business_Event_Name**  
(is displayed if **With Business Events** is selected) | Enter an event condition filter expression. A filter expression specifies that the contents (payload or headers) of a message be analyzed before any event subscription is sent. For example, you can apply a filter expression that specifies that an event subscription be sent only if the message includes a customer ID. When the expression logic is satisfied, the event is accepted for delivery to the integration.  
As another example, assume you have the following event payload and want to process records where OwnerName is provided. |

```xml
...<Body xmlns="http://schemas.xmlsoap.org/soap/envelope/">
  <ns01:onEvent
    xmlns:ns01="http://xmlns.oracle.com/cloud/adapter/osc/UpdateCustomerFromAccount_REQUEST/types">
    <ns0:getAccountResponse
      xmlns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd"
      xmlns:wsa="http://www.w3.org/2005/08/addressing"
      xmlns:ns0="http://xmlns.oracle.com/cloud/adapter/osc/UpdateCustomerFromAccount_REQUEST/types"
      xmlns:env="http://schemas.xmlsoap.org/soap/envelope/">
      <ns0:result
        xmlns:ns4="http://xmlns.oracle.com/apps/crmCommon/salesParties/accountService/
        xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
        xmlns:ns3="http://xmlns.oracle.com/apps/crmCommon/notes/noteService"
        xmlns:ns0="http://xmlns.oracle.com/apps/crmCommon/salesParties/accountService/types/
        xsi:type="ns4:Account">
        <ns4:PartyId>100000003362469</ns4:PartyId>
        <ns4:PartyNumber>AIMA-16BBRP</ns4:PartyNumber>
        <ns4:SourceSystem>CPI</ns4:SourceSystem>
```

---

4-4 Using the Oracle Sales Cloud Adapter
The incoming event payload is referenced with $inputVariable. The payload response from the enrichment service can be referenced with $eventPayload. Given the event payload, you reference OwnerName as follows:

```xml
<xpathExpr xmlns:ns0="http://xmlns.oracle.com/cloud/adapter/osc/
UpdateCustomerFromAccount_REQUEST/types" xmlns:ns1="http://xmlns.oracle.com/apps/crmCommon/salesParties/accountService/>
$inputVariable/ns0:result/ns1:OwnerName = 'Jim Hays'</xpathExpr>
```

### Filter by object name or Filter By Event Name

<table>
<thead>
<tr>
<th>Filter by object name or Filter By Event Name</th>
<th>Type the initial letters of the name to filter the display of business objects or event subscriptions.</th>
</tr>
</thead>
</table>

Configuring Oracle Sales Cloud Trigger Response Properties

Enter the Oracle Sales Cloud trigger response values for your integration.

Adding the Oracle Sales Cloud Adapter Connection to an Integration 4-5
Topics

- What You Can Do from the Oracle Sales Cloud Source Response Page
- What You See on the Oracle Sales Cloud Source Response Page

What You Can Do from the Oracle Sales Cloud Source Response Page

You can configure the operation and business object that comprise the response type for Oracle Sales Cloud.

- Immediate (synchronous) response: A response business object is immediately returned as output. You select **Immediate** as the response type on the Response page and select the business object as part of the response to the client.

- Delayed (asynchronous) response: A callback service to which to route the callback is exposed. You select **Delayed** as the response type on the Response page and select the operation and business object that comprise a successful callback response, a failed callback response, or both.

- No response is required: You select **None** on the Response page because a response is not required.

The Response page looks as follows:

![Response page screenshot]

What You See on the Oracle Sales Cloud Source Response Page

Select the business object for the integration to send as a response document to the Oracle Sales Cloud application.

The following types of responses are available:

- Immediate: A synchronous response is required (See Table 4-1 for instructions)
- Delayed: An asynchronous response is required (See Table 4-2 for instructions)
- None: No response is required (See Table 4-3 for instructions)
### Table 4-1  Response Type — Immediate (Synchronous) Response is Required

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response Type</td>
<td>Select <strong>Immediate</strong> for the Oracle Sales Cloud application to wait until a response is received from the integration. This is also known as the request and response message exchange pattern. This is the default selection.</td>
</tr>
<tr>
<td>Filter by object name</td>
<td>Type the initial letters to filter the display of business objects.</td>
</tr>
<tr>
<td>Select a Business Object</td>
<td>Select the business object to receive from the Oracle Sales Cloud application as a response. You can filter the display of business objects by typing the initial letters of business objects in the <strong>Filter by object name</strong> field. A description of the selected business object is displayed below this list.</td>
</tr>
</tbody>
</table>

### Table 4-2  Response Type — Delayed (Asynchronous) Response is Required

<table>
<thead>
<tr>

</table>
Element | Description
---|---
Select the Operation to Perform on the Business Object/Resource or Service | Select the operation to perform on the selected business object, business (REST) resource, or service.
Life Cycle | Displays the state of the selected business object or service. Deprecated indicates the business document is nearing the end of use and must be used with caution.
Description | Displays a description of the selected business object or service.

### Reviewing Configuration Values on the Summary Page
You can review the specified adapter configuration values on the Summary page.

#### Topics
- What You Can Do from the Summary Page
- What You See on the Summary Page

### What You Can Do from the Summary Page
You can review configuration details from the Summary page. The Summary page is the final wizard page for each adapter after you have completed your configuration.

- View the configuration details you defined for the adapter. For example, if you have defined an inbound trigger (source) adapter with a request business object and immediate response business object, specific details about this configuration are displayed on the Summary page.
- Click **Done** if you want to save your configuration details.
- Click a specific tab in the left panel or click **Back** to access a specific page to update your configuration definitions.
- Click **Cancel** to cancel your configuration details.

### What You See on the Summary Page
The following table describes the key information on the Summary page.
<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>Displays a summary of the source or target configuration values you defined on previous pages of the wizard. For adapters for which a generated XSD file is provided, click the XSD link to view a read-only version of the file. To return to a previous page to update any values, click the appropriate tab in the left panel or click Back.</td>
</tr>
</tbody>
</table>
Creating Mappings and Lookups in Integrations

You must map data between trigger connections and invoke connections in integrations. You can also optionally create lookups in integrations.

Topics

- Mapping Integration Cloud Service Data (in Using Oracle Integration Cloud Service)
- Creating Lookups (in Using Oracle Integration Cloud Service)
Oracle Integration Cloud Service provides you with the information and tools required to activate, monitor, and manage your integrations in the runtime environment.

**Topic**

- Administering Integration Cloud Service (in *Using Oracle Integration Cloud Service*)
Review the following topics to learn about troubleshooting issues with the Oracle Sales Cloud Adapter.

**Topics**

- If you receive an authentication failure error message when testing the Oracle Sales Cloud connection, you must file a service request with Oracle Support Services to create the CSF key:

  For more information, see [Logging an Oracle Service Request to Create a CSF Key for Event Subscriptions](#).
