Oracle® Cloud
Using the Salesforce Adapter
Release 16.4
E66628-04

December 2016
This guide describes how to configure and add the Salesforce Adapter to an integration in Oracle Integration Cloud Service.
# Contents

6 Administering Integrations ................................................................. 6-1
Preface

*Using the Salesforce Adapter* describes how to use the Salesforce Adapter as a connection in your integration.

**Topics:**
- Audience
- Related Resources
- Conventions

**Audience**

*Using the Salesforce Adapter* is intended for users who want to use the Salesforce Adapter in integrations.

**Related Resources**

For more information, see these Oracle resources:
- Oracle Cloud
  [http://cloud.oracle.com](http://cloud.oracle.com)
- *Using Oracle Integration Cloud Service*
- *Using the Oracle Mapper*
- *Getting Started with Oracle Cloud*
- *Managing and Monitoring Oracle Cloud*

**Conventions**

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>Convention</td>
<td>Meaning</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Getting Started with the Salesforce Adapter

Review the following conceptual topics to learn about the Salesforce Adapter and how to use it as a connection in integrations in Oracle Integration Cloud Service. A typical workflow of adapter and integration tasks is also provided.

Topics

• Salesforce Adapter Capabilities
• What Application Version Does the Salesforce Adapter Support?
• About Oracle Integration Cloud Service
• About Oracle Integration Cloud Service Connections
• About Oracle Integration Cloud Service Integrations
• About Salesforce Adapter Use Cases
• Typical Workflow for Creating and Including an Adapter Connection in an Integration

Salesforce Adapter Capabilities

The Salesforce Adapter enables you to create an integration with Salesforce CRM applications.

The Salesforce Adapter provides the following benefits:

• Integrates easily with the Salesforce application’s WSDL file to produce a simplified, integration-centric WSDL.
• Contacts the Salesforce application to fetch metadata information about business objects.
• Provides invoke (target) support for performing the following type of operations against business objects fetched from the Salesforce application:
  – CRUD (create, get, update, and destroy) operations
  – Salesforce Object Query Language (SOQL) or Salesforce Object Search Language (SOSL) query operations
• Provides invoke (outbound) support for using a custom WSDL that includes custom Apex classes exposed as SOAP web services.
• Provides trigger (source) messaging support for objects through use of the Salesforce outbound messaging WSDL.
• Provides trigger (source) callback support.
• Provides metadata caching support. For information, see Refreshing Integration Metadata.

What Application Version Does the Salesforce Adapter Support?
The Salesforce Adapter is compatible with all supported versions of Salesforce.com. Review the end-of-life and support policy of Salesforce.com for more information.

About Oracle Integration Cloud Service
Oracle Integration Cloud Service is a complete, secure, but lightweight integration solution that enables you to connect your applications in the cloud. It simplifies connectivity between your applications and connects both your applications that live in the cloud and your applications that still live on premises. Oracle Integration Cloud Service provides secure, enterprise-grade connectivity regardless of the applications you are connecting or where they reside.

Oracle Integration Cloud Service provides native connectivity to Oracle Software as a Service (SaaS) applications, such as Oracle Sales Cloud, Oracle RightNow Cloud, and so on. Oracle Integration Cloud Service adapters simplify connectivity by handling the underlying complexities of connecting to applications using industry-wide best practices. You only need to create a connection that provides minimal connectivity information for each system. Oracle Integration Cloud Service lookups map the different codes or terms used by the applications you are integrating to describe similar items (such as country or gender codes). Finally, the visual data mapper enables you to quickly create direct mappings between the trigger and invoke data structures. From the mapper, you can also access lookup tables and use standard XPath functions to map data between your applications.

Once you integrate your applications and activate the integrations to the runtime environment, the dashboard displays information about the running integrations so you can monitor the status and processing statistics for each integration. The dashboard measures and tracks the performance of your transactions by capturing and reporting key information, such as throughput, the number of messages processed successfully, and the number of messages that failed processing. You can also manage business identifiers that track fields in messages and manage errors by integrations, connections, or specific integration instances.

About Oracle Integration Cloud Service Connections
Connections define information about the instances of each configuration you are integrating. Oracle Integration Cloud Service includes a set of predefined adapters, which are the types of applications on which you can base your connections, such as Oracle Sales Cloud, Oracle Eloqua Cloud, Oracle RightNow Cloud, and others. A connection is based on an adapter. A connection includes the additional information required by the adapter to communicate with a specific instance of an application (this can be referred to as metadata or as connection details). For example, to create a connection to a specific RightNow Cloud application instance, you must select the Oracle RightNow adapter and then specify the WSDL URL, security policy, and security credentials to connect to it.
About Oracle Integration Cloud Service Integrations

Integrations are the main ingredient of Oracle Integration Cloud Service. An integration includes at least a trigger (source) connection (for requests sent to Oracle Integration Cloud Service) and invoke (target) connection (for requests sent from Oracle Integration Cloud Service to the target) and the field mapping between those two connections.

When you create your integrations, you build on the connections you already created by defining how to process the data for the trigger (source) and invoke (target) connections. This can include defining the type of operations to perform on the data, the business objects and fields against which to perform those operations, required schemas, and so on. To make this easier, the most complex configuration tasks are handled by Oracle Integration Cloud Service. Once your trigger (source) and invoke (target) connections are configured, the mappers between the two are enabled so you can define how the information is transferred between the trigger (source) and invoke (target) data structures for both the request and response messages.

About Salesforce Adapter Use Cases

The Salesforce Adapter can integrate with Salesforce.com. Use the Salesforce Adapter to send data to Salesforce.com and also receive events from Salesforce.com.

The following are some common use cases:

- Account and contact synchronization between Salesforce and ERP (such as Oracle E-Business Suite and Netsuite).
- Opportunity to order synchronization between Salesforce and ERP systems.
- Employee on-boarding from HCM systems to Salesforce.com.

Typical Workflow for Creating and Including an Adapter Connection in an Integration

You follow a very simple workflow to create a connection with an adapter and include the connection in an integration in Oracle Integration Cloud Service.

This table lists the workflow steps for both adapter tasks and overall integration tasks, and provides links to instructions for each step.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create the adapter connections for the applications you want to integrate. The connections can be reused in multiple integrations and are typically created by the administrator.</td>
<td>Creating a Salesforce Adapter Connection</td>
</tr>
<tr>
<td>2</td>
<td>Create the integration. When you do this, you add trigger and invoke connections to the integration.</td>

Typical Workflow for Creating and Including an Adapter Connection in an Integration

1-4 Using the Salesforce Adapter
Creating a Salesforce Adapter Connection

A connection is based on an adapter. You define connections to the specific cloud applications that you want to integrate. The following topics describe how to define connections.

Topics

- Prerequisites for Creating a Connection
- Uploading an SSL Certificate
- Creating a Connection
- Editing a Connection
- Cloning a Connection
- Deleting a Connection
- Refreshing Integration Metadata

Prerequisites for Creating a Connection

You must satisfy the following prerequisites to create a connection with the Salesforce Adapter:

- Understand Salesforce constraints. For more information, see Understanding Salesforce Cloud Constraints.
- If you are new to Salesforce, you must create a free Salesforce development organization. This registration provides you with the ability to create a WSDL to use in an integration. For information, visit https://www.salesforce.com.
- Create the type of WSDL to use in an integration:
  - Enterprise WSDL: For information, see Creating the Salesforce Adapter Enterprise WSDL.
  - Outbound messaging WSDL: For information, see Creating the Salesforce Adapter Outbound Messaging WSDL.
  - Custom WSDL: For information, see Creating the Salesforce Adapter Custom WSDL.

Understanding Salesforce Cloud Constraints

You must be aware of the following constraints before configuring the Salesforce Adapter.
• The Salesforce Adapter uses the SalesForceDotCom (SFDC) API for all activities. Therefore, it is subject to any Salesforce API limitations. The limitations are defined in the Salesforce Limits Quick Reference Guide.

• Not all the push topic queries are supported by Salesforce. See Supported Push Topic Queries and Unsupported PushTopic Queries.

• Client applications must adhere to Salesforce’s SOAP API support policy and backward compatibility terms. These terms are available at SFDC SOAP API Support Policy.

Creating the Salesforce Adapter Enterprise WSDL

You must create the Salesforce Adapter enterprise WSDL to include in an integration. You then specify this WSDL when creating a Salesforce Adapter connection on the Connections page.

To create the Salesforce Adapter enterprise WSDL:

1. Log in to your Enterprise, Unlimited, or Developer Edition Salesforce.com account. Open the Web browser and enter the following URL:
   www.salesforce.com

2. Log in to Salesforce.com using a valid user name and password.
   You must log in as an administrator or user with the Modify All Data permission. Logins are checked to ensure that they are from a known IP address.

3. Under App Setup, Expand Develop and click API to display the WSDL download page.

4. If the organization has managed packages installed in the organization, click Generate Enterprise WSDL. Salesforce prompts you to select the version of each installed package to include in the generated WSDL or right-click Generate Enterprise WSDL and save it to a local directory.
   In the right-click menu, Internet Explorer users can choose Save Target As, while Mozilla Firefox users can choose Save Link As to save it to the local directory.
   The Save dialog is displayed.

5. Provide a name for the WSDL file and a location to save the file on your file system, and click Save. For information about uploading this WSDL when creating a connection, see Configuring Connection Properties.

Creating the Salesforce Adapter Outbound Messaging WSDL

You can create an outbound messaging WSDL for the Salesforce Adapter. You then select this WSDL when configuring the Salesforce Adapter as a trigger in the Outbound Messaging page of the Adapter Endpoint Configuration Wizard.

This process consists of several steps:

• The outbound message consists of a workflow, approval, or milestone action that sends your specified information to your specified endpoint. You configure outbound messaging in the Salesforce setup menu. Afterward, you configure the endpoint.

To create a workflow rule:
1. Log in to your Salesforce account and go to Setup.

2. Under the App Setup menu, expand Create, followed by Workflow & Approvals.

3. Select a workflow rule or approval process as per your integration requirement.

4. Click Create New, provide the required information in the following wizards, and click Save.
   a. For the workflow rule, click Edit under the Workflow Action menu followed by Add Workflow Action, and then New Outbound Message.
   b. For the approval process, click Add New (you can select for one or more actions including Submission, Approval, Rejection, and Recall) followed by New Outbound Message.

Outbound messaging WSDLs associated with approval processes or entitlement processes are also supported and consumed by the adapter.

- Create the Salesforce outbound messaging WSDL at www.salesforce.com. You then select this WSDL to receive outbound message notifications from the Salesforce application on the Outbound Messaging page in the Adapter Endpoint Configuration Wizard. For instructions, see What You See on the Salesforce Cloud Trigger Outbound Messaging Properties.

   To create the Salesforce outbound messaging WSDL:
   1. Log in to your Salesforce account and go to Setup > Outbound Messages.
   2. Select the required object, and click Next.
   3. Enter other required details (in the Endpoint URL field, enter a dummy URL), and click Save.
   4. Click Generate WSDL to download the WSDL.
   5. Drag the Salesforce Adapter to the trigger (inbound) section of the integration canvas. This invokes the Adapter Endpoint Configuration Wizard.
   7. Activate the integration and copy the endpoint URL from the integration information icon.
   8. Go to the Outbound Messaging section at www.salesforce.com and replace the dummy URL you entered in Step 3 with the real endpoint URL.

**Creating the Salesforce Adapter Custom WSDL**

You can create a custom WSDL that includes custom Apex classes written on force.com and exposed as SOAP web services. This enables external applications to access your code and application.

You then select the custom WSDL when configuring the Salesforce Adapter in the invoke direction on the Basic Info page of the Adapter Endpoint Configuration Wizard. For instructions, see What You See on the Salesforce Cloud Invoke Basic Info Page.
For more information about custom WSDLs, see Exposing Apex Methods as SOAP Web Services.

**Uploading an SSL Certificate**

Certificates are used to validate outbound SSL connections. If you make an SSL connection in which the root certificate does not exist in Oracle Integration Cloud Service, an exception is thrown. In that case, you must upload the appropriate certificate. A certificate enables Oracle Integration Cloud Service to connect with external services. If the external endpoint requires a specific certificate, request the certificate and then upload it into Oracle Integration Cloud Service.

To upload a certificate:

1. From the Oracle Integration Cloud Service home page, click the Administration tab in the upper right corner.

   All certificates currently uploaded to the trust store are displayed in the Certificates dialog. The Filter By > Type list displays the following details:

   - **Preinstalled**: Displays the certificates automatically installed in Oracle Integration Cloud Service. These certificates cannot be deleted.
   - **Uploaded**: Displays the certificates uploaded by individual users. These certificates can be deleted and updated.

   You can also search for certificates in the Search field. The search results are limited to a maximum of ten records sorted by name for performance and usability reasons. To ensure that your search results are more granular, enter as much of the certificate name as possible.

2. Click Upload at the top of the page.

3. In the Upload Certificate dialog box, enter a unique identifier for the certificate.

   This is a name you can use to identify the certificate.

4. Click Browse to locate the certificate file (.cer).

5. Click Upload.

6. Click the certificate name to view details such as the subject of the certificate, the issuer of the certificate, the date the certificate was issued, and the date the certificate expires.

**Creating a Connection**

The first step in creating an integration is to create the connections to the applications with which you want to share data.

1. In the Integration Cloud Service toolbar, click Designer.

2. On the Designer Portal, click Connections.

3. Click New Connection.

   The Create Connection — Select Adapter dialog is displayed.

4. Select an adapter from the dialog. You can also search for the type of adapter to use by entering a partial or full name in the Search field, and clicking Search.
5. Enter the information to describe the connection.

- Enter a meaningful name to help others find your connection when they begin to create their own integrations. The name you enter is automatically added in capital letters to the **Identifier** field. If you modify the identifier name, do not include a blank space (for example, **OSC Inbound**).

- Select the role (direction) in which to use this connection (trigger, invoke, or both). Only the roles supported by this adapter are displayed for selection. When you select a role, only the connection properties and security policies appropriate to that role are displayed on the Connections page. If you select an adapter that supports both invoke and trigger, but select only one of those roles, then try to drag the adapter into the section you did not select, you receive an error (for example, configure an Oracle RightNow Cloud Adapter as only an invoke, but drag the adapter to the trigger section).

- Enter an optional description of the connection.

6. Click **Create**.

Your connection is created and you are now ready to configure connection details, such as email contact, connection properties, security policies, and connection login credentials.

**Adding a Contact Email**

From the Connection Administrator section of the connection, you can add a contact email address for notifications.

1. In the **Email Address** field, enter an email address to receive email notifications when problems occur.

2. In the upper right corner, click **Save**.
Configuring Connection Properties

Enter connection information so your application can process requests.

1. Click **Configure Connectivity**.

   The Connection Properties dialog is displayed.

2. Select the **Upload File** checkbox, then click **Upload** to select the enterprise WSDL URL to use in this integration. The enterprise WSDL is mandatory and must be specified regardless of whether you are also using a custom WSDL or an outbound messaging WSDL. For instructions on creating this WSDL, see Creating the **Salesforce Adapter Enterprise WSDL**.

3. Click **OK**.

4. Configure connection security. See **Configuring Connection Security**.

Configuring Connection Security

Configure security for your Salesforce Adapter connection by selecting the security policy and security token.

1. Click **Configure Credentials**.

2. Enter your login credentials:
   a. Select the security policy. Only the Salesforce Login Token policy is supported. It cannot be deselected.
   b. Enter the username and password that provide access to the destination web service.
   c. Reenter the password a second time.

3. Click **OK**.

Testing the Connection

Test your connection to ensure that it is successfully configured.

1. In the upper right corner of the page, click **Test**.

   If successful, the following message is displayed and the progress indicator shows 100%.

   **The connection test was successful!**

2. If your connection was unsuccessful, an error message is displayed with details. Verify that the configuration details you entered are correct.

3. When complete, click **Save**.

Editing a Connection

You can edit connection settings after creating a new connection.

1. In the Oracle Integration Cloud Service toolbar, click **Designer**.
2. On the Designer Portal, click Connections.
3. On the Connections page, search for the connection name.
4. Select Edit from the connection Actions menu or click the connection name.

The Connection page is displayed.
5. To edit the notification email contact, change the email address in the Email Address field.
6. To edit the connection properties, click Configure Connectivity. Note that some connections do not include this button. If your connector does not include a Configure Connectivity button, then click the Configure Credentials button.

Cloning a Connection
You can clone a copy of an existing connection. It is a quick way to create a new connection.

1. In the Oracle Integration Cloud Service toolbar, click Designer.
2. On the Designer Portal, click Connections.
3. On the Connections page, search for the connection name.
4. Select Clone from the connection Actions menu.

The Clone Connection dialog is displayed.
5. Enter the connection information.
6. Click Clone.
7. Click Edit to configure the credentials of your cloned connection. Cloning a connection does not copy the credentials.

See Editing a Connection for instructions.

Deleting a Connection
You can delete a connection from the connection menu.

1. In the Oracle Integration Cloud Service toolbar, click Designer.
2. On the Designer Portal, click **Connections**.

3. On the Connections page, search for the connection name.

4. Click **Delete** from the connection **Actions** menu.

   ![Actions](image)

   The Delete Connection dialog is displayed if the connection is not used in an integration.

5. Click **Yes** to confirm deletion.

### Refreshing Integration Metadata

You can manually refresh the currently-cached metadata available to adapters that have implemented metadata caching. Metadata changes typically relate to customizations of integrations, such as adding custom objects and attributes to integrations. There may also be cases in which integrations have been patched, which results in additional custom objects and attributes being added. This option is similar to clearing the cache in your browser. Without a manual refresh, a staleness check is only performed when you drag a connection into an integration. This is typically sufficient, but in some cases you may know that a refresh is required. For these cases, the **Refresh Metadata** menu option is provided.

To refresh integration metadata:

---

**Note:** The **Refresh Metadata** menu option is only available with adapters that have implemented metadata caching.

---

1. In the Integration Cloud Service toolbar, click **Designer**.

2. In the Designer Portal, click **Connections**.

3. Locate the connection to refresh.

4. From the menu at the right, select **Refresh Metadata**.

   ![Refresh Metadata](image)

   A message is displayed indicating that the refresh was successful.

   Metadata refresh for connection "connection_type" has been initiated successfully.
Integrations use the adapter connections you created to your applications, and define how information is shared between those applications. You can view, export, create, import, edit, or delete integrations; create integrations to publish or subscribe to messages; add and remove request and response enrichment triggers; and create routing paths for different target endpoints in integrations. Click the following topics for more information.

**Topic**

- Creating Integrations (in *Using Oracle Integration Cloud Service*)
Adding the Salesforce Adapter Connection to an Integration

When you drag the Salesforce Adapter into the trigger and invoke areas of an integration, the Adapter Endpoint Configuration Wizard is invoked. This wizard guides you through configuration of the Salesforce Adapter endpoint properties. The following sections describe the wizard pages that guide you through configuration of the Salesforce Adapter as a trigger or invoke in an integration.

Topics

• Configuring Basic Information Properties
• Configuring Salesforce Trigger Outbound Messaging Properties
• Configuring Salesforce Trigger Response Properties
• Configuring Salesforce Trigger Callback Response Properties
• Configuring Salesforce Invoke Basic Information Properties
• Configuring Salesforce Invoke Operation Properties
• Configuring Salesforce Invoke Header Properties
• Configuring Salesforce Invoke Custom Operations Properties
• Reviewing Configuration Values on the Summary Page
• Performing Salesforce Adapter Postconfiguration Tasks

For more information about the Salesforce Adapter, see Salesforce Adapter Capabilities.

Configuring Basic Information Properties

You can enter a name and description on the Basic Info page of each adapter in your integration.

Topics

• What You Can Do from the Basic Info Page
• What You See on the Basic Info Page
What You Can Do from the Basic Info Page

You can specify the following values on the Basic Info page. The Basic Info page is the initial wizard page that is displayed whenever you drag an adapter to the section of the integration canvas supported by your adapter.

- Specify a meaningful name.
- Specify a description of the responsibilities.

What You See on the Basic Info Page

The following table describes the key information on the Basic Info page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| What do you want to call your endpoint? | Provide a meaningful name so that others can understand the responsibilities of this connection. You can include English alphabetic characters, numbers, underscores, and dashes in the name. You cannot include the following:  
  - Blank spaces (for example, My Inbound Connection)  
  - Special characters (for example, #;836 or righ(t)now4)  
  - Multibyte characters |
| What does this endpoint do? | Enter an optional description of the connection’s responsibilities. For example: This connection receives an inbound request to synchronize account information with the cloud application. |

Configuring Salesforce Trigger Outbound Messaging Properties

Enter the Salesforce trigger outbound messaging values for your integration.

Topics

- What You Can Do from the Salesforce Cloud Trigger Outbound Messaging Properties Page
- What You See on the Salesforce Cloud Trigger Outbound Messaging Properties

What You Can Do from the Salesforce Cloud Trigger Outbound Messaging Properties Page

You can select the trigger outbound messaging WSDL to use with the Salesforce Adapter.
You must have already created this WSDL. This process consists of several steps. For information on creating the outbound Messaging WSDL, see Creating the Salesforce Adapter Outbound Messaging WSDL.

What You See on the Salesforce Cloud Trigger Outbound Messaging Properties

The following table describes the key information on the trigger Outbound Messaging page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| Select the Outbound Messaging WSDL | Select the invoke Salesforce outbound messaging WSDL to receive outbound message notifications from the Salesforce application. 
**Note:** You must first create a workflow rule and generate an outbound messaging WSDL as described in Creating the Salesforce Adapter Outbound Messaging WSDL. Outbound messaging WSDLs associated with approval processes or entitlement processes are also supported and consumed by the adapter. |

1. Browse for and select the invoke Salesforce outbound messaging WSDL

2. Activate the integration and copy the endpoint URL from the integration information icon.

3. Go to the **Outbound Messaging** section at www.salesforce.com and replace the dummy URL you entered in Creating the Salesforce Adapter Outbound Messaging WSDL with the real endpoint URL.

Configuring Salesforce Trigger Response Properties

Enter the Salesforce trigger response values for your integration.

**Topics**

- What You Can Do from the Salesforce Trigger Response Page
- What You See on the Salesforce Cloud Trigger Response Page

What You Can Do from the Salesforce Trigger Response Page

You can configure the response parameters for the Salesforce Adapter.

You can select the type of callback response to send as a response document from the integration flow to the Salesforce Cloud application.

- Configure to send no callback response.
- Configure the operation and business objects to use for a successful callback response.
- Configure the operation and business objects for a callback response for a failed integration flow.
What You See on the Salesforce Cloud Trigger Response Page

The following table describes the key information on the trigger Response page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a response</td>
<td>Deselect if no callback response is required.</td>
</tr>
<tr>
<td>Configuration a Successful Callback Response</td>
<td>Select <strong>Configure</strong> to configure the operation and business objects to use for a successful callback response.</td>
</tr>
<tr>
<td>Configuration a Failure Callback Response</td>
<td>Select <strong>Configure</strong> to configure the operation and business objects for a callback response for a failed integration flow. The option to configure a failure callback response gets enabled only after the configuration of successful callback response.</td>
</tr>
<tr>
<td>Edit</td>
<td>Click to edit the operation or business objects of a successful or failed callback response. This button is displayed after you configure a successful callback response, a failed callback response, or both.</td>
</tr>
<tr>
<td>Header</td>
<td>Click to configure the header properties for the selected operation. The headers available for configuration are based on the type of operation you selected. This button is displayed after you configure a successful callback response, a failed callback response, or both.</td>
</tr>
<tr>
<td>Reset</td>
<td>Click to reset the operation and header configuration to the default values. This button is displayed after you configure a successful callback response, a failed callback response, or both.</td>
</tr>
</tbody>
</table>

Configuring Salesforce Trigger Callback Response Properties

Enter the Salesforce trigger callback response values for your integration.

Topics

- What You Can Do from the Salesforce Trigger Callback Response Page

What You Can Do from the Salesforce Trigger Callback Response Page

You can configure the callback response parameters for the Salesforce Adapter.
- Configure the operation and business objects to use for a successful callback response.

- Configure the operation and business objects for a callback response for a failed integration flow.

**What You See on the Salesforce Cloud Trigger Callback Response Page**

The following table describes the key information on the trigger Callback Response page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Select an Operation Type</strong></td>
<td>Select the type of operation to perform on the business objects in a Salesforce Cloud application:</td>
</tr>
<tr>
<td></td>
<td>- <strong>CORE</strong>: Displays the following selections: ConvertLead, Merge, Undelete, or Upsert.</td>
</tr>
<tr>
<td></td>
<td>- <strong>CRUD</strong>: Represents the create, read, update, delete, or destroy operations to perform on Salesforce Cloud business objects. Each letter maps to a standard SQL statement, HTTP method, or DDS operation. Select the CRUD operation to perform on the business object: Create, Delete, or Update. Note: For the Update operation, external ID cannot be mapped to ID.</td>
</tr>
<tr>
<td></td>
<td>- <strong>MISC</strong>: Represents the set of specialized task operations to perform in the Salesforce Cloud application.</td>
</tr>
<tr>
<td><strong>Filter by object name</strong></td>
<td>Enter the initial letters of an object name to display a range of objects. You can also enter an asterisk (<em>) after the query in the search field (for example, to search for all objects starting with Acc, enter Acc</em>). You can also select a filter type:</td>
</tr>
<tr>
<td></td>
<td>- <strong>All</strong>: Displays all objects.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Custom</strong>: Displays objects you created. The naming convention is a combination of the object name appended with _c.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Standard</strong>: Displays business objects delivered as part of the Salesforce Cloud application.</td>
</tr>
</tbody>
</table>
Configuring Salesforce Invoke Basic Information Properties

You can enter a name and description and select the type of WSDL to use on the Salesforce invoke Basic Info page.

Topics

- What You Can Do from the Salesforce Cloud Invoke Basic Info Page
- What You See on the Salesforce Cloud Invoke Basic Info Page

What You Can Do from the Salesforce Cloud Invoke Basic Info Page

You can specify the following values on the Salesforce Cloud target Basic Info page. The Salesforce Cloud invoke Basic Info page is the initial wizard page that is displayed whenever you drag an adapter to the invoke area.

- Specify a meaningful name.
- Specify a description of the connection responsibilities.
- Select to use a standard application delivered by salesforce.com (enterprise WSDL) or custom application built using Apex classes and hosted on force.com (custom WSDL).

What You See on the Salesforce Cloud Invoke Basic Info Page

The following table describes the key information on the Salesforce Cloud invoke Basic Info page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Business Objects (Salesforce API version)</td>
<td>Select a single business object or multiple business objects from the Salesforce Cloud application. The selected operation acts upon these business objects. When you complete invoke operation configuration, the selected operation and business objects are defined in the integration-centric WSDL file.</td>
</tr>
</tbody>
</table>

Your Selected Business Objects | Displays the business objects you selected. |
Configuring Salesforce Invoke Operation Properties

Enter the Salesforce invoke operation values for your integration.

Topics

• What You Can Do from the Salesforce Target Operations Page
• What You See on the Salesforce Target Operation Page

What You Can Do from the Salesforce Cloud Invoke Operations Page

You can configure the following invoke operations values for Salesforce Cloud.

• Select either of the following operation types:

  1. CRUD
  2. Salesforce Object Query Language (SOQL) or Salesforce Object Search Language (SOSL) query

• Select the business objects.
• Specify the SOQL/SOSL query.

What You See on the Salesforce Invoke Operations Page

The following table describes the key information on the Salesforce Cloud invoke Operations page.
<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select an Operation Type</td>
<td>Select the type of operation to perform:</td>
</tr>
<tr>
<td>• CORE</td>
<td>Represents all core operations supported by the Salesforce application.</td>
</tr>
<tr>
<td>• CRUD</td>
<td>Represents the create, read, update, delete, or destroy operation to perform on Salesforce business objects. Each letter maps to a standard SQL statement, HTTP method, or DDS operation. Select the CRUD operation to perform: Create, Delete, Retrieve, or Update.</td>
</tr>
<tr>
<td>Note:</td>
<td>For the Update operation, external ID cannot be mapped to ID.</td>
</tr>
<tr>
<td>• MISC</td>
<td>Represents specialized task operations (such as fetching user information associated with the current session) in the Salesforce application.</td>
</tr>
<tr>
<td>• SOSL/SOQL</td>
<td>Select to enter a Salesforce Object Query Language (SOQL) or Salesforce Object Search Language (SOSL) query to send as a request to the Salesforce application. The following operations are available:</td>
</tr>
<tr>
<td></td>
<td>- query: Executes a query against specific criteria and returns data matching that criteria. Only records not deleted from your Salesforce application account are returned.</td>
</tr>
<tr>
<td></td>
<td>- queryAll: Returns the same data as the query operation, along with deleted records present in the recycle bin.</td>
</tr>
<tr>
<td></td>
<td>- search: Returns records from the Salesforce application. You can specify binding parameters to dynamically provide a search string as input to your search operation.</td>
</tr>
</tbody>
</table>

If you select this option, the page is refreshed to display a field for entering an SOQL or SOSL query to send for validation:

- **Query Statement:** Enter a valid query statement. SOQL statements evaluate to a list of sObjects, a single sObject, or an integer for count method queries. The following examples are provided:

  "SELECT Id FROM Contact WHERE Name LIKE 'A%' AND MailingCity = 'California'"

  SELECT COUNT() FROM Contact

  SOSL statements evaluate to a list of sObjects, where each list contains the search results for a particular sObject type. For example:

  "SELECT a.name, a.id, a.accountNumber, c.name from Contact c, c.Account"

- **Binding Parameters:** Displays any parameters included in the query. For example, orgId is a parameter in the following query:

  SELECT a.name, a.id, a.accountNumber, c.name from Contact c, c.Account a WHERE a.name = "$orgId"

  This query displays a binding parameters text box in which to enter a test value for orgId.

- **Test My Query.** Click to validate the query against the Salesforce application. Query results are displayed. If errors occur, you receive results about how to correct the query.

</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **AssignmentRuleHeader** (request header) | Specifies the assignment rule to use when creating or updating an account, case, or lead. The assignment rule can be active or inactive. The ID is retrieved by querying the `AssignmentRule` object. If the ID is specified, you do not need to specify the `useDefaultRule` value.  
  - assignmentRuleId: The ID of the assignment rule to use. The ID is not validated by the Salesforce Cloud application, whether or not it exists. Validation occurs during runtime.  
  - useDefaultRule: If set to `true`, the default (active) assignment rule is used. If set to `false`, the default (active) assignment rule is not used. |
| **EmailHeader** (request header) | Specifies whether or not to send a notification email. You can set the following properties:  
  - triggerAutoResponseEmail  
    - true: Triggers automatic response rules for leads and cases.  
    - false: Automatic response rules for leads and cases are not triggered.  
  - triggerOtherEmail  
    - true: The email is triggered outside the organization.  
    - false: The email is not triggered outside the organization.  
  - triggerUserEmail  
    - true: The email is triggered and sent to users in the organization. This email is triggered by a number of events such as adding comments to a case or updating a task.  
    - false: The email is not triggered and sent to users in the organization. |
| **DebuggingHeader** (request header) | Specify the debugging log level. The following log levels are supported:  
  - NONE (least verbose)  
  - DEBUGONLY  
  - DB  
  - PROFILING  
  - CALLOUT  
  - DETAIL (most verbose) |
<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| **MruHeader** (request header) | The Salesforce application shows the most recently used (MRU) items. In API version 7.0 or later, the list is not updated by itself. Use **MruHeader** to update the list. Using this header can negatively impact performance. Set **updateMru** to one of the following values:  
  - **true**: The list of MRU items is updated in the Salesforce application.  
  - **false**: The list of most recently used items is not updated in the Salesforce application. |
| **PackageVersionHeader** (request header) | Specifies the package version for any installed package. The package version identifies the components in a package. The package version follows the format majorNumber.minorNumber.patchNumber (for example, 3.4.5, where 3 refers to majorNumber, 4 refers to minorNumber, and 5 refers to patchNumber). |
| **QueryOptions** (request header) | Specifies the batch size for queries. The default value is 500, the minimum value is 200, and the maximum value is 2000.                                                                                     |
| **DebuggingInfo** (response header) | This information is only returned if the **debugLevel** request header is sent with the request payload to the Salesforce application.                                                                     |
| **LimitInfoHeader** (response header) | Provides information about the limitations of API calls on a per-day basis for the organization.  
  - **current**: The number of calls already used in the organization.  
  - **Limit**: The organization’s limit for the specified limit type.  
  - **Type**: The limit information type specified in the header **API REQUESTS** (contains limit information about API calls for the organization). |

**Configuring Salesforce Invoke Custom Operations Properties**

Specify the following values on the Salesforce invoke Custom Operations page.

**Topics**

- [What You See on the Salesforce Cloud Invoke Custom Operations Page](#)
What You Can Do from the Salesforce Cloud Invoke Custom Operations Page

You can specify the following values on the Salesforce Cloud invoke Custom Operations page.

- Select the custom WSDL.
- Select the operations to perform.
- Optionally select a new custom WSDL to use.

What You See on the Salesforce Cloud Invoke Custom Operations Page

The following table describes the key information on the Salesforce Cloud invoke Custom Operations page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select the Custom WSDL</td>
<td>Select the custom WSDL to use.</td>
</tr>
<tr>
<td>Operations in Uploaded WSDL</td>
<td>Displays the list of operations included in the uploaded custom WSDL. Select the operation to perform in the Salesforce Cloud application.</td>
</tr>
<tr>
<td>Select New Custom WSDL</td>
<td>Click Choose File to select the custom WSDL to use. This selection replaces any previously uploaded WSDL file. After selecting the new WSDL, return to the Operations in Uploaded WSDL list and select the new operation to use. To use a custom WSDL that includes custom Apex classes written on force.com and exposed as SOAP web services, see Exposing Apex Methods as SOAP Web Services.</td>
</tr>
</tbody>
</table>

Reviewing Configuration Values on the Summary Page

You can review the specified adapter configuration values on the Summary page.

Topics

- What You Can Do from the Summary Page
- What You See on the Summary Page

What You Can Do from the Summary Page

You can review configuration details from the Summary page. The Summary page is the final wizard page for each adapter after you have completed your configuration.

- View the configuration details you defined for the adapter. For example, if you have defined an inbound trigger (source) adapter with a request business object and immediate response business object, specific details about this configuration are displayed on the Summary page.
- Click Done if you want to save your configuration details.
• Click a specific tab in the left panel or click **Back** to access a specific page to update your configuration definitions.

• Click **Cancel** to cancel your configuration details.

**What You See on the Summary Page**

The following table describes the key information on the Summary page.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Summary</strong></td>
<td>Displays a summary of the configuration values you defined on previous pages of the wizard. The information that is displayed can vary by adapter. For some adapters, the selected business objects and operation name are displayed. For adapters for which a generated XSD file is provided, click the XSD link to view a read-only version of the file. To return to a previous page to update any values, click the appropriate tab in the left panel or click <strong>Back</strong>.</td>
</tr>
</tbody>
</table>

**Performing Salesforce Adapter Postconfiguration Tasks**

After activating your integration, you must update the outbound message for the Salesforce adapter to send messages to Oracle Integration Cloud Service. This section describes how to activate a workflow rule.

1. Open the Salesforce application.

2. Scroll down and click **Workflow Rules**.

3. In the **Workflow Rules** panel, click the workflow rule.

4. Scroll down to the **Immediate Workflow Actions** section and click the outbound message.

5. In the **Outbound Message** panel, click **Edit**.

6. In the **Edit Outbound Message** panel, enter the endpoint URL from the **Integration Details** icon for the integration.

7. In the **Edit Outbound Message** panel, click **Save**. The **Outbound Message** panel is displayed.

8. In the **Outbound Message** panel, scroll down and find the **Workflow Rules Using This Outbound Message** section.

9. Click the workflow link. The **Workflow Rule** panel is displayed.

10. In the **Workflow Rule** panel, click **Activate**.
Your workflow is activated. The Salesforce application starts sending messages to the integration endpoint URL created when you activated the integration.
Creating Mappings and Lookups in Integrations

You must map data between trigger connections and invoke connections in integrations. You can also optionally create lookups in integrations.

**Topics**

- Mapping Integration Cloud Service Data (in *Using Oracle Integration Cloud Service*)
- Creating Lookups (in *Using Oracle Integration Cloud Service*)
Administering Integrations

Oracle Integration Cloud Service provides you with the information and tools required to activate, monitor, and manage your integrations in the runtime environment.
