Policy Management 15.0 to 15.0.x Upgrade Procedure

F92411-04

June 2025

CAUTION: Use only the upgrade procedure included in the Upgrade Kit.

Before upgrading any system, access the Oracle Customer Support site and review any Technical Service Bulletins (TSBs) that relate to this upgrade.

Refer to Appendix C for instructions on accessing this site.

Contact the Oracle Customer Care Center (mailto:support@oracle.com) and inform them of your upgrade plans prior to beginning this or any upgrade procedure.

Oracle Communications Policy Management 15.0 to 15.0.x Upgrade Procedure

1 GEOREDUNDANCY ENABLED

1.1 Introduction

1.1.1 Purpose and Scope

This document describes methods utilized and procedures run to perform a software upgrade of Oracle Communications Policy Management Release 15.0 to Release 15.0.x when georedundancy is enabled.

Georedundancy as implemented in the MPE and the MRA uses the 2+1 server cluster scheme. The 2 refers to the current Active and Standby servers and the +1 refers to a third Spare server. The Spare server is added into the same cluster so that any server can assume the Active role if necessary. The Spare server is usually located in a separate geographical location in case the servers at the initial site become unavailable due to a site-wide failure. The Spare server, in most cases, would be unaffected by the same circumstances and would be able to continue to provide service as an Active server.

1.1.2 Acronyms

Acronym	Definition
CMP	Configuration Management Platform
DR-CMP	Configuration Management Platform for Disaster Recovery
Dit Civii	NOTE: It refers to the CMP on the secondary site
DSR	Diameter Signaling Router
GUI	Graphical User Interface
IPM	Initial Product Manufacture
LVM	Logical Volume Manager
MPE	Multimedia Policy Engine
MPE-LI	MPE for Lawful Intercept - a type of Multimedia Policy Engine
MRA	Multiprotocol Routing Agent (also known as the Policy Front End or PFE)
OCS	Online Charging System
OOS	Out of Service
PCEF	Policy Control Enforcement Function
PCRF	Policy and Charging Rules Function—Oracle MPE
TPD	Tekelec Platform Distribution

1.1.3 Terminology

Term	Description
Primary Site (Site1)	Site where the MPE/MRA Server-A and Server-B are deployed.
Secondary Site (Site2)	Site where the MPE/MRA Server-C is deployed.
Spare Server or Server-C	Server that is ready to take over from the Active server if both the Active and Standby servers fail. It is generally in a different location than the Active and Standby servers.

1.1.4 Software Release Numbering

COMCOL: 6.6TPD: 8.x

• Policy Management release 15.0

1.2 Upgrade Overview

This section lists the required materials and information needed to run Policy Management release 15.0.x software upgrades.

1.2.1 Upgrade Status Values

Status	Condition
OK All servers are up-to-date and no alarms are present.	
Info	No alarms are present, but a condition (such as out-of-date) is present that the operator should be made aware of.
Minor At least one minor alarm is present.	
Major	At least one major alarm is present.
Offline	The server cannot be reached.
Degraded	At least one server in the cluster cannot be reached.
Critical	At least one critical alarm is present.
Active	The server is active.
Standby	The server is in standby mode as part of normal operations.
Forced Standby	The server is in standby mode because it has been placed into that state via direct operator intervention or as part of the upgrade.
Offline	The server cannot be reached.
Zombie	The server is in a state where it cannot recover automatically and requires direct operator intervention.

1.2.2 Upgrade Paths

This upgrade document supports the following upgrade path:

• Policy Management 15.0 (fresh install) to 15.0.x (full DIU ISO) (Major Path)

NOTE:

- If the official upgrade paths mentioned in the release documents of each supported version are not followed, please contact Oracle Support before upgrading to 15.0.x. (Refer to individual patch release document to see the supported upgrade paths.)
- 15.0 to 15.0.x upgrade is only applicable for VM based environments.

1.2.3 Upgrade Information

This procedure applies to Active, Standby, and Spare servers. A group of servers is referred to as a cluster. The cluster types are CMP, MRA, and MPE.

- For a CMP cluster, there are only 2 servers (Active and Standby) in a cluster and the cluster can be either a Primary or Secondary cluster.
- For a non-CMP cluster (MRA/MPE), there can be 3 servers (Active, Standby, and Spare).

A Policy Management deployment can consist of multiple clusters.

NOTE: In a cluster with single node, upgrade is not supported.

1.2.3.1 Required Cluster Upgrade Sequence

Policy Management Server software upgrades are performed on a cluster-by-cluster basis at the local and remote sites within the same maintenance window.

The following is the upgrade sequence, specific process is documented by an Oracle provided Maintenance Operation Procedure (MOP).

- 1. Upgrade Primary CMP
- **2.** Upgrade Secondary CMP (if applicable)
- 3. Site 1 Segment 1—Upgrade non-CMP clusters (see note below)
- **4.** Site 2 Segment 1—Upgrade non-CMP clusters (see note below)
- 5. Site 1 Segment 2—Upgrade non-CMP clusters (see note below)
- **6.** Site 2 Segment 2—Upgrade non-CMP clusters (see note below)

NOTE: Up to 16 non-CMP clusters can be upgraded in parallel.

1.2.3.2 Policy Management Release Mixed-Version Operation and Limitation

The general expectation is that a system that is running in a mixed version configuration should support features, and perform at a level of the previous version. Thus, the system that is running pre-15.0.x release and release 15.0.x mixed configuration would support the performance and capacity of pre-15.0.x release. The mixed version Policy Management configuration would support pre-15.0.x release features.

Since the CMP is the first Policy Management system component that is upgraded to the new version, the release 15.0.x CMP is managing servers in both the previous release and release 15.0.x. In this mixed version configuration, release 15.0.x CMP does not prevent an operator from configuring anything that you could configure in a previous release and all configuration items from the previous release are still available. However, the configuration changes during the upgrade of Policy Management system are discouraged and have limited support.

In the mixed version Policy Management configuration release 15.0.x CMP has the following limitations while running in a mixed version environment:

- New features must not be enabled until the upgrades of all servers managed by that CMP are completed. This also applies to using policy rules that include new conditions and actions introduced in the release.
- As a general guideline, policy rules should not be changed while running in a mixed version
 environment. If it is necessary to make changes to the policy rules while running in a mixed
 version environment changes that do not utilize new conditions and actions for the release
 could be installed, but should be jointly reviewed by you and Oracle before deployment to verify
 that these policies indeed do not use new conditions or actions.
- The support for configuration of MPE/MRA servers is limited to parameters that are available in the previous version. Specifically, Network Elements can be added.

Table 1 Mixed-version configurations supported

Policy Management system components on	CMP R15.0.x	MRA R15.0.x	MPE R15.0.x
CMP 15.0	Yes	No	No
MRA 15.0	Yes	Yes	Yes
MPE 15.0	Yes	Yes	Yes

NOTE: Replication between CMP and DR-CMP is automatically disabled during upgrade of the CMP and DR-CMP from the previous release to release 15.0.x. The replication is automatically enabled after both active CMP and DR-CMP are upgraded to release 15.0.x.

1.2.4 Customer Impacts

The cluster upgrade proceeds by upgrading the standby server, then switching over from the active to the standby, then the spare server, and upgrading the new standby. The switchover of each non-CMP cluster has a small impact on traffic being processed at that cluster.

1.2.5 Rollback/Backout

The full pre-upgrade server image is stored on the server during the upgrade, and can be restored in the event of a problem during or after upgrade.

1.2.6 TPD Version

The Tekelec Platform Distribution (TPD) version needed for this release is included in the Policy Application Software Upgrade DIU ISO, and the TPD is upgraded to version 8.x as part of this procedure.

1.2.7 Loading Application Software

For upgrade of server application software, the recommended method is to copy the application DIU ISO images to the servers using the scp or ftp command.

1.2.8 Required Materials and Remote Access

The following materials and information are needed to run an upgrade:

- Policy Management 15.0.x software DIU ISO files
- Policy Management 15.0.x software Release Notes
- The capability to remotely login to the target server as admusr.

NOTE: The remote login can be done through SSH, local console, or iLO maintenance port. Ensure that the network firewall policy allows the required application and corresponded ports.

- The capability to secure copy (scp) from the local workstation being used to perform this upgrade to the target server, or otherwise be able to transfer binary files to the target server.
- User login IDs, passwords, IP addresses, and other administration information.
- VPN access to your network is required if that is the only method for remotely logging into the target servers. It must be also possible to access the Policy Management GUI.

1.2.8.1 Upgrade Media

See the release notes for the list of DIU ISO image files required for the Policy Management upgrade you are installing.

1.2.8.2 Login User IDs and Passwords

You must confirm login information for key interfaces, and document the information using Table 2.

NOTES:

- It is assumed that the login information may be common across sites. If not, record the information for each site.
- Consider the sensitivity of the information recorded in this table. While all of the information in
 the table is required to complete the upgrade, there may be security policies in place that
 prevent the actual recording of this information in a permanent form.

Table 2 Login IDs, Passwords and release Information

Item	Value
CMP servers	GUI Administrator Login User/Password
NOTE: Some older releases do not use admusr, instead use the default root Login using SSH.	
	admusr password:
MPE/MRA servers	admusr password:
Target OA	OA Administrator Login User/Password
Software Upgrade Target Release ¹	Target Release Number
	Policy Management 15.0.x software DIU ISO image filenames

1.3 Theory of Operation

1.3.1 Upgrade Manager Page

The Upgrade Manager was not up to the operator, with assistance from an MOP, to know the correct sequence of server selects and menu selections. The Upgrade Manager takes a different approach. It determines the next course of action to either

- Begin/continue upgrading a cluster
- Begin/continue backing out a cluster.

IMPORTANT: There is a point implicit in the list above: upgrade is now presented from a cluster perspective, instead of a server perspective.

In perspective has a number of ramifications, most noticeably it is not possible to select individual servers or to bulk select a group of servers. In fact, in order to perform any operation, it is necessary to select a cluster.

Certain operations are performed automatically on behalf of the operator. These operations are not presented to the operator as an option. However, the operator can see what has been done using the upgrade log.

¹ The ISO image filenames should match those referenced in the Release Notes for the target release.

Upgrade Manager

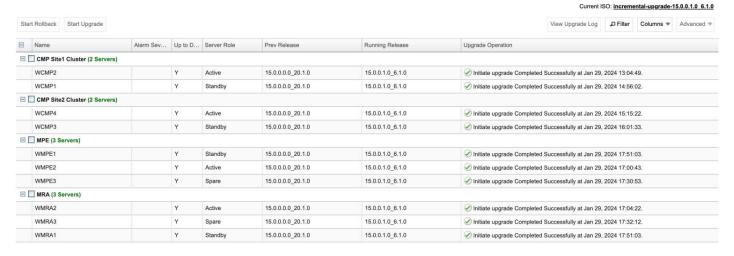

Figure 1 Sample display of the Upgrade Manager page

For the most part, the items in the display are self-explanatory. The following items are often used during the upgrade.

Start Rollback and Start Upgrade buttons (upper left):

If a cluster is selected and these buttons are disabled (grey), it means that there is not an appropriate action to take at this time. However, if a button is not disabled (white), then it means that there is a preferred action that can be taken to upgrade (or backout) the cluster. Normally, upgrading a cluster is a well-defined fixed procedure. However, in some cases there are a number of valid sequences. Selecting the preferred step causes the Upgrade Director to choose the default sequence. Only use the Upgrade Manager to perform upgrades unless the instructions direct otherwise.

Alarm Severity:

This column is used to indicate if there are alarms associated with a server. If so, it displays the severity of the most severe alarm here. It is important to explain the intent of this column. The intent is to give a visual indication that the particular server is experiencing alarms. This is not a reason to panic: During the upgrade, it is expected that the servers raise alarms:

The CMP raises alarms to indicate that it is initiating upgrade activity.

Servers reports alarms to indicate that their mate servers are offline.

However, if alarms are asserted for a server, it is good practice to look at the alarms prior to initiating upgrade activity on them.

• **Up to Date**: This column is used to indicate the state of the code on the server.

N—Server is running old code and must be upgraded

Y—Server is running new code.

N/A—Upgrade is not appropriate and/or the server is in a bad state

1.3.1.1 The Upgrade Log

Within the Upgrade Manager page, the operator can access the upgrade log. This displays attributes of the various actions (manual and automatic) that have been performed on the selected cluster. It is important to note that this is NOT the audit log. The audit log is meant to track what the operator has done. This log is meant to capture the sequence of upgrade activity—whether it was initiated by an operator or automatically triggered.

Figure 2 Upgrade Log

1.3.1.2 Optional Actions

It is possible to perform every step in the upgrade process using the **Upgrade** and **Backout** buttons. When the operator clicks one of these buttons, the Upgrade Director performs the next preferred action. However, there are times that the operator may want to take a slightly different—but still legal—procedure. For example, the Upgrade Director has a preferred order in which it upgrades a georedundant cluster. However, if the operator wanted to deviate from that default procedure—say to restrict upgrade to servers in a particular site—then they can use the optional actions menu. It is important to note that this menu is ONLY populated with legal/reasonable actions. Actions that are wrong or inconsistent are not displayed.

If the operator selects an optional action, they can go back to using the default/preferred at any time

1.3.1.3 The ISO Select

In the upper right hand corner, there is an item called the **Current ISO.** In some respects the term ISO is misleading. A better description might be upgrade procedure. This item shows the upgrade procedure that is being used. In common cases, this is going to be either:

An upgrade to version XXX

To start a new upgrade, click on this item. The Upgrade Director searches for valid upgrade procedures. In order to minimize confusion, these upgrade procedures are usually embedded within a CMP ISO file. This way, the CMP ISO file is always tied to the corresponding upgrade procedure.

When you select a new ISO file, you are telling the Upgrade Director to abandon the current upgrade procedure in favor of a new procedure.

1.3.1.4 Upgrade Director Behavior

The Upgrade Director is a component that tracks the state of the servers, cluster and system during an upgrade. The Upgrade Director is hidden. However, there are conventions/operating principles that have visible effects.

1.3.1.5 Alarm Philosophy

During an upgrade, the Upgrade Manager asserts (that is, generates) and displays alarms. An upgrade typically triggers multiple minor, major, and critical alarms as servers are taken out of service, go into forced standby, or fail over. This is normal and to be expected. Figure 3 shows an example of an upgrade in progress asserting multiple transient alarms.

NOTE: Click on the active alarms summary, in the upper right corner of every CMP page, to display a list of current active alarms.

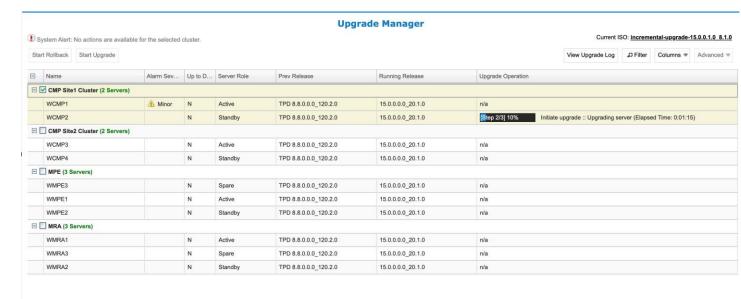

Figure 3 Upgrade in Progress Showing Transient Alarms

The Upgrade Manager clears alarms when appropriate, such as when server and cluster upgrades are complete. Table 3 lists transient alarms that the Upgrade Manager can assert during an upgrade.

Table 3 Transient Alarms Asserted During a Typical Upgrade

Alarm Number	Severity	Name
31227	Critical	HA availability status failed
31102	Minor	DB Replication from a master node DB has failed
31283	Critical	Lost Communication with server
70001	Critical	QP_procmgr failed
70007	Critical	Not all QP resources are ready
70025	Critical	QP Slave database is a different version than the master
31233	Major	HA Path Down
70004	Major	QP Processes down for maintenance
31101	Minor	DB replication to slave failure
31102	Minor	DB replication from a master node DB has failed
31106	Minor	DB merge to parent failure
31107	Minor	DB merge from child failure
31114	Minor	DB replication over SOAP has failed
31282	Minor	HA Management Fault
70500	Minor	System Mixed Version
70501	Minor	Cluster Mixed Version
70502	Minor	Cluster Replication Inhibited
70503	Minor	Server Forced Standby
70506	Minor	Upgrade Operation Failed
70507	Minor	Upgrade in Progress
70508	CRITICAL	Zombie Server

The Upgrade Manager also asserts an alarm if an unexpected error prevents it from continuing the upgrade. You should review all active alarms after each upgrade step to ensure that the alarms are expected. Alarms are described in the *Troubleshooting Guide*, Release 15.0, available at the Oracle Help Center.

1.3.1.6 General Upgrade Procedure

In general, the upgrade of a server goes through the following steps:

- **1.** Preflight checks—look for certain conditions which guarantee a failed upgrade. If such conditions are detected, fail. There are two principles behind the preflight checks.
- 2. It is better to fail early in a recoverable way than to fail late in an unrecoverable way.
- **3.** Preflight checks are VERY narrow. This prevents false positives for an otherwise valid upgrade.
- **4.** The upgrade itself

5. Wait for replication to synchronize.

This procedure is in place so that it should not be necessary to login to the target server to verify conditions. You should be able to stay on the Upgrade Manager page.

Upgrade Order

With a two-server cluster, there is only a single valid order:

- **1.** Upgrade the standby
- 2. Failover
- 3. Upgrade the remaining server.

With georedundant clusters, there are many valid permutations. The default order that the Upgrade Director takes is:

- 1. Upgrade the standby server
- 2. Failover
- 3. Reapply the configuration

NOTE: This requires you to navigate away from the Upgrade Manager page

- **4.** Upgrade the spare server
- 5. Upgrade the remaining server in the primary site

Unreachable Servers

During the course of an upgrade, servers can go unreachable. This is expected and the Upgrade Manager tries to be graceful about unreachable servers. However, if the CMP experiences a failover when another server is unreachable, this runs into limits. The promoted Upgrade Director does not have the full history/context. It waits until it can contact the unreachable server before it takes action on the server.

Reversing Directions

In general, it should be possible to reverse directions at any time. You should be able to upgrade a server in a cluster, back it out, upgrade it, upgrade its mate, back that out, etc. In this sense, upgrade/backout should be fully reversible. However, you are not permitted to reverse direction if there is an ongoing action: You cannot kick off a backout of a server if another server in the cluster is being upgraded. You have to wait for the upgrade to finish.

Mixed version and Forced Standby

As a general rule, if a cluster is in mixed version, then every server that is NOT running the same version as the active server must be in forced standby. This way, a simple failover does not cause a change in the version of code that is providing service.

NOTE: Forced standby is managed by the Upgrade Director and requires no action.

Failure Handling and Recovery

Failures fall into two categories:

- Failures that the Upgrade Director is able to recover from.
- Failures that the Upgrade Director cannot automatically recover from.

Any failure should generate an UPGRADE_OPERATION_FAILED alarm. In such cases, the operation can be attempted again. Ideally, the operator/support would investigate the original failure before

repeating. However, if the server is in an indeterminate state, the server is declared a ZOMBIE and no further action can be taken on the server. It requires direct action by support/engineering to repair.

For the current release, recovery or even deep failure diagnosis is not exposed via the GUI.

1.4 Upgrade Preparation

This section provides detailed procedures to prepare a system for upgrade. These procedures are run outside a maintenance window.

NOTE: If Veritas NetBackup is being used on the system, see the Maintenance Operation Procedure for pre and post upgrade steps.

Overview of steps:

- 1. Upgrade Primary (Site1) CMP
- 2. Upgrade Secondary (Site2) CMP (if applicable)
- 3. Segment 1 Site1:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters
- 4. Segment 1 Site2:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters
- 5. Segment 2 Site1:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters
- 6. Segment 2 Site2:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters

1.4.1 Prerequisites

Note: If the server uptime is greater than 900 days, you should reboot the node before starting the upgrade.

The following procedure table verifies that all required prerequisite steps needed to be performed before the upgrade procedure begins.

Procedure 1 Prerequisites

Step	Procedure	Details
1.	Verify all required materials are present	As listed in section 1.2.8 Required Materials and Remote Access.
2.	Review Release	Review Policy Management 15.0.x Release Notes for the following information: • Individual software components and versions included in target release.

Step	Procedure	Details							
	Notes	New features included in target release.							
		Issues (bugs) resolved in target release.							
		Known issues with target release.							
	 Any further instructions that may be required to complete the software upgrade the target release. In particular, the supported browsers: In release 15.0.x, only Mozilla Firefox and Google Chrome are fully supported. 								
	—End of Procedure—								

Note:

- During the upgrade from 15.0.0.x to 15.0.0.4.0 (or later), due to necessary security enhancements, the passwords will get expired and need to be reset for all the existing GUI users.
- During rollback, the passwords set after the upgrade will not be functional. The passwords will get set back to the original values as present before the upgrade.

Please follow the below procedure to upgrade/rollback (Only required if upgrading from 15.0.0.x to 15.0.0.4.0 (or later)):

- 1. Before starting upgrade, save the passwords for the existing GUI users (required during rollback).
- 2. Upgrade to 15.0.0.4.0 or later patch.
- 3. After upgrade, when you login as any existing GUI user, the password will get expired and need to be reset. (Follow the same steps for all the existing GUI users.)
- 4. In case of rollback, reuse the old passwords that were saved in step 1.

1.4.2 Plan and Track Upgrades

The upgrade procedures in this document are divided into the following sequential steps:

- 1. Upgrade CMP clusters
- 2. Upgrade MPE/MRA clusters

Table 4 can be completed before performing the upgrade, to identify the clusters to be upgraded and plan the work. It can also be used to track the completion of the upgrades and assign work to different engineers.

NOTES:

- Policy changes or configuration changes should NOT be made while the system is in mixedversion operation.
- Time estimates are for upgrade procedure without backout procedure. Backout procedure time is typically the same as, or less than the upgrade procedure.

Table 4 Upgrade information

Step	Procedure	Result	Engineer	Time
1.	Use the following checklist to plan the cluster upgrades for the entire system.	Maintenance windows are planned		
2.	Upgrade Site1 and Site2 CMP clusters. Each cluster takes approximately 40-50 minutes to complete	Site Names and		3 hrs
3.	Upgrade Site1 MPE/MRA clusters for Segment-1	Site Names Cluster List:		2 hrs
4.	Upgrade Site2 clusters for Segment-1	Site Names Cluster List:		2 hrs
5.	Upgrade Site1 clusters for Segment-2	Site Names Cluster List:		2 hrs

Step	Procedure	Result	Engineer	Time					
6.	Upgrade Site2			2 hrs					
	clusters for	Site Names							
	Segment-2	Cluster List:							
	—End of Procedure—								

1.4.3 Perform System Health Check

Use this procedure to determine the health and status of the servers to be upgraded and must be run at least once within the time frame of 24 to 36 hours prior to the start of a maintenance window.

Procedure 2 Perform system health check

Step	Procedure	Result								
1.	CMP GUI Access	Open a supported browser (Mozilla Firefox or Google Chrome) to access the Primary CMP GUI on its VIP address and login to verify access.								
2.	View Active Alarms	Identify the cause of any existing active alarms, and determine if these may have impact on the upgrade. Export current alarms to save into a file. IMPORTANT: Before starting any upgrade activity, ensure that all active alarms are understood and resolved.								
3.	View KPI reports	Verify that the system is running within expected parameters. Export current KPIs into a file.								
4.	Confirm NTP servers are reachable from all the servers (CMP, MPEs and MRAs) to be upgraded NOTE: If the time across the servers is out of synch, fix it and re-validate this step, before starting the upgrade procedures.	 Validate the IP connectivity between the server and NTP servers by PING. Confirm that time is synchronized on each server using the following CLI shell command: \$sudo chronyc tracking Confirm that date is correct on each server. Check that BIOS clock is synced with the clock using the following CLI shell command: \$sudo hwclock 								
		—End of Procedure—								

1.4.4 Deploy Policy Management Upgrade Software

Software should be deployed to each Policy Management server <code>/var/TKLC/upgrade</code> directory, before the actual upgrade activities. This is typically done with utilities such as SCP, WGET or SFTP. Because of the large size of the software DIU ISO file, sufficient time should be planned to accomplish this step. For Policy Management release 15.0.x, each DIU ISO image size is about 8GB for CMP and about 7GB for non-CMP servers.

1.4.6.1 Deploying Policy Management Upgrade Software to Servers

There are four possible software images in this upgrade (CMP, MPE/MPE-LI or MRA). A single image must be deployed to the $\protect\pr$

IMPORTANT: If the deployed image type (CMP, MPE, MRA, etc.) does not match the existing installed software type, the upgrade fails. Example: An attempt to upgrade a CMP with an MPE software image fails during the Upgrade action.

Also, if multiple images are copied into the /var/TKLC/upgrade directory, the upgrade fails.

1.4.6.2 Distribute Application DIU ISO Image Files to Servers

This procedure applies to all server types. It assumes that the DIU ISO image files is electronically copied to the sites to be upgraded.

NOTE: DIU ISO transfers to the target systems may require a significant amount of time depending on the number of systems and the speed of the network. The DIU ISO transfers to the target systems should be performed prior to and outside of the scheduled maintenance window. Schedule the required maintenance windows accordingly before proceeding.

Manual Distribution

Procedure 3 Manual Distribution

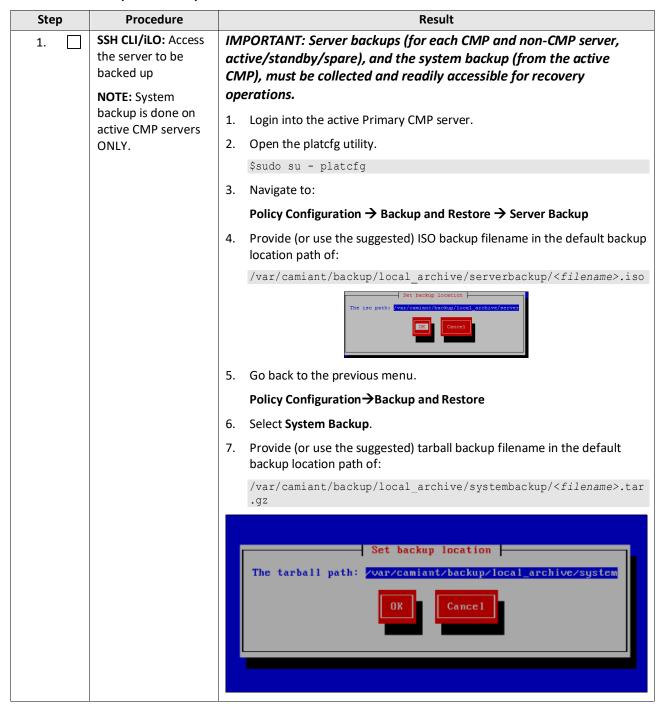

Step	Procedure	Result
1.	Transfer DIU ISO files to Policy Management server.	1. Transfer release 15.0.x DIU ISO files (CMP and non-CMP) into the /var/TKLC/upgrade directory on the respective server using one of the following methods:
		- SCP/WGET command
		- USB drive
		2. If the images are on a server in the same network, scp the files using the CLI, for example, for CMP:
		3. Copy CMP software DIU ISO file to ONE of the other CMP servers:
		\$sudo cp /var/TKLC/upgrade/cmp-15.0.0.1.0_x.x.0-x86_64-DIU.iso user@remote_host.com:/var/TKLC/upgrade
		4. Repeat for one server of all clusters.
		NOTE: After copying the DIU ISO to one of the respective servers, the DIU ISO Maintenance is used to upload to the rest of the servers.
		—End of Procedure—

1.4.6.3 Backups and Backup Locations

Perform the backups prior to the maintenance window period.

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

Procedure 4 Backups and Backup Locations

Step	Procedure	Result								
2.	SSH CLI/iLO: Verify the backup DIU ISO file	If default location is accepted in the previous step, change to the following directory and verify the file. For example for an MPE server backup: \$ cd /var/camiant/backup/local_archive/serverbackup \$ ls <hostname> -cmp_15.0.0.0.0_20.1.0-serverbackup- <mm><dd><hhmm>.iso And for the system backup: \$ cd /var/camiant/backup/local_archive/systembackup \$ ls <hostname> -cmp_15.0.0.0.0_20.1.0-systembackup- <mm><dd><hhmm>.tar.gz</hhmm></dd></mm></hostname></hhmm></dd></mm></hostname>								
3.	Copy backup files.	 Copy the files to remote server or local workstation/laptop. Example of a remote server copy. \$ sudo scp /var/camiant/backup/local_archive/systembackup/xx_tar.gz <remoteserver_ipaddress>:<destinationpath></destinationpath></remoteserver_ipaddress> Remove the backup ISO file from the TPD Sever. \$ sudo rm < backup_filename>.iso 								
4.	Identify backup location	Backup location is: Instructions to access to backups are as follows:								
		—End of Procedure—								

1.5 Upgrade CMP clusters (15.0 to 15.0.x)

Use this procedure to upgrade the Site1 CMP cluster, and if needed, upgrade the Site2 CMP cluster in a single maintenance window.

1.5.1 Upgrade CMP clusters Overview

- 1. Upgrade Primary CMP cluster
- 2. Start upgrade
- 3. Failover
- 4. Log back into the CMP GUI
- 5. Continue upgrade
- 6. Upgrade Secondary CMP cluster
- **7.** Start upgrade
- 8. Failover
- 9. Continue upgrade

This procedure should not be service affecting, but it is recommended to perform this in a maintenance window.

It is assumed that the CMPs may be deployed as 2 georedundant clusters, identified as Site1 and Site2 as displayed on the CMP GUI. When deployed as such, one site is designated as the Primary Site (which is the site that is managing the Policy Management system), and the other is as Secondary site (this site is ready to become Primary site, if needed).

If the System is deployed with only ONE CMP, then the upgrade of the Secondary CMP can be skipped.

Identify the CMP sites to be upgraded, and verify which site is the Primary site and which site is the Secondary site:

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

CMP Sites	Operator Site Name	Topology Site Designation (Site1 or Site2)	CMP Server-A	CMP Server-B
			Server-A Hostname	Server-B Hostname
Primary Site			Server-A IP Address	Server-B IP Address
			Server-A HA Status	Server-B HA Status
			Server-A Hostname	Server-B Hostname
Secondary Site			Server-A IP Address	Server-B IP Address
			Server-A HA Status	Server-B HA Status

IMPORTANT:

- Site1 CMP MUST be upgraded to the new release before the Site2 CMP
- CMP servers MUST be upgraded before the non-CMP clusters

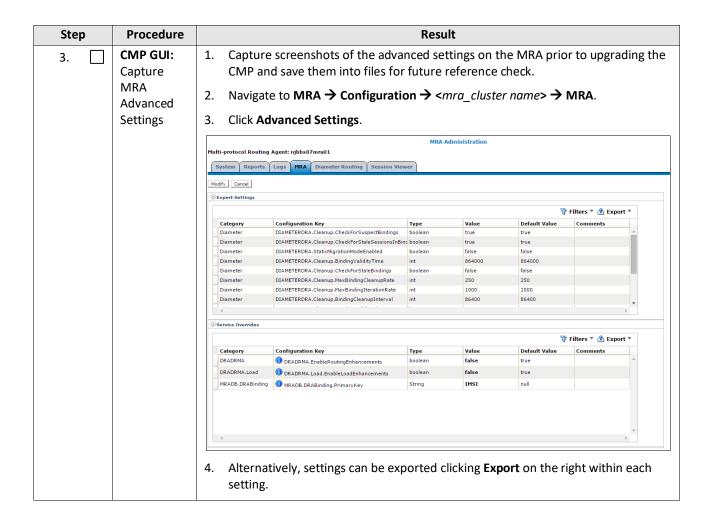

NOTE: The following steps use build 15.0 as example.

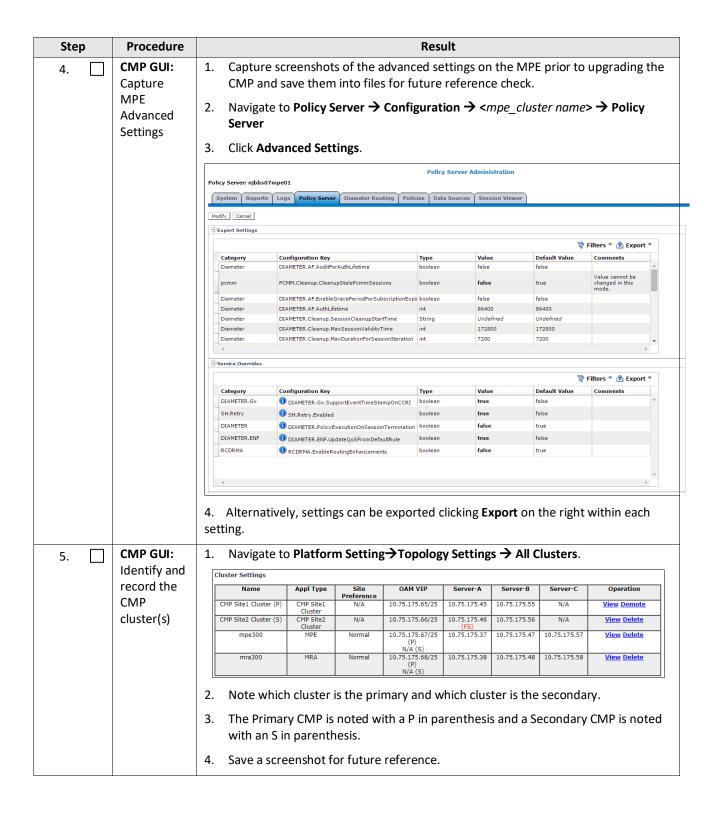

1.5.2 Upgrade Primary CMP cluster

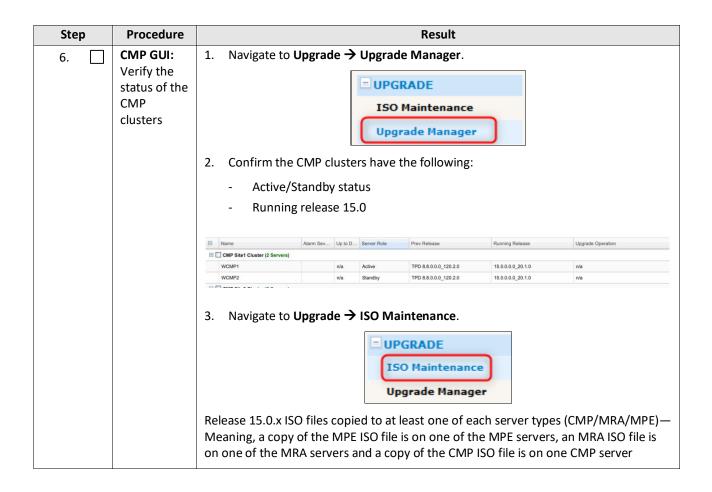

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

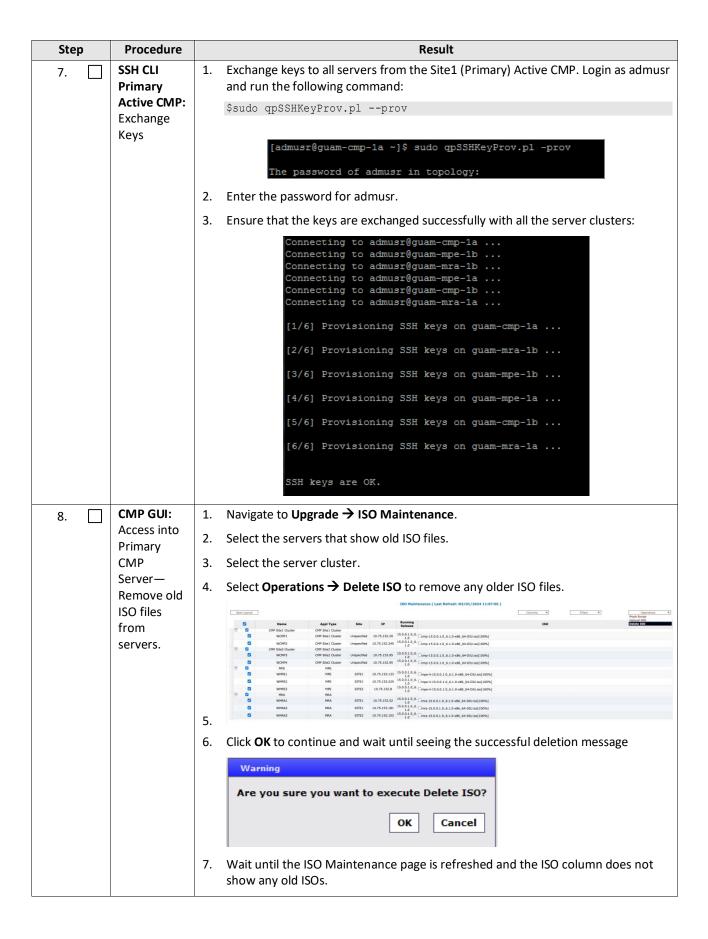

Procedure 5 Upgrade Primary CMP cluster

Step	Procedure		Result

1.7 Upgrade NON-CMP clusters (MPE, MRA)

The following procedures upgrades a site/segment containing one or more MPE, MRA clusters.

NOTE: Different cluster types can be upgraded at the same time. For example, 2 MPEs and 2 MRAs can be upgraded in parallel.

The following steps use build 15.0 as example.

1.7.1 Upgrade Preparation

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

Procedure 7: Configuration Preparation

Step P	rocedure	Result
_ -		se the supported browser to login as the admin user or as a user with dministrative privileges.
curren Manag softwa	t Upgrade ger status and ire release DIU ISO files 1.	Verify that all CMP clusters have both Active, Standby status.
	4.	Verify that Policy Management release 15.0.x DIU ISO files are available on /var/TKLC/upgrade for all MPE, and MRA clusters. One DIU ISO per server
	5.	Verify that the CMP cluster is upgraded successfully and running Policy Management release 15.0.x.
		—End of Procedure—

1.7.2 Upgrade MRA and MPE Servers

Use this procedure to upgrade one or more clusters (MPE and/or MRA).

This procedure is applicable for a 15.0 upgrade to 15.0.x

This section can be replicated for each site/segment to be upgraded, allowing you to add cluster and site specific information.

The upgrade procedure is essentially the same for an MRA cluster and an MPE cluster.

- 1. Select and start upgrade on the standby server
- 2. Failover
- 3. Re-apply configuration
- **4.** Continue to upgrade the spare server
- 5. Continue upgrade on remaining server
- **6.** (MPE only) Re-apply configuration one MPE cluster at a time

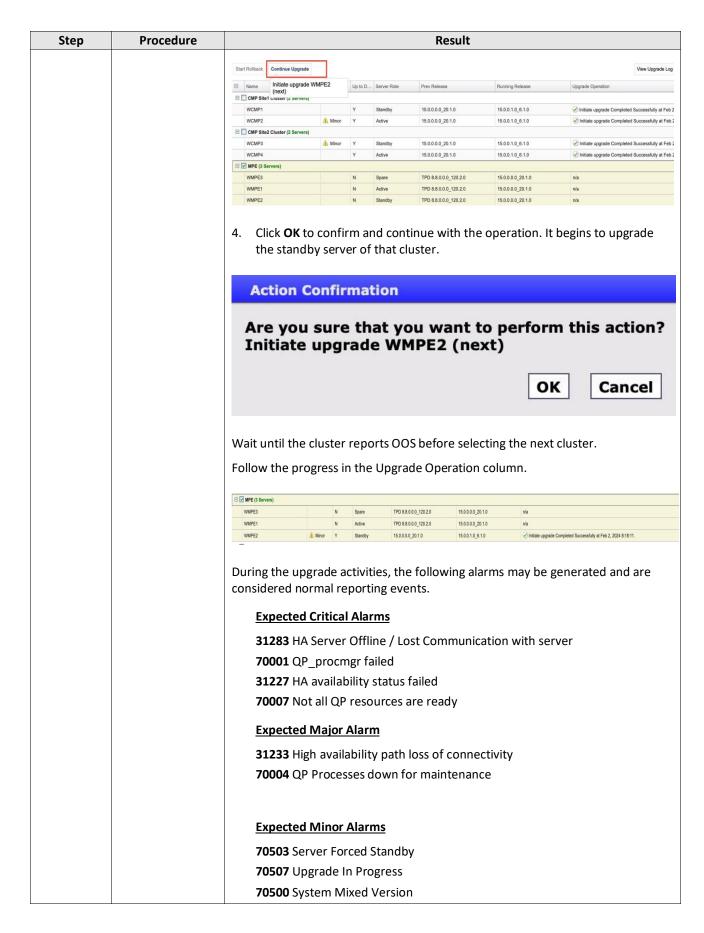

NOTES:

- All CMP clusters must be upgraded to Policy Management release 15.0.x prior to performing the following procedures.
- Four (4) clusters (8 for 15.0) can be running the upgrade at one time.
- Only ONE cluster can be selected for upgrade activity, bulk selection of servers is not supported in release 15.0.x.

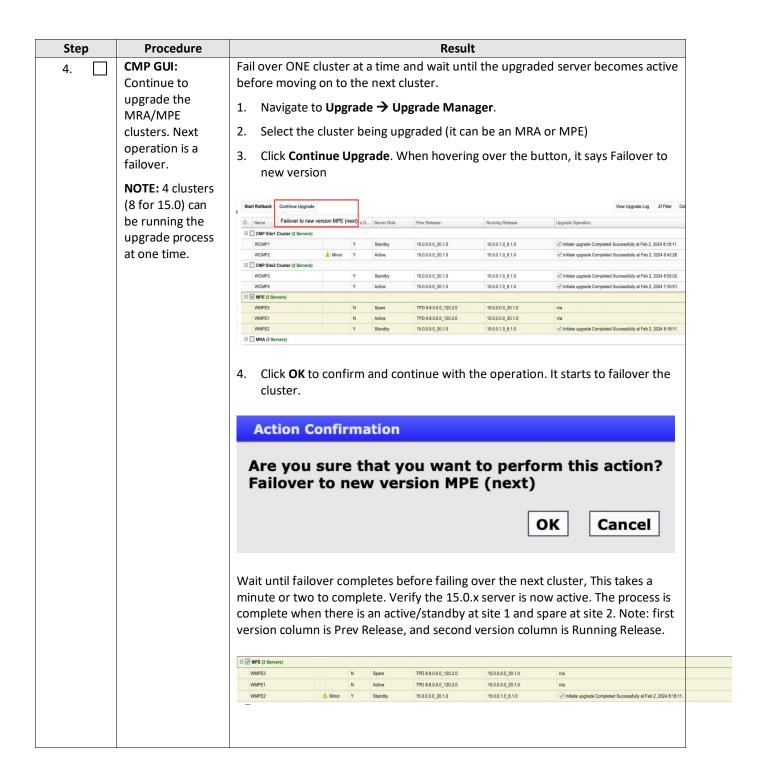

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

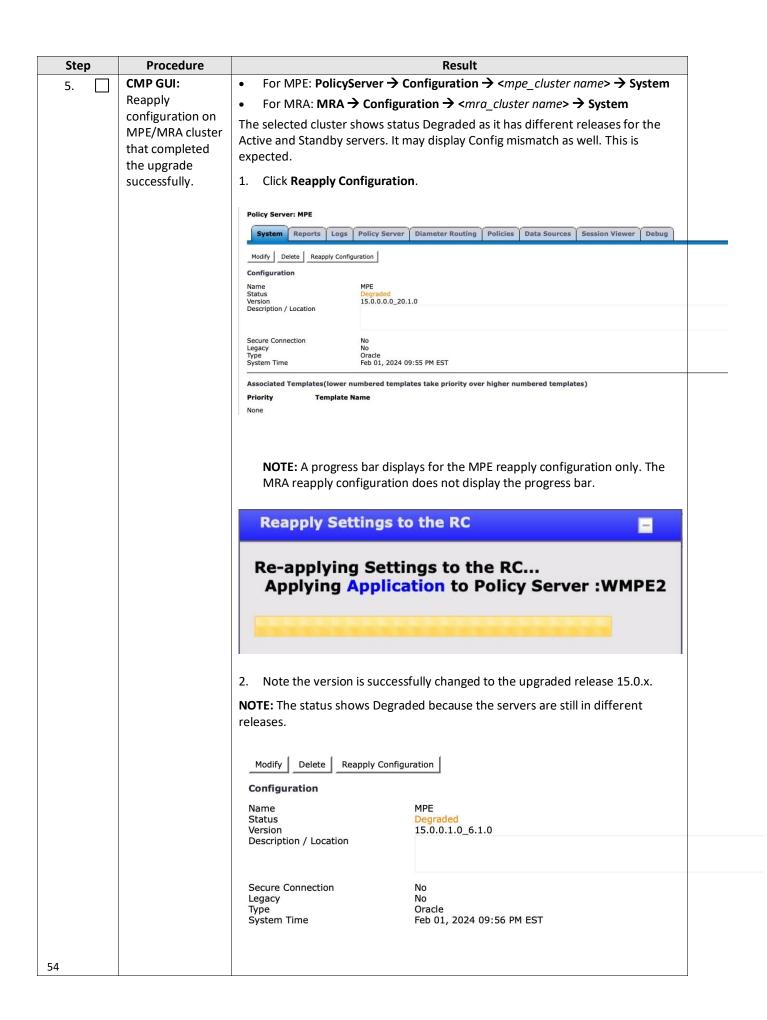

Procedure 8: Upgrade MRA and MPE Servers

Step	Procedure	Result							
2	CMP GUI: Health checks on the MPE/MRA servers to be upgraded CMP GUI: Verify upgrade status of selected MPE/MRA site/segment	Perform the following: 1. Check for current active alarms 2. Reset MPE/MRA counters to make a baseline - For the MPE: Policy Server → Configuration → <server_name> → Reports → Reset Counters - For the MRA: MRA → Configuration → <server_name> → Reports → Reset Counters 3. Go to the KPI Dashboard and capture a screenshot. 4. System Wide Reports → KPI Dashboard 1. Navigate to Upgrade → Upgrade Manager. 2. Verify information for the MRA/MPE servers: - Current release 15.0 installed - Active/Standby/Spare status - DIU ISO version to be deployed is 15.0.x (verify the current DIU ISO files are 15.0.x by going to Upgrade → ISO Maintenance) Note: first version column is Prev Release, and second version column is Running Release. MPE</server_name></server_name>							
3.	CMP GUI: Upgrade clusters NOTE: The upgrade of a single server takes approximately 20 minutes to complete.	 NOTE: Start the upgrade on ONE cluster. Wait until the cluster shows OOS, and then continue with the next cluster and so on. Up to 16 clusters may be running upgrade at any time. 1. Navigate to Upgrade → Upgrade Manager. 2. Select the cluster to be upgraded, it can be an MRA or MPE 3. Click Continue Upgrade.

1.9 Backout (ROLLBACK) 15.0 wireless mode

Use this procedure if an issue is found during the upgrade, as well as post-upgrade which impacts network performance.

The Policy Management system is backed out to the previous release.

Oracle strongly recommends consulting My Oracle Support before initiating the backout procedure. They determine the appropriate course of recovery options.

1.9.1 Backout Sequence

The backout sequence order is the reverse of the upgrade order. The following is the overall backout sequence:

- 1. Back out the non-CMP clusters (from both Site1 and Site2, if applicable)
- 2. Back out the Secondary CMP cluster (if applicable)
- 3. Back out the Primary CMP cluster

During a backout, it is important to control what version of the software is currently active. This control must be maintained even if there are unexpected failures.

NOTE: In the case of a non-CMP clusters, the upgrade/backout is NOT complete until the operator performs a Reapply Configuration from the CMP. The MRA/MPE can still operate, but may not be fully functional.

1.9.2 Pre-requisites

No new policies or features have been configured or run on the upgraded release.

The CMP cluster cannot backout if other non-CMP Policy Management servers are still on the upgraded release.

Note:

- During the upgrade from 15.0.0.x to 15.0.0.4.0 (or later), due to necessary security enhancements, the passwords will get expired and need to be reset for all the existing GUI users
- During rollback, the passwords set after the upgrade will not be functional. The passwords will get set back to the original values as present before the upgrade.

Please follow the below procedure to upgrade/rollback (Only required if upgrading from 15.0.0.x to 15.0.0.4.0 (or later)):

- 1. Before starting upgrade, save the passwords for the existing GUI users (required during rollback).
- 2. Upgrade to 15.0.0.4.0 or later patch.
- 3. After upgrade, when you login as any existing GUI user, the password will get expired and need to be reset. (Follow the same steps for all the existing GUI users.)
- 4. In case of rollback, reuse the old passwords that were saved in step 1.

1.9.3 Backout of Fully Upgraded Cluster

Prior to performing this procedure, Oracle recommends consulting My Oracle Support to discuss the next appropriate course of actions.

Use this to backout a cluster that has been fully upgraded. At the end of this procedure, all servers of the target cluster is on a pre-15.0.x release with Active, Standby, or Spare status.

Expected pre-conditions:

- 1. Primary Active CMP is on Release 15.0.x
- 2. Secondary CMP cluster is on Release 15.0.x
- 3. All MPE/MRA Clusters are on Release 15.0.x

1.10.3.1 Backout Sequence

This procedure applies to a cluster. The non-CMP cluster types (MRA, MPE) is in georedundant mode with active, standby, and spare servers. CMP clusters may be in Site1 or Site2. Each server backout will take about 20 minutes.

NOTE: It is possible, and desirable, to backout multiple clusters in parallel. However, in order to do this, each cluster must start the backout procedure one at a time, staggering by about 1 minute each.

Overview on Backout/Rollback MRA/MPE cluster

The following sequence preserves the cluster as a georedundant MRA/MPE cluster.

- **1.** Back out of the standby server.
- 2. Back out of the spare server.
- **3.** Fail over.
- **4.** Reapply the configuration.
- **5.** Back out of the new standby server.

Backout Secondary CMP (if applicable)

NOTE: At this time, all MPEs and MRAs must be backed out to the previous release.

Use the CMP GUI (Upgrade Manager) to backout the Secondary CMP cluster

Backout Primary CMP

NOTE: At this time, all of the MPE/MRA clusters must be backed out, the Secondary CMP must also be backed out.

1. Back out of the Primary standby CMP cluster.

- 2. Failover to older version CMP cluster.
- 3. Log back into the Primary CMP VIP.
- **4.** If needed, go to **Policy Server** → **Configuration** → **Policy Server** and click **Reapply Configuration**.
- **5.** Wait for 10-15 minutes before the rollback of secondary CMP (in Primary Site) to allow secondary site CMP nodes to sync with the new MySQL master.
- **6.** Back out of the new standby server.

1.10.3.2 Back-out Partially Upgraded MPE/MRA Cluster

Use this procedure to back-out a partially upgraded MPE/MRA Cluster.

Expected Pre-conditions:

- 1. Primary Active CMP is on Release 15.0.x
- 2. Cluster is any of MPE or MRA
- 3. One server of target cluster is on Release 15.0.x
- 4. Other servers of target cluster are on Release 15.0

NOTES:

- This procedure must be performed within a maintenance window.
- This procedure takes approximately 15 minutes per blade.
- If this procedure fails, contact Oracle Technical Services and ask for ASSISTANCE.

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

Procedure 10: Back-out Partially Upgraded MPE/MRA Cluster

Step	Procedure	Details
1.	II = = = = = = = = = = = = = = = = = =	Navigate to Upgrade → Upgrade Manager .
	status of affected Clusters	Confirm status of the cluster to be backed out:
		 Primary Active CMP is on Release 15.0.x
		 Target Cluster has 2 servers on Release 15.0, and 1 server on Release 15.0.x
		Active server is on 15.0
2.	,	Using SSH, log into the Standby server to be backed out as admusr.
	/var/log/messages file size	\$ 1s -lh /var/log/messages
		 ONLY if the resulting size of /var/log/messages is above 20M, run the following, otherwise proceed to the next step.
		<pre>\$ sudo cp /var/log/messages /var/camiant/log/messages.preBack-out</pre>
		<pre>\$ sudo cat /dev/null > /var/log/messages</pre>
		<pre>\$ logger -s "Truncated this file prior to back-out. Copy is in /var/camiant/log/messages.preBack-out"</pre>
		3. Verify:
		\$ 1s -lh /var/log/messages
3.	CMP GUI: Verify the	1. Navigate to Upgrade → Upgrade Manager.
э	status of affected Clusters	2. Hangate to appliance of appliance manager.

		\$ sudo syscheck
		—End of Procedure—

1.10.3.3 Back-out Fully Upgraded MPE/MRA Cluster

Use this procedure to back-out fully upgraded MPE/MRA Clusters.

Prior to performing this procedure, Oracle recommends consulting the Technical Services team to discuss the next appropriate course of actions.

This procedure is used to back-out a cluster that has been fully upgraded. At the end of this procedure, all servers of the target cluster is on Release 15.0 (MRA, MPE, CMP) with Active, Standby status.

Expected pre-conditions:

- 1. Primary Active CMP is on Release 15.0.x
- **2.** Cluster is of MPE or MRA
- **3.** Servers of target cluster are on Release 15.0.x in either in Active, Standby, Force Standby or Spare role

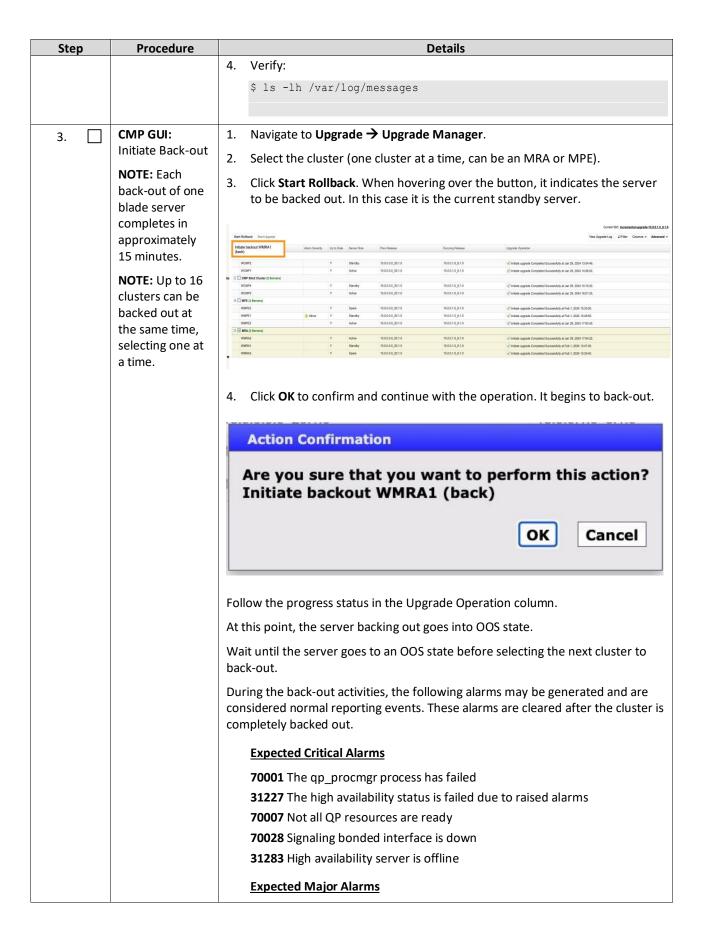

NOTES:

- This procedure must be performed within a maintenance window.
- This procedure takes approximately 45-60 minutes per MPE or MRA cluster.
- If this procedure fails, contact Oracle Technical Services and ask for ASSISTANCE.

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

Step	Procedure	Details
13.	MPE/MRA SSH:	Login to the backed-out Standby server as admusr.
	Verify syscheck and /tmp	2. Verify that there are not any failures in syscheck:
	directory	\$ sudo syscheck
	permission	[admusr@MRA175-38 ~]\$ sudo syscheck Running modules in class disk OK
		Running modules in class hardware OK
		Running modules in class net OK
		Running modules in class proc OK
		Running modules in class system OK
		LOG LOCATION: /var/TKLC/log/syscheck/fail_log [admusr@MRA175-38 ~]\$
		3. Verify /tmp directory permissions:
		\$ ls -l /
		4. NOTE: Permissions should be the following,
		drwxrwxrwt. 5 root root 4096 Apr 27 10:54 tmp
		If the permissions are not as listed above then perform the following otherwise skip to next step:
		\$ sudo chmod 777 /tmp
		<pre>\$ sudo chcon -h system_u:object_r:tmp_t:s0 /tmp</pre>
		\$ sudo chmod +t /tmp
		6. Verify:
		\$ 1s -1 / 7. Perform syscheck again:
		\$ sudo syscheck \$ syscheck
14.	CMP GUI: Verify	Verify Cluster is processing traffic normally:
14.	that backed out cluster is processing traffic normally.	Navigate to System Wide Reports → KPI Dashboard.

Step	Procedure	Details											
		KPI Dashboard (Last Refresh:02/01/2024 14:43:10) Filter ** Oward Throubids*											
		Performance											
		MPIs selected 0 0 0 4488 4485 0

		(a) MRAE(server-8) Standay 8 19 (a) MRAE(server-C) Spore 8 21 MRE State TPS PON Active CPU No Memory No MRA Sources Critical Major Minor Seet Received											
		□ MPX[Server-A) Forcet 9 23											
15.	CMP GUI: Verify alarms	1. Navigate to System Wide Reports → Alarms → Active Alarms.											
	alarins	2. Verify that there are not any unexpected active alarms present.											
		NOTE: Some Alarms take approximately 30 minutes to 1 hour to auto clear.											
		NOTE: After the backout of the clusters, if Critical Alarm 31283 (High											
		availability server is offline) does not clear, then REP route might be											
		missing from the backed-out server. Therefore Routes need to be verified and added. In this case, proceed to next step, otherwise, ski											
		step 20.											
16.	MPE/MRA SSH:	Login into MPE/MRA server as admusr											
10.	Verify routes	Copy routes_output.txt from /home/admusr to /tmp											
		<pre>\$ sudo cp routes_output.txt /tmp \$ cd /tmp</pre>											
		\$ 1s											
		routes output.txt											
		Too.											
		WARNING: It is critical that proper exit of the platcfg menu is strictly											
		adhered to. Not exiting the platefg menu and or in the event of a blade service											
		interruption occur while still within the platcfg menu can cause an adverse impact to application functionality on the blade. If this occurs contact Oracle											
		personnel immediately and alert Maintenance Engineering.											
		3. Run the platcfg utility:											
		\$ sudo su - platcfg											
		4. Navigate to Policy Configuration → Routing Config → Display Routes.											
		5. Verify that all routes are present.											
		6. Click Forward to view all the routes.											
		Example:

1.10.3.4 Back-out Fully Upgraded Secondary CMP cluster

Use this procedure to back-out a fully upgraded Secondary CMP cluster.

Expected Pre-conditions:

- 1. Primary Active CMP is on Release 15.0.x
- 2. Secondary CMP cluster is on Release 15.0.x
- 3. All MPE/MRA Clusters are on Release 15.0

NOTES:

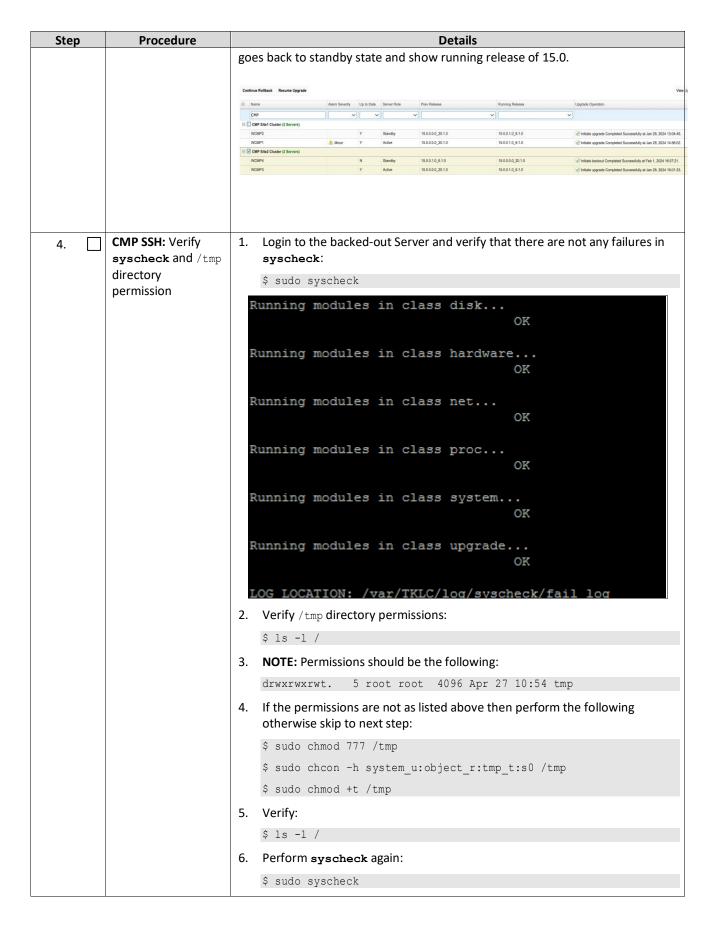

- This procedure must be performed within a maintenance window.
- This procedure takes approximately 45-60 minutes.
- If this procedure fails, contact Oracle Technical Services and ask for ASSISTANCE.

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

Procedure 12: Back-out Fully Upgraded Secondary CMP cluster

Step	Procedure	Details
1	CMP GUI: Verify the status of CMP clusters	1. Navigate to Upgrade → Upgrade Manager. 2. Confirm status of the cluster to be backed out: - Primary Active CMP is on Release 15.0.x - Secondary CMP cluster is on Release 15.0.x - Up to Date column shows Y for all servers 3. Click Filter and enter cmp in the Name field. Example: But Running Running
2.	CMP SSH: Verify /var/log/messages file size	 Using SSH, log into the Standby server to be backed out as admusr \$ ls -lh /var/log/messages ONLY if the resulting size of /var/log/messages is above 20M, run the following, otherwise proceed to the next step. \$ sudo cp /var/log/messages /var/camiant/log/messages.preBackout \$ sudo cat /dev/null > /var/log/messages \$ logger -s "Truncated this file prior to back-out. Copy is in /var/camiant/log/messages.preBack-out" Verify: \$ ls -lh /var/log/messages
3.	CMP GUI: Back-out clusters NOTE: Each back-out of one server takes about 20 minutes to complete.	 Navigate to Upgrade → Upgrade Manager. Select the Secondary CMP cluster Click Start Rollback. When hovering over the button, it indicates the backout server.

Step	Procedure					Details

		drwxrwxrwt. 5 root root 4096 Apr 27 10:54 tmp
		 If the permissions are not as listed above then perform the following otherwise skip to next step:
		\$ sudo chmod 777 /tmp
		<pre>\$ sudo chcon -h system_u:object_r:tmp_t:s0 /tmp</pre>
		\$ sudo chmod +t /tmp
		5. Verify:
		\$ ls -1 /
		6. Perform syscheck again:
		\$ sudo syscheck
12.	CMP GUI: Verify	 Navigate to System Wide Reports → Alarms → Active Alarms.
	Alarm Status.	2. Confirm that any existing alarm is understood.
		Oracle Communications Policy Management Active Alarms (Stats Reset: Interval / Last Refresh:01/15/2016 10:16:13) Tends See Land Display results per page 1 Trust Tends Tends
13.	CMP GUI: Verify Traffic Status - KPI Dashboard Report	 Navigate to System Wide Reports → KPI Dashboard. Confirm that all Connections and Traffic status are as expected. Observe it for a few screen refresh updates.

2 GEOREDUNDANCY DISABLED

2.1 Introduction

2.1.1 Purpose and Scope

This document describes methods utilized and procedures to perform a software upgrade of Oracle Communications Policy Management Release 15.0 to Release 15.0.x when georedundancy on non-CMP components (MPE/MRA) is disabled.

The non-georedundant MPE/MRA cluster scheme only has two servers active and standby co-located on one site.

Two sites can be used in Policy Management deployments, namely, a Site1 or Primary Site and a Site2 or Secondary Site. The primary MRA/MPE cluster of active and standby resides on Site1 while the secondary MRA/MPE cluster of active and standby resides on Site2 for disaster recovery.

2.1.2 Acronyms

Table 5: Acronyms

Acronym	Meaning
CMP	Configuration Management Product
	NOTE: It usually refers to the CMP on the primary site
DR-CMP	Configuration Management Platform for Disaster Recovery
	NOTE: It refers to the CMP on the secondary site
DSR	Diameter Signaling Router
GUI	Graphical User Interface
LVM	Logical Volume Manager
MPE	Multimedia Policy Engine
MPE-LI	MPE for Lawful Intercept - a type of Multimedia Policy Engine
MRA	Multiprotocol Routing Agent (also referred to as Policy Front End or PFE)
PC	Policy Counter
PCEF	Policy Control Enforcement Function
PCRF	Policy and Charging Rules Function—An Oracle Communications Policy Management system
TPD	Tekelec Platform Distribution
UE	User Equipment
UM	Upgrade Manager—The CMP GUI pages that the operator uses to perform an upgrade
VO	Verification Office
MOP	Method of Procedure
OOS	Out of Service

Acronym	Meaning
IPM	Initial product manufacture

2.1.3 Terminology

Table 6: Terminology

Term	Description
Primary Site (Site1)	A site where the MPE/MRA primary cluster exists with co-located Active and Standby servers.
Secondary Site (Site2)	A site where the MPE/MRA secondary cluster exists with co-located Active and Standby servers for disaster recovery.
Spare Server or Server-C	Server that is ready to take over from the Active server if both the Active and Standby servers fail. It is generally in a different location than the Active and Standby servers.

2.1.4 Software Release Numbering

TPD: 8.xCOMCOL: 6.6

• Policy Management Release 15.0

2.1.5 Upgrade Overview

This section lists the required materials and information needed to perform Policy Management Release 15.0 software upgrades.

2.1.6 Upgrade Status Values

Table 7: Upgrade Status Values

Status	Condition
OK	All servers are up-to-date and no alarms are present.
Info	No alarms are present, but a condition (such as out-of-date) is present that the operator should be made aware of.
Minor	At least one minor alarm is present.
Major	At least one major alarm is present.
Offline	The server cannot be reached.
Degraded	At least one server in the cluster cannot be reached.
Critical	At least one critical alarm is present.
Active	The server is active.
Standby	The server is in standby mode as part of normal operations.
Forced Standby	The server is in standby mode because it has been placed into that state via direct operator intervention or as part of the upgrade.
Offline	The server cannot be reached.
Zombie	The server is in a state where it cannot recover automatically and requires direct operator intervention.

2.1.7 Upgrade Path

This upgrade document supports the following upgrade path:

Policy Management 15.0 (fresh install) to 15.0.x (full DIU ISO) (Major Path)

NOTE:

- If the official upgrade paths mentioned in the release documents of each supported version is not followed, please contact Oracle Support before upgrading to 15.0.x. (Refer to individual patch release document to see the supported upgrade paths.)
- 15.0 to 15.0.x upgrade is only applicable for VM based environments.

2.1.8 Upgrade Information

2.1.8.1 Upgrade Sequence

An upgrade procedure applies to an Active/Standby pair of servers. This pair of servers is referred to as a cluster or HA cluster. A cluster can be of different types: CMP, MRA or MPE depending on the mode. For a CMP cluster, the cluster status may also be Primary site and/or Secondary site.

A deployment may consist of multiple clusters.

Required Cluster Upgrade Sequence

Policy Management Server software upgrades are performed on a cluster by cluster basis at the primary and secondary sites within the same maintenance window.

The following is the general upgrade sequence, specific procedures/steps can further be documented by an Oracle provided MOP.

The following are the steps for a Policy Management system upgrade procedure (specific process are documented by an Oracle provided MOP):

- 1. Upgrade Primary (Site1) CMP
- 2. Upgrade Secondary (Site2) CMP (if applicable)
- 3. Upgrade MPE/MRA (see note below)

NOTE: MPE/MRA clusters can be upgraded in parallel. (upgrades from 12.5.0 where 8 clusters can be upgraded in parallel, and from 12.6 where 16 clusters can be upgraded in parallel).

2.1.8.2 Policy Management Release Mixed-Version Operation and Limitation

The general expectation is that a system that is running in a mixed version configuration should support features and perform at a level of the previous version. Thus, a system that is running pre-15.0.x release and 15.0.x release in mixed configuration would support the performance and capacity of the pre-15.0 release. The mixed version Policy Management configuration would also support pre-15.0.x features.

Since the CMP is the first Policy Management system component that is upgraded to the new version, the Release 15.0.x CMP manages MRA/MPE servers in a pre-15.0.x release. In this mixed version configuration, a Release 15.0.x CMP does not prevent an operator from configuring anything that can be configured in a previous release and all configuration items from the previous release are still available. However, the configuration changes during the upgrade of Policy Management system are discouraged and have limited support.

In the mixed version, a Release 15.0.x CMP has the following limitations while running in a mixed version environment:

- New features must not be enabled until the upgrades of all servers managed by that CMP are completed. This also applies to using policy rules that include new conditions and actions introduced in the release.
- As a general guideline, policy rules should not be changed while running in a mixed version
 environment. If it is necessary to make changes to the policy rules while running in a mixed
 version environment changes that do not utilize new conditions and actions for the release
 could be installed, but should be jointly reviewed by the you and Oracle before deployment to
 verify that these policies indeed do not use new conditions or actions.
- The support for configuration of MPE/MRA servers is limited to parameters that are available in the previous version. Specifically:
 - Network Elements can be added

Table 8: Mixed-version configurations supported

Policy Management system components on	CMP R15.0.x	MRA R15.0.x	MPE R15.0.x
CMP 15.0	Yes	No	No
MRA 15.0	Yes	Yes	Yes
MPE 15.0	Yes	Yes	Yes

NOTE: Replication between CMP and DR-CMP is automatically disabled during upgrade of CMP and DR-CMP to Release 15.0.x. The replication is automatically enabled after both active CMP and DR-CMP are upgraded to Release 15.0.x.

2.1.9 Customer Impacts

The cluster upgrade proceeds by upgrading the Standby server, switching over from the Active to the Standby, and upgrading the second server (that is, the new Standby). The switchover of each cluster has a small impact on traffic being processed at that cluster, as in the past releases upgrades.

2.1.10 Rollback/Backout

The full pre-upgrade server image is stored on the server during the upgrade, and can be restored in the event of a problem discovered during or after upgrade.

2.1.11 TPD Version

The Tekelec Product Distribution (TPD) version needed for this release is included in the Policy Application Software Upgrade DUI ISO, and TPD is upgraded to version 8.x as part of this procedure.

2.1.12 Loading Application software

For upgrade of server application software, the recommended method is to copy the application DIU ISO images to the servers using scp or ftp.

2.1.13 Required Materials and Remote Access

- 1. Policy Management 15.0.x software DIU-ISO files
- 2. Policy Management 15.0.x software Release Notes
- **3.** The capability to remote login to the target server as admusr.

NOTE: The remote login can be done through SSH, local console. Ensure the network firewall policy allows the required application and corresponded ports.

- **4.** The capability to secure copy (scp) from the local workstation being used to perform this upgrade to the target server, or otherwise be able to transfer binary files to the target server.
- **5.** User logins, passwords, IP addresses and other administration information.
- **6.** VPN access to the network is required if that is the only method for remote logging into the target servers. It must be also possible to access the Policy Management GUI.

2.1.14 Upgrade Media

See the release notes for the list of DIU ISO image files required for the Policy Management upgrade you are installing.

2.1.14.1 Logins, Passwords and Server IP Addresses

The IP address assignments for each site, from the appropriate Oracle Network IP Site Survey/NAPD, must be available. This ensures that the necessary administration information is available prior to an upgrade.

Further, need to confirm login information for key interfaces, and document in table below.

It is assumed that the logins may be common across sites. If not, record the information for each site.

NOTE: Consider the sensitivity of the information recorded in this table. While all of the information in the table is required to complete the upgrade, there may be security policies in place that prevent the actual recording of this information in permanent form.

Table-9: Logins, Passwords and Server IP Addresses

Item	Value
CMP servers	GUI Administrator Login User/Password:
	admusr password:
MRA/MPE servers	admusr password:
Target OA	OA Administrator Login: User/Password
Software Upgrade Target Release ²	Target Release Number:
	Policy Management 15.0 software DIU ISO image filenames.

2.2 Theory of Operation

2.2.1 Upgrade Manager Page

The Upgrade Manager represents a significant shift from some of the previous upgrade pages. In the past it was up to the operator, with assistance from a MOP, to know the correct sequence of server selects and menu selects. The new upgrade manager takes a different approach. It determines the next course of action to either:

- 1. Begin/continue upgrading a cluster
- 2. Begin/continue backing out a cluster.

There is an important point implicit in the list above:

Upgrade is now presented from a cluster perspective, instead of a server perspective.

The shift in perspective has a number of ramifications, most noticeably it is not possible to select individual servers or bulk select a group of servers. In fact, in order to perform any operation, it is necessary to select a cluster first.

Another major shift is that certain operations are performed automatically on behalf of the operator. These operations are not even presented to the operator as an option. However, the operator can see what has been done via the upgrade log.

² The ISO image filenames should match those referenced in the Release Notes for the target release.

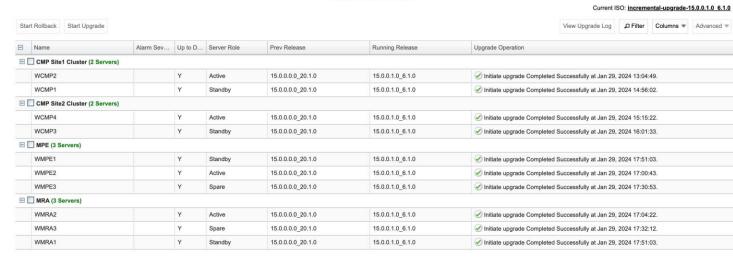

Figure 4: Sample display of the upgrade manager page.

For the most part, the items in the display are fairly self-explanatory. With that said, there are three items that deserve a deeper discussion.

Start Rollback or Start Upgrade buttons (upper left)

If these buttons are greyed out, it means that there is not an appropriate action to take at this time. However, if a button is not greyed out, then it means that there is a preferred action that can be taken to upgrade (or backout) the cluster. Normally, upgrading a cluster is a well-defined fixed procedure. However, in some cases there are a number of valid sequences. Selecting the preferred step causes the upgrade director to choose the default sequence. It is strongly recommended to exclusively use these buttons to upgrade or backout a cluster.

Alarm Severity

This column is used to indicate if there are alarms associated with a server. If so, it displays the severity of the most severe alarm here. It is important to explain the intent of this column. The intent is to give a visual indication that the particular server is experiencing alarms. This is not a reason to panic: During the upgrade we expect servers to raise alarms:

- The CMP raises alarms simply to indicate that it is initiating upgrade activity.
- Servers report alarms to indicate that their mate servers are offline.

However, if alarms are asserted for a server, it is good practice to look at the alarms prior to initiating upgrade activity on them.

Up to Date

This column is used to indicate the state of the code on the server.

N

The server is running old code and must be upgraded

Y

The server is running new code.

N/A

Upgrade is not appropriate and/or the server is in a bad state

2.2.2 The Upgrade Log

Within the Upgrade Manager page, the operator can access the upgrade log. This displays attributes of the various actions (manual and automatic) that have been performed on the selected cluster. It is important to note that this is NOT the audit log. The audit log is meant to track what the operator has done. This log is meant to capture the sequence of upgrade activity—whether it was initiated by an operator or automatically triggered.

ID Pare	ent ID Action Name	Start Time	End Time	Duration	Scope	Hostname	Result	Mode	Description

Figure 5: Upgrade Log

2.2.2.1 Optional Actions

It is possible to perform every step in the upgrade process just using the **Upgrade** and **Backout** buttons. When the operator clicks these buttons, the upgrade director performs the next preferred action. However, there are times that the operator may want to take a slightly different—but still legal—procedure. For example, the upgrade director has a preferred order in which it upgrades a cluster. However, if the operator wanted to deviate from that default procedure—say to restrict upgrade to servers in a particular site—then they can use the optional actions menu. It is important to note that this menu is ONLY be populated with legal/reasonable actions. Actions that are wrong or inconsistent are not displayed.

If the operator selects an optional action, they can go back to using the default/preferred at any time.

2.2.2.2 The DIU ISO Select

In the upper right hand corner, there is an item called the current DIU ISO. In some respects the term DIU ISO is misleading. A better description might be upgrade procedure. This item shows the upgrade procedure that is being used. In common cases, this is going to work out to either:

- A standard (full) upgrade to version XXX
- An incremental upgrade to version XXX

To start a new upgrade, click this item. The upgrade director searches for the valid upgrade procedures. To minimize confusion, the upgrade procedures are embedded in the CMP DIU ISO file. This way, the CMP DIU ISO file is tied to the corresponding upgrade procedure.

When you select a new DIU ISO file, you are telling the upgrade director to abandon its current upgrade procedure in favor of a new procedure.

2.2.2.3 Upgrade Director Behavior

The Upgrade Director (UD) is a component that tracks the state of the servers, cluster, and system during an upgrade. The UD is hidden. However, there are conventions and operating principles that are visible.

Alarm Philosophy

NOTE: During an upgrade, the Upgrade Manager asserts (that is, generates) and displays alarms. An upgrade typically triggers multiple minor, major, and critical alarms as servers are taken out of service, go into forced standby, or fail over. This is normal and to be expected.

In general, the Upgrade Director raises alarms if:

- A server is somehow impaired.
- There is activity expected of an operator.

The table summarizes the alarms that can be raised during a 15.0.x upgrade.

Table 5 Alarm summary

Alarm ID	Severity	Name	Description
70500	Minor	SYSTEM_MIXED_VERSION	The servers in the topology are running different versions of software. Upgrade of the

Alarm ID	Severity	Name	Description
			system is not complete.
70501	Minor	CLUSTER_MIXED_VERSION	The servers in the specified cluster are running different versions of software. The upgrade of the cluster is not complete.
70502	Minor	REPLICATION_INHIBITED	Replication is inhibited to the specified server. It is not receiving session information.
70503	Minor	SERVER_FORCED_STANDBY	The specified server has been placed in forced standby and cannot provide service.
70506	Minor	UPGRADE_OPERATION_FAILED	An upgrade operation failed on the specified server.
70507	Minor	UPGRADE_IN_PROGRESS	An upgrade/backout is currently in progress on the server. It may leave the cluster, become unreachable or even reboot.
70508	Critical	ZOMBIE_SERVER	The server is in an indeterminate state and must be repaired by support.

General Upgrade Procedure

In general, the upgrade of a server goes through three steps.

- 1. Preflight checks—look for certain conditions which guarantee a failed upgrade. If such conditions are detected, the upgrade fails. There are two principles behind the preflight checks
 - a. It is better to fail early in a recoverable way than to fail late in an unrecoverable way.
 - b. Preflight checks are VERY narrow. We do not want a false positive preventing an otherwise valid upgrade.
- 2. The upgrade itself
- **3.** Wait for replication to synchronize.

This procedure is in place so that it should not be necessary for an operator to login to the target server to verify conditions. They should be able to comfortably stay on the upgrade manager page.

Unreachable Servers

During the course of an upgrade, servers can go unreachable. This is expected and the Upgrade Manager tries to be graceful about unreachable servers. However, if the CMP experiences a failover when another server is unreachable, this runs into limits. The promoted UD does not have the full history/context. It waits until it can contact the unreachable server before it takes action on the server.

Reversing Directions

In general, it should be possible to reverse directions at any time. You should be able to upgrade a server in a cluster, back it out, upgrade it, upgrade its mate, back it out, and so on. In this sense, upgrade/backout should be fully reversible. However, you are not permitted to reverse direction if there is an ongoing action: You cannot kick off a backout of a server if another server in the cluster is being upgraded. You have to wait for the upgrade to finish.

Mixed Version and Forced Standby

As a general rule, if a cluster is in mixed version, then every server that is NOT running the same version as the active server must be in forced standby. This way, a simple failover does not cause a change in the version of code that is providing service.

Failure Handling and Recovery

Failures fall into two categories:

- Failures that the upgrade director is able to recover from.
- Failures that the upgrade director cannot automatically recover from.

Any failure should generate an UPGRADE_OPERATION_FAILED alarm. In such cases, the operation can be attempted again. Ideally, the operator/support would investigate the original failure before repeating. However, if the server is in an indeterminate state, the server is declared a ZOMBIE and no further action can be taken on the server. It requires direct action by support or engineering to repair.

For the current release, recovery or even deep failure diagnosis, is not something that we expose via the GUI.

2.3 Upgrade Preparation

This section provides detailed procedures to prepare a system for upgrade. These procedures are performed outside a maintenance window.

Overview:

- 1. Upgrade Primary (Site1) CMP
- 2. Upgrade Secondary (Site2) CMP (if applicable)
- 3. Segment 1 Site 1:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters
- 4. Segment 1 Site 2:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters
- **5.** Segment 2 Site 1:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters
- 6. Segment 2 Site 2:
 - a. Upgrade MPE clusters
 - b. Upgrade MRA clusters

2.3.1 Prerequisites

The following Procedure 16 table verifies that all required prerequisite steps needed to be performed before the upgrade procedure begins.

Procedure 14 Prerequisites

Step	Procedure	Details		
1.	Review Release	Review Policy Management Release 15.0.x for the following information:		
	Notes	 Individual Software components and versions included in target release New features included in target release Issues (Oracle BUGs) resolved in target release Known Issues with target release 		
		 Any further instructions that may be required to complete the Software Upgrade for the target release. In particular, the supported browsers: In release 15.0.x, only Mozilla Firefox and Google Chrome are fully supported. 		
	—End of Procedure—			

2.3.2 Plan and Track Upgrades

The upgrade procedures in this document are divided into the following three main sequential steps:

- 1. Upgrade CMP cluster(s)
- 2. Upgrade non-CMP clusters

The following table can be completed first before performing the upgrade, to identify the clusters to be upgraded and plan the work. It can also be used to track the completion of the upgrades, and assign work to different engineers.

NOTES:

- **1.** Policy changes or configuration changes should NOT be made while the system is in mixed-version operation.
- **2.** Time estimates are for upgrade procedures without backout procedure. Backout procedure time is typically same as, or less than the upgrade procedure.

Step	Procedure	Result	Engineer	Time
1.	Use the following checklist to plan the cluster upgrades for the entire system.	Maintenance windows are planned		
2. 🗌	Upgrade Site1 and Site2 CMP clusters	Site Names &		3 hrs

Step	Procedure	Result	Engineer	Time
3.	Upgrade Site1 non-CMP clusters for Segment-1	Site Names Cluster List:		2 hrs
4.	Upgrade Site2 clusters for Segment-1	Site Names Cluster List:		2 hrs
5.	Upgrade Site1 clusters for Segment-2	Site Names Cluster List:		2 hrs
6.	Upgrade Site2 clusters for Segment-2	Site Names Cluster List:		2 hrs

2.3.3 Perform System Health Check

Use this procedure to determine the health and status of the servers to be upgraded and must be performed at least once within the time frame of 24-36 hours prior to the start of a maintenance window.

Procedure 15 Perform System Heath Check

Step	Procedure	Result		
1.	CMP GUI access	Open a supported browser (Mozilla Firefox or Google Chrome) to access the Primary CMP GUI on its VIP address and login to verify access.		
2.	View active alarms	Identify the cause of any existing active alarms, and determine if these may have impact on the upgrade. Export current Alarms to save into a file. IMPORTANT: Before starting any upgrade activity, ensure that all		
		active alarms are understood and resolved.		
3.	View KPI reports	Verify that the system is running within expected parameters. Export current KPIs to save into a file.		
4.	Confirm NTP servers reachable from all the servers	Validate the IP connectivity between the server and NTP servers with the ping command.		
	(CMP and non- CMP) to be	Confirm that time is synchronized on each server with CLI shell command of:		
	upgraded	[admusr@CMP1194 ~]\$ sudo chronyc tracking		
	NOTE: If the time	3. Confirm the date is correct on each server.		
	across the servers is out of synch, fix it first and re-	 Check that the BIOS clock is synced with the clock using the shell hwclock command: 		
	validate this step,	[admusr@CMP1194 ~]\$ sudo hwclock		
	before starting the			
	upgrade			
	procedures.			
—End of Procedure—				

2.3.4 Deploy Policy Management Upgrade Software

Software should be deployed to each policy server <code>/var/TKLC/upgrade</code> directory, before the actual upgrade activities. This is typically done with utilities such as SCP, WGET, SFTP, or the Upgrade Manager. Because of the large size of the software ISO files, sufficient time should be planned to accomplish this step. For Policy Management Release 15.0.x, each DIU ISO image size is about 8GB for CMP and about 7GB for non-CMP servers.

2.3.4.1 Deploying Policy Management Upgrade Software to Servers

There are several possible software images in this upgrade (CMP, MPE, MPE-LI, MRA). A single image must be deployed to the <code>/var/TKLC/upgrade</code> directory of each server to be upgraded, where the image is the correct type for that server. Therefore, the CMP software image must be deployed to the CMP servers, the MPE image deployed to the MPE servers, the MRA image deployed to the MRA servers and so on.

IMPORTANT: If the deployed image type (CMP, MPE, MRA) does not match the existing installed software type, the upgrade fails. Example: an attempt to upgrade a CMP with a MPE software image fails during the upgrade action.

If multiple images are copied into the /var/TKLC/upgrade directory, the upgrade fails.

2.3.4.2 Distribute Application ISO Image Files to Servers

This procedure applies to all server types. It assumes that the ISO image files are copied to the sites to be upgraded.

NOTE: ISO transfers to the target systems may require a significant amount of time depending on the number of systems and the speed of the network. The ISO transfers to the target systems should be performed prior to, outside of, the scheduled maintenance window. Schedule the required maintenance windows accordingly before proceeding.

Procedure 16 Distribute Application ISO Image Files to Servers

Step	Procedure	Result		
1.	Transfer ISO files to Policy Management Servers.	Transfer release 15.0.x ISO files (CMP and non-CMP) into the /var/TKLC/upgrade directory on the respective server using one of the following methods		
		SCP/WGET command		
		USB drive		
		OR, if the images are on a server on the same network, scp via CLI.		
		Copy CMP software ISO to ONE of the other CMP servers:		
		\$sudo scp 872-* <cmp-15.0.x>:/var/TKLC/upgrade/</cmp-15.0.x>		
		Copy MPE software ISO to ONE of the other MPE servers:		
		\$sudo scp 872-* <mpe-15.0.x>:/var/TKLC/upgrade/</mpe-15.0.x>		
		Copy MPE-Li software ISO to ONE of the other MPE-Li servers:		
		\$sudo scp 872-* <mpe-li-15.0.x>:/var/TKLC/upgrade/</mpe-li-15.0.x>		
		Copy MRA software ISO to ONE of the other MRA servers:		
		\$sudo scp 872-* <mra-15.0.x>:/var/TKLC/upgrade/</mra-15.0.x>		
		NOTE: After copying the ISO to one of the respective servers, the ISO Maintenance option is used to upload to the rest of the servers.		
	—End of Procedure—			

2.3.4.3 Backups and Backup Locations

Procedure 17 Backup servers before upgrading servers

Step	Procedure	Result
1.	SSH CLI/ iLO: Access the server to be backed up	IMPORTANT: Server backups (for all CMP and non-CMP active and standby servers), and the system backup (from the active CMP), must be collected and readily accessible for recovery operations.
	NOTE: System Backup is done on Active	1. Login into the ACTIVE Primary CMP server.
	CMPs ONLY	2. Open the platcfg utility.
		\$sudo su - platcfg
		3. Navigate to Policy Configuration→Backup and Restore→Server Backup
		4. Enter an ISO backup filename (or use the suggested one) in the default backup location path:
		<pre>var/camiant/backup/local_archive/serverbackup/<serverbackup>. iso</serverbackup></pre>
		Set backup location The iso path: /var/camiant/backup/local_archive/server OK Cancel
		 5. Click OK. 6. Go back to the previous menu (Policy Configuration→Backup and Restore) and select System Backup. 7. Enter a tarball backup filename (or use the suggested one) in the default backup location path: /var/camiant/backup/local_archive/systembackup/<systembackup>.tar.gz</systembackup> Set backup location The tarball path: /var/camiant/backup/local_archive/system Cancel

Step	Procedure	Result		
2.	SSH CLI/iLO: Verify the backup file	If the default location is accepted in the previous step, change directory to the following and verify the file exists:		
		<pre>\$ cd /var/camiant/backup/local_archive/serverbackup</pre>		
		<pre>\$ 1s <hostname>-<servertype>_xx-serverbackup- <yyyy><mm><dd><hhmm>.iso</hhmm></dd></mm></yyyy></servertype></hostname></pre>		
		And:		
		<pre>\$ cd /var/camiant/backup/local_archive/systembackup</pre>		
		<pre>\$ ls <hostname>-cmp_xx-systembackup- <yyyy><mm><dd><hhmm>.tar.gz</hhmm></dd></mm></yyyy></hostname></pre>		
3.	Copy backup files.	Copy the ISO and tarball files to a safe location, for example, for a server backup file:		
		<pre>\$sudo scp -p /var/camiant/backup/local_archive/serverbackup/<serverbackup> .iso <remoteserverip>:<destinationpath></destinationpath></remoteserverip></serverbackup></pre>		
		Another option is to scp the server and system backup files to your local workstation.		
		After copying to remote server/workstation, remove the backup files from the server.		
		\$sudo rm <serverbackup>.iso</serverbackup>		
4.	Identify backup location	Backup location is:		
		Instructions to access to backups are as follows:		
	—End of Procedure—			

2.4 Upgrade CMP Clusters (15.0 to 15.0.x) wireless mode

2.4.1 Upgrade CMP Clusters Overview

The following is an overview of CMP Cluster upgrade.

1. Upgrade Primary CMP cluster

Use the CMP GUI, Upgrade

Upgrade Manager and upgrade the CMP Primary Site 1

- a. Start Upgrade
- b. Failover
- c. Log back into the CMP GUI
- d. Continue Upgrade
- **2.** Upgrade The Secondary CMP cluster

Use the CMP GUI, Upgrade → Upgrade Manager and upgrade the CMP Secondary Site 2

- a. Start Upgrade
- b. Failover
- c. Continue Upgrade

It is assumed that the CMPs may be deployed as 2 Geo-Redundant clusters, identified as Site-1 and Site-2 as displayed on the CMP GUI. When deployed as such, one site is designated as the Primary Site (which is the site that is managing the Policy Management system), and the other is as Secondary site (this site is ready to become Primary site, if needed).

CMP Sites Georedundant Status	Operator Site Name	Site Designation from Topology Form (Site1 or Site2)
Primary Site		,
Secondary Site		
Note the Information on this CMP cluster:		
Cluster Name		
Server-A Hostname		
Server-A IP Address		
Server-A Status		
Server-B Hostname		
Server-B IP Address		
Server-B Status		

IMPORTANT:

- CMP servers MUST be upgraded first, before the MPE or MRA clusters
- Site1 CMP MUST be upgraded to the new release first, before the Site2 CMP (if applicable)

2.4.1.1 Upgrade CMP Cluster

Use this procedure to upgrade a Primary CMP Cluster.

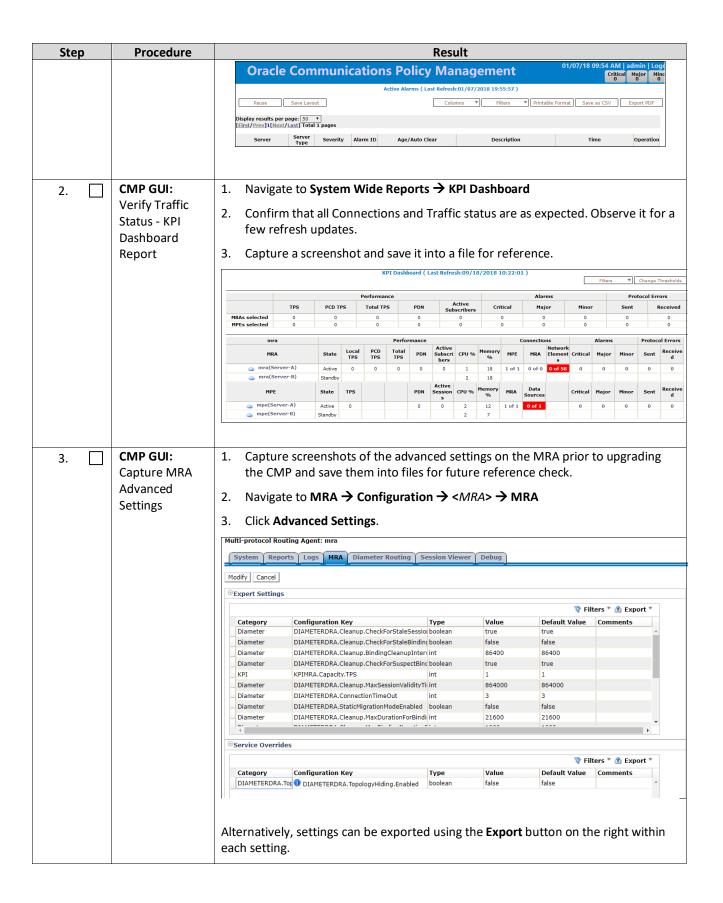

NOTES:

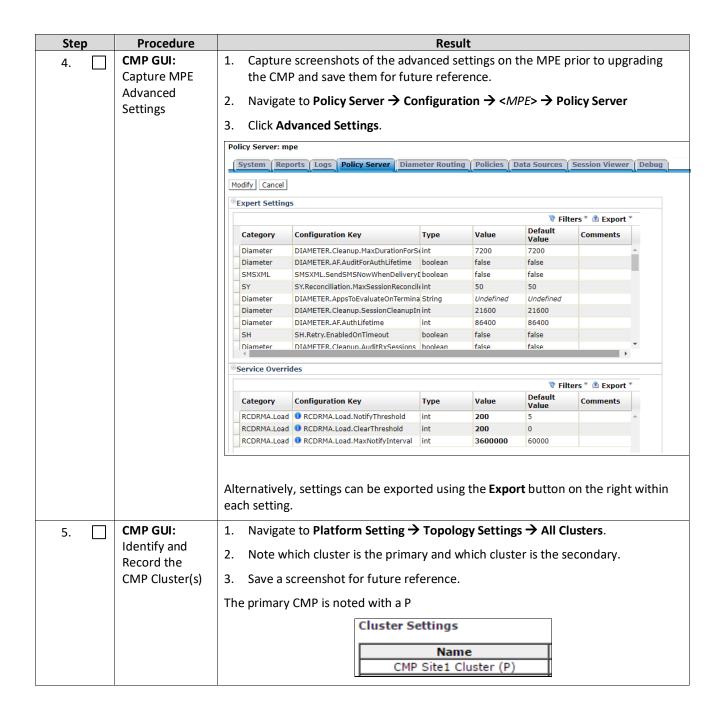

- This procedure must be performed in a maintenance window.
- This procedure takes approximately 60-75 minutes.
- If this procedure fails, contact Oracle Technical Services and ask for ASSISTANCE.

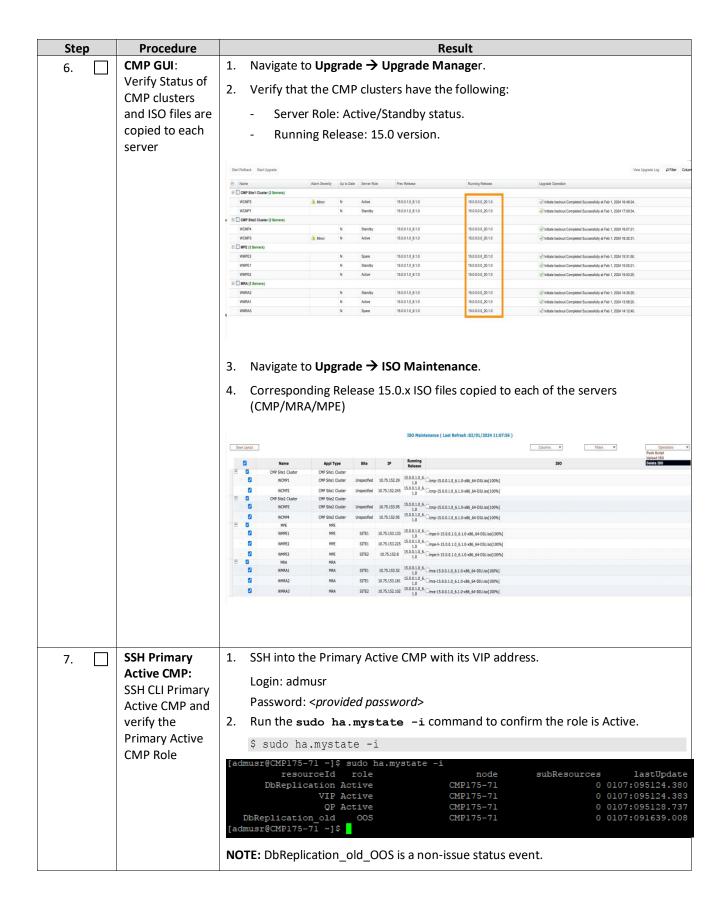

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

Procedure 18 Upgrade CMP Cluster

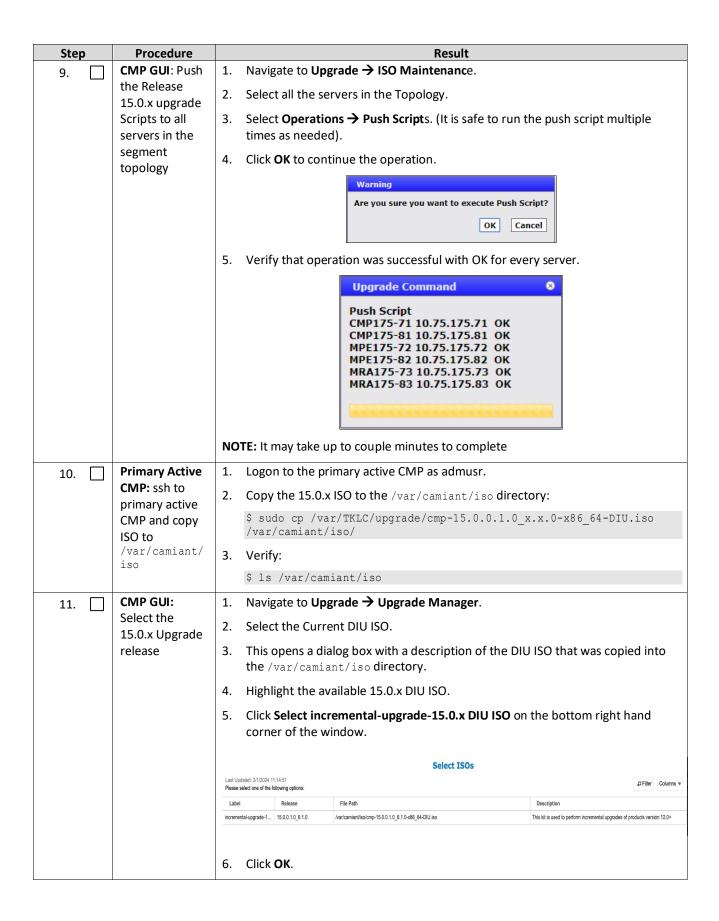

Step	Procedure	Result
1.	CMP GUI:	1. Navigate to System Wide Reports → Alarms → Active Alarms
	Verify Alarm Status.	Confirm that any existing alarm is understood and there is not any impact to the Upgrade procedure.
		3. Capture a screenshot and save it into a file for reference.

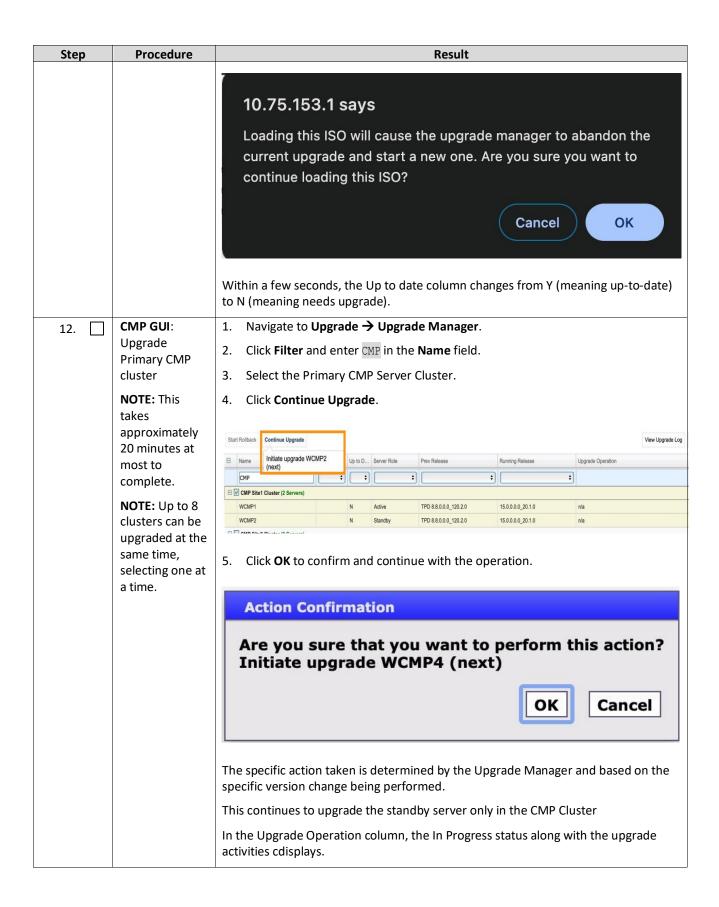

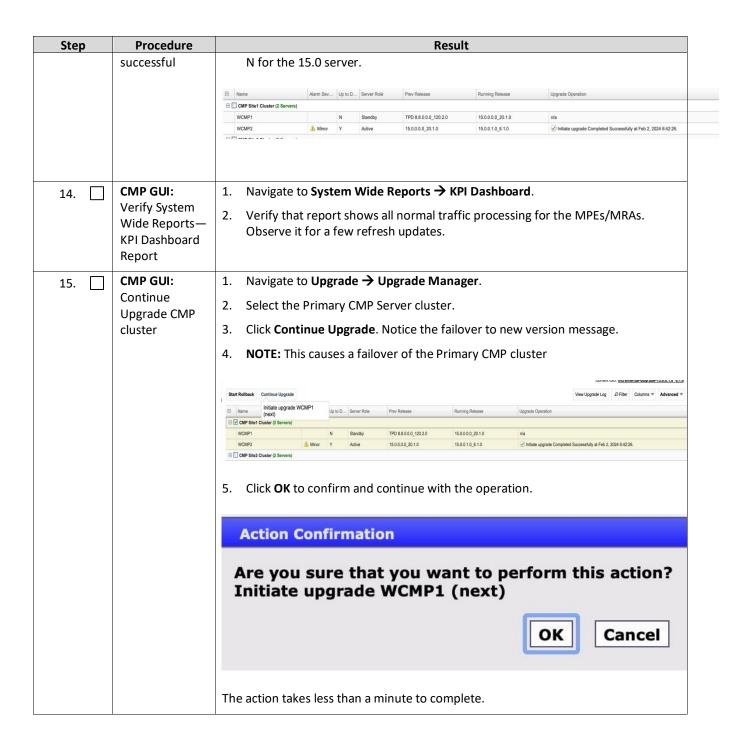

Step	Procedure	Result						
8.	SSH Primary	1. Exchange keys to all servers from the SITE 1 Active Primary CMP.						
	Active CMP: exchange keys	2. Login as admusr user.						
		3. Notes: This step could be skipped if your system was fresh installed in R15.0.						
		<pre>\$ sudo mount -o loop /var/TKLC/upgrade/cmp-15.0.0.1.0_x.x.0- x86_64-DIU.iso/mnt/upgrade/</pre>						
		<pre>\$ sudo cp /mnt/upgrade/upgrade/policyScripts/*.pl /opt/camiant/bin</pre>						
		NOTE: If prompted, answer Yes to all.						
		<pre>\$ sudo umount /mnt/upgrade</pre>						
		<pre>\$ sudo qpSSHKeyProv.plprov</pre>						
		Required to enter the PASSWORD for admusr user.						
		• Ensure that the Keys are exchanged successfully with all the server clusters						
		For example:						
		\$ sudo qpSSHKeyProv.plprov						
		The password of admusr in topology: <admusr password=""></admusr>						
		Connecting to admusr@njbbs07cmp01b						
		Connecting to admusr@njbbs07cmp01a						
		Connecting to admusr@txsls07mra01b						
		Connecting to admusr@njbbs07mpe02a						
		Connecting to admusr@txsls07mpe01b						
		Connecting to admusr@njbbs07mra01a						
		[16/17] Provisioning SSH keys on txsls07mpe02b						
		[17/17] Provisioning SSH keys on njbbs07mra01b						
		SSH keys are OK.						

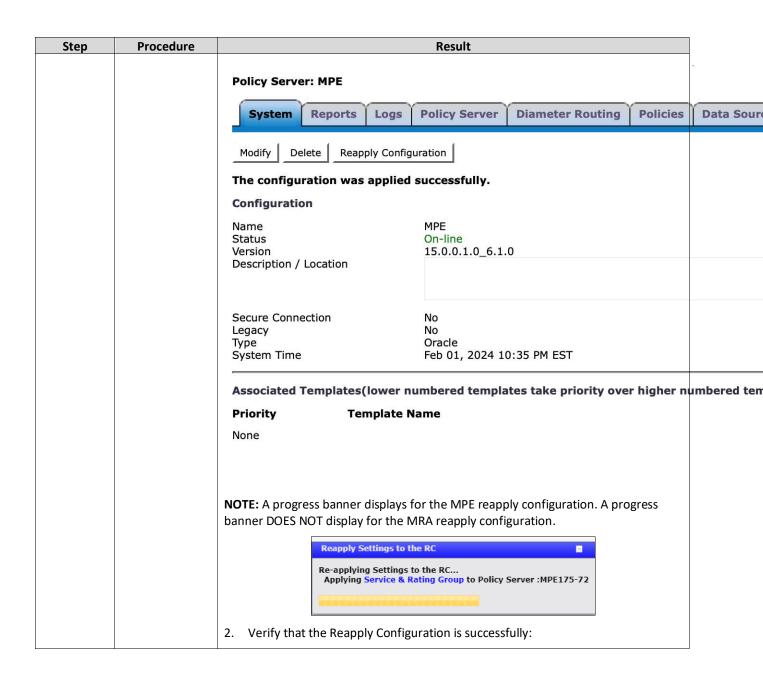

Step	Procedure				Re	esult

NOTE: A message "This system has been upgraded but the upgrade has not yet been accepted or rejected. Please accept or reject the upgrade soon." will be displayed after upgrade of each node in the terminal. This message is just a reminder to accept or reject the upgrade and can be ignored.

2.5 Upgrade non-cmp clusters 15.0 to 15.0.x

Use the following procedures to upgrade a site/segment containing one or more non-CMP clusters such as MPEs, MRAs.

NOTES: Different types of non-CMP clusters can be upgraded at the same time. 2 MPEs and 2 MRAs, for example, can be upgraded in parallel.

2.5.1 Site/Segment Upgrade Preparation

2.5.1.1 Configuration Preparation

Procedure 19 Preparation for NON-CMP Upgrade

Step	Procedure	Result
1.	CMP GUI: Access into CMP server	Use the supported browser to login as admin user or as a user with administrative privileges.
2.	CMP GUI: Verify current Upgrade Manager status and Software Release 15.0.x DIU ISO files	 Upgrade → Upgrade Manager Verify that all CMP clusters have both Active and Standby status. Verify that all MPE & MRA clusters have both Active and Standby status. Verify that the CMP cluster is upgraded successfully and running Policy Management Release 15.0.x Upgrade → ISO Maintenance Verify that Policy Management release 15.0.x DIU ISO files are available for all clusters. One DIU ISO per server
		—End of Procedure—

2.5.2 Upgrade Non-CMP Clusters (MPE or MRA)

Use this procedure to upgrade one or more non-CMP clusters at a site/segment.

This procedure is applicable for a 15.0 upgrade to 15.0.x

This section can be replicated for each site/segment to be upgraded, to allow the upgrade engineer to add cluster and site specific information.

The following sequence of server types to be upgraded for the system

- 1. Upgrade MRAs
- 2. Upgrade MPEs after MRA upgrade is done

The upgrade procedure is essentially the same for any non-CMP cluster.

- 1. Select and start upgrade on the Standby server
- 2. Failover
- 3. Continue upgrade on remaining server
- 4. Re-apply configuration

NOTES:

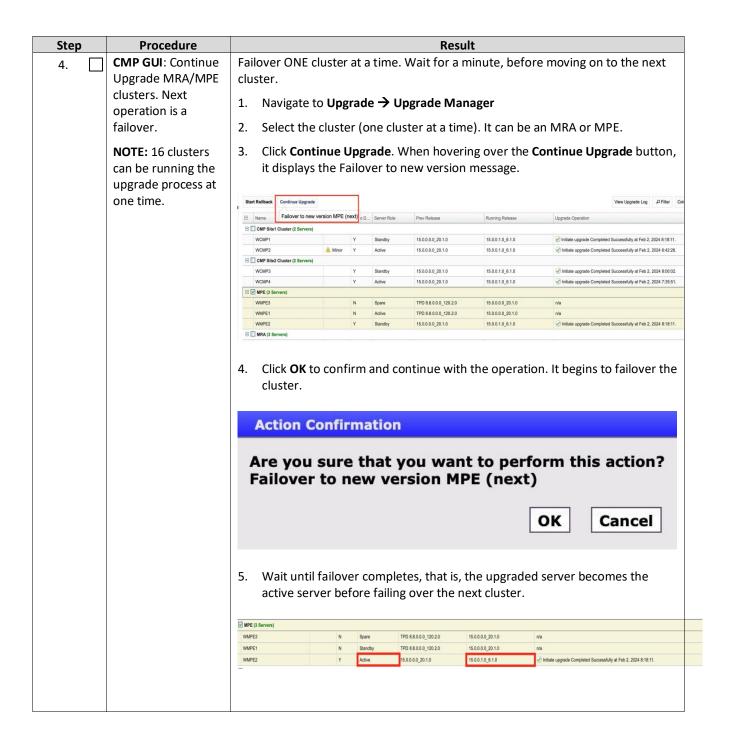

- All CMP clusters must have been upgraded to Policy Management release 15.0.x before performing the following procedures.
- The maximum clusters to be running the upgrade at one time is 16.

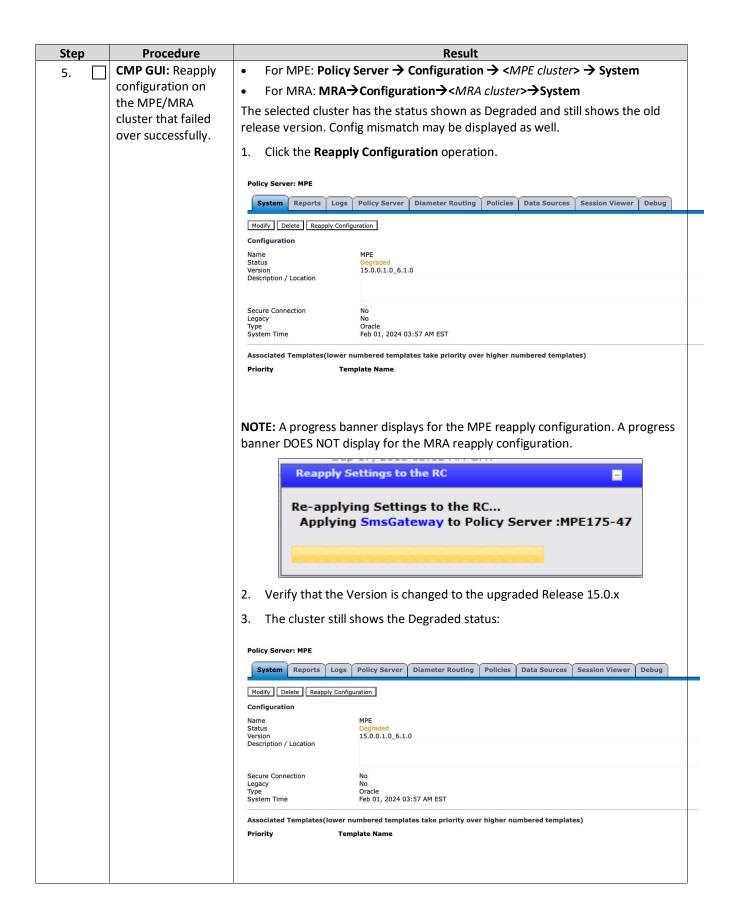

Procedure 20 Upgrade NON-CMP Servers

2.7 Backout (ROLLBACK) 15.0 wireless mode

This procedure is performed if an issue is found during the upgrade, as well as post-upgrade which impacts network performance.

The Policy Management system is backed out to the previous release.

Oracle strongly recommends consulting My Oracle Support before initiating the backout procedure. They determine the appropriate course of recovery options.

2.7.1 Backout Sequence

The Backout sequence order is the reverse of the Upgrade order as in the following sequence:

- 1. Backout MRA/MPE
- 2. Backout the Secondary CMP cluster (if applicable)
- **3.** Backout the Primary CMP cluster.

During a backout, it is important to control what version of the software is currently active. This control must be maintained even if there are unexpected failures.

NOTE: In the case of a non-CMP clusters, the upgrade/backout is NOT complete until the operator performs a Reapply Configuration from the CMP. The MRA/MPE can still operate, but may not be fully functional.

2.7.1.1 Pre-requisites

No new policies or features have been configured or run on the upgraded release.

The CMP cluster cannot backout if other non-CMP Policy Management servers are still on the upgraded release.

2.7.1.2 Backout of Fully Upgraded Cluster

Prior to performing this procedure, Oracle recommends consulting My Oracle Support to discuss the next appropriate course of actions.

Use this procedure to backout a cluster that has been fully upgraded. At the end of this procedure, all servers of the target cluster are on a pre-15.0 release with Active, Standby status.

Expected pre-conditions:

- The primary active CMP is on release 15.0.x
- The cluster servers to be backed out are on release 15.0

2.7.1.3 Backout Sequence

This procedure applies to a cluster. The non-CMP cluster types (MRA, MPE) are in non-georedundant mode with active, standby servers. CMP clusters may be in Site1 or Site2.

NOTE: It is possible, and desirable, to backout multiple clusters in parallel. However, in order to do this, each cluster must start the backout procedure one at a time, staggering by about 1 minute each.

Overview on Backout/Rollback MRA/MPE cluster

The following sequence preserves the cluster as a georedundant MRA/MPE cluster.

- 1. Back out of the standby server
- 2. Fail over
- 3. Reapply the configuration
- 4. Back out of the new standby server

Backout Secondary CMP (if applicable)

NOTE: At this time, all MPEs and MRAs must be backed out to the previous release.

Use the CMP GUI (Upgrade Manager) to backout the Secondary CMP cluster.

Backout Primary CMP (From 15.0.x to 15.0)

NOTE: At this time, all the MPE/MRA clusters must be backed out, the Secondary CMP must also be backed out.

- 1. Use the CMP GUI (Upgrade Manager) to backout the Primary standby CMP cluster.
- 2. Select the CMP cluster and click **Start Rollback** on the top left to initiate backout on Standby CMP.

3. Click **Continue Rollback**, which fails over to older version CMP cluster.

- 4. Log in to the Primary CMP VIP.
- **5.** Wait for 10-15 minutes before the rollback of secondary CMP (in Primary Site) to allow secondary site CMP nodes to sync with the new MySQL master.
- 6. Use the 15.0 Upgrade Manager to complete backout of the Primary CMP cluster.

7. If needed, go to Policy Server → Configuration → Policy Server and click Reapply Configuration.

2.7.1.4 Back-out Partially Upgraded MPE/MRA Cluster

Use this procedure to back-out a partially upgraded MPE/MRA Cluster.

Expected Pre-conditions:

- 1. Primary Active CMP is on Release 15.0.x
- 2. Cluster is any of MPE or MRA
- 3. One server of target cluster is on Release 15.0.x
- 4. Other servers of target cluster are on Release 15.0

NOTES:

- This procedure must be performed within a maintenance window.
- This procedure takes approximately 15 minutes at most per server.
- If this procedure fails, contact Oracle Technical Services and ask for ASSISTANCE.

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

Procedure 22 Back-out Partially Upgraded MPE/MRA Cluster

Step	Procedure	Result
1.	CMP GUI: Verify	 Navigate to Upgrade → Upgrade Manager
	the status of affected Clusters	2. Confirm status of the cluster to be backed out:
		- Primary Active CMP is on Release 15.0.x
		 Target Cluster has 1 server on Release 15.0, and 1 server on Release 15.0.x
		- Active server is on 15.0
2.	MPE/MRA SSH:	1. Using SSH, login to the Standby server to be backed out as admusr.
	Verify /var/log/	<pre>\$ 1s -lh /var/log/messages</pre>
	messages file size	ONLY if the resulting size of /var/log/messages is above 20M, run the following, otherwise proceed to the next step.
		<pre>\$ sudo cp /var/log/messages /var/camiant/log/messages.preBack-out</pre>

Step	Procedure	Result
ОССР		\$ sudo cat /dev/null > /var/log/messages
		<pre>\$ logger -s "Truncated this file prior to back-out. Copy is in /var/camiant/log/messages.preBack-out"</pre>
		3. Verify:
		\$ ls -lh /var/log/messages
3.	CMP GUI: Verify	Select Start Rollback or Continue Rollback. When hovering over the button, it
э	the status of affected Clusters	indicates the server to get backed out.

2.7.1.5 Back-out Fully Upgraded MPE/MRA Cluster

Use this procedure to back-out a fully upgraded MPE/MRA Clusters.

Prior to performing this procedure, Oracle recommends first consulting the Technical Services team to discuss the next appropriate course of actions.

At the end of this procedure, all servers of the target cluster are on Release 15.0 (MRA, MPE, CMP) with Active, Standby status.

Expected pre-conditions:

- **1.** Primary Active CMP is on Release 15.0.x.
- **2.** Cluster is of MPE or MRA.
- **3.** Servers of target cluster are on Release 15.0.x in either in Active, Standby or Force Standby role.

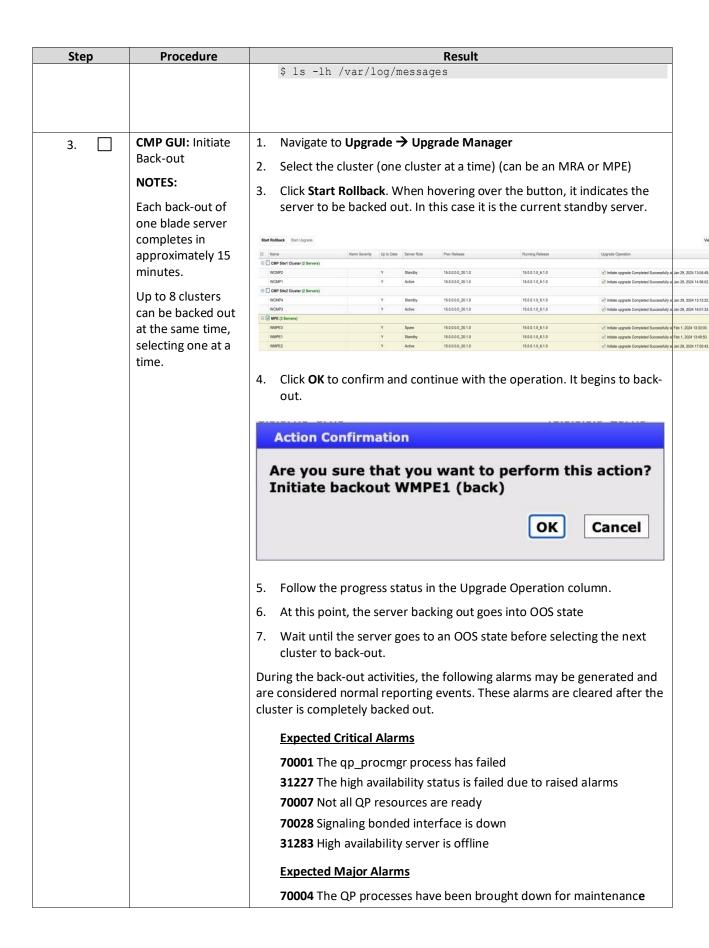

NOTES:

- This procedure must be performed within a maintenance window.
- This takes approximately 45-60 minutes per MPE or MRA cluster.
- If this procedure fails, contact Oracle Technical Services and ask for ASSISTANCE.

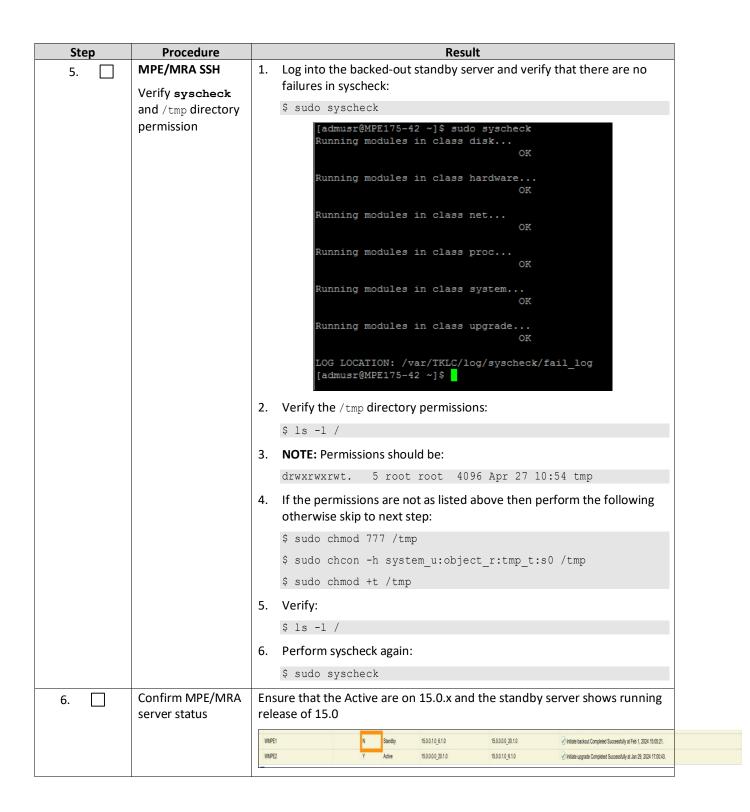

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

2.7.1.6 Back-out Fully Upgraded Primary CMP Cluster

Use this to back-out a fully upgraded Primary CMP Cluster.

Expected Pre-conditions:

- 1. Primary Active CMP Cluster is on Release 15.0.x
- 2. Secondary CMP, MPE and MRA Clusters are on Release 15.0

NOTES:

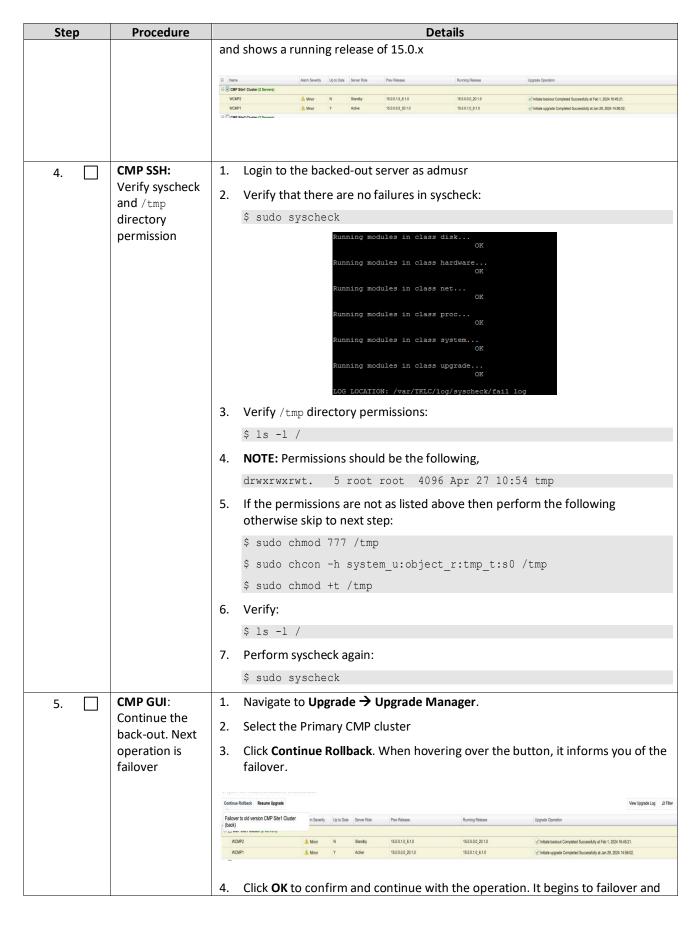

- This procedure must be performed within a maintenance window.
- This procedure takes approximately 40 minutes.
- If this procedure fails, contact Oracle Technical Services and ask for ASSISTANCE.

Check off ($\sqrt{}$) each step as it is completed. Boxes have been provided for this purpose under each step number.

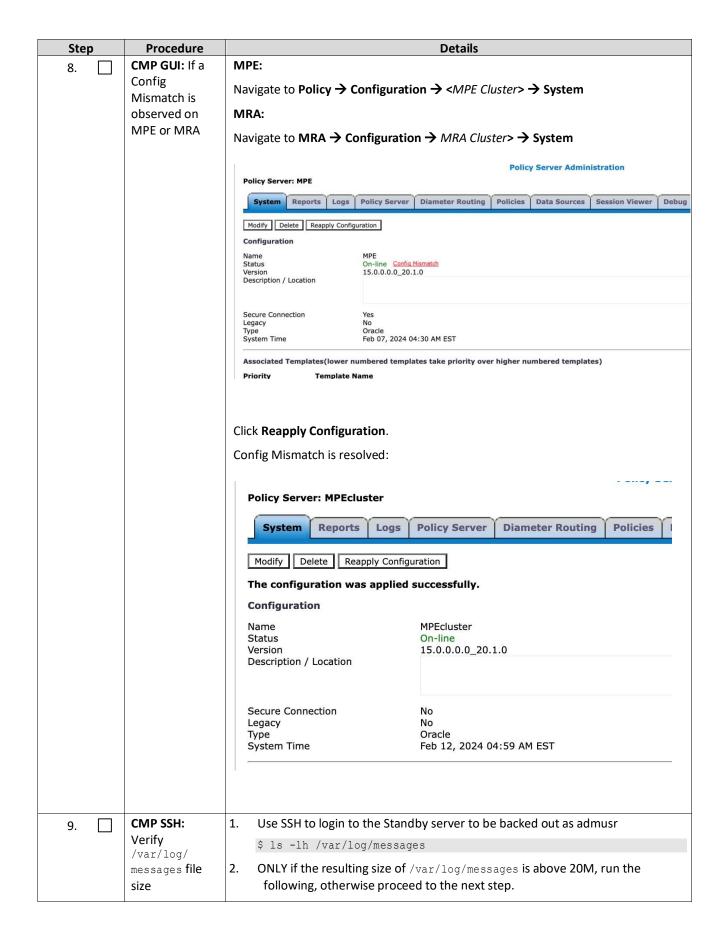

Procedure 24 Back-out Fully Upgraded Primary CMP Cluster

Step	Procedure	Details
1.	CMP GUI:	 Navigate to Upgrade → Upgrade Manager
	Verify the status of CMP Clusters	2. Confirm status of the cluster to be backed out: - Primary Active CMP is on Release 15.0.x - Secondary CMP, MPE and MRA Clusters are on Release 15.0 - Up to Date Column shows Y for all servers in Primary CMP Cluster 3. Click Filter and enter CMP in the Name field. Example Control to be backed out: - Primary Active CMP is on Release 15.0.x - Up to Date Column shows Y for all servers in Primary CMP Cluster 3. Click Filter and enter CMP in the Name field.

2.	CMP SSH: Verify /var/log/ messages file size	 SSH into the standby server to be backed out as admusr. <pre>\$ ls -lh /var/log/messages</pre> ONLY if the resulting size of /var/log/messages is above 20M, run the following, otherwise proceed to the next step. <pre>\$ sudo cp /var/log/messages /var/camiant/log/messages.preBack-out</pre> <pre>\$ sudo cat /dev/null > /var/log/messages</pre> <pre>\$ logger -s "Truncated this file prior to back-out. Copy is in /var/camiant/log/messages.preBack-out"</pre> Verify: <pre>\$ ls -lh /var/log/messages</pre>
3.	cmp GUI: Back- out standby server of Primary CMP cluster NOTE: Back-out of one server takes approximately 20 minutes to complete.	2. Click Start Rollback. When hovering over the button, it indicates the server to back out. Seat Rollback Start Lignals Seat Rollback Start Lignals West Lignals Lignals Wild Lignals Will Lignals Wild Lignals Will Lignals Wild Lignals Will Lignal

Step	Procedure	Details
		Action Confirmation
		Are you sure that you want to perform this action? Initiate backout WCMP2 (back)
		OK Cancel
		4. Server goes into an OOS server role.
		5. Follow the progress status in the Upgrade Operation column.
		During the back-out activities, the following alarms may be generated and are considered normal reporting events. These alarms are cleared after the cluster is completely backed out.
		Expected Critical Alarms
		70001 The qp_procmgr process has failed.
		31227 The high availability status is failed due to raised alarms
		31283 High availability server is offline
		70007 Not all QP resources are ready
		70025 The MySQL slave has a different schema version than the master
		Expected Major Alarms
		70004 The QP processes have been brought down for maintenance
		31236 High availability TCP link is down
		31233 High availability path loss of connectivity
		70021 The MySQL slave is not connected to the master
		Expected Minor Alarms
		70503 The server is in forced standby
		70507 An upgrade/backout action on a server is in progress
		70501 The Cluster is running different versions of software
		70502 Cluster Replication Inhibited
		31232 High availability server has not received a message
		31101 DB replication to a slave DB has failed
		31102 DB replication from a master DB has failed
		31107 DB merging from a child Source Node has failed
		31114 DB Replication of configuration data via SOAP has failed 31106 DB merging to the parent Merge Node has failed
		70500 The system is running different versions of software
		Back-out of the server is complete when the successful completion message displays in the Upgrade Operation column. The server goes back to standby state

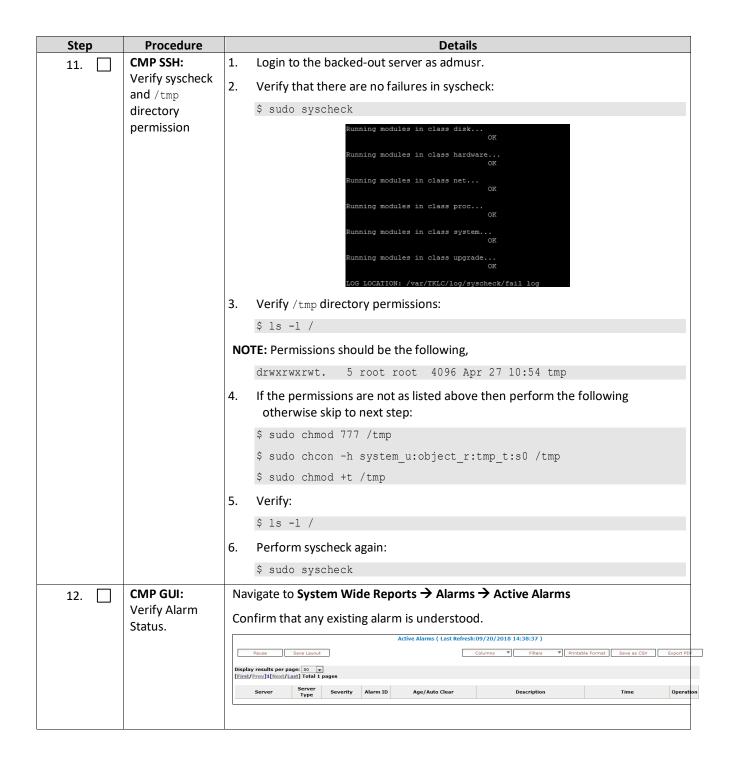

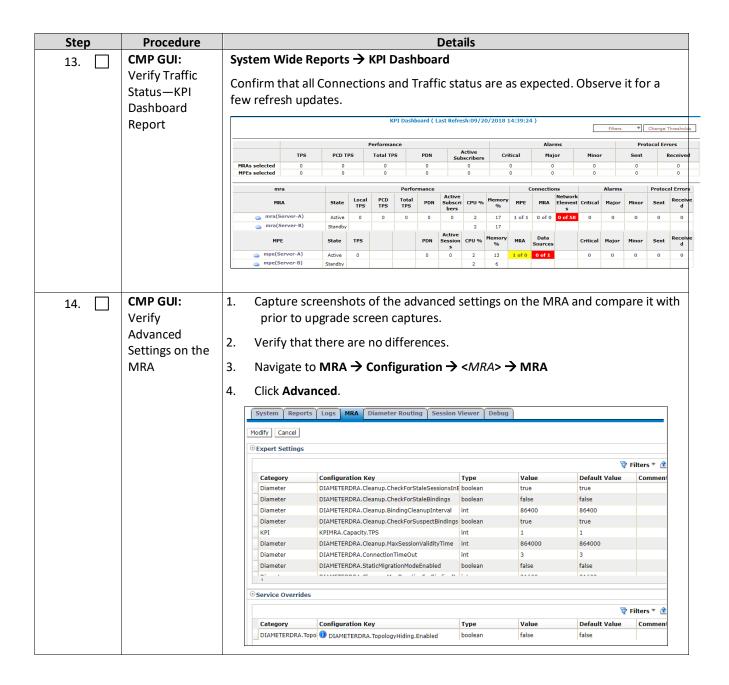

Step	Procedure	Details
•		takes couple of minutes to complete.
		Action Confirmation
		Are you sure that you want to perform this action? Failover to old version CMP Site1 Cluster (back) OK Cancel
		After a minute, you are required to log back in.
6.	CMP GUI: Log back into the Primary CMP VIP	After failover, you are required to log back in to the CMP GUI using the Primary CMP VIP. ORACLE* Welcome Welcome to the Configuration Management Platform (CMP). Please enter your user name and password below to access the CMP desktop. If you do not have an existing user name or password, or if you have misplaced either, please contact the system administrator. **You have logged out or your session has timed out. Please enter your username and password to start a new session. USERNAME admin PASSWORD Login
