**Changes in This Release for Oracle Database PL/SQL Packages and Types Reference** ................................................................................................................................................ cxxvii  
Changes in Oracle Database 12c Release 1 (12.1) ............................................................................................... cxxvii  

## 1 Introduction to Oracle Supplied PL/SQL Packages & Types

**Package Overview** ........................................................................................................................................ 1-2  
   Package Components ............................................................................................................................... 1-3  
   Using Oracle Supplied Packages ............................................................................................................ 1-4  
   Creating New Packages ........................................................................................................................ 1-5  
   Separating the Specification and Body .................................................................................................. 1-5  
   Referencing Package Contents .............................................................................................................. 1-8  
**Summary of Oracle Supplied PL/SQL Packages and Types** ................................................................. 1-9  

## 2 APEX_CUSTOM_AUTH

Documentation of APEX_CUSTOM_AUTH ........................................................................................................ 2-2  

## 3 APEX_APPLICATION

Documentation of APEX_APPLICATION ........................................................................................................... 3-2  

## 4 APEX_ITEM

Documentation of APEX_ITEM ......................................................................................................................... 4-2  

## 5 APEX_UTIL

Documentation of APEX_UTIL ....................................................................................................................... 5-2  

## 6 CTX_ADM

Documentation of CTX_ADM ............................................................................................................................ 6-2

Using DBMS_ADDM
Security Model
Summary of DBMS_ADDM Subprograms
ANALYZE_DB Procedure
ANALYZE_INST Procedure
ANALYZE_PARTIAL Procedure
COMPARE_CAPTURE_REPLAY_REPORT Function
COMPARE_DATABASES Function
COMPARE_INSTANCES Function
COMPARE_REPLAY_REPLAY_REPORT Function
DELETE Procedure
DELETE_FINDING_DIRECTIVE Procedure
17-2 |
18 DBMS_ADVANCED_REWRITE

Using DBMS_ADVANCED_REWRITE ........................................................................ 18-2
Security Model .................................................................................................. 18-3

Summary of DBMS_ADVANCED_REWRITE Subprograms ........................................... 18-4
ALTER_REWRITE_EQUIVALENCE Procedure ......................................................... 18-5
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure ............................................. 18-6
DECLARE_REWRITE_EQUIVALENCE Procedures .................................................. 18-7
DROP_REWRITE_EQUIVALENCE Procedure .......................................................... 18-9
VALIDATE_REWRITE_EQUIVALENCE Procedure .................................................. 18-10

19 DBMS_ADVISOR

Using DBMS_ADVISOR ....................................................................................... 19-2
Deprecated Subprograms .................................................................................... 19-3
Security Model .................................................................................................. 19-4

Summary of DBMS_ADVISOR Subprograms .......................................................... 19-5
ADD_SQLWKLD_REF Procedure ......................................................................... 19-8
ADD_SQLWKLD_STATEMENT Procedure .............................................................. 19-9
ADD_STS_REF Procedure ................................................................................... 19-11
CANCEL_TASK Procedure .................................................................................. 19-12
COPY_SQLWKLD_TO_STS Procedure ................................................................. 19-13
CREATE_FILE Procedure ................................................................................... 19-14
CREATE_OBJECT Procedure .............................................................................. 19-16
CREATE_SQLWKLD Procedure ........................................................................... 19-18
CREATE_TASK Procedures ............................................................................... 19-20
DELETE_SQLWKLD Procedure .......................................................................... 19-22
DELETE_SQLWKLD_REF Procedure .................................................................... 19-23
DELETE_SQLWKLD_STATEMENT Procedures .................................................... 19-24
DELETE_STS_REF Procedure ............................................................................. 19-25
DELETE_TASK Procedure .................................................................................. 19-26
EXECUTE_TASK Procedure ................................................................................ 19-27
GET_REC_ATTRIBUTES Procedure ..................................................................... 19-29
GET_TASK_REPORT Function .......................................................................... 19-30
GET_TASK_SCRIPT Function ............................................................................. 19-31
IMPLEMENT_TASK Procedure .......................................................................... 19-33
IMPORT_SQLWKLD_SCHEMA Procedure ............................................................ 19-34
20 DBMS_ALERT

Using DBMS_ALERT ................................................................. 20-2
   Overview ........................................................................ 20-3
   Security Model .............................................................. 20-4
   Constants ....................................................................... 20-5
   Restrictions .................................................................... 20-6
   Exceptions ....................................................................... 20-7
   Operational Notes ......................................................... 20-8
   Examples ......................................................................... 20-10

Summary of DBMS_ALERT Subprograms .................................. 20-11
   REGISTER Procedure ...................................................... 20-12
   REMOVE Procedure ....................................................... 20-13
   REMOVEALL Procedure .................................................. 20-14
   SET_DEFAULTS Procedure .............................................. 20-15
   SIGNAL Procedure .......................................................... 20-16
   WAITANY Procedure ....................................................... 20-17
   WAITONE Procedure ....................................................... 20-18

21 DBMS_APP_CONT

Using DBMS_APP_CONT .......................................................... 21-2
   Overview ......................................................................... 21-3
   Security Model .............................................................. 21-4

Summary of DBMS_APP_CONT Subprograms ............................... 21-5
   GET_LTXID_OUTCOME Procedure ................................. 21-6
22 DBMS_APPLICATION_INFO

Using DBMS_APPLICATION_INFO ............................................................................................................. 22-2
Overview .................................................................................................................................................. 22-3
Security Model ........................................................................................................................................ 22-4
Operational Notes .................................................................................................................................. 22-5

Summary of DBMS_APPLICATION_INFO Subprograms ........................................................................... 22-6
READ_CLIENT_INFO Procedure .................................................................................................................. 22-7
READ_MODULE Procedure .......................................................................................................................... 22-8
SET_ACTION Procedure .............................................................................................................................. 22-9
SET_CLIENT_INFO Procedure .................................................................................................................... 22-10
SET_MODULE Procedure ........................................................................................................................... 22-11
SET_SESSION_LONGOPS Procedure ......................................................................................................... 22-12

23 DBMS_APPLY_ADM

Using DBMS_APPLY_ADM ......................................................................................................................... 23-2
Overview .................................................................................................................................................. 23-3
Security Model ........................................................................................................................................ 23-4
Operational Notes .................................................................................................................................. 23-5
Deprecated Apply Component Parameter Value ....................................................................................... 23-5

Summary of DBMS_APPLY_ADM Subprograms ......................................................................................... 23-6
ADD_STMT_HANDLER Procedure ............................................................................................................... 23-8
ALTER_APPLY Procedure ........................................................................................................................... 23-10
COMPARE_OLD_VALUES Procedure ......................................................................................................... 23-16
CREATE_APPLY Procedure ......................................................................................................................... 23-18
CREATE_OBJECT_DEPENDENCY Procedure ............................................................................................. 23-24
DELETE_ALL_ERRORS Procedure .............................................................................................................. 23-25
DELETE_ERROR Procedure ....................................................................................................................... 23-26
DROP_APPLY Procedure ............................................................................................................................ 23-27
DROP_OBJECT_DEPENDENCY Procedure .................................................................................................. 23-29
EXECUTE_ALL_ERRORS Procedure .......................................................................................................... 23-30
EXECUTE_ERROR Procedure ..................................................................................................................... 23-31
GET_ERROR_MESSAGE Function ............................................................................................................... 23-34
REMOVE_STMT_HANDLER ......................................................................................................................... 23-36
SET_CHANGE_HANDLER Procedure .......................................................................................................... 23-38
SET_DML_HANDLER Procedure .................................................................................................................. 23-41
SET_ENQUEUE_DESTINATION Procedure ................................................................................................ 23-46
SET_EXECUTE Procedure .......................................................................................................................... 23-48
SET_GLOBAL_INSTANTIATION_SCN Procedure ....................................................................................... 23-50
SET_KEY_COLUMNS Procedures ............................................................................................................... 23-53
SET_PARAMETER Procedure ..................................................................................................................... 23-56
SET_SCHEMA_INSTANTIATION_SCN Procedure ........................................................................................ 23-74
SET_TABLE_INSTANTIATION_SCN Procedure .......................................................................................... 23-77
SET_UPDATE_CONFLICT_HANDLER Procedure ....................................................................................... 23-80
SET_VALUE_DEPENDENCY Procedure ..................................................................................................... 23-84
START_APPLY Procedure .......................................................................................................................... 23-86
STOP_APPLY Procedure ............................................................................................................................. 23-87
24  DBMS_AQ

Using DBMS_AQ .......................................................................................................................... 24-2
Security Model ................................................................................................................................. 24-3
Constants ........................................................................................................................................ 24-4
Data Structures ............................................................................................................................... 24-6
  Object Name .............................................................................................................................. 24-6
  Type Name .............................................................................................................................. 24-6
Oracle Database Advanced Queuing PL/SQL Callback .................................................................. 24-7
Operational Notes ........................................................................................................................... 24-9
  DBMS_AQ and DBMS_AQADM Java Classes ........................................................................ 24-9

Summary of DBMS_AQ Subprograms ......................................................................................... 24-10
BIND_AGENT Procedure .............................................................................................................. 24-11
DEQUEUE Procedure .................................................................................................................... 24-12
DEQUEUE_ARRAY Function ......................................................................................................... 24-15
ENQUEUE Procedure .................................................................................................................. 24-17
ENQUEUE_ARRAY Function ......................................................................................................... 24-19
LISTEN Procedures ..................................................................................................................... 24-20
POST Procedure .......................................................................................................................... 24-22
REGISTER Procedure ................................................................................................................... 24-23
UNBIND_AGENT Procedure ......................................................................................................... 24-24
UNREGISTER Procedure ................................................................................................................. 24-25

25  DBMS_AQADM

Using DBMS_AQADM .................................................................................................................... 25-2
Security Model ............................................................................................................................. 25-3
Constants ......................................................................................................................................... 25-4

Subprogram Groups ..................................................................................................................... 25-5
  Queue Table Subprograms ........................................................................................................ 25-6
  Privilege Subprograms .............................................................................................................. 25-7
  Queue Subprograms ................................................................................................................ 25-8
  Subscriber Subprograms .......................................................................................................... 25-9
  Notification Subprograms ....................................................................................................... 25-10
  Propagation Subprograms ..................................................................................................... 25-11
  Oracle Database Advanced Queuing Agent Subprograms .................................................... 25-12
  Alias Subprograms .................................................................................................................. 25-13

Summary of DBMS_AQADM Subprograms ................................................................................ 25-14
ADD_ALIAS_TO_LDAP Procedure ............................................................................................... 25-17
ADD_SUBSCRIBER Procedure ..................................................................................................... 25-18
ALTER_AQ_AGENT Procedure .................................................................................................... 25-19
ALTER_PROPAGATION_SCHEDULE Procedure ............................................................................ 25-20
ALTER_QUEUE Procedure .......................................................................................................... 25-21
ALTER_QUEUE_TABLE Procedure ............................................................................................. 25-22
ALTER_SUBSCRIBER Procedure ............................................................................................... 25-23
CREATE_AQ_AGENT Procedure ................................................................................................. 25-24
CREATE_NP_QUEUE Procedure ................................................................................................. 25-25
CREATE_QUEUE Procedure ...................................................................................................... 25-26
CREATE_SHARDED_QUEUE Procedure .................................................................................... 25-28
DROP_SHARDED_QUEUE Procedure................................................................. 25-29
CREATE_QUEUE_TABLE Procedure ................................................................. 25-30
DEL_ALIAS_FROM_LDAP Procedure ................................................................. 25-33
DISABLE_DB_ACCESS Procedure ................................................................. 25-34
DISABLE_PROPAGATION_SCHEDULE Procedure ........................................ 25-35
DROP_AQ_AGENT Procedure ........................................................................ 25-36
DROP_QUEUE Procedure............................................................................... 25-37
DROP_QUEUE_TABLE Procedure ................................................................... 25-38
ENABLE_DB_ACCESS Procedure .................................................................... 25-39
ENABLE_JMS_TYPES Procedure ................................................................. 25-40
ENABLE_PROPAGATION_SCHEDULE Procedure ............................................ 25-41
GET_WATERMARK Procedure ........................................................................ 25-42
GET_MAX_STREAMS_POOL Procedure ............................................................ 25-43
GET_MIN_STREAMS_POOL Procedure ............................................................ 25-44
GRANT_QUEUE_PRIVILEGE Procedure ......................................................... 25-45
GRANT_SYSTEM_PRIVILEGE Procedure ......................................................... 25-46
MIGRATE_QUEUE_TABLE Procedure .......................................................... 25-47
PURGE_QUEUE_TABLE Procedure .................................................................. 25-48
QUEUE_SUBSCRIBERS Function .................................................................. 25-50
REMOVE_SUBSCRIBER Procedure ............................................................... 25-51
REVOKE_QUEUE_PRIVILEGE Procedure ....................................................... 25-52
REVOKE_SYSTEM_SUBSCRIBER Procedure ................................................ 25-53
SCHEDULE_PROPAGATION Procedure ......................................................... 25-54
SET_WATERMARK Procedure ......................................................................... 25-56
SET_MAX_STREAMS_POOL Procedure ............................................................ 25-57
SET_MIN_STREAMS_POOL Procedure ............................................................ 25-58
START_QUEUE Procedure ........................................................................ 25-59
STOP_QUEUE Procedure ............................................................................... 25-60
UNSCHEDULE_PROPAGATION Procedure .................................................... 25-61
VERIFY_QUEUE_TYPES Procedure .............................................................. 25-62

26  DBMS_AQELM
Using DBMS_AQELM .................................................................................... 26-2
Security Model ............................................................................................. 26-3
Summary of DBMS_AQELM Subprograms .................................................... 26-4
SET_MAILHOST Procedure ........................................................................ 26-5
SET_MAILPORT Procedure .......................................................................... 26-6
SET_SENDFROM Procedure .......................................................................... 26-7

27  DBMS_AQIN
Using DBMS_AQIN ..................................................................................... 27-2
Security Model ............................................................................................. 27-3

28  DBMS_ASSERT
Using DBMS_ASSERT .................................................................................. 28-2
Operational Notes ........................................................................................ 28-3
Summary of DBMS_ASSERT Subprograms ......................................................................................... 28-4
    ENQUOTE_LITERAL Function ........................................................................................................ 28-5
    ENQUOTE_NAME Function ........................................................................................................... 28-6
    NOOP Functions ....................................................................................................................... 28-7
    QUALIFIED_SQL_NAME Function .............................................................................................. 28-8
    SCHEMA_NAME Function ........................................................................................................... 28-9
    SIMPLE_SQL_NAME Function .................................................................................................... 28-10
    SQL_OBJECT_NAME Function .................................................................................................... 28-11

29 DBMS_AUDIT_MGMT

Using DBMS_AUDIT_MGMT ................................................................................................................. 29-2
    Overview .................................................................................................................................. 29-3
    Security Model ......................................................................................................................... 29-4
    Constants ................................................................................................................................ 29-5
    Views ....................................................................................................................................... 29-7

Subprogram Groups .......................................................................................................................... 29-8
    Audit Trail Management Subprograms ..................................................................................... 29-9
    Audit Trail Cleanup Subprograms ............................................................................................ 29-10

Summary of DBMS_AUDIT_MGMT Subprograms ................................................................................ 29-11
    CLEAN_AUDIT_TRAIL Procedure ............................................................................................ 29-12
    CLEAR_AUDIT_TRAIL_PROPERTY Procedure ........................................................................ 29-14
    CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure .................................................................. 29-16
    CREATE_PURGE_JOB Procedure .......................................................................................... 29-18
    DEINIT_CLEANUP Procedure ................................................................................................ 29-20
    DROP_OLD_UNIFIED_AUDIT_TABLES Procedure ................................................................. 29-21
    DROP_PURGE_JOB Procedure ................................................................................................. 29-22
    FLUSH_UNIFIED_AUDIT_TRAIL Procedure .......................................................................... 29-23
    GET_AUDIT_COMMIT_DELAY Function .................................................................................. 29-24
    GET_AUDIT_TRAIL_PROPERTY Function ................................................................................ 29-25
    GET_LAST_ARCHIVE_TIMESTAMP Function ........................................................................... 29-26
    INIT_CLEANUP Procedure ..................................................................................................... 29-27
    IS_CLEANUP_INITIALIZED Function ...................................................................................... 29-29
    LOAD_UNIFIED_AUDIT_FILES Procedure ............................................................................ 29-30
    SET_AUDIT_TRAIL_LOCATION Procedure .......................................................................... 29-31
    SET_AUDIT_TRAIL_PROPERTY Procedure ............................................................................ 29-33
    SET_LAST_ARCHIVE_TIMESTAMP Procedure ..................................................................... 29-36
    SET_PURGE_JOB_INTERVAL Procedure ............................................................................... 29-38
    SET_PURGE_JOB_STATUS Procedure ............................................................................... 29-39

30 DBMS_AUTO_SQLTUNE

Using DBMS_AUTO_SQLTUNE .............................................................................................................. 30-2
    Overview .................................................................................................................................. 30-3
    Security Model ......................................................................................................................... 30-4

Summary of DBMS_AUTO_SQLTUNE Subprograms ............................................................................. 30-5
    EXECUTE_AUTO_TUNING_TASK Function & Procedure ....................................................... 30-6
    REPORT_AUTO_TUNING_TASK Function .............................................................................. 30-7
    SET_AUTO_TUNING_TASK_PARAMETER Procedures .......................................................... 30-9
35  DBMS_COMPARISON

Using DBMS_COMPARISON ........................................................................................................ 35-2
   Overview ................................................................................................................................ 35-3
   Security Model........................................................................................................................ 35-5
   Constants................................................................................................................................ 35-6
   Views........................................................................................................................................ 35-8
   Operational Notes ..................................................................................................................... 35-9
      Oracle Database Release Requirements for the DBMS_COMPARISON Package .................. 35-9
      Database Character Set Requirements for the DBMS_COMPARISON Package .................... 35-9
      Database Object Requirements for the DBMS_COMPARISON Package ............................... 35-9
      Index Column Requirements for the DBMS_COMPARISON Package .................................. 35-10
      Datatype Requirements for the DBMS_COMPARISON Package ........................................ 35-11
      Only Converge Rows That Are Not Being Updated ............................................................ 35-12

Data Structures .......................................................................................................................... 35-13
   COMPARISON_TYPE Record Type .......................................................................................... 35-14
      Syntax .................................................................................................................................. 35-14
      Fields.................................................................................................................................... 35-14

Summary of DBMS_COMPARISON Subprograms ..................................................................... 35-15
   COMPARE Function ................................................................................................................. 35-16
   CONVERGE Procedure ............................................................................................................ 35-18
   CREATE_COMPARISON Procedure ....................................................................................... 35-20
   DROP_COMPARISON Procedure ............................................................................................. 35-24
   PURGE_COMPARISON Procedure ......................................................................................... 35-25
   RECHECK Function .................................................................................................................. 35-26

36  DBMS_COMPRESSION

Using DBMS_COMPRESSION ......................................................................................................... 36-2
   Overview ................................................................................................................................ 36-3
   Security Model........................................................................................................................ 36-4
   Constants................................................................................................................................ 36-5

Data Structures .......................................................................................................................... 36-7
   COMPRECLIST Table Type ....................................................................................................... 36-8
   COMPREC Record Type ............................................................................................................ 36-9

Summary of DBMS_COMPRESSION Subprograms ..................................................................... 36-10
   GET_COMPRESSION_RATIO Procedure .................................................................................. 36-11
   GET_COMPRESSION_TYPE Function ....................................................................................... 36-13
40  DBMS_CRYPTO

Using the DBMS_CRYPTO Subprograms ................................................................. 40-2
  Overview ........................................................................................................... 40-3
  Security Model ................................................................................................. 40-4
  Datatypes ......................................................................................................... 40-5
  Algorithms ....................................................................................................... 40-6
  Restrictions ....................................................................................................... 40-8
  Exceptions ....................................................................................................... 40-9
  Operational Notes ............................................................................................ 40-10
  When to Use Encrypt and Decrypt Procedures ............................................... 40-10
  When to Use Hash or Message Authentication Code (MAC) Functions ............. 40-10
  About Generating and Storing Encryption Keys .............................................. 40-10
  Conversion Rules ............................................................................................ 40-11
  Examples ......................................................................................................... 40-12

Summary of DBMS_CRYPTO Subprograms ......................................................... 40-13
  DECRYPT Function ......................................................................................... 40-14
  DECRYPT Procedures ..................................................................................... 40-15
  ENCRYPT Function ......................................................................................... 40-16
  ENCRYPT Procedures ..................................................................................... 40-17
  HASH Function ................................................................................................ 40-18
  MAC Function ................................................................................................ 40-19
  RANDOMBYTES Function ............................................................................. 40-20
  RANDOMINTEGER Function .......................................................................... 40-21
  RANDOMNUMBER Function .......................................................................... 40-22

41  DBMS_CSX_ADMIN

Using DBMS_CSX_ADMIN .................................................................................... 41-2
  Overview ......................................................................................................... 41-3
  Security Model ................................................................................................. 41-4
  Constants ......................................................................................................... 41-5

Summary of DBMS_CSX_ADMIN ........................................................................ 41-6
  GETTOKENTABLEINFO Procedure & Function ............................................... 41-7
  GETTOKENTABLEINFOBYTABLESPACE Procedure ...................................... 41-8
  NAMESPACEIDTABLE Function ...................................................................... 41-9
  PATHIDTABLE Function ................................................................................ 41-10
  QNAMEIDTABLE Function ............................................................................ 41-11

42  DBMS_CUBE

Using DBMS_CUBE .............................................................................................. 42-2
  Security Model ................................................................................................. 42-3

Using SQL Aggregation Management ................................................................. 42-4
  Subprograms in SQL Aggregation Management ............................................. 42-5
  Requirements for the Relational Materialized View ........................................ 42-6
  Permissions for Managing and Querying Cube Materialized Views ................. 42-7
  Example of SQL Aggregation Management .................................................... 42-8
  About Relational Materialized View CAL_MONTH_SALES_MV ......................... 42-8
Creating the Cube Materialized View ................................................................. 42-8
Disabling the Relational Materialized Views ...................................................... 42-9
Creating Execution Plans for Cube Materialized Views .............................. 42-9
Maintaining Cube Materialized Views ............................................................ 42-10
New Database Objects ..................................................................................... 42-10
Upgrading 10g Analytic Workspaces ............................................................... 42-12
Correcting Naming Conflicts ........................................................................... 42-13
Initialization Table ............................................................................................ 42-13
Rename Table .................................................................................................... 42-14
Simple Upgrade ............................................................................................... 42-15
Custom Upgrade ............................................................................................. 42-16
Summary of DBMS_CUBE Subprograms ......................................................... 42-18
BUILD Procedure ............................................................................................. 42-19
CREATE_EXPORT_OPTIONS Procedure ......................................................... 42-32
CREATE_IMPORT_OPTIONS Procedure ............................................................. 42-35
CREATE_MVIEW Function ............................................................................ 42-37
DERIVE_FROM_MVIEW Function ................................................................. 42-42
DROP_MVIEW Procedure .............................................................................. 42-44
EXPORT_XML Procedure .............................................................................. 42-46
EXPORT_XML_TO_FILE Procedure ............................................................... 42-48
IMPORT_XML Procedure .............................................................................. 42-50
INITIALIZE_CUBE_UPGRADE Procedure ..................................................... 42-53
REFRESH_MVIEW Procedure ......................................................................... 42-55
UPGRADE_AW Procedure .............................................................................. 42-57
VALIDATE_XML Procedure ........................................................................... 42-59

43 DBMS_CUBE_ADVISE
Using DBMS_CUBE_ADVISE ........................................................................... 43-2
Security Model ............................................................................................... 43-3
Summary of DBMS_CUBE_ADVISE Subprograms ........................................... 43-4
MV_CUBE_ADVISE Function ......................................................................... 43-5
SET_CNS_EXCEPTION_LOG Procedure ......................................................... 43-8
TRACE Procedure ........................................................................................... 43-9

44 DBMS_CUBE_LOG
Using DBMS_CUBE_LOG ................................................................................ 44-2
Logging Types ............................................................................................... 44-3
Logging Targets ............................................................................................. 44-4
Verbosity Levels ............................................................................................. 44-5
Security Model ............................................................................................... 44-6
Creating Cube Logs ....................................................................................... 44-7
Cube Build Log ............................................................................................... 44-8
Cube Dimension Compile Log ................................................................. 44-10
Cube Operations Log .................................................................................... 44-11
Cube Rejected Records Log .......................................................................... 44-12
Summary of DBMS_CUBE_LOG Subprograms ............................................... 44-13
DEFAULT_NAME Function ........................................................................................................ 44-15
DISABLE Procedure ............................................................................................................. 44-16
ENABLE Procedure ............................................................................................................ 44-17
FLUSH Procedure ............................................................................................................. 44-19

- OPEN Procedures ................................................................. 88-72
- READ Procedures ................................................................. 88-74
- SET_DBFS_LINK Procedures ..................................................... 88-76
- SETCONTENTTYPE Procedure ................................................... 88-77
- SETOPTIONS Procedures ........................................................ 88-78
- SUBSTR Functions ................................................................. 88-79
- TRIM Procedures ................................................................. 88-81
- WRITE Procedures ............................................................... 88-83
- WRITEAPPEND Procedures ....................................................... 88-85
89  DBMS_LOCK

Using DBMS_LOCK.................................................................................................................. 89-2
Overview ................................................................................................................................. 89-3
Security Model......................................................................................................................... 89-4
Constants ................................................................................................................................. 89-5
Rules and Limits ....................................................................................................................... 89-6
Operational Notes .................................................................................................................. 89-7

Summary of DBMS_LOCK Subprograms .............................................................................. 89-8
ALLOCATE_UNIQUE Procedure ............................................................................................... 89-9
CONVERT Function .................................................................................................................. 89-11
RELEASE Function .................................................................................................................. 89-12
REQUEST Function .................................................................................................................. 89-13
SLEEP Procedure .................................................................................................................... 89-14

90  DBMS_LOGMNR

Using DBMS_LOGMNR ............................................................................................................. 90-2
Overview ................................................................................................................................. 90-3
Security Model......................................................................................................................... 90-4
Constants ................................................................................................................................. 90-5
Views ....................................................................................................................................... 90-7
Operational Notes .................................................................................................................. 90-8

Summary of DBMS_LOGMNR Subprograms ........................................................................ 90-9
ADD_LOGFILE Procedure ....................................................................................................... 90-10
COLUMN_PRESENT Function ................................................................................................... 90-12
END_LOGMNR Procedure ........................................................................................................ 90-14
MINE_VALUE Function ............................................................................................................. 90-15
REMOVE_LOGFILE Procedure ............................................................................................... 90-17
START_LOGMNR Procedure .................................................................................................. 90-18

91  DBMS_LOGMNR_D

Using DBMS_LOGMNR_D ......................................................................................................... 91-2
Overview ................................................................................................................................. 91-3
Security Model......................................................................................................................... 91-4

Summary of DBMS_LOGMNR_D Subprograms ..................................................................... 91-5
BUILD Procedure ..................................................................................................................... 91-6
SET_TABLESPACE Procedure ................................................................................................. 91-9

92  DBMS_LOGSTDBY

Using DBMS_LOGSTDBY .......................................................................................................... 92-2
Overview ................................................................................................................................. 92-3
Security Model......................................................................................................................... 92-4
Constants ................................................................................................................................. 92-5

Summary of DBMS_LOGSTDBY Subprograms ...................................................................... 92-6
APPLY_SET Procedure ............................................................................................................ 92-8
APPLY_UNSET Procedure ....................................................................................................... 92-11
BUILD Procedure .......................................................... 92-12
EDS_ADD_TABLE ............................................................... 92-14
EDS_EVOLVE_AUTOMATIC ................................................. 92-16
EDS_EVOLVE_MANUAL ....................................................... 92-18
EDS_REMOVE_TABLE ......................................................... 92-20
INSTANTIATE_TABLE Procedure ....................................... 92-22
IS_APPLY_SERVER Function ............................................. 92-24
MAP_PRIMARY_SCN Function ............................................ 92-25
PREPARE_FOR_NEW_PRIMARY Procedure ......................... 92-26
PURGE_SESSION Procedure .............................................. 92-28
REBUILD Procedure ........................................................ 92-29
SET_TABLESPACE Procedure ........................................... 92-30
SKIP Procedure .............................................................. 92-31
SKIP_ERROR Procedure ................................................... 92-40
SKIP_TRANSACTION Procedure ......................................... 92-44
UNSKIP Procedure .......................................................... 92-46
UNSKIP_ERROR Procedure ............................................... 92-48
UNSKIP_TRANSACTION Procedure ..................................... 92-50

93  DBMS_LOGSTDBY_CONTEXT

Using DBMS_LOGSTDBY_CONTEXT ..................................... 93-2
Overview ................................................................. 93-3
Security Model .......................................................... 93-4
Summary of DBMS_LOGSTDBY_CONTEXT Subprograms ......... 93-5
CLEAR_ALL_CONTEXT Procedure .................................... 93-6
CLEAR_CONTEXT Procedure ........................................... 93-7
GET_CONTEXT Procedure ............................................... 93-8
SET_CONTEXT Procedure ............................................... 93-9

94  DBMS_METADATA

Using DBMS_METADATA .................................................. 94-2
Overview ................................................................. 94-3
Retrieving Metadata ..................................................... 94-3
Submitting XML .......................................................... 94-3
Security Model .......................................................... 94-4
Rules and Limits .......................................................... 94-5
Data Structures - Object and Table Types ......................... 94-6
Subprogram Groupings .................................................. 94-8
Subprograms for Retrieving Multiple Objects From the Database ........................................ 94-9
Subprograms for Submitting XML to the Database .......... 94-10
Summary of All DBMS_METADATA Subprograms .................. 94-11
ADD_TRANSFORM Function .......................................... 94-12
CLOSE Procedure ......................................................... 94-16
FETCH_xxx Functions and Procedures ............................... 94-17
GET_xxx Functions ........................................................ 94-19
GET_QUERY Function ..................................................... 94-22
OPEN Function........................................................................................................................................ 94-27
OPENW Function................................................................................................................................... 94-34
PUT Function......................................................................................................................................... 94-35
SET_COUNT Procedure.......................................................................................................................... 94-37
SET_FILTER Procedure............................................................................................................................ 94-38
SET_PARSE_ITEM Procedure.................................................................................................................... 94-49
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures......................................................... 94-52

95  DBMS_METADATA_DIFF

Using DBMS_METADATA_DIFF.................................................................................................................... 95-2
 Overview .................................................................................................................................................. 95-3
 Security Model.......................................................................................................................................... 95-4
 Browsing APIs for Fetching and Comparing Objects ............................................................................. 95-5
 Summary of DBMS_METADATA_DIFF Subprograms .............................................................................. 95-7
 OPENC Function ..................................................................................................................................... 95-8
 ADD_DOCUMENT Procedure ..................................................................................................................... 95-9
 FETCH_CLOB Functions and Procedures ............................................................................................... 95-10
 CLOSE Procedure ...................................................................................................................................... 95-11

96  DBMS_MGD_ID_UTL

Using DBMS_MGD_ID_UTL.......................................................................................................................... 96-2
 Security Model.......................................................................................................................................... 96-3
 Constants ................................................................................................................................................... 96-4
 Exceptions .................................................................................................................................................. 96-5
 Summary of DBMS_MGD_ID_UTL Subprograms .................................................................................... 96-6
 ADD_SCHEME Procedure .......................................................................................................................... 96-7
 CREATE_CATEGORY Function .................................................................................................................... 96-11
 EPC_TO_ORACLE_SCHEME Function ....................................................................................................... 96-12
 GET_CATEGORY_ID Function ..................................................................................................................... 96-15

GETCOMMENT Function .................................................................. 187-13
GETCONTENTBLOB Function .......................................................... 187-14
GETCONTENTCLOB Function ............................................................ 187-15
GETCONTENTTREF Function ........................................................... 187-16
GETCONTENTTYPE Function ........................................................... 187-17
Using DBMS_XDBT

Overview
### 189  DBMS_XDBZ

**Using DBMS_XDBZ** ................................................................. 189-2
- Security Model .................................................................. 189-3
- Constants ......................................................................... 189-4

**Summary of DBMS_XDBZ Subprograms** ............................... 189-5
- CREATEONCEKEY Procedure ........................................ 189-6
- DISABLE_HIERARCHY Procedure ...................................... 189-7
- ENABLE_HIERARCHY Procedure ........................................ 189-8
- GET_ACLOID Function ..................................................... 189-9
- GET_USERID Function ........................................................ 189-10
- IS_HIERARCHY_ENABLED Function ..................................... 189-11
- PURGELDAPCACHE Function ............................................. 189-12

### 190  DBMS_XEVENT

**Using DBMS_XEVENT** ............................................................... 190-2
- Security Model .................................................................. 190-3
- Constants ......................................................................... 190-4

**Subprogram Groups** ............................................................. 190-5
- XDBEvent Type Subprograms ........................................... 190-6
- XDBRepositoryEvent Type Subprograms ........................ 190-7
- XDBHandlerList Type Subprograms .................................. 190-8
- XDBHandler Type Subprograms ......................................... 190-9
- XDBPath Type Subprograms ............................................. 190-10
- XDBLink Type Subprograms ............................................. 190-11

**Summary of DBMS_XEVENT Subprograms** .......................... 190-12
- CLEAR Procedure ......................................................... 190-15
- GETAPPLICATIONDATA Function .................................... 190-16
- GETCHILDOID Function .................................................. 190-17
- GETCURRENTUSER Function ........................................... 190-18
- GETEVENT Function ......................................................... 190-19
- GETFIRST Function .......................................................... 190-20
191  DBMS_XMLDOM

Using DBMS_XMLDOM ........................................................................................................ 191-3

Overview ......................................................................................................................... 191-4
Security Model.................................................................................................................. 191-6
Constants .......................................................................................................................... 191-7
Types .................................................................................................................................. 191-8
Exceptions ....................................................................................................................... 191-9

  PUT_LINE Procedure ....................................................................................................... 251-31
  PUT_LINE_NCHAR Procedure .......................................................................................... 251-32
  PUT_NCHAR Procedure ..................................................................................................... 251-33
  PUTF Procedure ............................................................................................................... 251-34
  PUTF_NCHAR Procedure ................................................................................................... 251-36
  PUT_RAW Procedure ......................................................................................................... 251-37

252 UTL_HTTP

Using UTL_HTTP .................................................................................................................. 252-2
  Overview ............................................................................................................................ 252-3
Using UTL_I18N

Security Model

Constants

Summary of UTL_I18N Subprograms

ESCAPE_REFERENCE Function

GET_COMMON_TIME_ZONES Function

GET_DEFAULT CHARSET Function

GET_COMMON_TIME_ZONES Function

ESCAPE_REFERENCE Function
Summary of UTL_MATCH Subprograms .................................................................................... 258-3
SEND Procedure ...................................................................................................................... 258-4
SEND_ATTACH_RAW Procedure .............................................................................................. 258-5
SEND_ATTACH_VARCHAR2 Procedure ................................................................................... 258-6

258 UTL_MATCH

Using UTL_MATCH .................................................................................................................... 258-7
Overview .................................................................................................................................... 258-8
Security Model ............................................................................................................................ 258-9

Summary of UTL_MATCH Subprograms .................................................................................... 258-10
EDIT_DISTANCE Function .......................................................................................................... 258-11
EDIT_DISTANCE_SIMILARITY Function .................................................................................. 258-12
JARO_WINKLER Function ......................................................................................................... 258-13
JARO_WINKLER_SIMILARITY Function .................................................................................... 258-14

259 UTL_NLA

Using UTL_NLA ........................................................................................................................ 259-15
Overview .................................................................................................................................... 259-16
Rules and Limits .......................................................................................................................... 259-17
Security Model ............................................................................................................................. 259-18

Subprogram Groups ................................................................................................................ 259-19
BLAS Level 1 (Vector-Vector Operations) Subprograms .......................................................... 259-20
BLAS Level 2 (Matrix-Vector Operations) Subprograms .......................................................... 259-21
BLAS Level 3 (Matrix-Matrix Operations) Subprograms .......................................................... 259-22
LAPACK Driver Routines (Linear Equations) Subprograms .................................................... 259-23
LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms .................................. 259-24

Summary of UTL_NLA Subprograms ......................................................................................... 259-25
BLAS_ASUM Functions .............................................................................................................. 259-26
BLAS_AXPY Procedures ............................................................................................................ 259-27
BLAS_COPY Procedures .......................................................................................................... 259-28
BLAS_DOT Functions ............................................................................................................... 259-29
BLAS_GBMV Procedures ......................................................................................................... 259-30
BLAS_GEMM Procedures ......................................................................................................... 259-31
BLAS_GEMV Procedures ......................................................................................................... 259-32
BLAS_GER Procedures ............................................................................................................. 259-33
BLAS_IAMAX Functions ........................................................................................................... 259-34
BLAS_NRM2 Functions ............................................................................................................ 259-35
BLAS_ROT Procedures ............................................................................................................. 259-36
BLAS_ROTG Procedures .......................................................................................................... 259-37
BLAS_SCAL Procedures .......................................................................................................... 259-38
BLAS_SPMV Procedures ......................................................................................................... 259-39
BLAS_SPR Procedures ............................................................................................................. 259-40
BLAS_SPR2 Procedures .......................................................................................................... 259-41
BLAS_SWAP Procedures ......................................................................................................... 259-42
UTL_RAW

Using UTL_RAW ......................................................................................................................... 260-2
Overview ........................................................................................................................................ 260-3
Operational Notes ........................................................................................................................... 260-4

Summary of UTL_RAW Subprograms ............................................................................................ 260-5

BIT_AND Function ......................................................................................................................... 260-7
BIT_COMPLEMENT Function ......................................................................................................... 260-8
BIT_OR Function ............................................................................................................................ 260-9
BIT_XOR Function ......................................................................................................................... 260-10
CAST_FROM_BINARY_DOUBLE Function ..................................................................................... 260-11
261 UTL_RECOMP

Using UTL_RECOMP ................................................. 261-2
Overview .............................................................. 261-3
Operational Notes .................................................. 261-4
Examples .............................................................. 261-5
Summary of UTL_RECOMP Subprograms .............. 261-6
RECOMP_PARALLEL Procedure ......................... 261-7
RECOMP_SERIAL Procedure ................................. 261-8

262 UTL_REF

Using UTL_REF ....................................................... 262-2
Overview .............................................................. 262-3
Security Model ..................................................... 262-4
Types ................................................................. 262-5
Exceptions .......................................................... 262-6
Summary of UTL_REF Subprograms ...................... 262-7
DELETE_OBJECT Procedure ................................. 262-8
LOCK_OBJECT Procedure ...................................... 262-10
SELECT_OBJECT Procedure ............................... 262-11
UPDATE_OBJECT Procedure ............................... 262-12

263 UTL_SMTP

Using UTL_SMTP ..................................................... 263-2
Overview .............................................................. 263-3
Summary of UTL_SMTP Subprograms

AUTH Function and Procedure .......................................................... 263-15
CLOSE_CONNECTION Procedure ...................................................... 263-17
CLOSE_DATA Function and Procedure .............................................. 263-18

Index
Preface

This Preface contains these topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents:

- Oracle Database Development Guide
- Oracle Database PL/SQL Language Reference

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to Oracle Database Sample Schemas for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at...
http://shop.oracle.com/

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN).

**Conventions**

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

**Conventions in Text**

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.</td>
<td>When you specify this clause, you create an index-organized table.</td>
</tr>
<tr>
<td><em>Italics</em></td>
<td>Italic typeface indicates book titles or emphasis.</td>
<td>Oracle Database Concepts</td>
</tr>
<tr>
<td><strong>UPPERCASE monospace (fixed-width) font</strong></td>
<td>Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.</td>
<td>You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the <code>TABLE_NAME</code> column in the <code>USER_TABLES</code> data dictionary view. Use the <code>DBMS_STATS.GENERATE_STATS</code> procedure.</td>
</tr>
<tr>
<td><strong>lowercase monospace (fixed-width) font</strong></td>
<td>Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</td>
<td>Enter sqlplus to start SQL*Plus. The password is specified in the <code>orapwd</code> file. Back up the datafiles and control files in the <code>/disk1/oracle/dbs</code> directory. The <code>department_id</code>, <code>department_name</code>, and <code>location_id</code> columns are in the <code>hr.departments</code> table. Set the <code>QUERY_REWRITE_ENABLED</code> initialization parameter to <code>true</code>. The <code>JRepUtil</code> class implements these methods.</td>
</tr>
<tr>
<td><strong>lowercase italic monospace (fixed-width) font</strong></td>
<td>Lowercase italic monospace font represents placeholders or variables.</td>
<td>You can specify the <code>parallel_clause</code>. Run <code>old_release.SQL</code> where <code>old_release</code> refers to the release you installed prior to upgrading.</td>
</tr>
</tbody>
</table>
Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>Anything enclosed in brackets is optional.</td>
<td>DECIMAL (digits [ , precision ])</td>
</tr>
<tr>
<td>{ }</td>
<td>Braces are used for grouping items.</td>
<td>{ENABLE</td>
</tr>
<tr>
<td></td>
<td>A vertical bar represents a choice of two options.</td>
<td>{ENABLE</td>
</tr>
<tr>
<td>...</td>
<td>Ellipses points mean repetition in syntax descriptions.</td>
<td>CREATE TABLE ... AS subquery;</td>
</tr>
<tr>
<td></td>
<td>In addition, ellipses points can mean an omission in code examples or text.</td>
<td>SELECT col1, col2, ..., coln FROM employees;</td>
</tr>
<tr>
<td>Other symbols</td>
<td>You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (</td>
<td>), and ellipses points (...) exactly as shown.</td>
</tr>
<tr>
<td>Italic</td>
<td>Italicized text indicates placeholders or variables for which you must supply particular values.</td>
<td>enter password</td>
</tr>
<tr>
<td>uppercase</td>
<td>Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.</td>
<td>DB_NAME = database_name</td>
</tr>
<tr>
<td>lowercase</td>
<td>Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files. Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</td>
<td>SELECT last_name, employee_id FROM employees; sqlplus hr/hr CREATE USER mjones IDENTIFIED BY ty3MU9;</td>
</tr>
</tbody>
</table>
Changes in This Release for Oracle Database
PL/SQL Packages and Types Reference

This preface contains:
- Changes in Oracle Database 12c Release 1 (12.1)

Changes in Oracle Database 12c Release 1 (12.1)
The following are changes in Oracle Database PL/SQL Packages and Types Reference for Oracle Database 12c Release 1 (12.1).

New Features
The following features are new in this release:
- Decision Tree Mining Text Data
  See DBMS_DATA_MINING
- Native Text Support
  See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM
- Native Text Support
  See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM
- XStream Support for XML Object Relational and Binary
  See Logical Change Record TYPES
- Native Double in Data Mining Functions
  See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM
- Feature Selection and Creation for Generalized Linear Models (GLM)
  See DBMS_DATA_MINING_TRANSFORM
- Expectation Maximization (EM) Clustering and Density Estimation
  See DBMS_DATA_MINING
- Feature Extraction Using Singular Value Decomposition
  See DBMS_DATA_MINING
- Privilege Analysis
  See DBMS_PRIVILEGE_CAPTURE
- Database Replay Support for Database Consolidation
See DBMS_WORKLOAD_REPLAY

- Rules Engine Result Cache
  See DBMS_RULE
- AQ Rules Engine Fast Evaluation of SYS_CONTEXT and Other Predicates
  See DBMS_RULE
- Oracle Data Redaction
  See DBMS_REDACT
- Real-Time Database Operations Monitoring
  See DBMS_MONITOR
- Support for Secure Hash Algorithm SHA-2 in Oracle Database
  See DBMS_CRYPTO
- Pluggable Databases Resource Plans
  See DBMS_RESOURCE_MANAGER
- Segment-Level Compression Tiering
  See DBMS_ILM, DBMS_ILM_ADMIN and DBMS_HEAT_MAP
- Row-Level Compression Tiering
  See DBMS_ILM, DBMS_ILM_ADMIN and DBMS_HEAT_MAP
- PL/SQL Interface for Managing ADO Policies
  See DBMS_ILM, DBMS_ILM_ADMIN and DBMS_HEAT_MAP
- Resource Manager Runaway Query Management
  See DBMS_RESOURCE_MANAGER
- Oracle Data Pump No Logging Option for Import
  See DBMS_DATAPUMP
- Oracle Data Pump Export View As a Table
  See DBMS_DATAPUMP and DBMS_METADATA
- Oracle Data Pump: Support SecureFiles LOB as Default
  See DBMS_DATAPUMP and DBMS_METADATA
- Pluggable Databases
  See DBMS_PDB and UTL_RECOMP
- Synchronous Materialized View Refresh
  See DBMS_SYNC_REFRESH
- Enhanced Parallel Statement Queuing
  See DBMS_RESOURCE_MANAGER and DBMS_SESSION
- XStream New Apply Parameters
  See DBMS_APPLY_ADM
- XStream Optimized Management of Large Transactions
  See DBMS_APPLY_ADM
• Adaptive SQL Plan Management
   See DBMS_AUTO_SQLTUNE, DBMS_SPM and DBMS_XPLAN

• SQL Plan Directives
   See DBMS_SPD and DBMS_STATS

• Mechanism to Pass Results From SQL Statements Embedded in Database PL/SQL Programs Implicitly to the External Client Program
   See DBMS_SQL

• Concurrent Statistics Gathering
   See DBMS_SPD and DBMS_STATS

• Application Continuity for Java
   See DBMS_APP_CONT and DBMS_SERVICE

• SQL Translation Framework
   See DBMS_SERVICE, DBMS_SQL and DBMS_SQL_TRANSLATOR

• New Types of Optimizer Statistics
   See DBMS_SPD and DBMS_STATS

• Session-Private Statistics for Global Temporary Table
   See DBMS_SPD and DBMS_STATS

• Adaptive Query Optimization
   See DBMS_XPLAN

• Rolling Upgrade Using Active Data Guard
   See DBMS_ROLLING

• Enable Digest Authentication with Oracle Database HTTP Listener
   See DBMS_XDB, DBMS_XDB_ADMIN and DBMS_XDBZ

• XStream New Capture Parameters
   See DBMS_CAPTURE_ADM

• Online Redefinition of Multiple Partitions
   See DBMS_REDEFINITION

• Support Redefinition of Tables With VPD Policies
   See DBMS_REDEFINITION

• Lock Timeout for FINISH_REDEF_TABLE
   See DBMS_REDEFINITION

• New Job Types
   See DBMS_SCHEDULER

• Native Text Support
   See DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM

• Sharded Queues for Performance and Scalability
   See DBMS_AQ, DBMS_AQADM and DBMS_PROPAGATION_ADM
- New PL/SQL DBMS_UTILIT. EXPAND_SQL_TEXT Procedure
  See DBMS_UTILIT
- New PL/SQL Package UTL_CALL_STACK
  See UTL_CALL_STACK
- Oracle Data Pump Support for Database Consolidation: Full Transportable
  See DBMS_DATAPUMP
- Automatic Column Group Detection
  See DBMS_STATS
- Heat Map
  See DBMS_HEAT_MAP, DBMS_ILM, DBMS_ILM_ADMIN and DBMS_FLASHBACK
- New schema Parameter for DBMS_SQL.PARSE Procedure
  See DBMS_SQL
- Asynchronous Global Index Maintenance for DROP and TRUNCATE Partition
  See DBMS_PART
- VPD Fine-Grained Context-Sensitive Policies
  See DBMS_RLS
- Out-of-Place Materialized View Refresh
  See DBMS_MVIEW
- Improved Automatic Degree of Parallelism
  See DBMS_STATS
- Transparent Sensitive Data Protection
  See DBMS_TSDP_MANAGE and DBMS_TSDP_PROTECT
- Oracle Data Pump Enhanced Compression Options
  See DBMS_DATAPUMP
- Enhancements to System Statistics
  See DBMS_STATS
- Transaction Guard
  See DBMS_APP_CONT
- Enhancements to Incremental Statistics
  See DBMS_STATS
- Temporal Validity Flashback Queries
  See DBMS_FLASHBACK_ARCHIVE
- LOGTIME Parameter for Oracle Data Pump Command
  See DBMS_DATAPUMP
- Queryable Patch Inventory
  See DBMS_QOPATCH
Enterprise Manager Database Express
See DBMS_XDB_ADMIN and DBMS_XDB_CONFIG
Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```sql
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
WHERE Owner IN ('SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
AND Object_Type IN ('PACKAGE', 'TYPE')
ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- Package Overview
- Summary of Oracle Supplied PL/SQL Packages and Types

See Also: Oracle Database Development Guide for information on how to create your own packages
Package Overview

A package is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.
Package Overview

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS  -- specification (visible part)
    -- public type and item declarations
    -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
    -- private type and item declarations
    -- subprogram bodies
BEGIN
    -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.
Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have 
`EXECUTE` privileges on the function. To select from a view defined with a PL/SQL function, you must have `SELECT` privileges on the view. No separate `EXECUTE` privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.
Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.
   
   You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   **Note:** It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.
   
   You can declare and define program objects in the package body.
   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

**See Also:**

- Oracle Database PL/SQL Language Reference
- Oracle Database Development Guide for more information on creating new packages
- Oracle Database Concepts for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.
CREATE PACKAGE employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
                       mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
                       deptno NUMBER) RETURN NUMBER;
    PROCEDURE fire_emp (emp_id NUMBER);
    PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;

The body for this package defines the function and the procedures:

CREATE PACKAGE BODY employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
                       mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
                       deptno NUMBER) RETURN NUMBER IS
        new_empno    NUMBER(10);
        BEGIN
            SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
            INSERT INTO emp VALUES (new_empno, name, job, mgr,
                                     hiredate, sal, comm, deptno);
            RETURN (new_empno);
        END hire_emp;

    PROCEDURE fire_emp(emp_id IN NUMBER) AS
        BEGIN
            DELETE FROM emp WHERE empno = emp_id;
            IF SQL%NOTFOUND THEN
                raise_application_error(-20011, 'Invalid Employee
                                          Number: ' || TO_CHAR(emp_id));
            END IF;
        END fire_emp;

    PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
        BEGIN
            -- If employee exists, then update salary with increase.
            UPDATE emp
                SET sal = sal + sal_incr
                WHERE empno = emp_id;
            IF SQL%NOTFOUND THEN
                raise_application_error(-20011, 'Invalid Employee
                                          Number: ' || TO_CHAR(emp_id));
            END IF;
        END sal_raise;
END employee_management;

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

The procedure deletes the employee with an employee number that corresponds to the argument emp_id. If no employee is found, then an exception is raised.

The procedure accepts two arguments. Emp_id is a number that corresponds to an employee number. Sal_incr is the amount by which to increase the employee's salary.
**Note:** If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
    > START WITH 8000 INCREMENT BY 10;
```
Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```
Summary of Oracle Supplied PL/SQL Packages and Types

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

Table 1–1  Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APEX_CUSTOM_AUTH</td>
<td>Provides an interface for authentication and session management</td>
</tr>
<tr>
<td>APEX_APPLICATION</td>
<td>Enables users to take advantage of global variables</td>
</tr>
<tr>
<td>APEX_ITEM</td>
<td>Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page</td>
</tr>
<tr>
<td>APEX_UTIL</td>
<td>Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users</td>
</tr>
<tr>
<td>CTX_ADM</td>
<td>Lets you administer servers and the data dictionary</td>
</tr>
<tr>
<td>CTX_CLS</td>
<td>Lets you generate CTXRULE rules for a set of documents</td>
</tr>
<tr>
<td>CTX_DDL</td>
<td>Lets you create and manage the preferences, section lists and stopgroups required for Text indexes</td>
</tr>
<tr>
<td>CTX_DOC</td>
<td>Lets you request document services</td>
</tr>
<tr>
<td>CTX_OUTPUT</td>
<td>Lets you manage the index log</td>
</tr>
<tr>
<td>CTX_QUERY</td>
<td>Lets you generate query feedback, count hits, and create stored query expressions</td>
</tr>
<tr>
<td>CTX_REPORT</td>
<td>Lets you create various index reports</td>
</tr>
<tr>
<td>CTX_THES</td>
<td>Lets you to manage and browse thesauri</td>
</tr>
<tr>
<td>CTX_ULEXER</td>
<td>For use with the user-lexer</td>
</tr>
<tr>
<td>DBMS_ADDM</td>
<td>Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor</td>
</tr>
<tr>
<td>DBMS_ADVANCED_REWRITE</td>
<td>Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite</td>
</tr>
<tr>
<td>DBMS_ADVISOR</td>
<td>Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements</td>
</tr>
</tbody>
</table>
### Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_ALERT</td>
<td>Provides support for the asynchronous notification of database events</td>
</tr>
<tr>
<td>DBMS_APPLICATION_INFO</td>
<td>Lets you register an application name with the database for auditing or performance tracking purposes</td>
</tr>
<tr>
<td>DBMS.Apply_ADM</td>
<td>Provides administrative procedures to start, stop, and configure an apply process</td>
</tr>
<tr>
<td>DBMS_AQ</td>
<td>Lets you add a message (of a predefined object type) onto a queue or to dequeue a message</td>
</tr>
<tr>
<td>DBMS_AQADM</td>
<td>Lets you perform administrative functions on a queue or queue table for messages of a predefined object type</td>
</tr>
<tr>
<td>DBMS_AQELM</td>
<td>Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP</td>
</tr>
<tr>
<td>DBMS_AQIN</td>
<td>Plays a part in providing secure access to the Oracle JMS interfaces</td>
</tr>
<tr>
<td>DBMS_ASSERT</td>
<td>Provides an interface to validate properties of the input value</td>
</tr>
<tr>
<td>DBMS_AUTO_TASK_ADMIN</td>
<td>Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls</td>
</tr>
<tr>
<td>DBMS_AW_STATS</td>
<td>Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions</td>
</tr>
<tr>
<td>DBMS_CAPTURE_ADM</td>
<td>Describes administrative procedures to start, stop, and configure a capture process; used in Streams</td>
</tr>
<tr>
<td>DBMS_COMPARISON</td>
<td>Provides interfaces to compare and converge database objects at different databases</td>
</tr>
<tr>
<td>DBMS_COMPRESSION</td>
<td>Provides an interface to facilitate choosing the correct compression level for an application</td>
</tr>
<tr>
<td>DBMS_CONNECTION_POOL</td>
<td>Provides an interface to manage the Database Resident Connection Pool</td>
</tr>
<tr>
<td>DBMS_CQ_NOTIFICATION</td>
<td>Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.</td>
</tr>
<tr>
<td>DBMS_CRYPTO</td>
<td>Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms</td>
</tr>
<tr>
<td>DBMS_CSX_ADMIN</td>
<td>Provides an interface to customize the setup when transporting a tablespace containing binary XML data</td>
</tr>
<tr>
<td>DBMS_CUBE</td>
<td>Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying</td>
</tr>
<tr>
<td>DBMS_CUBE_ADVISE</td>
<td>Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite</td>
</tr>
<tr>
<td>DBMS_DATA_MINING</td>
<td>Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models</td>
</tr>
<tr>
<td>DBMS_DATA_MINING_TRANSFORM</td>
<td>Provides subroutines that can be used to prepare data for Oracle Data Mining</td>
</tr>
</tbody>
</table>

1-10  Oracle Database PL/SQL Packages and Types Reference
<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_DATAPUMP</td>
<td>Lets you move all, or part of, a database between databases, including both data and metadata</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT</td>
<td>Provides an interface comprising a file system-like abstraction backed by one or more Store Providers</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT_SPI</td>
<td>Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers</td>
</tr>
<tr>
<td>DBMS_DBFS_HS</td>
<td>Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables</td>
</tr>
<tr>
<td>DBMS_DBFS_SFS</td>
<td>Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package</td>
</tr>
<tr>
<td>DBMS_DB_VERSION</td>
<td>Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions</td>
</tr>
<tr>
<td>DBMS_DDL</td>
<td>Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs</td>
</tr>
<tr>
<td>DBMS_DEBUG</td>
<td>Implements server-side debuggers and provides a way to debug server-side PL/SQL program units</td>
</tr>
<tr>
<td>DBMS_DEFER</td>
<td>Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DEFER_QUERY</td>
<td>Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DEFER_SYS</td>
<td>Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DESCRIBE</td>
<td>Describes the arguments of a stored procedure with full name translation and security checking</td>
</tr>
<tr>
<td>DBMS_DG</td>
<td>Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover</td>
</tr>
<tr>
<td>DBMS_DIMENSION</td>
<td>Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition</td>
</tr>
<tr>
<td>DBMS_DISTRIBUTED_TRUST_ADMIN</td>
<td>Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted</td>
</tr>
<tr>
<td>DBMS_EPG</td>
<td>Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener</td>
</tr>
<tr>
<td>DBMS_ERRLOG</td>
<td>Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and rollback</td>
</tr>
<tr>
<td>DBMS_EXPPIL</td>
<td>Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter</td>
</tr>
</tbody>
</table>
### Table 1–1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_FGA</td>
<td>Provides fine-grained security functions</td>
</tr>
<tr>
<td>DBMS_FILE_GROUP</td>
<td>One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories</td>
</tr>
<tr>
<td>DBMS_FILE_TRANSFER</td>
<td>Lets you copy a binary file within a database or to transfer a binary file between databases</td>
</tr>
<tr>
<td>DBMS_FLASHBACK</td>
<td>Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)</td>
</tr>
<tr>
<td>DBMS_FLASHBACK_ARCHIVE</td>
<td>Contains procedures for disassociation and re-association of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.</td>
</tr>
<tr>
<td>DBMS_FREQUENT_ITEMSET</td>
<td>Enables frequent itemset counting</td>
</tr>
<tr>
<td>DBMS_HM</td>
<td>Contains constants and procedure declarations for health check management</td>
</tr>
<tr>
<td>DBMS_HPROF</td>
<td>Provides an interface for profiling the execution of PL/SQL applications</td>
</tr>
<tr>
<td>DBMS_HS_PARALLEL</td>
<td>Enables parallel processing for heterogeneous targets access</td>
</tr>
<tr>
<td>DBMS_HS_PASSTHROUGH</td>
<td>Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems</td>
</tr>
<tr>
<td>DBMS_IOT</td>
<td>Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command</td>
</tr>
<tr>
<td>DBMS_JAVA</td>
<td>Provides a PL/SQL interface for accessing database functionality from Java</td>
</tr>
<tr>
<td>DBMS_JOB</td>
<td>Schedules and manages jobs in the job queue</td>
</tr>
<tr>
<td>DBMS_LDAP</td>
<td>Provides functions and procedures to access data from LDAP servers</td>
</tr>
<tr>
<td>DBMS_LDAP_UTL</td>
<td>Provides the Oracle Extension utility functions for LDAP</td>
</tr>
<tr>
<td>DBMS_LIBCACHE</td>
<td>Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution</td>
</tr>
<tr>
<td>DBMS_LOB</td>
<td>Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILEs (read-only)</td>
</tr>
<tr>
<td>DBMS_LOCK</td>
<td>Lets you request, convert and release locks through Oracle Lock Management services</td>
</tr>
<tr>
<td>DBMS_LOGMNR</td>
<td>Provides functions to initialize and run the log reader</td>
</tr>
<tr>
<td>DBMS_LOGMNR_D</td>
<td>Queries the dictionary tables of the current database, and creates a text based file containing their contents</td>
</tr>
<tr>
<td>DBMS_LOGSTDBY</td>
<td>Describes procedures for configuring and managing the logical standby database environment</td>
</tr>
<tr>
<td>DBMS_METADATA</td>
<td>Lets callers easily retrieve complete database object definitions (metadata) from the dictionary</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_METADATA_DIFF</td>
<td>Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.</td>
</tr>
<tr>
<td>DBMS_MGD_ID_UTL</td>
<td>Provides a set of utility subprograms</td>
</tr>
<tr>
<td>DBMS_MGWADM</td>
<td>Describes the Messaging Gateway administrative interface; used in Advanced Queuing</td>
</tr>
<tr>
<td>DBMS_MGWMSG</td>
<td>Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_MONITOR</td>
<td>Let you use PL/SQL for controlling additional tracing and statistics gathering</td>
</tr>
<tr>
<td>DBMS_MVIEW</td>
<td>Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.</td>
</tr>
<tr>
<td>DBMS_NETWORK_ACL_ADMIN</td>
<td>Provides the interface to administer the network Access Control List (ACL)</td>
</tr>
<tr>
<td>DBMS_NETWORK_UTL</td>
<td>Provides the interface to administer the network Access Control List (ACL)</td>
</tr>
<tr>
<td>DBMS_ODCI</td>
<td>Returns the CPU cost of a user function based on the elapsed time of the function</td>
</tr>
<tr>
<td>DBMS_OFFLINE_OG</td>
<td>Provides a public interface for offline instantiation of master groups</td>
</tr>
<tr>
<td>DBMS_OLAP</td>
<td>Provides procedures for summaries, dimensions, and query rewrites</td>
</tr>
<tr>
<td>DBMS_OUTLN</td>
<td>Provides the interface for procedures and functions associated with management of stored outlines. Synonymous with OUTLN_PKG</td>
</tr>
<tr>
<td>DBMS_OUTPUT</td>
<td>Accumulates information in a buffer so that it can be retrieved later</td>
</tr>
<tr>
<td>DBMS_PARALLEL_EXECUTE</td>
<td>Enables the user to incrementally update table data in parallel</td>
</tr>
<tr>
<td>DBMS_PCLXUTIL</td>
<td>Provides intra-partition parallelism for creating partition-wise local indexes</td>
</tr>
<tr>
<td>DBMS_PIPE</td>
<td>Provides a DBMS pipe service which enables messages to be sent between sessions</td>
</tr>
<tr>
<td>DBMS_PREDICTIVE_ANALYTICS</td>
<td>Provides subroutines that implement automatic data mining operations for predict, explain, and profile</td>
</tr>
<tr>
<td>DBMS_PREPROCESSOR</td>
<td>Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form</td>
</tr>
<tr>
<td>DBMS_PROFILER</td>
<td>Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks</td>
</tr>
<tr>
<td>DBMS_PROPAGATION_ADM</td>
<td>Provides administrative procedures for configuring propagation from a source queue to a destination queue</td>
</tr>
<tr>
<td>DBMS_RANDOM</td>
<td>Provides a built-in random number generator</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_RECTIFIER_DIFF</td>
<td>Provides an interface to detect and resolve data inconsistencies between two replicated sites</td>
</tr>
<tr>
<td>DBMS_REDEFINITION</td>
<td>Lets you perform an online reorganization of tables</td>
</tr>
<tr>
<td>DBMS_REFRESH</td>
<td>Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option</td>
</tr>
<tr>
<td>DBMS_REPAIR</td>
<td>Provides data corruption repair procedures</td>
</tr>
<tr>
<td>DBMS_REPCAT</td>
<td>Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_ADMIN</td>
<td>Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_INSTANTIATE</td>
<td>Instantiates deployment templates. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_RGT</td>
<td>Controls the maintenance and definition of refresh group templates. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPUTIL</td>
<td>Provides routines to generate shadow tables, triggers, and packages for table replication.</td>
</tr>
<tr>
<td>DBMS_RECONFIG</td>
<td>Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER</td>
<td>Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER_PRIVS</td>
<td>Maintains privileges associated with resource consumer groups</td>
</tr>
<tr>
<td>DBMS_RESULT_CACHE</td>
<td>Provides an interface to operate on the Result Cache</td>
</tr>
<tr>
<td>DBMS_RESUMABLE</td>
<td>Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution</td>
</tr>
<tr>
<td>DBMS_RLMGR</td>
<td>Contains various procedures to create and manage rules and rule sessions by the Rules Manager</td>
</tr>
<tr>
<td>DBMS_RLS</td>
<td>Provides row level security administrative interface</td>
</tr>
<tr>
<td>DBMS_ROWID</td>
<td>Provides procedures to create rowids and to interpret their contents</td>
</tr>
<tr>
<td>DBMS_RULE</td>
<td>Describes the <code>EVALUATE</code> procedure used in Streams</td>
</tr>
<tr>
<td>DBMS_RULE_ADM</td>
<td>Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams</td>
</tr>
<tr>
<td>DBMS_SCHEDULER</td>
<td>Provides a collection of scheduling functions that are callable from any PL/SQL program</td>
</tr>
<tr>
<td>DBMS_SERVER_ALERT</td>
<td>Lets you issue alerts when some threshold has been violated</td>
</tr>
<tr>
<td>DBMS_SERVICE</td>
<td>Lets you create, delete, activate and deactivate services for a single instance</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_SESSION</td>
<td>Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures</td>
</tr>
<tr>
<td>DBMS_SHARED_POOL</td>
<td>Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism</td>
</tr>
<tr>
<td>DBMS_SPACE</td>
<td>Provides segment space information not available through standard SQL</td>
</tr>
<tr>
<td>DBMS_SPACE_ADMIN</td>
<td>Provides tablespace and segment space administration not available through the standard SQL</td>
</tr>
<tr>
<td>DBMS_SPM</td>
<td>Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements</td>
</tr>
<tr>
<td>DBMS_SQL</td>
<td>Lets you use dynamic SQL to access the database</td>
</tr>
<tr>
<td>DBMS_SQLDIAG</td>
<td>Provides an interface to the SQL Diagnosability functionality</td>
</tr>
<tr>
<td>DBMS_SQLPA</td>
<td>Provides an interface to implement the SQL Performance Analyzer.</td>
</tr>
<tr>
<td>DBMS_SQLTUNE</td>
<td>Provides the interface to tune SQL statements</td>
</tr>
<tr>
<td>DBMS_STAT_FUNCS</td>
<td>Provides statistical functions</td>
</tr>
<tr>
<td>DBMS_STATS</td>
<td>Provides a mechanism for users to view and modify optimizer statistics gathered for database objects</td>
</tr>
<tr>
<td>DBMS_STORAGE_MAP</td>
<td>Communicates with FMON to invoke mapping operations</td>
</tr>
<tr>
<td>DBMS_STREAMS</td>
<td>Describes the interface to convert SYS.AnyData objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.</td>
</tr>
<tr>
<td>DBMS_STREAMS_ADMIN</td>
<td>Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level</td>
</tr>
<tr>
<td>DBMS_STREAMS_ADVISOR_ADM</td>
<td>Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered</td>
</tr>
<tr>
<td>DBMS_STREAMS_AUTH</td>
<td>Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators</td>
</tr>
<tr>
<td>DBMS_STREAMS_HANDLER_ADM</td>
<td>Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue</td>
</tr>
<tr>
<td>DBMS_STREAMS_MESSAGING</td>
<td>Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue</td>
</tr>
<tr>
<td>DBMS_STREAMS_TABLESPACE_ADM</td>
<td>Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_TDB</td>
<td>Reports whether a database can be transported between platforms using the RMAN <code>CONVERT DATABASE</code> command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.</td>
</tr>
<tr>
<td>DBMS_TRACE</td>
<td>Provides routines to start and stop PL/SQL tracing</td>
</tr>
<tr>
<td>DBMS_TRANSACTION</td>
<td>Provides access to SQL transaction statements from stored procedures and monitors transaction activities</td>
</tr>
<tr>
<td>DBMS_TRANSFORM</td>
<td>Provides an interface to the message format transformation features of Oracle Advanced Queuing</td>
</tr>
<tr>
<td>DBMS_TTS</td>
<td>Checks if the transportable set is self-contained</td>
</tr>
<tr>
<td>DBMS_TYPES</td>
<td>Consists of constants, which represent the built-in and user-defined types</td>
</tr>
<tr>
<td>DBMSUTILITY</td>
<td>Provides various utility routines</td>
</tr>
<tr>
<td>DBMS_WARNING</td>
<td>Provides the interface to query, modify and delete current system or session settings</td>
</tr>
<tr>
<td>DBMS_WM</td>
<td>Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_CAPTURE</td>
<td>Configures the Workload Capture system and produce the workload capture data.</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPLAY</td>
<td>Provides an interface to replay and report on a record of a workload on a production or test system</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPOSITORY</td>
<td>Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines</td>
</tr>
<tr>
<td>DBMS_XA</td>
<td>Contains the XA/Open interface for applications to call XA interface in PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB</td>
<td>Describes Resource Management and Access Control interface for PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB_ADMIN</td>
<td>Provides an interface to implement XMLIndex administration operation</td>
</tr>
<tr>
<td>DBMS_XDBRESOURCE</td>
<td>Provides an interface to operate on the XDB resource’s metadata and contents</td>
</tr>
<tr>
<td>DBMS_XDB_VERSION</td>
<td>Describes the versioning interface</td>
</tr>
<tr>
<td>DBMS_XDBT</td>
<td>Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance</td>
</tr>
<tr>
<td>DBMS_XDBZ</td>
<td>Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)</td>
</tr>
<tr>
<td>DBMS_XEVENT</td>
<td>Provides event-related types and supporting subprograms</td>
</tr>
<tr>
<td>DBMS_XMLDOM</td>
<td>Explains access to XMLType objects</td>
</tr>
<tr>
<td>DBMS_XMLGEN</td>
<td>Converts the results of a SQL query to a canonical XML format</td>
</tr>
<tr>
<td>DBMS_XMINDEX</td>
<td>Provides an interface to implement asynchronous indexing and apply node referencing</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_XMLPARSER</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DBMS_XMLQUERY</td>
<td>Provides database-to-XMLType functionality</td>
</tr>
<tr>
<td>DBMS_XMLSAVE</td>
<td>Provides XML-to-database-type functionality</td>
</tr>
<tr>
<td>DBMS_XMLSCHEMA</td>
<td>Explains procedures to register and delete XML schemas</td>
</tr>
<tr>
<td>DBMS_XMLSTORE</td>
<td>Provides the ability to store XML data in relational tables</td>
</tr>
<tr>
<td>DBMS_XMLTRANSLATIONS</td>
<td>Provides an interface to perform translations so that strings can be searched or displayed in various languages</td>
</tr>
<tr>
<td>DBMS_XPLAN</td>
<td>Describes how to format the output of the EXPLAIN PLAN command</td>
</tr>
<tr>
<td>DBMS_XSLPROCESSOR</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DEBUG_EXTPROC</td>
<td>Lets you debug external procedures on platforms with debuggers that attach to a running process</td>
</tr>
<tr>
<td>HTF</td>
<td>Hypertext functions generate HTML tags</td>
</tr>
<tr>
<td>HTP</td>
<td>Hypertext procedures generate HTML tags</td>
</tr>
<tr>
<td>ORD_DICOM</td>
<td>Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type</td>
</tr>
<tr>
<td>ORD_DICOM_ADMIN</td>
<td>Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository</td>
</tr>
<tr>
<td>OWA_CACHE</td>
<td>Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications</td>
</tr>
<tr>
<td>OWA_COOKIE</td>
<td>Provides an interface for sending and retrieving HTTP cookies from the client’s browser</td>
</tr>
<tr>
<td>OWA_CUSTOM</td>
<td>Provides a Global PSQL Agent Authorization callback function</td>
</tr>
<tr>
<td>OWA_IMAGE</td>
<td>Provides an interface to access the coordinates where a user clicked on an image</td>
</tr>
<tr>
<td>OWA_OPT_LOCK</td>
<td>Contains subprograms that impose optimistic locking strategies so as to prevent lost updates</td>
</tr>
<tr>
<td>OWA_PATTERN</td>
<td>Provides an interface to locate text patterns within strings and replace the matched string with another string</td>
</tr>
<tr>
<td>OWA_SEC</td>
<td>Provides an interface for custom authentication</td>
</tr>
<tr>
<td>OWA_TEXT</td>
<td>Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.</td>
</tr>
<tr>
<td>OWA_UTIL</td>
<td>Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table</td>
</tr>
</tbody>
</table>
### Table 1–1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDO_CS</td>
<td>Provides functions for coordinate system transformation</td>
</tr>
<tr>
<td>SDO_CSW_PROCESS</td>
<td>Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)</td>
</tr>
<tr>
<td>SDO_GCDR</td>
<td>Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses</td>
</tr>
<tr>
<td>SDO_GEOM</td>
<td>Provides functions implementing geometric operations on spatial objects</td>
</tr>
<tr>
<td>SDO_GEOR</td>
<td>Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata</td>
</tr>
<tr>
<td>SDO_GEOR_ADMIN</td>
<td>Contains subprograms for administrative operations related to GeoRaster.</td>
</tr>
<tr>
<td>SDO_GEOR_UTL</td>
<td>Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data</td>
</tr>
<tr>
<td>SDO_LRS</td>
<td>Provides functions for linear referencing system support</td>
</tr>
<tr>
<td>SDO_MIGRATE</td>
<td>Provides functions for migrating spatial data from previous releases</td>
</tr>
<tr>
<td>SDO_NET</td>
<td>Provides functions and procedures for working with data modeled as nodes and links in a network</td>
</tr>
<tr>
<td>SDO_NET_MEM</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_OLS</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_PC_PKG</td>
<td>Contains subprograms to support the use of point clouds in Spatial</td>
</tr>
<tr>
<td>SDO_SAM</td>
<td>Contains functions and procedures for spatial analysis and data mining</td>
</tr>
<tr>
<td>SDO_TIN_PKG</td>
<td>Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial</td>
</tr>
<tr>
<td>SDO_TOPO</td>
<td>Provides procedures for creating and managing Spatial topologies</td>
</tr>
<tr>
<td>SDO_TOPO_MAP</td>
<td>Contains subprograms for editing Spatial topologies using a cache (TopoMap object)</td>
</tr>
<tr>
<td>SDO_TUNE</td>
<td>Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial</td>
</tr>
<tr>
<td>SDO_UTIL</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>SDO_WFS_LOCK</td>
<td>Contains subprograms for WFS support for registering and unregistering feature tables</td>
</tr>
<tr>
<td>SDO_WFS_PROC</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SEM_APIS</td>
<td>Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.</td>
</tr>
<tr>
<td>SEM_PERF</td>
<td>Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database</td>
</tr>
<tr>
<td>SEM_RDFCTX</td>
<td>Contains subprograms for managing extractor policies and semantic indexes created for documents</td>
</tr>
<tr>
<td>SEM_RDFSFA</td>
<td>Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)</td>
</tr>
<tr>
<td>UTL_COLL</td>
<td>Enables PL/SQL programs to use collection locators to query and update</td>
</tr>
<tr>
<td>UTL_COMPRESS</td>
<td>Provides a set of data compression utilities</td>
</tr>
<tr>
<td>UTL_DBWS</td>
<td>Provides database Web services</td>
</tr>
<tr>
<td>UTL_ENCODE</td>
<td>Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts</td>
</tr>
<tr>
<td>UTL_FILE</td>
<td>Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O</td>
</tr>
<tr>
<td>UTL_HTTP</td>
<td>Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges</td>
</tr>
<tr>
<td>UTL_I18N</td>
<td>Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications</td>
</tr>
<tr>
<td>UTL_INADDR</td>
<td>Provides a procedure to support internet addressing</td>
</tr>
<tr>
<td>UTL_IDENT</td>
<td>Specifies which database or client PL/SQL is running</td>
</tr>
<tr>
<td>UTL_LMS</td>
<td>Retrieves and formats error messages in different languages</td>
</tr>
<tr>
<td>UTL_MAIL</td>
<td>A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt</td>
</tr>
<tr>
<td>UTL_NLA</td>
<td>Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs</td>
</tr>
<tr>
<td>UTL_RAW</td>
<td>Provides SQL functions for manipulating RAW datatypes</td>
</tr>
<tr>
<td>UTL_RECOMP</td>
<td>Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels</td>
</tr>
<tr>
<td>UTL_REF</td>
<td>Enables a PL/SQL program to access an object by providing a reference to the object</td>
</tr>
<tr>
<td>UTL_SMTP</td>
<td>Provides PL/SQL functionality to send emails</td>
</tr>
<tr>
<td>UTL_SPADV</td>
<td>Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UTL_TCP</td>
<td>Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world</td>
</tr>
<tr>
<td>UTL_URL</td>
<td>Provides escape and unescape mechanisms for URL characters</td>
</tr>
<tr>
<td>WPG_DOCLOAD</td>
<td>Provides an interface to download files, both BLOBs and BFILEs</td>
</tr>
<tr>
<td>ANYDATA TYPE</td>
<td>A self-describing data instance type containing an instance of the type plus a description</td>
</tr>
<tr>
<td>ANYDATASET TYPE</td>
<td>Contains a description of a given type plus a set of data instances of that type</td>
</tr>
<tr>
<td>ANYTYPE TYPE</td>
<td>Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions</td>
</tr>
<tr>
<td>Oracle Database Advanced Queuing Types</td>
<td>Describes the types used in Advanced Queuing</td>
</tr>
<tr>
<td>DBFS Content Interface Types</td>
<td>Describes public types defined to support the DBMS_DBFS_CONTENT interface.</td>
</tr>
<tr>
<td>Database URI Type</td>
<td>Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package</td>
</tr>
<tr>
<td>Expression Filter Types</td>
<td>Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.</td>
</tr>
<tr>
<td>JMS TYPES</td>
<td>Describes JMS types so that a PL/SQL application can use JMS queues of JMS types</td>
</tr>
<tr>
<td>Oracle Multimedia ORDAudio TYPE</td>
<td>Supports the storage and management of audio data</td>
</tr>
<tr>
<td>Oracle Multimedia ORDDicom Type</td>
<td>Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data</td>
</tr>
<tr>
<td>Oracle Multimedia ORDDoc TYPE</td>
<td>Supports the storage and management of heterogeneous media data including image, audio, and video</td>
</tr>
<tr>
<td>Oracle Multimedia ORDImage TYPE</td>
<td>Supports the storage, management, and manipulation of image data</td>
</tr>
<tr>
<td>Oracle Multimedia SQL/MM Still Image TYPE</td>
<td>Supports the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates</td>
</tr>
<tr>
<td>Oracle Multimedia ORDVideo TYPE</td>
<td>Supports the storage and management of video data</td>
</tr>
<tr>
<td>LOGICAL CHANGE RECORD TYPES</td>
<td>Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams</td>
</tr>
<tr>
<td>MG_ID Package Types</td>
<td>Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types</td>
</tr>
<tr>
<td>RULES TYPEs</td>
<td>Describes the types used with rules, rule sets, and evaluation contexts</td>
</tr>
<tr>
<td>RULES Manager Types</td>
<td>Rules Manager is supplied with one predefined type and a public synonym</td>
</tr>
</tbody>
</table>
### Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UTL Streams Types</td>
<td>Describes describes abstract streams types used with Oracle XML functionality</td>
</tr>
<tr>
<td>XMLType</td>
<td>Describes the types and functions used for native XML support in the server</td>
</tr>
</tbody>
</table>
The APEX_CUSTOM_AUTH package provides an interface for authentication and session management.

- Documentation of APEX_CUSTOM_AUTH
Documentation of APEX_CUSTOM_AUTH

For a complete description of this package within the context of APEX, see APEX_CUSTOM_AUTH in the Oracle Application Express API Reference.
The APEX_APPLICATION package enables users to take advantage of global variables.

- Documentation of APEX_APPLICATION
For a complete description of this package within the context of APEX, see APEX_APPLICATION in the Oracle Application Express API Reference.
The APEX_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

- Documentation of APEX_ITEM
For a complete description of this package within the context of APEX, see APEX_ITEM in the Oracle Application Express API Reference.
The APEX_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

- Documentation of APEX_UTIL
For a complete description of this package within the context of APEX, see APEX_UTIL in the Oracle Application Express API Reference.
The CTX_ADM package lets you administer the Oracle Text data dictionary. Note that you must install this package in order to use it.

- Documentation of CTX_ADM
For a complete description of this package within the context of Oracle Text, see CTX_ADM in the Oracle Text Reference.
The `CTX_ANL` package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer. A custom dictionary might be one that you develop for a special field of study or for your industry. In most cases, the dictionaries supplied for the supported languages with Oracle Text are more than sufficient to handle your requirements.

- Documentation of `CTX_ANL`
Documentation of CTX_ANL

For a complete description of this package within the context of Oracle Text, see CTX_ANL in the Oracle Text Reference.
The CTX_CLS package enables generation of CTXRULE rules for a set of documents.

- Documentation of CTX_CLS
Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see CTX_CLS in the Oracle Text Reference.
The CTX_DDL package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- Documentation of CTX_DDL
For complete description of this package within the context of Oracle Text, see CTX_DDL in the Oracle Text Reference.
The CTX_DOC package lets you request document services. Note that you must install this package in order to use it.

- Documentation of CTX_DOC
For a complete description of this package within the context of Oracle Text, see CTX_DOC in the Oracle Text Reference.
The CTX_ENTITY package enables you to search for terms that are unknown to you without specifying a particular search text. It does this by identifying names, places, dates, and other objects when they are mentioned in a document and by tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text and data mining and more comprehensive intelligence analysis.

- Documentation of CTX_ENTITY
Documentation of CTX_ENTITY

For the complete description of this package within the context of Oracle Text, see CTX_ENTITY in the Oracle Text Reference.
This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- Documentation of CTX_OUTPUT
Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see CTX_OUTPUT in the Oracle Text Reference.
This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- Documentation of CTX_QUERY
Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see CTX_QUERY in the Oracle Text Reference.
This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- Documentation of CTX_REPORT
For a complete description of this package within the context of Oracle Text, see CTX_REPORT in the Oracle Text Reference.
This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- Documentation of CTX_THES
Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see CTX_THES in the Oracle Text Reference.
This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- Documentation of CTX_ULEXER
Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see CTX_ULEXER in the Oracle Text Reference.
The `DBMS_ADDM` package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

**See Also:**

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"

- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

This chapter contains the following topics:

- **Using DBMS_ADDM**
  - Security Model

- **Summary of DBMS_ADDM Subprograms**
Using DBMS_ADDM

- Security Model
Security Model

The DBMS_ADDM package runs with the caller’s permission, not the definer’s, and then applies the security constraints required by the DBMS_ADVISOR package.

See Also: The DBMS_ADVISOR package for more information about "Security Model".

<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE_DB Procedure on page 17-6</td>
<td>Creates an ADDM task for analyzing in database analysis mode and executes it</td>
</tr>
<tr>
<td>ANALYZE_INST Procedure on page 17-7</td>
<td>Creates an ADDM task for analyzing in instance analysis mode and executes it</td>
</tr>
<tr>
<td>ANALYZE_PARTIAL Procedure on page 17-8</td>
<td>Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it</td>
</tr>
<tr>
<td>COMPARE_CAPTURE_REPLAY_REPORT Function on page 17-9</td>
<td>Produces a Compare Period ADDM report comparing the performance of a capture to a replay</td>
</tr>
<tr>
<td>COMPARE_DATABASES Function on page 17-10</td>
<td>Produces a Compare Period ADDM report for a database-wide performance comparison</td>
</tr>
<tr>
<td>COMPARE_INSTANCES Function on page 17-11</td>
<td>Produces a Compare Period ADDM report for an instance-level performance comparison</td>
</tr>
<tr>
<td>COMPARE_REPLAY_REPLAY_REPORT Function on page 17-12</td>
<td>Produces a Compare Period ADDM report comparing the performance of a replay to another replay</td>
</tr>
<tr>
<td>DELETE Procedure on page 17-13</td>
<td>Deletes an already created ADDM task (of any kind)</td>
</tr>
<tr>
<td>DELETE_FINDING_DIRECTIVE Procedure on page 17-14</td>
<td>Deletes a finding directive</td>
</tr>
<tr>
<td>DELETE_PARAMETER_DIRECTIVE Procedure on page 17-15</td>
<td>Deletes a parameter directive</td>
</tr>
<tr>
<td>DELETE_SEGMENT_DIRECTIVE Procedure on page 17-16</td>
<td>Deletes a segment directive</td>
</tr>
<tr>
<td>DELETE_SQL_DIRECTIVE Procedure on page 17-17</td>
<td>Deletes a SQL directive</td>
</tr>
<tr>
<td>GET_ASH_QUERY Function on page 17-18</td>
<td>Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding</td>
</tr>
<tr>
<td>GET_REPORT Function on page 17-19</td>
<td>Retrieves the default text report of an executed ADDM task</td>
</tr>
<tr>
<td>INSERT_FINDING_DIRECTIVE Procedure on page 17-20</td>
<td>Creates a directive to limit reporting of a specific finding type.</td>
</tr>
<tr>
<td>INSERT_PARAMETER_DIRECTIVE Procedure on page 17-21</td>
<td>Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter</td>
</tr>
<tr>
<td>INSERT_SEGMENT_DIRECTIVE Procedure on page 17-22</td>
<td>Creates a directive to prevent ADDM from creating actions to &quot;run Segment Advisor&quot; for specific segments</td>
</tr>
<tr>
<td>INSERT_SQL_DIRECTIVE Procedure on page 17-24</td>

### Table 17–1  DBMS_ADDM Package Subprograms (Cont.)

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REAL_TIME_ADDM_REPORT</td>
<td>Produces a real-time report of ADDM activity as described in Function on page 17-25</td>
</tr>
</tbody>
</table>
ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_DB (  
    task_name           IN OUT VARCHAR2,  
    begin_snapshot      IN     NUMBER,  
    end_snapshot        IN     NUMBER,  
    db_id               IN     NUMBER := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);  
BEGIN  
  :tname := 'my_database_analysis_mode_task';  
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);  
END
```

To see a report:

```
SET LONG 100000  
SET PAGESIZE 50000  
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.
**ANALYZE_INST Procedure**

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

**Syntax**

```sql
DBMS_ADDM.ANALYZE_INST ( 
    task_name           IN OUT VARCHAR2, 
    begin_snapshot      IN     NUMBER, 
    end_snapshot        IN     NUMBER, 
    instance_number     IN     NUMBER := NULL, 
    db_id               IN     NUMBER := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>instance_number</td>
<td>Number of the instance to analyze. By default it is the instance currently connected</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

**Return Values**

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

**Usage Notes**

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the `ANALYZE_DB` procedure.

**Examples**

To create an ADDM task in instance analysis mode and execute it, with its name in variable `tname`:

```sql
var tname VARCHAR2(60);
BEGIN
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.
ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (  
    task_name           IN OUT VARCHAR2,  
    instance_numbers    IN     VARCHAR2,  
    begin_snapshot      IN     NUMBER,  
    end_snapshot        IN     NUMBER,  
    db_id               IN     NUMBER := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>instance_numbers</td>
<td>Comma separated list of instance numbers to analyze</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_moderatask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a `CLOB`, formatted to fit line size of 80.
COMPARE_CAPTURE_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a capture to a replay. The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```sql
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (replay_id IN NUMBER, report_type IN VARCHAR2 := 'HTML') RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report
COMPARE_DATABASES Function

This function produces a Compare Period ADDM report comparing the performance of a database over two different time periods or the performance of two different databases over two different time periods. The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_DATABASES (
    base_dbid             IN NUMBER := NULL,
    base_begin_snap_id    IN NUMBER,
    base_end_snap_id      IN NUMBER,
    comp_dbid             IN NUMBER := NULL,
    comp_begin_snap_id    IN NUMBER,
    comp_end_snap_id      IN NUMBER,
    report_type           IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_dbid</td>
<td>Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.</td>
</tr>
<tr>
<td>base_begin_snap_id</td>
<td>Begin AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>base_end_snap_id</td>
<td>End AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>comp_dbid</td>
<td>Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.</td>
</tr>
<tr>
<td>comp_begin_snap_id</td>
<td>Begin AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>comp_end_snap_id</td>
<td>End AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report
**COMPARE_INSTANCES Function**

This function produces a Compare Period ADDM report comparing the performance of a single instance over two different time periods or the performance of two different instances over two different time periods. The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

**Syntax**

```sql
DBMS_ADDM.COMPARE_INSTANCES (  
  base_dbid             IN NUMBER := NULL,  
  base_instance_id      IN NUMBER,  
  base_begin_snap_id    IN NUMBER,  
  base_end_snap_id      IN NUMBER,  
  comp_dbid             IN NUMBER := NULL,  
  comp_instance_id      IN NUMBER,  
  comp_begin_snap_id    IN NUMBER,  
  comp_end_snap_id      IN NUMBER,  
  report_type           IN VARCHAR2 := 'HTML')  
RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_dbid</td>
<td>Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.</td>
</tr>
<tr>
<td>base_instance_id</td>
<td>Instance number of the database instance to include from the base period</td>
</tr>
<tr>
<td>base_begin_snap_id</td>
<td>Begin AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>base_end_snap_id</td>
<td>End AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>comp_dbid</td>
<td>Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.</td>
</tr>
<tr>
<td>comp_instance_id</td>
<td>Instance number of the database instance to include from the comparison period</td>
</tr>
<tr>
<td>comp_begin_snap_id</td>
<td>Begin AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>comp_end_snap_id</td>
<td>End AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

**Return Values**

A CLOB containing a compare period ADDM report
COMPARE_REPLAY_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a replay to another replay. The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```sql
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
    replay_id1            IN NUMBER,
    replay_id2            IN NUMBER,
    report_type           IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Replay ID to use as the comparison period. The comparison period is the period to compare to the base period in order to determine improvement or regression.</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report
DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

Syntax

DBMS_ADDM.DELETE (  
    task_name IN VARCHAR2);

Parameters

Table 17–9  DELETE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be deleted</td>
</tr>
</tbody>
</table>

Examples

BEGIN  
    DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');  
END
DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```sql
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (  
  task_name           IN VARCHAR2,  
  dir_name            IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

Syntax

```sql
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (
    task_name           IN VARCHAR2,
    dir_name            IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>

Examples

```sql
BEGIN
    DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');
END;
```
DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```sql
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (  
    task_name    IN VARCHAR2,  
    dir_name     IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (
    task_name           IN VARCHAR2,
    dir_name            IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
GET_ASH_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding. For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding’s impact or the finding’s specific activity.

Syntax

```sql
DBMS_ADDM.GET_ASH_QUERY (    task_name           IN   VARCHAR2,    finding_id          IN   NUMBER)    RETURN VARCHAR2;
```

Parameters

Table 17–14 GET_ASH_QUERY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>finding_id</td>
<td>ID of the finding within the task</td>
</tr>
</tbody>
</table>

Return Values

A VARCHAR containing an ASH query identifying the rows in ASH with impact for the finding.
GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```sql
DBMS_ADDM.GET_REPORT (  
    task_name           IN VARCHAR2  
)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```
**INSERT_FINDING_DIRECTIVE Procedure**

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

**Syntax**

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (  
  task_name             IN VARCHAR2,  
  dir_name              IN VARCHAR2,  
  finding_name          IN VARCHAR2,  
  min_active_sessions   IN NUMBER := 0,  
  min_perc_impact       IN NUMBER := 0);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>finding_name</td>
<td>Name of an ADDM finding to which this directive applies. All valid findings names appear in the <code>NAME</code> column of view <code>DBA_ADVISOR_FINDING_NAMES</code>.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.</td>
</tr>
<tr>
<td>min_perc_impact</td>
<td>Minimal number for the &quot;percent impact&quot; of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

**Examples**

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of `GET_REPORT` shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(  
    NULL,  
    'Undersized SGA directive',  
    'Undersized SGA',  
    2,  
    10);  
  :tname := 'my_instance_analysis_mode_task';  
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```
INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (  
    task_name             IN VARCHAR2,  
    dir_name              IN VARCHAR2,  
    parameter_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>parameter_name</td>
<td>Specifies the parameter to use. Valid parameter names appear in V$PARAMETER.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter 'sga_target'. The result of GET_REPORT does not show these actions.

```
var tname varchar2(60);
BEGIN
    DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
        NULL,  
        'my Parameter directive',  
        'sga_target');
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```
**INSERT_SEGMENT_DIRECTIVE Procedure**

This procedure creates a directive to prevent ADDM from creating actions to “run Segment Advisor” for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

**Syntax**

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (  
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    owner_name            IN VARCHAR2,
    object_name           IN VARCHAR2  := NULL,
    sub_object_name       IN VARCHAR2  := NULL);
```

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (  
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    object_number         IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for &quot;like&quot; constraints.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>sub_object_name</td>
<td>Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.'). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>object_number</td>
<td>Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS</td>
</tr>
</tbody>
</table>

**Examples**

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```sql
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
    'my Segment directive',
    'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```
To see a report containing all actions regardless of the directive:

```sql
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```
**INSERT_SQL_DIRECTIVE** Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    sql_id                IN VARCHAR2,
    min_active_sessions   IN NUMBER := 0,
    min_response_time     IN NUMBER := 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.</td>
</tr>
<tr>
<td>min_response_time</td>
<td>Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of GET_REPORT shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE(
    NULL,
    'my SQL directive',
    'abcd123456789',
    2,
    1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```
REAL_TIME_ADDM_REPORT Function

This function produces a real-time ADDM report for ADDM-related activity for the last five minutes. In an Oracle Real Application Clusters (Oracle RAC) environment, the function assumes that executing SQL over GV$ is possible.

Syntax

DBMS_ADDM.REAL_TIME_ADDM_REPORT ()
RETURN CLOB;

Return Values

CLOB containing a real-time ADDM report
DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

See Also: Oracle Database Data Warehousing Guide for more information about query rewrite

This chapter contains the following topics:

- Using DBMS_ADVANCED_REWRITE
  - Security Model
- Summary of DBMS_ADVANCED_REWRITE Subprograms
Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the DBMS_ADVANCED_REWRITE package.

- Security Model
Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

GRANT CREATE MATERIALIZED VIEW TO er;
Summary of DBMS_ADVANCED_REWRITE Subprograms

This table lists all the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_REWRITE_EQUVALENCE</td>
<td>Changes the mode of the rewrite equivalence declaration to the mode you specify</td>
</tr>
<tr>
<td>BUILD_SAFE_REWRITE_EQUVALENCE</td>
<td>Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure</td>
</tr>
<tr>
<td>DECLARE_REWRITE_EQUVALENCE</td>
<td>Creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance</td>
</tr>
<tr>
<td>DROP_REWRITE_EQUVALENCE</td>
<td>Drops the specified rewrite equivalence declaration</td>
</tr>
<tr>
<td>VALIDATE_REWRITE_EQUVALENCE</td>
<td>Validates the specified rewrite equivalence declaration using the same validation method as described with the validate parameter</td>
</tr>
</tbody>
</table>
**ALTER_REWRITE_EQUIVALENCE Procedure**

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

**Syntax**

```sql
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name            VARCHAR2,
    rewrite_mode    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to alter. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>
| rewrite_mode | The following modes are supported, in increasing order of power:  
  - disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration.  
  - text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations.  
  - general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query.  
  - recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration.  
Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem. |
This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the DBMS_ADVISOR.TUNE_MVIEW procedure. It is required to enable query rewrite and fast refresh when DBMS_ADVISOR.TUNE_MVIEW decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the BUILD_SAFE_REWRITE_EQUIVALENCE procedure. You should use either the DBMS_ADVISOR.TUNE_MVIEW or the DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE procedure as appropriate.
DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in `QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated` modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in `trusted` and `stale_tolerated` integrity modes.

Syntax

```sql
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE ( name                 VARCHAR2, source_stmt          VARCHAR2, destination_stmt     VARCHAR2, validate             BOOLEAN    := TRUE, rewrite_mode         VARCHAR2   := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE ( name                 VARCHAR2, source_stmt          CLOB, destination_stmt     CLOB, validate             BOOLEAN   := TRUE, rewrite_mode         VARCHAR2  := 'TEXT_MATCH');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration. The name can be of the form <code>owner.name</code>, where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate <code>CREATE MATERIALIZED VIEW</code> privileges to alter an equivalence declaration.</td>
</tr>
<tr>
<td>source_stmt</td>
<td>A sub-SELECT expression in either <code>VARCHAR2</code> or <code>CLOB</code> format. This is the query statement that is the target of optimization.</td>
</tr>
<tr>
<td>destination_stmt</td>
<td>A sub-SELECT expression in either <code>VARCHAR2</code> or <code>CLOB</code> format.</td>
</tr>
<tr>
<td>validate</td>
<td>A Boolean indicating whether to validate that the specified <code>source_stmt</code> is functionally equivalent to the specified <code>destination_stmt</code>. If <code>validate</code> is specified as <code>TRUE</code>, <code>DECLARE_REWRITE_EQUIVALENCE</code> evaluates the two sub-SELECTs and compares their results. If the results are not the same, <code>DECLARE_REWRITE_EQUIVALENCE</code> does not create the rewrite equivalence and returns an error condition. If <code>FALSE</code>, <code>DECLARE_REWRITE_EQUIVALENCE</code> does not validate the equivalence.</td>
</tr>
</tbody>
</table>
Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration’s `source_stmt` or the materialized view’s defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration’s `destination_stmt` or the materialized view’s container table, respectively.
DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (  
    name    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to drop. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>
This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the VALIDATE parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure" on page 18-10.

Syntax

```sql
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
    name         VARCHAR2
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the source_stmt and destination_stmt of the specified equivalence declaration.</td>
</tr>
</tbody>
</table>
DBMS_ADVISOR is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than DBMS_ADVISOR. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (DBMS_ADDM)
- SQL Performance Analyzer (DBMS_SQLPA)
- SQL Repair Advisor (DBMS_SQLDIAG)
- SQL Tuning Advisor (DBMS_SQLTUNE)
- Compression Advisor (DBMS_COMPRESSION.GET_COMPRESSION_RATIO)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for DBMS_ADVISOR. Undo Advisor and Compression Advisor do not support DBMS_ADVISOR subprograms.

See Also:

- Oracle Database Administrator’s Guide to learn about Segment Advisor
- Oracle Database 2 Day + Performance Tuning Guide for information regarding how to use SQL Access Advisor in Enterprise Manager
- Oracle Database SQL Tuning Guide for information regarding SQL Access Advisor

This chapter contains the following topics:

- Using DBMS_ADVISOR
  - Deprecated Subprograms
  - Security Model
- Summary of DBMS_ADVISOR Subprograms
Using DBMS_ADVISOR

This section contains topics which relate to using the DBMS_ADVISOR package.

- Deprecated Subprograms
- Security Model
Deprecated Subprograms

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g:

- ADD_SQLWKLD_REF Procedure
- CREATE_SQLWKLD Procedure
- DELETE_SQLWKLD Procedure
- DELETE_SQLWKLD_REF Procedure
- DELETE_SQLWKLD_STATEMENT Procedures
- IMPORT_SQLWKLD_SCHEMA Procedure
- IMPORT_SQLWKLD_SQLCACHE Procedure
- IMPORT_SQLWKLD_STS Procedure
- IMPORT_SQLWKLD_SUMADV Procedure
- IMPORT_SQLWKLD_USER Procedure
- RESET_SQLWKLD Procedure
- SET_SQLWKLD_PARAMETER Procedures
- UPDATE_SQLWKLD_ATTRIBUTES Procedure
- UPDATE_SQLWKLD_STATEMENT Procedure
Security Model

The ADVISOR privilege is required to use this package.
Summary of DBMS_ADVISOR Subprograms

Table 19–1 summarizes the subprograms in this package. The Used in column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.

Table 19–1  DBMS_ADVISOR Package Subprograms

<table>

</tbody>
</table>
ADD_SQLWKLD_REF Procedure

Note: This procedure is deprecated starting in Oracle Database 11g.

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use ADD_STS_REF instead of ADD_SQLWKLD_REF for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```sql
DBMS_ADVISOR.ADD_SQLWKLD_REF (  
    task_name              IN VARCHAR2,
    workload_name          IN VARCHAR2,
    is_sts                 IN NUMBER := 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure DELETE_REFERENCE.</td>
</tr>
<tr>
<td>is_sts</td>
<td>Indicates the type of workload source. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ 0 - SQL workload object</td>
</tr>
<tr>
<td></td>
<td>■ 1 - SQL tuning set</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
/```
**ADD_SQLWKLD_STATEMENT Procedure**

*Note:* This procedure is deprecated starting in Oracle Database 11g.

This procedure adds a single statement to the specified workload.

### Syntax

```sql
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (  
    workload_name          IN VARCHAR2,  
    module                 IN VARCHAR2,  
    action                 IN VARCHAR2,  
    cpu_time               IN NUMBER := 0,  
    elapsed_time           IN NUMBER := 0,  
    disk_reads             IN NUMBER := 0,  
    buffer_gets            IN NUMBER := 0,  
    rows_processed         IN NUMBER := 0,  
    optimizer_cost         IN NUMBER := 0,  
    executions             IN NUMBER := 1,  
    priority               IN NUMBER := 2,  
    last_execution_date    IN DATE := 'SYSDATE',  
    stat_period            IN NUMBER := 0,  
    username               IN VARCHAR2,  
    sql_text               IN CLOB);  
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>module</td>
<td>An optional business application module that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>action</td>
<td>An optional application action that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>cpu_time</td>
<td>The total CPU time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>elapsed_time</td>
<td>The total elapsed time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>disk_reads</td>
<td>The total disk-read operations that are consumed by the SQL statement.</td>
</tr>
<tr>
<td>buffer_gets</td>
<td>The total buffer-get operations that are consumed by the SQL statement.</td>
</tr>
<tr>
<td>rows_processed</td>
<td>The average number of rows processed by the SQL statement.</td>
</tr>
<tr>
<td>optimizer_cost</td>
<td>The optimizer’s calculated cost value.</td>
</tr>
<tr>
<td>executions</td>
<td>The total execution count by the SQL statement. This value should be greater than zero.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>last_execution_date</td>
<td>The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.</td>
</tr>
<tr>
<td>stat_period</td>
<td>Time interval in seconds from which statement statistics were calculated.</td>
</tr>
</tbody>
</table>
**Usage Notes**

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [*RESET_TASK Procedure*](#) on page 19-49 for directions on setting a task to its initial state.

The `ADD_SQLWKLD_STATEMENT` procedure accepts several parameters that may be ignored by the caller: `cpu_time`, `elapsed_time`, `disk_reads`, `buffer_gets`, and `optimizer_cost` are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the `order_list` task parameter references a particular statistic. To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter `order_list`. The `order_list` parameter accepts any combination of the keys: `buffer_gets`, `optimizer_cost`, `cpu_time`, `disk_reads`, `elapsed_time`, `executions`, and `priority`. A typical setting of `priority`, `optimizer_cost` would indicate the SQL Access Advisor will sort the workload data by `priority` and `optimizer_cost` and process the highest cost statements first. Any statements added to the workload would need to include appropriate `priority` and `optimizer_cost` values. All other statistics can be defaulted or set to zero. For the statistical keys referenced by the `order_list` task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

**Examples**

```sql
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100, 400, 5041, 103, 640445, 680000, 2, 1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
FROM sh.sales');
END;
/
```

**Table 19–3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>username</code></td>
<td>The Oracle user name that executed the SQL statement. Because a user name is an Oracle identifier, the <code>username</code> value must be entered exactly as it is stored in the server. For example, if the user <code>SCOTT</code> is the executing user, then you must provide the user identifier <code>SCOTT</code> in all uppercase letters. It will not recognize the user <code>scott</code> as a match for <code>SCOTT</code>.</td>
</tr>
<tr>
<td><code>sql_text</code></td>
<td>The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.</td>
</tr>
</tbody>
</table>
**ADD_STS_REF Procedure**

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set. The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use `ADD_STS_REF` for any STS-based advisor runs. The older method of using `ADD_SQLWKLD_REF` with parameter `IS_STS=1` is only supported for backward compatibility. Furthermore, the `ADD_STS_REF` function accepts a SQL tuning set owner name, whereas `ADD_SQLWKLD_REF` does not.

**Syntax**

```sql
DBMS_ADVISOR.ADD_STS_REF(
  task_name       IN VARCHAR2 NOT NULL,
  sts_owner       IN VARCHAR2,
  workload_name   IN VARCHAR2 NOT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. After a workload has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workloads. To remove the link to the workload, use the procedure <code>DBMS_ADVISOR.DELETE_STS_REF</code>.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');
```
CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as Ctrl-C. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (  
    task_name IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Usage Notes

A cancel command restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.CANCEL_TASK('My Task');  
END;  
/```
COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

```
DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (  
    workload_name    IN VARCHAR2,  
    sts_name         IN VARCHAR2,  
    import_mode      IN VARCHAR2 := 'NEW');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name to copy.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The SQL tuning set name into which the SQL Workload object will be copied.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the handling of the target SQL tuning set. Possible values are:</td>
</tr>
</tbody>
</table>
|                | • APPEND  
|                | Causes SQL Workload data to be appended to the target SQL tuning set.       |
|                | • NEW  
|                | Indicates the SQL tuning set can only contain the copied contents. If the SQL tuning set exists and has data, an error will be reported. |
|                | • REPLACE  
|                | Causes any existing data in the target SQL tuning set to be purged prior to the workload copy. |

In all cases, if the specified SQL tuning set does not exist, it will be created.

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

Examples

```
BEGIN  
    DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');  
END;  
/  
```
CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```sql
DBMS_ADVISOR.CREATE_FILE (
    buffer       IN  CLOB,
    location     IN  VARCHAR2,
    filename     IN  VARCHAR2);
```

Parameters

**Table 19–7  CREATE_FILE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>A CLOB buffer containing report or script information.</td>
</tr>
<tr>
<td>location</td>
<td>Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.</td>
</tr>
<tr>
<td>filename</td>
<td>Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.</td>
</tr>
</tbody>
</table>

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```sql
CREATE DIRECTORY MY_DIR as '/homedir/user4/gsmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100,400,5041,103,640445,680000,2,
        1,SYSDATE,1,'SH', 'SELECT AVG(amount_sold)
        FROM sh.sales');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
        'MY_DIR','script.sql');
END;
```
CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (  
    task_name      IN VARCHAR2,  
    object_type    IN VARCHAR2,  
    attr1          IN VARCHAR2 := NULL,  
    attr2          IN VARCHAR2 := NULL,  
    attr3          IN VARCHAR2 := NULL,  
    attr4          IN CLOB    := NULL,  
    object_id      OUT NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_type</td>
<td>Specifies the external object type.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator’s Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be
obtained on a single segment, such as the partition or subpartition of a table, index, or LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See Oracle Database Administrator’s Guide for further information regarding the Segment Advisor.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_OBJECT ('SQL','SELECT * FROM SH.SALES',obj_id);
END;
/```
CREATE_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

DBMS_ADVISOR.CREATE_SQLWKLD (
  workload_name            IN OUT VARCHAR2,
  description              IN VARCHAR2 := NULL,
  template                 IN VARCHAR2 := NULL,
  is_template              IN VARCHAR2 := 'FALSE');

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>Specifies an optional workload description. Descriptions can be up to 256 characters.</td>
</tr>
<tr>
<td>template</td>
<td>An optional SQL Workload name of an existing workload data object or data object template.</td>
</tr>
<tr>
<td>is_template</td>
<td>An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.</td>
</tr>
</tbody>
</table>

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

Examples

DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;

Note: This procedure is deprecated starting in Oracle Database 11g.
CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

DBMS_ADVISOR.CREATE_TASK ()
  advisor_name  IN VARCHAR2,
  task_id       OUT NUMBER,
  task_name     IN OUT VARCHAR2,
  task_desc     IN VARCHAR2 := NULL,
  template      IN VARCHAR2 := NULL,
  is_template   IN VARCHAR2 := 'FALSE',
  how_created   IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK ()
  advisor_name  IN VARCHAR2,
  task_name     IN VARCHAR2,
  task_desc     IN VARCHAR2 := NULL,
  template      IN VARCHAR2 := NULL,
  is_template   IN VARCHAR2 := 'FALSE',
  how_created   IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK ()
  parent_task_name  IN VARCHAR2,
  rec_id            IN NUMBER,
  task_id           OUT NUMBER,
  task_name         IN OUT VARCHAR2,
  task_desc         IN VARCHAR2,
  template          IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>task_id</td>
<td>A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.</td>
</tr>
<tr>
<td>task_name</td>
<td>Specifies a new task name. Names must be unique among all tasks for the user.</td>
</tr>
<tr>
<td>task_desc</td>
<td>Specifies an optional task description. Descriptions can be up to 256 characters in length.</td>
</tr>
<tr>
<td>template</td>
<td>An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.</td>
</tr>
<tr>
<td>is_template</td>
<td>An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.</td>
</tr>
<tr>
<td>how_created</td>
<td>An optional value that identifies how the source was created.</td>
</tr>
</tbody>
</table>
Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier DBMS_ADVISOR.SQLACCESS_ADVISOR as the advisor_name.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- **DBMS_ADVISOR.SQLACCESS_OLTP**
  - Parameters are preset to favor an OLTP application environment.

- **DBMS_ADVISOR.SQLACCESS_WAREHOUSE**
  - Parameters are preset to favor a data warehouse application environment.

- **DBMS_ADVISOR.SQLACCESS_GENERAL**
  - Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```sql
DECLARE
task_id NUMBER;
task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```
DELETE_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD (
    workload_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td></td>
<td>The wildcard <code>%</code> is supported as a WORKLOAD_NAME. The rules of use are</td>
</tr>
<tr>
<td></td>
<td>identical to the LIKE operator. For example, to delete all tasks for the</td>
</tr>
<tr>
<td></td>
<td>current user, use the wildcard <code>%</code> as the WORKLOAD_NAME. If a wildcard is</td>
</tr>
<tr>
<td></td>
<td>provided, the DELETE_SQLWKLD operation will not delete any workloads</td>
</tr>
<tr>
<td></td>
<td>marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

Note: This procedure is deprecated starting in Oracle Database 11g.
DELETE_SQLWKLD_REF Procedure

Note: This procedure is deprecated starting in Oracle Database 11g.

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Use DELETE_STS_REF instead of DELETE_SQLWKLD_REF for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_REF (  
task_name              IN VARCHAR2,  
workload_name          IN VARCHAR2,  
is_sts                 IN NUMBER :=0);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.</td>
</tr>
<tr>
<td>is_sts</td>
<td>Indicates the type of workload source. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ 0 - SQL workload object</td>
</tr>
<tr>
<td></td>
<td>■ 1 - SQL tuning set</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
    DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);  
END;  
/
```
DELETE_SQLWKLD_STATEMENT Procedures

This procedure has been deprecated.
This procedure deletes one or more statements from a workload.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name        IN VARCHAR2,
    sql_id               IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name        IN VARCHAR2,
    search               IN VARCHAR2,
    deleted              OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement.</td>
</tr>
<tr>
<td>search</td>
<td>Disabled.</td>
</tr>
<tr>
<td>deleted</td>
<td>Returns the number of statements deleted by the searched deleted operation.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the `RESET_TASK Procedure` on page 19-49 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    deleted NUMBER;
    id NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                        100,400,5041,103,640445,680000,2,
                                        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                        FROM sh.sales');

    SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
    WHERE workload_name = 'My Workload';

    DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```
DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL tuning set. Use DELETE_STS_REF for any STS-based advisor runs. The older method of using DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the DELETE_STS_REF function accepts an STS owner name, whereas DELETE_SQLWKLD_REF does not.

Syntax

DBMS_ADVISOR.DELETE_STS_REF (  
  task_name      IN VARCHAR2 NOT NULL,  
  sts_owner      IN VARCHAR2,  
  workload_name  IN VARCHAR2 NOT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL,</td>
</tr>
<tr>
<td></td>
<td>in which case the advisor assumes the SQL tuning set to be owned by the</td>
</tr>
<tr>
<td></td>
<td>currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be unlinked. A workload consists of one or</td>
</tr>
<tr>
<td></td>
<td>more SQL statements, plus statistics and attributes that fully describe</td>
</tr>
<tr>
<td></td>
<td>each statement. The database stores a workload as a SQL tuning set.</td>
</tr>
<tr>
<td></td>
<td>The wildcard % is supported as a workload name. The rules of use are</td>
</tr>
<tr>
<td></td>
<td>identical to the SQL LIKE operator. For example, to remove all links to</td>
</tr>
<tr>
<td></td>
<td>SQL tuning set objects, use the wildcard % as the STS_NAME.</td>
</tr>
</tbody>
</table>

Examples

DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My workload');
DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (  
    task_name          IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be deleted from the repository. The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/  
```
EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```sql
DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
    task_name         IN VARCHAR2,
    execution_type    IN VARCHAR2             := NULL,
    execution_name    IN VARCHAR2             := NULL,
    execution_params  IN dbms_advisor.argList := NULL,
    execution_desc    IN VARCHAR2             := NULL,
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>execution_type</td>
<td>The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter.</td>
</tr>
<tr>
<td></td>
<td>As an example, the SQL Performance Analyzer accepts the following possible values:</td>
</tr>
<tr>
<td></td>
<td>■ EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task.</td>
</tr>
<tr>
<td></td>
<td>■ TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework.</td>
</tr>
<tr>
<td></td>
<td>■ ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for.</td>
</tr>
<tr>
<td></td>
<td>As an example, consider the following:</td>
</tr>
<tr>
<td></td>
<td>DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'hr')</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution.</td>
</tr>
</tbody>
</table>
Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```
GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```sql
DBMS_ADVISOR.GET_REC_ATTRIBUTES (    workload_name IN VARCHAR2,    rec_id IN NUMBER,    action_id IN NUMBER,    attribute_name IN VARCHAR2,    value OUT VARCHAR2,    owner_name IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute to change.</td>
</tr>
<tr>
<td>value</td>
<td>The buffer to receive the requested attribute value.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Optional owner name of the target task. This permits access to task data not owned by the current user.</td>
</tr>
</tbody>
</table>

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                        100, 400, 5041, 103, 640445, 680000, 2,
                                        1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                        FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```
GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```sql
DBMS_ADVISOR.GET_TASK_REPORT (
  task_name      IN VARCHAR2,
  type           IN VARCHAR2 := 'TEXT',
  level          IN VARCHAR2 := 'TYPICAL',
  section        IN VARCHAR2 := 'ALL',
  owner_name     IN VARCHAR2 := NULL,
  execution_name IN VARCHAR2 := NULL,
  object_id      IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task from which the script will be created.</td>
</tr>
<tr>
<td>type</td>
<td>The only valid value is TEXT.</td>
</tr>
<tr>
<td>level</td>
<td>The possible values are BASIC, TYPICAL, and ALL.</td>
</tr>
<tr>
<td>section</td>
<td>Advisor-specific report sections.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

Return Values

Returns the buffer receiving the script.
GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (  
  task_name          IN VARCHAR2  
  type               IN VARCHAR2 := 'IMPLEMENTATION',  
  rec_id             IN NUMBER   := NULL,  
  act_id             IN NUMBER   := NULL,  
  owner_name         IN VARCHAR2 := NULL,  
  execution_name     IN VARCHAR2 := NULL,  
  object_id          IN NUMBER   := NULL)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.</td>
</tr>
<tr>
<td>act_id</td>
<td>Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.</td>
</tr>
<tr>
<td>owner_name</td>
<td>An optional task owner name.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
  task_id NUMBER;
```
task_name VARCHAR2(30);
workload_name VARCHAR2(30);
buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                      100, 400, 5041, 103, 640445, 680000, 2,
                                      SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                      FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified task.

Syntax

```sql
DBMS_ADVISOR.IMPLEMENT_TASK (
    task_name          IN VARCHAR2,
    rec_id             IN NUMBER := NULL,
    exit_on_error      IN BOOLEAN := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation ID.</td>
</tr>
<tr>
<td>exit_on_error</td>
<td>An optional boolean to exit on the first error.</td>
</tr>
</tbody>
</table>
This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

### Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
    workload_name    IN VARCHAR2,
    import_mode      IN VARCHAR2 := 'NEW',
    priority         IN NUMBER := 2,
    saved_rows       OUT NUMBER,
    failed_rows      OUT NUMBER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>- NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>- REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td></td>
<td>The default value is NEW.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number or rows that were not saved due to syntax or validation errors</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
</tbody>
</table>

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the `VALID_TABLE_LIST` parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.
If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

**Examples**

```sql
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved, failed);
END;
/```
IMPORT_SQLWKLD_SQLCACHE Procedure

**Note:** This procedure is deprecated starting in Oracle Database 11g.

This procedure creates a SQL workload from the current contents of the server's SQL cache.

**Syntax**

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
    workload_name         IN VARCHAR2,
    import_mode           IN VARCHAR2 := 'NEW',
    priority              IN NUMBER := 2,
    saved_rows            OUT NUMBER,
    failed_rows           OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>APPEND</strong> Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>- <strong>NEW</strong> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>- <strong>REPLACE</strong> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows saved as output parameters.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

**Return Values**

This call returns the number of rows saved and failed as output parameters.

**Usage Notes**

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See **RESET_TASK Procedure** on page 19-49 to set a task to its initial state.

**Examples**

```sql
DECLARE
    `Note:` This procedure is deprecated starting in Oracle Database 11g.

DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
    workload_name         IN VARCHAR2,
    import_mode           IN VARCHAR2 := 'NEW',
    priority              IN NUMBER := 2,
    saved_rows            OUT NUMBER,
    failed_rows           OUT NUMBER);
```

**Table 19–22 IMPORT_SQLWKLD_SQLCACHE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>

workload_name VARCHAR2(30);
saved NUMBER;
failed NUMBER;

BEGIN

workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved, failed);

END;
/

IMPORT_SQLWKLD_STS Procedure

Note: This procedure is deprecated starting in Oracle Database 11g.

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

Syntax

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (  
  workload_name IN VARCHAR2,  
  sts_name IN VARCHAR2,  
  import_mode IN VARCHAR2 := 'NEW',  
  priority IN NUMBER := 2,  
  saved_rows OUT NUMBER,  
  failed_rows OUT NUMBER);  

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (  
  workload_name IN VARCHAR2,  
  sts_owner IN VARCHAR2,  
  sts_name IN VARCHAR2,  
  import_mode IN VARCHAR2 := 'NEW',  
  priority IN NUMBER := 2,  
  saved_rows OUT NUMBER,  
  failed_rows OUT NUMBER);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The optional owner of the SQL tuning set.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The name of an existing SQL tuning set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>- NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>- REPLACE Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, 3-LOW. The default value is 2.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
</tbody>
</table>
Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1, saved, failed);
END;
/```
IMPORT_SQLWKLD_SUMADV Procedure

Note: This procedure is deprecated starting in Oracle Database 11g.

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   sumadv_id             IN NUMBER,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>■ APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>sumadv_id</td>
<td>Specifies the Summary Advisor workload identifier number.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state.

Examples

DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/

IMPORT_SQLWKLD_USER Procedure

This procedure collects a SQL workload from a specified user table.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (  
    workload_name         IN VARCHAR2,  
    import_mode           IN VARCHAR2 := 'NEW',  
    owner_name            IN VARCHAR2,  
    table_name            IN VARCHAR2,  
    saved_rows            OUT NUMBER,  
    failed_rows           OUT NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>- NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>- REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>table_name</td>
<td>Specifies the name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the workload object.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See `RESET_TASK Procedure` on page 19-49 to set a task to its initial state.

Note: This procedure is deprecated starting in Oracle Database 11g.
Examples

DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH', 'USER_WORKLOAD', saved, failed);
END;
/
INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```sql
DBMS_ADVISOR.INTERRUPT_TASK (
    task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be interrupted.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/

While this session is executing its task, you can interrupt the task from a second session using the following statement:

BEGIN
    DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```
MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```sql
DBMS_ADVISOR.MARK_RECOMMENDATION (
  task_name          IN VARCHAR2
  id                 IN NUMBER,
  action             IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>id</td>
<td>The recommendation identifier number assigned by the Advisor.</td>
</tr>
<tr>
<td>action</td>
<td>The recommendation action setting. The possible actions are:</td>
</tr>
<tr>
<td></td>
<td>■ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts.</td>
</tr>
<tr>
<td></td>
<td>■ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script.</td>
</tr>
<tr>
<td></td>
<td>■ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.</td>
</tr>
</tbody>
</table>

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```sql
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                       100, 400, 5041, 103, 640445, 680000, 2,
                                       1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                           FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/```
QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```sql
DBMS_ADVISOR.QUICK_TUNE (advisor_name IN VARCHAR2,
                        task_name IN VARCHAR2,
                        attr1 IN CLOB,
                        attr2 IN VARCHAR2 := NULL,
                        attr3 IN NUMBER := NULL,
                        task_or_template IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Name of the Advisor that will perform the analysis.</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific attribute in the form of a CLOB variable.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific attribute in the form of a VARCHAR2 variable.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific attribute in the form of a NUMBER.</td>
</tr>
<tr>
<td>task_or_template</td>
<td>An optional task name of an existing task or task template.</td>
</tr>
</tbody>
</table>

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```sql
DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
                            'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
```
RESET_SQLWKLD Procedure

Note: This procedure is deprecated starting in Oracle Database 11g.

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```sql
DBMS_ADVISOR.RESET_SQLWKLD (
    workload_name        IN VARCHAR2);
```

Parameters

Table 19–29 RESET_SQLWKLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
</tbody>
</table>

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100, 400, 5041, 103, 640445, 680000, 2,
        1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```
RESET_TASK Procedure

This procedure re-initializes the metadata for the specified task. The task status will be set to INITIAL.

Syntax

```
DBMS_ADVISOR.RESET_TASK (
    task_name           IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.RESET_TASK(task_name);
END;
/```
This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```sql
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
    parameter  IN VARCHAR2,
    value      IN VARCHAR2);
```

```sql
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
    parameter  IN VARCHAR2,
    value      IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is <code>DBMS_ADVISOR.DEFAULT</code>, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```sql
BEGIN
    DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```
SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name        IN VARCHAR2
    parameter           IN VARCHAR2,
    value               IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name        IN VARCHAR2
    parameter           IN VARCHAR2,
    value               IN NUMBER);
```

Parameters

**Table 19–32**  SET_DEFAULT_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number.</td>
</tr>
</tbody>
</table>

Examples

```
BEGIN
    DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (DBMS_ADVISOR.SQLACCESS_ADVISOR,
        'VALID_TABLE_LIST', 'SH.%');
END;
/```
This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```sql
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (  
    workload_name        IN VARCHAR2,  
    parameter            IN VARCHAR2,  
    value                IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (  
    workload_name        IN VARCHAR2,  
    parameter            IN VARCHAR2,  
    value                IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;
/
```

Note: This procedure is deprecated starting in Oracle Database 11g.
SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
    task_name IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
    task_name IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A task cannot be modified unless it is in its initial state. See RESET_TASK Procedure on page 19-49 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 19–35 lists SQL Access Advisor task parameters.
Table 19–35  SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYSIS_SCOPE</td>
<td>A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>- ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION.</td>
</tr>
<tr>
<td></td>
<td>- EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone.</td>
</tr>
<tr>
<td></td>
<td>- INDEX Allows the SQL Access Advisor to recommend index structure changes.</td>
</tr>
<tr>
<td></td>
<td>- MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes.</td>
</tr>
<tr>
<td></td>
<td>- PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options.</td>
</tr>
<tr>
<td></td>
<td>- TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning.</td>
</tr>
<tr>
<td></td>
<td>Using the new keywords, the following combinations are valid:</td>
</tr>
<tr>
<td></td>
<td>- INDEX</td>
</tr>
<tr>

<td>The default value is ADVISOR_UNUSED. The datatype is STRING.</td>
</tr>
</tbody>
</table>

Oracle Database PL/SQL Packages and Types Reference
## Summary of DBMS_ADVISOR Subprograms

### DEF_INDEX_TABLESPACE
Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause.

- **Possible values are:**
  - Existing tablespace name. Quoted identifiers are supported.
  - ADVISOR_UNUSED: No tablespace clause will be present in the script for indexes.

  The default value is ADVISOR_UNUSED. The datatype is STRING.

### DEF_MVIEW_OWNER
Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name.

- **Possible values are:**
  - Existing schema name. Quoted identifiers are supported.
  - ADVISOR_UNUSED

  The default value is ADVISOR_UNUSED. The datatype is STRING.

### DEF_MVIEW_TABLESPACE
Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause.

- **Possible values are:**
  - Existing tablespace name. Quoted identifiers are supported.
  - ADVISOR_UNUSED: No tablespace clause will be present in the script for materialized view logs.

  The default value is ADVISOR_UNUSED. The datatype is STRING.

### DEF_MVLOG_TABLESPACE
Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause.

- **Possible values are:**
  - Existing tablespace name. Quoted identifiers are supported.
  - ADVISOR_UNUSED: No tablespace clause will be present in the script for materialized view logs.

  The default value is ADVISOR_UNUSED. The datatype is STRING.

### DEF_PARTITION_TABLESPACE
Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause.

- **Possible values are:**
  - Existing tablespace name. Quoted identifiers are supported.
  - ADVISOR_UNUSED: No tablespace clause will be present in the script for materialized views.

  The default value is ADVISOR_UNUSED. The datatype is STRING.

### DML_VOLATILITY
When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DML statements on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The datatype is STRING.

- See the related parameter refresh_mode.

### END_TIME
Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.

- Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:
  - DD is the numeric date
  - MM is the numeric month
  - YYYY is the numeric year
  - HH is the hour in 24 hour format
  - MI is the minute
  - SS is the second

  The datatype is STRING.

- DD is the numeric date  
- MM is the numeric month  
- YYYY is the numeric year  
- HH is the hour in 24 hour format  
- MI is the minute  
- SS is the second  
  The datatype is STRING. |
This parameter is maintained for backward compatibility. All values will be translated and placed into the `ANALYSIS_SCOPE` task parameter.

If set to `TRUE`, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated.

Possible values are:
- `FALSE`
- `TRUE`

The default value is `FALSE`. The datatype is `STRING`.

**EXECUTION_TYPE**

This parameter is maintained for backward compatibility. All values will be translated and placed into the `ANALYSIS_SCOPE` task parameter.

The translated values are:
- `FULL` => `FULL`
- `INDEX_ONLY` => `INDEX`
- `MVIEW_ONLY` => `MVIEW`
- `MVIEW_LOG_ONLY` => `MVIEW_LOG_ONLY`

The type of recommendations that is desired. Possible values:
- `FULL` All supported recommendation types will be considered.
- `INDEX_ONLY` The SQL Access Advisor will only consider index solutions as recommendations.
- `MVIEW_ONLY` The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations.
- `MVIEW_LOG_ONLY` The SQL Access Advisor will only consider materialized view log solutions as recommendations.

The default value is `FULL`. The datatype is `STRINGLIST`.

**IMPLEMENT_EXIT_ON_ERROR**

When performing an `IMPLEMENT_TASK` operation, this parameter will control behavior when an action fails to implement. If set to `TRUE`, `IMPLEMENT_TASK` will stop on the first unexpected error.

The possible values are:
- `TRUE`
- `FALSE`

The default value is `TRUE`. The datatype is `STRING`.

**INDEX_NAME_TEMPLATE**

Specifies the method by which new index names are formed.

If the `TASK_ID` is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the `TASK_ID` in the template. Once formatted, the maximum size of a name is 30 characters.

Valid keywords are:
- Any literal value up to 22 characters.
- `TABLE` Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit.
- `TASK_ID` Causes the current task identifier number to be inserted in hexadecimal form.
- `SEQ` Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.

The default template is `table_IDX$$_task_idsequence`. The datatype is `STRING`.

**INVALID_ACTION_LIST**

Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.

During a task execution, if a SQL statement’s action matches a name in the action list, it will not be processed by the task. An action name is case sensitive.

The possible values are:
- single action
- comma-delimited action list
- `ADVISOR_UNUSED`

The default value is `ADVISOR_UNUSED`. The datatype is `STRINGLIST`.

</tbody>
</table>
### INVALID_MODULE_LIST
Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.

During a task execution, if a SQL statement’s module matches a name in the list, it will not be processed by the task. A module name is case sensitive.

The possible values are:
- single application
- comma-delimited module list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

### INVALID_SQLSTRING_LIST
Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported.

A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.

During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task.

The possible values are:
- single string
- comma-delimited string list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

### INVALID_USERNAME_LIST
Contains a fully qualified list of user names that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

During a task execution, if a SQL statement’s user name matches a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted.

The possible values are:
- single user name
- comma-delimited user name list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

### JOURNALING
Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal.

Possible values are:
- UNUSED: no journal messages
- FATAL: explanation of fatal conditions
- ERROR: explanation of errors
- WARNING: explanation of warnings
- INFORMATION: information message
- INFORMATION2: common information
- INFORMATION3: common information
- INFORMATION4: common information
- INFORMATION5: common information
- INFORMATION6: common information

Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository.

INFORMATION6 represents the most thorough message recording and UNUSED is the least.

The default value is INFORMATION. The datatype is NUMBER.

---

**Table 19–35 (Cont.) SQL Access Advisor Task Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

Table 19–35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIMITED_PARTITION_SCHEMES</td>
<td>User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• An integer in the range of 1 to 10</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The datatype is NUMBER.</td>
</tr>
<tr>
<td>MAX_NUMBER_PARTITIONS</td>
<td>Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• An integer in the range of 1 to 4294967295</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNLIMITED</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.</td>
</tr>
<tr>
<td>MODE</td>
<td>Specifies the mode by which Access Advisor will operate during an analysis. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality.</td>
</tr>
<tr>
<td></td>
<td>• COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality.</td>
</tr>
<tr>
<td></td>
<td>The default value is COMPREHENSIVE. The datatype is STRING.</td>
</tr>
<tr>
<td>MVIEW_NAME_TEMPLATE</td>
<td>Specifies the method by which new materialized view names are formed. If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template.</td>
</tr>
<tr>
<td></td>
<td>The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are:</td>
</tr>
<tr>
<td></td>
<td>• Any literal value up to 22 characters.</td>
</tr>
<tr>
<td></td>
<td>• TASK_ID Causes the current task identifier number to be inserted in hexadecimal form.</td>
</tr>
<tr>
<td></td>
<td>• SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</td>
</tr>
<tr>
<td></td>
<td>The default template is: MV$$_task_idsequence. The datatype is STRING.</td>
</tr>
<tr>
<td>ORDER_LIST</td>
<td>This parameter has been deprecated. Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_LIST values. A comma must separate multiple order keys. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• BUFFER_GETS Sets the order using the SQL statement’s buffer-get count value.</td>
</tr>
<tr>
<td></td>
<td>• CPU_TIME Sets the order using the SQL statement’s CPU time value.</td>
</tr>
<tr>
<td></td>
<td>• DISK_READS Sets the order using the SQL statement’s disk-read count value.</td>
</tr>
<tr>
<td></td>
<td>• ELAPSED_TIME Sets the order using the SQL statement’s elapsed time value.</td>
</tr>
<tr>
<td></td>
<td>• EXECUTIONS Sets the order using the SQL statement’s execution frequency value.</td>
</tr>
<tr>
<td></td>
<td>• OPTIMIZER_COST Sets the order using the SQL statement’s optimizer cost value.</td>
</tr>
<tr>
<td></td>
<td>• I/O Sets the order using the SQL statement’s I/O count value.</td>
</tr>
<tr>
<td></td>
<td>• PRIORITY Sets the order using the user-supplied business priority value.</td>
</tr>
<tr>
<td></td>
<td>All values are accessed in descending order, where a high value is considered more interesting than a low value.</td>
</tr>
<tr>
<td></td>
<td>The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINILIST.</td>
</tr>
</tbody>
</table>
PARTITION_NAME_TEMPLATE: Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.

Valid tokens are:
- Any literal value up to 22 characters.
- `table` - Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit.
- `task_id` - Causes the current task identifier number to be inserted in hexadecimal form.
- `sequence` - Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.

The default template is `PTN$$_table_task_idsequence`. The datatype is `STRING`.

PARTITIONING_GOAL: Specifies the approach used to make partitioning recommendations. One possible value is `PERFORMANCE`, which is the default. The datatype is `STRING`.

PARTITIONING_TYPES: Specifies the type of partitioning used. Possible values are `RANGE` and `HASH`. The datatype is `STRING`.

RANKING_MEASURE: Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using `RANKING_MEASURE` values. A comma must separate multiple order keys.

Possible values are:
- `BUFFER_GETS` Sets the order using the SQL statement's buffer-get count value.
- `CPU_TIME` Sets the order using the SQL statement's CPU time value.
- `DISK_READS` Sets the order using the SQL statement's disk-read count value.
- `ELAPSED_TIME` Sets the order using the SQL statement's elapsed time value.
- `EXECUTIONS` Sets the order using the SQL statement's elapsed time value.
- `OPTIMIZER_COST` Sets the order using the SQL statement's optimizer cost value.
- `PRIORITY` Sets the order using the user-supplied business priority value.

All values are accessed in descending order, where a high value is considered more interesting than a low value.

The default value is `PRIORITY, OPTIMIZER_COST`. The datatype is `STRINGLIST`.

RECOMMEND_MV_EXACT_TEXT_MATCH: When considering candidate materialized views, exact text match solutions will only be included if this parameter contains `TRUE`.

The possible values are:
- `TRUE`
- `FALSE` (the default)

The default value is `TRUE`. The datatype is `STRING`.

RECOMMENDED_TABLESPACES: Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage.

Possible values are:
- `TRUE`
- `FALSE` (the default)

The datatype is `STRING`.

REFRESH_MODE: Specifies whether materialized views are refreshed `ON_DEMAND` or `ON_COMMIT`. This will be used to weigh the impact of materialized view refresh when the parameter `dml_volatility` is set to `TRUE`.

Possible values are:
- `ON_DEMAND`
- `ON_COMMIT`

The default value is `ON_DEMAND`. The datatype is `STRING`.

REPORT_DATE_FORMAT: This is the default date and time formatting template. The default format is `DD/MM/YYYYHH24:MI`. The datatype is `STRING`.

<tr>
<td>REPORT_DATE_FORMAT</td>
<td>This is the default date and time formatting template. The default format is <code>DD/MM/YYYYHH24:MI</code>. The datatype is <code>STRING</code>.</td>
</tr>
</tbody>
</table>
SHOW_RETAINS  Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are:
- TRUE
- FALSE
The default value is TRUE. The datatype is STRING.

SQL_LIMIT  Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements.
When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys.
The possible values are:
- an integer in the range of 1 to 2147483647
- ADVISOR_UNLIMITED
- ADVISOR_UNUSED
The default value is ADVISOR_UNUSED. The datatype is NUMBER.

START_TIME  Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.
Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:
- DD is the numeric date
- MM is the numeric month
- YYYY is the numeric year
- HH is the hour in 24 hour format
- MI is the minute
- SS is the second
The datatype is STRING.

STORAGE_CHANGE  Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL.
When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand.
Possible values:
- Any valid integer including negative values, zero and positive values.
The default value is ADVISOR_UNUSED. The datatype is NUMBER.

TIME_LIMIT  Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time.
Possible values:
- An integer in the range of 1 to 10,000
- ADVISOR_UNLIMITED
The default value is 720 (12 hours). The datatype is NUMBER.
Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.
### VALID_ACTION_LIST
Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.

During a task execution, if a SQL statement’s action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.

The possible values are:
- single action
- comma-delimited action list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

### VALID_MODULE_LIST
Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.

During a task execution, if a SQL statement’s module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive.

The possible values are:
- single application
- comma-delimited module list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

### VALID_SQLSTRING_LIST
Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.

A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.

During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task.

The possible values are:
- single string
- comma-delimited string list
- ADVISOR_UNUSED

The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
Segment Advisor Parameters

Table 19–36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| VALID_TABLE_LIST | Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user’s scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is:  
  - schema.table  
  - schema  
  - schema.% (equivalent to schema)  
  - comma-delimited action list  
  - ADVISOR_UNUSED  
The possible values are:  
  - single table reference  
  - comma-delimited reference list  
  - ADVISOR_UNUSED  
The default value is ADVISOR_UNUSED. The datatype is TABLELIST. |
| VALID_USERNAME_LIST | Contains a fully qualified list of user names that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement’s user name does not match a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted. The possible values are:  
  - single user name  
  - comma-delimited user name list  
  - ADVISOR_UNUSED  
The default value is ADVISOR_UNUSED. The datatype is STRINGLIST. |
| WORKLOAD_SCOPE | Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL.  
  - FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables.  
  - PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.  
The datatype is STRING. |

Table 19–36 Segment Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| MODE        | The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are:  
  - LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository  
  - COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics |
| TIME_LIST   | The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED. |
Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST', 'SH.%,SCOTT.EMP');
END;
/

Undo Advisor Task Parameters

Table 19–37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TARGET_OBJECTS</td>
<td>The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.</td>
</tr>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>BEGIN_TIME_SEC</td>
<td>The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
<tr>
<td>END_TIME_SEC</td>
<td>The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    tname  VARCHAR2(30);
    oid    NUMBER;
BEGIN
    DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
SET_TASK_PARAMETER Procedure

```
DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 19–38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure. See Oracle Database Performance Tuning Guide for more information on using these parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>DB_ID</td>
<td>The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.</td>
</tr>
<tr>
<td>INSTANCE</td>
<td>The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.</td>
</tr>
<tr>
<td>INSTANCES</td>
<td>If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, &quot;1, 3, 5&quot;). By default, all instances are analyzed.</td>
</tr>
<tr>
<td>DBIO_EXPECTED</td>
<td>The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.</td>
</tr>
</tbody>
</table>

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

```
DECLARE
tid NUMBER;
tname VARCHAR2(30) := 'ADDM_TEST';
BEGIN
  DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/```

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package on page 154-1 and Oracle Database SQL Tuning Guide for more information.
TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```sql
DBMS_ADVISOR.TUNE_MVIEW (  
    task_name IN OUT VARCHAR2,  
    mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.</td>
</tr>
<tr>
<td>mv_create_stmt</td>
<td>The original materialized view creation statement.</td>
</tr>
</tbody>
</table>

See Also: *Oracle Database SQL Tuning Guide* for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>The materialized view owner's name.</td>
</tr>
<tr>
<td>TASK_NAME</td>
<td>The task name as a key to access the set of recommendations</td>
</tr>
<tr>
<td>SCRIPT_TYPE</td>
<td>Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.</td>
</tr>
<tr>
<td>ACTION_ID</td>
<td>Action ID used as the command order number.</td>
</tr>
<tr>
<td>STATEMENT</td>
<td>For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options:</td>
</tr>
<tr>
<td></td>
<td>■ CREATE MATERIALIZED VIEW LOG</td>
</tr>
<tr>
<td></td>
<td>■ ALTER MATERIALIZED VIEW LOG FORCE</td>
</tr>
<tr>
<td></td>
<td>■ [CREATE</td>
</tr>
</tbody>
</table>
Examples

```sql
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE
MATERIALIZED VIEW statement:

NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_ MVIEW as the following example:

SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';

Alternatively, you can save the output results in an external script file as in the
following example:

CREATE DIRECTORY TUNE_RESULTS AS ''/myscript_dir'' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_ task'), -
'/homes/tune','my_tune_mview_create.sql');

The preceding statement will save the CREATE output results in /myscript_dir/my_ tune_mview_create.sql.
```
UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```sql
DBMS_ADVISOR.UPDATE_OBJECT (
    task_name       IN VARCHAR2
    object_id       IN NUMBER,
    attr1           IN VARCHAR2 := NULL,
    attr2           IN VARCHAR2 := NULL,
    attr3           IN VARCHAR2 := NULL,
    attr4           IN CLOB := NULL,
    attr5           IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See Oracle Database Administrator’s Guide for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See Oracle Database Administrator’s Guide for further information regarding the Segment Advisor.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';
```
DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
   'SELECT * FROM SH.SALES', obj_id);
DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id, NULL, NULL, NULL,
   'SELECT count(*) FROM SH.SALES');
END;
/

UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```plsql
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (  
    task_name            IN VARCHAR2  
  , rec_id               IN NUMBER  
  , action_id            IN NUMBER  
  , attribute_name       IN VARCHAR2  
  , value                IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be changed. The valid values are:</td>
</tr>
<tr>
<td></td>
<td>■ owner The new owner of the object.</td>
</tr>
<tr>
<td></td>
<td>■ name The new name of the object.</td>
</tr>
<tr>
<td></td>
<td>■ tablespace The new tablespace for the object.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies the new value for the recommendation attribute.</td>
</tr>
</tbody>
</table>

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```plsql
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
    100,400,5041,103,640445,680000,2,
    1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
    FROM sh.sales WHERE promo_id = 10');

  attribute := 'SH';
```

19-70   Oracle Database PL/SQL Packages and Types Reference
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/

UPDATE_SQLWKLD_ATTRIBUTES Procedure

**Note:** This procedure is deprecated starting in Oracle Database 11g.

This procedure changes various attributes of a SQL Workload object or template.

**Syntax**

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (  
    workload_name        IN VARCHAR2,  
    new_name             IN VARCHAR2 := NULL,  
    description          IN VARCHAR2 := NULL,  
    read_only            IN VARCHAR2 := NULL,  
    is_template          IN VARCHAR2 := NULL,  
    how_created          IN VARCHAR2 := NULL);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new workload object name. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to</td>
</tr>
<tr>
<td></td>
<td>30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new workload description. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the description will not be changed. Names can be up to</td>
</tr>
<tr>
<td></td>
<td>256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Set to TRUE so it cannot be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>TRUE if workload is to be used as a template.</td>
</tr>
<tr>
<td>how_created</td>
<td>Indicates a source application name that initiated the workload creation.</td>
</tr>
<tr>
<td></td>
<td>If the value is NULL or contains the value ADVISOR_UNUSED, the source will</td>
</tr>
<tr>
<td></td>
<td>not be changed.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (workload_name, 'MONTHLY', 'ROLLUP',  
        100, 400, 5041, 103, 640445, 680000, 2,  
        1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)  
        FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (workload_name, 'New workload name');
END;
/```
UPDATE_SQLWKLD_STATEMENT Procedure

**Note:** This procedure is deprecated starting in Oracle Database 11g.

This procedure updates an existing SQL statement in a specified SQL workload.

**Syntax**

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
    workload_name     IN VARCHAR2,
    sql_id            IN NUMBER,
    application       IN VARCHAR2 := NULL,
    action            IN VARCHAR2 := NULL,
    priority          IN NUMBER := NULL,
    username          IN VARCHAR2 := NULL);
```

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
    workload_name     IN VARCHAR2,
    search            IN VARCHAR2,
    updated           OUT NUMBER,
    application       IN VARCHAR2 := NULL,
    action            IN VARCHAR2 := NULL,
    priority          IN NUMBER := NULL,
    username          IN VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.</td>
</tr>
<tr>
<td>updated</td>
<td>Returns the number of statements changed by a searched update.</td>
</tr>
<tr>
<td>application</td>
<td>Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>action</td>
<td>Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
</tbody>
</table>
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See **RESET_TASK Procedure** on page 19-49 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    updated NUMBER;
    id NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                           100, 400, 5041, 103, 640445, 680000, 2,
                                           1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                           FROM sh.sales WHERE promo_id = 10');

    SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
    WHERE workload_name = 'My Workload';

    DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```
**UPDATE_TASK_ATTRIBUTES Procedure**

This procedure changes various attributes of a task or a task template.

**Syntax**

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (  
  task_name          IN VARCHAR2  
  new_name           IN VARCHAR2 := NULL,  
  description        IN VARCHAR2 := NULL,  
  read_only          IN VARCHAR2 := NULL,  
  is_template        IN VARCHAR2 := NULL,  
  how_created        IN VARCHAR2 := NULL);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.</td>
</tr>
<tr>
<td>how_created</td>
<td>Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DECLARE  
  task_id NUMBER;  
  task_name VARCHAR2(30);  
BEGIN  
  task_name := 'My Task';  
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');  
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');  
END;  
/```
DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- **Using DBMS_ALERT**
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Exceptions
  - Operational Notes
  - Examples

- **Summary of DBMS_ALERT Subprograms**
Using DBMS_ALERT

- Overview
- Security Model
- Constants
- Restrictions
- Exceptions
- Operational Notes
- Examples
Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (WAITONE) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (SIGNAL) whenever the trigger is fired.
Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. EXECUTE privilege on this cover package can then be granted rather than on this package.
Constants

The DBMS_ALERT package uses the constants shown in Table 20–1:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAXWAIT</td>
<td>INTEGER</td>
<td>8640000</td>
<td>The maximum time to wait for an alert (1000 days which is essentially forever).</td>
</tr>
</tbody>
</table>
Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.
Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 20–2 shows the messages and the procedures that can raise them.
Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.

- A waiting application is blocked in the database and cannot do any other work.

- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.

- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.

- The signalling session can optionally pass a message that is received by the waiting session.

- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).

- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

  See Also: Chapter 112, "DBMS_PIPE"

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.

- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the `prior` alert, but before the data was read for that `prior` alert.

- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:

  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.

  - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

### Table 20–2 DBMS_ALERT Error Messages

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORU-10001 lock request error, status: N</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10015 error: N waiting for pipe status</td>
<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10016 error: N sending on pipe ‘X’</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10017 error: N receiving on pipe ‘X’</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10019 error: N on lock request</td>
<td>WAIT</td>
</tr>
<tr>
<td>ORU-10020 error: N on lock request</td>
<td>WAITANY</td>
</tr>
<tr>
<td>Error Message</td>
<td>Procedure</td>
</tr>
<tr>
<td>------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>ORU-10021 lock request error; status: N</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10022 lock request error, status: N</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10023 lock request error; status N</td>
<td>WAITONE</td>
</tr>
<tr>
<td>ORU-10024 there are no alerts registered</td>
<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10025 lock request error; status N</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10037 attempting to wait on uncommitted signal from same session</td>
<td>WAITONE</td>
</tr>
</tbody>
</table>
Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```plsql
DBMS_ALERT.REGISTER('emp_table_alert');
<<readagain>>:
    /* ... read the emp table and graph it */
    DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
    if status = 0 then goto <<readagain>>; else
    /* ... error condition */

The EMP table would have a trigger similar to this:

```plsql
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
    BEGIN
        DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
    END;
```

When the application is no longer interested in the alert, it makes this request:

```plsql
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.
# Summary of DBMS_ALERT Subprograms

<table>
<thead>
<tr>
<th>Table 20–3</th>
<th>DBMS_ALERT Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>REGISTER Procedure on page 20-12</td>
<td>Receives messages from an alert</td>
</tr>
<tr>
<td>REMOVE Procedure on page 20-13</td>
<td>Disables notification from an alert</td>
</tr>
<tr>
<td>REMOVEALL Procedure on page 20-14</td>
<td>Removes all alerts for this session from the registration list</td>
</tr>
<tr>
<td>SET_DEFAULTS Procedure on page 20-15</td>
<td>Sets the polling interval</td>
</tr>
<tr>
<td>SIGNAL Procedure on page 20-16</td>
<td>Signals an alert (send message to registered sessions)</td>
</tr>
<tr>
<td>WAITANY Procedure on page 20-17</td>
<td>Waits ( \text{timeout} ) seconds to receive alert message from an alert registered for session</td>
</tr>
<tr>
<td>WAITONE Procedure on page 20-18</td>
<td>Waits ( \text{timeout} ) seconds to receive message from named alert</td>
</tr>
</tbody>
</table>
REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```sql
DBMS_ALERT.REGISTER (
    name IN VARCHAR2,
    cleanup IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert in which this session is interested</td>
</tr>
<tr>
<td>cleanup</td>
<td>Specifies whether to perform cleanup of any extant orphaned pipes used by the DBMS_ALERT package. This cleanup is only performed on the first call to REGISTER for each package instantiation. The default for the parameter is TRUE.</td>
</tr>
</tbody>
</table>

Caution: Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.
REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (
    name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert (case-insensitive) to be removed from registration list.</td>
</tr>
</tbody>
</table>

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.
REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```
**SET DEFAULTS Procedure**

In case a polling loop is required, use the SET DEFAULTS procedure to set the polling interval.

**Syntax**

```
DBMS_ALERT.SET_DEFAULTS (  
    sensitivity IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitivity</td>
<td>Polling interval, in seconds, to sleep between polls. The default interval is five seconds.</td>
</tr>
</tbody>
</table>
SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (  
    name   IN  VARCHAR2,  
    message  IN  VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to signal.</td>
</tr>
<tr>
<td>message</td>
<td>Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.</td>
</tr>
</tbody>
</table>
WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (  
    name      OUT  VARCHAR2,  
    message   OUT  VARCHAR2,  
    status    OUT  INTEGER,  
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 20–8 WAITANY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Returns the name of the alert that occurred.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert.</td>
</tr>
<tr>
<td></td>
<td>This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
<tr>
<td>status</td>
<td>Values returned:</td>
</tr>
<tr>
<td></td>
<td>0 - alert occurred</td>
</tr>
<tr>
<td></td>
<td>1 - timeout occurred</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum time to wait for an alert.</td>
</tr>
<tr>
<td></td>
<td>If no alert occurs before timeout seconds, this returns a status of 1.</td>
</tr>
</tbody>
</table>

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

-20000, ORU-10024: there are no alerts registered.
WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
    name      IN   VARCHAR2,
    message   OUT  VARCHAR2,
    status    OUT  INTEGER,
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to wait for.</td>
</tr>
</tbody>
</table>
| message   | Returns the message associated with the alert.  
This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded. |
| status    | Values returned:  
0 - alert occurred  
1 - timeout occurred |
| timeout   | Maximum time to wait for an alert.  
If the named alert does not occurs before timeout seconds, this returns a status of 1. |
The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.

Overview

Problem Description
One of the fundamental problems for recovering applications after an outage is that the commit message that is sent back to the client is not durable. If there is a break between the client and the server, the client sees an error message indicating that the communication failed. This error does not inform the application whether the submission executed any commit operations or if a procedural call, ran to completion executing all expected commits and session state changes or failed part way through or yet worse, is still running disconnected from the client.

GET_LTXID_OUTCOME
The purpose of the GET_LTXID_OUTCOME Procedure is to determine if the in-flight transaction on a now unavailable session completed or not. It is used when the original session returned an error due to unavailability. Situations that can cause such session unavailability may occur at the session, instance, server, or network, and result from planned or unplanned outages. When such an outage occurs, the application receives a disconnection error. Such an error provides no insight as to whether the transaction committed. It also does not reveal what the application might have been expecting from that commit if it had returned.

See Also: Oracle Database Concepts for explanation of Logical Transaction ID
Security Model

Applications must have the EXECUTE privilege on the DBMS_APP_CONT package. To grant this privilege, ask your database administrator to run the following SQL statement:

```
GRANT execute on DBMS_APP_CONT to application user;
```
## Summary of DBMS_APP_CONT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_LTXID_OUTCOME</td>
<td>Lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.</td>
</tr>
</tbody>
</table>
**GET_LTXID_OUTCOME Procedure**

This procedure lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.

### Syntax

```
DBMS_APP_CONT.GET_LTXID_OUTCOME (  
  client_ltxid          IN    RAW,  
  committed             OUT   BOOLEAN,  
  user_call_completed   OUT   BOOLEAN)
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_ltxid</td>
<td>Client-side logical transaction ID. Obtain the LTXID from the previous failed session using the client driver provided APIs - getLTXID for JDBC, and LogicalTransactionId for ODP.net., and OCI_ATTR_GET with LTXID for OCI.</td>
</tr>
<tr>
<td>committed</td>
<td>Returns TRUE if the transaction with the named logical LTXID has COMMITTED. Returns FALSE if the logical LTXID has not COMMITTED. When returning FALSE, the procedure blocks the LTXID from further use so that there is no possibility of previous in-flight work committing this LTXID.</td>
</tr>
<tr>
<td>user_call_completed</td>
<td>Whether all information has been returned to the client. Examples of such messages are the number of rows processed when using autocommit or commit on success, parameter and function results when calling PL/SQL, or PL/SQL with more work to do after the COMMIT. Applications that expect to use data returned from the commit in order to function correctly must look at this second parameter.</td>
</tr>
</tbody>
</table>

### Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-14950 - SERVER_AHEAD</td>
<td>The server is ahead so the transaction is both an old transaction and one which has already committed. This is an error as the application is passing an older LTXID that is the not the last used for that session. The purpose of GET_LTXID_OUTCOME is to return the current transaction outcome for that session after a recoverable outage.</td>
</tr>
<tr>
<td>ORA-14951 - CLIENT_AHEAD</td>
<td>The client is ahead of the server. This can happen if the server has been flashed backed, recovered using media recovery, or is a standby that has opened earlier with data loss.</td>
</tr>
<tr>
<td>ORA-14906 - SAME_SESSION</td>
<td>Executing GET_LTXID_OUTCOME is not supported on the session owning the LTXID as it blocks further processing on that session after a recoverable outage.</td>
</tr>
<tr>
<td>ORA-14909 - COMMIT_BLOCKED</td>
<td>Your session has been blocked from committing by another user with the same username using GET_LTXID_OUTCOME. GET_LTXID_OUTCOME should only be called on dead sessions. Please check with your application administrator.</td>
</tr>
</tbody>
</table>
### Table 21–3  (Cont.) GET_LTXID_OUTCOME Procedure Exceptions

<table>
<thead>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-14952 - ERROR</td>
<td>The outcome cannot be determined. During processing an error happened. The error stack shows the error detail.</td>
</tr>
</tbody>
</table>
Application developers can use the DBMS_APPLICATION_INFO package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- **Using DBMS_APPLICATION_INFO**
  - Overview
  - Security Model
  - Operational Notes

- **Summary of DBMS_APPLICATION_INFO Subprograms**
Using DBMS_APPLICATION_INFO

- Overview
- Security Model
- Operational Notes
Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V$SESSION and V$SQLAREA views.
No further privileges are required. The DBMSAPIN.SQL script is already run as a part of standard database creation.

**Note:** The public synonym for DBMS_APPLICATION_INFO is not dropped before creation so that you can redirect the public synonym to point to your own package.
Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the SYS version of the package. The public synonym for DBMS_APPLICATION_INFO can then be changed to point to the DBA’s version of the package.
Summary of DBMS_APPLICATION_INFO Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>READ_CLIENT_INFO Procedure</td>
<td>Reads the value of the client_info field of the current session</td>
</tr>
<tr>
<td>READ_MODULE Procedure</td>
<td>Reads the values of the module and action fields of the current session</td>
</tr>
<tr>
<td>SET_ACTION Procedure</td>
<td>Sets the name of the current action within the current module</td>
</tr>
<tr>
<td>SET_CLIENT_INFO Procedure</td>
<td>Sets the client_info field of the session</td>
</tr>
<tr>
<td>SET_MODULE Procedure</td>
<td>Sets the name of the module that is currently running to a new module</td>
</tr>
<tr>
<td>SET_SESSION_LONGOPS Procedure</td>
<td>Sets a row in the V$SESSION_LONGOPS table</td>
</tr>
</tbody>
</table>
READ_CLIENT_INFO Procedure

This procedure reads the value of the client_info field of the current session.

Syntax

```sql
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (
    client_info OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Last client information value supplied to the SET_CLIENT_INFO procedure.</td>
</tr>
</tbody>
</table>
READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (  
    module_name OUT VARCHAR2,  
    action_name OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Last value that the module name was set to by calling SET_MODULE.</td>
</tr>
<tr>
<td>action_name</td>
<td>Last value that the action name was set to by calling SET_ACTION or SET_MODULE.</td>
</tr>
</tbody>
</table>

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action  
FROM v$sqlarea  
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ------------------ ----------------
INSERT INTO emp 1 add_employee insert into emp  
(ename, empno, sal, mgr, job, hiredate, comm, deptno)  
VALUES  
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```
**SET_ACTION Procedure**

This procedure sets the name of the current action within the current module.

**Syntax**

```sql
DBMS_APPLICATION_INFO.SET_ACTION (
    action_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_name</td>
<td>The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

**Example**

The following is an example of a transaction that uses the registration procedure:

```sql
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN
    -- balance transfer transaction
    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
    WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
    WHERE acct# = :acct;
    COMMIT;
    DBMS_APPLICATION_INFO.SET_ACTION(null);
END;
```
SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```sql
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (  
    client_info IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Supplies any additional information about the client application. This information is stored in the V$SESSION view. Information exceeding 64 bytes is truncated.</td>
</tr>
</tbody>
</table>

**Note:** CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.
SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
    module_name IN VARCHAR2,
    action_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
    name VARCHAR2,
    salary NUMBER,
    manager NUMBER,
    title VARCHAR2,
    commission NUMBER,
    department NUMBER) AS
BEGIN
    DBMS_APPLICATION_INFO.SET_MODULE(
        module_name => 'add_employee',
        action_name => 'insert into emp');
    INSERT INTO emp
        (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
    DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```
**SET_SESSION_LONGOPS Procedure**

This procedure sets a row in the `V$SESSION_LONGOPS` view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the `SET_SESSION_LONGOPS` procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the `V$SESSION_LONGOPS` view.

**Syntax**

```sql
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (rindex IN OUT BINARY_INTEGER,
slno IN OUT BINARY_INTEGER,
op_name IN VARCHAR2 DEFAULT NULL,
target IN BINARY_INTEGER DEFAULT 0,
context IN BINARY_INTEGER DEFAULT 0,
ssofar IN NUMBER DEFAULT 0,
totalwork IN NUMBER DEFAULT 0,
target_desc IN VARCHAR2 DEFAULT 'unknown target',
units IN VARCHAR2 DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rindex</td>
<td>A token which represents the <code>v$session_longops</code> row to update. Set this to <code>set_session_longops_nohint</code> to start a new row. Use the returned value from the prior call to reuse a row.</td>
</tr>
<tr>
<td>slno</td>
<td>Saves information across calls to <code>set_session_longops</code>: It is for internal use and should not be modified by the caller.</td>
</tr>
<tr>
<td>op_name</td>
<td>Specifies the name of the long running task. It appears as the <code>OPNAME</code> column of <code>v$session_longops</code>. The maximum length is 64 bytes.</td>
</tr>
<tr>
<td>target</td>
<td>Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the <code>TARGET</code> column of <code>v$session_longops</code>.</td>
</tr>
<tr>
<td>context</td>
<td>Any number the client wants to store. It appears in the <code>CONTEXT</code> column of <code>v$session_longops</code>.</td>
</tr>
<tr>
<td>sofar</td>
<td>Any number the client wants to store. It appears in the <code>SOFAR</code> column of <code>v$session_longops</code>. This is typically the amount of work which has been done so far.</td>
</tr>
<tr>
<td>totalwork</td>
<td>Any number the client wants to store. It appears in the <code>TOTALWORK</code> column of <code>v$session_longops</code>. This is typically an estimate of the total amount of work needed to be done in this long running operation.</td>
</tr>
<tr>
<td>target_desc</td>
<td>Specifies the description of the object being manipulated in this long operation. This provides a caption for the <code>target</code> parameter. This value appears in the <code>TARGET_DESC</code> field of <code>v$session_longops</code>. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>
Table 22–7 (Cont.) SET_SESSION_LONGOPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>units</td>
<td>Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of V$SESSION_LONGOPS. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```sql
DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
        -- perform task on object target
        sofar := sofar + 1;
        dbms_application_info.set_session_longops(rindex, slno,
            'Operation X', obj, 0, sofar, totalwork, "table", "tables");
    END LOOP;
END;
```
The **DBMS_APPLY_ADM** package provides subprograms to configure and manage Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers.

This chapter contains the following topics:

- **Using DBMS_APPLY_ADM**
  - Overview
  - Security Model
  - Operational Notes

- **Summary of DBMS_APPLY_ADM Subprograms**

**See Also:**

- *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator’s Guide* for more information about this package and apply processes

- *Oracle Database XStream Guide* for more information about XStream outbound servers and inbound servers
Using DBMS_APPLY_ADM

This section contains topics which relate to using the DBMS_APPLY_ADM package.

- Overview
- Security Model
- Operational Notes
Overview

This package provides interfaces to start, stop, and configure Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

---

**Note:**

- For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as **apply components**. This chapter identifies a specific type of apply component when necessary.
- Using XStream requires purchasing a license for the Oracle GoldenGate product.

---

**See Also:**

- *Oracle Streams Concepts and Administration*
- *Oracle Streams Replication Administrator’s Guide*
- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs
Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

When the DBMS_APPLY_ADM package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the DBMS_APPLY_ADM package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

---

**Note:** The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

---

**See Also:**

- Oracle Streams Concepts and Administration for information about configuring an Oracle Streams administrator
- Oracle Database XStream Guide for information about configuring an XStream administrator
Operational Notes

The following sections contain operational notes for this package:

- Deprecated Apply Component Parameter Value

Deprecated Apply Component Parameter Value

**Note:** Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only.

The **NONE** value for the commit_serialization apply component parameter is deprecated. It is replaced by the **DEPENDENT_TRANSACTIONS** value.

**See Also:** SET_PARAMETER Procedure on page 23-56

</tr>
</tbody>
</table>

Note: All procedures commit unless specified otherwise. However, the GET_ERROR_MESSAGE function does not commit.
ADD_STMT_HANDLER Procedure

This procedure adds a statement DML handler for a specified operation on a specified database object. The procedure adds the statement DML handler to a single apply component or to all apply components in the database.

This procedure is overloaded. One version of this procedure contains the statement and comment parameters, and the other does not. The statement parameter enables you to create the statement DML handler and add it to one or more processes in one step. Otherwise, create the statement DML handler using the DBMS_STREAMS_HANDLER_ADM package before adding it to one or more processes.

See Also:
- Chapter 162, "DBMS_STREAMS_HANDLER_ADM"
- Oracle Streams Concepts and Administration

Syntax

```sql
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    statement       IN  CLOB,
    apply_name      IN  VARCHAR2  DEFAULT NULL,
    comment         IN  VARCHAR2  DEFAULT NULL);
```

```sql
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as [schema_name].object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>INSERT</td>
</tr>
<tr>
<td></td>
<td>UPDATE</td>
</tr>
<tr>
<td></td>
<td>DELETE</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Note: Statement DML handlers cannot be specified for LOB operations.
Summary of DBMS_APPL Y_ADM Subprograms

Usage Notes

The following usage notes apply to this procedure:

- The ADD_STMT_HANDLER Procedure and XStream Outbound Servers
- The ADD_STMT_HANDLER Procedure and XStream Inbound Servers

The ADD_STMT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers. Outbound servers ignore all apply handlers.

The ADD_STMT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

Table 23–2 (Cont.) ADD_STMT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler. If the specified statement DML handler exists, then the statement in the statement parameter is added to the existing handler. Ensure that the existing statement DML handler is for the same operation on the same database object as the settings for the operation_name and object_name parameters, respectively. If the existing handler is for a different operation or database object, then an apply error results when the handler is invoked. If the specified statement DML handler does not exist and a non-NULL statement parameter is specified, then this procedure creates the statement DML handler. If the specified statement DML handler does not exist and the statement parameter is not specified or is NULL, then this procedure raises an error. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>statement</td>
<td>The text of the SQL statement to add to the statement DML handler. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that uses the statement DML handler. If NULL, then the procedure adds the statement DML handler as a general handler to all apply components in the database.</td>
</tr>
<tr>
<td>comment</td>
<td>A comment for the statement DML handler. If NULL, then no comment is recorded for the statement DML handler.</td>
</tr>
</tbody>
</table>
ALTER_APPLY Procedure

This procedure alters an apply component.

Syntax

```sql
DBMS_APPLY_ADM.ALTER_APPLY(
    apply_name                IN  VARCHAR2,
    rule_set_name             IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
    message_handler           IN  VARCHAR2  DEFAULT NULL,
    remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
    ddl_handler               IN  VARCHAR2  DEFAULT NULL,
    remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
    apply_user                IN  VARCHAR2  DEFAULT NULL,
    apply_tag                 IN  RAW       DEFAULT NULL,
    remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
    precommit_handler         IN  VARCHAR2  DEFAULT NULL,
    remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
    negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
    remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set for the specified apply component. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set from the specified apply component.</td>
</tr>
</tbody>
</table>
remove_rule_set

If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue.

If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set.

If FALSE, then the procedure retains the positive rule set for the specified apply component.

If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

message_handler

A user-defined procedure that processes non-LCR messages in the queue for the apply component.

See "Usage Notes" on page 23-22 in the CREATE_APPLY Procedure for more information about a message handler procedure.

remove_message_handler

If TRUE, then the procedure removes the message handler for the specified apply component.

If FALSE, then the procedure retains any message handler for the specified apply component.

If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.

ddl_handler

A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component.

All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.

See "Usage Notes" on page 23-22 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.

remove_ddl_handler

If TRUE, then the procedure removes the DDL handler for the specified apply component.

If FALSE, then the procedure retains any DDL handler for the specified apply component.

If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.
The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If NULL, then the apply user is not changed.

If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS.

If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue.

In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:

- The necessary privileges to perform DML and DDL changes on the apply objects
- EXECUTE privilege on the rule sets used by the apply component
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all apply handler procedures

These privileges can be granted directly to the apply user, or they can be granted through roles.

In addition, the apply user must be granted the EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.

By default, this parameter is set to the user who created the apply component by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package.

**Note:** If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.

A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.

The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.

If NULL, the default, then the apply tag for the apply component is not changed.

The following is an example of a tag with a hexadecimal value of 17:

```sql
HEXTORAW('17')
```

**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags
remove_apply_tag

If TRUE, then the procedure sets the apply tag for the specified apply component to NULL, and the apply component generates redo entries with NULL tags.

If FALSE, then the procedure retains any apply tag for the specified apply component.

If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.

precommit_handler

A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.

An internal commit directive is enqueued in the following ways:

- When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.
- When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.

For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component.

The precommit handler procedure must conform to the following restrictions:

- Any work that commits must be an autonomous transaction.
- Any rollback must be to a named savepoint created in the procedure.

If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.

See "Usage Notes" on page 23-22 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.

remove_precommit_handler

If TRUE, then the procedure removes the precommit handler for the specified apply component.

If FALSE, then the procedure retains any precommit handler for the specified apply component.

If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 23–3 (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_apply_tag</td>
<td>If TRUE, then the procedure sets the apply tag for the specified apply component to NULL, and the apply component generates redo entries with NULL tags. If FALSE, then the procedure retains any apply tag for the specified apply component. If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>precommit_handler</td>
<td>A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component. An internal commit directive is enqueued in the following ways: - When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. - When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component. The precommit handler procedure must conform to the following restrictions: - Any work that commits must be an autonomous transaction. - Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See &quot;Usage Notes&quot; on page 23-22 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.</td>
</tr>
<tr>
<td>remove_precommit_handler</td>
<td>If TRUE, then the procedure removes the precommit handler for the specified apply component. If FALSE, then the procedure retains any precommit handler for the specified apply component. If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>
The following usage notes apply to this procedure:

- **Automatic Restart of Apply Components**
- **The ALTER_APPLY Procedure and XStream Outbound Servers**
- **The ALTER_APPLY Procedure and XStream Inbound Servers**

### Automatic Restart of Apply Components
An apply component is stopped and restarted automatically when you change the value of one or more of the following `ALTER_APPLY` procedure parameters:

- `message_handler`
- `ddl_handler`
- `apply_user`
- `apply_tag`
- `precommit_handler`

---

### Table 23–3 (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>negative_rule_set_name</code></td>
<td>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages. If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first. If the <code>negative_rule_set_name</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</td>
</tr>
<tr>
<td><code>remove_negative_rule_set</code></td>
<td>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified apply component. If you remove the negative rule set for an apply component, and the apply component does not have a positive rule set, then the apply component dequeues all messages in its queue. If you remove the negative rule set for an apply component, and a positive rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the positive rule set. If <code>FALSE</code>, then the procedure retains the negative rule set for the specified apply component. If the <code>negative_rule_set_name</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</td>
</tr>
</tbody>
</table>
The ALTER_APPLY Procedure and XStream Outbound Servers
The following usage notes apply to this procedure and XStream outbound servers:

- The apply_user parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: message_handler, ddl_handler, and precommit_handler.

  The client application can perform custom processing of the LCRs instead if necessary.

- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the apply_tag parameter.

The ALTER_APPLY Procedure and XStream Inbound Servers
Inbound servers can use apply handlers and process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the message_handler parameter.
COMPARE OLD VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply. This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

See Also: Oracle Streams Replication Administrator’s Guide for more information about conflict detection and resolution in an Oracle Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name IN VARCHAR2,
    column_list IN VARCHAR2,
    operation IN VARCHAR2 DEFAULT 'UPDATE',
    compare IN BOOLEAN  DEFAULT TRUE,
    apply_database_link IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name IN VARCHAR2,
    column_table IN DBMS_UTILITY.LNAME_ARRAY,
    operation IN VARCHAR2 DEFAULT 'UPDATE',
    compare IN BOOLEAN  DEFAULT TRUE,
    apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries. Specify * to include all nonkey columns.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
<tr>
<td>operation</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>• UPDATE for UPDATE operations</td>
</tr>
<tr>
<td></td>
<td>• DELETE for DELETE operations</td>
</tr>
<tr>
<td></td>
<td>• * for both UPDATE and DELETE operations</td>
</tr>
<tr>
<td>compare</td>
<td>If compare is TRUE, the old values of the specified columns are compared during apply. If compare is FALSE, the old values of the specified columns are not compared during apply.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- **Conflict Detection**
- **The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers**
- **The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers**

**Conflict Detection**

By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the `COMPARE_OLD_VALUES` procedure, specify the set of columns in the `column_list` or `column_table` parameter, and set the `compare` parameter to `FALSE`.

In addition, when the `compare_key_only` apply component parameter is set to `Y`, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the `compare_key_only` apply component parameter is set to `N`, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.

**Note:**

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter `compare_key_only` is set to `N`.
- This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

**See Also:** [SET_PARAMETER Procedure](#) on page 23-56 for more information about the `compare_key_only` apply component parameter

**The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

---

**Table 23-4 (Cont.) COMPARE_OLD_VALUES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
</tbody>
</table>
CREATE_APPLY Procedure

This procedure creates an apply component.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
  queue_name              IN  VARCHAR2,
  apply_name              IN  VARCHAR2,
  rule_set_name           IN  VARCHAR2  DEFAULT NULL,
  message_handler         IN  VARCHAR2  DEFAULT NULL,
  ddl_handler             IN  VARCHAR2  DEFAULT NULL,
  apply_user              IN  VARCHAR2  DEFAULT NULL,
  apply_database_link     IN  VARCHAR2  DEFAULT NULL,
  apply_tag               IN  RAW       DEFAULT '00',
  apply_captured          IN  BOOLEAN   DEFAULT FALSE,
  precommit_handler       IN  VARCHAR2  DEFAULT NULL,
  negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
  source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

**Table 23–5 CREATE_APPLY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form [schema_name.]queue_name. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. <strong>Note:</strong> The queue_name setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply component or messaging client. <strong>Note:</strong> The apply_name setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job.apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</td>
</tr>
</tbody>
</table>
message_handler
A user-defined procedure that processes non-LCR messages in the queue for the apply component.
See "Usage Notes" on page 23-22 for more information about a message handler procedure.

ddl_handler
A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component.
All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.
See "Usage Notes" on page 23-22 for more information about a DDL handler procedure.

apply_user
The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.
The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue.

In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:

- The necessary privileges to perform DML and DDL changes on the apply objects
- EXECUTE privilege on the rule sets used by the apply component
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all apply handler procedures

These privileges can be granted directly to the apply user, or they can be granted through roles.

In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.

You can use the packages DBMS_STREAMS_AUTH and DBMS_XSTREAM_AUTH to grant and revoke administrative privileges in Oracle Streams and XStream configurations, respectively. These packages do not configure the necessary privileges to perform DML or DDL changes on the apply objects.

Note: If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.
See "Usage Notes" on page 23-22 for more information about this parameter.
apply_database_link

The database at which the apply component applies messages. This parameter is used by an apply component when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply component applies messages at the local database.

Note: The apply_database_link setting cannot be altered after the apply component is created.

apply_tag

A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.

The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.

By default, the tag for an apply component is the hexadecimal equivalent of '00' (double zero).

The following is an example of a tag with a hexadecimal value of 17:

HEXTORAW('17')

If NULL, then the apply component generates redo entries with NULL tags.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

apply_captured

Either TRUE or FALSE.

If TRUE, then the apply component applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Streams capture process.

If FALSE, then the apply component applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Streams capture process, such as persistent LCRs or user messages.

To apply both captured LCRs and messages in a persistent queue, you must create at least two apply components.

Note: The apply_captured setting cannot be altered after the apply component is created.

See Also: Oracle Streams Concepts and Administration for more information about processing messages with an apply component
precommit_handler

A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.

An internal commit directive is enqueued in the following ways:

- When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.
- When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction.
- When a user or application enqueues messages and then issues a \texttt{COMMIT} statement, the commit directive is enqueued automatically.

For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For a message enqueued by a user or application, the commit SCN is generated by the apply component.

The precommit handler procedure must conform to the following restrictions:

- Any work that commits must be an autonomous transaction.
- Any rollback must be to a named savepoint created in the procedure.

If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.

See "Usage Notes" on page 23-22 for more information about a precommit handler procedure.

negative_rule_set_name

The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.

If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form \texttt{[schema_name.]rule_set_name}. For example, to specify a negative rule set in the \texttt{hr} schema named \texttt{neg_apply_rules}, enter \texttt{hr.neg_apply_rules}. If the schema is not specified, then the current user is the default.

If you specify \texttt{NULL}, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the \texttt{apply_captured} parameter.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the \texttt{DBMS_STREAMS_ADM} package or the \texttt{DBMS_RULE_ADM} package.

If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.
**Usage Notes**

The following sections describe usage notes for this procedure:

- **DBA Role Requirement**
- **Handler Procedure Names**
- **Message Handler and DDL Handler Procedure**
- **Precommit Handler Procedure**
- **The CREATE_APPLY Procedure and XStream Outbound Servers**
- **The CREATE_APPLY Procedure and XStream Inbound Servers**

**DBA Role Requirement**

If the user who invokes this procedure is different from the user specified in the `apply_user` parameter, then the invoking user must be granted the `DBA` role. If the user who invokes this procedure is the same as the user specified in the `apply_user` parameter, then the `DBA` role is not required for the invoking user. Only the `SYS` user can set the `apply_user` to `SYS`.

**Handler Procedure Names**

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.
The user who invokes the `CREATE_APPLY` procedure must have `EXECUTE` privilege on a specified handler procedure. Also, if the `schema_name` is not specified, then the user who invokes the `CREATE_APPLY` procedure is the default.

**Message Handler and DDL Handler Procedure**
The procedure specified in both the `message_handler` parameter and the `ddl_handler` parameter must have the following signature:

```sql
PROCEDURE handler_procedure (  
    parameter_name IN ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is an `ANYDATA` encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a `ANYDATA` encapsulation of a DDL LCR.

**Precommit Handler Procedure**
The procedure specified in the `precommit_handler` parameter must have the following signature:

```sql
PROCEDURE handler_procedure (  
    parameter_name IN NUMBER);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

**The CREATE_APPLY Procedure and XStream Outbound Servers**
This procedure cannot create an XStream outbound server. To create an XStream outbound server, use the `DBMS_XSTREAM_ADM` package.

**The CREATE_APPLY Procedure and XStream Inbound Servers**
The following usage notes apply to this procedure and XStream inbound servers:

- The `CREATE_APPLY` procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

- When creating an inbound server using the `CREATE_APPLY` procedure, set the `applyCaptured` parameter to `TRUE`. Inbound servers only process LCRs captured by a capture process.

- Inbound servers can use apply handlers. Inbound servers process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.
CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

**Note:** An error is raised if NULL is specified for either of the procedure parameters.

See Also:
- DROP_OBJECT_DEPENDENCY Procedure on page 23-29
- Oracle Streams Concepts and Administration

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
    object_name         IN  VARCHAR2,
    parent_object_name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the child database object, specified as <code>[schema_name].object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>parent_object_name</td>
<td>The name of the parent database object, specified as <code>[schema_name].object_name</code>. For example, <code>hr.departments</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:
- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers
- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

**The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.
DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
    apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are deleted.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers
- The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.
DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

DBMS_APPLY_ADM.DELETE_ERROR(
  local_transaction_id  IN  VARCHAR2);

Parameter

<table>
<thead>
<tr>
<th>Table 23–8  DELETE_ERROR Procedure Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>local_transaction_id</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

**The DELETE_ERROR Procedure and XStream Outbound Servers**
Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

**The DELETE_ERROR Procedure and XStream Inbound Servers**
This procedure functions the same way for apply processes and inbound servers.
DROP_APPLY Procedure

This procedure drops an apply component.

Syntax

```sql
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name             IN  VARCHAR2,
    drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Streams or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The DROP_APPLY Procedure and Rules
- The DROP_APPLY Procedure and XStream Outbound Servers
- The DROP_APPLY Procedure and XStream Inbound Servers

The DROP_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component using the DBMS_STREAMS_ADM package is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
The DROP_APPLY Procedure and XStream Outbound Servers
When the DROP_APPLY procedure is executed on an outbound server, it runs the DROP_OUTBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the outbound server's capture process and queue.

The DROP_APPLY Procedure and XStream Inbound Servers
When the DROP_APPLY procedure is executed on an inbound server, it runs the DROP_INBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the inbound server's queue.

See Also: Oracle Streams Concepts and Administration for more information about Oracle Streams data dictionary views
DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:
- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if NULL is specified for either of the procedure parameters.

See Also:
- CREATE_OBJECT_DEPENDENCY Procedure on page 23-24
- Oracle Streams Concepts and Administration

Syntax

```sql
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
    object_name        IN  VARCHAR2,
    parent_object_name IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the child database object, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>parent_object_name</td>
<td>The name of the parent database object, specified as [schema_name.]object_name. For example, hr.departments. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

The DROP_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The DROP_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply component.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```sql
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
    apply_name       IN  VARCHAR2  DEFAULT NULL,
    execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are reexecuted.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If TRUE, then the procedure reexecutes the transactions in the security context of the current user. If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The <strong>DBA_APPLY_ERROR</strong> data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers
- The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.
EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

See Also: Oracle Streams Concepts and Administration for more information about the error queue

Syntax

DBMS_APPLY_ADM.EXECUTE_ERROR(
   local_transaction_id  IN  VARCHAR2,
   execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
   user_procedure        IN  VARCHAR2  DEFAULT NULL);

Parameters

Table 23–12 EXECUTE_ERROR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If TRUE, then the procedure reexecutes the transaction in the security context of the current user. If FALSE, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
<tr>
<td>user_procedure</td>
<td>A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify NULL to execute the error transaction without running a user procedure.</td>
</tr>
</tbody>
</table>

See Also: "Usage Notes" on page 23-31 for more information about the user procedure

Usage Notes

The following usage notes apply to this procedure:

- The User Procedure
- The EXECUTE_ERROR Procedure and XStream Outbound Servers
- The EXECUTE_ERROR Procedure and XStream Inbound Servers

The User Procedure

You must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [schema_name.]package_name.procedure_name
- [schema_name.]procedure_name
If the procedure is in a package, then the package_name must be specified. The user who invokes the EXECUTE_ERROR procedure must have EXECUTE privilege on the specified procedure. Also, if the schema_name is not specified, then the user who invokes the EXECUTE_ERROR procedure is the default.

For example, suppose the procedure_name has the following properties:

- strmadmin is the schema_name.
- fix_errors is the package_name.
- fix_hr_errors is the procedure_name.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```plaintext
PROCEDURE user_procedure (  
in_anydata                    IN      ANYDATA,  
error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,  
error_message_number          IN      NUMBER,  
messaging_default_processing  IN OUT  BOOLEAN,  
out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- **in_anydata**: The ANYDATA encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- **error_record**: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction.
- **error_message_number**: The message number of the ANYDATA object in the in_anydata parameter, starting at 1.
- **messaging_default_processing**: If TRUE, then the apply component continues processing the message in the in_anydata parameter, which can include executing DML or DDL statements and invoking apply handlers. If FALSE, then the apply component skips processing the message in the in_anydata parameter and moves on to the next message in the in_anydata parameter.
- **out_anydata**: The ANYDATA object processed by the user procedure and used by the apply component if messaging_default_processing is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the messaging_default_processing parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:
- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in_anydata parameter is a row LCR, then the out_anydata parameter must be row LCR if the messaging_default_processing parameter is set to TRUE.
- If the ANYDATA object in the in_anydata parameter is a DDL LCR, then the out_anydata parameter must be DDL LCR if the messaging_default_processing parameter is set to TRUE.
- The user who runs the user procedure must have the SELECT or READ privilege on the DBA_APPLY_ERROR data dictionary view.

Note: LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

The EXECUTE_ERROR Procedure and XStream Outbound Servers
Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ERROR Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two OUT parameters. These OUT parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the SET_ENQUEUE_DESTINATION procedure, and the execution directive is specified using the SET_EXECUTE procedure.

See Also:
- SET_ENQUEUE_DESTINATION Procedure on page 23-46
- SET_EXECUTE Procedure on page 23-48

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
message_number        IN   NUMBER,
local_transaction_id    IN   VARCHAR2,
destination_queue_name  OUT  VARCHAR2,
execute                 OUT  BOOLEAN)
RETURN ANYDATA;
```

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
message_number        IN   NUMBER,
local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_number</td>
<td>The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error.</td>
</tr>
<tr>
<td>local_transaction_id</td>
<td>Identifier of the error transaction for which to return a message.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains NULL.</td>
</tr>
<tr>
<td>execute</td>
<td>Contains TRUE if the message should be executed. Contains FALSE if the message should not be executed</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:
- The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
- The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers
The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
REMOVE_STMT_HANDLER

This procedure removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database.

See Also:
- Chapter 162, "DBMS_STREAMS_HANDLER_ADM"
- Oracle Streams Concepts and Administration

Syntax

```sql
DBMS_APPLY_ADM.REMOVE_STMT_HANDLER(
  object_name     IN  VARCHAR2,
  operation_name  IN  VARCHAR2,
  handler_name    IN  VARCHAR2,
  apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as [schema_name].object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>- INSERT</td>
</tr>
<tr>
<td></td>
<td>- UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that uses the statement DML handler. If NULL, then the procedure removes the statement DML handler from all apply components in the database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:
- The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers
- The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers

The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.
The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
SET_CHANGE_HANDLER Procedure

This procedure sets or unsets a change handler that tracks changes for a specified operation on a specified database object for a single apply component.

A change handler is a special type of statement DML handler that tracks table changes and was created by either the `DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE` procedure or this `SET_CHANGE_HANDLER` procedure. Information about change handlers is stored in the `ALL_APPLY_CHANGE_HANDLERS` and `DBA_APPLY_CHANGE_HANDLERS` views.

This procedure automatically generates the statement that is added to the change handler based on values specified in the procedure parameters. You should only run this procedure when a configuration that tracks database changes exists.

Note: Use the `MAINTAIN_CHANGE_TABLE` Procedure to configure an environment that tracks table changes

Syntax

```sql
DBMS_APPLY_ADM.SET_CHANGE_HANDLER(
    change_table_name    IN  VARCHAR2,
    source_table_name    IN  VARCHAR2,
    capture_values       IN  VARCHAR2,
    apply_name           IN  VARCHAR2,
    operation_name       IN  VARCHAR2,
    change_handler_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_table_name</td>
<td>The table that records changes to the source table.</td>
</tr>
<tr>
<td></td>
<td>Specify the table as <code>[schema_name.]table_name</code>. For example, <code>hr.jobs_change_table</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
<tr>
<td>source_table_name</td>
<td>The table at the source database for which changes are recorded.</td>
</tr>
<tr>
<td></td>
<td>Specify the table as <code>[schema_name.]table_name</code>. For example, <code>hr.jobs</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code>, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Summary of DBMS_APPLY_ADM Subprograms

Table 23–15 (Cont.) SET_CHANGE_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_values</td>
<td>Specify which values to record in the change table when update operations are performed on the source table:</td>
</tr>
<tr>
<td></td>
<td>■ old - To record the original values for an updated column in the source table</td>
</tr>
<tr>
<td></td>
<td>■ new - To record the new values for an updated column in the source table</td>
</tr>
<tr>
<td></td>
<td>■ * - To record both the original and the new values for an updated column in the source table</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For insert operations, only new column values are captured. For delete operations, only old column values are captured.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that applies changes to the change table. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>■ INSERT</td>
</tr>
<tr>
<td></td>
<td>■ UPDATE</td>
</tr>
<tr>
<td></td>
<td>■ DELETE</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Change handlers cannot be specified for LOB operations.</td>
</tr>
<tr>
<td>change_handler_name</td>
<td>The name of the change handler.</td>
</tr>
<tr>
<td></td>
<td>If the specified change handler exists, then a statement is added to the existing handler. Ensure that the existing change handler is for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively. If the existing handler is for a different operation or table, then an apply error results when the handler is invoked.</td>
</tr>
<tr>
<td></td>
<td>If non-NULL and the specified change handler does not exist, then this procedure creates the change handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a change handler exists for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively, then the existing change handler is removed.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the specified change handler does not exist, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> &quot;Usage Notes&quot; on page 23-39 for more information about this parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

■ Checking for an Existing Change Handler

■ The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers

■ The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers
Checking for an Existing Change Handler
To check for an existing change handler for a specific operation on a specific source table, run the following query:

```
SELECT HANDLER_NAME, APPLY_NAME FROM DBA_APPLY_CHANGE_HANDLERS
WHERE operation_name = 'operation'
  AND source_table_owner = 'source_table_owner'
  AND source_table_name = 'source_table_name'
  AND change_table_owner = 'change_table_owner'
  AND change_table_name = 'change_table_name';
```

where:
- `operation` is operation specified for the new handler, either INSERT, UPDATE, or DELETE
- `source_table_owner` is the owner of the source table
- `source_table_name` is the name of the source table
- `change_table_owner` is the owner of the change table
- `change_table_name` is the owner of the change table

The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers
Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
**SET_DML_HANDLER Procedure**

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_DML_HANDLER(
  object_name          IN  VARCHAR2,
  object_type          IN  VARCHAR2,
  operation_name       IN  VARCHAR2,
  error_handler        IN  BOOLEAN   DEFAULT FALSE,
  user_procedure       IN  VARCHAR2,
  apply_database_link  IN  VARCHAR2  DEFAULT NULL,
  apply_name           IN  VARCHAR2  DEFAULT NULL,
  assemble_lobs        IN  BOOLEAN   DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as <code>[schema_name.]object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.</td>
</tr>
<tr>
<td>object_type</td>
<td>The type of the source object. Currently, <code>TABLE</code> is the only possible source object type.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>- INSERT</td>
</tr>
<tr>
<td></td>
<td>- UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td></td>
<td>- LOB_UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DEFAULT</td>
</tr>
</tbody>
</table>

For example, suppose you run this procedure twice for the `hr.employees` table. In one call, you set `operation_name` to `UPDATE` and `user_procedure` to `employees_update`. In another call, you set `operation_name` to `INSERT` and `user_procedure` to `employees_insert`. Both times, you set `error_handler` to `FALSE`. In this case, the employees_update procedure is run for UPDATE operations on the `hr.employees` table, and the employees_insert procedure is run for INSERT operations on the `hr.employees` table.

Specify `DEFAULT` to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any INSERT, UPDATE, DELETE, and LOB_WRITE on the database object, if another procedure DML handler is not specifically set for the operation on the database object.
Table 23–16  (Cont.) SET_DML_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_handler</td>
<td>If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.</td>
</tr>
<tr>
<td>user_procedure</td>
<td>A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a procedure DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when an apply error is encountered. Specify NULL to unset a procedure DML handler that is set for the specified operation on the specified object.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that uses the procedure DML handler or error handler. If NULL, then the procedure sets the procedure DML handler or error handler as a general handler for all apply components in the database. If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply component, then use the apply_name parameter to specify the apply component to unset the handler.</td>
</tr>
<tr>
<td>assemble_lob</td>
<td>If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly. If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Run the SET_DML_HANDLER Procedure at the Destination Database
- Procedure DML Handlers and Error Handlers
- The apply_name Parameter
- Signature of a DML Handler Procedure or Error Handler Procedure
- LOB Assembly
- The SET_DML_HANDLER Procedure and XStream Outbound Servers
- The SET_DML_HANDLER Procedure and XStream Inbound Servers
Run the SET_DML_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

Procedure DML Handlers and Error Handlers

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

---

**Note:** Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

The apply_name Parameter

If the apply_name parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named handler_hr is specified for an apply component named apply_hr for UPDATE operations on the hr.employees table.
- A general procedure DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.

In this case, the apply_hr apply component uses the handler_hr procedure DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Signature of a DML Handler Procedure or Error Handler Procedure

You can use the SET_DML_HANDLER procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [schema_name.]package_name.procedure_name
- [schema_name.]procedure_name

If the procedure is in a package, then the package_name must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the
specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the `SET_DML_HANDLER` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `hr` is the `schema_name`.
- `apply_pkg` is the `package_name`.
- `employees_default` is the `procedure_name`.

In this case, specify the following:

```plaintext
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute `COMMIT` or `ROLLBACK` statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the `EXECUTE` member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is `UPDATE` or `DELETE`, then row operations resubmitted using the `EXECUTE` member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one `NOT NULL` column, unless a substitute key has been specified by the `SET_KEY_COLUMNS` procedure. If there is no specified key, then the key consists of all non `LOB`, non `LONG`, and non `LONG RAW` columns.
- If the command type is `INSERT`, then row operations resubmitted using the `EXECUTE` member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one `NOT NULL` column, unless a substitute key has been specified by the `SET_KEY_COLUMNS` procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: `LOB`, `LONG`, `LONG RAW`, user-defined types (including object types, `REFs`, varrays, nested tables), and Oracle-supplied types (including `Any` types, `XML` types, spatial types, and media types).

**See Also:** Oracle Streams Replication Administrator’s Guide for information about and restrictions regarding procedure DML handlers and `LOB`, `LONG`, and `LONG RAW` data types

The procedure specified in the `user_procedure` parameter must have the following signature:

```plaintext
PROCEDURE user_procedure ( parameter_name IN ANYDATA );
```

Here, `user_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a `ANYDATA` encapsulation of a row LCR.

**See Also:** Chapter 275, "Logical Change Record TYPES" for more information about LCRs

The procedure you create for error handling must have the following signature:

```plaintext
PROCEDURE user_procedure ( ...
```
message IN ANYDATA,
error_stack_depth IN NUMBER,
error_numbers IN DBMS_UTILITY.NUMBER_ARRAY,
error_messages IN emsg_array);

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use error_numbers(1) and error_messages(1).

---

**Note:**
- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
- The emsg_array value must be a user-defined array that is a table of type VARCHAR2 with at least 76 characters.

---

Running an error handler results in one of the following outcomes:
- The error handler successfully resolves the error and returns control to the apply component.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

**LOB Assembly**
Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

**The SET_DML_HANDLER Procedure and XStream Outbound Servers**
Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

**The SET_DML_HANDLER Procedure and XStream Inbound Servers**
This procedure functions the same way for apply processes and inbound servers.
SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_ENQUEUE.
- The value is an ANYDATA instance containing the queue name specified as a VARCHAR2.

Syntax

DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
  rule_name               IN  VARCHAR2,
  destination_queue_name  IN  VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the queue into which the apply component enqueues the message. Specify the queue in the form [schema_name.]queue_name. Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
- Considerations for the SET_ENQUEUE_DESTINATION Procedure
- The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

Considerations for the SET_ENQUEUE_DESTINATION Procedure
The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$INV_LIST, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_EXECUTE.
- The value is an ANYDATA instance that contains NO as a VARCHAR2. When the value is NO, an apply component does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
    rule_name IN VARCHAR2,
    execute IN BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>execute</td>
<td>If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_EXECUTE Procedure
- The SET_EXECUTE Procedure and XStream Outbound Servers
- The SET_EXECUTE Procedure and XStream Inbound Servers
Considerations for the SET_EXECUTE Procedure
The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.

- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.

- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.

The SET_EXECUTE Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_EXECUTE Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

Syntax

```sql
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
<tr>
<td>recursive</td>
<td>If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- **Instantiation SCNs and DDL LCRs**
- **The recursive Parameter**
- **Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure**
- **The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers**
- **The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers**
- **The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs**

**See Also:**
- [SET_SCHEMA_INSTANTIATION_SCN Procedure on page 23-74](#)
- [SET_TABLE_INSTANTIATION_SCN Procedure on page 23-77](#)
- [LCR$_DDL_RECORD Type on page 275-6 for more information about DDL LCRs](#)
- [Oracle Streams Replication Administrator’s Guide](#)

**Instantiation SCNs and DDL LCRs**

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, and `base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

**The recursive Parameter**

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.
If the recursive parameter is set to FALSE, then this procedure does not set the instantiation SCN for any schemas or tables.

**Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure**

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

**The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers**

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.

**See Also:** Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

**The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers**

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

**The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs**

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.
SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
    object_name      IN VARCHAR2,
    column_list          IN  VARCHAR2,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
    object_name      IN VARCHAR2,
    column_table         IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object_name</code></td>
<td>The name of the table specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.</td>
</tr>
<tr>
<td><code>column_list</code></td>
<td>A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names.</td>
</tr>
<tr>
<td><code>column_table</code></td>
<td>A PL/SQL associative array of type <code>DBMS_UTILITY.NAME_ARRAY</code> of the columns in the table to use as the substitute primary key. The index for <code>column_table</code> must be 1-based, increasing, dense, and terminated by a <code>NULL</code>.</td>
</tr>
<tr>
<td><code>apply_database_link</code></td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_KEY_COLUMNS Procedure
- Duplicate Rows and Substitute Primary Key Columns
- The SET_KEY_COLUMNS Procedure and XStream Outbound Servers
Considerations for the SET_KEY_COLUMNS Procedure

The following are considerations for using this procedure:

- When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.
- Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.
- Unlike true primary keys, columns specified as substitute key columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using the SET_KEY_COLUMNS procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the allow_duplicate_rows apply component parameter is set to Y, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the allow_duplicate_rows apply component parameter is set to Y, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination
database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply component ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply component determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW columns). Therefore, an apply component always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply component does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply component raises an error regardless of the setting for the `allow_duplicate_rows` apply component parameter.

See Also: `SET_PARAMETER Procedure` on page 23-56 for more information about the `allow_duplicate_rows` apply component parameter

The `SET_KEY_COLUMNS Procedure and XStream Outbound Servers` This procedure has no effect on XStream outbound servers.

The `SET_KEY_COLUMNS Procedure and XStream Inbound Servers` This procedure functions the same way for apply processes and inbound servers.

The `SET_KEY_COLUMNS Procedure and CDBs` This procedure defines the columns that are used as a substitute primary key. You must perform the `SET_KEY_COLUMNS` procedure in the appropriate PDB.
**SET_PARAMETER Procedure**

This procedure sets an apply parameter to the specified value.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_PARAMETER (  
  apply_name  IN  VARCHAR2,  
  parameter IN  VARCHAR2,  
  value     IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting. See &quot;Apply Component Parameters&quot; on page 23-56 for a list of these parameters.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set. If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>

**Apply Component Parameters**

The following table lists the parameters for an apply component.
Summary of DBMS_APLlx_ADM Subprograms
Table 23–22  Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_duplicate_rows</td>
<td>Y or N</td>
<td>N</td>
<td>If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply component only updates or deletes one of the rows. If N, then the apply component raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. Note: Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. See Also: “Usage Notes” on page 23-71 and “Duplicate Rows and Substitute Primary Key Columns” on page 23-54</td>
</tr>
<tr>
<td>apply_sequence_nextval</td>
<td>Y or N</td>
<td>N for apply processes Y for XStream outbound servers and XStream inbound servers</td>
<td>Controls whether the apply component checks and adjusts sequence values. If Y, then the apply component checks and adjusts sequence values. For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values. For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values. If N, then the apply component does not check or adjust sequence values. Note: This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_STREAMS_LOAD_ENABLE_GG_STREAMS procedure. See “ENABLE_GG_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations. See Also: SET_PARAMETER Procedure on page 34-42 for information about the capture_sequence_nextval capture process parameter</td>
</tr>
</tbody>
</table>
The order in which applied transactions are committed.

Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database.

You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the commit_serialization apply parameter. This parameter has the following settings:

- **DEPENDENT_TRANSACTIONS** - The apply component can commit nondependent transactions in any order. Performance is best if you specify **DEPENDENT.TRANSACTIONS**.
- **FULL** - The apply component commits applied transactions in the order in which they were committed at the source database.

Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies.

If you specify **DEPENDENT.TRANSACTIONS**, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order:

1. Transaction A
2. Transaction B

At the destination database, these transactions might be committed in the opposite order:

1. Transaction B
2. Transaction A

If you specify **DEPENDENT.TRANSACTIONS** and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add **RELY** constraints to account for the application constraints. See Oracle Streams Concepts and Administration for information about virtual dependency definitions and Oracle Database Data Warehousing Guide for information about **RELY** constraints.

**Note:** The **NONE** value is deprecated for this parameter. It is replaced by the **DEPENDENT.TRANSACTIONS** value.

**See Also:** “Usage Notes” on page 23-71

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>commit_serialization</td>
<td>DEPENDENT.</td>
<td></td>
<td>The order in which applied transactions are</td>
</tr>
<tr>
<td></td>
<td>TRANSACTIONS or</td>
<td></td>
<td>committed.</td>
</tr>
<tr>
<td></td>
<td>FULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If you specify **DEPENDENT.TRANSACTIONS** and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add **RELY** constraints to account for the application constraints. See Oracle Streams Concepts and Administration for information about virtual dependency definitions and Oracle Database Data Warehousing Guide for information about **RELY** constraints.

**Note:** The **NONE** value is deprecated for this parameter. It is replaced by the **DEPENDENT.TRANSACTIONS** value.

DBMS_APPLY_ADM 23-59
If `Y`, the dependencies are computed as the LCRs for the transaction are received.

If `N`, the dependencies are computed only after all the LCRs for a transaction are received.

If the target table has all of the same constraints as the source table, you can improve the performance by setting this parameter to `Y`.

If the number of LCRs in transaction exceeds the value of the number of the `eager_size` parameter, then the dependencies for that transaction are calculated on arrival regardless of the setting of `compute_lcr_dep_on_arrival`.

**Note:** This parameter is intended for XStream. Do not set this parameter to `Y` for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the `DBMS_XSTREAMADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.

If `Y`, then the apply component is disabled on the first unresolved error, even if the error is not irrecoverable.

If `N`, then the apply component continues regardless of unresolved errors.

If `Y`, then the apply component is disabled if the apply component terminates because it reached a value specified by the `time_limit` parameter or `transaction_limit` parameter.

If `N`, then the apply component is restarted immediately after stopping because it reached a limit.

When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (`APnr`) remains the same.

</tr>
</tbody>
</table>
The apply component usually waits until it receives a commit record before starting to apply changes of a transaction. If XStream is enabled and more than eager_size LCRs arrive for a given transaction, then apply starts processing the changes. If XStream is not enabled and more than eager_size LCRs arrive for a given transaction, then apply waits until the complete transaction is received before processing the changes.

Since it is possible that all existing apply servers are handling complete transactions from the source, additional apply servers are automatically created to handle outstanding eager transactions. The apply parameter max_parallelism limits the maximum number of apply servers that can be used for an apply process.

This apply parameter is relevant only if its value is less than the value of the txn_lcr_spill_threshold apply parameter. When the value of txn_lcr_spill_threshold is lower than the value of eager_size, transactions spill to disk before eager apply begins.

Note: This parameter is intended for XStream. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.

### Table 23–22 (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grouptransops</td>
<td>A positive integer from 1 to 10000 for apply processes and XStream inbound servers</td>
<td>250 for apply processes and XStream inbound servers</td>
<td>The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction. This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions. If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions. This parameter only takes effect if the parallelism parameter setting is 1. The grouptransops parameter is ignored if the parallelism parameter setting is greater than 1. <strong>Note:</strong> This parameter is intended for XStream outbound servers and inbound servers. An Oracle Streams apply process ignores this parameter unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations. <strong>See Also:</strong> “Usage Notes” on page 23-71</td>
</tr>
</tbody>
</table>
| handlecollisions | Y or N                                                                           | N       | This parameter controls whether the apply component tries to resolve duplicate-record and missing-record errors when applying changes during data loading. This parameter should be set to N for normal replication activity. It should be set to Y only when data is being loaded (instantiated) and replication is enabled. If Y, then does the equivalent of `OVERWRITE` for `INSERT`, `UPDATE` and `DELETE` operations that get `ROW_EXISTS` errors, and ignores `UPDATE` and `DELETE` operations that get `ROW_MISSING` errors. Specifically, the apply component performs the following actions when this parameter is set to Y:  
  - If the operation is an insert and the primary key or unique key exists, then the insert is converted to an update.  
  - If the operation is an update that does not modify the primary key or unique key columns, and the row does not exist, then the change is ignored.  
  - If the operation is an update that modifies the primary key or unique key columns, and the row does not exist, then the change is ignored.  
  - If the operation is an update that modifies the primary key or unique key columns, and the row with the new key values already exists, then delete the row with the old key values and replace the row with the new key values.  
  - If the operation is a delete and the row does not exist, then the change is ignored.  
  If N then it disables the above settings. **Note:** This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Streams replication environment. |
### Table 23–22 (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignore_transaction</td>
<td>A valid source</td>
<td>NULL</td>
<td>Instructs the apply component to ignore the specified transaction from the source database, effective immediately. Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database. To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_APPLY_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter. If NULL, then the apply component ignores this parameter. <strong>Note:</strong> An apply component ignores this parameter for transactions that were not captured by a capture process. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 23-71</td>
</tr>
<tr>
<td>maximum_scn</td>
<td>A valid SCN or</td>
<td>INFINITE</td>
<td>The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If INFINITE, then the apply component runs regardless of the SCN value. <strong>Note:</strong> An apply component ignores this parameter for transactions that were not captured by a capture process. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 23-71</td>
</tr>
<tr>
<td>max_parallelism</td>
<td>A positive</td>
<td>50</td>
<td>Limits the maximum number of apply servers that can be used for an apply component. When the apply parallelism parameter is set greater than one, the apply component adds apply servers when necessary to process transactions until it reaches the limit set by this parameter (max_parallelism). Transactions include both unassigned (eager) and assigned transactions. Apply servers that idle for more than 5 minutes are shut down until the configured parallelism is attained. Runtime statistics for servers that have been shut down are aggregated into apply server 0 so that accurate apply statistics for the entire apply process can be maintained. <strong>Note:</strong> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; on page 204-75 for information about enabling XStream optimizations.</td>
</tr>
</tbody>
</table>
max_sga_size: A positive integer INFINITE

Controls the amount of system global area (SGA) memory allocated specifically to the apply component, in megabytes.

The memory is allocated for the duration of the apply component's session and is released when the apply component becomes disabled.

Note: The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter.

If NULL, then the apply component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value.

Note: This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.

See Also: "Usage Notes" on page 23-71

optimize_progress_table: Y or N Y

This parameter determines if a table or the redo log tracks the apply transactions. The progress table tracks completed apply transactions.

If Y, transactions are tracked in the redo log.

If N, transactions are tracked in a table.

If the database is not in archivelog mode, then the setting of Y is ignored.

Note: This parameter is intended for XStream. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.

See Also: "Usage Notes" on page 23-71

optimize_self_updates: Y or N Y

This parameter affects conflict resolution when an update in the source database sets a column to its existing value.

When this parameter is set to Y, a conflict between the value in the LCR and the corresponding column in the target database is considered resolved.

When this parameter is set to N, the conflict is processed.
The number of apply servers that can concurrently apply transactions.

The reader server and the apply server process names are ASnn, where nn can include letters and numbers. The total number of ASnn processes is the value of the parallelism parameter plus one.

For example, if parallelism is set to 4, then an apply component uses a total of five ASnn processes. In this case, there is one reader server and four apply servers.

Setting the parallelism parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the PROCESSES initialization parameter is set appropriately when you set the parallelism parameter.

Note: When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart.

See Also: "Usage Notes" on page 23-71

The parallelism interval is the interval in seconds at which the current workload activity is computed.

The apply component calculates the mean throughput every 5 X parallelism_interval seconds. After each calculation, the apply component can increase or decrease the number of apply servers to try to improve throughput. If throughput is improved, then the apply component keeps the new number of apply servers.

The parallelism interval is used only if the parallelism parameter is set to a value greater than one and the max_parallelism parameter value is greater than the parallelism parameter value.

Note: This parameter is intended for an XStream environment with one or more inbound servers. XStream outbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.

See Also: "Usage Notes" on page 23-71
Whether to preserve encryption for columns encrypted using Transparent Data Encryption.

If \( Y \), then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply component tries to apply the row LCRs.

If \( N \), then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply component applies the changes in the row LCRs.

**Note:** When the value of this parameter is changed for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.

**See Also:** “Usage Notes” on page 23-71

### rtrim_on_implicit_conversion

Whether to remove blank padding from the right end of a column when automatic datatype conversion is performed during apply.

If \( Y \), then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table.

If \( N \), then blank padding is preserved in the column.

**See Also:** “Usage Notes” on page 23-71 and Oracle Streams Concepts and Administration for information about automatic datatype conversion during apply

### startup_seconds

The maximum number of seconds to wait for another instantiation of the same apply component to finish. If the other instantiation of the same apply component does not finish within this time, then the apply component does not start.

If \( \text{INFINITE} \), then an apply component does not start until another instantiation of the same apply component finishes.

**See Also:** “Usage Notes” on page 23-71
This parameter controls whether triggers fire when a change is made by the apply component. If Y, triggers do not fire for changes made by the apply component. If N, triggers fire for changes made by the apply component. If a trigger’s firing property is set to always fire, then the trigger always fires for changes made by the apply component, regardless of the value of the suppresstriggers parameter. A trigger’s firing property is set to always fire by running the DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY procedure with the fire_once parameter set to FALSE.

**Note:** This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Streams replication environment.

**See Also:** “Usage Notes” on page 23-71

| time_limit       | A positive integer or INFINITE | INFINITE | The apply component stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the apply component continues to run until it is stopped explicitly. **See Also:** “Usage Notes” on page 23-71
| trace_level      | 0 or a positive integer | 0       | Set this parameter only under the guidance of Oracle Support Services. **See Also:** “Usage Notes” on page 23-71
| transaction_limit| A positive integer or INFINITE | INFINITE | The apply component stops after applying the specified number of transactions. If INFINITE, then the apply component continues to run regardless of the number of transactions applied. **See Also:** “Usage Notes” on page 23-71
The apply component begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds.

When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.

Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply component detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk.

If INFINITE, then the apply component does not spill messages to the hard disk based on the age of the messages.

Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component.

</tbody>
</table>
The following usage notes apply to this procedure:

- **Delays Are Possible Before New Parameter Settings Take Effect**

### Table 23–22 (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| txn_lcr_spill_threshold         | A positive integer or INFINITE    | 10000   | The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way:

1. Reads the first 10,000 messages in the transaction into memory
2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000
3. Reads the next 100 messages in the transaction into memory
4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100
5. Reads the next 100 messages in the transaction into memory

The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory.

When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.

Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages.

If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction.

Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component.**

| write_alert_log                  | Y or N                             | Y       | If **Y**, then the apply component writes a message to the alert log on exit.
|---------------------------------|------------------------------------|---------| If **N**, then the apply component does not write a message to the alert log on exit.
|                                 |                                    |         | The message specifies the reason why the apply component stopped.  

### Usage Notes

The following usage notes apply to this procedure:

- **Delays Are Possible Before New Parameter Settings Take Effect**
Parameters Interpreted as Positive Integers
For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting
For parameters that require an SCN setting, any valid SCN value can be specified.

The SET_PARAMETER Procedure and Streams
You can use the following parameters in Streams if you enable XStream performance optimizations for Oracle Streams using the procedure DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS:

- apply_sequence_nextval
- compute_lcr_dep_on_arrival
- eager_size
- grouptransops
- max_parallelism
- max_sga_size
- optimize_progress_table
- parallelism_interval

The SET_PARAMETER Procedure and XStream Outbound Servers
Outbound servers ignore the settings for the following apply parameters:

- allow_duplicate_rows
- commit_serialization
- compare_key_only
- compute_lcr_dep_on_arrival
- disable_on_error
- eager_size
- enable_xstream_table_stats
- grouptransops
- handlecollisions
- optimize_self_updates

Delays Are Possible Before New Parameter Settings Take Effect
When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.
The commit_serialization parameter is always set to FULL for an outbound server, and the parallelism parameter is always set to 1 for an outbound server.

You can use the other apply parameters with outbound servers.

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

### The SET_PARAMETER Procedure and XStream Inbound Servers

Inbound servers ignore the settings for the following apply parameters:

- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- ignore_transaction
- maximum scn

You can use all of the other apply component parameters with inbound servers.

The default setting for the compare_key_only parameter for an inbound server is Y.

The default setting for the parallelism parameter for an inbound server is 4.

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*. 

---
SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE,
  source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_schema_name</td>
<td>The name of the source schema. For example, hr. When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
</tbody>
</table>
Summary of DBMS_APPL Y_ADM Subprograms

Usage Notes

The following usage notes apply to this procedure:

- The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs
- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_GLOBAL_INSTANTIATION_SCN Procedure on page 23-50
- SET_TABLE_INSTANTIATION_SCN Procedure on page 23-77
- LCR$_$DDL_RECORD Type on page 275-6 for more information about DDL LCRs
- Oracle Streams Replication Administrator’s Guide

The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

■ DDL LCRs with a `command_type` of `CREATE TABLE`
■ DDL LCRs with a non-NULL `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also: Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.
**SET_TABLE_INSTANTIATION_SCN Procedure**

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_object_name</td>
<td>The name of the source object specified as `{schema_name}.{object_name}. For example, hr.employees. If the schema is not specified, then the current user is the default. When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database. Note: This parameter must be NULL when the procedure is invoked from the root of a CDB.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- **Instantiation SCNs and LCRs**
The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers
The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers
The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

Instantiation SCNs and LCRs
If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a command_type of ALTER TABLE or CREATE TRIGGER.

---

**Note:** The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

---

See Also:

- SET_GLOBAL_INSTANTIATION_SCN Procedure on page 23-50
- SET_SCHEMA_INSTANTIATION_SCN Procedure on page 23-74
- LCR$_ROW_RECORD Type on page 275-15 for more information about row LCRs
- LCR$_DDL_RECORD Type on page 275-6 for more information about DDL LCRs
- Oracle Streams Replication Administrator’s Guide

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The apply_database_link parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.
See Also: Oracle Database XStream Guide for more information about outbound servers and instantiation SCNs

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers
Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs
In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.
SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```sql
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name    IN  VARCHAR2,
    method_name    IN  VARCHAR2,
    resolution_column IN  VARCHAR2,
    column_list    IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The schema and name of the table, specified as <code>[schema_name].object_name</code>, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
| method_name          | Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:  
  - **MAXIMUM**: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database.  
  - **MINIMUM**: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database.  
  - **OVERWRITE**: Applies the column list from the source database, overwriting the column values at the destination database.  
  - **DISCARD**: Retains the column list from the destination database, discarding the column list from the source database.  
  | resolution_column   | Name of the column used to uniquely identify an update conflict handler. For the **MAXIMUM** and **MINIMUM** prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the `column_list` parameter. **NULL** is not allowed for this parameter. For the **OVERWRITE** and **DISCARD** prebuilt methods, you can specify any column in the `column_list` parameter. |
Usage Notes

The following usage notes apply to this procedure:

- Modifying an Existing Update Conflict Handler
- Removing an Existing Update Conflict Handler
- Series of Actions for Conflicts
- Procedure DML Handlers for Conflicts
- A Column Can Be in Only One Column List
- Update Conflict Handlers and Non-Oracle Databases
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers
- The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

**See Also:** *Oracle Streams Replication Administrator’s Guide* for more information about prebuilt and custom update conflict handlers

### Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an existing update conflict handler. You can modify the prebuilt method or the column list.

### Removing an Existing Update Conflict Handler

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

### Series of Actions for Conflicts

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error.

3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue.

See Also: "Signature of a DML Handler Procedure or Error Handler Procedure" on page 23-43 for information about setting an error handler.

Procedure DML Handlers for Conflicts
If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the SET_DML_HANDLER procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

See Also: SET_DML_HANDLER Procedure on page 23-41

A Column Can Be in Only One Column List
When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED

Update Conflict Handlers and Non-Oracle Databases
Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.

Examples
The following is an example for setting an update conflict handler for the employees table in the hr schema:

```sql
DECLARE
    cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
    cols(1) := 'salary';
    cols(2) := 'commission_pct';
    DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
        object_name           =>  'hr.employees',
        method_name           =>  'MAXIMUM',
        resolution_column     =>  'salary',
        column_list           =>  cols);
END;
/```

See Also: SET_DML_HANDLER Procedure on page 23-41
This example sets a conflict handler that is called if a conflict occurs for the salary or commission_pct column in the hr.employees table. If such a conflict occurs, then the salary column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the job_id column, then this conflict handler is not called.
SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The attribute_list and attribute_table parameters are mutually exclusive.

See Also: Oracle Streams Concepts and Administration

Syntax

```sql
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_list  IN VARCHAR2);
```

```sql
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dependency_name</td>
<td>The name of the value dependency.</td>
</tr>
<tr>
<td></td>
<td>If a dependency with the specified name does not exist, then it is created.</td>
</tr>
<tr>
<td></td>
<td>If a dependency with the specified name exists, then the specified object and attributes are added to the dependency.</td>
</tr>
<tr>
<td></td>
<td>If NULL, an error is raised.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the specified dependency exists, then the dependency is removed.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the specified dependency does not exist, then an error is raised.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then attribute_list and attribute_table also must be NULL.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries.</td>
</tr>
<tr>
<td>attribute_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.NAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
- The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.
START_APPLY Procedure

This procedure directs the apply component to start applying messages.

Syntax

```sql
DBMS_APPLY_ADM.START_APPLY(
    apply_name  IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- **Apply Component Status**
- **The START_APPLY Procedure and XStream Outbound Servers**
- **The START_APPLY Procedure and XStream Inbound Servers**

**Apply Component Status**

The apply component status is persistently recorded. Hence, if the status is **ENABLED**, then the apply component is started upon database instance startup. An apply component (an `nnn`) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply component.

**The START_APPLY Procedure and XStream Outbound Servers**

This procedure functions the same way for apply processes and outbound servers.

**The START_APPLY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.
STOP_APPLY Procedure

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

Syntax

```sql
DBMS_APPLY_ADM.STOP_APPLY(
    apply_name  IN  VARCHAR2,
    force  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the apply component as soon as possible. If FALSE, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter. See “Usage Notes” for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- **Apply Component Status**
- **Queue Subprograms Have No Effect on Apply Component Status**
- **The STOP_APPLY force Parameter and the commit_serialization Apply Parameter**
- **The STOP_APPLY Procedure and XStream Outbound Servers**
- **The STOP_APPLY Procedure and XStream Inbound Servers**

**Apply Component Status**

The apply component status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply component is not started upon database instance startup.

**Queue Subprograms Have No Effect on Apply Component Status**

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the STOP status of an apply component.

**The STOP_APPLY force Parameter and the commit_serialization Apply Parameter**

The following table describes apply component behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.
For example, assume that the `commit_serialization` apply component parameter is set to `DEPENDENT_TRANSACTIONS` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction 2 is applied before the apply component stops.

A different scenario would result if the `commit_serialization` apply component parameter is set to `FULL`. For example, assume that the `commit_serialization` apply component parameter is set to `FULL` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction B is applied before the apply component stops, and transaction C is rolled back.

**See Also:** [SET_PARAMETER Procedure](#) on page 23-56 for more information about the `commit_serialization` apply component parameter.

**The STOP_APPLY Procedure and XStream Outbound Servers**
This procedure functions the same way for apply processes and outbound servers.

**The STOP_APPLY Procedure and XStream Inbound Servers**
This procedure functions the same way for apply processes and inbound servers.
The DBMS_AQ package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:

- Oracle Database Advanced Queuing User’s Guide
- Oracle Database Advanced Queuing (AQ) Types for information about types to use with DBMS_AQ.

This chapter contains the following topics:

- Using DBMS_AQ
  - Security Model
  - Constants
  - Data Structures
  - Operational Notes
- Summary of DBMS_AQ Subprograms
This section contains the following topics.

- Security Model
- Constants
- Data Structures
- Operational Notes
Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQ and DBMS_AQADM.

Queue Security
To enqueue or dequeue, users need EXECUTE rights on DBMS_AQ and either ENQUEUE or DEQUEUE privileges on target queues, or ENQUEUE_ANY/DEQUEUE_ANY system privileges. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas.

As a database user, you do not need any explicit object-level or system-level privileges to enqueue or dequeue to queues in your own schema other than the EXECUTE right on DBMS_AQ.

See Also: Oracle Database Advanced Queuing User’s Guide for more information on queue privileges and access control.

OCI Applications and Queue Access
For an Oracle Call Interface (OCI) application to access a queue, the session user must be granted either the object privilege of the queue he intends to access or the ENQUEUE ANY QUEUE or DEQUEUE ANY QUEUE system privileges. The EXECUTE right of DBMS_AQ is not checked against the session user’s rights.

Security Required for Propagation
Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

See Also:
- Chapter 25, "DBMS_AQADM."
- Oracle Database Advanced Queuing User’s Guide for more information on security required for propagation.
Constants

The DBMS_AQ package uses the constants shown in Table 24–1. When using enumerated constants such as \texttt{BROWSE}, \texttt{LOCKED}, or \texttt{REMOVE}, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with \texttt{DBMS_AQ}. For example: \texttt{DBMS_AQ.BROWSE}.

\begin{table}[h]

Data Structures

Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

**Syntax**

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

**Usage Notes**

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The `type_name` data structure defines queue types.

**Syntax**

```
type_name := VARCHAR2;
type_name := object_type | 'RAW';
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object_type</code></td>
<td>Maximum number of attributes in the object type is limited to 900.</td>
</tr>
</tbody>
</table>
Using DBMS_AQ

**Oracle Database Advanced Queuing PL/SQL Callback**

The `plsqlcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

**Syntax**

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```sql
procedure plsqlcallback(
    context IN RAW,
    reginfo IN SYS.AQ$_REGS_INFO,
    descr IN SYS.AQ$_DESCRIPTOR,
    payload IN RAW,
    payloadl IN NUMBER);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>context</code></td>
<td>Specifies the context for the callback function that was passed by <code>dbms_aq.register</code>. See <code>AQ$_REGS_INFO Type</code> on page 271-14.</td>
</tr>
<tr>
<td><code>reginfo</code></td>
<td>See <code>AQ$_REGS_INFO Type</code> on page 271-14.</td>
</tr>
<tr>
<td><code>descr</code></td>
<td>See <code>AQ$_DESCRIPTOR Type</code> on page 271-7</td>
</tr>
<tr>
<td><code>payload</code></td>
<td>If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.</td>
</tr>
<tr>
<td><code>payloadl</code></td>
<td>Specifies the length of <code>payload</code>. If <code>payload</code> is null, <code>payloadl</code> = 0.</td>
</tr>
</tbody>
</table>

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```sql
procedure plsqlcallback(
    context IN RAW,
```
reginfo IN SYS.AQS_REG_INFO,
descr IN SYS.AQS_DESCRIPTOR,
payload IN VARCHAR2,
payloadl IN NUMBER);
Operational Notes

- **DBMS_AQ and DBMS_AQADM Java Classes**

**DBMS_AQ and DBMS_AQADM Java Classes**

Java interfaces are available for DBMS_AQ and DBMS_AQADM. The Java interfaces are provided in the $ORACLE_HOME/rdbms/jlib/aqapi.jar. Users are required to have EXECUTE privileges on the DBMS_AQIN package to use these interfaces.
Summary of DBMS_AQ Subprograms

Table 24–5   DBMS_AQ Package Subprograms

<table>
<thead>
<tr>

</tr>
<tr>
<td>UNREGISTER Procedure on page 24-25</td>
<td>Unregisters a subscription which turns off notification</td>
</tr>
</tbody>
</table>

Note: DBMS_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.
BIND_AGENT Procedure

This procedure creates an entry for an Oracle Database Advanced Queuing agent in the LDAP server.

Syntax

```sql
DBMS_AQ.BIND_AGENT(
    agent IN SYS.AQ$_AGENT,
    certificate IN VARCHAR2 default NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be registered in LDAP server.</td>
</tr>
<tr>
<td>certificate</td>
<td>Location (LDAP distinguished name) of the &quot;organizationalperson&quot; entry in LDAP whose digital certificate (attribute usercertificate) is to be used for this agent. Example: &quot;cn=OE, cn=ACME, cn=com&quot; is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.</td>
</tr>
</tbody>
</table>

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (usercertificate) of the OrganizationalPerson entity. The distinguished name for this OrganizationalPerson must be specified when binding the agent.
DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```sql
DBMS_AQ.DEQUEUE (  
  queue_name          IN      VARCHAR2,  
  dequeue_options     IN      dequeue_options_t,  
  message_properties  OUT     message_properties_t,  
  payload             OUT     "<ADT_1>"  
  msgid               OUT     RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue.</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>See DEQUEUE_OPTIONS_T Type on page 271-19.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type on page 271-26.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. For the definition of type_name refer to Type Name on page 24-6.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message.</td>
</tr>
</tbody>
</table>

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in dequeue_options:

- consumer_name
- msgid

Msgid uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless msgid is specified.

- correlation

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Database Advanced Queuing.

- deq_condition

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include priority, corr1d and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload.
Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

---

**Note:** It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Database Advanced Queuing continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Database Advanced Queuing uses a new snapshot for every dequeue command.

---

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

### Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See `DEQUEUE_OPTIONS_T Type` on page 271-19 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See `CREATE_AQ_AGENT Procedure` on page 25-24.

- You must map the Oracle Database Advanced Queuing agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See `ENABLE_DB_ACCESS Procedure` on page 25-39.
See Also: Oracle Streams Concepts and Administration for information about secure queues
DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```sql
DBMS_AQ.DEQUEUE_ARRAY (  
    queue_name    IN   VARCHAR2,
    dequeue_options IN   dequeue_options_t,
    array_size    IN   pls_integer,
    message_properties_array OUT  message_properties_array_t,
    payload_array OUT  "<COLLECTION_1>",
    msgid_array   OUT  msgid_array_t,
    error_array   OUT  error_array_t)
RETURN pls_integer;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name from which messages are dequeued (same as single-row dequeue).</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>The set of options which will be applied to all messages in the array (same as single-row dequeue).</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to dequeue.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 271-30.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of dequeued payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, varray or nested table in its PL/SQL representation.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 271-31.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeue by message_id is not supported. See DEQUEUE Procedure on page 24-12 for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

See Also: ENQUEUE_OPTIONS_T Type on page 271-22
For transaction grouped queues and \texttt{ONE\_GROUP} navigation, messages are dequeued from a single transaction group only, subject to the \texttt{array\_size} limit. In \texttt{MULTI\_GROUP} navigation, messages are dequeued across multiple transaction groups, still subject to the \texttt{array\_size} limit. ORA-25235 is returned to indicate the end of a transaction group.

\texttt{DEQUEUE\_ARRAY} is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting \texttt{array\_size} to one message.
ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```sql
DBMS_AQ.ENQUEUE (
    queue_name          IN      VARCHAR2,
    enqueue_options     IN      enqueue_options_t,
    message_properties  IN      message_properties_t,
    payload             IN       '<ADT_1>',
    msgid               OUT     RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type on page 271-22.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type on page 271-26.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of type_name refer to Type Name on page 24-6.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.</td>
</tr>
</tbody>
</table>

Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter relative_msgid. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

**Note:** The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error ORA_24033 is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.
Using Secure Queues

For secure queues, you must specify the sender_id in the messages_properties parameter. See MESSAGE_PROPERTIES_T Type on page 271-26 for more information about sender_id.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using DBMS_AQADM.CREATE_AQ_AGENT. See CREATE_AQ_AGENT Procedure on page 25-24.

- You must map sender_id to a database user with enqueue privileges on the secure queue. Use DBMS_AQADM.ENABLE_DB_ACCESS to do this. See ENABLE_DB_ACCESS Procedure on page 25-39.

See Also: Oracle Streams Concepts and Administration for information about secure queues
ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```sql
DBMS_AQ.ENQUEUE_ARRAY ( 
    queue_name                IN   VARCHAR2,
    enqueue_options           IN   enqueue_options_t,
    array_size                IN   pls_integer,
    message_properties_array  IN   message_properties_array_t,
    payload_array             IN   "<COLLECTION_1>",
    msgid_array               OUT  msgid_array_t,
    error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name in which messages are enqueued (same as single-row enqueue).</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type on page 271-22.</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to enqueue.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 271-30.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, VARRAY, or nested table in its PL/SQL representation.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 271-31.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.
LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
    agent_list            IN    AQ$_AGENT_LIST_T,
    wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
    agent                 OUT   SYS.AQ$_AGENT);
```

```
DBMS_AQ.LISTEN (
    agent_list             IN   AQ$_AGENT_LIST_T,
    wait                   IN   BINARY_INTEGER DEFAULT FOREVER,
    listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
    agent                  OUT  SYS.AQ$_AGENT,
    message_delivery_mode  OUT  PLS_INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_list</td>
<td>List of agents to listen for</td>
</tr>
<tr>
<td>wait</td>
<td>Time out for the listen call in seconds. By default, the call will block forever.</td>
</tr>
<tr>
<td>listen_delivery_mode</td>
<td>The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED</td>
</tr>
<tr>
<td>agent</td>
<td>Agent with a message available for consumption</td>
</tr>
<tr>
<td>message_delivery_mode</td>
<td>Returns the message type along with the queue and consumer for which there is a message</td>
</tr>
</tbody>
</table>

**Usage Notes**

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.
A successful return from the LISTEN call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

**Note:** You cannot call LISTEN on nonpersistent queues.
POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```sql
DBMS_AQ.POST (  
    post_list       IN  SYS.AQ$_POST_INFO_LIST,  
    post_count      IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>post_list</td>
<td>Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.</td>
</tr>
<tr>
<td>post_count</td>
<td>Specifies the number of entries in the post_list.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.
REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```sql
DBMS_AQ.REGISTER (  
    reg_list     IN  SYS.AQ$_REG_INFO_LIST,  
    count        IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reg_list</code></td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td><code>count</code></td>
<td>Specifies the number of entries in the <code>reg_list</code>.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only TIME criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion TIME)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for DBCHANGE namespace)
  - Repeat count – how many times to perform grouping (Default is FOREVER)
  - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

See Also: Chapter 26, "DBMS_AQELM" for more information on e-mail and HTTP notifications
UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Database Advanced Queuing agent from the LDAP server.

Syntax

```plsql
DBMS_AQ.UNBIND_AGENT(
    agent    IN SYS.AQ$_AGENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be removed from the LDAP server</td>
</tr>
</tbody>
</table>

UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```sql
DBMS_AQ.UNREGISTER (
    reg_list     IN  SYS.AQ$_REG_INFO_LIST,
    reg_count    IN  NUMBER);
```

Parameters

Table 24–15  **UNREGISTER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>reg_count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.
The `DBMS_AQADM` package provides procedures to manage Oracle Database Advanced Queuing (AQ) configuration and administration information.

**See Also:**
- *Oracle Database Advanced Queuing User’s Guide*

  - Alias Subprograms

- **Summary of DBMS_AQADM Subprograms**
Using DBMS_AQADM

This section contains the following topics.

- Security Model
- Constants
Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQADM and DBMS_AQ. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas and can be granted and revoked through DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE respectively.

User Roles

The database administrator has the option of granting the system privileges ENQUEUE_ANY and DEQUEUE_ANY, exercising DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE directly to a database user, if you want the user to have this level of control.

The application developer gives rights to a queue by granting and revoking privileges at the object level by exercising DBMS_AQADM.GRANT_QUEUE_PRIVILEGE and DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE.

See Also: Chapter 24, "DBMS_AQ."

Oracle Database Advanced Queuing User’s Guide for more information on queue privileges and access control.

Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

See Also: Oracle Database Advanced Queuing User’s Guide for more information on security required for propagation.

Queue Table Migration

The MIGRATE_QUEUE_TABLE procedure requires that the EXECUTE privilege on DBMS_AQADM be granted to the queue table owner, who is probably an ordinary queue user. If you do not want ordinary queue users to be able to create and drop queues and queue tables, add and delete subscribers, and so forth, then you must revoke the EXECUTE privilege as soon as the migration is done.

See Also: "MIGRATE_QUEUE_TABLE Procedure" on page 25-47.

Oracle Database Advanced Queuing User’s Guide for more information on granting Oracle Database Advanced Queuing system privileges.
Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>0, 1, 2...INFINITE</td>
</tr>
<tr>
<td>message_grouping</td>
<td>TRANSACTIONAL, NONE</td>
</tr>
<tr>
<td>queue_type</td>
<td>NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE</td>
</tr>
</tbody>
</table>

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.
Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

- Queue Table Subprograms on page 25-6
- Privilege Subprograms on page 25-7
- Queue Subprograms on page 25-8
- Subscriber Subprograms on page 25-9
- Notification Subprograms on page 25-10
- Propagation Subprograms on page 25-11
- Oracle Database Advanced Queuing Agent Subprograms on page 25-12
- Alias Subprograms on page 25-13

</tbody>
</table>
ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
    alias IN VARCHAR2,
    obj_location IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Name of the alias. Example: west_shipping.</td>
</tr>
<tr>
<td>obj_location</td>
<td>The distinguished name of the object (queue, agent or connection factory) to which alias refers.</td>
</tr>
</tbody>
</table>

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Database Advanced Queuing Internet access.
ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```sql
DBMS_AQADM.ADD_SUBSCRIBER (  
queue_name      IN    VARCHAR2,  
subscriber      IN    sys.aq$_agent,  
rule            IN    VARCHAR2 DEFAULT NULL,  
transformation  IN    VARCHAR2 DEFAULT NULL  
queue_to_queue  IN    BOOLEAN DEFAULT FALSE,  
delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being defined.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
<tr>
<td>queue_to_queue</td>
<td>If TRUE, propagation is from queue-to-queue.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.</td>
</tr>
</tbody>
</table>

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```sql
rule  => 'PRIORITY <= 3 AND CORRID = 'FROM JAPAN''  
```

Note that these are all single quotation marks.
**ALTER_AQ_AGENT Procedure**

This procedure alters an agent registered for Oracle Database Advanced Queuing Internet access. It is also used to alter an Oracle Database Advanced Queuing agent that accesses secure queues.

*See Also:* *Oracle Streams Concepts and Administration* for information about secure queues

**Syntax**

```
DBMS_AQADM.ALTER_AQ_AGENT (  
  agent_name                IN VARCHAR2,  
  certificate_location      IN VARCHAR2 DEFAULT NULL,  
  enable_http               IN BOOLEAN DEFAULT FALSE,  
  enable_smtp               IN BOOLEAN DEFAULT FALSE,  
  enable_anyp              IN BOOLEAN DEFAULT FALSE )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>
**ALTER_PROPAGATION_SCHEDULE Procedure**

This procedure alters parameters for a propagation schedule.

Syntax

```sql
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (    
  queue_name           IN    VARCHAR2,    
  destination          IN    VARCHAR2 DEFAULT NULL,    
  duration             IN    NUMBER   DEFAULT NULL,    
  next_time            IN    VARCHAR2 DEFAULT NULL,    
  latency              IN    NUMBER   DEFAULT 60,    
  destination_queue    IN    VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td><code>destination</code></td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td><code>duration</code></td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
<tr>
<td><code>next_time</code></td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, <code>next_time</code> should be specified as <code>SYSDATE + 1 - duration/86400</code>.</td>
</tr>
<tr>
<td><code>latency</code></td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will overwrite any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.</td>
</tr>
<tr>
<td><code>destination_queue</code></td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters max_retries, retention_time, and retry_delay are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
  queue_name        IN    VARCHAR2,
  max_retries       IN    NUMBER   DEFAULT NULL,
  retry_delay       IN    NUMBER   DEFAULT NULL,
  retention_time    IN    NUMBER   DEFAULT NULL,
  auto_commit       IN    BOOLEAN  DEFAULT TRUE,
  comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be altered</td>
</tr>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of max_retries is $2^{31}-1$. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retention_time</td>
<td>Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.</td>
</tr>
</tbody>
</table>
ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (  
  queue_table          IN   VARCHAR2,  
  comment              IN   VARCHAR2       DEFAULT NULL,  
  primary_instance     IN   BINARY_INTEGER DEFAULT NULL,  
  secondary_instance   IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created.</td>
</tr>
<tr>
<td>comment</td>
<td>Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.</td>
</tr>
<tr>
<td>primary_instance</td>
<td>This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
</tbody>
</table>
ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```sql
DBMS_AQADM.ALTER_SUBSCRIBER (
    queue_name     IN    VARCHAR2,
    subscriber     IN    sys.aq$_agent,
    rule           IN    VARCHAR2
    transformation IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being altered. See &quot;AQ$_AGENT Type&quot; on page 271-5.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the `schema.AQ$queue_table_R` and `schema.AQ$queue_table_S` views.
CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Database Advanced Queuing agent to access secure queues.

See Also: Oracle Streams Concepts and Administration for information about secure queues

Syntax

DBMS_AQADM.CREATE_AQ_AGENT (  
agent_name                IN VARCHAR2,  
certificate_location      IN VARCHAR2 DEFAULT NULL,  
enable_http               IN BOOLEAN DEFAULT FALSE,  
enable_smtp               IN BOOLEAN DEFAULT FALSE,  
enable_anyp               IN BOOLEAN DEFAULT FALSE )

Parameters

Table 25–18 CREATE_AQ_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>

Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents.
CREATE_NP_QUEUE Procedure

Note: nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent RAW queue.

Syntax

```sql
DBMS_AQADM.CREATE_NP_QUEUE (  
    queue_name              IN        VARCHAR2,  
    multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,  
    comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference.</td>
</tr>
</tbody>
</table>
| multiple_consumers | FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.  
                  | Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table. |
| comment       | User-specified description of the queue. This user comment is added to the queue catalog.                                                  |

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ$_MEM_SC or AQ$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with CREATE_NP_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the LISTEN call on a nonpersistent queue.
CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (  
  queue_name          IN       VARCHAR2,  
  queue_table         IN       VARCHAR2,  
  queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,  
  max_retries         IN       NUMBER         DEFAULT NULL,  
  retry_delay         IN       NUMBER         DEFAULT 0,  
  retention_time      IN       NUMBER         DEFAULT 0,  
  dependency_tracking IN       BOOLEAN        DEFAULT FALSE,  
  comment             IN       VARCHAR2       DEFAULT NULL,  
  auto_commit         IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference with regard to reserved characters.</td>
</tr>
<tr>
<td>queue_table</td>
<td>Name of the queue table that will contain the queue.</td>
</tr>
<tr>
<td>queue_type</td>
<td>Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.</td>
</tr>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retention_time</td>
<td>Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.</td>
</tr>
</tbody>
</table>
**Usage Notes**

All queue names must be unique within a schema. After a queue is created with `CREATE_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

---

**Table 25–20 (Cont.) CREATE_QUEUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dependency_tracking</td>
<td>Reserved for future use. FALSE is the default. TRUE is not permitted in this release.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>
CREATE_SHARDED_QUEUE Procedure

CREATE_SHARDED_QUEUE is a new API in 12c Release 1 (12.1) to create a queue and its queue table as appropriate for a JMS sharded queue. This API cannot be used to create unsharded queues. JMS sharded queues must be created using this single integrated API that will automatically set AQ properties as needed for JMS.

JMS Sharded queues may be either a single consumer or a multi-consumer queue.

Syntax

```plaintext
PROCEDURE CREATE_SHARDED_QUEUE ( 
queue_name             IN VARCHAR2, 
storage_clause         IN VARCHAR2       DEFAULT NULL, 
multiple_consumers     IN BOOLEAN        DEFAULT FALSE, 
max_retries            IN NUMBER         DEFAULT NULL, 
comment                IN VARCHAR2       DEFAULT NULL); 
```

Parameters

**Table 25–21 CREATE_SHARDED_QUEUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>This required parameter specifies the name of the new queue.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>The storage parameter is included in the <code>CREATE TABLE</code> statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard <code>CREATE TABLE</code> storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See Oracle Database SQL Language Reference for the usage of these parameters.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</td>
</tr>
<tr>
<td>max_retries</td>
<td>This optional parameter limits the number of times that a dequeue can reattempted on a message after a failure. The maximum value of max_retries is $2^{31} - 1$. After the retry limit has been exceeded, the message will be purged from the queue. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER_SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</td>
</tr>
<tr>
<td>comment</td>
<td>This optional parameter is a user-specified description of the queue table. This user comment is added to the queue catalog.</td>
</tr>
</tbody>
</table>
DROP_SHARDED_QUEUE Procedure

This procedure drops an existing sharded queue from the database queuing system. You must stop the queue before calling DROP_SHARDED_QUEUE. User must stop the queue explicitly if force is set to FALSE before calling DROP_SHARDED_QUEUE. If force is set to TRUE then queue will be stopped internally and then dropped.

Syntax

DBMS_AQADM.DROP_SHARDED_QUEUE (  
    queue_name IN VARCHAR2,  
    force IN BOOLEAN DEFAULT FALSE )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>This required parameter specifies the name of the sharded queue.</td>
</tr>
<tr>
<td>force</td>
<td>The sharded queue is dropped even if the queue is not stopped.</td>
</tr>
</tbody>
</table>
CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (  
    queue_table         IN      VARCHAR2,  
    queue_payload_type  IN      VARCHAR2,  
    storage_clause      IN      VARCHAR2 DEFAULT NULL,  
    sort_list           IN      VARCHAR2 DEFAULT NULL,  
    multiple_consumers  IN      BOOLEAN DEFAULT FALSE,  
    message_grouping    IN      BINARY_INTEGER DEFAULT None,  
    comment             IN      VARCHAR2 DEFAULT NULL,  
    auto_commit         IN      BOOLEAN DEFAULT TRUE,  
    primary_instance    IN      BINARY_INTEGER DEFAULT 0,  
    secondary_instance  IN      BINARY_INTEGER DEFAULT 0,  
    compatible          IN      VARCHAR2 DEFAULT NULL,  
    secure              IN      BOOLEAN DEFAULT FALSE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created</td>
</tr>
<tr>
<td>queue_payload_type</td>
<td>Type of the user data stored. See Type Name on page 24-6 for valid values for this parameter.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See Oracle Database SQL Language Reference for the usage of these parameters.</td>
</tr>
</tbody>
</table>

Table 25–23 CREATE_QUEUE_TABLE Procedure Parameters
The columns to be used as the sort key in ascending order. This parameter has the following format:
'sort_column_1,sort_column_2'

The allowed column names are priority, enq_time, and commit_time. If both columns are specified, then sort_column_1 defines the most significant order.

After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created.

If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order.

Even with the default ordering defined, a dequeeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified.

When commit_time is specified for the sort_list parameter the resulting queue table uses commit-time ordering. See "Commit-Time Queues" in Oracle Streams Concepts and Administration for more information about commit-time ordering.

See also "Priority and Ordering of Messages" in Oracle Database Advanced Queuing User's Guide for information about message ordering in Oracle Database Advanced Queuing.

FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.

Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.

User-specified description of the queue table. This user comment is added to the queue catalog.

TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.

Note: This parameter has been deprecated.

The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance.

The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.
The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- **aq$_queue_table_name_e**, a default exception queue associated with the queue table
- **aq$queue_table_name**, a read-only view, which is used by Oracle Database Advanced Queuing applications for querying queue data
- **aq$_queue_table_name_t**, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- **aq$_queue_table_name_i**, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- **aq$_queue_table_name_s**, a table for storing information about the subscribers
- **aq$_queue_table_name_r**, a table for storing information about rules on subscriptions
- **aq$_queue_table_name_h**, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Database Advanced Queuing object type payloads. However, only CLOB and BLOB can be propagated using Oracle Database Advanced Queuing propagation in Oracle8i release 8.1.5 or later. See the Oracle Database Advanced Queuing User’s Guide for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.

You can specify and modify the primary_instance and secondary_instance only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.
DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(
    alias IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>The alias to be removed.</td>
</tr>
</tbody>
</table>
DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent.

Syntax

```sql
DBMS_AQADM.DISABLE_DB_ACCESS (agent_name    IN VARCHAR2,
                                db_username    IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specifies the database user whose privileges are to be revoked from the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.
DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```sql
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
  queue_name    IN   VARCHAR2,
  destination   IN   VARCHAR2 DEFAULT NULL,
  destination_queue IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
This procedure drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access.

Syntax

```sql
DBMS_AQADM.DROP_AQ_AGENT (
    agent_name        IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent</td>
</tr>
</tbody>
</table>
DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (  
    queue_name    IN    VARCHAR2,  
    auto_commit   IN    BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be dropped.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.
DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```sql
DBMS_AQADM.DROP_QUEUE_TABLE (  
    queue_table       IN    VARCHAR2,  
    force             IN    BOOLEAN DEFAULT FALSE,  
    auto_commit       IN    BOOLEAN DEFAULT TRUE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be dropped.</td>
</tr>
<tr>
<td>force</td>
<td>FALSE means the operation does not succeed if there are any queues in the</td>
</tr>
<tr>
<td></td>
<td>table. This is the default. TRUE means all queues in the table are stopped</td>
</tr>
<tr>
<td></td>
<td>and dropped automatically.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.</td>
</tr>
</tbody>
</table>

Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.
ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user.

Syntax

```sql
DBMS_AQADM.ENABLE_DB_ACCESS (  
    agent_name       IN VARCHAR2,  
    db_username      IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specified the database user whose privileges are to be granted to the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

See Also: Oracle Streams Concepts and Administration for information about secure queues

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents and the names of the database users whose privileges are granted to them.
ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams Sys.Anydata queues unless you call this procedure after DBMS_STREAMS_ADM.SET_UP_QUEUE. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

DBMS_AQADM.ENABLE_JMS_TYPES (queue_table IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be enabled for JMS and XML types.</td>
</tr>
</tbody>
</table>
ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
    queue_name         IN   VARCHAR2,
    destination        IN   VARCHAR2 DEFAULT NULL,
    destination_queue  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET_WATERMARK.

Syntax

```sql
DBMS_AQADM.GET_WATERMARK (    wmvalue   IN   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>
GET_MAX_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit.

Syntax

```sql
DBMS_AQADM.GET_MAX_STREAMS_POOL (    value     OUT      NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>
GET_MIN_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit.

Syntax

```
DBMS_AQADM.GET_MIN_STREAMS_POOL (  
    value    OUT      NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>
GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
    privilege        IN    VARCHAR2,
    queue_name       IN    VARCHAR2,
    grantee          IN    VARCHAR2,
    grant_option     IN    BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>grant_option</td>
<td>Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.</td>
</tr>
</tbody>
</table>

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Database Advanced Queuing system privileges to users and roles. The privileges are ENQUEUE ANY, DEQUEUE ANY, and MANAGE ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (  
  privilege         IN    VARCHAR2,  
  grantee           IN    VARCHAR2,  
  admin_option      IN    BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing system privilege to grant. The options are ENQUEUE ANY, DEQUEUE ANY, and MANAGE ANY. ENQUEUE ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>admin_option</td>
<td>Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.</td>
</tr>
</tbody>
</table>
MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (  
    queue_table   IN   VARCHAR2,  
    compatible    IN   VARCHAR2);
```

Parameters

| Table 25–38  MIGRATE_QUEUE_TABLE Procedure Parameters |
|-------------|-----------------------------------------------------|
| Parameter   | Description                                         |
| queue_table | Specifies name of the queue table to be migrated.   |
| compatible  | Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table. |
PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
    queue_table        IN   VARCHAR2,
    purge_condition    IN   VARCHAR2,
    purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Chapter 271, "Oracle Database Advanced Queuing (AQ) Types".

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies the name of the queue table to be purged.</td>
</tr>
<tr>
<td>purge_condition</td>
<td>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table_name view. When specifying the purge_condition, qualify the column names in aq$queue_table_name view with qtview. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or '' (two single quotes).</td>
</tr>
<tr>
<td>purge_options</td>
<td>Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter.</td>
</tr>
<tr>
<td></td>
<td>■ If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</td>
</tr>
<tr>
<td></td>
<td>■ delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.</td>
</tr>
</tbody>
</table>

Usage Notes

■ You can purge selected messages from the queue table by specifying a purge_condition. Table 25–39 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.
A trace file is generated in the udump destination when you run this procedure. It details what the procedure is doing.

This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one purge_queue_table call depending on the number of messages in the queue table.
**QUEUE_SUBSCRIBERS Function**

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$subscriber_list_t`. Each element of the collection is of type `sys.aq$agent`. This functionality is provided for 8.1-compatible queues by the `AQ$queue_table_name_S` view.

**Syntax**

```sql
DBMS_AQADM.QUEUE_SUBSCRIBERS (
    queue_name    IN    VARCHAR2);
RETURN aq$subscriber_list_t IS
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>Specifies the queue whose subscribers are to be printed.</td>
</tr>
</tbody>
</table>
**REMOVE_SUBSCRIBER Procedure**

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

**Syntax**

```sql
DBMS_AQADM.REMOVE_SUBSCRIBER (
    queue_name         IN         VARCHAR2,
    subscriber         IN         sys.aq$_agent);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent who is being removed. See <code>AQ$_AGENT Type</code> on page 271-5.</td>
</tr>
</tbody>
</table>
REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```sql
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
    privilege         IN      VARCHAR2,
    queue_name        IN      VARCHAR2,
    grantee           IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.</td>
</tr>
</tbody>
</table>

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor’s privileges are revoked.
REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Database Advanced Queuing system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```sql
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
    privilege IN VARCHAR2,
    grantee   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
</tbody>
</table>
SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```sql
DBMS_AQADM.SCHEDULE_PROPAGATION (
    queue_name          IN    VARCHAR2,
    destination         IN    VARCHAR2 DEFAULT NULL,
    start_time          IN    DATE     DEFAULT SYSDATE,
    duration            IN    NUMBER   DEFAULT NULL,
    next_time           IN    VARCHAR2 DEFAULT NULL,
    latency             IN    NUMBER   DEFAULT 60,
    destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>start_time</td>
<td>Initial start time for the propagation window for messages from the source queue to the destination.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as <code>SYSDATE + 1 - duration/86400</code>.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink.</td>
</tr>
</tbody>
</table>

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in
either the same or different queues, the message is propagated to all of them at the same time.
SET_WATERMARK Procedure

This procedure is used for Oracle Database Advanced Queuing notification to specify and limit memory use.

Syntax

```sql
DBMS_AQADM.SET_WATERMARK (
    wmvalue IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>
**SET_MAX_STREAMS_POOL Procedure**

This procedure is used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use.

**Syntax**

```
DBMS_AQADM.SET_MAX_STREAMS_POOL (  
   value     IN      NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>
SET_MIN_STREAMS_POOL Procedure

This procedure is used for Oracle Database AQ to specify and limit minimum streams pool memory use.

Syntax

```
DBMS_AQADM.SET_MIN_STREAMS_POOL (
    value IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>
START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (  
    queue_name      IN     VARCHAR2,  
    enqueue         IN     BOOLEAN DEFAULT TRUE,  
    dequeue         IN     BOOLEAN DEFAULT TRUE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be enabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
</tbody>
</table>

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.
STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (  
    queue_name      IN   VARCHAR2,  
    enqueue         IN   BOOLEAN DEFAULT TRUE,  
    dequeue         IN   BOOLEAN DEFAULT TRUE,  
    wait            IN   BOOLEAN DEFAULT TRUE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be disabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>wait</td>
<td>Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.</td>
</tr>
</tbody>
</table>

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.
**UNSCHEDULE_PROPAGATION Procedure**

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

**Syntax**

```sql
DBMS_AQADM.UNSCHEDULE_PROPAGATION (    queue_name IN VARCHAR2,
  destination IN VARCHAR2 DEFAULT NULL
  destination_queue IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table sys.aq$_message_types, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
    src_queue_name    IN    VARCHAR2,
    dest_queue_name   IN    VARCHAR2,
    destination       IN    VARCHAR2 DEFAULT NULL,
    rc                OUT   BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>dest_queue_name</td>
<td>Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>rc</td>
<td>Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in rc.</td>
</tr>
</tbody>
</table>
The **DBMS_AQELM** package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

**See Also:** *Oracle Database Advanced Queuing User’s Guide* for detailed information about **DBMS_AQELM**

This chapter contains the following topic:

- **Using DBMS_AQELM**
  - Security Model

- **Summary of DBMS_AQELM Subprograms**
Using DBMS_AQELM

This section contains the following topic:

- Security Model
Security Model

You need the administrator role AQ_ADMINISTRATOR_ROLE to run all procedures in DBMS_AQELM.
## Summary of DBMS_AQELM Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_MAILHOST Procedure on page 26-5</td>
<td>Sets the host name for the SMTP server that the database will use for e-mail notifications</td>
</tr>
<tr>
<td>SET_MAILPORT Procedure on page 26-6</td>
<td>Sets the port number for the SMTP server</td>
</tr>
<tr>
<td>SET_SENDFROM Procedure on page 26-7</td>
<td>Sets the sent-from e-mail address</td>
</tr>
</tbody>
</table>
SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```sql
DBMS_AQELM.SET_MAILHOST (
    mailhost  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailhost</td>
<td>SMTP server host name.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.
SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```sql
DBMS_AQELM.SET_MAILPORT (  
    mailport  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailport</td>
<td>SMTP server port number.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on `DBMS_AQELM` package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25.
SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```sql
DBMS_AQELM.SET_SENDFROM (
    sendfrom  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendfrom</td>
<td>The sent-from e-mail address.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications.
The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

See Also: Oracle Database Advanced Queuing User’s Guide for detailed information about DBMS_AQIN

This chapter contains the following topic:
- Using DBMS_AQIN
  - Security Model
Using DBMS_AQIN

This section contains the following topic.

- Security Model
Security Model

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

GRANT EXECUTE ON DBMS_AQIN to user;

You must have EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. You can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINISTRATOR_ROLE.

See Also: Oracle Database Advanced Queuing User’s Guide for more information on accessing standard and Oracle JMS applications.
The DBMS_ASSERT package provides an interface to validate properties of the input value.

**See Also:** Oracle Database PL/SQL Language Reference for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- Using DBMS_ASSERT
  - Operational Notes
- Summary of DBMS_ASSERT Subprograms
Using DBMS_ASSERT

- Operational Notes
Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.
# Summary of DBMS_ASSERT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENQUOTE_LITERAL Function on page 28-5</td>
<td>Enquotes a string literal</td>
</tr>
<tr>
<td>ENQUOTE_NAME Function on page 28-6</td>
<td>Encloses a name in double quotes</td>
</tr>
<tr>
<td>NOOP Functions on page 28-7</td>
<td>Returns the value without any checking</td>
</tr>
<tr>
<td>QUALIFIED_SQL_NAME Function on page 28-8</td>
<td>Verifies that the input string is a qualified SQL name</td>
</tr>
<tr>
<td>SCHEMA_NAME Function on page 28-9</td>
<td>Verifies that the input string is an existing schema name</td>
</tr>
<tr>
<td>SIMPLE_SQL_NAME Function on page 28-10</td>
<td>Verifies that the input string is a simple SQL name</td>
</tr>
<tr>
<td>SQL_OBJECT_NAME Function on page 28-11</td>
<td>Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object</td>
</tr>
</tbody>
</table>
ENQUOTE_LITERAL Function

This function adds leading and trailing single quotes to a string literal.

Syntax

```sql
DBMS_ASSERT.ENQUOTE_LITERAL (
    str            VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
</tbody>
</table>

Usage Notes

- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.
- No additional quotes are added if the name was already in quotes.
ENQUOTE_NAME Function

This function encloses the provided string within quotation marks. However, additional quotation marks are not added if the string is already in quotation marks. The quoted string is then checked to see if it is a valid identifier.

For more information on Database object names and qualifiers, see Oracle Database SQL Language Reference Guide.

Syntax

```sql
DBMS_ASSERT.ENQUOTE_NAME (str VARCHAR2, capitalize BOOLEAN DEFAULT TRUE) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
<tr>
<td>capitalize</td>
<td>If TRUE or defaulted, alphabetic characters of str which was not in quotes are translated to upper case</td>
</tr>
</tbody>
</table>

Usage Notes

- No additional quotes are added if the name was already in quotes.
- Verify that all other double quotes in the string are adjacent pairs of double quotes.
NOOP Functions

This function returns the value without any checking.

Syntax

```
DBMS_ASSERT.NOOP (
    str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

```
DBMS_ASSERT.NOOP (
    str CLOB CHARACTER SET ANY_CS)
RETURN CLOB CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Table 28–4 NOOP Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>str</td>
</tr>
</tbody>
</table>
QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

Syntax

```sql
DBMS_ASSERT.QUALIFIED_SQL_NAME (  
    str      VARCHAR2 CHARACTER SET ANY_CS)  
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44004: string is not a qualified SQL name

Usage Notes

A qualified SQL name `<qualified name>` can be expressed by the following grammar:

```sql
<local qualified name> ::= <simple name> {'.' <simple name>}
<database link name> ::= <local qualified name> ['@' <connection string>]
<connection string> ::= <simple name>
<qualified name> ::= <local qualified name> ['@' <database link name>]
```
SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```sql
DBMS_ASSERT.SCHEMA_NAME (
    str      VARCHAR2 CHARACTER SET ANY_CS)
RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.
SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

- The input value must be meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumerical characters as well as the characters _, $, and # in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with " inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.
SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

Syntax

```sql
DBMS_ASSERT.SQL_OBJECT_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44002: Invalid object name

Usage Notes

The use of synonyms requires that the base object exists.
The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail. In a mixed-mode environment, these audit trails comprise the database, operating system (OS), and XML audit trails. In a unified auditing environment, this comprises the unified audit trail.

**See Also:**

  - Constants
  - Views

- **Subprogram Groups**
  - Audit Trail Management Subprograms
  - Audit Trail Cleanup Subprograms

- **Summary of DBMS_AUDIT_MGMT Subprograms**
This section contains topics which relate to using the DBMS_AUDIT_MGMT package. The following topics are included:

- Overview
- Security Model
- Constants
- Views
Overview

Database auditing helps meet your database security and compliance requirements. In a mixed mode environment, audit records are written to database tables, operating system (OS) files, or XML files depending on the AUDIT_TRAIL initialization parameter setting. If you have upgraded to unified auditing, then the audit records are written to the unified audit trail.

In a mixed mode environment, when AUDIT_TRAIL is set to DB, database records are written to the AUD$ table. In a unified auditing environment, audit records are written to a read-only table in the AUDSYS schema. The contents of this table are available from the UNIFIED_AUDIT_TRAIL data dictionary view. When AUDIT_TRAIL is set to OS, audit records are written to operating system files. When AUDIT_TRAIL is set to XML, audit records are written to operating system files in XML format.

With Unified Auditing facility, all audit records are written to the unified audit trail in a uniform format and are made available through the UNIFIED_AUDIT_TRAIL views.

It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The DBMS_AUDIT_MGMT subprograms enable you to efficiently manage your audit trail records.

If you have not yet migrated to unified auditing, the DBMS_AUDIT_MGMT package provides a subprogram that allows you to move the database audit trail tables out of the SYSTEM tablespace. This improves overall database performance by reducing the load on the SYSTEM tablespace. It also enables you to dedicate an optimized tablespace for audit records.

For a mixed mode environment, the DBMS_AUDIT_MGMT subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The DBMS_AUDIT_MGMT subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the last archive timestamp value. The last archive timestamp represents the timestamp of the most recent audit record that was securely archived.

The DBMS_AUDIT_MGMT package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The DBMS_AUDIT_MGMT subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

See Also: Oracle Database Security Guide for a detailed description of unified auditing
Security Model

All DBMS_AUDIT_MGMT subprograms require the user to have EXECUTE privilege over the DBMS_AUDIT_MGMT package. The SYSDBA and AUDIT_ADMIN roles have EXECUTE privileges on the package by default.

Oracle strongly recommends that only audit administrators should have the EXECUTE privilege on the DBMS_AUDIT_MGMT package and be granted the AUDIT_ADMIN role.

Executions of the DBMS_AUDIT_MGMT subprograms are always audited.
The `DBMS_AUDIT_MGMT` package defines several constants that can be used for specifying parameter values.

The `DBMS_AUDIT_MGMT` package includes the constants shown in the following tables:

- **DBMS_AUDIT_MGMT Constants - Audit Trail Types**
- **DBMS_AUDIT_MGMT Constants - Audit Trail Properties**
- **DBMS_AUDIT_MGMT Constants - Purge Job Status**

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. Table 29–1 lists the audit trail type constants.

### Table 29–1  DBMS_AUDIT_MGMT Constants - Audit Trail Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUDIT_TRAIL_ALL</td>
<td>PLS_INTEGER</td>
<td>All audit trail types. This includes the standard database audit trail (SYS.AUD$, SYS.FGA_LOG$ and unified audit trail tables), operating system (OS) audit trail, and XML audit trail.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_AUD_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database audit records in the SYS.AUD$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_DB_STD</td>
<td>PLS_INTEGER</td>
<td>Both standard audit (SYS.AUD$) and FGA audit(SYS.FGA_LOG$) records</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FGA_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FILES</td>
<td>PLS_INTEGER</td>
<td>Both operating system (OS) and XML audit trails</td>
</tr>
<tr>
<td>AUDIT_TRAIL_OS</td>
<td>PLS_INTEGER</td>
<td>Operating system audit trail. This refers to the audit records stored in operating system files.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_UNIFIED</td>
<td>PLS_INTEGER</td>
<td>Unified audit trail. In unified auditing, all audit records are written to the unified audit trail and are made available through the unified audit trail views, such as UNIFIED_AUDIT_TRAIL.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_XML</td>
<td>PLS_INTEGER</td>
<td>XML audit trail. This refers to the audit records stored in XML files.</td>
</tr>
</tbody>
</table>

Audit trail properties determine the audit configuration settings. Table 29–2 lists the constants related to audit trail properties.

### Table 29–2  DBMS_AUDIT_MGMT Constants - Audit Trail Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUDIT_TRAIL_WRITE_MODE</td>
<td>PLS_INTEGER</td>
<td>A value of AUDIT_TRAIL_IMMEDIATE_WRITE indicates that the audit record must be immediately persisted and not to be queued. By contrast, AUDIT_TRAIL_QUEUE_WRITE indicates that the audit record can be queued and persisting can be done according the database's flushing strategy.</td>
</tr>
</tbody>
</table>

See Also Oracle Database Security Guide
The audit trail purge job cleans the audit trail. Table 29–3 lists the constants related to purge job status values.

Table 29–3  DBMS_AUDIT_MGMT Constants - Purge Job Status

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE_JOB_DISABLE</td>
<td>PLS_INTEGER</td>
<td>Disables a purge job</td>
</tr>
<tr>
<td>PURGE_JOB_ENABLE</td>
<td>PLS_INTEGER</td>
<td>Enables a purge job</td>
</tr>
</tbody>
</table>
Views

The views listed in Table 29–4 are used to display DBMS_AUDIT_MGMT configuration and cleanup events.

Table 29–4  Views used by DBMS_AUDIT_MGMT

The DBMS_AUDIT_MGMT package subprograms can be grouped into the following categories:

- Audit Trail Management Subprograms
- Audit Trail Cleanup Subprograms
Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

Table 29–5  Audit Trail Management Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_AUDIT_TRAIL_PROPERTY Procedure</td>
<td>Clears the value for the audit trail property that you specify</td>
</tr>
<tr>
<td>FLUSH_UNIFIED_AUDIT_TRAIL Procedure</td>
<td>Writes the unified audit trail records in the SGA queue to disk</td>
</tr>
<tr>
<td>GET_AUDIT_TRAIL_PROPERTY_VALUE Function</td>
<td>Returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure</td>
</tr>
<tr>
<td>GET_LAST_ARCHIVE_TIMESTAMP Function</td>
<td>Returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance</td>
</tr>
<tr>
<td>LOAD_UNIFIED_AUDIT_FILES Procedure</td>
<td>Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace</td>
</tr>
<tr>
<td>SET_AUDIT_TRAIL_LOCATION Procedure</td>
<td>Moves the audit trail tables from their current tablespace to a user-specified tablespace</td>
</tr>
<tr>
<td>SET_AUDIT_TRAIL_PROPERTY Procedure</td>
<td>Sets an audit trail property for the audit trail type that you specify</td>
</tr>
<tr>
<td>SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Sets a timestamp indicating when the audit records or files were last archived</td>
</tr>
</tbody>
</table>

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.
Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAN_AUDIT_TRAIL Procedure</td>
<td>Deletes audit trail records or files that have been archived</td>
</tr>
<tr>
<td>CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
</tr>
<tr>
<td>CREATE_PURGE_JOB Procedure</td>
<td>Creates a purge job for periodically deleting the audit trail records or files</td>

</tr>
<tr>
<td>SET_PURGE_JOB_STATUS Procedure on page 29-39</td>
<td>Enables or disables the purge job that you specify</td>
</tr>
</tbody>
</table>
CLEAN_AUDIT_TRAIL Procedure

This procedure deletes audit trail records. The CLEAN_AUDIT_TRAIL procedure is usually called after the SET_LAST_ARCHIVE_TIMESTAMP Procedure has been used to set the last archived timestamp for the audit records.

Syntax

```sql
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type         IN PLS_INTEGER,
    use_last_arch_timestamp  IN BOOLEAN DEFAULT TRUE,
    container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id              IN NUMBER DEFAULT NULL,
    container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in Table 29-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted. A value of FALSE indicates that all audit records should be deleted. The default value is TRUE. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this purges the audit trail in all the PDBs, otherwise it only purges from the connected PDB.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the SYS.AUD$ and SYS.FGA$ audit records to cleanup; does not apply to unified audit records.</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup; applies to unified audit records.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the AUDIT_FILE_DEST parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the audit_trail_type parameter is set to DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`, it removes only the *.aud files under the directory specified by the `AUDIT_FILE_DEST` initialization parameter.

See Also: "AUDIT_SYSLOG_LEVEL" in the Oracle Database Reference

When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML`, this procedure only removes XML audit files (*.xml) from the current audit directory.

Oracle database maintains a book-keeping file (adx_$ORACLE_SID.txt) for the XML audit files. This file is not removed by the cleanup procedure.

Examples

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```
BEGIN
  DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    use_last_arch_timestamp => TRUE);
END;
```
CLEAR_AUDIT_TRAIL_PROPERTY Procedure

This procedure clears the value for the audit trail property that is specified. Audit trail properties are set using the SET_AUDIT_TRAIL_PROPERTY Procedure.

The CLEAR_AUDIT_TRAIL_PROPERTY procedure can optionally reset the property value to its default value through the use_default_values parameter.

Syntax

```sql
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
    audit_trail_type        IN PLS_INTEGER,
    audit_trail_property    IN PLS_INTEGER,
    use_default_values      IN BOOLEAN DEFAULT FALSE) ;
```

Parameters

Table 29–9  CLEAR_AUDIT_TRAIL_PROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the property needs to be cleared. Audit trail types are listed in Table 29-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property whose value needs to be cleared. You cannot clear the value for the CLEANUP_INTERVAL property. Audit trail properties are listed in Table 29-2, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Properties&quot;</td>
</tr>
<tr>
<td>use_default_values</td>
<td>Specifies whether the default value of the audit_trail_property should be used in place of the cleared value. A value of TRUE causes the default value of the parameter to be used. A value of FALSE causes the audit_trail_property to have no value. The default value for this parameter is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the OS_FILE_MAX_SIZE property.

- You can also use this procedure to reset an audit trail property to its default value. You need to set use_default_values to TRUE when invoking the procedure.

- The DB_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot clear this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.

- If you clear the value of the DB_DELETE_BATCH_SIZE property with use_default_value set to FALSE, the default value of DB_DELETE_BATCH_SIZE is still assumed. This is because audit records are always deleted in batches.

- The FILE_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot clear this
property collectively using the \texttt{AUDIT\_TRAIL\_FILES} and \texttt{AUDIT\_TRAIL\_ALL} audit trail types.

- If you clear the value of the \texttt{FILE\_DELETE\_BATCH\_SIZE} property with \texttt{use\_default\_value} set to \texttt{FALSE}, the default value of \texttt{FILE\_DELETE\_BATCH\_SIZE} is still assumed. This is because audit files are always deleted in batches.

- You cannot clear the value for the \texttt{CLEANUP\_INTERVAL} property.

- You cannot clear the value for the \texttt{AUDIT\_TRAIL\_WRITE\_MODE} property.

\section*{Examples}

The following example calls the \texttt{CLEAR\_AUDIT\_TRAIL\_PROPERTY} procedure to clear the value for the audit trail property, \texttt{OS\_FILE\_MAX\_SIZE}. The procedure uses a value of \texttt{FALSE} for the \texttt{USE\_DEFAULT\_VALUES} parameter. This means that there will be no maximum size threshold for operating system (OS) audit files.

\begin{verbatim}
BEGIN
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
    AUDIT_TRAIL_TYPE        => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    AUDIT_TRAIL_PROPERTY    => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    USE_DEFAULT_VALUES      => FALSE );
END;
\end{verbatim}
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure.

Syntax

```sql
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type         IN PLS_INTEGER,
    rac_instance_number      IN PLS_INTEGER DEFAULT NULL,
    container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id              IN NUMBER DEFAULT NULL,
    container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in Table 29-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for single instance databases. You can find the instance number by issuing the SHOW PARAMETER INSTANCE_NUMBER command in SQL*Plus.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this clears the last archive timestamp from all the PDBs, otherwise it clears from only the connected PDB.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- The timestamp for only one audit_trail_type can be cleared at a time.
- The following are invalid audit_trail_type values for this procedure and cannot be used:
  - AUDIT_TRAIL_ALL
  - AUDIT_TRAIL_DB_STD
  - AUDIT_TRAIL_FILES

Examples

The following example calls the CLEAR_LAST_ARCHIVE_TIMESTAMP procedure to clear the timestamp value for the operating system (OS) audit trail type.

```sql
BEGIN
    DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
        audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    );
END;
```
rack_instance_number => 1);
END;
CREATE_PURGE_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records.

This procedure carries out the cleanup operation at intervals specified by the user. It calls the CLEAN_AUDIT_TRAIL Procedure to perform the cleanup operation.

The SET_PURGE_JOB_INTERVAL Procedure is used to modify the frequency of the purge job.

The SET_PURGE_JOB_STATUS Procedure is used to enable or disable the purge job.

The DROP_PURGE_JOB Procedure is used to drop a purge job created with the CREATE_PURGE_JOB procedure.

Syntax

```
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type            IN PLS_INTEGER,
    audit_trail_purge_interval  IN PLS_INTEGER,
    audit_trail_purge_name      IN VARCHAR2,
    use_last_arch_timestamp     IN BOOLEAN DEFAULT TRUE,
    container                   IN PLS_INTEGER DEFAULT CONTAINER_CURRENT) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the purge job needs to be created. Audit trail types are listed in Table 29-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5.</td>
</tr>
<tr>
<td>audit_trail_purge_interval</td>
<td>The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.</td>
</tr>
<tr>
<td>audit_trail_purge_name</td>
<td>A name to identify the purge job.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, it creates one job in the Root PDB and the invocation of this job will invoke cleanup in all the PDBs.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to schedule the CLEAN_AUDIT_TRAIL Procedure for your audit trail records.
Examples

The following example calls the `CREATE_PURGE_JOB` procedure to create a cleanup job called `CLEANUP`, for all audit trail types. It sets the `audit_trail_purge_interval` parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the `use_last_arch_timestamp` parameter value to `TRUE`. This means that all audit records older than the last archive timestamp are deleted.

```sql
BEGIN
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    audit_trail_purge_interval => 100 /* hours */,
    audit_trail_purge_name => 'CLEANUP',
    use_last_arch_timestamp => TRUE);
END;
```
DEINIT_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the INIT_CLEANUP Procedure. The DEINIT_CLEANUP procedure clears the value of the default_cleanup_interval parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

Syntax

```sql
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
    audit_trail_type  IN PLS_INTEGER,
    container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the procedure needs to be called.</td>
</tr>
<tr>
<td></td>
<td>Audit trail types are listed in Table 29–1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this de-initializes the audit trail from cleanup in all the pluggable databases, otherwise it de-initializes the audit trail from cleanup in the connected PDB only.</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot invoke this procedure for AUDIT_TRAIL_UNIFIED. Doing so it will raise ORA-46250: Invalid value for argument 'AUDIT_TRAIL_TYPE'

Examples

The following example clears the default_cleanup_interval parameter setting for the standard database audit trail:

```sql
BEGIN
    DBMS_AUDIT_MGMT.DEINIT_CLEANUP(  
        AUDIT_TRAIL_TYPE => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);  
END;
```
DROP_OLD_UNIFIED_AUDIT_TABLES Procedure

This procedure drops old unified audit tables following the cloning of a pluggable database (PDB).

Syntax

DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES(
    container_guid IN VARCHAR2) ;

Parameters

Table 29–13  DROP_OLD_UNIFIED_AUDIT_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container_guid</td>
<td>Container GUID of the old unified audit tables</td>
</tr>
</tbody>
</table>

Usage Notes

When a pluggable database gets cloned, the unified audit tables get newly created in the new pluggable database. To drop the old unified audit tables, use the DROP_OLD_UNIFIED_AUDIT_TABLES by specifying the old GUID of the PDB from which the clone was created. You can query the historical GUIDs from the DBA_PDB_HISTORY view for the given PDB.

Examples

BEGIN
    DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES ( 
        container_guid => 'E4721865A9321CB5E043EFA9E80A2D77' );
END;
DROP_PURGE_JOB Procedure

This procedure drops the purge job created using the CREATE_PURGE_JOB Procedure. The name of the purge job is passed as an argument.

Syntax

```sql
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
    audit_trail_purge_name    IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job which is being deleted. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.</td>
</tr>
</tbody>
</table>

Examples

The following example calls the DROP_PURGE_JOB procedure to drop the purge job called CLEANUP.

```sql
BEGIN
    DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
        AUDIT_TRAIL_PURGE_NAME => 'CLEANUP');
END;
```
FLUSH_UNIFIED_AUDIT_TRAIL Procedure

This procedure writes the unified audit trail records in the SGA queue to disk.

Syntax

```sql
DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL (  
  flush_type      IN BINARY_INTEGER   DEFAULT FLUSH_CURRENT_INSTANCE,  
  container       IN BINARY_INTEGER   DEFAULT CONTAINER_CURRENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush_type</td>
<td>Takes one of the following two arguments:</td>
</tr>
<tr>
<td></td>
<td>■ FLUSH_CURRENT_INSTANCE - Flushes the audit records from SGA queues in that particular RAC instance</td>
</tr>
<tr>
<td></td>
<td>■ FLUSH_ALL_INSTANCES - Flushes the audit records from SGA queues in all the RAC instances</td>
</tr>
<tr>
<td>container</td>
<td>The containers where the SGA queues should be flushed. It takes one of the following two arguments:</td>
</tr>
<tr>
<td></td>
<td>■ CONTAINER_CURRENT - Flushes the audit records from SGA queues in that particular PDB</td>
</tr>
<tr>
<td></td>
<td>■ CONTAINER_ALL - Flushes the audit records from SGA queues in all the active PDBs.</td>
</tr>
</tbody>
</table>
GET_AUDIT_COMMIT_DELAY Function

This function returns the audit commit delay time as the number of seconds. Audit commit delay time is the maximum time that it takes to COMMIT an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the audit commit delay time, then a copy of the audit record is written to the operating system (OS) audit trail.

The audit commit delay time value is useful when determining the last archive timestamp for database audit records.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
RETURN NUMBER;
```
Summary of DBMS_AUDIT_MGMT Subprograms

GET_AUDIT_TRAIL_PROPERTY_VALUE Function

This procedure returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

Syntax

```
DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type    IN PLS_INTEGER,
    audit_trail_property IN PLS_INTEGER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 29-1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 29-5.</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property that is being queried. Audit trail properties are listed in Table 29-2, “DBMS_AUDIT_MGMT Constants - Audit Trail Properties” on page 29-5.</td>
</tr>
</tbody>
</table>

Return Values

If the property value is cached in SGA memory, this function will return the value set by the SET_AUDIT_TRAIL_PROPERTY Procedure. Else it will return NULL.

Examples

The following example prints the property value of OS_FILE_MAX_AGE set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

```
SET_AUDIT_TRAIL_PROPERTY.
SET SERVEROUTPUT ON
DECLARE
    OS_MAX_AGE_VAL NUMBER;
BEGIN
    OS_MAX_AGE_VAL := DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
        audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
        audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE);
    IF OS_MAX_AGE_VAL is not NULL THEN
        DBMS_OUTPUT.PUT_LINE('The Maximum Age configured for OS Audit files is: ' ||
            OS_MAX_AGE_VAL);
    END IF;
END;
```
GET_LAST_ARCHIVE_TIMESTAMP Function

This procedure returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance.

Syntax

```sql
DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type IN PLS_INTEGER)
RETURN TIMESTAMP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 29–1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 29-5.</td>
</tr>
</tbody>
</table>

Return Values

In a database that is opened for READ WRITE, since there will no timestamp stored in SGA memory, this function will return NULL. But in a database that is opened for READ ONLY, if a timestamp is set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure, the timestamp will be returned. Else it will return NULL.

Usage Notes

This function will return NULL on a database that is opened READ WRITE. Use DBA_AUDIT_MGMT_LAST_ARCH_TS view to check the timestamp set in such a case.

Examples

The following example prints the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure on a READ ONLY database.

```sql
SET SERVEROUTPUT ON
DECLARE
  LAT_TS TIMESTAMP;
BEGIN
  LAT_TS := DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS);
  IF LAT_TS is not NULL THEN
    DBMS_OUTPUT.PUT_LINE('The Last Archive Timestamp is: ' || to_char(LAT_TS));
  END IF;
END;
```
INIT_CLEANUP Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records. If the audit trail tables are in the SYSTEM tablespace, then the procedure moves them to the SYSAUX tablespace. If you are using unified auditing, you do not need to run this procedure because the unified audit trail tables are in the SYSAUX tablespace by default. If you are not using unified auditing, refer to Oracle Database Upgrade Guide for documentation which references an environment without unified auditing.

Moving the audit trail tables out of the SYSTEM tablespace enhances overall database performance. The INIT_CLEANUP procedure moves the audit trail tables to the SYSAUX tablespace. If the SET_AUDIT_TRAIL_LOCATION Procedure has already moved the audit tables elsewhere, then no tables are moved.

The SET_AUDIT_TRAIL_LOCATION Procedure enables you to specify an alternate target tablespace for the database audit tables.

The INIT_CLEANUP procedure is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. No preliminary set up is required for these audit trail types.

See Also: Table 29-1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 for a list of all audit trail types

This procedure also sets a default cleanup interval for the audit trail records.

Syntax

DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type          IN PLS_INTEGER,
    default_cleanup_interval  IN PLS_INTEGER,
    container                 IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);

Parameters

Table 29–18 INIT_CLEANUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the clean up operation needs to be initialized.</td>
</tr>
<tr>
<td></td>
<td>Audit trail types are listed in Table 29-1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5 except AUDIT_TRAIL_UNIFIED</td>
</tr>
<tr>
<td>default_cleanup_interval</td>
<td>The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this initializes the audit trails for clean up in all the pluggable databases, otherwise this initializes the audit trail in the connected PDB only.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:
- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.

- You should ensure that the SYSAUX tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the SYSAUX tablespace for frequent write operations.

- You can change the default_cleanup_interval later using the SET_AUDIT_TRAIL_PROPERTY Procedure.

- If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION procedure to move the audit trail tables to another tablespace before calling the INIT_CLEANUP procedure.

- Invoking this procedure with AUDIT_TRAIL_UNIFIED results in ORA-46250. It requires no initializations for cleanup since it is cleanup-ready by default.

  **See Also:** "SET_AUDIT_TRAIL_LOCATION Procedure" on page 29-31

### Examples

The following example calls the INIT_CLEANUP procedure to set a default_cleanup_interval of 12 hours for all audit trail types:

```sql
BEGIN
  DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    default_cleanup_interval => 12 /* hours */);
END;
```

  **See Also:** Table 29–1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 for a list of all audit trail types
IS_CLEANUP_INITIALIZED Function

This function checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type. The IS_CLEANUP_INITIALIZED function returns TRUE if the procedure has already been run for the audit trail type. It returns FALSE if the procedure has not been run for the audit trail type.

This function is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The function always returns TRUE for these audit trail types. No preliminary set up is required for these audit trail types.

See Also: Table 29–1, "DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 29-5 for a list of all audit trail types

Syntax

```
DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(
    audit_trail_type  IN PLS_INTEGER
    container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the function needs to be called. Note that this does not apply to AUDIT_TRAIL_UNIFIED. Audit trail types are listed in Table 29–1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs).</td>
</tr>
<tr>
<td></td>
<td>- When CONTAINER is set to CONTAINER_ALL, this function returns the initialization status of all the pluggable databases. The function returns FALSE even if one of the PDBs is not initialized.</td>
</tr>
<tr>
<td></td>
<td>- When CONTAINER is set to CONTAINER_CURRENT, this returns the initialization status of the connected PDB.</td>
</tr>
</tbody>
</table>

Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the INIT_CLEANUP Procedure to initialize the audit trail type.

```
BEGIN
  IF NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD) THEN
    DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval => 12 /* hours */);
  END IF;
END;
```
LOAD_UNIFIED_AUDIT_FILES Procedure

This procedure loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace.

See Also: Oracle Database Security Guide for information about moving the OS audit trail records into the unified audit trail

Syntax

```sql
DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES (  
    container       IN BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs).</td>
</tr>
</tbody>
</table>

- CONTAINER_CURRENT - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in only current PDB

- CONTAINER_ALL - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in the respective PDBs, but for all the active PDBs
**SET_AUDIT_TRAIL_LOCATION Procedure**

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The SET_AUDIT_TRAIL_LOCATION procedure is not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The AUDIT_FILE_DEST initialization parameter is the only way you can specify the destination directory for these audit trail types.

**See Also:**
- Table 29–1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 29-5 for a list of all audit trail types
- "AUDIT_FILE_DEST" in the Oracle Database Reference

**Syntax**

DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_location_value  IN VARCHAR2) ;

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the audit trail location needs to be set.</td>
</tr>
<tr>
<td>audit_trail_location_value</td>
<td>Target location or tablespace for the audit trail records</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply:

- This procedure involves data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.

- You should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.

- This procedure is valid for the following audit_trail_type values only:
  - AUDIT_TRAIL_AUD_STD
  - AUDIT_TRAIL_FGA_STD
  - AUDIT_TRAIL_DB_STD

- You optionally can specify an encrypted tablespace for the audit trail location.
When `AUDIT_TRAIL_TYPE` is `AUDIT_TRAIL_UNIFIED`, this procedure sets the tablespace for newer audit records in the unified audit trail but does not move the older audit records. Thus, it is not resource intensive for unified audit trail.

**Examples**

The following example moves the database audit trail tables, `AUD$` and `FGA_LOG$`, from the current tablespace to a user-created tablespace called `RECORDS`:

```sql
BEGIN
  DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
    audit_trail_location_value  => 'RECORDS');
END;
```
SET_AUDIT_TRAIL_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.
The procedure sets the properties OS_FILE_MAX_SIZE, OS_FILE_MAX_AGE, and FILE_DELETE_BATCH_SIZE for operating system (OS) and XML audit trail types. The OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The FILE_DELETE_BATCH_SIZE property specifies the number of audit trail files that are deleted in one batch.

The procedure sets the properties DB_DELETE_BATCH_SIZE and CLEANUP_INTERVAL for the database audit trail type. DB_DELETE_BATCH_SIZE specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The CLEANUP_INTERVAL specifies the frequency, in hours, with which the cleanup procedure is called.

Syntax

```sql
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type            IN PLS_INTEGER,
    audit_trail_property        IN PLS_INTEGER,
    audit_trail_property_value  IN PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the property needs to be set. Audit trail types are listed in Table 29–1, “DBMS_AUDIT_MGMT Constants - Audit Trail Types” on page 29-5</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property that is being set. Audit trail properties are listed in Table 29–2, “DBMS_AUDIT_MGMT Constants - Audit Trail Properties”</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply:

- The audit trail properties for which you do not explicitly set values use their default values.

- If you have set both the `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.

For example, let us take a scenario where `OS_FILE_MAX_SIZE` is 10000 and `OS_FILE_MAX_AGE` is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.

- The `DB_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.

- The `DB_DELETE_BATCH_SIZE` property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.

- The `FILE_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.

- The `FILE_DELETE_BATCH_SIZE` property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the GEN0 background process for a long time.

---

### Table 29–22  (Cont.) SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>audit_trail_property_value</code></td>
<td>The value of the property specified using <code>audit_trail_property</code>. The following are valid values for audit trail properties:</td>
</tr>
<tr>
<td></td>
<td>- <code>OS_FILE_MAX_SIZE</code> can have a minimum value of 1 and maximum value of 2000000. The default value is 10000. <code>OS_FILE_MAX_SIZE</code> is measured in kilobytes (KB).</td>
</tr>
<tr>
<td></td>
<td>- <code>OS_FILE_MAX_AGE</code> can have a minimum value of 1 and a maximum value of 497. The default value is 5. <code>OS_FILE_MAX_AGE</code> is measured in days.</td>
</tr>
<tr>
<td></td>
<td>- <code>DB_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. <code>DB_DELETE_BATCH_SIZE</code> is measured as the number of audit records that are deleted in one batch.</td>
</tr>
<tr>
<td></td>
<td>- <code>FILE_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. <code>FILE_DELETE_BATCH_SIZE</code> is measured as the number of audit files that are deleted in one batch.</td>
</tr>
<tr>
<td></td>
<td>- <code>CLEANUP_INTERVAL</code> can have a minimum value of 1 and a maximum value of 999. The default value is set using the <code>INIT_CLEANUP</code> Procedure. <code>CLEANUP_INTERVAL</code> is measured in hours.</td>
</tr>
</tbody>
</table>
In Oracle Database Standard Edition, you can only associate the tablespace for unified auditing once. You should perform this association before you generate any audit records for the unified audit trail. The default tablespace is SYSAUX. After you have associated the tablespace, you cannot modify it on the Standard Edition because the partitioning feature is not supported in the Standard Edition.

**Examples**

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_SIZE` property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    audit_trail_property_value => 102400 /* 100MB*/);
END;
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_AGE` property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
    audit_trail_property_value => 5 /* days */);
END;
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `DB_DELETE_BATCH_SIZE` property for the `AUDIT_TRAIL_AUD_STD` audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the `SYS.AUD$` table in batches of size 100000.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
    audit_trail_property => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
    audit_trail_property_value => 100000 /* delete batch size */);
END;
```
SET_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records. The CLEAN_AUDIT_TRAIL Procedure uses this timestamp to decide on the audit records to be deleted.

Syntax

```
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type IN PLS_INTEGER,
    last_archive_time IN TIMESTAMP,
    rac_instance_number IN PLS_INTEGER DEFAULT NULL,
    container IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id IN NUMBER DEFAULT NULL,
    container_guid IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the timestamp needs to be set. Audit trail types are listed in Table 29–1, &quot;DBMS_AUDIT_MGMT Constants - Audit Trail Types&quot; on page 29-5.</td>
</tr>
<tr>
<td>last_archive_time</td>
<td>The TIMESTAMP value based on which the audit records or files should be deleted. This indicates the last time when the audit records or files were archived.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for the database audit trail type, as the database audit trail tables are shared by all Oracle RAC instances. The rac_instance_number is also not relevant for a single-instance database.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this sets the value for last archive timestamp in all the pluggable databases, otherwise it sets the value in the connected PDB only.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- The last_archive_time must be specified in Coordinated Universal Time (UTC) when the audit trail types are AUDIT_TRAIL_AUD_STD, AUDIT_TRAIL_FGA_STD, or AUDIT_TRAIL_UNIFIED. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).
- The last_archive_time must be specified as the local time zone time when the audit trail types are AUDIT_TRAIL_OS or AUDIT_TRAIL_XML. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last
Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.

- The following `audit_trail_type` values for valid for this procedure:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_OS`
  - `AUDIT_TRAIL_XML`

- When using an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.

**Examples**

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the `CLEAN_AUDIT_TRAIL` Procedure, with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2012 14:10:10.0.

```sql
BEGIN
  DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    last_archive_time => TO_TIMESTAMP('12-SEP-0714:10:10.0','DD-MON-RRHH24:MI:SS.FF'),
    rac_instance_number => 1);
END;
```
SET_PURGE_JOB_INTERVAL Procedure

This procedure sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job specified. The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```sql
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
    audit_trail_purge_name IN VARCHAR2,
    audit_trail_interval_value IN PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job for which the interval is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.</td>
</tr>
<tr>
<td>audit_trail_interval_value</td>
<td>The interval, in hours, at which the clean up procedure should be called. This value modifies the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to modify the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the SET_PURGE_JOB_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

```sql
BEGIN
    DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
        AUDIT_TRAIL_PURGE_NAME => 'CLEANUP',
        AUDIT_TRAIL_INTERVAL_VALUE => 24 );
END;
```
**SET_PURGE_JOB_STATUS** Procedure

This procedure enables or disables the specified purge job. The purge job must have already been created using the **CREATE_PURGE_JOB** Procedure.

**Syntax**

```sql
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
    audit_trail_purge_name    IN VARCHAR2,
    audit_trail_status_value  IN PLS_INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job for which the status is being set. This is the purge job name that you specified with the <strong>CREATE_PURGE_JOB</strong> Procedure.</td>
</tr>
<tr>
<td>audit_trail_status_value</td>
<td>One of the values specified in <strong>DBMS_AUDIT_MGMT</strong> Constants - Purge Job Status.</td>
</tr>
</tbody>
</table>

- The value **PURGE_JOB_ENABLE** enables the specified purge job.
- The value **PURGE_JOB_DISABLE** disables the specified purge job.

**Examples**

The following example calls the **SET_PURGE_JOB_STATUS** procedure to enable the **CLEANUP** purge job.

```sql
BEGIN
    DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
        audit_trail_purge_name => 'CLEANUP',
        audit_trail_status_value => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
```
The `DBMS_AUTO_SQLTUNE` package is the interface for managing the Automatic SQL Tuning task. Unlike `DBMS_SQLTUNE`, the `DBMS_AUTO_SQLTUNE` package requires the DBA role.

The chapter contains the following topics:

- **Using DBMS_AUTO_SQLTUNE**
  - Overview
  - Security Model

- **Summary of DBMS_AUTO_SQLTUNE Subprograms**
Using DBMS_AUTO_SQLTUNE

- Overview
- Security Model
Overview

The `DBMS_AUTO_SQLTUNE` package is the interface to SQL Tuning Advisor (`DBMS_SQLTUNE`) when run within the Autotask framework. The database creates the automated system task `SYS_AUTO_SQL_TUNING_TASK` as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the `SET_AUTO_TUNING_TASK_PARAMETER` API to set the `ACCEPT_SQL_PROFILES` parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the `DBA_ADVISOR_EXECUTIONS` view for information about task executions. Use the `REPORT_AUTO_TUNING_TASK` Function to view reports that span multiple executions.
Security Model

This package is available to users with the DBA role. For other users, you must grant the EXECUTE privilege on the package explicitly. Note that the EXECUTE_AUTO_TUNING_TASK procedure is an exception: only SYS can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the ADVISOR privilege to have access to this package.
### Summary of DBMS_AUTO_SQLTUNE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTE_AUTO_TUNING_TASK Function &amp; Procedure on page 30-6</td>
<td>Executes the Automatic SQL Tuning task immediately (SYS only)</td>
</tr>
<tr>
<td>REPORT_AUTO_TUNING_TASK Function on page 30-7</td>
<td>Displays a text report of the automatic tuning task’s history</td>
</tr>
<tr>
<td>SET_AUTO_TUNING_TASK_PARAMETER Procedures on page 30-9</td>
<td>Changes a task parameter value for the daily automatic runs</td>
</tr>
</tbody>
</table>

Table 30–1  DBMS_AUTO_SQLTUNE Package Subprograms
EXECUTE_AUTO_TUNING_TASK Function & Procedure

This function and procedure executes the Automatic SQL Tuning task (SYS_AUTO_SQL_TUNING_TASK). Both the function and the procedure run in the context of a new task execution. The difference is that the function returns that new execution name. Note that only SYS can invoke this subprogram.

Syntax

```sql
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
    execution_name    IN VARCHAR2               := NULL,
    execution_params  IN dbms_advisor.argList   := NULL,
    execution_desc    IN VARCHAR2               := NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_AUTO_TUNING_TASK_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution</td>
</tr>
</tbody>
</table>

Usage Notes

A tuning task can be executed multiple times without having to reset it.

Examples

```sql
EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(:exec_name);
```
REPORT_AUTO_TUNING_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

Syntax

```
DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec IN VARCHAR2 := NULL,
    end_exec  IN VARCHAR2 := NULL,
    type      IN VARCHAR2 := 'TEXT',
    level     IN VARCHAR2 := 'TYPICAL',
    section   IN VARCHAR2 := ALL,
    object_id IN NUMBER  := NULL,
    result_limit IN NUMBER := NULL)
RETURN CLOB;
```

Parameters

**Table 30–3 REPORT_TUNING_TASK Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_exec</td>
<td>Name of the beginning task execution to use. If NULL, the report is generated for the most recent task execution.</td>
</tr>
<tr>
<td>end_exec</td>
<td>Name of the ending task execution to use. If NULL, the report is generated for the most recent task execution.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT which produces a text report.</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>• ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Section of the report to include:</td>
</tr>
<tr>
<td></td>
<td>• SUMMARY: summary information</td>
</tr>
<tr>
<td></td>
<td>• FINDINGS: tuning findings</td>
</tr>
<tr>
<td></td>
<td>• PLAN: explain plans</td>
</tr>
<tr>
<td></td>
<td>• INFORMATION: general information</td>
</tr>
<tr>
<td></td>
<td>• ERROR: statements with errors</td>
</tr>
<tr>
<td></td>
<td>• ALL: all sections</td>
</tr>
<tr>
<td>object_id</td>
<td>Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing the desired report.
Examples

-- Get the whole report for the most recent execution
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM   DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec, 'TEXT',
       'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
       'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
SET_AUTO_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER as used for the reserved auto tuning task, SYS_AUTO_SQL_TUNING_TASK.

Syntax

```sql
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter  IN  VARCHAR2,
    value      IN  VARCHAR2);

DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter  IN  VARCHAR2,
    value      IN  NUMBER);
```
Parameters

Table 30–4  SET_AUTO_TUNING_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</td>
</tr>
<tr>
<td></td>
<td>■ MODE: tuning scope (comprehensive, limited)</td>
</tr>
<tr>
<td></td>
<td>■ USERNAME: username under which the statement is parsed</td>
</tr>
<tr>
<td></td>
<td>■ DAYS_TO_EXPIRE: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>■ EXECUTION_DAYS_TO_EXPIRE: number of days until the task's executions is deleted (without deleting the task)</td>
</tr>
<tr>
<td></td>
<td>■ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_AUTO_TUNING_TASK Function &amp; Procedure.</td>
</tr>
<tr>
<td></td>
<td>■ TIME_LIMIT: global time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>■ LOCAL_TIME_LIMIT: per-statement time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>■ TEST_EXECUTE: FULL/AUTO/OFF.</td>
</tr>
<tr>
<td></td>
<td>* FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</td>
</tr>
<tr>
<td></td>
<td>* AUTO - test-execute for an automatically-chosen time proportional to the tuning time</td>
</tr>
<tr>
<td></td>
<td>* OFF - do not test-execute</td>
</tr>
<tr>
<td></td>
<td>■ BASIC_FILTER: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>■ OBJECT_FILTER: object filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</td>
</tr>
<tr>
<td></td>
<td>■ RANK_MEASURE1: first ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>■ RANK_MEASURE2: second possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>■ RANK_MEASURE3: third possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</td>
</tr>
<tr>
<td></td>
<td>■ SQL_LIMIT: maximum number of SQL statements to tune</td>
</tr>
<tr>
<td></td>
<td>■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements</td>
</tr>
<tr>
<td></td>
<td>The following parameters are supported for the automatic tuning task only:</td>
</tr>
<tr>
<td></td>
<td>■ ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL profiles automatically</td>
</tr>
<tr>
<td></td>
<td>■ MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum</td>
</tr>
<tr>
<td></td>
<td>■ MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.</td>
</tr>

The **DBMS_AUTO_REPORT** package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.

**See Also:** *Oracle Database SQL Tuning Guide* for more information about reporting database operations

This chapter contains the following topics:

- Using **DBMS_AUTO_REPORT**
  - Overview
  - Security Model
- Summary of **DBMS_AUTO_REPORT** Subprograms
Using DBMS_AUTO_REPORT

- Overview
- Security Model
Overview

This package provides an interface to view SQL Monitoring and Real-time ADDM data that has been captured into AWR. It also provides subprograms to control the behavior of how these data are captured to AWR. Captured data are stored in AWR and exposed via 2 views: `DBA_HIST_REPORTS` and `DBA_HIST_REPORTS_DETAILS`. 
Security Model

This package is available to PUBLIC and performs its own security checking.
Summary of DBMS_AUTO_REPORT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FINISH_REPORT_CAPTURE Procedure on page 31-6</td>
<td>Ends the complete capture of SQL monitor data that was started with the START_REPORT_CAPTURE Procedure.</td>
</tr>
<tr>
<td>REPORT_REPOSITORY_DETAIL Function on page 31-7</td>
<td>Obtains the stored report for a given report ID</td>
</tr>
<tr>
<td>REPORT_REPOSITORY_DETAIL_XML Function on page 31-8</td>
<td>Obtains the stored XML report for a given report ID</td>
</tr>
<tr>
<td>REPORT_REPOSITORY_LIST_XML Function on page 31-9</td>
<td>Obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR</td>
</tr>
<tr>
<td>START_REPORT_CAPTURE Procedure on page 31-11</td>
<td>Captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.</td>
</tr>
</tbody>
</table>
FINISH_REPORT_CAPTURE Procedure

This procedure ends the complete capture of SQL monitor data that was started with the START_REPORT_CAPTURE Procedure. This subprogram runs a last capture cycle immediately to capture any new data and then ends the per-minute complete capture.

After calling this subprogram, capture of data continues every minute except that it is not captured for all active SQLs but only for those deemed important, namely the top 5 SQLs (by elapsed time, or elapsed time*DOP in case of PQ) whose monitoring has completed.

Syntax

DBMS_AUTO_REPORT.FINISH_REPORT_CAPTURE;
REPORT_REPOSITORY_DETAIL Function

This procedure obtains the stored report for a given report ID in the specified format such as XML or HTML.

Syntax

```sql
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL (
    rid           IN NUMBER    DEFAULT NULL,
    type          IN VARCHAR2  DEFAULT 'XML',
    base_path     IN VARCHAR2  DEFAULT NULL
) RETURNS CLOB
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>ID of the stored report which returned by the function</td>
</tr>
<tr>
<td>type</td>
<td>Desired format of the report. Values can be 'XML', 'TEXT', 'HTML', 'EM' or 'ACTIVE'. The last two options generate a report in the same format called active HTML. Default value is 'XML'.</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>

Return Values

The persisted report for the given record ID
REPORT_REPOSITORY_DETAIL_XML Function

This procedure obtains the stored XML report for a given report ID.

Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL_XML (
    rid              IN NUMBER    DEFAULT NULL,
    base_path        IN VARCHAR2  DEFAULT NULL)
RETURNS XMLTYPE
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>ID of the stored report which returned by the function</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>

Return Values

The persisted XML report for the given record ID
REPORT_REPOSITORY_LIST_XML Function

This procedure obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR. The input parameters can be used to select and restrict which captured data will be included in the list report. All parameters are optional.

Syntax

```sql
DBMS_AUTO_REPORT.REPORT_REPOSITORY_LIST_XML (
    active_since              IN DATE     DEFAULT NULL,
    active_upto               IN DATE     DEFAULT NULL,
    snapshot_id               IN NUMBER   DEFAULT NULL,
    dbid                      IN NUMBER   DEFAULT NULL,
    inst_id                   IN NUMBER   DEFAULT NULL,
    con_dbid                  IN NUMBER   DEFAULT NULL,
    session_id                IN NUMBER   DEFAULT NULL,
    session_serial            IN NUMBER   DEFAULT NULL,
    component_name            IN VARCHAR2 DEFAULT NULL,
    key1                      IN VARCHAR2 DEFAULT NULL,
    key2                      IN VARCHAR2 DEFAULT NULL,
    key3                      IN VARCHAR2 DEFAULT NULL,
    report_level              IN VARCHAR2 DEFAULT 'TYPICAL',
    base_path                 IN VARCHAR2 DEFAULT NULL)
RETURNS XMLTYPE
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active_since</td>
<td>Start of a time range used to select data. When a time range is specified, only those data are included in the list that were active during the time range. When no value is specified the time range is chosen as the last 24 hours ending at the current system time.</td>
</tr>
<tr>
<td>active_upto</td>
<td>Same as active_since except that it is the end of the time range.</td>
</tr>
<tr>
<td>snapshot_id</td>
<td>If a value is specified, only those data captured during the specified snapshot ID are included in the list report. If no value is specified, no filtering is performed on snapshot ID.</td>
</tr>
<tr>
<td>dbid</td>
<td>If a value is specified, only those data captured for the specified database ID are included in the list report. If no value is specified, no filtering is performed on database ID.</td>
</tr>
<tr>
<td>inst_id</td>
<td>If a value is specified, only those data captured on the specified instance number are included in the list report. If no value is specified, no filtering is performed on the instance ID.</td>
</tr>
<tr>
<td>con_dbid</td>
<td>If a value is specified, only those data captured on the specified container DBID are included in the list report. If no value is specified, no filtering is performed on the container DBID.</td>
</tr>
<tr>
<td>session_id</td>
<td>If a value is specified, only those data captured for the specified session ID are included in the list report. If no value is specified, no filtering is performed on session ID.</td>
</tr>
<tr>
<td>session_serial</td>
<td>If a value is specified, only those data captured for the specified session are included in the list report. If no value is specified, no filtering is performed on session serial number. This parameter should be used in conjunction with the session_id parameter.</td>
</tr>
</tbody>
</table>
**Table 31–4  (Cont.) REPORT_REPOSITORY_LIST_XML Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_name</td>
<td>Can be ‘sqlmonitor’ for SQL Monitor data or ‘rtaddm’ for Real-time ADDM data. If a value is specified then data pertaining only to the specified component will be included in the list report. If no value is specified, no filtering is performed.</td>
</tr>
<tr>
<td>key1</td>
<td>Key value relevant to a component. For SQL Monitor, key1 is the SQL ID of the captured SQL statement. If a value is specified, only those data having specified value for key1 are included, else no filtering is performed on key1.</td>
</tr>
<tr>
<td>key2</td>
<td>Key value relevant to a component. For SQL Monitor, key2 is the SQL execution ID of the captured SQL statement. If a value is specified, only those data having specified value for key2 are included, else no filtering is performed on key2.</td>
</tr>
<tr>
<td>key3</td>
<td>Key value relevant to a component. For SQL Monitor, key3 is the SQL execution start time of the captured SQL statement. If a value is specified, only those data having specified value for key3 are included, else no filtering is performed on key3.</td>
</tr>
<tr>
<td>report_level</td>
<td>Currently only ‘TYPICAL’ is used</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>
START_REPORT_CAPTURE Procedure

This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR. Every capture cycle attempts to capture data for SQLs that are not currently executing or queued. This is a complete capture since data of all newly monitored SQLs is captured. It continues to run every minute until it is explicitly ended with the FINISH_REPORT_CAPTURE Procedure. In the case of a RAC system, the capture will start on each node of the cluster.

Syntax

DBMS_AUTO_REPORT.START_REPORT_CAPTURE;
The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

See Also: Oracle Database Administrator’s Guide for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- Using DBMS_AUTO_TASK_ADMIN
  - Deprecated Subprograms
  - Security Model
  - Constants
- Summary of DBMS_AUTO_TASK_ADMIN Subprograms
Using DBMS_AUTO_TASK_ADMIN

- Deprecated Subprograms
- Security Model
- Constants
Deprecation Subprograms

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- OVERRIDE_PRIORITY Procedures
Security Model

DBMS_AUTO_TASK_ADMIN is a definer's rights package, and EXECUTE is automatically granted to DBA, IMP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE.
Constants

The `DBMS_AUTO_TASK_ADMIN` package uses the constants shown in Table 32–1:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORITY_MEDIUM</td>
<td>VARCHAR2</td>
<td>'MEDIUM'</td>
<td>Task with this priority should be executed as time permits</td>
</tr>
<tr>
<td>PRIORITY_HIGH</td>
<td>VARCHAR2</td>
<td>'HIGH'</td>
<td>Task with this priority should be executed within the current Maintenance Window</td>
</tr>
<tr>
<td>PRIORITY_URGENT</td>
<td>VARCHAR2</td>
<td>'URGENT'</td>
<td>Task with this priority is to be executed at the earliest opportunity</td>
</tr>
</tbody>
</table>
### Summary of DBMS_AUTO_TASK_ADMIN Subprograms

#### Table 32–2  DBMS_XMLSTORE Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedures on page 32-7</td>
<td>Prevents AUTOTASK from executing any requests from a specified client or operation.</td>
</tr>
<tr>
<td>ENABLE Procedures on page 32-8</td>
<td>Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control.</td>
</tr>
<tr>
<td>GET_CLIENT_ATTRIBUTES Procedure on page 32-9</td>
<td>Returns values of select client attributes</td>
</tr>
<tr>
<td>GET_P1_RESOURCES Procedure on page 32-10</td>
<td>Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups</td>
</tr>
<tr>
<td>OVERRIDE_PRIORITY Procedures on page 32-11</td>
<td>Manually overrides task priority.</td>
</tr>
<tr>
<td>SET_CLIENT_SERVICE Procedure on page 32-12</td>
<td>Associates an AUTOTASK Client with a specified Service</td>
</tr>
<tr>
<td>SET_P1_RESOURCES Procedure on page 32-13</td>
<td>Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients</td>
</tr>
</tbody>
</table>
**DISABLE Procedures**

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

**Syntax**

Disables all AUTOTASK functionality:

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
    client_name       IN    VARCHAR2,
    operation         IN    VARCHAR2,
    window_name       IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be disabled</td>
</tr>
</tbody>
</table>

**Usage Notes**

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.
ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control. Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (  
    client_name       IN    VARCHAR2,  
    operation         IN    VARCHAR2,  
    window_name       IN    VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be enabled</td>
</tr>
</tbody>
</table>

Usage Notes

- If `operation` and `window_name` are both NULL, the client is enabled.
- If `operation` is not NULL, `window_name` is ignored and the specified operation is enabled.
- If `operation` is NULL and `window_name` is not NULL, the client is enabled in the specified window.
GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

```sql
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(
    client_name IN VARCHAR2, service_name OUT VARCHAR2,
    window_group OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
<tr>
<td>window_group</td>
<td>Name of the window group in which the client is active</td>
</tr>
</tbody>
</table>
GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

Syntax

```sql
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(
    stats_group_pct OUT NUMBER,
    seg_group_pct  OUT NUMBER,
    tune_group_pct  OUT NUMBER,
    health_group_pct OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seg_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values will add up to 100%.
OVERRIDE_PRIORITY Procedures

**Note:** This subprogram is deprecated and becomes nonoperative with Oracle Database 12c.

This procedure is used to manually override task priority. This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to **URGENT** causes a high priority job to be generated at the start of the maintenance window. Setting priority to **CLEAR** removes the override.

**Syntax**

Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
    client_name       IN    VARCHAR2,
    priority          IN    VARCHAR2);
```

Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
    client_name       IN    VARCHAR2,
    operation         IN    VARCHAR2,
    priority          IN    VARCHAR2);
```

Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
    client_name       IN    VARCHAR2,
    operation         IN    VARCHAR2,
    task_target_type  IN    VARCHAR2,
    task_target_name  IN    VARCHAR2,
    priority          IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>priority</td>
<td>URGENT, HIGH, MEDIUM or LOW</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>task_target_type</td>
<td>Type of target to be affected, as found in V$AUTOTASK_TARGET_TYPE View</td>
</tr>
<tr>
<td>task_target_name</td>
<td>Name of the specific target to be affected</td>
</tr>
</tbody>
</table>
SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```sql
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
    client_name    IN    VARCHAR2,
    service_name   IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
</tbody>
</table>

Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.
SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```sql
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
    stats_group_pct  OUT  NUMBER,
    seg_group_pct    OUT  NUMBER,
    tune_group_pct   OUT  NUMBER,
    health_group_pct OUT  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seg_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.
DBMS_AW_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

**See Also:** Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topic:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms
Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.
# Summary of DBMS_AW_STATS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ANALYZE Procedure</strong> on page 33-4</td>
<td>Generates optimizer statistics on cubes and cube dimensions.</td>
</tr>
<tr>
<td><strong>CLEAR Procedure</strong> on page 33-7</td>
<td>Clears optimizer statistics from cubes and cube dimensions.</td>
</tr>
</tbody>
</table>
### ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension. These statistics are used to generate some execution plans, as described in "Using DBMS_AW_STATS" on page 33-2.

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

### Syntax

```sql
DBMS_AW_STATS.ANALYZE
  (inname       IN VARCHAR2);
```

### Parameters

*Table 33–2  ANALYZE Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| inname    | The qualified name of a cube or a dimension.  

  For a cube, the format of a qualified name is `owner.cube_name`.  

  For a dimension, the format is `owner.dimension_name`. |

### Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

### Example

This sample script generates optimizer statistics on `UNITS_CUBE` and its dimensions.

```sql
BEGIN
  DBMS_AW_STATS.ANALYZE('time');
  DBMS_AW_STATS.ANALYZE('customer');
  DBMS_AW_STATS.ANALYZE('product');
  DBMS_AW_STATS.ANALYZE('channel');
  DBMS_AW_STATS.ANALYZE('units_cube');
END;
/
```
The following statements create and display an execution plan for a SELECT statement that joins columns from UNITS_CUBE_VIEW, CUSTOMER_PRIMARY_VIEW, and the ACCOUNTS table:

```sql
EXPLAIN PLAN FOR SELECT
cu.long_description customer,
a.city city,
a.zip_pc zip,
cu.level_name 'LEVEL',
round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
product_primary_view p,
customer_view cu,
channel_view ch,
units_cube_view f,
account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
AND p.level_name = 'TOTAL'
AND cu.customer_account_id like 'COMP%' 
AND ch.level_name = 'TOTAL' 
/* Join dimension views to cube view */
AND t.dim_key = f.TIME
AND p.dim_key = f.product
AND cu.dim_key = f.customer
AND ch.dim_key = f.channel
AND a.account_id = cu.customer_account_id
ORDER BY zip;
```

SQL> SELECT plan_table_output FROM TABLE(dbms_xplan.display());

Predicate Information (identified by operation id):

2 - access('A', 'ACCOUNT_ID'=SYS_OP_ATG(VALUE(KOKBF$),39,40,2))
8 - filter(SYS_OP_ATG(VALUE(KOKBF$),16,17,2)='2004' AND
SYS_OP_ATG(VALUE(KOKBF$),39,40,2) LIKE 'COMP%' AND
SYS_OP_ATG(VALUE(KOKBF$),47,48,2)='TOTAL' AND
SYS_OP_ATG(VALUE(KOKBF$),25,26,2)='TOTAL')
ANALYZE Procedure

9 - filter("A"."ACCOUNT_ID" LIKE 'COMP\%'"

Note
-----
- dynamic statistics used for this statement

30 rows selected.
CLEAR Procedure

Clears the statistics generated by the ANALYZE Procedure.

Syntax

```
DBMS_AW_STATS.CLEAR {
    inname    IN  VARCHAR2;
}
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inname</td>
<td>The qualified name of a cube or a dimension. For a cube, the format of a qualified name is <code>owner.cube_name</code>. For a dimension, the format is <code>owner.dimension_name</code>.</td>
</tr>
</tbody>
</table>

Examples

The following scripts clears the statistics from `UNITS_CUBE` and its dimensions.

```
BEGIN
    DBMS_AW_STATS.clear('units_cube');
    DBMS_AW_STATS.clear('time');
    DBMS_AW_STATS.clear('customer');
    DBMS_AW_STATS.clear('product');
    DBMS_AW_STATS.clear('channel');
END;
/
The `DBMS_CAPTURE_ADM` package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

**See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator’s Guide* for more information about this package and capture processes.

This chapter contains the following topics:

- **Using DBMS_CAPTURE_ADM**
  - Overview
  - Security Model
- **Summary of DBMS_CAPTURE_ADM Subprograms**
Using DBMS_CAPTURE_ADM

This section contains topics which relate to using the DBMS_CAPTURE_ADM package.

- Overview
- Security Model
Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.

Capture processes can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also: Oracle Database Concepts for more information about CDBs and PDBs
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_CAPTURE_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the `DBMS_CAPTURE_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

---

**Note:**

- The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting a capture user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.
- Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

**See Also:**

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator

**Note:** All subprograms commit unless specified otherwise.
Summary of DBMS_CAPTURE_ADM Subprograms

**ABORT_GLOBAL_INSTANTIATION Procedure**

This procedure reverses the effects of running the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures. Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures

**Syntax**

```sql
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION(
    container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If pdb_name is specified, then this procedure removes supplemental logging for the specified PDB. ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>
ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. It also reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE_SCHEMA_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure for tables in the specified schema

Syntax

```sql
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
  schema_name  IN  VARCHAR2,
  container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema for which to abort the effects of preparing instantiation</td>
</tr>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If pdb_name is specified, then this procedure removes supplemental logging for the specified PDB. ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The table_names parameter is VARCHAR2 datatype in one version and DBMS_UTILITY.UNCL_ARRAY datatype in the other version.

Syntax

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN  VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN  DBMS_UTILITY.UNCL_ARRAY);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_names</td>
<td>When the table_names parameter is VARCHAR2 datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries.</td>
</tr>
<tr>
<td></td>
<td>When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY datatype, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
<tr>
<td></td>
<td>In either version of the procedure, specify the name of each table in the form [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
**ABORT_TABLE_INSTANTIATION Procedure**

This procedure reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure

**Syntax**

```sql
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
    table_name  IN  VARCHAR2;
    container   IN  VARCHAR2  DEFAULT 'CURRENT');
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table_name</code></td>
<td>The name of the table for which to abort the effects of preparing instantiation, specified as <code>[schema_name.]object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>container</code></td>
<td>Either <code>CURRENT</code>, <code>ALL</code>, or <code>pdb_name</code>. If <code>CURRENT</code> is specified, then this procedure removes supplemental logging for the current container. If <code>ALL</code> is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If <code>pdb_name</code> is specified, then this procedure removes supplemental logging for the specified PDB. <code>ALL</code> and <code>pdb_name</code> are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>
ALTER_CAPTURE Procedure

This procedure alters a capture process.

See Also: Oracle Streams Concepts and Administration for more information about altering a capture process

Syntax

```sql
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2   DEFAULT NULL,
    remove_rule_set            IN  BOOLEAN    DEFAULT FALSE,
    start_scn                  IN  NUMBER     DEFAULT NULL,
    use_database_link          IN  BOOLEAN    DEFAULT NULL,
    first_scn                  IN  NUMBER     DEFAULT NULL,
    negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
    remove_negative_rule_set   IN  BOOLEAN    DEFAULT FALSE,
    capture_user               IN  VARCHAR2   DEFAULT NULL,
    checkpoint_retention_time  IN  NUMBER     DEFAULT NULL,
    start_time                 IN  TIMESTAMP  DEFAULT NULL);
```

Parameters

Table 34–6  ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. To change the positive rule set for the capture process, specify an existing rule set in the form <code>${schema_name}.${rule_set_name}</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>job_capture_rules</code>, enter <code>hr.job_capture_rules</code>. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then the procedure removes any existing positive rule set. See Also: Oracle Streams Concepts and Administration for more information about the changes that can be captured by a capture process</td>
</tr>
</tbody>
</table>
ALTER_CAPTURE Procedure

remove_rule_set

If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.

If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set.

If FALSE, then the procedure retains the positive rule set for the specified capture process.

If the rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.

start_scn

A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN.

An error is returned if an invalid SCN is specified or if the capture process is enabled.

use_database_link

If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database.

If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects.

If NULL, then the current value of this parameter for the capture process is not changed.

Table 34-6 (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_rule_set</td>
<td>If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.</td>
</tr>
<tr>
<td>start_scn</td>
<td>A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.</td>
</tr>
<tr>
<td>use_database_link</td>
<td>If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.</td>
</tr>
</tbody>
</table>
first_scn

The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:

- It must be greater than the current first SCN for the capture process.
- It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.
- It must be less than or equal to the required checkpoint SCN for the capture process.

An error is returned if the specified SCN does not meet the first three requirements. See “Usage Notes” on page 34-15 for information about determining an SCN value that meets all of these conditions.

When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure on page 34-18 for more information about a LogMiner data dictionary.

If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.

negative_rule_set_name

The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.

To change the negative rule set for the capture process, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set.

If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

Table 34–6 (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_scn</td>
<td>The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:</td>
</tr>
<tr>
<td></td>
<td>- It must be greater than the current first SCN for the capture process.</td>
</tr>
<tr>
<td></td>
<td>- It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.</td>
</tr>
<tr>
<td></td>
<td>- It must be less than or equal to the required checkpoint SCN for the capture process.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified SCN does not meet the first three requirements. See “Usage Notes” on page 34-15 for information about determining an SCN value that meets all of these conditions.</td>
</tr>
<tr>
<td></td>
<td>When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure on page 34-18 for more information about a LogMiner data dictionary.</td>
</tr>
<tr>
<td></td>
<td>If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.</td>
</tr>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</td>
</tr>
<tr>
<td></td>
<td>To change the negative rule set for the capture process, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set.</td>
</tr>
<tr>
<td></td>
<td>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</td>
</tr>
</tbody>
</table>
remove_negative_rule_set

If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.

If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.

If FALSE, then the procedure retains the negative rule set for the specified capture process.

If the negative_rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.

capture_user

The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed.

To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.

If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

The capture process is stopped and restarted automatically when you change the value of this parameter.

Note: If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.
Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the `first_scn` parameter.

Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```sql
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```
**ALTER_SYNC_CAPTURE Procedure**

This procedure alters a synchronous capture.

**See Also:** Oracle Streams Concepts and Administration for more information about altering a capture process

**Syntax**

```sql
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
  capture_name   IN  VARCHAR2,
  rule_set_name  IN  VARCHAR2  DEFAULT NULL,
  capture_user   IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>strmadmin</code> schema named <code>sync_cap_rules</code>, enter <code>strmadmin.sync_cap_rules</code>. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the <code>DBMS_STREAMS_ADM</code> package. If NULL, then the rule set is not changed. <strong>See Also:</strong> Oracle Streams Concepts and Administration for more information about the changes that can be captured by a synchronous capture</td>
</tr>
</tbody>
</table>
| capture_user | The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges:  
  - EXECUTE privilege on the rule sets used by the synchronous capture  
  - EXECUTE privilege on all rule-based transformation functions used in the rule set  
  These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles. |
Usage Notes

If the capture user for a synchronous capture is dropped using \texttt{DROP USER . . . CASCADE}, then the synchronous capture is also dropped automatically.
BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `first_scn`, and the other does not.

Syntax

```sql
DBMS_CAPTURE_ADM.BUILD(
    first_scn OUT NUMBER);

DBMS_CAPTURE_ADM.BUILD;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_scn</td>
<td>Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.
- In a CDB, the `BUILD` procedure must be executed from the root.
CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:
- Oracle Streams Replication Administrator's Guide for more information about creating a capture process
- Chapter 139, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```sql
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
    queue_name                 IN  VARCHAR2,
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2   DEFAULT NULL,
    start_scn                  IN  NUMBER     DEFAULT NULL,
    source_database            IN  VARCHAR2   DEFAULT NULL,
    use_database_link          IN  BOOLEAN    DEFAULT FALSE,
    first_scn                  IN  NUMBER     DEFAULT NULL,
    logfile_assignment         IN  VARCHAR2   DEFAULT 'implicit',
    negative_rule_set_name     IN  VARCHAR2   DEFAULT NULL,
    capture_user               IN  VARCHAR2   DEFAULT NULL,
    checkpoint_retention_time  IN  NUMBER     DEFAULT 60,
    start_time                 IN  TIMESTAMP  DEFAULT NULL,
    source_root_name           IN  VARCHAR2   DEFAULT NULL,
    capture_class              IN  VARCHAR2   DEFAULT 'Streams');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form <code>schema_name.queue_name</code>. For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default. <strong>Note:</strong> The <code>queue_name</code> setting cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the capture process being created. A <code>NULL</code> specification is not allowed. Do not specify an owner. <strong>Note:</strong> The <code>capture_name</code> setting cannot be altered after the capture process is created.</td>
</tr>
</tbody>
</table>
The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.

If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form `schema_name.rule_set_name`. For example, to specify a positive rule set in the `hr` schema named `job_capture_rules`, enter `hr.job_capture_rules`. If the schema is not specified, then the current user is the default.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

If you specify `NULL`, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the `SYS` and `SYSTEM` schemas.

If you specify `NULL`, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process.

A valid SCN for the database from which the capture process starts capturing changes.

An error is returned if an invalid SCN is specified.

The `start_scn` and `start_time` parameters are mutually exclusive.

**See Also:** "Usage Notes" on page 34-23 for more information setting the `start_scn` parameter.

The global name of the source database. The source database is where the changes to be captured originated.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `.EXAMPLE.COM`, then the procedure specifies `DBS1.EXAMPLE.COM` automatically.

If `NULL`, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for `use_database_link` and `first_scn` can be specified.
If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database.

The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary.

During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned.

If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:

- Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created.
- Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process.
- Prepare source database objects for instantiation.

first_scn

The lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database.

You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available.

See Also: "Usage Notes" on page 34-23 for more information setting the first_scn parameter.
If implicit, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database.

If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR logminer_session_name clause. If explicit, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created.

If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log.

**See Also:** "Usage Notes" on page 34-23 for information about adding redo log files manually.

The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.

If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default.

If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.

If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used.

**Note:** If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.

**See Also:** "Usage Notes" on page 34-23 for more information about this parameter.
Consider the following usage notes when you run this procedure:

- **DBA Role Requirement**
- **Capture User Requirements**
- **First SCN and Start SCN Settings**
- **Explicit Log File Assignment**
**DBA Role Requirement**

If the user who invokes this procedure is different from the user specified in the `capture_user` parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the `capture_user` parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the `capture_user` to SYS.

**Capture User Requirements**

The `capture_user` parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- **EXECUTE** privilege on the rule sets used by the capture process
- **EXECUTE** privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted **EXECUTE** privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

---

**Note:**

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

---

**First SCN and Start SCN Settings**

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

---

**Note:** When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.  

---
In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:

<table>
<thead>
<tr>
<th>first_scn Setting</th>
<th>start_scn Setting</th>
<th>Capture Process Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-NULL</td>
<td>NULL</td>
<td>Local or Downstream</td>
<td>The new capture process is created at the local database with a new LogMiner session starting from the value specified for the first_scn parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised when the capture process is started. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
<tr>
<td>Non-NULL</td>
<td>Non-NULL</td>
<td>Local or Downstream</td>
<td>If the specified value for the start_scn parameter is greater than or equal to the specified value for the first_scn parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the start_scn parameter is less than the specified value for the first_scn parameter, then an error is raised. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been called at least once before on the source database, and the specified first_scn must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
</tbody>
</table>
The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:

- There is no existing capture process for the local source database, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.
- There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.

In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.

However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.

If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.
Explicit Log File Assignment

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```
NULL NULL
```

```
Local or Downstream
```

The behavior is the same as setting the `first_scn` parameter to `NULL` and setting the `start_scn` parameter to the current SCN of the source database.

---

**Note:** When you create a capture process using the `DBMS_STREAMS_ADM` package, both the first SCN and the start SCN are set to `NULL` during capture process creation.

---

**See Also:** BUILD Procedure on page 34-18 for more information about the BUILD procedure and the LogMiner data dictionary

---

**Explicit Log File Assignment**

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```
NULL
```
ALTER DATABASE REGISTER LOGICAL LOGFILE
  file_name FOR capture_process;

Here, file_name is the name of the redo log file being added and capture_process is
the name of the capture process that will use the redo log file at the downstream
database. The capture_process is equivalent to the logminer_session_name and must
be specified. The redo log file must be present at the site running the downstream
database. You must transfer this file manually to the site running the downstream
database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

See Also: Oracle Database SQL Language Reference for more
  information about the ALTER DATABASE statement and Oracle Data
Guard Concepts and Administration for more information registering
redo log files
CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

See Also: Oracle Streams Replication Administrator’s Guide for more information about creating a synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
  queue_name IN VARCHAR2,
  capture_name IN VARCHAR2,
  rule_set_name IN VARCHAR2,
  capture_user IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| queue_name     | The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form [schema_name.]queue_name. For example, to specify a queue in the strmadmin schema named streams_queue, enter strmadmin.streams_queue. If the schema is not specified, then the current user is the default.  
  **Note:** The queue_name setting cannot be altered after the synchronous capture is created. |
| capture_name   | The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner.  
  **Note:** The capture_name setting cannot be altered after the synchronous capture is created. |
| rule_set_name  | The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes.  
  Specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default.  
  An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the DBMS_STREAMS_ADM package. If NULL, then an error is returned.  
  **Note:** Synchronous capture rules must be added to the synchronous capture rule set using the ADD_TABLE_RULES or ADD_SUBSET_RULES procedure in the DBMS_STREAMS_ADM package. A synchronous capture ignores rules added to the rule set with other procedures.  
  **See Also:** Oracle Streams Concepts and Administration for more information about the changes that can be captured by a synchronous capture |
CREATE_SYNC_CAPTURE Procedure

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.

Note: A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

Table 34–10  CREATE_SYNC_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_user</td>
<td>The user in whose security domain the synchronous capture captures changes</td>
</tr>
<tr>
<td></td>
<td>that satisfy its rule set and runs custom rule-based transformations</td>
</tr>
<tr>
<td></td>
<td>configured for synchronous capture rules. If NULL, then the user who runs</td>
</tr>
<tr>
<td></td>
<td>the CREATE_SYNC_CAPTURE procedure is used.</td>
</tr>
</tbody>
</table>

Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the capture_user to SYS.

Note: If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically.

See Also: "Usage Notes" on page 34-30 for more information about this parameter.
**DROP_CAPTURE Procedure**

This procedure drops a capture process.

**Syntax**

```sql
DBMS_CAPTURE_ADM.DROP_CAPTURE(
  capture_name           IN  VARCHAR2,
  drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- The Capture Process Must Be Stopped Before It Is Dropped
- The DROP_CAPTURE Procedure and Rules-related Information

**The Capture Process Must Be Stopped Before It Is Dropped**

A capture process must be stopped before it can be dropped.

See Also: STOP_CAPTURE Procedure on page 34-58

**The DROP_CAPTURE Procedure and Rules-related Information**

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
DROP_CAPTURE Procedure

- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES
- DBA_STREAMS_RULES

See Also: Oracle Streams Concepts and Administration for more information about Oracle Streams data dictionary views
INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```sql
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
  capture_name    IN  VARCHAR2,
  attribute_name  IN  VARCHAR2,
  include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings:</td>
</tr>
<tr>
<td></td>
<td>- row_id                                                                     The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>- serial#                                                                    The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>- session#                                                                   The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>- thread#                                                                    The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>- tx_name                                                                     The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>- username                                                                    The name of the user who performed the change captured in the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td>include</td>
<td>If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.</td>
</tr>
</tbody>
</table>

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want
to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify FALSE for the include parameter.
PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

See Also: Oracle Streams Replication Administrator’s Guide for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
    supplemental_logging IN VARCHAR2 DEFAULT 'KEYS',
    container             IN VARCHAR2 DEFAULT 'CURRENT');
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns. If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</td>
</tr>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB. ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>
Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.
PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

See Also: Oracle Streams Replication Administrator’s Guide for more information about instantiation and supplemental logging

Syntax

DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
    schema_name         IN  VARCHAR2,
    supplemental_logging IN  VARCHAR2  DEFAULT 'KEYS',
    container           IN  VARCHAR2  DEFAULT 'CURRENT');

Parameters

Table 34–14 PREPARE_SCHEMA_INSTANTIATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
</tbody>
</table>
| supplemental_logging | Either NONE, KEYS, or ALL.  
If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.  
If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns.  
If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types. |
| container          | Either CURRENT, ALL, or pdb_name.  
If CURRENT is specified, then this procedure adds supplemental logging for the current container.  
If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB.  
If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB  
ALL and pdb_name are valid only when you invoke the procedure from the root. |
Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.
PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The table_names parameter is VARCHAR2 datatype in one version and DBMS_UTILITY.UNCL_ARRAY datatype in the other version.

See Also: Oracle Streams Replication Administrator’s Guide for more information about instantiation

Syntax

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names  IN  VARCHAR2)
RETURN NUMBER;

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names  IN  DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;

Parameters

<table>
<thead>
<tr>
<th>Table 34–15 PREPARE_SYNC_INSTANTIATION Function Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>table_names</td>
</tr>
</tbody>
</table>
PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table. This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

See Also: Oracle Streams Replication Administrator’s Guide for more information about instantiation and supplemental logging.

Syntax

```sql
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
    table_name            IN  VARCHAR2,
    supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
    container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.</td>
</tr>
<tr>
<td></td>
<td>If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying KEYS does not enable supplemental logging of bitmap join index columns.</td>
</tr>
<tr>
<td></td>
<td>If ALL is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</td>
</tr>
</tbody>
</table>
**Usage Notes**

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

---

**Table 34–16 (Cont.) PREPARE_TABLE_INSTANTIATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name.</td>
</tr>
</tbody>
</table>

- If CURRENT is specified, then this procedure adds supplemental logging for the current container.
- If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB.
- If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB.

ALL and pdb_name are valid only when you invoke the procedure from the root.
SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(
    capture_name  IN  VARCHAR2,
    parameter     IN  VARCHAR2,
    value         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

```
Table 34–17  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting. See &quot;Capture Process Parameters&quot; on page 34-42 for a list of these parameters.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set. If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>
```

Capture Process Parameters

The following table lists the parameters for the capture process.
### Table 34–18  Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_idkey_objects</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures ID key logical change records (LCRs). If N, then the capture process does not capture ID key LCRs. Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADMS.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; on page 204-75 for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 34-53 for more information about this parameter and <em>Oracle Database XStream Guide</em> for more information about ID key LCRs.</td>
</tr>
<tr>
<td>capture_sequence_nextval</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as <em>SYS</em> and <em>SYSTEM</em>. The capture process’s rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs. If N, then the capture process does not capture sequence LCRs. An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADMS.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; on page 204-75 for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; on page 34-53 for more information about this parameter and &quot;SET_PARAMETER Procedure&quot; on page 23-56 for information about the <code>apply_sequence_nextval</code> apply process parameter.</td>
</tr>
</tbody>
</table>
Summary of DBMS_CAPTURE_ADM Subprograms

Table 34–18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit. When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (CPnn) remains the same.</td>
</tr>
<tr>
<td>downstream_real_time_mine</td>
<td>Y or N</td>
<td>Y for local capture processes N for downstream capture processes</td>
<td>If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement ALTER SYSTEM ARCHIVE LOG CURRENT to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See Oracle Streams Replication Administrator’s Guide for information about creating a real-time downstream capture process. If N, then the capture process is an archived-log downstream capture process. An error is raised if an attempt is made to set this parameter for a local capture process.</td>
</tr>
<tr>
<td>excludetag</td>
<td>Comma-delimited list of Oracle Streams tags NULL</td>
<td>Controls whether the capture process captures DML changes that are tagged with one of the specified Oracle Streams tags. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations. See Also: “Usage Notes” on page 34-53 for more information about this parameter.</td>
<td></td>
</tr>
</tbody>
</table>
Table 34–18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludetrans</td>
<td>Comma-delimited list of transaction names</td>
<td>NULL</td>
<td>Controls whether the capture process captures DML changes in the specified transaction names. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. If NULL, then the capture process ignores this parameter. Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations. See Also: “Usage Notes” on page 34-53 for more information about this parameter</td>
</tr>
<tr>
<td>excludeuser</td>
<td>Comma-delimited list of user names</td>
<td>NULL</td>
<td>Controls whether the capture process captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user. If NULL, then the capture process ignores this parameter. Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations. See Also: “Usage Notes” on page 34-53 for more information about this parameter</td>
</tr>
<tr>
<td>excludeuserid</td>
<td>Comma-delimited list of user ID values</td>
<td>NULL</td>
<td>Controls whether the capture process captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. To view the user ID for a user, query the USER_ID column in the ALL_USERS data dictionary view. If NULL, then the capture process ignores this parameter. Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations. See Also: “Usage Notes” on page 34-53 for more information about this parameter</td>
</tr>
</tbody>
</table>
getapplops Y or N Y

If Y, then the capture process captures DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter.

If N, then the capture process ignores DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter.

In either case, the capture process captures a DML change only if it satisfies the capture process’s rule sets.

Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_XSTREAM_FOR_STREAMS procedure. See “ENABLE_XSTREAM_FOR_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations.

See Also: “Usage Notes” on page 34-53 for more information about this parameter.

getrepliNes Y or N N

If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter.

If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter.

In either case, the capture process captures a DML change only if it satisfies the capture process’s rule sets.

Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_XSTREAM_FOR_STREAMS procedure. See “ENABLE_XSTREAM_FOR_STREAMS Procedure” on page 204-75 for information about enabling XStream optimizations.

See Also: “Usage Notes” on page 34-53 for more information about this parameter.
ignore_transaction  A valid transaction ID or NULL  NULL  Instructs the capture process to ignore the specified transaction from the source database, effective immediately.

The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled backed at the destination database.

If NULL, then the capture process ignores this parameter.

Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.

To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.

ignore_unsupported_table  A fully qualified table name, *, or -  *  Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table.

A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process's rule sets exclude unsupported tables.

When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form table_owner. table_name. For example, hr.employees. To specify multiple tables, specify each table in a separate call to the SET_PARAMETER procedure.

When * is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log.

When - is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.
### Table 34-18 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_objects</td>
<td>A list of tables or schema names</td>
<td>none</td>
<td>Directs capture to include changes from the specified tables or schemas.</td>

<td>A valid SCN or INFINITE</td>
<td>INFINITE</td>
<td>The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If INFINITE, then the capture process runs regardless of the SCN value.</td>
</tr>
</tbody>
</table>
max_sga_size

A positive integer

INFINITE

Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log.

The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled.

Note: The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter.

If NULL, then the capture component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value.

Note: This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75 for information about enabling XStream optimizations.

See Also: "Usage Notes" on page 34-53 for more information about this parameter

merge_threshold

A negative integer, 0, a positive integer, or INFINITE

60

The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process.

Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the MERGE_STREAMS procedure. If the difference is greater than the value specified by this parameter, then automatic merge does not begin, and the value is recorded in the LAG column of the DBA_STREAMS_SPLIT_MERGE view. The CAPTURE_MESSAGE_CREATE_TIME is recorded in the V$STREAMS_CAPTURE view.

This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the split_threshold parameter is set to a value other than INFINITE.

If a negative value is specified, then automatic merge is disabled.

If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge.

If INFINITE is specified, then automatic merging starts immediately.

See Also: Oracle Streams Replication Administrator’s Guide

message_limit

A positive integer or INFINITE

INFINITE

The capture process stops after capturing the specified number of messages.

If INFINITE, then the capture process continues to run regardless of the number of messages captured.
### Table 34–18 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_tracking_frequency</td>
<td>0 or a positive integer</td>
<td>2000000</td>
<td>The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is capture_process_name:AUTOTRACK, where capture_process_name is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically. See Oracle Streams Replication Administrator’s Guide for more information about message tracking.</td>
</tr>
<tr>
<td>parallelism</td>
<td>A positive integer</td>
<td>1</td>
<td>The number of preparer servers that can concurrently mine the redo log for the capture process. A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the parallelism capture process parameter. So, if parallelism is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server. Setting the parallelism parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the PROCESSES initialization parameter is set appropriately when you set the parallelism capture process parameter. Note: When you change the value of this parameter, the capture process is stopped and restarted automatically. See Also: Oracle Streams Concepts and Administration for more information about capture process components</td>
</tr>
<tr>
<td>skip_autofiltered_table_ddl</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process. If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets. The AUTO_FILTERED column in the DBA_STREAMS_UNSUPPORTED data dictionary view shows which tables are automatically filtered by capture processes.</td>
</tr>
</tbody>
</table>
The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned.

In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled.

This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes.

If 0 (zero), then automatic splitting starts immediately.

If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken.

This parameters is designed to be used with the merge_threshold parameter. You can monitor an automatic split and merge operation by querying the DBA_STREAMS_SPLIT_MERGE view.

See Also: Oracle Streams Replication Administrator’s Guide

The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually.

If INFINITE, then the capture process does not start until another instantiation of the same capture process finishes.

The capture process stops as soon as possible after the specified number of seconds since it started.

If INFINITE, then the capture process continues to run until it is stopped explicitly.

Set this parameter only under the guidance of Oracle Support Services.

Usage Notes

The following usage notes apply to the SET_PARAMETER procedure:

- **Delays Are Possible Before New Parameter Settings Take Effect**
- **Parameters Interpreted as Positive Integers**
- **Parameters with a System Change Number (SCN) Setting**
- **Parameters that Require XStream Optimizations**
- **XStream or Oracle GoldenGate Integrated Capture Configurations**

### Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

### Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify **INFINITE** for larger values.
Parameters with a System Change Number (SCN) Setting
For parameters that require an SCN setting, any valid SCN value can be specified.

Parameters that Require XStream Optimizations
A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream optimizations are enabled for Oracle Streams components:

- capture_idkey_objects
- capture_sequence_nextval
- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- include_objects
- inline_lob_optimization
- max_sga_size
- use_rac_services

The DBMS_XSTREAM_ADMIN.ENABLE_GG_XSTREAM_FOR_STREAMS procedure enables XStream optimizations for Oracle Streams. When XStream optimizations are not enabled by the DBMS_XSTREAM_ADMIN.ENABLE_GG_XSTREAM_FOR_STREAMS procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream optimizations are enabled for Oracle Streams and the capture_idkey_objects parameter is set to Y, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.

To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```
SELECT OWNER, OBJECT_NAME
FROM DBA_XSTREAM_OUT_SUPPORT_MODE
WHERE SUPPORT_MODE='ID KEY';
```

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

XStream or Oracle GoldenGate Integrated Capture Configurations
In an XStream or Oracle GoldenGate integrated capture configuration, the following parameters control which changes are captured by a capture process:

- capture_idkey_objects
- capture_sequence_nextval
You can set these parameters to avoid change cycling. Change cycling sends a change back to the database where it originated. Typically, change cycling should be avoided in a replication environment so that the same change is not made to a database more than once.

In an XStream or Oracle GoldenGate integrated capture configuration that performs bi-directional replication, a GoldenGate Replicat process runs on the source database for a capture process. Therefore, the changes made by the GoldenGate Replicat are recorded in the redo log.

If an integrated configuration performs bi-directional replication, then, to avoid change cycling, the capture process should not capture the changes made by the Oracle GoldenGate Replicat process. To accomplish this goal, use the default settings for the `getapplops` and `getreplicates` parameters and exclude changes made by the user running the Replicat process. To exclude these changes, specify this user in the `excludeuserid` or `excludeuser` parameter. Typically, the user running the Oracle GoldenGate Replicat process is the XStream administrator.

In some configurations, the goal might be to capture or exclude changes made by applications or by the Replicat process. For example, an intermediate database in a replication environment might capture all of the changes made to the database, including both application changes and Replicat process changes, and send these changes to a different destination database.

Table 34–19 describes the capture process behavior when at least one of the exclude parameters is non-NULL.

<table>
<thead>
<tr>
<th>getapplops Setting</th>
<th>getreplicates Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>Y</td>
<td>The capture process captures all DML changes.</td>
</tr>
<tr>
<td>Y</td>
<td>N</td>
<td>The capture process captures the DML changes made by the users that are not in the <code>excludeuserid</code> or <code>excludeuser</code> parameters. The capture process captures the DML changes that are not in the transactions in the <code>excludetrans</code> parameter. The capture process captures only the DML changes that do not have a tag that is in the <code>excludetags</code> parameter.</td>
</tr>
</tbody>
</table>
Table 34–19 describes the capture process behavior when all of the exclude parameters are set to NULL.

Table 34–20 describes the capture process behavior when at least one exclude parameter is non-NULL.

Note: A capture process evaluates a change using these parameters before it evaluates a change using its rule sets. Therefore, a capture process can discard a change before the change is evaluated against the capture process’s rule sets. Also, regardless of the settings for these parameters, a capture process captures a change only if the change satisfies the capture process’s rule sets.

See Also: Oracle Database XStream Guide
START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

See Also: Chapter 159, "DBMS_STREAMS_ADM"

Syntax

DBMS_CAPTURE_ADM.START_CAPTURE(
    capture_name  IN  VARCHAR2);

Parameters

Table 34–21  START_CAPTURE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>The capture process uses LogMiner to capture changes in the redo information. A NULL setting is not allowed.</td>
</tr>
</tbody>
</table>

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process (cnnn) is an Oracle background process.
STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
    capture_name  IN  VARCHAR2,
    force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form CPnn, where nn can include letters and numbers.
- The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.
The `DBMS_COMPARISON` package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- **Using DBMS_COMPARISON**
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- **Data Structures**
- **Summary of DBMS_COMPARISON Subprograms**

**See Also:**

- *Oracle Streams Replication Administrator’s Guide* for information about using the basic features of this package
Using DBMS_COMPARISON

This section contains topics which relate to using the DBMS_COMPARISON package.

- Overview
- Security Model
- Constants
- Views
- Operational Notes
Overview

The DBMS_COMPARISON package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you to converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a shared database object. Several data dictionary views contain information about comparisons made with the DBMS_COMPARISON package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the CREATE_COMPARISON Procedure in this package to create a comparison. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the COMPARE Function in this package to compare the database object at the two databases and identify differences. This function returns TRUE when no differences are found and FALSE when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the COMPARE function.
3. If you want to examine the comparison results, query the following data dictionary views:
   - DBA_COMPARISON_SCAN
   - USER_COMPARISON_SCAN
   - DBA_COMPARISON_SCAN_VALUES
   - USER_COMPARISON_SCAN_VALUES
   - DBA_COMPARISON_ROW_DIF
   - USER_COMPARISON_ROW_DIF
4. If there are differences, and you want to synchronize the database objects at the two databases, then run the CONVERGE procedure in this package.

After you create a comparison with the CREATE_COMPARISON procedure in the DBMS_COMPARISON package, you can run the comparison at any time using the COMPARE function. Each time you run the COMPARE function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the RECHECK function.

The comparison results for a single execution of the COMPARE function can include one or more scans. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.
A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the `COMPARE` function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the `RECHECK` function, and you can converge a scan using the `CONVERGE` procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for more information about comparisons, including detailed information about scans, buckets, parent scans, and root scans.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a comparison_name parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have the SELECT or READ privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

In addition, when the CONVERGE procedure is run with either the local_converge_tag or remote_converge_tag parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the CONVERGE procedure connects through a database link must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- If the remote table "wins," then the invoker of the CONVERGE procedure at the local database must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.

**Note:** The database administrator (DBA) can assume control over some of the DBMS_COMPARISON functions and procedures owned by other users. This control applies to DROP_COMPARISON and PURGE_COMPARISON. This DBA override can be particularly useful in cleanup operations when comparisons created by another user need to be dropped.
Constants

The **DBMS_COMPARISON** package defines several enumerated constants to use specifying parameter values. Enumerated constants must be prefixed with the package name. For example, **DBMS_COMPARISON.CMP_SCAN_MODE_FULL**.

Table 35–1 lists the parameters and enumerated constants.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

Using DBMS_COMPARISON

Operational Notes

This section contains the following operational notes for the DBMS_COMPARISON package:

- Oracle Database Release Requirements for the DBMS_COMPARISON Package
- Database Character Set Requirements for the DBMS_COMPARISON Package
- Database Object Requirements for the DBMS_COMPARISON Package
- Index Column Requirements for the DBMS_COMPARISON Package
- Datatype Requirements for the DBMS_COMPARISON Package
- Only Converge Rows That Are Not Being Updated

Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

- The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11g Release 1 (11.1) database.
- The remote database must be an Oracle Database 10g Release 1 (10.1) or later database. Oracle databases before this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

See Also: Oracle Database Globalization Support Guide for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the datatypes of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the columns that exist in both database objects.
Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following datatypes:

- Number columns are of the following datatypes: NUMBER, FLOAT, BINARY_FLOAT, and BINARY_DOUBLE.

- Timestamp columns are of the following datatypes: TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE

- Interval columns are of the following datatypes: INTERVAL YEAR TO MONTH and INTERVAL DAY TO SECOND.

For all scan modes to be supported by the DBMS_COMPARISON package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or DATE datatype column

- A composite index that only includes number, timestamp, interval, or DATE datatype columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

For the scan modes CMP_SCAN_MODE_FULL and CMP_SCAN_MODE_CUSTOM to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, DATE, VARCHAR2, or CHAR datatype column

- A composite index that only includes number, timestamp, interval, DATE, VARCHAR2, or CHAR columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the DBMS_COMPARISON package does not support the database objects. For example, if the database objects only have a single index on an NVARCHAR2 column, then the DBMS_COMPARISON package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a NUMBER column and an NCHAR column, then the DBMS_COMPARISON package does not support them.

You can specify an index when you create a comparison using the index_schema_name and index_name parameters in the CREATE_COMPARISON procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint

- A unique constraint on one or more non-NULL columns

If these constraints are not present on a table, then use the index_schema_name and index_name parameters in the CREATE_COMPARISON procedure to specify an index whose columns satisfy this requirement.

When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.
The DBMS_COMPARISON package can use an index only if all of the columns in the index are included in the column_list parameter when the comparison is created with the CREATE_COMPARISON procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
INDEX_COLUMN    = 'Y';
```

If there are multiple index columns, then the index column with 1 for the COLUMN_POSITION is the lead index column in the composite index.

See Also:

- "Constants" on page 35-6 for information about scan modes
- CREATE_COMPARISON Procedure on page 35-20 for information about specifying an index for a comparison

Datatype Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare data in columns of the following datatypes:

- VARCHAR2
- NVARCHAR2
- NUMBER
- FLOAT
- DATE
- BINARY_FLOAT
- BINARY_DOUBLE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND
- RAW
- CHAR
- NCHAR

If a column with datatype TIMESTAMP WITH LOCAL TIME ZONE is compared, then the two databases must use the same time zone. Also, if a column with datatype NVARCHAR2 or NCHAR is compared, then the two databases must use the same national character set.

The DBMS_COMPARISON package cannot compare data in columns of the following datatypes:

- LONG
- LONG RAW
- ROWID
- UROWID
- CLOB
- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFS, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the `column_list` parameter in the `CREATE_COMPARISON` procedure to list only the supported columns in a shared database object.

**See Also:**
- `CREATE_COMPARISON` Procedure on page 35-20
- *Oracle Database SQL Language Reference* for more information about datatypes
- *Oracle Database Globalization Support Guide* for information about national character sets

**Only Converge Rows That Are Not Being Updated**

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

**Attention:** If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the `CONVERGE` procedure is run.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for information about the `DBMS_COMPARISON` package in an Oracle Streams replication environment.
Data Structures

The DBMS_COMPARISON package defines a RECORD type.

RECORD Types

- COMPARISON_TYPE Record Type
COMPARISON_TYPE Record Type

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

---

**Note:** The COMPARE function only returns a value for the scan_id field.

---

**Syntax**

```sql
TYPE COMPARISON_TYPE IS RECORD(
    scan_id            NUMBER,
    loc_rows_merged    NUMBER,
    rmt_rows_merged    NUMBER,
    loc_rows_deleted   NUMBER,
    rmt_rows_deleted   NUMBER);
```

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan</td>
</tr>
<tr>
<td>loc_rows_merged</td>
<td>The number of rows in the local database object updated with information from the database object at the remote site</td>
</tr>
<tr>
<td>rmt_rows_merged</td>
<td>The number of rows in the database object updated at the remote site with information from the database object at the local site</td>
</tr>
<tr>
<td>loc_rows_deleted</td>
<td>The number of rows deleted from the local database object</td>
</tr>
<tr>
<td>rmt_rows_deleted</td>
<td>The number of rows deleted from the remote database object</td>
</tr>
</tbody>
</table>
# Summary of DBMS_COMPARISON Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPARE Function on page 35-16</td>
<td>Performs the specified comparison</td>
</tr>
<tr>
<td>CONVERGE Procedure on page 35-18</td>
<td>Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan</td>
</tr>
<tr>
<td>CREATE_COMPARISON Procedure on page 35-20</td>
<td>Creates a comparison</td>
</tr>
<tr>

<td>Drops a comparison</td>
</tr>
<tr>
<td>PURGE_COMPARISON Procedure on page 35-25</td>
<td>Purges the comparison results, or a subset of the comparison results, for a comparison</td>
</tr>
<tr>
<td>RECHECK Function on page 35-26</td>
<td>Rechecks the differences in a specified scan for a comparison</td>
</tr>
</tbody>
</table>
COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the CREATE_COMPARISON procedure.

See Also:
- "Overview" on page 35-3
- CREATE_COMPARISON Procedure on page 35-20

Syntax

```sql
DBMS_COMPARISON.COMPARE(
    comparison_name  IN   VARCHAR2,
    scan_info        OUT  COMPARISON_TYPE,
    min_value        IN   VARCHAR2   DEFAULT NULL,
    max_value        IN   VARCHAR2   DEFAULT NULL,
    perform_row_dif  IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_info</td>
<td>Information about the compare operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type on page 35-14.</td>
</tr>
<tr>
<td>min_value</td>
<td>When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See &quot;Index Column Requirements for the DBMS_COMPARISON Package&quot; on page 35-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See Constants on page 35-6 for information about scan modes.</td>
</tr>
<tr>
<td>max_value</td>
<td></td>
</tr>
<tr>
<td>perform_row_dif</td>
<td></td>
</tr>
</tbody>
</table>
Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.
CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```sql
DBMS_COMPARISON.CONVERGE(
    comparison_name      IN   VARCHAR2,
    scan_id              IN   NUMBER,
    scan_info            OUT  COMPARISON_TYPE,
    converge_options     IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
    perform_commit       IN   BOOLEAN   DEFAULT TRUE,
    local_converge_tag   IN   RAW       DEFAULT NULL,
    remote_converge_tag  IN   RAW       DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The identifier for the scan that contains the differences between the database objects being converged.</td>
</tr>
<tr>
<td>scan_info</td>
<td>Information about the converge operation returned in the COMPARISON_TYPE datatype.</td>
</tr>
<tr>
<td>converge_options</td>
<td>Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant.</td>
</tr>
<tr>
<td>perform_commit</td>
<td>If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE.</td>
</tr>
<tr>
<td>local_converge_tag</td>
<td>The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged.</td>
</tr>
</tbody>
</table>

See “Overview” on page 35-3 for more information about specifying a scan ID in this parameter.

See COMPARISON_TYPE Record Type on page 35-14.

See “Constants” on page 35-6 for information about these constants.

See “Security Model” on page 35-5 for information about security requirement related to this parameter, and see the Oracle Streams Replication Administrator’s Guide for more information about tags.
If one of the database objects being converged is a read-only materialized view, then the \texttt{converge_options} parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The \texttt{CONVERGE} procedure raises an error if it tries to make changes to a read-only materialized view.
CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```sql
DBMS_COMPARISON.CREATE_COMPARISON(
    comparison_name      IN  VARCHAR2,
    schema_name          IN  VARCHAR2,
    object_name          IN  VARCHAR2,
    dblink_name          IN  VARCHAR2,
    index_schema_name    IN  VARCHAR2  DEFAULT NULL,
    index_name           IN  VARCHAR2  DEFAULT NULL,
    remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
    remote_object_name   IN  VARCHAR2  DEFAULT NULL,
    comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
    column_list          IN  VARCHAR2  DEFAULT '*',
    scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
    scan_percent         IN  NUMBER    DEFAULT NULL,
    null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
    local_converge_tag   IN  RAW       DEFAULT NULL,
    remote_converge_tag  IN  RAW       DEFAULT NULL,
    max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
    min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema that contains the local database object to compare.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the local database object to compare.</td>
</tr>
<tr>
<td>dblink_name</td>
<td>Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database. If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the <code>remote_schema_name</code> and <code>remote_object_name</code> parameters.</td>
</tr>
<tr>
<td>index_schema_name</td>
<td>The name of the schema that contains the index.</td>
</tr>
<tr>
<td>index_name</td>
<td>The name of the index. If NULL, then the system determines the index columns for the comparison automatically. If the <code>index_schema_name</code> parameter is non-NULL, then the <code>index_name</code> parameter must also be non-NULL. Otherwise, an error is raised.</td>
</tr>
</tbody>
</table>

See Also: "Usage Notes" on page 35-22 for more information about specifying an index.
remote_schema_name  The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases.

If NULL, then the schema specified in the schema_name parameter is used.

remote_object_name  The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases.

If NULL, then the database object specified in the object_name parameter is used.

comparison_mode  Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.

column_list  Specify '*' to include all of the columns in the database objects being compared.

To compare a subset of columns in the database objects, specify a comma-delimited list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence.

See "Usage Notes" on page 35-22 for information about columns that are required in the column_list parameter.

scan_mode  Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM.

If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function.

See "Constants" on page 35-6 for information about these constants.

scan_percent  The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required.

If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison.

If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run.

If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored.

Note: When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10 for more information about the lead index column.
Table 35–6 (Cont.) CREATE_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>null_value</td>
<td>The value to substitute for each null in the database objects being compared. Specify a value or use the CMP_NULL_VALUE_DEF constant. If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found. See &quot;Constants&quot; on page 35-6 for information about this constant.</td>
</tr>
<tr>
<td>local_converge_tag</td>
<td>The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared. If the local_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 35-18 for more information. See the Oracle Streams Replication Administrator’s Guide for more information about tags.</td>
</tr>
<tr>
<td>remote_converge_tag</td>
<td>The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared. If the remote_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 35-18 for more information. See the Oracle Streams Replication Administrator’s Guide for more information about tags.</td>
</tr>
<tr>
<td>max_num_buckets</td>
<td>Specify the maximum number of buckets to use. Specify a value or use the CMP_MAX_NUM_BUCKETS constant. See &quot;Constants&quot; on page 35-6 for information about this constant. See &quot;Overview&quot; on page 35-3 for information about buckets. Note: If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the max_num_buckets parameter.</td>
</tr>
<tr>
<td>min_rows_in_bucket</td>
<td>Specify the minimum number of rows in each bucket. Specify a value or use the CMP_MIN_ROWS_IN_BUCKET constant. See &quot;Constants&quot; on page 35-6 for information about this constant. See &quot;Overview&quot; on page 35-3 for information about buckets.</td>
</tr>
</tbody>
</table>

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the index_schema_name and index_name parameters, the specified index determines the comparison’s index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.
The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in column_list parameter might or might not be used.

The columns in the specified index must meet the requirements described in "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10. If the index columns do not meet these requirements, then an error is raised.

---

**Note:** If you do not specify an index when you create a comparison, then the CREATE_COMPARISON procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the CREATE_COMPARISON procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the CONVERGE procedure synchronizes data.

---

**Usage Notes for the column_list Parameter**

When the column_list parameter is set to a value other than '*', the following columns are required in the column_list parameter:

- Any columns that are required to meet the index column requirements for the DBMS_COMPARISON package. If the index_name parameter is non-NULL, then the columns in the specified index must be in the column list. If the index_name parameter is NULL, then see "Index Column Requirements for the DBMS_COMPARISON Package" on page 35-10.

- If you plan to use the CONVERGE procedure to make changes to a database object based on the comparison, then any columns in this database object that have a NOT NULL constraint but no default value must be included in the column list. If these columns are not included, then the CONVERGE procedure returns an error. See CONVERGE Procedure on page 35-18.
DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

```sql
DBMS_COMPARISON.DROP_COMPARISON(
    comparison_name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
</tbody>
</table>
PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

Note: At least one of the following parameters must be set to NULL: scan_id or purge_time. If both the scan_id and purge_time parameters are NULL, then this procedure purges all comparison results for the comparison.

Syntax

```sql
DBMS_COMPARISON.PURGE_COMPARISON(
    comparison_name  IN  VARCHAR2,
    scan_id          IN  NUMBER     DEFAULT NULL,
    purge_time       IN  TIMESTAMP  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged. If NULL, then no scan ID is considered when purging comparison results for the comparison. See “Overview” on page 35-3 for information about scans.</td>
</tr>
<tr>
<td>purge_time</td>
<td>The date before which results are purged. If NULL, then no date is considered when purging comparison results for the comparison.</td>
</tr>
</tbody>
</table>
RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function continues to check the database object from the point where the previous scan ended.

Note: This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the COMPARE function.

See Also:
- Oracle Streams Replication Administrator’s Guide
- COMPARE Function on page 35-16

Syntax

DBMS_COMPARISON.RECHECK(
    comparison_name  IN  VARCHAR2,
    scan_id          IN  NUMBER,
    perform_row_dif  IN  BOOLEAN  DEFAULT FALSE)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan to recheck.</td>
</tr>
<tr>
<td>perform_row_dif</td>
<td>If TRUE, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket.</td>
</tr>
</tbody>
</table>

See "Overview" on page 35-3 for more information about specifying a scan ID in this parameter.

Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.
The **DBMS_COMPRESSION** package provides an interface to facilitate choosing the correct compression level for an application.

Using DBMS_COMPRESSION

- Overview
- Security Model
- Constants
Overview

The DBMS_COMPRESSION package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.
The DBMS_COMPRESSSION package is defined with AUTHID CURRENT USER, so it executes with the privileges of the current user.
The **DBMS_COMPRESSION** package uses the constants shown in Table 36–1, "DBMS_COMPRESSION Constants - Compression Types":

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>

**Note:** Hybrid columnar compression is a feature of certain Oracle storage systems. See *Oracle Database Concepts* for more information.
Data Structures

The DBMS_COMPRESSION package defines a RECORD type and a TABLE type.

RECORD TYPES

COMPREC Record Type

TABLE TYPES

COMPRECLIST Table Type
COMPREC Record Type

Record for calculating an individual index compression ratio on a table.

Syntax

```
TYPE COMPREC IS RECORD(
    ownname    varchar2(255),
    objname    varchar2(255),
    blkcnt_cmp PLS_INTEGER,
    blkcnt_uncmp PLS_INTEGER,
    row_cmp    PLS_INTEGER,
    row_uncmp  PLS_INTEGER,
    cmp_ratio  NUMBER,
    objtype    PLS_INTEGER);
```

Fields

```
Table 36–2  COMPREC Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the object owner</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>blkcnt_cmp</td>
<td>Number of blocks used by the compressed sample of the object</td>
</tr>
<tr>
<td>blkcnt_uncmp</td>
<td>Number of blocks used by the uncompressed sample of the object</td>
</tr>
<tr>
<td>row_cmp</td>
<td>Number of rows in a block in compressed sample of the object</td>
</tr>
<tr>
<td>row_uncmp</td>
<td>Number of rows in a block in uncompressed sample of the object</td>
</tr>
<tr>
<td>cmp_ratio</td>
<td>Compression ratio, blkcnt_uncmp divided by blkcnt_cmp</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object</td>
</tr>
</tbody>
</table>
```
COMPRECLIST Table Type

A table type of COMPREC Record Type.

Syntax

```
TYPE compreclist IS TABLE OF comprec;
```
### Summary of DBMS_COMPRESSION Subprograms

**Table 36–3  DBMS_COMPRESSION Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_COMPRESSION_RATIO Procedure</td>
<td>Analyzes the compression ratio of a table, and gives information about compressibility of a table</td>
</tr>
<tr>
<td>GET_COMPRESSION_TYPE Function</td>
<td>Returns the compression type for a specified row</td>
</tr>
</tbody>
</table>
GET_COMPRESSION_RATIO Procedure

This procedure analyzes the compression ratio of a table, and gives information about compressibility of a table. Various parameters can be provided by the user to selectively analyze different compression types.

Syntax

Get compression ratio for an object (table or index, default is table):

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
  scratchtbsname IN VARCHAR2,  
  ownname IN VARCHAR2,  
  objname IN VARCHAR2,  
  subobjname IN VARCHAR2,  
  comptype IN NUMBER,  
  blkcnt_cmp OUT PLS_INTEGER,  
  blkcnt_uncmp OUT PLS_INTEGER,  
  row_cmp OUT PLS_INTEGER,  
  row_uncmp OUT PLS_INTEGER,  
  cmp_ratio OUT NUMBER,  
  comptype_str OUT VARCHAR2,  
  subset_numrows IN NUMBER DEFAULT COMP_RATIO_MINROWS,  
  objtype IN PLS_INTEGER DEFAULT OBJTYPE_TABLE);  
```

Get compression ratio for LOBs:

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
  scratchtbsname IN VARCHAR2,  
  tabowner IN VARCHAR2,  
  tabname IN VARCHAR2,  
  lobname IN VARCHAR2,  
  partname IN VARCHAR2,  
  comptype IN NUMBER,  
  blkcnt_cmp OUT PLS_INTEGER,  
  blkcnt_uncmp OUT PLS_INTEGER,  
  lobcnt OUT PLS_INTEGER,  
  cmp_ratio OUT NUMBER,  
  comptype_str OUT VARCHAR2,  
  subset_numrows IN NUMBER DEFAULT COMP_RATIO_LOB_MAXROWS);  
```

Get compression ratio for all indexes on a table. The compression ratios are returned as a collection.

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
  scratchtbsname IN VARCHAR2,  
  ownname IN VARCHAR2,  
  tabname IN VARCHAR2,  
  comptype IN NUMBER,  
  index_cr OUT compRecList,  
  comptype_str OUT VARCHAR2,  
  subset_numrows IN NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scratchtbsname</td>
<td>Temporary scratch tablespace that can be used for analysis</td>
</tr>
</tbody>
</table>
### Table 36–4 (Cont.) GET_COMPRESSION_RATIO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname/tabowner</td>
<td>Schema of the table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to analyze</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>subobjname</td>
<td>Name of the partition or sub-partition of the object</td>
</tr>
<tr>
<td>comptype</td>
<td>Compression types for which analysis should be performed</td>
</tr>
<tr>
<td>blkcnt_cmp</td>
<td>Number of blocks used by compressed sample of the table</td>
</tr>
<tr>
<td>blkcnt_uncmp</td>
<td>Number of blocks used by uncompressed sample of the table</td>
</tr>
<tr>
<td>row_cmp</td>
<td>Number of rows in a block in compressed sample of the table</td>
</tr>
<tr>
<td>row_uncmp</td>
<td>Number of rows in a block in uncompressed sample of the table</td>
</tr>
<tr>
<td>cmp_ratio</td>
<td>Compression ratio, blkcnt_uncmp divided by blkcnt_cmp</td>
</tr>
<tr>
<td>comptype_str</td>
<td>String describing the compression type</td>
</tr>
<tr>
<td>subset_numrows</td>
<td>Number of rows sampled to estimate compression ratio.</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object. Should be a constant to indicate object types defined in this package.</td>
</tr>
<tr>
<td>lobname</td>
<td>Name of the LOB column</td>
</tr>
<tr>
<td>partname</td>
<td>In case of partitioned tables, the related partition name</td>
</tr>
<tr>
<td>lobcnt</td>
<td>Number of lobs actually sampled to estimate compression ratio</td>
</tr>
<tr>
<td>index_cr</td>
<td>List of indexes and their estimated compression ratios</td>
</tr>
</tbody>
</table>

### Usage Notes

The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.
GET_COMPRESSION_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

Syntax

```sql
DBMS_COMPRESSION.GET_COMPRESSION_TYPE (
    ownname      IN    VARCHAR2,
    tabname      IN    VARCHAR2,
    row_id       IN    ROWID,
    subobjname   IN    VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema name of the table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>rowid</td>
<td>Rowid of the row</td>
</tr>
<tr>
<td>subobjname</td>
<td>Name of the table partition or subpartition</td>
</tr>
</tbody>
</table>

Return Values

Flag to indicate the compression type (see DBMS_COMPRESSION Constants - Compression Types).
The DBMS_CONNECTION_POOL package provides an interface to manage Database Resident Connection Pool.

See Also: Oracle Database Concepts for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- Summary of DBMS_CONNECTION_POOL Subprograms
## Summary of DBMS_CONNECTION_POOL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PARAM Procedure on page 37-3</td>
<td>Alters a specific configuration parameter as a standalone unit and does not affect other parameters</td>
</tr>
<tr>
<td>CONFIGURE_POOL Procedure on page 37-4</td>
<td>Configures the pool with advanced options</td>
</tr>
<tr>
<td>START_POOL Procedure on page 37-6</td>
<td>Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions</td>
</tr>
<tr>
<td>STOP_POOL Procedure on page 37-7</td>
<td>Stops the pool and makes it unavailable for the registered connection clients</td>
</tr>
<tr>
<td>RESTORE_DEFAULTS Procedure on page 37-8</td>
<td>Restores the pool to default settings</td>
</tr>
</tbody>
</table>
ALTER_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

Syntax

DBMS_CONNECTION_POOL.ALTER_PARAM (  pool_name     IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',   param_name  IN  VARCHAR2,   param_value   IN  VARCHAR2);

Parameters

Table 37–2 ALTER_PARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>param_name</td>
<td>Any parameter name from CONFIGURE_POOL</td>
</tr>
<tr>
<td>param_value</td>
<td>Parameter value for param_name.</td>
</tr>
</tbody>
</table>

Exceptions

Table 37–3 ALTER_PARAM Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56504</td>
<td>Invalid connection pool configuration parameter name</td>
</tr>
<tr>
<td>ORA-56505</td>
<td>Invalid connection pool configuration parameter value</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Examples

DBMS_CONNECTION_POOL.ALTER_PARAM(  'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```sql
DBMS_CONNECTION_POOL.CONFIGURE_POOL ( 
    pool_name                IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
    minsize                  IN NUMBER   DEFAULT 4,
    maxsize                  IN NUMBER   DEFAULT 40,
    incrsize                 IN NUMBER   DEFAULT 2,
    sessionCachedCursors     IN NUMBER   DEFAULT 20,
    inactivityTimeout        IN NUMBER   DEFAULT 300,
    maxThinkTime             IN NUMBER   DEFAULT 120,
    maxUseSession            IN NUMBER   DEFAULT 500000,
    maxLifetimeSession       IN NUMBER   DEFAULT 86400,
    numCbrok                 IN NUMBER   DEFAULT 1,
    maxConnCbrok             IN NUMBER   DEFAULT 40000);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>minsize</td>
<td>Minimum number of pooled servers in the pool</td>
</tr>
<tr>
<td>maxsize</td>
<td>Maximum allowed pooled servers in the pool</td>
</tr>
<tr>
<td>incrsize</td>
<td>Pool would increment by this number of pooled server when pooled server are unavailable at application request time</td>
</tr>
<tr>
<td>sessionCachedCursors</td>
<td>Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter</td>
</tr>
<tr>
<td>inactivityTimeout</td>
<td>TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.</td>
</tr>
<tr>
<td>maxThinkTime</td>
<td>Maximum time of inactivity by the client after getting a session from the pool. If the client does not issue a database call after grabbing a server from the pool, the client will be forced to relinquish control of the pooled server and will get an ORA-xxxxxx error. The freed up server may or may not be returned to the pool.</td>
</tr>
<tr>
<td>maxUseSession</td>
<td>Maximum number of times a connection can be taken and released to the pool</td>
</tr>
<tr>
<td>maxLifetimeSession</td>
<td>TTL (Time to live) for a pooled session</td>
</tr>
<tr>
<td>numCbrok</td>
<td>Number of brokers to be started at pool start</td>
</tr>
<tr>
<td>maxConnCbrok</td>
<td>Maximum number of connections for each broker</td>
</tr>
</tbody>
</table>
Exceptions

Table 37–5  CONFIGURE_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
- `minsize` should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- `maxsize` should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- `session_cached_cursors` is typically set to the number of most frequently used statements. It occupies cursor resource on the server.
- In doubt, do not set the `increment` and `inactivity_timeout`. The pool will have reasonable defaults.
- `max_use_session` and `max_lifetime_session` allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.
- The connection pool reserves 5% of the pooled servers for authentication, and at least one pooled server is always reserved for authentication. When setting the `maxsize` parameter, ensure that there are enough pooled servers for both authentication and connections.
START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```sql
DBMS_CONNECTION_POOL.START_POOL (  
    pool_name  IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be started. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56501</td>
<td>Connection pool startup failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```sql
DBMS_CONNECTION_POOL.STOP_POOL (    
    pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be stopped. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56506</td>
<td>Connection pool shutdown failed</td>
</tr>
</tbody>
</table>

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.
RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```sql
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (  
    pool_name   IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be restored. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
The DBMS_CQ_NOTIFICATION package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

See Also: Oracle Database Development Guide regarding implementing database change notification.

This chapter contains the following topics:

Using DBMS_CQ_NOTIFICATION

- Overview
- Security Model
- Constants
- Operational Notes
- Examples
Overview

The DBMS_CQ_NOTIFICATION package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and \( \textit{COMMIT} \)s, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a BEGIN-END block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered “interesting queries” and objects referenced by those queries during query execution are registered. The registration is completed by \textit{ENDING} the registration block. The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.
The DBMS_CQ_NOTIFICATION package requires that the user have the CHANGE NOTIFICATION system privilege in order to receive notifications, and be granted EXECUTE privilege on the DBMS_CQ_NOTIFICATION package.

In addition the user is required to have SELECT or READ privileges on all objects to be registered. Note that if the SELECT or READ privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.
Constants

The DBMS_CQ_NOTIFICATION package uses the constants shown in Table 38–1. The constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CQ_NOTIFICATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDS describe registration Quality of Service properties that the client requires. These are specified during registration.

Table 38–1  DBMS_CQ_NOTIFICATION Constants

<table>

</tr>
</tbody>
</table>
Operational Notes

With regard to object level registration:

- The notifications are published by the database when a transaction changes the registered objects and COMMITs.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

With regard to query result change registration:

- The notifications are published by the database when a transaction changes the result set of the registered query and COMMITs.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the job_queue_processes parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you COMMITting the transaction? Please note that the notifications are transactional and will be generated when the transaction COMMITs.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named $ORACLE_SID_j*<PID>.trc.'

For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.'

Suppose a registration is created with 'chnf_callback' as the notification handler and with registration_id 100. Let us suppose the user forgets to define the chnf_callback procedure. Then the JOBQ trace file might contain a message of the following form.

Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
Error in PLSQL notification of msgid:
Queue :
Consumer Name :
PLSQL function :chnf_callback
Exception Occurred, Error msg:
ORA-00604: error occurred at recursive SQL level 2
ORA-06550: line 1, column 7:
PLS-00201: identifier 'CHNF_CALLBACK' must be declared
ORA-06550: line 1, column 7:
PL/SQL: Statement ignored

See Also: For more information about troubleshooting Database Change Notification, see Oracle Database Development Guide.
Examples

Object Change Registration Example

Suppose that a mid-tier application has a lot of queries on the `HR.EMPLOYEES` table. If the `EMPLOYEES` table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The `DBMS_CQ_NOTIFICATION` package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.

2. Create a server side stored procedure to process notifications

```sql
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$DESC) IS
    regid           NUMBER;
tbname          VARCHAR2(60);
event_type      NUMBER;
numtables       NUMBER;
operation_type  NUMBER;
numrows         NUMBER;
row_id          VARCHAR2(20);
BEGIN
    regid      := ntfnds.registration_id;
    numtables  := ntfnds.numtables;
    event_type := ntfnds.event_type;

    INSERT INTO nfevents VALUES(regid, event_type);
    IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
        FOR i IN 1..numtables LOOP
            tbname          := ntfnds.table_desc_array(i).table_name;
            operation_type  := ntfnds.table_desc_array(I).Opflags;
            INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
        END LOOP;

    END IF;
END;
```

Examples
In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

Notes

a. In the above example, a registration was created on the EMPLOYEES table with 'chnf_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS_RELIABLE) and rowid notifications (QOS_ROWIDS).

b. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be accessed.

c. The handler accesses the row descriptor array from the table notification descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the ALL_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation. This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL_HTTP. The listener could then refresh its cache by querying from the back-end database.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (chnf_callback) as the name of the server side PL/SQL procedure to be executed when a notification is generated.
Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
    REGDS SYS.CHNF$_REG_INFO;
    regid NUMBER;
    mgr_id NUMBER;
    dept_id NUMBER;
    qosflags NUMBER;
BEGIN
    qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
                DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
    REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0, 0, 0);
    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
    SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

Once the registration is created in Step 3 above, the server side PL/SQL procedure
defined in Step 2 is executed in response to any COMMITted changes to the HR.EMPLOYEES
table. As an example, let us assume that the following update is performed on the
employees table.

UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;COMMIT;

Once the notification is processed, you will find rows which might look like the
following in the nfevents, nftablechanges and nfrowchanges tables.

SQL> SELECT * FROM nfevents;
REGID    EVENT_TYPE
---------------------------
20045      6

SQL> SELECT * FROM nftablechanges;
REGID    TABLE_NAME         TABLE_OPERATION
-------------------------------------------
20045    HR.EMPLOYEES            4

SQL> select * from nfrowchanges;
REGID    TABLE_NAME          ROW_ID
------------------------------------------------------
20045     HR.EMPLOYEES    AAAKE/AABAAJ8zAaF

Query Result Change Registration Example
1. Creating a Callback

CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;

END;
/

3. After creating the query registrations, the output from USER_CQ_NOTIFICATION_ QUERIES would appear as follows.

SQL> SELECT queryid, regid, to_char(querytext)
    FROM user_cq_notification_queries;

<table>
<thead>
<tr>
<th>QUERYID</th>
<th>REGID</th>
<th>TO_CHAR(QUERYTEXT)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Now, let us perform an UPDATE that changes the result of the query with queryid 22 by renaming the department with name 'IT' to FINANCE.

SQL> update departments set department_name = 'FINANCE' where department_name = 'IT';

1 row updated.

SQL> commit;

Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;

REGID EVENT_TYPE
---------- ----------
   61          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nfqueries;

QID QOP
---------- ----------
  42          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;

REGID TABLE_NAME
---------- ---------------------------------------------------------------
   42 HR.DEPARTMENTS-------------------------------------------------------

TABLE_OPERATION 4 corresponds to UPDATEOP
```sql
SQL> select * from nfrowchanges;
   REGID  
--------
TABLE_NAME  
-----------------------------------------------
   -  
ROW_ID  
-----------------------------------------------
   -  
   61
   HR.DEPARTMENTS
   AAAAAAABAAAALinAAP
```
Data Structures

The DBMS_CQ_NOTIFICATION package defines the following OBJECT types.

OBJECT Types

- CQ_NOTIFICATION$_DESCRIPTOR Object Type
- CQ_NOTIFICATION$_QUERY Object Type
- CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_TABLE Object Type
- CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_ROW Object Type
- CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_REG_INFO Object Type
CQ_NOTIFICATION$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF$_DESC type.

Syntax

```sql
TYPE SYS.CHNF$_DESC IS OBJECT(
    registration_id NUMBER,
    transaction_id RAW(8),
    dbname VARCHAR2(30),
    event_type NUMBER,
    numtables NUMBER,
    table_desc_array CQ_NOTIFICATION$_TABLE_ARRAY,
    query_desc_array CQ_NOTIFICATION$_QUERY_ARRAY);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registration_id</td>
<td>Registration ID returned during registration</td>
</tr>
<tr>
<td>transaction_id</td>
<td>Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.</td>
</tr>
<tr>
<td>dbname</td>
<td>Name of database</td>
</tr>
<tr>
<td>event_type</td>
<td>Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)</td>
</tr>
<tr>
<td>numtables</td>
<td>Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>query_desc_array</td>
<td>Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE</td>
</tr>
</tbody>
</table>

Table 38–2  CQ_NOTIFICATION$_DESCRIPTOR Object Type
CQ_NOTIFICATIONS_QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit. An array of CQ_NOTIFICATIONS_QUERY descriptors is embedded inside the top level notification descriptor (CQ_NOTIFICATIONS_DESCRIPTOR) for events of type EVENT_QUERYCHANGE. The array corresponds to the set of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF$QDESC.

Syntax

```sql
TYPE SYS.CHNF$QDESC IS OBJECT (
  queryid     NUMBER,
  queryop    NUMBER,
  table_desc_array        CQ_NOTIFICATIONS_TABLE_ARRAY);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryid</td>
<td>QueryId of the changed query</td>
</tr>
<tr>
<td>queryop</td>
<td>Operation describing change to the query</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table changes which contributed to the query Result Set change</td>
</tr>
</tbody>
</table>
CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$_QUERY objects. It is a synonym for the SYS.CHNF$_QUERY_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```
CQ_NOTIFICATION$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for events of type EVENT_OBJCHANGE. For query result set changes (event type will be set to EVENT_QUERYCHANGE), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_TDESC.

Syntax

```sql
TYPE SYS.CHNF$_TDESC IS OBJECT (
    opflags            NUMBER,
    table_name         VARCHAR2(2*M_IDEN+1),
    numrows            NUMBER,
    row_desc_array     CQ_NOTIFICATION$_ROW_ARRAY)
```

Attributes

### Table 38–4  TYPE SYS.CQ_NOTIFICATION$_TABLE Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of modified table</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.</td>
</tr>
<tr>
<td>row_desc_array</td>
<td>Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.</td>
</tr>
</tbody>
</table>
CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$_TABLE objects. It is a synonym for the SYS.CHNF$_TDESC_ARRAY type.

Syntax

```sql
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```
CQ_NOTIFICATION$._ROW Object Type

An array of CQ_NOTIFICATION$._ROW is embedded inside a CQ_NOTIFICATION$._TABLE (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$._RDESC.

Syntax

```sql
TYPE SYS.CHNF$._RDESC IS OBJECT (
  opflags    NUMBER,
  row_id     VARCAHR2 (2000));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).</td>
</tr>
<tr>
<td>row_id</td>
<td>The rowid of the modified row</td>
</tr>
</tbody>
</table>
This object type corresponds to an array of CQ_NOTIFICATION$_ROW objects and is embedded inside the CQ_NOTIFICATION$_TABLE if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

This type is a synonym for the SYS.CHNF$_RDESC_ARRAY type.

Syntax

TYPE CQ_NOTIFICATIONS$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATIONS$_ROW;
CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named SYS.CHNF$_REG_INFO.

Syntax

```sql
TYPE SYS.CHNF$_REG_INFO IS OBJECT {
    callback                        VARCHAR2(20),
    qosflags                       NUMBER,
    timeout                        NUMBER,
    operations_filter              NUMBER,
    transaction_lag                NUMBER,
    ntfn_grouping_class            NUMBER,
    ntfn_grouping_value            NUMBER,
    ntfn_grouping_type             NUMBER,
    ntfn_grouping_start_time       TIMESTAMP WITH TIME ZONE,
    ntfn_grouping_repeat_count     NUMBER);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callback</td>
<td>Name of the server side PL/SQL procedure to be executed on a notification. Prototype is <code>&lt;call_backname&gt;(ntfnds IN SYS.chnfs_desc)</code></td>
</tr>
<tr>
<td>qosflags</td>
<td>Quality of service flags. Can be set to an OR of the following values:</td>
</tr>
<tr>
<td></td>
<td>- QOS_RELIABLE (0x1): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in an Oracle RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown.</td>
</tr>
<tr>
<td></td>
<td>- QOS_DEREG_NFY (0x2): The registration will be expunged on the first notification</td>
</tr>
<tr>
<td></td>
<td>- QOS_ROWIDS (0x4): The notification needs to include information about the rowids that were modified</td>
</tr>
<tr>
<td></td>
<td>- QOS_QUERY (0x8): specifies query result change notification as opposed to object change notification</td>
</tr>
<tr>
<td></td>
<td>- QOS_BEST_EFFORT (0x16): can register simplified versions of queries and minimizes evaluation with some false positives.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 38–6</th>
<th>TYPE CQ_NOTIFICATION$_REG_INFO Object Type</th>
<th>Description</th>
</tr>
</thead>
</table>
### Table 38–6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.</td>
</tr>
<tr>
<td>operations_filter</td>
<td>if nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types:</td>
</tr>
<tr>
<td></td>
<td>■ 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS)</td>
</tr>
<tr>
<td></td>
<td>■ 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP)</td>
</tr>
<tr>
<td></td>
<td>■ 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP)</td>
</tr>
<tr>
<td></td>
<td>■ 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP)</td>
</tr>
<tr>
<td></td>
<td>A combination of operations can be specified by using a bitwise OR.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the &quot;GROUPING notification&quot; option.</td>
</tr>
<tr>
<td>transaction_lag</td>
<td>Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter will be honored for object level registrations but ignored for query result change notification registrations.</td>
</tr>
<tr>
<td>ntfn_grouping_class</td>
<td>When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME by which notifications are grouped by time.</td>
</tr>
<tr>
<td>ntfn_grouping_value</td>
<td>The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.</td>
</tr>
<tr>
<td>ntfn_grouping_type</td>
<td>The type of grouping desired. It can be one of two allowed values</td>
</tr>
<tr>
<td></td>
<td>■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY - all notifications in the group are summarized into a single notification</td>
</tr>
<tr>
<td></td>
<td>■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST - only the last notification in the group is published and the earlier ones discarded</td>
</tr>
<tr>
<td>ntfn_grouping_start_time</td>
<td>When to start generating notifications. If specified as NULL, it defaults to the current system generated time.</td>
</tr>
</tbody>
</table>
The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```plaintext
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    quosflags                       NUMBER,
    timeout                         NUMBER);
```

The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```plaintext
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    quosflags                       NUMBER,
    timeout                         NUMBER,
    operations_filter               NUMBER,
    transaction_lag                 NUMBER);
```

The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

```plaintext
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    quosflags                       NUMBER,
    timeout                         NUMBER,
    operations_filter               NUMBER,
    ntfn_grouping_class             NUMBER,
    ntfn_grouping_value             NUMBER,
    ntfn_grouping_type              NUMBER,
    ntfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,
    ntfn_grouping_repeat_count      NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

  ```plaintext
  PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
  ```

  `CHNF$_DESC` describes the change notification descriptor.

- The init.ora parameter `job_queue_processes` must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

### Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

  ```plaintext
  TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    quosflags                       NUMBER,
    timeout                         NUMBER);
  ```

  The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

  ```plaintext
  TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    quosflags                       NUMBER,
    timeout                         NUMBER,
    operations_filter               NUMBER,
    transaction_lag                 NUMBER);
  ```

  The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

  ```plaintext
  TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    quosflags                       NUMBER,
    timeout                         NUMBER,
    operations_filter               NUMBER,
    ntfn_grouping_class             NUMBER,
    ntfn_grouping_value             NUMBER,
    ntfn_grouping_type              NUMBER,
    ntfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,
    ntfn_grouping_repeat_count      NUMBER);
  ```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

  ```plaintext
  PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
  ```

  `CHNF$_DESC` describes the change notification descriptor.

- The init.ora parameter `job_queue_processes` must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.
### Summary of DBMS_CQ_NOTIFICATION Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CQ_NOTIFICATION_QUERYID Function on page 38-27</td>
<td>Returns the queryid of the most recent query that was attempted to be registered in a registration block</td>
</tr>
<tr>
<td>DEREGISTER Procedure on page 38-28</td>
<td>De-subscribes the client with the supplied registration identifier (ID)</td>
</tr>
<tr>
<td>ENABLE_REG Procedure on page 38-29</td>
<td>Begins a registration block using an existing registration identifier (ID)</td>
</tr>
<tr>
<td>NEW_REG_START Function on page 38-30</td>
<td>Begins a new registration block</td>
</tr>
<tr>
<td>REG_END Procedure on page 38-31</td>
<td>Ends the registration boundary</td>
</tr>
<tr>
<td>SET_ROWID_ THRESHOLD Procedure on page 38-32</td>
<td>Configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction</td>
</tr>
</tbody>
</table>
CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```sql
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.
DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER {
    regid IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>

Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.
ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). It is similar to the interface for creating a new registration, except that it takes an existing regid to which to add objects. Subsequent execution of queries causes the objects referenced in the queries to be added to the specified regid, and the registration is completed on invoking the REG_END Procedure.

Syntax

```plaintext
DBMS_CQ_NOTIFICATION.ENABLE_REG (regid IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.
NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the `REG_END` procedure.

Syntax

```sql
DBMS_CQ_NOTIFICATION.NEW_REG_START (
    regds IN sys.chnf$_reg_info)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys.chnf$_reg_info</td>
<td>Registration descriptor describing the notification handler and other properties of the registration</td>
</tr>
</tbody>
</table>

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the `CHANGE NOTIFICATION` system privilege and `SELECT` or `READ` privileges on any objects to be registered.
- The `SYS` user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.
REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CQ_NOTIFICATION.REG_END;
```
SET_ROWID_THRESHOLD Procedure

This procedure configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction.

Syntax

```sql
DBMS_CQ_NOTIFICATION.SET_ROWID_THRESHOLD (  
    tbname     IN  VARCHAR2,
    threshold  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tbname</td>
<td>Table name qualified by the schema name in the form schemaname.tablename</td>
</tr>
<tr>
<td>threshold</td>
<td>Maximum number of modified rows of the table to be published in the change notification</td>
</tr>
</tbody>
</table>

Usage Notes

- The table needs to be registered for change notification either at object change granularity or at query result set granularity.
- The threshold set by means of this subprogram applies to that instance only and does not persist across instance startup/shutdown.
The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.

- Examples
Overview

Credentials are database objects that hold a username/password pair for authenticating and impersonating EXTPROC callout functions, as well as remote jobs, external jobs and file watchers from the SCHEDULER. They are created using the CREATE_CREDENTIAL Procedure. The procedure also allows you to specify the Windows domain for remote external jobs executed against a Windows server.
Security Model

Every Oracle credential has a unique credential name and we can associate a credential through its unique credential name with EXTPROC by means of a PL/SQL alias library.

In order to associate a credential with a PL/SQL alias library and external procedure, you must have the CREATE AND/OR REPLACE LIBRARY privilege or CREATE AND/OR REPLACE FUNCTION / PROCEDURE privilege and read permission of the DLL or shared object that the alias library to be associated with so that you can create and/or replace function or procedure to make use of the alias library.

Once authenticated, EXTPROC must act on behalf of the client based on client's identity defined in the supplied user credential. If not authenticated, EXTPROC must return an error message.

In order to create or alter a credential, you must have the CREATE CREDENTIAL privilege. If you are attempting to create or alter a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
Operational Notes

As the existing CREATE OR REPLACE LIBRARY statement and CREATE OR REPLACE FUNCTION/PROCEDURE do not support a CREDENTIAL clause, this model requires syntax and semantic changes in CREATE OR REPLACE LIBRARY and CREATE OR REPLACE FUNCTION/PROCEDURE statement.

For example:

CREATE OR REPLACE LIBRARY test
  AS '$ORACLE_HOME/bin/test.so' CREDENTIAL ricky_cred;
CREATE OR REPLACE FUNCTION ftest1
  (x VARCHAR2, y BINARY_INTEGER)
RETURN BINARY_INTEGER
AS LANGUAGE C
LIBRARY test
NAME 'negative'
PARAMETERS(x STRING, y INT);

The credential name defined in the CREDENTIAL clause is a name of a database object. Therefore, do not enclose the credential name with single or double quotes.

An example of a credential being used on an external job:

BEGIN
  DBMS_SCHEDULER.CREATE_JOB(
    job_name => 'example_job',
    job_type => 'EXECUTABLE',
    job_action => '/bin/ls',
    credential_name => 'ricky_cred');
END;
/

### Summary of DBMS_CREDENTIAL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
</table>
CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair in a database object called an Oracle credential.

Syntax

```sql
DBMS_CREDENTIAL.CREATE_CREDENTIAL (
    credential_name   IN  VARCHAR2,
    username          IN  VARCHAR2,
    password          IN  VARCHAR2,
    database_role     IN  VARCHAR2 DEFAULT NULL,
    windows_domain    IN  VARCHAR2 DEFAULT NULL,
    comments          IN  VARCHAR2 DEFAULT NULL,
    enabled           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to uppercase case unless enclosed in double quotes.</td>
</tr>
<tr>
<td>username</td>
<td>User name to login to the operating system or remote database to run a job if this credential is chosen. This cannot be set to NULL.</td>
</tr>
<tr>
<td>password</td>
<td>Password to login to the remote operating system to run a job if this credential is chosen. It is case sensitive.</td>
</tr>
<tr>
<td>database_role</td>
<td>Whether a database job using this credential should attempt to log in with administrative privileges. Values: SYSDBA, SYSDG, SYSADMIN or SYSBACKUP.</td>
</tr>
<tr>
<td>windows_domain</td>
<td>For a Windows remote executable target, this is the domain that the specified user belongs to. The domain will be converted to uppercase automatically.</td>
</tr>
<tr>
<td>comments</td>
<td>A text string that can be used to describe the credential to the user. The Scheduler does not use this field.</td>
</tr>
<tr>
<td>enabled</td>
<td>Determines whether the credential is enabled or not</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE_CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE_CREDENTIAL or CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- Attempting to create a credential with an existing credential name returns an error. To alter an existing credential, users must drop the existing credential first using the DROP_CREDENTIAL Procedure.
- Attempting to drop an existing credential, which is already referenced by alias libraries, returns an error. To drop an existing credential without any checking, users must set the force parameter of DROP_CREDENTIAL Procedure to TRUE.
You may also alter a credential, by means of the `UPDATE_CREDENTIAL` Procedure.

**Examples**

**Create a Basic Credential**

```
CONN scott
Enter password: password

BEGIN
  -- Basic credential.
  DBMS_CREDENTIAL.CREATE_CREDENTIAL(
    credential_name  =>  'TIM_HALL_CREDENTIAL',
    username         =>  'tim_hall',
    password         =>  'password');
END
```

**Create a Windows Credential**

```
CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.CREATE_CREDENTIAL(
    credential_name   =>  'TIM_HALL_WIN_CREDENTIAL',
    username          =>  'tim_hall',
    password          =>  'password',
    windows_domain    =>  'localdomain');
END
```

**Display Information about Credentials**

Information about credentials is displayed using the `[DBA|ALL|USER] _CREDENTIALS` views.

```
COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name, username, windows_domain
FROM   user_credentials
ORDER BY credential_name;

CREDENTIAL_NAME   USERNAME      WINDOWS_DOMAIN
----------------- -------------- -------------------
TIM_HALL_CREDENTIAL tim_hall
TIM_HALL_WIN_CREDENTIAL tim_hall   LOCALDOMAIN
2 rows selected.
```

SQL>
**DISABLE_CREDENTIAL Procedure**

This procedure disables an Oracle credential.

**Syntax**

```sql
DBMS_CREDENTIAL.DISABLE_CREDENTIAL (  
    credential_name   IN  VARCHAR2,  
    force             IN  BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
<tr>
<td>force</td>
<td>If FALSE, the credential is not disabled provided it has no dependency on any existing scheduler job or PL/SQL library. An error is returned if the dependency is observed. If TRUE, the credential is disabled whether or not there is any scheduler job or PL/SQL library referencing it.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.

- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled lets an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user of external jobs, database jobs, file transfers, external procedures, and file watching. To enable an existing disabled credential, you need to use the ENABLE_CREDENTIAL Procedure.

- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.
DROP_CREDENTIAL Procedure

This procedure drops an Oracle credential.

Syntax

```
DBMS_CREDENTIAL.DROP_CREDENTIAL (
    credential_name   IN  VARCHAR2,
    force             IN  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If set to FALSE, the credential must not be referenced by any EXTPROC alias library or an error is raised. If set to TRUE, the credential is dropped whether or not there are extproc alias libraries referencing it. EXTPROC alias libraries that reference the dropped credential become invalid.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner of a credential or a user with the CREATE ANY CREDENTIAL system privilege may drop the credential.

Examples

```
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_CREDENTIAL', FALSE);
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_WIN_CREDENTIAL', FALSE);
```
ENABLE_CREDENTIAL Procedure

This procedure enables an Oracle credential.

Syntax

```sql
DBMS_CREDENTIAL.ENABLE_CREDENTIAL (    credential_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE CREDENTIAL or CREATE ANY CREDENTIAL privilege.

- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled would allow an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user (external jobs, file transfers, external procedures, file watching). To disable an existing credential, you need to use the DISABLE_CREDENTIAL Procedure.

- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.
UPDATE_CREDENTIAL Procedure

This procedure updates an existing Oracle credential.

Syntax

```sql
DBMS_CREDENTIAL.UPDATE_CREDENTIAL ( 
    credential_name   IN   VARCHAR2, 
    attribute         IN   VARCHAR2, 
    value             IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td>attribute</td>
<td>Name of attribute to update: USERNAME, PASSWORD, WINDOWS_DOMAIN, DATABASE_ROLE or COMMENTS</td>
</tr>
<tr>
<td>value</td>
<td>New value for the selected attribute</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- EXTPROC alias libraries that reference the updated credential will become invalid. A library becomes invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

Examples

Update a Basic Credential

```sql
CONN scott
Enter password: password

BEGIN
    -- Basic credential.
    DBMS_CREDENTIAL.UPDATE_CREDENTIAL ( 
        credential_name => 'TIM_HALL_CREDENTIAL', 
        attribute       => 'password', 
        value           => 'password2');

    DBMS_CREDENTIAL.UPDATE_CREDENTIAL ( 
        credential_name => 'TIM_HALL_CREDENTIAL', 
        attribute       => 'username', 
        value           => 'tim_hall');
END;
```
**Update a Windows Credential**

```
CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
  DBMS_CREDENTIAL.UPDATE_CREDENTIAL(
    credential_name => 'TIM_HALL_WIN_CREDENTIAL',
    username        => 'tim_hall',
    password        => 'password',
    windows_domain  => 'localdomain');
END
```

**Display Information about Credentials**

Information about credentials is displayed using the `[DBA|ALL|USER]_CREDENTIALS` views.

```
COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   all_credentials
ORDER BY credential_name;
```

<table>
<thead>
<tr>
<th>CREDENTIAL_NAME</th>
<th>USERNAME</th>
<th>WINDOWS_DOMAIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIM_HALL_CREDENTIAL</td>
<td>tim_hall</td>
<td></td>
</tr>
<tr>
<td>TIM_HALL_WIN_CREDENTIAL</td>
<td>tim_hall</td>
<td>LOCALDOMAIN</td>
</tr>
</tbody>
</table>

2 rows selected.

SQL>
DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

See Also: Oracle Database Security Guide for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

Using the DBMS_CRYPTO Subprograms

- Overview
- Security Model
- Datatypes
- Algorithms
- Restrictions
- Exceptions
- Operational Notes
Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, SHA-1, and SHA-2 cryptographic hashes
- MD5, SHA-1, and SHA-2 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 40–1 summarizes the DBMS_CRYPTO package features.

<table>
<thead>
<tr>
<th>Package Feature</th>
<th>DBMS_CRYPTO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cryptographic algorithms</td>
<td>DES, 3DES, AES, RC4, 3DES_2KEY</td>
</tr>
<tr>
<td>Padding forms</td>
<td>PKCS5, zeroes</td>
</tr>
<tr>
<td>Block cipher chaining modes</td>
<td>CBC, CFB, ECB, OFB</td>
</tr>
<tr>
<td>Cryptographic hash algorithms</td>
<td>MD5, SHA-1, SHA-2 (SHA-256, SHA-384, SHA-512), MD4</td>
</tr>
<tr>
<td>Keyed hash (MAC) algorithms</td>
<td>HMAC_MD5, HMAC_SH1, HMAC_SH256, HMAC_SH384, HMAC_SH512</td>
</tr>
<tr>
<td>Cryptographic pseudo-random number generator</td>
<td>RAW, NUMBER, BINARY_INTEGER</td>
</tr>
<tr>
<td>Database types</td>
<td>RAW, CLOB, BLOB</td>
</tr>
</tbody>
</table>

The DBMS_CRYPTO package replaces DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, SHA-1, or SHA-2.
Security Model

Oracle Database installs this package in the SYS schema. You can then grant package access to existing users and roles as needed.
Datatypes

Parameters for the DBMS_CRYPTO subprograms use these datatypes:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOB</td>
<td>A source or destination binary LOB</td>
</tr>
<tr>
<td>CLOB</td>
<td>A source or destination character LOB (excluding NCLOB)</td>
</tr>
<tr>
<td>PLS_INTEGER</td>
<td>Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)</td>
</tr>
<tr>
<td>RAW</td>
<td>A source or destination RAW buffer</td>
</tr>
</tbody>
</table>
The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

### Table 40–3  DBMS_CRYPTO Cryptographic Hash Functions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAD_PKCS5</td>
<td>Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard</td>
</tr>
<tr>
<td>PAD_NONE</td>
<td>Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.</td>
</tr>
<tr>
<td>PAD_ZERO</td>
<td>Provides padding consisting of zeroes</td>
</tr>
</tbody>
</table>
Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype. After performing these conversions, you can then encrypt it with the DBMS_CRYPTO package.

See Also: "Conversion Rules" on page 40-11 for information about converting datatypes.
## Exceptions

Table 40–9 lists exceptions that have been defined for DBMS_CRYPTO.

<table>
<thead>
<tr>

<td>No value has been specified for the cipher suite to be used.</td>
</tr>
<tr>
<td>KeyNull</td>
<td>28239</td>
<td>The encryption key has not been specified or contains a NULL value.</td>
</tr>
<tr>
<td>KeyBadSize</td>
<td>28234</td>
<td>DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits).&lt;br&gt;AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.</td>
</tr>
<tr>
<td>DoubleEncryption</td>
<td>28233</td>
<td>Source data was previously encrypted.</td>
</tr>
</tbody>
</table>
Operational Notes

- When to Use Encrypt and Decrypt Procedures or Functions
- When to Use Hash or Message Authentication Code (MAC) Functions
- About Generating and Storing Encryption Keys
- Conversion Rules

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both ENCRYPT and DECRYPT procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the ENCRYPT and DECRYPT functions are used to encrypt and decrypt RAW datatypes. Data of type VARCHAR2 must be converted to RAW before you can use DBMS_CRYPTO functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the HASH function and the MAC function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, the user runs DBMS_CRYPTO.HASH against the stored data to create a hash value. On returning the stored data, the user can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to “file fingerprints” and are used to ensure data integrity.

The HASH function included with DBMS_CRYPTO is a one-way hash function that you can use to generate a hash value from either RAW or LOB data. The MAC function is also a one-way hash function, but with the addition of a secret key. It works the same way as the DBMS_CRYPTO.HASH function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The DBMS_CRYPTO package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by DBMS_CRYPTO occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.
Although `DBMS_CRYPTO` cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the `RANDOMBYTES` function to generate random material for keys.

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:
- *Oracle Database Advanced Security Guide* for information about configuring network encryption and SSL.
- "RANDOMBYTES Function" on page 40-20

Conversion Rules

- To convert `VARCHAR2` to `RAW`, use the `UTL_I18N.STRING_TO_RAW` function to perform the following steps:
  1. Convert `VARCHAR2` in the current database character set to `VARCHAR2` in the AL32UTF8 database character.
  2. Convert `VARCHAR2` in the AL32UTF8 database character set to `RAW`.

  Syntax example:
  ```sql
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```

- To convert `RAW` to `VARCHAR2`, use the `UTL_I18N.RAW_TO_CHAR` function to perform the following steps:
  1. Convert `RAW` to `VARCHAR2` in the AL32UTF8 database character set.
  2. Convert `VARCHAR2` in the AL32UTF8 database character set to `VARCHAR2` in the database character set you wish to use.

  Syntax example:
  ```sql
  UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
  ```

  See Also: Chapter 253, "UTL_I18N" for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the `RAW` datatype in a `VARCHAR2` database column, then use `RAWTOHEX` or `UTL_ENCODE.BASE64_ENCODE` to make it suitable for `VARCHAR2` storage. These functions expand data size by 2 and 4/3, respectively.
The following listing shows PL/SQL block encrypting and decrypting pre-defined 'input_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
    input_string       VARCHAR2 (200) := 'Secret Message';
    output_string      VARCHAR2 (200);
    encrypted_raw      RAW (2000)             -- stores encrypted binary text
    decrypted_raw      RAW (2000);             -- stores decrypted binary text
    num_key_bytes      NUMBER := 256/8;       -- key length 256 bits (32 bytes)
    key_bytes_raw      RAW (32);             -- stores 256-bit encryption key
    encryption_type    PLS_INTEGER :=        -- total encryption type
        DBMS_CRYPTO.ENCRYPT_AES256
    + DBMS_CRYPTO.CHAIN_CBC
    + DBMS_CRYPTO.PAD_PKCS5;
    iv_raw             RAW (16);
BEGIN
    DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
    key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
    iv_raw        := DBMS_CRYPTO.RANDOMBYTES (16);
    encrypted_raw := DBMS_CRYPTO.ENCRYPT
        (src => UTL_I18N.STRING_TO_RAW (input_string, 'AL32UTF8'),
         typ => encryption_type,
         key => key_bytes_raw,
         iv  => iv_raw);
    -- The encrypted value 'encrypted_raw' can be used here
    decrypted_raw := DBMS_CRYPTO.DECRYPT
        (src => encrypted_raw,
         typ => encryption_type,
         key => key_bytes_raw,
         iv  => iv_raw);
    output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

    DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```
## Summary of DBMS_CRYPTO Subprograms

**Table 40–10  DBMS_CRYPTO Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECRIPT Function on page 40-14</td>
<td>Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector)</td>
</tr>
<tr>
<td>DECRYPT Procedures on page 40-15</td>
<td>Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Function on page 40-16</td>
<td>Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Procedures on page 40-17</td>
<td>Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>HASH Function on page 40-18</td>
<td>Applies one of the supported cryptographic hash algorithms (MD4, MD5, SHA-1, or SHA-2) to data</td>
</tr>
<tr>
<td>MAC Function on page 40-19</td>
<td>Applies Message Authentication Code algorithms (MD5, SHA-1, or SHA-2) to data to provide keyed message protection</td>
</tr>
<tr>
<td>RANDOMBYTES Function on page 40-20</td>
<td>Returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys</td>
</tr>
<tr>
<td>RANDOMINTEGER Function on page 40-21</td>
<td>Returns a random BINARY_INTEGER</td>
</tr>
<tr>
<td>RANDOMNUMBER Function on page 40-22</td>
<td>Returns a random 128-bit integer of the NUMBER datatype</td>
</tr>
</tbody>
</table>
DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.DECRYPT(
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW,
    iv  IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

`pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);`

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be decrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- To retrieve original plaintext data, `DECRYPT` must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

  **See Also:** "Usage Notes" for the `ENCRYPT` function on page 40-16 for additional information about the ciphers and modifiers available with this package.

- If `VARCHAR2` data is converted to `RAW` before encryption, then it must be converted back to the appropriate database character set by using the `UTL_I18N` package.

  **See Also:** "Conversion Rules" on page 40-11 for a discussion of the `VARCHAR2` to `RAW` conversion process.
DECRIPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

```
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is all zeroes.</td>
</tr>
</tbody>
</table>
```
ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW,
    iv  IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be encrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>
```

Usage Notes

■ Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 40–7 and Table 40–8 on page 40-7 for block cipher chaining and padding modifier constants that have been defined for this package.

■ To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

```
DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
  + DBMS_CRYPTO.CHAIN_CBC
  + DBMS_CRYPTO.PAD_NONE;
```

See Table 40–6 on page 40-7 for the block cipher suites already defined as constants for this package.

■ To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

   See Also: "Conversion Rules" on page 40-11 for a discussion of the conversion process.

■ Stream ciphers, such as RC4, are not recommended for stored data encryption.
ENCRIPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.ENCRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.ENCRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            CLOB         CHARACTER SET ANY_CS,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```sql
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

See “Conversion Rules” on page 40-11 for usage notes about using the ENCRYPT procedure.
HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a hash value. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 40-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 40–3 on page 40-6.

Syntax

```
DBMS_CRYPTO.Hash (  
    src IN RAW,  
    typ IN PLS_INTEGER)  
RETURN RAW;

DBMS_CRYPTO.Hash (  
    src IN BLOB,  
    typ IN PLS_INTEGER)  
RETURN RAW;

DBMS_CRYPTO.Hash (  
    src IN CLOB CHARACTER SET ANY_CS,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The source data to be hashed.</td>
</tr>
<tr>
<td>typ</td>
<td>The hash algorithm to be used.</td>
</tr>
</tbody>
</table>
```

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm) or SHA-2 because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.
MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "HASH Function" on page 40-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 40-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See Table 40-4 on page 40-6 for a list of MAC algorithms that have been defined for this package.

Syntax

```sql
DBMS_CRYPTO.MAC (  
    src IN RAW,  
    typ IN PLS_INTEGER,  
    key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
    src IN BLOB,  
    typ IN PLS_INTEGER  
    key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
    src IN CLOB CHARACTER SET ANY_CS,  
    typ IN PLS_INTEGER  
    key IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Table 40–16</th>
<th>MAC Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter Name</td>
<td>Description</td>
</tr>
<tr>
<td>src</td>
<td>Source data to which MAC algorithms are to be applied.</td>
</tr>
<tr>
<td>typ</td>
<td>MAC algorithm to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for MAC algorithm.</td>
</tr>
</tbody>
</table>
RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator).

Syntax

```sql
DBMS_CRYPTO.RANDOMBYTES (  
    number_bytes IN POSITIVE)  
RETURN RAW;
```

Pragmas

`pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);`

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_bytes</td>
<td>The number of pseudo-random bytes to be generated.</td>
</tr>
</tbody>
</table>

Usage Note

The `number_bytes` value should not exceed the maximum length of a RAW variable.
RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle BINARY_INTEGER datatype.

Syntax

DBMS_CRYPTO.RANDOMINTEGER
RETURN BINARY_INTEGER;

Pragmas

pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of [0..2**128-1].

Syntax

DBMS_CRYPTO.RANDOMNUMBER
RETURN NUMBER;

Pragmas

pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- Using DBMS_CSX_ADMIN
  - Overview
  - Security Model
  - Constants
- Summary of DBMS_CSX_ADMIN
Using DBMS_CSX_ADMIN

- Overview
- Security Model
- Constants
Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.
Security Model

Owned by XDB, the DBMS_CSX_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.
### Constants

The DBMS_CSX_ADMIN package uses the constants shown in Table 41–1:

**Table 41–1  DBMS_CSX_ADMIN Constants**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_LEVEL</td>
<td>BINARY_INTEGER</td>
<td>0</td>
<td>Default token table</td>

</tbody>
</table>
### Summary of DBMS_CSX_ADMIN

#### Table 41–2  DBMS_CSX_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETTOKENTABLEINFO Procedure &amp; Function on page 41-7</td>
<td>Returns the GUID of the token table set where token mappings for this table</td>
</tr>
<tr>
<td>GETTOKENTABLEINFOBYTABLE SPACE Procedure on page 41-8</td>
<td>Returns the GUID and the token table names for this tablespace</td>
</tr>
<tr>
<td>NAMESPACEIDTABLE Function on page 41-9</td>
<td>Returns default namespace-ID token table</td>
</tr>
<tr>
<td>PATHIDTABLE Function on page 41-10</td>
<td>Returns the default path-ID token table</td>
</tr>
<tr>
<td>QNAMEIDTABLE Function on page 41-11</td>
<td>Returns the default qname-ID token table.</td>
</tr>
</tbody>
</table>
GETTOKENTABLEINFO Procedure & Function

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
    ownername      IN   VARCHAR2,
    tablename      IN   VARCHAR2,
    guid           OUT  RAW,
    qnametable     OUT  VARCHAR2,
    nmspctable     OUT  VARCHAR2,
    level          OUT  NUMBER,
    tabno          OUT  NUMBER);
```

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
    tabno          IN   NUMBER,
    guid           OUT  RAW);
```

RETURN BOOLEAN;

Parameters

**Table 41–3 GETTOKENTABLEINFO Procedure & Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>Owner of the table</td>
</tr>
<tr>
<td>tablename</td>
<td>Name of the table</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set used by the given table</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table in the new set</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table in the new set</td>
</tr>
<tr>
<td>level</td>
<td>DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise</td>
</tr>
<tr>
<td>tabno</td>
<td>Table object number</td>
</tr>
</tbody>
</table>
GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

```plsql
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE (  
tsname          IN   VARCHAR2,  
tablespaceno    IN   NUMBER,  
guid            OUT  RAW,  
qnametable      OUT  VARCHAR2,  
nmspctable      OUT  VARCHAR2,  
isdefault       OUT  BOOLEAN,  
containTokTab   OUT  BOOLEAN);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tname</td>
<td>Tablespace name</td>
</tr>
<tr>
<td>tablespaceno</td>
<td>Tablespace number</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set associated with this tablespace (if any)</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table</td>
</tr>
<tr>
<td>isdefault</td>
<td>TRUE if the token table is the default one</td>
</tr>
<tr>
<td>containTokTab</td>
<td>TRUE if the tablespace contains its own token table set</td>
</tr>
</tbody>
</table>
NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE
RETURN VARCHAR2;
```
PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing \texttt{EXPLAIN PLAN} for a query on an XML table with an XML index.

Syntax

\begin{verbatim}
DBMS_CSX_ADMIN.PATHIDTABLE
   RETURN VARCHAR2;
\end{verbatim}
QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

```sql
DBMS_CSX_ADMIN.QNAMEIDTABLE
RETURN VARCHAR2;
```
DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

See Also: Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications.

This chapter contains the following topics:

- Using DBMS_CUBE
- Using SQL Aggregation Management
- Upgrading 10g Analytic Workspaces
- Summary of DBMS_CUBE Subprograms
Using DBMS_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several DBMS_CUBE subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in "Using SQL Aggregation Management" on page 42-4.

The metadata for cubes and dimensions is defined in XML documents, called templates, which you can derive from relational materialized views using the CREATE_CUBE or DERIVE_FROM_MVIEW functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other DBMS_CUBE subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The IMPORT_XML procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The BUILD procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.
Security Model

The following roles and system privileges are required to use this package:

To create dimensional objects in the user's own schema:
- OLAP_USER role
- CREATE SESSION privilege

To create dimensional objects in different schemas:
- OLAP_DBA role
- CREATE SESSION privilege

To create cube materialized views in the user's own schema:
- CREATE MATERIALIZED VIEW privilege
- CREATE DIMENSION privilege
- ADVISOR privilege

To create cube materialized views in different schemas:
- CREATE ANY MATERIALIZED VIEW privilege
- CREATE ANY DIMENSION privilege
- ADVISOR privilege

If the source tables are in a different schema, then the owner of the dimensional objects needs SELECT object privileges on those tables.
Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in DBMS_CUBE that supports the rapid deployment of cube materialized views from existing relational materialized views. Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, DBMS_CUBE also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.

Cube materialized views are registered in the data dictionary along with all other materialized views. A CB$ prefix identifies a cube materialized view.

The DBMS_CUBE subprograms also support life-cycle management of cube materialized views.

See Also: Oracle OLAP User’s Guide for more information about cube materialized views and enhanced OLAP analytics.
Subprograms in SQL Aggregation Management

These subprograms are included in SQL Aggregation Management:

- CREATE_MVIEW Function
- DERIVE_FROM_MVIEW Function
- DROP_MVIEW Procedure
- REFRESH_MVIEW Procedure
Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the GROUP BY clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

- Explicit `GROUP BY` clause for one or more columns.
- No expressions in the select list or `GROUP BY` clause.
- At least one of these numeric aggregation methods: `SUM`, `MIN`, `MAX`, or `AVG`.
- No outer joins.
- Summary keys with at least one simple column associated with a relational dimension.
  
  or

  Summary keys with at least one simple column and no hierarchies or levels.

- Numeric datatype of any type for the fact columns. All facts are converted to `NUMBER`.
- Eligible for rewrite. `REWRITE_CAPABILITY` should be `GENERAL`; it cannot be `NONE`. Refer to the `ALL_MVIEWS` entry in the Oracle Database Reference.
- Cannot use the `DISTINCT` or `UNIQUE` keywords with an aggregate function in the defining query. For example, `AVG(DISTINCT units)` causes an error in `STRICT` mode and is ignored in `LOOSE` mode.

You can choose between two modes when rendering the cube materialized view, `LOOSE` and `STRICT`. In `STRICT` mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In `LOOSE` mode (the default), some deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.
- The `AVG` function is changed to `SUM` and `COUNT`.
- The `COUNT` function without a `SUM`, `MIN`, `MAX`, or `AVG` function is ignored.
- The `STDDEV` and `VARIANCE` functions are ignored.

You can also choose how conditions in the `WHERE` clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.
Permissions for Managing and Querying Cube Materialized Views

To create cube materialized views, you must have these privileges:

- CREATE [ANY] MATERIALIZED VIEW privilege
- CREATE [ANY] DIMENSION privilege
- ADVISOR privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- GLOBAL QUERY REWRITE privilege
- SELECT or READ privilege on the relational source tables
- SELECT or READ privilege on the analytic workspace (AW$name) that supports the cube materialized view
- SELECT or READ privilege on the cube
- SELECT or READ privilege on the dimensions of the cube

Note that you need SELECT or READ privileges on the database objects that support the cube materialized views, but not on the cube materialized views.
Example of SQL Aggregation Management

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEK_PSCAT_SALES_MV.

About Relational Materialized View CAL_MONTH_SALES_MV

This example uses CAL_MONTH_SALES_MV as the basis for creating a cube materialized view. The following query was used to create CAL_MONTH_SALES_MV. CAL_MONTH_SALES_MV summarizes the daily sales data stored in the SALES table by month.

```
SELECT query FROM user_mviews
   WHERE mview_name='CAL_MONTH_SALES_MV';
```

```
---------------------------------------------
SELECT   t.calendar_month_desc
         ,        sum(s.amount_sold) AS dollars
FROM     sales s
         ,        times t
WHERE    s.time_id = t.time_id
GROUP BY t.calendar_month_desc
```

DBMS_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

```
SELECT dimension_name FROM user_dimensions;
```

```
DIMENSION_NAME
-----------------------------
CUSTOMERS_DIM
PRODUCTS_DIM
TIMES_DIM
CHANNELS_DIM
PROMOTIONS_DIM
```

Creating the Cube Materialized View

This PL/SQL script uses the CREATE_MVIEW function to create a cube materialized view from CAL_MONTH_SALES_MV. CREATE_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

```
SET serverout ON format wrapped
DECLARE
   salesaw  varchar2(30);
BEGIN
   salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV',
         'build=immediate');
END;
/
```

These messages confirm that the script created and refreshed CB$CAL_MONTH_SALES successfully:

```
Completed refresh of cube mview 'SH'.'CB$CAL_MONTH_SALES' at 20130212 08:42:58.03.
```
Created cube organized materialized view `CB$CAL_MONTH_SALES` for rewrite at 200130212 08:42:58.004.

The following query lists the materialized views in the `SH` schema:

```
SELECT mview_name FROM user_mviews;
```

```
MVIEW_NAME
-------------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEK_PSCAT_SALES_MV
```

Two new materialized views are registered in the data dictionary:
- `CB$CAL_MONTH_SALES`: Cube materialized view
- `CB$TIMES_DIM_D1_CAL_ROLLUP`: Cube dimension materialized view for the `TIME_DIM` Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

**Disabling the Relational Materialized Views**

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

```
ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;
```

Materialized view altered.

You can also use the `DISABLEQRW` parameter in the `CREATE_MVIEW` function, which disables query rewrite on the source materialized view as described in Table 42–7.

**Creating Execution Plans for Cube Materialized Views**

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the `SALES` table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

```
EXPLAIN PLAN FOR SELECT
    t.calendar_quarter_desc,
    sum(s.amount_sold) AS dollars
FROM     sales s,
          times t
WHERE    s.time_id = t.time_id
AND      t.calendar_quarter_desc LIKE '2001%'
GROUP BY t.calendar_quarter_desc
ORDER BY t.calendar_quarter_desc;
```

The query returns these results:

```
CALENDAR_QUARTER_DESC  DOLLARS
-------------------------------
```
Example of SQL Aggregation Management

<table>
<thead>
<tr>
<th>Year</th>
<th>Sales</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01</td>
<td>6547097.44</td>
</tr>
<tr>
<td>2001-02</td>
<td>6922468.39</td>
</tr>
<tr>
<td>2001-03</td>
<td>7195998.63</td>
</tr>
<tr>
<td>2001-04</td>
<td>7470897.52</td>
</tr>
</tbody>
</table>

The execution plan shows that query rewrite returned the summary data from the cube materialized view, CB$CAL_MONTH_SALES, instead of recalculating it from the SALES table.

```sql
SELECT plan_table_output FROM TABLE(dbms_xplan.display());
PLAN_TABLE_OUTPUT
Plan hash value: 2999729407
```

Predicate Information (identified by operation id):
```
  2 - filter("CB$CAL_MONTH_SALES"."D1_CALENDAR_QUARTER_DESC" LIKE '2001%' AND "CB$CAL_MONTH_SALES"."SYS_GID"=63)
```

15 rows selected.

**Maintaining Cube Materialized Views**

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the **REFRESH_MVIEW Procedure**:

```
BEGIN
    dbms_cube.refresh_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/
```

Completed refresh of cube mview 'SH'."CB$CAL_MONTH_SALES" at 20130212 14:30:59.534.

If you want to drop a cube materialized view, use the **DROP_MVIEW Procedure** so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```
BEGIN
    dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/
```

Dropped cube organized materialized view 'SH'."CAL_MONTH_SALES" including container analytic workspace 'SH'."CAL_MONTH_SALES_AW" at 20130212 13:38:47.878.

**New Database Objects**

The **CREATE_MVIEW function** creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as **ALL_CUBES** and **ALL_CUBE_DIMENSIONS**.

This example created the following supporting objects:
- Analytic workspace CAL_MONTH_SALES_AW (AW$CAL_MONTH_SALES_AW table)
- Cube CAL_MONTH_SALES
- Cube dimension TIMES_DIM_D1
- Dimension hierarchy CAL_ROLLUP
- Dimension levels ALL_TIMES_DIM, YEAR, QUARTER, and MONTH
- Numerous attributes for levels in the CAL_ROLLUP hierarchy
Upgrading 10g Analytic Workspaces

Oracle OLAP metadata is the same in OLAP 11g and OLAP 12c so you do not need to upgrade an OLAP 11g analytic workspace to OLAP 12c. This topic describes upgrading an Oracle OLAP 10g analytic workspace to OLAP 12c.

You can upgrade an OLAP 10g analytic workspace to OLAP 12c by saving the OLAP 10g objects as an XML template and importing the XML into a different schema. The original analytic workspace remains accessible and unchanged by the upgrade process.

**Tip:** Oracle recommends using Analytic Workspace Manager for performing upgrades. See the *Oracle OLAP User's Guide*.

**See Also:** *Oracle Database Upgrade Guide* for information on upgrading Oracle Database.

These subprograms in `DBMS_CUBE` support the upgrade process:

- `CREATE_EXPORT_OPTIONS` Procedure
- `CREATE_IMPORT_OPTIONS` Procedure
- `EXPORT_XML` Procedure
- `EXPORT_XML_TO_FILE` Procedure
- `IMPORT_XML` Procedure
- `INITIALIZE_CUBE_UPGRADE` Procedure
- `UPGRADE_AW` Procedure

**Prerequisites:**

- The OLAP 10g analytic workspace can use OLAP standard form metadata.
- Customizations to the OLAP 10g analytic workspace may not be exported to the XML template. You must re-create them in OLAP 12c.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 12c analytic workspace in the same schema as the OLAP 10g analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - `SELECT` or `READ` privileges on the OLAP 10g analytic workspace (`GRANT SELECT ON schema.AW$analytic_workspace`).
  - `SELECT` or `READ` privileges on all database tables and views that contain the source data for the OLAP 10g analytic workspace.
  - Appropriate privileges for an OLAP administrator.
  - Same default tablespace as the Oracle 10g user.

See the *Oracle OLAP User's Guide*. 

Tip: Oracle recommends using Analytic Workspace Manager for performing upgrades. See the *Oracle OLAP User’s Guide*.

See Also: *Oracle Database Upgrade Guide* for information on upgrading Oracle Database.

Prerequisites:

- The OLAP 10g analytic workspace can use OLAP standard form metadata.
- Customizations to the OLAP 10g analytic workspace may not be exported to the XML template. You must re-create them in OLAP 12c.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 12c analytic workspace in the same schema as the OLAP 10g analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - `SELECT` or `READ` privileges on the OLAP 10g analytic workspace (`GRANT SELECT ON schema.AW$analytic_workspace`).
  - `SELECT` or `READ` privileges on all database tables and views that contain the source data for the OLAP 10g analytic workspace.
  - Appropriate privileges for an OLAP administrator.
  - Same default tablespace as the Oracle 10g user.

See the *Oracle OLAP User’s Guide*. 

Tip: Oracle recommends using Analytic Workspace Manager for performing upgrades. See the *Oracle OLAP User’s Guide*.

See Also: *Oracle Database Upgrade Guide* for information on upgrading Oracle Database.
Correcting Naming Conflicts

The namespaces are different in OLAP 10g than those in OLAP 12c. For a successful upgrade, you must identify any 10g object names that are used multiple times under the 12c naming rules and provide unique names for them.

The following namespaces control the uniqueness of OLAP object names in Oracle 12c:

- **Schema**: The names of cubes, dimensions, and measure folders must be unique within a schema. They cannot conflict with the names of tables, views, indexes, relational dimensions, or any other first class objects. However, these OLAP 12c object names do not need to be distinct from 10g object names, because they are in different namespaces.
- **Cube**: The names of measures must be unique within a cube.
- **Dimension**: The names of hierarchies, levels, and attributes must be unique within a dimension. For example, a dimension cannot have a hierarchy named Customers and a level named Customers.

You can use an initialization table and a rename table to rename objects in the upgraded 12c analytic workspace.

Initialization Table

The `INITIALIZE_CUBE_UPGRADE` procedure identifies ambiguous names under the OLAP 12c naming rules. For example, a 10g dimension might have a hierarchy and a level with the same name. Because hierarchies and levels are in the same 12c namespace, the name is not unique in 12c; to a 12c client, the hierarchy and the level cannot be differentiated by name.

`INITIALIZE_CUBE_UPGRADE` creates and populates a table named `CUBE_UPGRADE_INFO` with unique names for these levels, hierarchies, and attributes. By using the unique names provided in the table, a 12c client can browse the OLAP 12c metadata. You cannot attach an OLAP 12c client to the analytic workspace or perform an upgrade without a `CUBE_UPGRADE_INFO` table, if the 10g metadata contains ambiguous names.

You can edit `CUBE_UPGRADE_INFO` to change the default unique names to names of your choosing. You can also add rows to change the names of any other objects. When using an 12c client, you see the new object names. When using an 10g client, you see the original names. However, the `INITIALIZE_CUBE_UPGRADE` procedure overwrites this table, so you may prefer to enter customizations in a rename table.

During an upgrade from OLAP 10g, the unique object names in `CUBE_UPGRADE_INFO` are used as the names of 12c objects in the new analytic workspace. However, `INITIALIZE_CUBE_UPGRADE` does not automatically provide unique names for cubes, dimensions, and measure folders. To complete an upgrade, you must assure that these objects have unique names within the 12c namespace. You can provide these objects with new names in the `CUBE_UPGRADE_INFO` table or in a rename table.

OLAP 12c clients automatically use `CUBE_UPGRADE_INFO` when it exists in the same schema as the OLAP 10g analytic workspace.

See Also: "INITIALIZE_CUBE_UPGRADE Procedure" on page 42-53
Correcting Naming Conflicts

**Rename Table**

You can create a rename table that contains new object names for an OLAP 12c analytic workspace. You can then use the rename table in the `CREATE_IMPORT_OPTIONS` and `UPGRADE_AW` procedures.

When upgrading within the same schema, you must provide a unique name for the 12c analytic workspace. The `UPGRADE_AW` procedure provides a parameter for this purpose; otherwise, you must provide the new name in the rename table. The duplication of cube names does not create ambiguity because the 12c cubes are created in a different namespace than the 10g cubes.

The names provided in a rename table are used only during an upgrade and overwrite any names entered in the `CUBE_UPGRADE_INFO` table.

**To create a rename table:**

1. Open SQL*Plus or another SQL client, and connect to Oracle Database as the owner of the 10g analytic workspace.

2. Issue a command like the following:

   ```sql
   CREATE TABLE table_name (    
       source_id    VARCHAR2(300),    
       new_name     VARCHAR2(30),    
       object_type  VARCHAR2(30));
   ```

3. Populate the rename table with the appropriate values, as follows.

   - `table_name` is the name of the rename table.
   - `source_id` is the identifier for an object described in the XML document supplied to `IMPORT_XML`. The identifier must have this format:
     ```sql
     schema_name.object_name[.subobject_name]
     ```
   - `new_name` is the object name given during the import to the object specified by `source_id`.
   - `object_type` is the object type as described in the XML, such as `StandardDimension` or `DerivedMeasure`.

   For example, these SQL statements populate the table with new names for the analytic workspace, a cube, and four dimensions:

   ```sql
   INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW', 'GLOBAL12', 'AW');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.UNITS_CUBE', 'UNIT_SALES_CUBE', 'Cube');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.CUSTOMER', 'CUSTOMERS', 'StandardDimension');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.CHANNEL', 'CHANNELS', 'StandardDimension');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.PRODUCT', 'PRODUCTS', 'StandardDimension');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.TIME', 'TIME_PERIODS', 'TimeDimension');
   ```

**See Also:** "`CREATE_IMPORT_OPTIONS Procedure`" on page 42-35
Simple Upgrade

A simple upgrade creates an OLAP 12c analytic workspace from an OLAP 10g analytic workspace.

To perform a simple upgrade of an Oracle OLAP 10g analytic workspace:
1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12c as the schema owner for the OLAP 12c analytic workspace.
2. To rename any objects in the 12c analytic workspace, create a rename table as described in "Rename Table" on page 42-14. (Optional)
3. Perform the upgrade, as described in "UPGRADE_AW Procedure" on page 42-57.
4. Use the DBMS_CUBE.BUILD procedure to load data into the cube.

Example 42–1 Performing a Simple Upgrade to the GLOBAL Analytic Workspace

This example creates an OLAP 12c analytic workspace named GLOBAL12 from an OLAP 10g analytic workspace named GLOBAL10. GLOBAL10 contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

BEGIN
    -- Upgrade the analytic workspace
    dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12');

    -- Load and aggregate the data
    dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

A custom upgrade enables you to set the export and import options.

To perform a custom upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12c as the schema owner of the OLAP 12c analytic workspace.

2. Generate an initialization table, as described in "Initialization Table" on page 42-13. Review the new, default object names and modify them as desired.

3. Create a rename table, as described in "Rename Table" on page 42-14. If you are upgrading in the same schema, you must use a rename table to provide a unique name for the 12c analytic workspace. Otherwise, a rename table is needed only if names are duplicated among the cubes, dimensions, and measure folders of the analytic workspace, or between those names and the existing cubes, dimensions, measure folders, or tables of the destination schema.

4. Create a SQL script that does the following:
   a. Create an XML document for the export options, as described in "CREATE_EXPORT_OPTIONS Procedure" on page 42-32. The SUPPRESS_NAMESPACE option must be set to TRUE for the upgrade to occur.
   b. Create an XML document for the import options, as described in "CREATE_IMPORT_OPTIONS Procedure" on page 42-35.
   c. Create an XML template in OLAP 12c format, as described in "EXPORT_XML Procedure" on page 42-46.
   d. Create an OLAP 12c analytic workspace from the XML template, as described in "IMPORT_XML Procedure" on page 42-50.

5. Load and aggregate the data in the new analytic workspace, as described in "BUILD Procedure" on page 42-19.

Example 42–2  Performing a Custom Upgrade to the GLOBAL Analytic Workspace

This example upgrades the GLOBAL10 analytic workspace from OLAP 10g metadata to OLAP 12c metadata in the GLOBAL_AW schema.

The rename table provides the new name of the analytic workspace. These commands define the rename table.

```sql
CREATE TABLE my_object_map(
  source_id    VARCHAR2(300),
  new_name     VARCHAR2(30),
  object_type  VARCHAR2(30));

INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW',  'GLOBAL12', 'AW');
COMMIT;
```

Following is the script for performing the upgrade.

```sql
set serverout on
DECLARE
  importClob     clob;
  exportClob    clob;
  exportOptClob clob;
  importOptClob clob;
```
BEGIN

-- Create table of reconciled names
dbms_cube.initialize_cube_upgrade;

-- Create a CLOB containing the export options
dbms_lob.createtemporary(exportOptClob, TRUE);
dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

-- Create a CLOB containing the import options
dbms_lob.createtemporary(importOptClob, TRUE);
dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table => 'MY_OBJECT_MAP');

-- Create CLOBs for the metadata
dbms_lob.createtemporary(importClob, TRUE);
dbms_lob.createtemporary(exportClob, TRUE);

-- Export metadata from a 10g analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_xml=>exportClob);

-- Import metadata from the CLOB
dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_xml=>importClob);

-- Load and aggregate the data
dbms_cube.build('UNITS_CUBE, PRICE_AND_COST_CUBE');

END; /

Upgrading 10g Analytic Workspaces
## Summary of DBMS_CUBE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD Procedure on page 42-19</td>
<td>Loads data into one or more cubes and dimensions, and prepares the data for querying.</td>
</tr>
<tr>
<td>CREATE_EXPORT_OPTIONS Procedure on page 42-32</td>
<td>Creates an input XML document of processing options for the EXPORT_XML procedure.</td>
</tr>
<tr>
<td>CREATE_IMPORT_OPTIONS Procedure on page 42-35</td>
<td>Creates an input XML document of processing options for the IMPORT_XML procedure.</td>
</tr>
<tr>
<td>CREATE_MVIEW Function on page 42-37</td>
<td>Creates a cube materialized view from the definition of a relational materialized view.</td>
</tr>
<tr>
<td>DERIVE_FROM_MVIEW Function on page 42-42</td>
<td>Creates an XML template for a cube materialized view from the definition of a relational materialized view.</td>
</tr>
<tr>
<td>DROP_MVIEW Procedure on page 42-44</td>
<td>Drops a cube materialized view.</td>
</tr>
<tr>
<td>EXPORT_XML Procedure on page 42-46</td>
<td>Exports the XML of an analytic workspace to a CLOB.</td>
</tr>
<tr>
<td>EXPORT_XML_TO_FILE Procedure on page 42-48</td>
<td>Exports the XML of an analytic workspace to a file.</td>

<td>Upgrades an analytic workspace from Oracle OLAP 10g to 12c.</td>
</tr>
<tr>
<td>VALIDATE_XML Procedure on page 42-59</td>
<td>Checks the XML to assure that it is valid, without committing the results to the database.</td>
</tr>
</tbody>
</table>
BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

DBMS_CUBE.BUILD (script IN VARCHAR2, method IN VARCHAR2 DEFAULT NULL, refresh_after_errors IN BOOLEAN DEFAULT FALSE, parallelism IN BINARY_INTEGER DEFAULT 0, atomic_refresh IN BOOLEAN DEFAULT FALSE, automatic_order IN BOOLEAN DEFAULT TRUE, add_dimensions IN BOOLEAN DEFAULT TRUE, scheduler_job IN VARCHAR2 DEFAULT NULL, master_build_id IN BINARY_INTEGER DEFAULT 0, nested IN BOOLEAN DEFAULT FALSE, job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS');

Parameters

Table 42–2 BUILD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>A list of cubes and dimensions and their build options (see &quot;SCRIPT Parameter&quot; on page 42-20).</td>
</tr>
<tr>
<td>method</td>
<td>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube and dimension in sequential order, or a single method to apply to all cubes and dimensions. If you list more objects than methods, then the last method applies to the additional objects.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</td>
</tr>
<tr>
<td>parallelism</td>
<td>Number of parallel processes to allocate to this job (see Usage Notes).</td>
</tr>
</tbody>
</table>

Methods do not apply to dimensions.

See the "Usage Notes" on page 42-26 for additional details.
The `SCRIPT` parameter identifies the objects to include in the build, and specifies the type of processing to perform on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects [ USING ( commands ) ][,...]
```

Where:

- **VALIDATE** checks all steps of the build and sends the planned steps to `CUBE_BUILD_LOG` without executing the steps. You can view all generated SQL in the `OUTPUT` column of the log table.

- **NO COMMIT** builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See "SCRIPT Parameter: USING Clause: SET command" on page 42-25.

`objects` is the qualified name of one or more cubes or dimensions, separated by commas, in the form `[aw_name.]object`, such as `UNITS_CUBE` or `GLOBAL.UNITS_CUBE`.

### SCRIPT Parameter: USING Clause

The `USING` clause specifies the processing options. It consists of one or more commands separated by commas.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomic_refresh</td>
<td>TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state.</td>
</tr>
<tr>
<td>automatic_order</td>
<td>TRUE enables optimization of the build order. Dimensions are loaded before cubes.</td>
</tr>
<tr>
<td>add_dimensions</td>
<td>TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script.</td>
</tr>
<tr>
<td>scheduler_job</td>
<td>Any text identifier for the job, which will appear in the log table. The string does not need to be unique.</td>
</tr>
<tr>
<td>master_build_id</td>
<td>A unique name for the build.</td>
</tr>
<tr>
<td>nested</td>
<td>TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.</td>
</tr>
<tr>
<td>job_class</td>
<td>The class this job is associated with.</td>
</tr>
</tbody>
</table>

All objects must reside in a single analytic workspace.
The commands can be any of the following.

- **AGGREGATE USING [MEASURE]**
  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

- **ANALYZE**
  Runs `DBMS_AW_STATS.ANALYZE`, which generates and stores optimizer statistics for cubes and dimensions.

- **CLEAR [VALUES | LEAVES | AGGREGATES] [SERIAL | PARALLEL]**
  Prepares the cube for a data refresh. It can also be used on dimensions, but `CLEAR` removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

  These optional arguments control the refresh method. If you omit the argument, then the behavior of `CLEAR` depends on the refresh method. The ‘C’ (complete) refresh method runs `CLEAR VALUES`, and all other refresh methods run `CLEAR LEAVES`.

  - **VALUES**: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)
  - **LEAVES**: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the ? method)
  - **AGGREGATES**: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

  These optional arguments control the load method, and can be combined with any of the refresh options:

  - **PARALLEL**: Each partition is cleared separately. (Default)
  - **SERIAL**: All partitions are cleared together.

  If you omit the `CLEAR` command, `DBMS_CUBE` loads new and updated facts, but does not delete any old detail data. This is equivalent to a `LOAD NO SYNC` for dimensions.

- **COMPILE [SORT | NO SORT | SORT ONLY]**
  Creates the supporting structures for the dimension. (Dimensions only)

  These options control the use of a sort order attribute:

  - **SORT**: The user-defined sort order attribute populates the sort column in the embedded-total (ET) view. (Default)
  - **NO SORT**: Any sort order attribute is ignored. This option is for very large dimensions where sorting could consume too many resources.
  - **SORT ONLY**: The compile step only runs the sort.

- **EXECUTE PLSQL string**
Executes a PL/SQL command or script in the database.

- EXECUTE OLAP DML string [PARALLEL | SERIAL]

  Executes an OLAP DML command or program in the analytic workspace. The options control execution of the command or program:
  - PARALLEL: Execute the command or program once for each partition. This option can be used to provide a performance boost to complex DML operations, such as forecasts and models.
  - SERIAL: Execute the command or program once for the entire cube. (Default)

- [INSERT | MERGE] INTO [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] VALUES (dim_key, parent, level_name)

  Adds a dimension member to one or more hierarchies. INSERT throws an error if the member already exists, while MERGE does not. See "Dimension Maintenance Example" on page 42-29.

  - dimension.hierarchy: The name of a hierarchy the new member belongs to. Enclose each part of the name in double quotes, for example, "PRODUCT"."PRIMARY".
  - dim_key: The DIM_KEY value of the dimension member.
  - parent: The parent of the dimension key.
  - level_name: The level of the dimension key.

- UPDATE [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] SET PARENT = parent, LEVEL=level_name WHERE MEMBER = dim_key

  Alters the level or parent of an existing dimension member. See INSERT for a description of the options. Also see "Dimension Maintenance Example" on page 42-29.

- DELETE FROM DIMENSION WHERE MEMBER=dim_key

  Deletes a dimension member. See "Dimension Maintenance Example" on page 42-29.

  - dim_key: The DIM_KEY value of the dimension member to be deleted.

- SET dimension.attribute[qdr] = CAST('attribute_value' AS VARCHAR2))

  Sets the value of an attribute for a dimension member. See "Dimension Maintenance Example" on page 42-29.

  - dimension.attribute: The name of the attribute. Enclose each part of the name in double quotes, for example, "PRODUCT"."LONG_DESCRIPTION".
  - qdr: The dimension member being given an attribute value in the form of a qualified data reference, such as "PRODUCT"='OPT MOUSE'.
  - attribute_value: The value of the attribute, such as 'Optical Mouse'.

- FOR dimension_clause measure_clause BUILD (commands)

  Restricts the build to particular measures and dimension values, using the following arguments. See "FOR Clause Example" on page 42-28.

  - dimension_clause:
    
    dimension ALL | NONE | WHERE condition | LEVELS (level [, level...])
    
    dimension is the name of a dimension of the cube.
ALL sets the dimension status to all members before executing the list of commands.

NONE loads values for no dimension members.

WHERE loads values for those dimension members that match the condition.

LEVELS loads values for dimension members in the named levels.

level is a level of the named dimension.

- measure_clause:
  MEASURES (measure [, measure ...])

measure is the name of a measure in the cube.

- commands: Any of the other USING commands.

LOAD [SYNCH | NO SYNCH | RETAIN] [PRUNE | PARALLEL | SERIAL] [WHERE condition]

Loads data into the dimension or cube.

- WHERE limits the load to those values in the mapped relational table that match condition.

- condition is a valid predicate based on the columns of the mapped table. See the "Examples" on page 42-28.

These optional arguments apply only to dimensions:

- SYNCH matches the dimension keys to the relational data source. (Default)

- NO SYNCH loads new dimension keys but does not delete old keys.

  If the parent of a dimension key has changed in the relational data source, this option allows the load to change the parent/child relation in the analytic workspace.

- RETAIN loads new dimension keys but does not delete old keys.

  This option does not allow the parent of a dimension key to change. If the parent has changed, the load rejects the record. The rejection generates an error in the rejected records log, if the log is enabled.

These optional arguments apply only to cubes:

- PRUNE: Runs a full table scan on the fact table to determine which partitions to load. For example, if a cube is partitioned by month and the fact table has values only for the last two months, then jobs are only started to load the partitions for the last two months.

- PARALLEL: Each partition is loaded separately. (Default)

- SERIAL: All partitions are loaded in one SELECT statement.

MODEL model_name [PARALLEL | SERIAL]

Executes a model previously created for the cube. It accepts these arguments:

- PARALLEL: The model runs separately on each partition.

- SERIAL: The model runs on all cubes at the same time. (Default)

SET

Supports write-back to the cube using the syntax described in "SCRIPT Parameter: USING Clause: SET command" on page 42-25. (Cubes only)
SOLVE [PARALLEL | SERIAL]

Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

It accepts these arguments:

- PARALLEL: Each partition is solved separately. (Default)
- SERIAL: All partitions are solved at the same time.

**SCRIPT Parameter: USING Clause: AGGREGATE command**

The AGGREGATE command in a script specifies the aggregation rules for one or more measures.

**Note:** The AGGREGATE command is available only for uncompressed cubes.

AGGREGATE has the following syntax:

```
{ AGGREGATE USING MEASURE
  WHEN measure1 THEN operator1
  WHEN measure2 THEN operator2...
  ELSE default_operator
  | [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES {hierarchy}}
```

**USING MEASURE Clause**

This clause enables you to specify different aggregation operators for different measures in the cube.

**Operator Clause**

The operator_clause has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

**WEIGHTBY** multiplies each data value by an expression before aggregation.

**SCALEBY** adds the value of an expression to each data value before aggregation.

**Table 42–3 Aggregation Operators**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of data values that were added together.</td>
</tr>
<tr>
<td>FIRST</td>
<td>WEIGHTBY</td>
<td>The first real data value.</td>
</tr>
<tr>
<td>HIER_AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.</td>
</tr>
<tr>
<td>HIER_FIRST</td>
<td>WEIGHTBY</td>
<td>The first data value in the hierarchy, even when that value is NA.</td>
</tr>
</tbody>
</table>
Processing Options
You can specify these processing options for aggregation:

- **(ALLOW | DISALLOW) OVERFLOW**
  Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.
  - **ALLOW**: A calculation that generates overflow executes without error and produces null results. (Default)
  - **DISALLOW**: A calculation involving overflow stops executing and generates an error message.

- **(ALLOW | DISALLOW) DIVISION BY ZERO**
  Specifies whether to allow division by zero.
  - **ALLOW**: A calculation involving division by zero executes without error but returns a null value. (Default)
  - **DISALLOW**: A calculation involving division by zero stops executing and generates an error message.

- **(CONSIDER | IGNORE) NULLS**
  Specifies whether nulls are included in the calculations.
  - **CONSIDER**: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
  - **IGNORE**: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

- **MAINTAIN COUNT**
  Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

**SCRIPT Parameter: USING Clause: SET command**
The **SET** command in a script assigns values to one or more cells in a stored measure. It has this syntax:

```
SET target = expression
```
Where:

target is a measure or a qualified data reference.

expression returns values of the appropriate datatype for target.

Qualified Data References

Qualified data references (QDRs) limit a dimensional object to a single member in one or more dimensions for the duration of a query.

A QDR has the following syntax:

expression [{ dimension = member }[ , { dimension = member } ... ]]

Where:

expression is a dimensional expression, typically the name of a measure.

dimension is a primary dimension of expression.

member is a value of dimension.

The outside square brackets shown in bold are literal syntax elements; they do not indicate an optional argument. The inside square brackets shown in regular text delimit an optional argument and are not syntax elements.

This example returns Sales values for calendar year 2007:

global.sales[global.time = 'CY2007']

The next example returns Sales values only for the United States in calendar year 2007:

sales[customer = 'US', time = 'CY2007']

See the Examples for qualified data references in SET commands.

Usage Notes

Build Methods

The C, S, and ? methods always succeed and can be used on any cube.

The F and P methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the PARALLELISM argument of the BUILD procedure.
- Setting of the JOB_QUEUE_PROCESSES database initialization parameter.

Suppose UNITS_CUBE has 12 partitions, PARALLELISM is set to 10, and JOB_QUEUE_PROCESSES is set to 4. OLAP uses four processes, which appear as slave processes in the build log.
The SQL engine may allocate additional processes when the PARALLEL_DEGREE_POLICY database initialization parameter is set to AUTO or LIMITED. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

Build Logs
OLAP generates three logs that provide diagnostic information about builds:
- Cube build log
- Rejected records log
- Cube dimension compile log

Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the DBMS_CUBE_LOG package.

You can also create the cube log file by running $ORACLE_HOME/olap/admin/utlolaplog.sql. This script creates three additional views:
- CUBE_BUILD_LATEST: Returns rows only from the last build.
- CUBE_BUILD_REPORT: Returns one row for each command with elapsed times.
- CUBE_BUILD_REPORT_LATEST: Returns a report like CUBE_BUILD_REPORT only from the last build.

This report shows a successfully completed build of the objects in the GLOBAL analytic workspace, which has four dimensions and two cubes.

```
SELECT command, status, build_object, build_object_type type
FROM cube_build_report_latest;
```

</table>
**Examples**

This example uses the default parameters to build \texttt{UNITS\_CUBE}.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS\_CUBE');
```

The next example builds \texttt{UNITS\_CUBE} and explicitly builds two of its dimensions, \texttt{TIME} and \texttt{CHANNEL}. The dimensions use the complete (C) method, and the cube uses the fast solve (S) method.

```
BEGIN
    DBMS_CUBE.BUILD(
        script=>'GLOBAL."TIME", GLOBAL.CHANNEL, GLOBAL.UNITS\_CUBE',
        method=>'CCS',
        parallelism=>2);
END;
/
```

The following example loads only the selection of data identified by the \texttt{WHERE} clause:

```
BEGIN
    DBMS_CUBE.BUILD(q'!
        GLOBAL."TIME",
        GLOBAL.CHANNEL,
        GLOBAL.CUSTOMER,
        GLOBAL.PRODUCT,
        GLOBAL.UNITS\_CUBE USING (LOAD NO SYNCH
            WHERE UNITS\_FACT.MONTH\_ID LIKE '2006%'
            AND UNITS\_FACT.SALES > 5000)!!');
END;
/
```

**FOR Clause Example**

In this example, the Time dimension is partitioned by calendar year, and \texttt{DBMS\_CUBE} builds only the partition identified by \texttt{CY2006}. The \texttt{HIER\_ANCESTOR} is an analytic function in the OLAP expression syntax.

```
BEGIN
    dbms_cube.build(q'!
        UNITS\_CUBES USING
            (FOR "TIME"
                WHERE HIER\_ANCESTOR(WITHIN "TIME".CALENDAR LEVEL "TIME".CALENDAR\_YEAR) = 'CY2006'
                    BUILD (LOAD, SOLVE)
            )!!,
            parallelism=>1);
END;
/
```

The next example uses a \texttt{FOR} clause to limit the build to the \texttt{SALES} measure in 2006. All objects are built using the complete (C) method.

```
BEGIN
    DBMS_CUBE.BUILD(
```

```
script => ' 
GLOBAL."TIME", 
GLOBAL.CHANNEL, 
GLOBAL.CUSTOMER, 
GLOBAL.PRODUCT, 
GLOBAL.UNITS_CUBE USING 
{ 
  FOR MEASURES(GLOBAL.UNITS_CUBE.SALES) 
  BUILD(LOAD NO SYNCH WHERE GLOBAL.UNITS_FACT.MONTH_ID LIKE "'2006%'"
  )
}, 
method => 'C', 
parallelism => 2); 
END; /

Write-Back Examples
The following examples show various use of the SET command in a USING clause.
This example sets Sales Target to Sales increased by 5%:

DBMS_CUBE.BUILD('UNITS_CUBE USING(
  SET UNITS_CUBE.SALES_TARGET = UNITS_CUBE.SALES * 1.05, SOLVE)
);

This example sets the price of the Deluxe Mouse in May 2007 to $29.99:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
  SET PRICE_CUBE.UNIT_PRICE["TIME"='2007.05', "PRODUCT"='DLX MOUSE']
  = 29.99, SOLVE)
);

The next example contains two SET commands, but does not reaggregate the cube:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
  SET PRICE_CUBE.UNIT_PRICE["TIME"='2006.12', "PRODUCT"='DLX MOUSE']
  = 29.49, 
  SET PRICE_CUBE.UNIT_PRICE["TIME"='2007.05', "PRODUCT"='DLX MOUSE']
  = 29.99')
);

Dimension Maintenance Example
This script shows dimension maintenance. It adds a new dimension member named OPT MOUSE to all hierarchies, alters its position in the Primary hierarchy, assigns it a long description, then deletes it from the dimension.

BEGIN 
dbms_output.put_line('Add optical mouse'); 

dbms_cube.build(q'!
  "PRODUCT" using (MERGE INTO ALL HIERARCHIES 
  VALUES ('ITEM_OPT MOUSE', 'CLASS_SFT', "PRODUCT"."FAMILY"))
!'); 

dbms_output.put_line('Alter optical mouse'); 

dbms_cube.build(q'!
  "PRODUCT" using (UPDATE HIERARCHIES ("PRODUCT"."ITEM"
  WHERE MEMBER = 'ITEM_OPT MOUSE')
  SET PARENT = 'FAMILY_ACC', LEVEL = "PRODUCT"."ITEM"
) 
!'); 

dbms_output.put_line('Provide attributes to optical mouse'); 

dbms_cube.build(q'!
  "PRODUCT" USING (SET "PRODUCT"."LONG_DESCRIPTION"["PRODUCT" = 'ITEM_OPT MOUSE']
  = CAST('Optical Mouse' AS VARCHAR2))
!');
dbms_output.put_line('Delete optical mouse');
dbms_cube.build(q'!
  "PRODUCT" USING (DELETE FROM DIMENSION WHERE MEMBER='ITEM_OPT MOUSE')
!');

END;
/

**OLAP DML Example**

This example uses the OLAP DML to add comments to the cube build log:

```sql
BEGIN
  DBMS_CUBE.BUILD(q'
    global.units_cube USING {
      EXECUTE OLAP DML 'SHOW STATLEN(units_cube_prt_list)' PARALLEL,
      EXECUTE OLAP DML 'SHOW LIMIT(units_cube_prt_list KEEP ALL)' PARALLEL,
      EXECUTE OLAP DML 'SHOW STATLEN(time)' parallel,
      EXECUTE OLAP DML 'SHOW LIMIT(time KEEP time_levelrel ''CALENDAR_YEAR''')' parallel!,
    parallelism=>2,
    add_dimensions=>false);
END;
/
```

This query shows the comments in the cube build log:

```sql
SELECT partition, slave_number, TO_CHAR(output) output
FROM cube_build_log
WHERE command = 'OLAP DML'
AND status = 'COMPLETED'
ORDER BY slave_number, time;
```

<table>
<thead>
<tr>

.
CREATE_EXPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the EXPORT_XML Procedure on page 42-46 and the EXPORT_XML_TO_FILE Procedure on page 42-48.

Syntax

```
DBMS_CUBE.CREATE_EXPORT_OPTIONS (  
    out_options_xml        IN/OUT  CLOB,  
    target_version         IN      VARCHAR2  DEFAULT NULL,  
    suppress_owner         IN      BOOLEAN   DEFAULT FALSE,  
    suppress_namespace     IN      BOOLEAN   DEFAULT FALSE,  
    preserve_table_owners  IN      BOOLEAN   DEFAULT FALSE,  
    metadata_changes       IN      CLOB      DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed into the options_xml parameter of the EXPORT_XML Procedure.</td>
</tr>
<tr>
<td>target_version</td>
<td>Specifies the version of Oracle Database in which the XML document generated by EXPORT_XML or EXPORT_XML_TO_FILE will be imported. You can specify two to five digits, such as 12.1 or 12.1.0.1.0. This parameter defaults to the current database version, and so can typically be omitted.</td>
</tr>
<tr>
<td>suppress_owner</td>
<td>Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter True to drop the owner from the XML, or enter False to retain it. Enter True if you plan to import the exported metadata into a different schema.</td>
</tr>
<tr>
<td>suppress_namespace</td>
<td>Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter True to drop the namespace from the XML, or enter False to retain it (default). Enter True when upgrading to Oracle OLAP 12c metadata. Namespaces allow objects created in Oracle 10g to coexist with objects created in Oracle 12c. You cannot set or change namespaces.</td>
</tr>
<tr>
<td>preserve_table_owners</td>
<td>Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter True to retain the table owner, or enter False to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to True to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.</td>
</tr>
<tr>
<td>metadata_changes</td>
<td>Contains an 12c XML description of an object that overwrites the exported object description. The XML document must contain all parent XML elements of the modified element with the attributes needed to uniquely identify them. Use the Name attribute if it exists. See the Examples.</td>
</tr>
</tbody>
</table>

Examples

The following example generates an XML document of export options:
DECLARE
  optionsClob CLOB;
BEGIN
  dbms_lob.createtemporary(optionsClob, false, dbms_lob.CALL);
  dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_namespace=>TRUE);
  dbms_output.put_line(optionsClob);
END;
/

The DBMS_OUTPUT.PUT_LINE procedure displays this XML document (formatted for readability):

<?xml version="1.0"?><Export TargetVersion="12.1.0.1">
  <ExportOptions>
    <Option Name="SuppressOwner" Value="FALSE"/>
    <Option Name="SuppressNamespace" Value="TRUE"/>
    <Option Name="PreserveTableOwners" Value="FALSE"/>
  </ExportOptions>
</Export>

The next example generates an XML document with a metadata change to the mapping of the American long description attribute of the CHANNEL dimension.

DECLARE
  importClob        clob;
  exportClob        clob;
  overClob          clob;
  exportOptClob     clob;
  importOptClob     clob;
BEGIN
  dbms_lob.createtemporary(overClob, TRUE);
  dbms_lob.open(overClob, DBMS_LOB.LOB_READWRITE);
  dbms_lob.writeappend(overClob,58, '<Metadata Version="1.3" MinimumDatabaseVersion="12.1.0.1">');
  dbms_lob.writeappend(overClob,34, '<StandardDimension Name="CHANNEL">');
  dbms_lob.writeappend(overClob,75, '<Description Type="Description" Language="AMERICAN" Value="Sales Channel"/>
  dbms_lob.writeappend(overClob,20, '</StandardDimension>');
  dbms_lob.writeappend(overClob,11, '</Metadata>');
  dbms_lob.close(overClob);

  -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
  dbms_cube.initialize_cube_upgrade;

  -- Create a CLOB containing the export options
  dbms_lob.createtemporary(exportOptClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, metadata_changes=>overClob);

  -- Create a CLOB containing the import options
  dbms_lob.createtemporary(importOptClob, TRUE);
  dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table => 'MY_OBJECT_MAP');

  -- Create CLOBs for the metadata
  dbms_lob.createtemporary(importClob, TRUE);
  dbms_lob.createtemporary(exportClob, TRUE);
-- Export metadata from a 10g analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_xml=>exportClob);

-- Import metadata from the CLOB
dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob, out_xml=>importClob);

-- Load and aggregate the data
dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

The following is the content of exportClob (formatting added for readability). The XML document changes the description of Channel to Sales Channel.

<Metadata Version="1.3" MinimumDatabaseVersion="12.1.0.1">
  <StandardDimension Name="CHANNEL">
    <Description Type="Description" Language="AMERICAN" Value="Sales Channel"/>
  </StandardDimension>
</Metadata>
CREATE_IMPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the IMPORT_XML Procedure on page 42-50.

Syntax

```
DBMS_CUBE.CREATE_IMPORT_OPTIONS (  
   out_options_xml  IN/OUT  CLOB,  
   validate_only    IN      BOOLEAN   DEFAULT FALSE,  
   rename_table     IN      VARCHAR2  DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed to the options_xml parameter of the IMPORT_XML Procedure.</td>
</tr>
<tr>
<td>validate_only</td>
<td>TRUE causes the IMPORT_XML procedure to validate the metadata described in the input file or the in_xml parameter, without committing the changes to the metadata.</td>
</tr>
<tr>
<td>rename_table</td>
<td>The name of a table identifying new names for the imported objects, in the form [schema_name.]table_name. The IMPORT_XML procedure creates objects using the names specified in the table instead of the ones specified in the XML document. See the Usage Notes for the format of the rename table.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Rename Table" on page 42-14.

Examples

This example specifies validation only and a rename table. For an example of the import CLOB being used in an import, see "IMPORT_XML Procedure" on page 42-50.

```
DECLARE  
   importClob  clob;  
BEGIN  
   dbms_lob.createtemporary(importClob, TRUE);  
   
   dbms_cube.create_import_options(out_options_xml => importClob, rename_table => 'MY_OBJECT_MAP', validate_only => TRUE);  
   
   dbms_output.put_line(importClob);  
END;  
/  
```

It generates the following XML document:

```
<?xml version="1.0"?>  
<Import>  
   <ImportOptions>  
      <Option Name="ValidateOnly" Value="TRUE"/>  
      <Option Name="RenameTable" Value="MY_OBJECT_MAP"/>  
   </ImportOptions>  
</Import>  
```
CREATE_IMPORT_OPTIONS Procedure

</Import>
CREATE_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

Syntax

```sql
DBMS_CUBE.CREATE_MVIEW (
    mvowner    IN  VARCHAR2,
    mvname     IN  VARCHAR2,
    sam_parameters IN  CLOB  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot; on page 42-6. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Parameters in the form 'parameter1=value1, parameter2=value2,...'. See &quot;SQL Aggregation Management Parameters&quot;.</td>
</tr>
</tbody>
</table>

SQL Aggregation Management Parameters

The CREATE_MVIEW and DERIVE_FROM_MVIEW functions use the SQL aggregation management (SAM) parameters described in Table 42–7. Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDTOPS</td>
<td>Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created. TRUE: Creates levels named ALL_dimension with level members ALL_dimension. (Default) FALSE: Creates only the hierarchies and levels identified by the relational dimensions.</td>
</tr>
<tr>
<td>ADDUNIQUEKEYPREFIX</td>
<td>Controls the creation of dimension keys. TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as CITY_NEW_YORK and STATE_NEW_YORK. (Default) FALSE: Uses the relational dimension keys as cube dimension keys.</td>
</tr>
</tbody>
</table>
### Table 42–7 (Cont.) SQL Aggregation Management Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ATRMAPTYPE</code></td>
<td>Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both.</td>
</tr>
<tr>
<td><code>HIER_LEVEL</code></td>
<td>Maps attributes to the levels of a particular dimension hierarchy. (Default)</td>
</tr>
<tr>
<td><code>DIM_LEVEL</code></td>
<td>Maps attributes to the levels of the dimension regardless of hierarchy.</td>
</tr>
<tr>
<td><code>BOTH</code></td>
<td>Maps attributes to both dimension and hierarchy levels.</td>
</tr>
<tr>
<td><code>AUTO</code></td>
<td>Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema.</td>
</tr>
<tr>
<td><code>AWNAME</code></td>
<td>Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is <code>fact_tablename_AWn</code>.</td>
</tr>
<tr>
<td><code>BUILD</code></td>
<td>Specifies whether a data refresh will immediately follow creation of the cube materialized view.</td>
</tr>
<tr>
<td><code>IMMEDIATE</code></td>
<td>Refreshes immediately.</td>
</tr>
<tr>
<td><code>DEFERRED</code></td>
<td>Does not perform a data refresh. (Default)</td>
</tr>
<tr>
<td><strong>Note:</strong> Only the <code>CREATE_MVIEW</code> function uses this parameter.</td>
<td></td>
</tr>
<tr>
<td><code>CUBEMVOPTION</code></td>
<td>Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions.</td>
</tr>
<tr>
<td><code>COMPLETE_REFRESH</code></td>
<td>Creates a complete refresh cube materialized view (full update).</td>
</tr>
<tr>
<td><code>FAST_REFRESH</code></td>
<td>Creates a fast refresh materialized view (incremental update).</td>
</tr>
<tr>
<td><code>REWRITE_READY</code></td>
<td>Runs validation checks for a rewrite cube materialized view, but does not create it.</td>
</tr>
<tr>
<td><code>REWRITE</code></td>
<td>Creates a rewrite cube materialized view.</td>
</tr>
<tr>
<td><code>REWRITE_WITH_ATTRIBUTES</code></td>
<td>Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default)</td>
</tr>
<tr>
<td><strong>Note:</strong> The following settings do not create a cube materialized view. Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the <code>DROP_MVIEW</code> procedure to delete an analytic workspace only when it supports a cube materialized view.</td>
<td></td>
</tr>
<tr>
<td><code>NONE</code></td>
<td>Does not create a cube materialized view.</td>
</tr>
<tr>
<td><code>COMPLETE_REFRESH_READY</code></td>
<td>Runs validation checks for a complete refresh cube materialized view, but does not create it.</td>
</tr>
<tr>
<td><code>FAST_REFRESH_READY</code></td>
<td>Runs validation checks for fast refresh, but does not create the cube materialized view.</td>
</tr>
<tr>
<td><code>CUBENAME</code></td>
<td>Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is <code>fact_tablename_Cn</code>.</td>
</tr>
</tbody>
</table>
Table 42–7 (Cont.) SQL Aggregation Management Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIMJAVA BIND VARS</td>
<td>Supports access by Java programs to the XML document.</td>
</tr>
<tr>
<td>TRUE: Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the IMPORT XML procedure to create a cube using this template.</td>
<td></td>
</tr>
<tr>
<td>FALSE: Generates an XML template that does not support Java bind variables. (Default)</td>
<td></td>
</tr>
<tr>
<td>DISABLE Q R W</td>
<td>Controls disabling of query rewrite on the source relational materialized view.</td>
</tr>
<tr>
<td>TRUE: Issues an ALTER MATERIALIZED VIEW mview_name DISABLE QUERY REWRITE command.</td>
<td></td>
</tr>
<tr>
<td>FALSE: No action.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong>: Only the CREATE_MVIEW function with BUILD=IMMEDIATE uses this parameter.</td>
<td></td>
</tr>
<tr>
<td>EXPORT XML</td>
<td>Exports the XML that defines the dimensional objects to a file, which you specify as dir/filename. Both the directory and the file name are case sensitive.</td>
</tr>
<tr>
<td>dir: Name of a database directory.</td>
<td></td>
</tr>
<tr>
<td>filename: The name of the file, typically given an XML filename extension.</td>
<td></td>
</tr>
<tr>
<td>FILTER PARTITIONANCESTORLEVELS</td>
<td>Controls the generation of aggregate values above the partitioning level of a partitioned cube.</td>
</tr>
<tr>
<td>TRUE: Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL.</td>
<td></td>
</tr>
<tr>
<td>FALSE: All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)</td>
<td></td>
</tr>
<tr>
<td>LOG DEST</td>
<td>Directs and stores log messages. By default, the messages are not available.</td>
</tr>
<tr>
<td>SERVER OUT: Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer.</td>
<td></td>
</tr>
<tr>
<td>TRAC FILE: Sends messages to the session trace file.</td>
<td></td>
</tr>
<tr>
<td>PARTITION OPTION</td>
<td>Controls partitioning of the cube.</td>
</tr>
<tr>
<td>NONE: Prevents partitioning.</td>
<td></td>
</tr>
<tr>
<td>DEFAULT: Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default)</td>
<td></td>
</tr>
<tr>
<td>FORCE: Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning.</td>
<td></td>
</tr>
<tr>
<td>dimension.hierarchy.level: Partitions the cube using the specified dimension, hierarchy, and level.</td>
<td></td>
</tr>
<tr>
<td>POPULATE LINEAGE</td>
<td>Controls the appearance of attributes in a cube materialized view.</td>
</tr>
<tr>
<td>TRUE: Includes all dimension attributes in the cube materialized view. (Default)</td>
<td></td>
</tr>
<tr>
<td>FALSE: Omits all dimension attributes from the cube materialized view.</td>
<td></td>
</tr>
</tbody>
</table>
PRECOMPUTE

Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session.

\[ \text{precompute_percentage}[:\text{precompute_top_percentage}] \]

Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored.

REMAPCOMPOSITEKEYS

Controls how multicolumn keys are rendered in the cube.

\[ \text{TRUE} \]: Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default)

\[ \text{FALSE} \]: Creates a unique key attribute for each column.

RENDERINGMODE

Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See "Requirements for the Relational Materialized View" on page 42-6.

\[ \text{LOOSE} \]: Losses are noted in the optional logs generated by the CREATE_MVIEW Function and the DERIVE_FROM_MVIEW Function. No exceptions are raised. (Default)

\[ \text{STRICT} \]: Any loss in fidelity raises an exception so that no XML template is created.

SEEFILTERS

Controls whether conditions in the \texttt{WHERE} clause of the relational materialized view’s defining query are retained or ignored.

\[ \text{TRUE} \]: Renders valid conditions in the XML template. (Default)

\[ \text{FALSE} \]: Ignores all conditions.

UNIQUENAMES

Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects.

\[ \text{TRUE} \]: Modifies all relational names when they are rendered in the cube. (Default)

\[ \text{FALSE} \]: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created.

UNKNOWNKEYASDIM

Controls handling of simple columns with no levels or hierarchies in the \texttt{GROUP BY} clause of the relational materialized view’s defining query.

\[ \text{TRUE} \]: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies.

\[ \text{FALSE} \]: Raises an exception when no relational dimension is found for the column. (Default)

VALIDATEXML

Controls whether the generated XML document is validated.

\[ \text{TRUE} \]: Validates the template using the \texttt{VALIDATE_XML} procedure. (Default)

\[ \text{FALSE} \]: No validation is done.

VALIDATEXML & Controls whether the generated XML document is validated. \\
& \[ \text{TRUE} \]: Validates the template using the \texttt{VALIDATE_XML} procedure. (Default) \\
& \[ \text{FALSE} \]: No validation is done. \\
\hline
\end{tabular}
\end{table}
Returns

The name of the cube materialized view created by the function.

Usage Notes

See "Using SQL Aggregation Management" on page 42-4

Examples

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEEK_PSCAT_SALES_MV.

The following script creates a cube materialized view using CAL_MONTH_SALES_MV as the relational materialized view. It uses all default options.

SET serverout ON format wrapped

DECLARE
  salesaw  varchar2(30);
BEGIN
  salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV');
END;
/

The next example sets several parameters for creating a cube materialized view from FWEEEK_PSCAT_SALES_MV. These parameters change the cube materialized view in the following ways:

- ADDTOPS: Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- PRECOMPUTE: Changes the percentage of materialized aggregates from 35:0 to 40:10.
- EXPORTXML: Creates a text file for the XML document.
- BUILD: Performs a data refresh.

DECLARE
  salescubemv   varchar2(30);
  sam_param     clob := 'ADDTOPS=FALSE,';
  PRECOMPUTE=40:10,';
  EXPORTXML=WORK_DIR/sales.xml,';
  BUILD=IMMEDIATE';
BEGIN
  salescubemv := dbms_cube.create_mview('SH', 'FWEEK_PSCAT_SALES_MV',
                                             sam_param);
END;
/
DERIVE_FROM_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

Syntax

```sql
DBMS_CUBE.DERIVE_FROM_MVIEW (  
    mvowner        IN  VARCHAR2,  
    mvname         IN  VARCHAR2,  
    sam_parameters IN  CLOB  DEFAULT NULL)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot; on page 42-6. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Optional list of parameters in the form 'parameter1=value1, parameter2=value2,...'. See &quot;SQL Aggregation Management Parameters&quot; on page 42-37.</td>
</tr>
</tbody>
</table>

Returns

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

Usage Notes

To create a cube materialized view from an XML template, use the `IMPORT_XML` procedure. Then use the `REFRESH_MVIEW` procedure to refresh the cube materialized view with data.

See "Using SQL Aggregation Management" on page 42-4.

Examples

The following example generates an XML template named `sales_cube.xml` from the `CAL_MONTH_SALES_MV` relational materialized view in the `SH` schema.

```sql
DECLARE  
    salescubexml  clob := null;  
    sam_param     clob := 'exportXML=WORK_DIR/sales_cube.xml';
BEGIN  
    salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV',  
        sam_param);  
END;
```
END;
/

Summary of DBMS_CUBE Subprograms
DROP_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

Syntax

```sql
DBMS_CUBE.DROP_MVIEW (    mvowner        IN  VARCHAR2,
                        mvname         IN  VARCHAR2,
                        sam_parameters IN  CLOB  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>EXPORTXML: Exports the XML that drops the dimensional objects to a file, which you specify as dir/filename. Both the directory and the file name are case sensitive.</td>
</tr>
<tr>
<td></td>
<td>dir: Name of a database directory.</td>
</tr>
<tr>
<td></td>
<td>filename: The name of the file, typically given an XML filename extension.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to drop a cube materialized view that you created using the CREATE_MVIEW and DERIVE_FROM_MVIEW functions. If you make modifications to the cubes or dimensions, then DROP_MVIEW may not be able to drop the cube materialized view.

Some of the CUBEMVOPTION parameters used by the CREATE_MVIEW and DERIVE_FROM_MVIEW functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the EXPORTXML parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the IMPORT_XML procedure.

See "Using SQL Aggregation Management" on page 42-4.

Examples

The current schema has four materialized views. CB$CAL_MONTH_SALES is a cube materialized view for the SALES table. CB$TIMES_DIM_D1_CAL_ROLLUP is a cube dimension materialized view for the TIMES_DIM dimension on the TIMES dimension table. The others are relational materialized views.

```sql
SELECT mview_name FROM user_mviews;

MVIEW_NAME
-------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
```
Fweek_PSCat_Sales_MV

The following command drops both CB$CAL_MONTH_SALES and CB$TIMES_DIM_D1_CAL_ROLLUP.

EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20130213 16:31:40.056.

This query against the data dictionary confirms that the materialized views have been dropped.

SELECT mview_name FROM user_mviews;

MVIEW_NAME
-------------------
CAL_MONTH_SALES_MV
Fweek_PSCAT_SALES_MV
EXPORT_XML Procedure

This procedure writes OLAP metadata to a CLOB.

Syntax

DBMS_CUBE.EXPORT_XML
(object_ids            IN      VARCHAR2,
 out_xml               IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
(object_ids            IN      VARCHAR2,
options_xml           IN      CLOB,
 out_xml               IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
(object_ids            IN      VARCHAR2,
options_dirname       IN      VARCHAR2,
options_filename      IN      VARCHAR2,
 out_xml               IN/OUT  CLOB;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td></td>
<td>- The name of a schema, such as GLOBAL.</td>
</tr>
<tr>
<td></td>
<td>- The fully qualified name of an analytic workspace in the form owner.aw_name.AW, such as GLOBAL.GLOBAL.AW.</td>
</tr>
<tr>
<td></td>
<td>- Cube</td>
</tr>
<tr>
<td></td>
<td>- Dimension</td>
</tr>
<tr>
<td></td>
<td>- Named build process</td>
</tr>
<tr>
<td></td>
<td>- Measure folder</td>
</tr>
</tbody>
</table>

You can specify multiple objects by separating the names with commas.

Note: When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when exporting a cube, you must also export the dimensions of the cube.

options_dirname | The case-sensitive name of a database directory that contains options_filename.

options_filename | A file containing an XML document of export options.

options_xml | A CLOB variable that contains an XML document of export options. Use the CREATE_EXPORT_OPTIONS Procedure to generate this document.

out_xml | A CLOB variable that will store the XML document of OLAP metadata for the objects listed in object_ids.

Export Options

The default settings for the export options are appropriate in many cases, so you can omit the options_xml parameter or the options_dirname and options_filename.
parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 12c, you must specify an XML document that changes the default settings. This example changes all of the parameters from False to True; set them appropriately for your schema.

```xml
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure on page 42-32.

### Usage Notes

See "Upgrading 10g Analytic Workspaces" on page 42-12.

### Example

For an example of using EXPORT_XML in an upgrade to the same schema, see "Upgrading 10g Analytic Workspaces" on page 42-12.

The following PL/SQL script copies an OLAP 12c analytic workspace named GLOBAL12 from the GLOBAL_AW schema to the GLOBAL schema. No upgrade is performed.

To upgrade into a different schema, change the example as follows:

- Call the INITIALIZE_CUBE_UPGRADE procedure.
- Call the CREATE_EXPORT_OPTIONS procedure with the additional parameter setting SUPPRESS_NAMESPACE=>TRUE.

The PL/SQL client must be connected to the database as GLOBAL. The GLOBAL user must have SELECT permissions on GLOBAL_AW.AW$GLOBAL and on all relational data sources.

```plsql
BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>optionsClob, suppress_owner=>TRUE, preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);

  -- Export metadata from an analytic workspace to a CLOB
  dbms_cube.export_xml(object_ids=>'GLOBAL_AW.GLOBAL12.AW', options_xml=>optionsClob, out_xml=>exportClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(in_xml=>exportClob);

  -- Load and aggregate the data
  dbms_cube.build(script=>'GLOBAL.UNITS_CUBE, GLOBAL.PRICE_AND_COST_CUBE');
END;
/
EXPORT_XML_TO_FILE Procedure

This procedure exports OLAP metadata to a file. This file can be imported into a new or existing analytic workspace using the IMPORT_XML procedure. In this way, you can create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading OLAP standard form metadata contained in an Oracle OLAP 10g analytic workspace to OLAP 12c format.

Syntax

```
DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids            IN      VARCHAR2,
   output_dirname        IN      VARCHAR2,
   output_filename       IN      VARCHAR2);

DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids            IN      VARCHAR2,
   options_dirname       IN      VARCHAR2,
   options_filename      IN      VARCHAR2,
   output_dirname        IN      VARCHAR2,
   output_filename       IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td></td>
<td>- The name of a schema, such as GLOBAL.</td>
</tr>
<tr>
<td></td>
<td>- The fully qualified name of an analytic workspace in the form owner.aw_name.AW, such as GLOBAL.GLOBAL.AW.</td>
</tr>
<tr>
<td></td>

<td>The name of a file containing an XML document of export options. See &quot;Export Options&quot;.</td>
</tr>
<tr>
<td>output_dirname</td>
<td>The case-sensitive name of a database directory where output_filename is created.</td>
</tr>
<tr>
<td>output_filename</td>
<td>The name of the template file created by the procedure.</td>
</tr>
</tbody>
</table>
Export Options

The default settings for the export options are appropriate in most cases, and you can omit the `options_dirname` and `options_filename` parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 12c, you must specify an XML document that changes the default settings, like the following:

```xml
<?xml version="2.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the `CREATE_EXPORT_OPTIONS` Procedure on page 42-32.

Usage Notes

See "Upgrading 10g Analytic Workspaces" on page 42-12.

Examples

The following example generates an XML file named `global.xml` in OLAP 12c format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the `GLOBAL_AW` schema. The output file is generated in the `WORK_DIR` database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named `global.xml` in OLAP 12c format using the export options set in `options.xml`. The metadata is derived from the `GLOBAL` analytic workspace in the `GLOBAL_AW` schema. Both the options file and the output file are in the `WORK_DIR` database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL_AW', 'WORK_DIR', 'options.xml', 'WORK_DIR', 'global.xml');
```
IMPORT_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

Syntax

```sql
DBMS_CUBE.IMPORT_XML
  (dirname               IN      VARCHAR2,
   filename              IN      VARCHAR2 );

DBMS_CUBE.IMPORT_XML
  (dirname               IN      VARCHAR2,
   filename              IN      VARCHAR2,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (input_dirname         IN      VARCHAR2,
   input_filename        IN      VARCHAR2
   options_dirname       IN      VARCHAR2,
   options_filename      IN      VARCHAR2,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB,
   options_xml           IN      CLOB,
   out_xml               IN/OUT  CLOB );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory containing the XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>filename</td>
<td>A file containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>in_xml</td>
<td>A CLOB containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>input_dirname</td>
<td>The case-sensitive name of a database directory containing the XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>input_filename</td>
<td>A file containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory containing a file of import options.</td>
</tr>
<tr>
<td>options_filename</td>
<td>A file of import options.</td>
</tr>
</tbody>
</table>
Summary of DBMS_CUBE Subprograms

**Usage Notes**

The XML can define, modify, or drop an entire analytic workspace, or one or more cubes or dimensions. When defining just cubes or dimensions, you must do so within an existing analytic workspace.

You can also use `IMPORT_XML` to drop an analytic workspace by using the XML document generated by the `DROP_MVIEW` procedure with the `EXPORTXML` parameter.

See "Upgrading 10g Analytic Workspaces" on page 42-12.

**Example**

This example loads an XML template from a file named `GLOBAL.XML` and located in a database directory named `XML_DIR`.

```sql
EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');
```

The next example exports an OLAP 10g template and uses `IMPORT_XML` to validate it before an upgrade to 12c.

```sql
DECLARE
    exportOptClob clob;
    importOptClob clob;
    importClob    clob;
    exportClob    clob;
BEGIN
    -- Create a CLOB for the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob, suppress_namespace=>TRUE, preserve_table_owners=>TRUE);
    -- Create a CLOB for the XML template
    dbms_lob.createtemporary(exportClob, TRUE);
    -- Create a CLOB for import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, validate_only=>TRUE);
    -- Create a CLOB for the change log
    dbms_lob.createtemporary(importClob, TRUE);
    -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;
    -- Export metadata from an analytic workspace to a CLOB
```

---

**Table 42–12 (Cont.) IMPORT_XML Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_xml</td>
<td>An XML document describing the import options. Use the CREATE_IMPORT_OPTIONS Procedure on page 42-35 to generate this document.</td>
</tr>
<tr>
<td>out_xml</td>
<td>An XML document that either describes the analytic workspace or, for validation only, describes any errors. It may contain changes that DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.</td>
</tr>
</tbody>
</table>
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob, out_xml=>exportClob);

/* Import metadata from the CLOB. No objects are committed to the database because the validate_only parameter of CREATE_IMPORT_OPTIONS is set to TRUE. */

dbms_cube.import_xml(in_xml=>exportClob, options_xml=>importOptClob, out_xml=>importClob);

-- Output the metadata changes
dbms_output.put_line('This is the validation log:');
dbms_output.put_line(importClob);

END;
/

The contents of importClob show that the XML is valid. Otherwise, error messages appear in the <RootCommitResult> element.

This is the validation log:
<?xml version="1.0" encoding="UTF-16"?>
<RootCommitResult>

</RootCommitResult>

For an example of IMPORT_XML within the context of an upgrade from 10g to 12c metadata, see 'Custom Upgrade' on page 42-16.
**INITIALIZE_CUBE_UPGRADE Procedure**

This procedure processes analytic workspaces created in Oracle OLAP 10g so they can be used by Oracle OLAP 12c clients. It processes all analytic workspaces in the current schema. Run this procedure once for each schema in which there are 10g analytic workspaces.

Without this processing step, 12c clients cannot connect to a database containing a 10g analytic workspace with subobjects of a dimension or cube having the same name. Additionally, some DBMS_CUBE procedures and functions, such as EXPORT_XML and EXPORT_XML_TO_FILE, do not work on the 10g metadata.

After processing, OLAP 12c clients can connect and use the alternate names provided by INITIALIZE_CUBE_UPGRADE for the conflicting subobjects. OLAP 10g clients continue to use the original names.

INITIALIZE_CUBE_UPGRADE does not upgrade any OLAP 10g objects to OLAP 12c format.

See "Upgrading 10g Analytic Workspaces" on page 42-12.

**Syntax**

```
DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
```

**Usage Notes**

This procedure creates and populates a table named CUBE_UPGRADE_INFO. If it already exists, the table is truncated and repopulated.

While the 10g namespace allowed subobjects with the same name in the same dimension or cube, the 12c namespace does not. When INITIALIZE_CUBE_UPGRADE detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in CUBE_UPGRADE_INFO providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the CONFLICT column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL INSERT and UPDATE if you want to customize the names of OLAP 10g objects on OLAP 12c clients.

The UPGRADE_AW, EXPORT_XML and EXPORT_XML_TO_FILE procedures use the names specified in the NEW_NAME column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

The following table describes the columns of CUBE_UPGRADE_INFO.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Owner of the analytic workspace.</td>
</tr>
<tr>
<td>AW</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Name of the analytic workspace.</td>
</tr>
<tr>
<td>AWXML_ID</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Full logical name of the object requiring modification, in the form simple_name.[subtype_name].object_type. For example, TIME.DIMENSION and PRODUCT.COLOR.ATTRIBUTE.</td>
</tr>
<tr>
<td>NEW_NAME</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>The name the object will have in Oracle 12c after the upgrade.</td>
</tr>
</tbody>
</table>
The following command creates and populates the CUBE_UPGRADE_INFO table:

```
EXECUTE dbms_cube.initialize_cube_upgrade;
```

The table shows that the OLAP 10g analytic workspace has a hierarchy and a level named MARKET_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming. The value of CONFLICT is 0.

```
SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;
```

<table>
<thead>
<tr>
<th>AWXML_ID</th>
<th>NEW_NAME</th>
<th>CONFLICT</th>
</tr>
</thead>
<tbody>
<tr>

Examples
REFRESH_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

Syntax

```sql
DBMS_CUBE.REFRESH_MVIEW (  
  mvowner        IN  VARCHAR2,  
  mvname         IN  VARCHAR2,  
  method         IN  VARCHAR2       DEFAULT NULL,  
  refresh_after_errors IN  BOOLEAN        DEFAULT FALSE,  
  parallelism    IN  BINARY_INTEGER DEFAULT 0,  
  atomic_refresh IN  BOOLEAN        DEFAULT FALSE,  
  scheduler_job  IN  VARCHAR2       DEFAULT NULL,  
  sam_parameters IN  CLOB           DEFAULT NULL,  
  nested         IN  BOOLEAN        DEFAULT FALSE );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view.</td>
</tr>
<tr>
<td>method</td>
<td>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes.</td>
</tr>
<tr>
<td></td>
<td>- C: Complete refresh clears all dimension values before loading. (Default)</td>
</tr>
<tr>
<td></td>
<td>- F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.</td>
</tr>
<tr>
<td></td>
<td>- ?: Fast refresh if possible, and otherwise a complete refresh.</td>
</tr>
<tr>
<td></td>
<td>- P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.</td>
</tr>
<tr>
<td></td>
<td>- S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</td>
</tr>
<tr>
<td></td>
<td>FALSE to roll back all objects in the build.</td>
</tr>
<tr>
<td>parallelism</td>
<td>Number of parallel processes to allocate to this job.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>See the &quot;Usage Notes&quot; for the BUILD procedure on page 42-26 for additional details.</td>
</tr>
<tr>
<td>nested</td>
<td>See the &quot;Usage Notes&quot; for the BUILD procedure for additional details.</td>
</tr>
</tbody>
</table>
REFRESH_MVIEW Procedure

Usage Notes

REFRESH_MVIEW changes mvname to the name of the cube, then passes the cube name and all parameters to the BUILD procedure. Thus, you can use the BUILD procedure to refresh a cube materialized view. See the 'BUILD Procedure' on page 42-19 for additional information about the parameters.

Examples

The following example uses the default settings to refresh a cube materialized view named CB$FWEEK_PSCAT_SALES.

SET serverout ON format wrapped
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES');

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES', '?', TRUE, 2);

After successfully refreshing the cube materialized view, REFRESH_MVIEW returns a message like the following:
Completed refresh of cube mview 'SH'. 'CB$FWEEK_PSCAT_SALES' at 20130212 15:04:46.370.

Table 42–13  (Cont.)  REFRESH_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomic_refresh</td>
<td>TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.</td>
</tr>
<tr>
<td>scheduler_job</td>
<td>Any text identifier for the job, which will appear in the log table. The string does not need to be unique.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>None.</td>
</tr>
<tr>
<td>nested</td>
<td>TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.</td>
</tr>
</tbody>
</table>
UPGRADE_AW Procedure

This procedure creates an Oracle OLAP 12c analytic workspace from a copy of the metadata contained in an OLAP 10g analytic workspace. The original OLAP 10g analytic workspace is not affected and can exist at the same time and in the same schema as the OLAP 12c analytic workspace.

UPGRADE_AW automatically runs INITIALIZE_CUBE_UPGRADE if the CUBE_UPGRADE_INFO table does not exist. If it does exist, then UPGRADE_AW does not overwrite it, thus preserving any changes you made to the table.

See “Upgrading 10g Analytic Workspaces” on page 42-12.

Syntax

```sql
DBMS_CUBE.UPGRADE_AW
    (sourceaw              IN  VARCHAR2,
     destaw                IN  VARCHAR2,
     upgoptions            IN  CLOB DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceaw</td>
<td>The name of a 10g analytic workspace.</td>
</tr>
<tr>
<td>destaw</td>
<td>A new name for the generated 12c analytic workspace. It cannot be the same as sourceaw.</td>
</tr>
<tr>
<td>upgoptions</td>
<td>One or more of these upgrade options, as a string in the form 'OPTION=VALUE'. Separate multiple options with commas.</td>
</tr>
</tbody>
</table>

- **PRESERVE_TABLE_OWNERS:**
  - YES preserves the original source table mappings. Use this option when creating an OLAP 12c analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the original schema. (Default)
  - NO removes the schema owner from the source table mappings. Use this option when creating an OLAP 12c analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the destination schema.

- **RENAME_TABLE:** The name of a table that specifies new names for objects as they are created in OLAP 12c format. These changes are in addition to those specified by the INITIALIZE_CUBE_UPGRADE procedure. See “CREATE_IMPORT_OPTIONS Procedure” on page 42-35 for information about creating a rename table.

Examples

This example upgrades an OLAP 10g analytic workspace named GLOBAL10 to an OLAP 12c analytic workspace named GLOBAL12, using a rename table named MY_OBJECT_MAP:

```sql
BEGIN
    -- Upgrade the analytic workspace
    dbms_cube.upgrade_aw(sourceaw => 'GLOBAL10', destaw => 'GLOBAL12', upgoptions =>
```
'RENAME_TABLE=MY_OBJECT_MAP');

-- Load and aggregate the data
dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

\[
\text{DBMS_CUBE.VALIDATE_XML} \\
\quad \text{(dirname\hspace{1em}IN\hspace{0.5em}VARCHAR2,} \\
\quad \text{filename\hspace{1em}IN\hspace{0.5em}VARCHAR2 );} \\
\text{DBMS_CUBE.VALIDATE_XML} \\
\quad \text{(in\_xml\hspace{1em}IN\hspace{0.5em}CLOB );}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of a file containing an XML template.</td>
</tr>
<tr>
<td>IN_XML</td>
<td>The name of a CLOB containing an XML template.</td>
</tr>
</tbody>
</table>

Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example reports a problem in the schema:

```sql
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;
*
ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.SAW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube 'GLOBAL.PRICE_CUBE' contains multiple BuildSpecifications with the same name.
'GLOBAL.UNITS_CUBE.SAW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube 'GLOBAL.UNITS_CUBE' contains multiple BuildSpecifications with the same name.
XOQ-01400: invalid metadata objects
ORA-06512: at 'SYS.DBMS_CUBE', line 411
ORA-06512: at 'SYS.DBMS_CUBE', line 441
ORA-06512: at 'SYS.DBMS_CUBE', line 501
ORA-06512: at 'SYS.DBMS_CUBE', line 520
ORA-06512: at line 1

After the problems are corrected, the procedure reports no errors:

EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
PL/SQL procedure successfully completed.
This example loads an XML template into a temporary CLOB, then validates it. The script is named `GLOBAL.XML`, and it is located in a database directory named `XML_DIR`.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
    xml_file       BFILE := bfilename('XML_DIR', '&xml_file');
    in_xml         CLOB;
    out_xml        CLOB := NULL;
    dest_offset    INTEGER := 1;
    src_offset     INTEGER := 1;
    lang_context   INTEGER := 0;
    warning        INTEGER;
BEGIN
    -- Setup the clob from a file
    DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
    DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
    DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
    DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
                            dest_offset, src_offset, 0, lang_context, warning);

    -- Validate the xml
    DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topics:

- Using DBMS_CUBE_ADVISE
- Summary of DBMS_CUBE_ADVISE Subprograms

## Summary of DBMS_CUBE_ADVISE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MV_CUBE_ADVICE Function</strong>&lt;br&gt;on page 43-5</td>
<td>Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.</td>
</tr>
<tr>
<td><strong>SET_CNS_EXCEPTION_LOG Procedure</strong>&lt;br&gt;on page 43-8</td>
<td>Identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.</td>
</tr>
<tr>
<td><strong>TRACE Procedure</strong>&lt;br&gt;on page 43-9</td>
<td>Displays or suppresses diagnostic messages for MV_CUBE_ADVICE.</td>
</tr>
</tbody>
</table>
**MV_CUBE_ADVICE Function**

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

**Syntax**

```sql
DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (
    owner        IN  VARCHAR2  DEFAULT USER,
    mvname       IN  VARCHAR2,
    reqtype      IN  VARCHAR2  DEFAULT '0',
    validate     IN  NUMBER    DEFAULT 0)
RETURN COAD_ADVICE_T  PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE</td>
</tr>
<tr>
<td>reqtype</td>
<td>Type of advice to generate:</td>
</tr>
<tr>
<td></td>
<td>- 0: All applicable advice types</td>
</tr>
<tr>
<td></td>
<td>- 1: Column NOT NULL constraints</td>
</tr>
<tr>
<td></td>
<td>- 2: Primary key constraints</td>
</tr>
<tr>
<td></td>
<td>- 3: Foreign key constraints</td>
</tr>
<tr>
<td></td>
<td>- 4: Relational dimension objects</td>
</tr>
<tr>
<td></td>
<td>- 5: Cube materialized view logs with primary key</td>
</tr>
<tr>
<td>validate</td>
<td>Validation option:</td>
</tr>
<tr>
<td></td>
<td>- 0: Validate the constraints</td>
</tr>
<tr>
<td></td>
<td>- 1: Do not validate the constraints</td>
</tr>
</tbody>
</table>

**Returns**

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. Table 43–3 describes the columns.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2 (30)</td>
<td>Owner of the dimensional object identified in APIOBJECT.</td>
</tr>
<tr>
<td>APIOBJECT</td>
<td>VARCHAR2 (30)</td>
<td>Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.</td>
</tr>
<tr>
<td>SQLOBJOWN</td>
<td>VARCHAR2 (30)</td>
<td>Owner of the relational object identified in SQLOBJECT.</td>
</tr>
<tr>
<td>SQLOBJECT</td>
<td>VARCHAR2 (65)</td>
<td>Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB$UNITS_CUBE.</td>
</tr>
</tbody>
</table>
**Usage Notes**

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

**MV_CUBE_ADVICE** generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

**Examples**

The following query displays the SQL statements recommended by **MV_CUBE_ADVICE**. **UNITS_FACT** is the master table for **UNITS_CUBE**, and **MV_CUBE_ADVICE** generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB$UNITS_CUBE cube materialized view.

```sql
SQL> SELECT apiobject, sqlobject, sqltext
       FROM TABLE(dxms_cube_advice.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));
```

<table>
<thead>
<tr>
<th>APIOBJECT</th>
<th>SQLOBJECT</th>
<th>SQLTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNITS_CUBE</td>
<td>UNITS_FACT</td>
<td>alter table &quot;GLOBAL&quot;.&quot;UNITS_FACT&quot; add constr</td>
</tr>
<tr>
<td></td>
<td></td>
<td>int &quot;COAD_PK000208&quot; PRIMARY KEY {&quot;CHANNEL_ID&quot;}</td>
</tr>
</tbody>
</table>

---

**Table 43–3 (Cont.) MV_CUBE_ADVICE Return Values**

<table>
<thead>
<tr>

</tbody>
</table>

| DISPOSITION | CLOB             | Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed. |
| SQLTEXT     | CLOB             | SQL statement that implements the recommendation.                           |
| DROPTEXT    | CLOB             | SQL statement that reverses SQLTEXT.                                        |

Pre-existing conditions may prevent these statements from restoring the schema to its previous state.
UNITS_CUBE CB$UNITS_CUBE

alter materialized view "GLOBAL"."CB$UNITS_CUBE" compile
SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

Syntax

DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (  
    exceptlogtab IN   VARCHAR2  DEFAULT user.EXCEPTIONS);

Parameters

Table 43–4  SET_CNS_EXCEPTION_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exceptlogtab</td>
<td>The name of an existing exception log.</td>
</tr>
</tbody>
</table>

Usage Notes

To create an exception log, use the utlexcpt.sql or the utlexpt1.sql script before executing SET_CNS_EXCEPTION_LOG.

The validate parameter of MV_CUBE_ADVICE must be set to 1.

Examples

The utlexcpt.sql script creates a table named EXCEPTIONS, and the SET_CNS_EXCEPTION_LOG procedure identifies it as the exception log for MV_CUBE_ADVICE. The ALTER TABLE statement now includes the clause VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS".

SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
    FROM TABLE(
      dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));

<table>
<thead>
<tr>
<th>APIOBJECT</th>
<th>SQLOBJECT</th>
<th>TYPE</th>
<th>SQLTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNITS_CUBE</td>
<td>UNITS_FACT</td>
<td>2</td>
<td>alter table &quot;GLOBAL&quot;.&quot;UNITS_FACT&quot; add constraint &quot;COAD_PK000219&quot; PRIMARY KEY (&quot;CHANNEL_ID&quot;, &quot;ITEM_ID&quot;, &quot;SHIP_TO_ID&quot;, &quot;MONTH_ID&quot;) norely enable validate exceptions into &quot;GLOBAL&quot;.&quot;EXCEPTIONS&quot;</td>
</tr>
<tr>
<td>UNITS_CUBE</td>
<td>CB$UNITS_CUBE</td>
<td>8</td>
<td>alter materialized view &quot;GLOBAL&quot;.&quot;CB$UNITS_CUBE&quot; compile</td>
</tr>
</tbody>
</table>
TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the MV_CUBE_ADVICE function.

Syntax

```
DBMS_CUBE_ADVISE.TRACE (  
    diaglevel       IN  BINARY_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diaglevel</td>
<td>0 to turn tracing off, or 1 to turn tracing on.</td>
</tr>
</tbody>
</table>

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus SERVEROUTPUT setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
DBMS_COAD_DIAG: Changing diagLevel from [0] to [1]
PL/SQL procedure successfully completed.
```

```
SQL> SELECT sqlobject, sqltext, droptext  
    2 FROM TABLE(  
    3     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))  
    4 WHERE apiobject='UNITS_CUBE';
```

```
<table>
<thead>
<tr>
<th>SQLOBJECT</th>
<th>SQLTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNITS_FACT</td>
<td>alter table &quot;GLOBAL&quot;.&quot;UNITS_FACT&quot; add constraint &quot;COAD_PK000222&quot; PRIMARY KEY (&quot;COLUME&quot;, &quot;ITEM_ID&quot;, &quot;SHIP_TO_ID&quot;, &quot;MO</td>
</tr>
<tr>
<td></td>
<td>NTH_ID&quot;) reily disable novalidate</td>
</tr>
<tr>

SQL> EXECUTE dbms_cube_advise.trace(0);
DBMS_COAD_DIAG: Changing diagLevel from [1] to [0]

PL/SQL procedure successfully completed.
DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

See Also: Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_CUBE_LOG
- Summary of DBMS_CUBE_LOG Subprograms
Using DBMS_CUBE_LOG

DBMS_CUBE_LOG manages several logs. These logs enable you to track the progress of long running processes, then use the results to profile performance characteristics. They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube, such as hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

This section contains the following topics:

■ Logging Types
■ Logging Targets
■ Verbosity Levels
■ Security Model
■ Creating Cube Logs
■ Cube Build Log
■ Cube Dimension Compile Log
■ Cube Operations Log
■ Cube Rejected Records Log
Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable. The logs and their contents are described later in this topic.

- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log

DBMS_CUBE_LOG provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TYPE_BUILD Function
- TYPE_DIMENSION_COMPILE Function
- TYPE_OPERATIONS Function
- TYPE_REJECTED_RECORDS Function
Logging Targets

The TABLE_CREATE procedure creates database tables for storing the logs. Using the ENABLE procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file. These are the available targets:

- Disk file
- LOB
- Database table
- Trace file

See "ENABLE Procedure" on page 44-17 for more information about creating multiple targets.

DBMS_CUBE_LOG provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TARGET_FILE Function
- TARGET_LOB Function
- TARGET_TABLE Function
- TARGET_TRACE Function
Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer details when leaving a job to run overnight than when you are monitoring the success of a new build. You can choose from these verbosity levels. Each level adds to the preceding level.

- **LOWEST**: Logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records. This is the basic logging level.
- **LOW**: Logs messages from the OLAP engine, such as start and finish records for SQL Import, Aggregate, and Update.
- **MEDIUM**: Logs messages at the level used by Analytic Workspace Manager.
- **HIGH**: Logs messages that provide tuning information, such as composite lengths, partitioning details, object sizes, and aggregation work lists. This level is intended for use by Oracle Field Services.
- **HIGHEST**: Logs debugging messages and other information typically sent to a trace file. This level is intended for use by Oracle Support Services.

**DBMS_CUBE_LOG** provides functions that return the binary integer for each verbosity level. You can produce more readable code by using these functions instead of integers for the argument values of other **DBMS_CUBE_LOG** procedures and functions. Refer to these descriptions:

- **LEVEL_LOWEST Function**
- **LEVEL_LOW Function**
- **LEVEL_MEDIUM Function**
- **LEVEL_HIGH Function**
- **LEVEL_HIGHEST Function**
The `TABLE_CREATE` procedure requires the `CREATE TABLE` privilege.
Creating Cube Logs

To store logging information in a database table, you must create that table using the TABLE_CREATE procedure. Cube Build logs are always stored in tables. The ENABLE procedure creates the other target types for the other logs.

To create a Cube Build log:

- Execute the TABLE_CREATE procedure.

The following command creates a Cube Build log with the default name of CUBE_BUILD_LOG:

```sql
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the TABLE_CREATE procedure to create the table.
2. Execute the ENABLE procedure to begin logging.

These commands create and enable a Cube Operations table with the default name of CUBE_OPERATIONS_LOG and the default verbosity level:

```sql
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the ENABLE procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named rejects.log in the WORK_DIR database directory:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -
  dbms_cube_log.target_file, dbms_cube_log.level_lowest, -
  'WORK_DIR/rejects.log');
```
Cube Build Log

The Cube Build log provides information about what happened during a build. Use this log to determine whether the build produced the results you were expecting, and if not, why not.

The contents of the Cube Build log are refreshed continuously during a build. You can query the log at any time to evaluate the progress of the build and to estimate the time to completion.

The default name of the Cube Build log is `CUBE_BUILD_LOG`. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_ID</td>
<td>NUMBER</td>
<td>--</td>
<td>A unique sequence number for the build. The same number is used for slave processes in a parallel build.</td>
</tr>
<tr>
<td>SLAVE_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>A counter for slave processes in a parallel build: 0 is the master process, 1 is the first slave, 2 is the second slave, and so forth.</td>
</tr>
<tr>
<td>STATUS</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The current status of the command: STARTED, COMPLETED, FAILED, or WORKING.</td>
</tr>
<tr>
<td>COMMAND</td>
<td>VARCHAR2(25)</td>
<td>--</td>
<td>The name of the command being executed, such as BUILD, LOAD, and SOLVE.</td>
</tr>
<tr>
<td>BUILD_OBJECT</td>
<td>VARCHAR2(500)</td>
<td>--</td>
<td>The name of the cube or cube dimension being processed.</td>
</tr>
<tr>
<td>BUILD_OBJECT_TYPE</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The type of object: CUBE, DIMENSION, or BUILD.</td>
</tr>
<tr>
<td>OUTPUT</td>
<td>CLOB</td>
<td>--</td>
<td>Information structured like an XML document about the command, or NULL when there is no additional information, such as for a STARTED row.</td>
</tr>
<tr>
<td>AW</td>
<td>VARCHAR2(30)</td>
<td>--</td>
<td>The name of the analytic workspace that contains the objects of the build.</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>The owner of the analytic workspace and all the objects of the build.</td>
</tr>
<tr>
<td>PARTITION</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The name of the partition being processed, or NULL when the current operation does not correspond to a partition.</td>
</tr>
<tr>
<td>SCHEDULER_JOB</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>A user-specified string to identify the build.</td>
</tr>
<tr>
<td>TIME</td>
<td>TIMESTAMP(6)</td>
<td>--</td>
<td>The time the row is added to the table.</td>
</tr>
<tr>
<td>BUILD_SCRIPT</td>
<td>CLOB</td>
<td>--</td>
<td>The cube build script. Populated only in rows where COMMAND is BUILD.</td>
</tr>
<tr>
<td>BUILD_TYPE</td>
<td>VARCHAR2(22)</td>
<td>--</td>
<td>The origin of the build: DBMS_CUBE, DBMS_MVIEW, JAVA, or SLAVE.</td>
</tr>
<tr>
<td>COMMANDDEPTH</td>
<td>NUMBER(2)</td>
<td>--</td>
<td>The nesting depth of the command. For example, COMPARE_HIERARCHIES is a component step of COMPARE, so if COMPARE has a depth of 1, then COMPARE HIERARCHIES has a depth of 2.</td>
</tr>
</tbody>
</table>

Note: To manage a Cube Build log, use only the `TABLE_CREATE` and `VERSION` procedures.
<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_SUB_OBJECT</td>
<td>VARCHAR2 (30)</td>
<td>--</td>
<td>The name of a subobject being processed, such as a measure that does not inherit the aggregation rules of the cube.</td>
</tr>
<tr>
<td>REFRESH_METHOD</td>
<td>VARCHAR2 (1)</td>
<td>--</td>
<td>The refresh method, such as C or F, that is associated with the current command. The refresh method is important only for the CLEAR step.</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Not currently used.</td>
</tr>
<tr>
<td>COMMAND_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>The sequence number of the command in the current process, which can be used to distinguish the same command on different objects. For example, a LOAD on PRODUCT and a LOAD on TIME.</td>
</tr>
<tr>
<td>IN_BRANCH</td>
<td>NUMBER (1)</td>
<td>--</td>
<td>Not currently used.</td>
</tr>
<tr>
<td>COMMAND_STATUS_</td>
<td>NUMBER</td>
<td>--</td>
<td>Identifies the sequence number of all rows for a particular command. For example, a particular command might be represented by four rows: The first row has a status of STARTED and the last row has a status of COMPLETED. This column is used for sorting.</td>
</tr>
<tr>
<td>NUMBER</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Cube Dimension Compile Log**

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log. The checks include:

- **Circularity**: Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.

- **Hierarchy type**: Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.

- **Level options**: Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is `CUBE_DIMENSION_COMPILE`. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Sequence number in the Cube Build log</td>
</tr>
<tr>
<td>ERROR#</td>
<td>NUMBER(8)</td>
<td>NOT NULL</td>
<td>Number of the error being reported</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR2(2000)</td>
<td>--</td>
<td>Error message associated with the error</td>
</tr>
<tr>
<td>DIMENSION</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Name of the dimension being compiled</td>
</tr>
<tr>
<td>DIMENSION_MEMBER</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Faulty dimension member</td>
</tr>
<tr>
<td>MEMBER&gt;Ancestor</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Parent of DIMENSION_MEMBER</td>
</tr>
<tr>
<td>HIERARCHY1</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>First hierarchy involved in the error</td>
</tr>
<tr>
<td>HIERARCHY2</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Second hierarchy involved in the error</td>
</tr>
<tr>
<td>ERROR_CONTEXT</td>
<td>CLOB</td>
<td>--</td>
<td>Additional information about the error</td>
</tr>
</tbody>
</table>
Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the SQL_ID column, you can join the Cube Operations log to dynamic performance views such as V$SQL, V$SESSION, and V$SESSION_LONGOPS to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is CUBE_OPERATIONS_LOG. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INST_ID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Instance identifier</td>
</tr>
<tr>
<td>SID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Session identifier</td>
</tr>
<tr>
<td>SERIAL#</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Session serial number</td>
</tr>
<tr>
<td>USER#</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>User identifier</td>
</tr>
<tr>
<td>SQL_ID</td>
<td>VARCHAR2(13)</td>
<td>--</td>
<td>Executing SQL statement identifier</td>
</tr>

</tr>
<tr>
<td>NAME</td>
<td>VARCHAR2(20)</td>
<td>NOT NULL</td>
<td>Name of the record, such as ROWS LOADED, AVE_ROW_LEN, and PAGEPOOLSIZE</td>
</tr>
<tr>
<td>VALUE</td>
<td>VARCHAR2(4000)</td>
<td>--</td>
<td>Value of NAME</td>
</tr>
<tr>
<td>DETAILS</td>
<td>CLOB</td>
<td>--</td>
<td>Additional information about NAME.</td>
</tr>
</tbody>
</table>
The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field generates an error in the log, resulting in multiple rows with the same rowid in the `SOURCE_ROW` column.

The default name of the Cube Rejected Records log is `CUBE_REJECTED_RECORDS`. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Sequence number in the Cube Build log</td>
</tr>
<tr>
<td>ERROR#</td>
<td>NUMBER(8)</td>
<td>NOT NULL</td>
<td>Number of the error triggered by the record</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>

</table>
### Table 44–1  (Cont.) DBMS_CUBE_LOG Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_OPERATIONS Function on page 44-39</td>
<td>Returns the integer value of the Cube Operations log.</td>
</tr>
<tr>
<td>TYPE_REJECTED_RECORDS Function on page 44-40</td>
<td>Returns the integer value of the Cube Rejected Records log.</td>
</tr>
<tr>
<td>VERSION Function on page 44-41</td>
<td>Returns the version number of a specific log table or the current version number of a specific log type.</td>
</tr>
</tbody>
</table>
DEFAULT_NAME Function

This function returns the default table names of the various log types.

Syntax

```sql
DBMS_CUBE_LOG.DEFAULT_NAME (LOG_TYPE IN BINARY_INTEGER DEFAULT TYPE_OPERATIONS) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TYPE_BUILD</td>
</tr>
</tbody>
</table>

See “Logging Types” on page 44-3.

Returns

The default table name of the specified log type.

Examples

This example returns the default name of the Cube Operations log:

```sql
SELECT dbms_cube_log.default_name FROM dual;
```

```
DEFAULT_NAME
------------------
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```sql
select dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) - 'Default Name' from dual;
```

```
Default Name
-------------
CUBE_REJECTED_RECORDS
```
DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the ENABLE procedure.

Syntax

```sql
DBMS_CUBE_LOG.DISABLE (
    LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
    LOG_TARGET     IN   BINARY_INTEGER  DEFAULT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: You cannot disable the Cube Build log with this procedure. See &quot;Logging Types&quot; on page 44-3.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>■ 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>■ 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>■ 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot; on page 44-4</td>
</tr>
</tbody>
</table>

Example

This command disables the dimension compilation error log table:

```sql
EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);
```
ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the DISABLE procedure.

The ENABLE procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.

Syntax

```sql
DBMS_CUBE_LOG.ENABLE (  
  LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL);  

DBMS_CUBE_LOG.ENABLE (  
  LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LOCATION   IN     VARCHAR2        DEFAULT NULL);  

DBMS_CUBE_LOG.ENABLE (  
  LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,  
  LOG_LOCATION   IN/OUT CLOB );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| log_type   | One of the following log types:  
  - 1: TYPE_OPERATIONS  
  - 2: TYPE_REJECTED_RECORDS  
  - 3: TYPE_DIMENSION_COMPILE  
  **Note**: You cannot disable the Cube Build log with this procedure.  
  See "Logging Types" on page 44-3.  
| log_target | One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure.  
  - 1: TARGET_TABLE  
  - 2: TARGET_TRACE  
  - 3: TARGET_FILE  
  - 4: TARGET_LOB  
  See "Logging Targets" on page 44-4 |
The following command enables all cube logs:

```sql
EXECUTE dbms_cube_log.enable;
```

The following PL/SQL procedure sets the log level to `LEVEL_LOWEST`:

```sql
BEGIN
    dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
    dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
                         dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/
```
FLUSH Procedure

This procedure forces all buffered messages to be written to the logs. The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

Syntax

DBMS_CUBE_LOG.FLUSH ();

Example

The following example flushes the buffers for all of the logs:

EXECUTE dbms_cube_log.flush;
This procedure returns the current settings for the level and location of a particular log.

**Syntax**

```sql
DBMS_CUBE_LOG.GET_LOG (
   LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS,
   LOG_TARGET     IN   BINARY_INTEGER  DEFAULT TARGET_TABLE,
   LOG_LEVEL      OUT  BINARY_INTEGER,
   LOG_LOCATION   OUT  VARCHAR2 );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>- 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>- 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>- 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot; on page 44-3.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent</td>
</tr>
<tr>
<td></td>
<td>to a table unless you previously specified a different target using the</td>
</tr>
<tr>
<td></td>
<td>ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>- 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>- 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>- 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>- 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot; on page 44-4</td>
</tr>
<tr>
<td>log_level</td>
<td>One of the following log verbosity levels. Each level adds new types of</td>
</tr>
<tr>
<td></td>
<td>messages to the previous level.</td>
</tr>
<tr>
<td></td>
<td>- 1: LEVEL_LOWEST</td>
</tr>
<tr>
<td></td>
<td>- 2: LEVEL_LOW</td>
</tr>
<tr>
<td></td>
<td>- 3: LEVEL_MEDIUM</td>
</tr>
<tr>
<td></td>
<td>- 4: LEVEL_HIGH</td>
</tr>
<tr>
<td></td>
<td>- 5: LEVEL_HIGHEST</td>
</tr>
<tr>
<td></td>
<td>See &quot;Verbosity Levels&quot; on page 44-5</td>
</tr>
<tr>
<td>log_location</td>
<td>The full identity of the log, such as owner.table_name when log_target is a</td>
</tr>
<tr>
<td></td>
<td>table.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If `log_type` is not active, then `log_level` and `log_location` are null. Use `DBMS_CUBE_LOG.ENABLE` to activate a log.

**Examples**

This PL/SQL procedure provides information about the Cube Rejected Records log:
SET serverout ON format wrapped

DECLARE
    myloglevel    binary_integer;
    mylogtarget  varchar2(128);

BEGIN
    dbms_cube_log.get_log(dbms_cube_log.type_rejected_records,
                          dbms_cube_log.target_table, myloglevel, mylogtarget);
    dbms_output.put_line('Log Level: ' || myloglevel);
    dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/

The procedure generates results like the following:

Log Level: 5

Log Target: GLOBAL.CUBE_REJECTED_RECORDS
GET_LOG_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

Syntax

```sql
DBMS_CUBE_LOG.GET_LOG_SPEC()
RETURN VARCHAR2;
```

Returns

The type and target of all active logs.

Usage Notes

You can use the output from this function as the input to SET_LOG_SPEC.

Examples

The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```sql
SELECT dbms_cube_log.get_log_spec FROM dual;
```

```
GET_LOG_SPEC
--------------------------------------------------------------------------------
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

44-22   Oracle Database PL/SQL Packages and Types Reference
GET_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the SET_PARAMETER function.

Syntax

```
DBMS_CUBE_LOG.GET_PARAMETER (  
   LOG_TYPE       IN   BINARY_INTEGER,  
   LOG_PARAMETER  IN   BINARY_INTEGER )  
RETURN BINARY_INTEGER;  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot; on page 44-3.</td>
</tr>
<tr>
<td>log_parameter</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>■ 1: MAX_ERRORS</td>
</tr>
<tr>
<td></td>
<td>■ 2: FLUSH_INTERVAL</td>
</tr>
<tr>
<td></td>
<td>■ 3: LOG_FULL_RECORD</td>
</tr>
<tr>
<td></td>
<td>■ 4: LOG_EVERY_N</td>
</tr>
<tr>
<td></td>
<td>■ 5: ALLOW_ERRORS</td>
</tr>
<tr>
<td></td>
<td>See &quot;SET_PARAMETER Procedure&quot; on page 44-30.</td>
</tr>
</tbody>
</table>

Returns

The value of the specified logParameter.

Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the SET_PARAMETER procedure.

```
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) -  
   'Maximum Records' FROM dual;
```

Maximum Records
---------------
100
LEVEL_HIGH Function

This function returns the integer value of the high verbosity level.

Syntax

DBMS_CUBE_LOG.LEVEL_HIGH ()
RETURN BINARY_INTEGER;

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to high:

EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
       dbms_cube_log.target_table, dbms_cube_log.level_high);
**LEVEL_HIGHEST Function**

This function returns the integer value of the highest verbosity level.

**Syntax**

```sql
DBMS_CUBE_LOG.LEVEL_HIGHEST ()
    RETURN BINARY_INTEGER;
```

**Returns**

5

**Usage Notes**

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

**Example**

This command sets the verbosity level of the cube operations table to highest:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_highest);
```
LEVEL_LOW Function

This function returns the integer value of the low verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOW ();
RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to low:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
   dbms_cube_log.target_table, dbms_cube_log.level_low);
```
LEVEL_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOWEST ()
RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to lowest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_lowest);
```
LEVEL_MEDIUM Function

This function returns the integer value of the medium verbosity level.

Syntax

```sql
DBMS_CUBE_LOG.LEVEL_MEDIUM ()
RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 44-5.

Example

This command sets the verbosity level of the cube operations table to medium:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
dbms_cube_log.target_table, dbms_cube_log.level_medium);
```
SET_LOG_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

Syntax

```sql
DBMS_CUBE_LOG.SET_LOG_SPEC (
    LOG_SPEC       IN   VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_spec</td>
<td>A string consisting of type(target) pairs. Type can be: ■ OPERATIONS ■ REJECTED_RECORDS ■ DIMENSION_COMPILE Target can be: ■ TABLE ■ TRACE ■ FILE ■ LOB</td>
</tr>
</tbody>
</table>

Usage Notes

The GET_LOG_SPEC function returns a properly formatted string for SET_LOG_SPEC.

Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

```sql
BEGIN
    dbms_cube_log.disable;
    dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);

    dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
    dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/
```

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET_LOG_SPEC function activated two logs:

Cube Logs:

Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)
SET_PARAMETER Procedure

This procedure sets options that control various aspects of logging. To obtain the current value of these options, use the GET_PARAMETER function.

Syntax

```sql
DBMS_CUBE_LOG.SET_PARAMETER (  
  LOG_TYPE       IN   BINARY_INTEGER,  
  LOG_PARAMETER  IN   BINARY_INTEGER,  
  VALUE          IN   BINARY_INTEGER );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot; on page 44-3.</td>
</tr>
<tr>
<td>log_parameter</td>
<td>One of the following parameters:</td>
</tr>
<tr>
<td></td>
<td>1: MAX_ERRORS</td>
</tr>
<tr>
<td></td>
<td>Maximum number of records before signalling an end to logging,</td>
</tr>
<tr>
<td></td>
<td>such as the number of rejected records in the Cube Rejected</td>
</tr>
<tr>
<td></td>
<td>Records log or the number of compilation errors in the dimension</td>
</tr>
<tr>
<td></td>
<td>compilation error log.</td>
</tr>
<tr>
<td></td>
<td>2: FLUSH_INTERVAL</td>
</tr>
<tr>
<td></td>
<td>The number of seconds to buffer the records before writing them</td>
</tr>
<tr>
<td></td>
<td>to a log. When this parameter is 0, the records are written</td>
</tr>
<tr>
<td></td>
<td>directly to the logs without buffering.</td>
</tr>
<tr>
<td></td>
<td>3: LOG_FULL_RECORD</td>
</tr>
<tr>
<td></td>
<td>Controls logging of rejected records. Set this parameter to one</td>
</tr>
<tr>
<td></td>
<td>of the following constants:</td>
</tr>
<tr>
<td></td>
<td>0: FULL_RECORD_AUTO: Log the full record when no row ID is</td>
</tr>
<tr>
<td></td>
<td>available.</td>
</tr>
<tr>
<td></td>
<td>1: FULL_RECORD_ALWAYS: Always log the full record.</td>
</tr>
<tr>
<td></td>
<td>2: FULL_RECORD_NEVER: Never log the full record.</td>
</tr>
<tr>
<td></td>
<td>4: LOG_EVERY_N</td>
</tr>
<tr>
<td></td>
<td>Enters a progress message every n rows during data maintenance.</td>
</tr>
<tr>
<td></td>
<td>5: ALLOW_ERRORS: Displays logging errors, which are initially</td>
</tr>
<tr>
<td></td>
<td>turned off to allow processing to proceed.</td>
</tr>
<tr>
<td>value</td>
<td>The new value of log_parameter.</td>
</tr>
</tbody>
</table>

Examples

This PL/SQL procedure sets the two parameters, then uses the GET_PARAMETER function to show the settings:
BEGIN
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);

    dbms_output.put_line('Max rejected records: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));

    dbms_output.put_line('Buffer time: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 2) ||
        ' seconds');
END;
/

The procedure displays this information:

Max rejected records: 150

Buffer time: 5 seconds
TABLE_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the CREATE TABLE privilege to use this procedure.

TABLE_CREATE also upgrades existing log tables to the current version while preserving the data.

Syntax

```
DBMS_CUBE_LOG.TABLE_CREATE ( 
    LOG_TYPE IN   BINARY_INTEGER  DEFAULT, 
    TBLNAME IN   VARCHAR2        DEFAULT );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>■ 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>■ 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ 4: TYPE_BUILD</td>
</tr>
</tbody>
</table>

See "Logging Types" on page 44-3.

<table>
<thead>
<tr>
<th>tblname</th>
<th>A table name for the log. These are the default names:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>■ CUBE_OPERATIONS_LOG</td>
</tr>
<tr>
<td></td>
<td>■ CUBE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>■ CUBE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>■ CUBE_BUILD_LOG</td>
</tr>
</tbody>
</table>

Examples

This example creates a Cube Operations log table named CUBE_OPERATIONS_LOG:

```
EXECUTE dbms_cube_log.table_create;
```

This example creates a Cube Rejected Records log table named CUBE_REJECTED_RECORDS:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);
```

The next example creates a Cube Build log table named MY_BUILD_LOG:

```
EXECUTE dbms_cube_log.table_create - 
  (dbms_cube_log.type_build, 'MY_BUILD_LOG');
```
TARGET_FILE Function

This function returns the integer value of a file target in DBMS_CUBE_LOG subprograms.

Syntax

```
DBMS_CUBE_LOG.TARGET_FILE ()
RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log file:

```
EXECUTE dbms_cube_log.disable -
   (dbms_cube_log.type_operations, dbms_cube_log.target_file);
```
TARGET_LOB Function

This function returns the integer value of a LOB target.

Syntax

```
DBMS_CUBE_LOG.TARGET_LOB ()
    RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log LOB:

```
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_lob);
```
TARGET_TABLE Function

This function returns the integer value of a table target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TABLE ();
RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log table:

```
EXECUTE dbms_cube_log.disable -
   (dbms_cube_log.type_operations, dbms_cube_log.target_table);
```
TARGET_TRACE Function

This function returns the integer value of a trace file target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TRACE ()
RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 44-4.

Example

This command disables the Cube Operations log trace file:

```
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_trace);
```
**TYPE_BUILD Function**

This function returns the integer value of the Cube Build log.

**Syntax**

```
DBMS_CUBE_LOG.TYPE_BUILD ()
RETURN BINARY_INTEGER;
```

**Returns**

4

**Usage Notes**

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 44-3.

**Example**

This query returns the default name of a Cube Build log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_build) "Log Name" -
FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUBE_BUILD_LOG</td>
</tr>
</tbody>
</table>

**TYPE_DIMENSION_COMPILE Function**

This function returns the integer value of the Cube Dimension Compile log.

**Syntax**

```sql
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()
RETURN BINARY_INTEGER;
```

**Returns**

3

**Usage Notes**

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 44-3.

**Example**

This query returns the default name of a Cube Dimension Compile log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) -
      "Log Name" FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------------------------</td>
</tr>
<tr>
<td>CUBE_DIMENSION_COMPILE</td>
</tr>
</tbody>
</table>
TYPE_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

Syntax

DBMS_CUBE_LOG.TYPE_OPERATIONS ()
RETURN BINARY_INTEGER;

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 44-3.

Example

This query returns the default name of a Cube Dimension Compile log:

SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -
FROM dual;

Log Name
-------------------------
CUBE_OPERATIONS_LOG
**TYPE_REJECTED_RECORDS Function**

This function returns the integer value of the cube Cube Rejected Records log.

**Syntax**

```sql
DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS ()
RETURN BINARY_INTEGER;
```

**Returns**

2

**Usage Notes**

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 44-3.

**Example**

This query returns the default name of a Cube Rejected Records log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
     'Log Name' FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUBE_REJECTED_RECORDS</td>
</tr>
</tbody>
</table>
VERSION Function

This function returns the version number of a specific log table or the current version number of a specific log type.

Syntax

```
DBMS_CUBE_LOG.VERSION ( 
  LOG_TYPE       IN   BINARY_INTEGER  DEFAULT 1, 
  TBLNAME        IN   VARCHAR2        DEFAULT NULL) 
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>log_type</code></td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>- 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>- 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>- 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>- 4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot; on page 44-3.</td>
</tr>
<tr>
<td><code>tblname</code></td>
<td>The name of the log table whose version is returned.</td>
</tr>
</tbody>
</table>

Returns

A version number

Examples

This example returns the current version of the Cube Operations log:

```
SELECT dbms_cube_log.version FROM dual;
```

```
VERSION
---------
2
```

This example returns the version number of an existing Cube Rejected Records log named CUBE_REJECTED_RECORDS.

```
SELECT dbms_cube_log.version(dbms_cube_log.type_rejected_records, -
  'CUBE_REJECTED_RECORDS') version FROM dual;
```

```
VERSION
---------
2
```
The DBMS_DATA_MINING package is the application programming interface for creating, evaluating, and querying data mining models.

- Summary of DBMS_DATA_MINING Subprograms
This section contains topics that relate to using the `DBMS_DATA_MINING` package.

- Overview
- Security Model
- Mining Functions
- Model Settings
- Datatypes
Overview

Oracle Data Mining supports both supervised and unsupervised data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target. You can use Oracle Data Mining to mine structured data and unstructured text.

Supervised data mining functions include:

- Classification
- Regression
- Feature Selection (Attribute Importance)

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection

The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in Table 45–1.

Oracle Data Mining supports more than one algorithm for the classification, regression, clustering, and feature extraction mining functions. Each of these mining functions has a default algorithm, as shown in Table 45–2.

Security Model

The DBMS_DATA_MINING package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers’ rights (run with the privileges of the current user).

The DBMS_DATA_MINING package exposes APIs that are leveraged by the Oracle Data Mining component of the Advanced Analytics Option. Users who wish to create mining models in their own schema require the CREATE MINING MODEL system privilege (as well as the CREATE TABLE and CREATE VIEW system privilege). Users who wish to create mining models in other schemas require the CREATE ANY MINING MODEL system privilege (as well as the corresponding table and view creation privileges).

Users have full control over managing models that exist within their own schema. Additional system privileges necessary for managing data mining models in other schemas include ALTER ANY MINING MODEL, DROP ANY MINING MODEL, SELECT ANY MINING MODEL, COMMENT ANY MINING MODEL, and AUDIT ANY.

Individual object privileges on mining models, ALTER MINING MODEL and SELECT MINING MODEL, can be used to selectively grant privileges on a model to a different user.

See Also: Oracle Data Mining User’s Guide for more information about the security features of Oracle Data Mining
Mining Functions

A data mining function refers to the methods for solving a given class of data mining problems. The mining function must be specified when a model is created. (See CREATE_MODEL Procedure.)

Table 45–3   Mining Functions

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSOCIATION</td>
<td>Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.</td>
</tr>
<tr>
<td>ATTRIBUTE_IMPORTANCE</td>
<td>Attribute importance is a predictive mining function, also known as feature selection. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute importance models use Minimum Description Length.</td>
</tr>
<tr>
<td>CLASSIFICATION</td>
<td>Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use: Naive Bayes, Decision Tree, Logistic Regression, or Support Vector Machine. The default is Naive Bayes. The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</td>
</tr>
<tr>
<td>CLUSTERING</td>
<td>Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. Clustering models can use k-Means, O-Cluster, or Expectation Maximization. The default is k-Means.</td>
</tr>
<tr>
<td>FEATURE_EXTRACTION</td>
<td>Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model. Feature extraction models can use Non-Negative Matrix Factorization, Singular Value Decomposition, or Principal Component Analysis. Non-Negative Matrix Factorization is the default.</td>
</tr>
<tr>
<td>REGRESSION</td>
<td>Regression is a predictive mining function. A regression model uses historical data to predict a numerical target. Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.</td>
</tr>
</tbody>
</table>

See Also: Oracle Data Mining Concepts for more information about mining functions
Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and datatypes shown in Table 45-4.

Table 45–4  Required Columns in the Model Settings Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETTING_NAME</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SETTING_VALUE</td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure.

You can find the settings used by a model by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view lists the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified.

See Also:
- ALL_MINING_MODEL_SETTINGS in Oracle Database Reference
- Oracle Data Mining User’s Guide for information about specifying model settings

Algorithm Names

The ALGO_NAME setting specifies the model algorithm. The values for the ALGO_NAME setting are listed in Table 45–5.

Table 45–5  Algorithm Names

<table>
<thead>
<tr>
<th>ALGO_NAME Value</th>
<th>Description</th>
<th>Mining Function</th>
</tr>
</thead>
<tbody>
<tr>

<td>Feature Extraction</td>
</tr>
<tr>
<td>ALGO_SUPPORT_VECTOR_MACHINES</td>
<td>Support Vector Machine</td>
<td>Classification and Regression</td>
</tr>
</tbody>
</table>
The PREP_AUTO setting indicates whether or not the model will use Automatic Data Preparation (ADP). By default ADP is disabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. The transformation instructions are stored with the model and reused whenever the model is applied. You can view the transformation instructions in the model details (DBMS_DATA_MINING.GET_MODELDETAILS_* functions).

You can choose to supplement automatic data preparations by specifying additional transformations in the xform_list parameter when you build the model. (See "CREATE_MODEL Procedure" on page 45-53.)

If you do not use ADP (default) and do not specify transformations in the xform_list parameter to CREATE_MODEL (also the default), you must implement your own transformations separately in the build, test, and scoring data. You must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you do specify transformations in the xform_list parameter to CREATE_MODEL, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data.

The values for the PREP_AUTO setting are described in Table 45–6.

<table>
<thead>
<tr>
<th>PREP_AUTO Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREP_AUTO_OFF</td>
<td>Disable Automatic Data Preparation (default).</td>
</tr>
<tr>
<td>PREP_AUTO_ON</td>
<td>Enable Automatic Data Preparation.</td>
</tr>
</tbody>
</table>

Mining Function Settings

The settings described in Table 45–7 apply to a mining function.

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Association</td>
<td>ASO_MAX_RULE_LENGTH</td>
<td>TO_CHAR( 2&lt;=numeric_expr &lt;=20)</td>
<td>Maximum rule length for association rules.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Default is 4.</td>
</tr>
<tr>
<td>Association</td>
<td>ASO_MIN_CONFIDENCE</td>
<td>TO_CHAR( 0&lt;=numeric_expr &lt;=1)</td>
<td>Minimum confidence for association rules.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Default is 0.1.</td>
</tr>
<tr>
<td>Association</td>
<td>ASO_MIN_SUPPORT</td>
<td>TO_CHAR( 0&lt;=numeric_expr &lt;=1)</td>
<td>Minimum support for association rules.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Default is 0.1.</td>
</tr>
</tbody>
</table>
Global Settings

The configuration settings in Table 45–8 are applicable to any type of model, but are currently only implemented for specific algorithms.

### Table 45–7 (Cont.) Mining Function Settings

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>CLAS_COST_TABLE_NAME</td>
<td>table_name</td>
<td>(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See &quot;ADD_COST_MATRIX Procedure&quot; on page 45-26 for the column requirements. See Oracle Data Mining Concepts for information about costs.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_PRIORS_TABLE_NAME</td>
<td>table_name</td>
<td>(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See Oracle Data Mining User’s Guide for the column requirements. See Oracle Data Mining Concepts for additional information about priors.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_WEIGHTS_TABLE_NAME</td>
<td>table_name</td>
<td>(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See Oracle Data Mining User’s Guide for the column requirements. See Oracle Data Mining Concepts for additional information about class weights.</td>
</tr>
<tr>
<td>Clustering</td>
<td>CLUS_NUM_CLUSTERS</td>
<td>TO_CHAR( numeric_expr &gt;=1)</td>
<td>Maximum number of leaf clusters generated by a clustering algorithm. The algorithm may return fewer clusters, depending on the data. Enhanced k-Means usually produces the exact number of clusters specified by CLUS_NUM_CLUSTERS, unless there are fewer distinct data points. Expectation Maximization (EM) may return fewer clusters than the number specified by CLUS_NUM_CLUSTERS depending on the data. The number of clusters returned by EM cannot be greater than the number of components, which is governed by algorithm-specific settings. (See Table 45–10, &quot;Expectation Maximization Settings for Data Preparation and Analysis&quot;) Depending on these settings, there may be fewer clusters than components. If component clustering is disabled, the number of clusters equals the number of components. For EM, the default value of CLUS_NUM_CLUSTERS is system-determined. For k-Means and O-CLuster, the default is 10.</td>
</tr>
<tr>
<td>Feature Extraction</td>
<td>FEAT_NUM_FEATURES</td>
<td>TO_CHAR( numeric_expr &gt;=1)</td>
<td>Number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm.</td>
</tr>
</tbody>
</table>
Table 45–8  Global Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODMSS_APPROXIMATE_COMPUTATION</td>
<td>ODMSS_APPR_COMP_ENABLE</td>
<td>(EM, GLM, and SVD) Whether the algorithm should use approximate computations to improve performance. For EM, approximation is appropriate for large models with many components and for data sets with many columns. The approximate computation uses localized parameter optimization that restricts learning to parameters that are likely to have the most significant impact on the model. For SVD, approximation is often appropriate for data sets with many columns. An approximate low-rank decomposition provides good solutions at a reasonable computational cost. If you disable ODMSS_APPROXIMATE_COMPUTATION for SVD, approximation is dependent on the characteristics of the data. For data sets with more than 2500 attributes (the maximum number of features allowed) only approximate decomposition is possible. If approximate computation is disabled for a data set with more than 2500 attributes, an exception is raised. For GLM, approximation is appropriate for data sets that have many rows and are densely populated (not sparse). Default is system determined.</td>
</tr>
</tbody>
</table>
| ODMSS_ITEM_ID_COLUMN_NAME             | column_name            | (Association Rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in native transactional format, consisting of two columns:  
  - Case ID, either categorical or numerical  
  - Item ID, either categorical or numerical, specified by ODMSS_ITEM_ID_COLUMN_NAME  
  A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data.  
  Association Rules is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms).  
  For more information about single-record and multi-record case data, see Oracle Data Mining User’s Guide. |
| ODMSS_ITEM_VALUE_COLUMN_NAME          | column_name            | (Association Rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMSS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format. When ODMSS_ITEM_VALUE_COLUMN_NAME is specified, the algorithm expects the build data to consist of three columns:  
  - Case ID, either categorical or numerical  
  - Item ID, either categorical or numerical, specified by ODMSS_ITEM_ID_COLUMN_NAME  
  - Item value, either categorical or numerical, specified by ODMSS_ITEM_VALUE_COLUMN_NAME  
  The item value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples). |
### Algorithm Settings: Decision Tree

These settings configure the behavior of the Decision Tree algorithm.

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODMS_MISSING_VALUE_TREATMENT</td>
<td>ODMS_MISSING_VALUE_MEAN_MODE</td>
<td>(GLM only) How to treat missing values in the training data. This setting does not affect the scoring data. The default value is <strong>ODMS_MISSING_VALUE_MEAN_MODE</strong>, which causes missing numeric values in the training data to be replaced with the mean and missing categorical values in the training data to be replaced with the mode. Oracle Data Mining replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time. You can set <strong>ODMS_MISSING_VALUE_TREATMENT</strong> to <strong>ODMS_MISSING_VALUE_DELETE_ROW</strong> to override this behavior in the training data. When <strong>ODMS_MISSING_VALUE_TREATMENT</strong> is set to <strong>ODMS_MISSING_VALUE_DELETE_ROW</strong>, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, you must perform the transformation explicitly. The value <strong>ODMS_MISSING_VALUE_DELETE_ROW</strong> is only valid for tables without nested columns. If this value is used with nested data, an exception is raised.</td>
</tr>
<tr>
<td>ODMS_ROW_WEIGHT_COLUMN_NAME</td>
<td>column_name</td>
<td>(GLM only) Name of a column in the training data that contains a weighting factor for the rows. The column datatype must be NUMBER. Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.</td>
</tr>
<tr>
<td>ODMS_TEXT_POLICY_NAME</td>
<td>The name of an Oracle Text POLICY created using CTX_DDL.CREATE_POLICY.</td>
<td>Affects how individual tokens are extracted from unstructured text. For details about CTX_DDL.CREATE_POLICY, see Oracle Text Reference.</td>
</tr>
<tr>
<td>ODMS_TEXT_MAX_FEATURES</td>
<td>1 &lt;= value &lt;= 100000</td>
<td>Maximum number of distinct features, across all text attributes, to use from a document set passed to CREATE_MODEL. The default is 3000.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_CLUSTER_COMPONENTS</td>
<td>EMCS_CLUSTER_COMP_ENABLE</td>
<td>Enables or disables the grouping of EM components into high-level clusters. When disabled, the components themselves are treated as clusters.</td>
</tr>
<tr>
<td></td>
<td>EMCS_CLUSTER_COMP_DISABLE</td>
<td>When component clustering is enabled, model scoring through the SQL CLUSTER function will produce assignments to the higher level clusters. When clustering is disabled, the CLUSTER function will produce assignments to the original components. Default is EMCS_CLUSTER_COMP_ENABLE.</td>
</tr>
<tr>
<td>EMCS_CLUSTER_THRESH</td>
<td>TO_CHAR( numeric_expr &gt;= 1)</td>
<td>Dissimilarity threshold that controls the clustering of EM components. When the dissimilarity measure is less than the threshold, the components are combined into a single cluster. A lower threshold may produce more clusters that are more compact. A higher threshold may produce fewer clusters that are more spread out. Default is 2.</td>
</tr>
<tr>
<td>EMCS_LINKAGE_FUNCTION</td>
<td>EMCS_LINKAGE_SINGLE</td>
<td>Allows the specification of a linkage function for the agglomerative clustering step. EMCS_LINKAGE_SINGLE uses the nearest distance within the branch. The clusters tend to be larger and have arbitrary shapes. EMCS_LINKAGE_AVERAGE uses the average distance within the branch. There is less chaining effect and the clusters are more compact. EMCS_LINKAGE_COMPLETE uses the maximum distance within the branch. The clusters are smaller and require strong component overlap. Default is EMCS_LINKAGE_SINGLE.</td>
</tr>

<tr>
<td>SVMS_KERNEL_CACHE_SIZE</td>
<td></td>
<td>Default is 50000000 bytes.</td>
</tr>
</tbody>
</table>
Kernel for Support Vector Machine. The default is determined by the algorithm based on the number of attributes in the training data. When there are many attributes, the algorithm uses a linear kernel, otherwise it uses a nonlinear (Gaussian) kernel.

The number of attributes does not correspond to the number of columns in the training data. The algorithm explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining handles each row in a nested column as a separate attribute. SVM takes these factors into account when choosing the kernel function.

The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection).

Default is 0.1.

Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.

**See Also:** *Oracle Data Mining Concepts* for information about SVM
Datatypes

The `DBMS_DATA_MINING` package defines object datatypes for storing information about model attributes. Most of these types are returned by the table functions `GET_n`, where `n` identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows. For a list of the `GET` functions, see “Summary of DBMS_DATA_MINING Subprograms” on page 45-24.

The `DBMS_DATA_MINING` package also defines object datatypes for mining transactional data. These types are called `DM_NESTED_n`, where `n` identifies the Oracle datatype of the nested attributes. For more information about mining nested data, see Oracle Data Mining User’s Guide.

All the table functions use pipelining, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the Oracle Database PL/SQL Language Reference.

The Data Mining object datatypes are described in Table 45–22.

</tbody>
</table>
ADD_COST_MATRIX Procedure

This procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes. The cost matrix is stored with the model and taken into account when the model is scored. The stored cost matrix is the default scoring matrix for the model.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. When an inline cost matrix is specified, it is used instead of the default, stored cost matrix (if one exists).

To obtain the default scoring matrix for a model, use the GET_MODEL_COST_MATRIX function. To remove the default scoring matrix from a model, use the REMOVE_COST_MATRIX procedure. See "GET_MODEL_COST_MATRIX Function" on page 45-68 and "REMOVE_COST_MATRIX Procedure" on page 45-118.

See Also:
- "Biasing a Classification Model" in Oracle Data Mining Concepts for more information about costs
- Oracle Database SQL Language Reference for syntax of inline cost matrix

Syntax

```
DBMS_DATA_MINING.ADD_COST_MATRIX (
    model_name            IN VARCHAR2,
    cost_matrix_table_name IN VARCHAR2,
    cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is assumed.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table (described in Table 45–25).</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. If the model is not in your schema, then ADD_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.
2. The cost matrix table must have the columns shown in Table 45–25.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTUAL_TARGET_VALUE</td>
<td>Valid target data type</td>
</tr>
<tr>
<td>PREDICTED_TARGET_VALUE</td>
<td>Valid target data type</td>
</tr>
</tbody>
</table>
3. The types of the actual and predicted target values must be the same as the type of the model target. For example, if the target of the model is BINARY_DOUBLE, then the actual and predicted values must be BINARY_DOUBLE. If the actual and predicted values are CHAR or VARCHAR, ADD_COST_MATRIX treats them as VARCHAR2 internally.

If the types do not match, or if the actual or predicted value is not a valid target value, the ADD_COST_MATRIX procedure raises an error.

4. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the costs column of the cost matrix table.

5. All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 45–7, "Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

Example

This example creates a cost matrix table called COSTS_NB and adds it to a Naive Bayes model called NB_SH_CLAS_SAMPLE. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```sql
CREATE TABLE costs_nb {
    actual_target_value NUMBER,
    predicted_target_value NUMBER,
    cost NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;
```
EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(nb_sh_clas_sample COST MODEL
    USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>72</td>
<td>39</td>
</tr>
<tr>
<td>M</td>
<td>555</td>
<td>44</td>
</tr>
</tbody>
</table>
ALTER_REVERSE_EXPRESSION Procedure

This procedure replaces a reverse transformation expression with an expression that you specify. If the attribute does not have a reverse expression, the procedure creates one from the specified expression.

You can also use this procedure to customize the output of clustering, feature extraction, and anomaly detection models.

Syntax

```
DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION (
    model_name             VARCHAR2,
    expression             CLOB,
    attribute_name         VARCHAR2 DEFAULT NULL,
    attribute_subname      VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>expression</td>
<td>An expression to replace the reverse transformation associated with the attribute.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute. Specify NULL if you wish to apply expression to a cluster, feature, or One-Class SVM prediction.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

1. For purposes of model transparency, Oracle Data Mining provides reverse transformations for transformations that are embedded in a model. Reverse transformations are applied to the attributes returned in model details (GET_MODEL_DETAILS_* functions) and to the scored target of predictive models. See Also: About Transformation Lists in Chapter 46, "DBMS_DATA_MINING_TRANSFORM"

2. If you alter the reverse transformation for the target of a model that has a cost matrix, you must specify a transformation expression that has the same type as the actual and predicted values in the cost matrix. Also, the reverse transformation that you specify must result in values that are present in the cost matrix. See Also: "ADD_COST_MATRIX Procedure" on page 45-26 and Oracle Data Mining Concepts for information about cost matrices.

3. To prevent reverse transformation of an attribute, you can specify NULL for expression.

4. The reverse transformation expression can contain a reference to a PL/SQL function that returns a valid Oracle datatype. For example, you could define a
function like the following for a categorical attribute named `blood_pressure` that has values 'Low', 'Medium' and 'High'.

```sql
CREATE OR REPLACE FUNCTION numx(c char) RETURN NUMBER IS
BEGIN
  CASE c WHEN ''Low'' THEN RETURN 1;
    WHEN ''Medium'' THEN RETURN 2;
    WHEN ''High'' THEN RETURN 3;
    ELSE RETURN null;
  END CASE;
END numx;
END;
```

Then you could invoke `ALTER_REVERSE_EXPRESSION` for `blood_pressure` as follows.

```sql
EXEC dbms_data_mining.alter_reverse_expression(
  '<model_name>', 'NUMX(blood_pressure)', 'blood_pressure');
```

5. You can use `ALTER_REVERSE_EXPRESSION` to label clusters produced by clustering models and features produced by feature extraction. You can use `ALTER_REVERSE_EXPRESSION` to replace the zeros and ones returned by anomaly-detection models. By default, anomaly-detection models label anomalous records with 0 and all other records with 1.

**See Also:** Oracle Data Mining Concepts for information about anomaly detection

### Examples

1. In this example, the target (`affinity_card`) of the model `CLASS_MODEL` is manipulated internally as `yes` or `no` instead of 1 or 0 but returned as 1s and 0s when scored. The `ALTER_REVERSE_EXPRESSION` procedure causes the target values to be returned as `TRUE` or `FALSE`.

The data sets `MINING_DATA_BUILD` and `MINING_DATA_TEST` are included with the Oracle Data Mining sample programs. See Oracle Data Mining User’s Guide for information about the sample programs.

```sql
DECLARE
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
    'affinity_card', NULL,
    'decode(affinity_card, 1, ''yes'', ''no'')',
    'decode(affinity_card, ''yes'', 1, 0)');
  dbms_data_mining.CREATE_MODEL(
    model_name => 'CLASS_MODEL',
    mining_function => dbms_data_mining.classification,
    data_table_name => 'mining_data_build',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    settings_table_name => NULL,
    data_schema_name => 'dmuser',
    settings_schema_name => NULL,
    xform_list => v_xlst );
END;
/
```

```sql
SELECT cust_income_level, occupation,
  PREDICTION(CLASS_MODEL USING *) predict_response
FROM mining_data_test WHERE age = 60 AND cust_gender IN 'M'
ORDER BY cust_income_level;
```

**See Also:** Oracle Data Mining Concepts for information about anomaly detection

100006 Cluster 7
100007 Cluster 18
ALTER_REVERSE_EXPRESSION Procedure

100008 Cluster 14
100009 Cluster 8
100010 Cluster 8
APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the results in a table. The apply process is also referred to as **scoring**.

For predictive mining functions, the apply process generates predictions in a target column. For descriptive mining functions such as clustering, the apply process assigns each case to a cluster with a probability.

In Oracle Data Mining, the apply operation is not applicable to association models and attribute importance models.

### Syntax

```
DBMS_DATA_MINING.APPLY (
  model_name           IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  case_id_column_name  IN VARCHAR2,
  result_table_name    IN VARCHAR2,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of table or view containing the data to be scored</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table in which to store apply results</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema containing the data to be scored</td>
</tr>
</tbody>
</table>

### Usage Notes

1. The data provided for APPLY must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model — both at build time and apply time. (See "Automatic Data Preparation" on page 45-8.)

2. APPLY creates a table in the user's schema to hold the results. The columns are algorithm-specific.

   The columns in the results table are listed in Table 45–28 through Table 45–32. The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in APPLY output.

---

**Note:** Scoring can also be performed directly in SQL using the Data Mining functions. See

- "Data Mining Functions" in *Oracle Database SQL Language Reference*
- "Scoring and Deployment" in *Oracle Data Mining User’s Guide*
3. The datatype for the ‘PREDICTION’, ‘CLUSTER_ID’, and ‘FEATURE_ID’ output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure" on page 45-29.

Classification

The results table for classification has the columns described in Table 45–28. If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 datatype. If the target has a binary type, the PREDICTION column will have the binary type of the target.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>Type of the target</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Anomaly Detection

The results table for anomaly detection has the columns described in Table 45–29.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Values in the PREDICTION column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression

The results table for regression has the columns described in Table 45–30.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>Type of the target</td>
</tr>
</tbody>
</table>
Clustering

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in Table 45–31.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>CLUSTER_ID</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Feature Extraction

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 45–32.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>FEATURE_ID</td>
<td>NUMBER</td>
</tr>
<tr>
<td>MATCH_QUALITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Examples

This example applies the GLM regression model GLMR_SH_REGR_SAMPLE to the data in the MINING_DATA_APPLY_V view. The apply results are output to the table REGRESSION_APPLY_RESULT.

```
SQL> BEGIN
    2   DBMS_DATA_MINING.APPLY (model_name     => 'glmr_sh_regr_sample',
                                data_table_name => 'mining_data_apply_v',
                                case_id_column_name => 'cust_id',
                                result_table_name   => 'regression_apply_result');
END;
/

SQL> SELECT * FROM regression_apply_result WHERE cust_id > 101485;

</table>
**COMPUTE_CONFUSION_MATRIX Procedure**

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

**COMPUTE_CONFUSION_MATRIX** accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs

- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

**See Also:**

*Oracle Data Mining Concepts* for more details about confusion matrices and other test metrics for classification

"COMPUTE_LIFT Procedure" on page 45-43
"COMPUTE_ROC Procedure" on page 45-48

**Syntax**

```sql
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (  
  accuracy OUT NUMBER,
  apply_result_table_name IN VARCHAR2,
  target_table_name IN VARCHAR2,
  case_id_column_name IN VARCHAR2,
  target_column_name IN VARCHAR2,
  confusion_matrix_table_name IN VARCHAR2,
  score_column_name IN VARCHAR2 DEFAULT 'PREDICTION',
  score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
  cost_matrix_table_name IN VARCHAR2 DEFAULT NULL,
  apply_result_schema_name IN VARCHAR2 DEFAULT NULL,
  target_schema_name IN VARCHAR2 DEFAULT NULL,
  cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL,
  score_criterion_type IN VARCHAR2 DEFAULT 'PROBABILITY');
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accuracy</td>
<td>Output parameter containing the overall percentage accuracy of the predictions.</td>
</tr>
<tr>
<td>apply_result_table_name</td>

<tr>
<td>case_id_column_name</td>
<td>Case ID column in the apply results table. Must match the case identifier in the targets table.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Target column in the targets table. Contains the known target values from the test data.</td>
</tr>
<tr>
<td>confusion_matrix_table_name</td>
<td>Table containing the confusion matrix. The table will be created by the procedure in the user's schema.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Column containing the predictions in the apply results table. The default column name is <code>PREDICTION</code>, which is the default name created by the <code>APPLY</code> procedure (See “APPLY Procedure” on page 45-33).</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the <code>score_criterion_type</code> parameter is set to 'COSTS', the costs in this table will be used as the scoring criteria.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Schema of the apply results table. If null, the user's schema is assumed.</td>
</tr>
<tr>
<td>target_schema_name</td>
<td>Schema of the table containing the known targets. If null, the user's schema is assumed.</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.</td>
</tr>
</tbody>
</table>
Summary of DBMS_DATA_MINING Subprograms

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>score_criterion_type</td>
<td>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.</td>
</tr>
</tbody>
</table>

Usage Notes

- The predictive information you pass to COMPUTE_CONFUSION_MATRIX may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING/APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.

- Instead of passing a cost matrix to COMPUTE_CONFUSION_MATRIX, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.

- The predictions that you pass to COMPUTE_CONFUSION_MATRIX are in a table or view specified in apply_result_table_name.

CREATE TABLE apply_result_table_name AS {
    case_id_column_name VARCHAR2,
    score_column_name VARCHAR2,
    score_criterion_column_name VARCHAR2);

- A cost matrix must have the columns described in Table 45–34.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>cost</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

See Also:

Oracle Data Mining User’s Guide for valid target datatypes
Oracle Data Mining Concepts for more information about cost matrixes

- The confusion matrix created by COMPUTE_CONFUSION_MATRIX has the columns described in Table 45–35.
**Examples**

These examples use the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

### Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```sql
CREATE TABLE nb_apply_results AS
SELECT cust_id,
       PREDICTION(nb_sh_clas_sample USING *) prediction,
       PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```sql
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy                     => v_accuracy,
    apply_result_table_name      => 'nb_apply_results',
    target_table_name            => 'mining_data_test_v',
    case_id_column_name          => 'cust_id',
    target_column_name           => 'affinity_card',
    confusion_matrix_table_name  => 'nb_confusion_matrix',
    score_column_name            => 'PREDICTION',
    score_criterion_column_name  => 'PROBABILITY',
    cost_matrix_table_name       => null,
    apply_result_schema_name     => null,
    target_schema_name           => null,
    cost_matrix_schema_name      => null,
    score_criterion_type         => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The confusion matrix and model accuracy are shown as follows.

```
**** MODEL ACCURACY ****: .7847
```

SQL> SELECT * from nb_confusion_matrix;
```
ACTUAL_TARGET_VALUE  PREDICTED_TARGET_VALUE VALUE
-------------------  ----------------------  ----------
```

---

**Table 45–35  Columns in a Confusion Matrix**

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target is the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>value</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

See Also:  *Oracle Data Mining Concepts* for more information about confusion matrices
Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```sql
SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
------------------- ---------------------- ----------
          0          0          0
          0          1        .75
          1          0        .25
          1          1          0
```

This statement shows how to generate the predictions using `APPLY`.

```sql
BEGIN
  DBMS_DATA_MINING.APPLY(
    model_name          => 'nb_sh_clas_sample',
    data_table_name     => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    result_table_name   => 'nb_apply_results');
END;
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by `APPLY`.

```sql
DECLARE
  v_accuracy    NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy                     => v_accuracy,
    apply_result_table_name      => 'nb_apply_results',
    target_table_name            => 'mining_data_test_v',
    case_id_column_name          => 'cust_id',
    target_column_name           => 'affinity_card',
    confusion_matrix_table_name  => 'nb_confusion_matrix',
    score_column_name            => 'PREDICTION',
    score_criterion_column_name  => 'PROBABILITY',
    cost_matrix_table_name       => 'nb_cost_matrix',
    apply_result_schema_name     => null,
    target_schema_name           => null,
    cost_matrix_schema_name      => null,
    score_criterion_type         => 'COST');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

**** MODEL ACCURACY ****: .798
**Compute a Confusion Matrix Based on Embedded Costs**

You can use the `ADD_COST_MATRIX` procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```sql
BEGIN
    DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```sql
CREATE TABLE nb_apply_results AS
    SELECT cust_id,
           PREDICTION ('nb_sh_clas_sample' COST MODEL USING '*') prediction,
           PREDICTION_COST ('nb_sh_clas_sample' COST MODEL USING '*') cost
    FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```sql
DECLARE
    v_accuracy NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (accuracy => v_accuracy,
                                                apply_result_table_name => 'nb_apply_results',
                                                target_table_name => 'mining_data_test_v',
                                                case_id_column_name => 'cust_id',
                                                target_column_name => 'affinity_card',
                                                confusion_matrix_table_name => 'nb_confusion_matrix',
                                                score_column_name => 'PREDICTION',
                                                score_criterion_column_name => 'COST',
                                                cost_matrix_table_name => null,
                                                apply_result_schema_name => null,
                                                target_schema_name => null,
                                                cost_matrix_schema_name => null,
                                                score_criterion_type => 'COST');
END;
```

The results are:

```
**** MODEL ACCURACY ****: .798
```

```sql
SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
1                   0                      91
0                   0                      942
1                   1                      255
0                   1                      212
```

---

The confusion matrix is computed as follows:

```sql
SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
1                   0                      91
0                   0                      942
1                   1                      255
0                   1                      212
```
**COMPUTE_LIFT Procedure**

This procedure computes lift and stores the results in a table in the user's schema. Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. **COMPUTE_LIFT** compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases. **COMPUTE_LIFT** calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, **COMPUTE_LIFT** accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

<td>Schema of the table containing the known targets. If null, the user's schema is assumed.</td>
</tr>
</tbody>
</table>
The predictive information you pass to `COMPUTE_LIFT` may be generated using SQL `PREDICTION` functions, the `DBMS_DATA_MINING.APPLY` procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.

Instead of passing a cost matrix to `COMPUTE_LIFT`, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL `PREDICTION_COST` function to populate the score criterion column.

The predictions that you pass to `COMPUTE_LIFT` are in a table or view specified in `apply_results_table_name`.

```sql
CREATE TABLE apply_result_table_name AS {
  case_id_column_name VARCHAR2,
  score_column_name VARCHAR2,
  score_criterion_column_name VARCHAR2);
```

A cost matrix must have the columns described in Table 45–37.

### Table 45–37 Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>cost</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

See Also: Oracle Data Mining Concepts for more information about cost matrixes

The table created by `COMPUTE_LIFT` has the columns described in Table 45–38.
When a cost matrix is passed to `COMPUTE_LIFT`, the cost threshold is returned in the `probability_threshold` column of the lift table.

### Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure" on page 45-37.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```sql
CREATE TABLE nb_apply_results AS
   SELECT cust_id, t.prediction, t.probability
   FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```sql
BEGIN
   DBMS_DATA_MINING.COMPUTE_LIFT (  
      apply_result_table_name        => 'nb_apply_results',
      target_table_name              => 'mining_data_test_v',
      case_id_column_name            => 'cust_id',
      target_column_name             => 'affinity_card',
      lift_table_name                => 'nb_lift',
      positive_target_value          => to_char(1),
      score_column_name              => 'PREDICTION',
      score_criterion_column_name    => 'PROBABILITY',
      num_quantiles                  => 10,
      cost_matrix_table_name         => null,
      apply_result_schema_name       => null,
      target_schema_name             => null,
   );
```

See Also: *Oracle Data Mining Concepts* for details about the information in the lift table.

</table>
This procedure computes receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. **COMPUTE_ROC** compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

**COMPUTE_ROC** accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to COMPUTE_ROC are in a table or view specified in apply_results_table_name.
The table created by COMPUTE_ROC has the columns shown in Table 45–40.

**Table 45–40  COMPUTE_ROC Output**

<td>NUMBER</td>
</tr>
<tr>
<td>false_positive_fraction</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

See Also: *Oracle Data Mining Concepts* for details about the output of COMPUTE_ROC

ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```sql
SELECT case_id_column_name
FROM apply_result_table_name
WHERE probability > probability_threshold
ORDER BY probability DESC;
```

There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```sql
WITH cost AS (  
SELECT probability_threshold, 20 * false_negatives + false_positives cost  
FROM ROC_table  
GROUP BY probability_threshold),  
minCost AS (  
SELECT min(cost) minCost  
FROM cost)  
SELECT max(probability_threshold)minCost  
FROM cost, minCost  
WHERE cost = minCost;
```
If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```
SELECT * FROM ROC_table
ORDER BY probability_threshold;
```

### Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id, t.prediction, t.probability
  FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
  v_area_under_curve NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_ROC (
    roc_area_under_curve          => v_area_under_curve,
    apply_result_table_name       => 'nb_apply_results',
    target_table_name             => 'mining_data_test_v',
    case_id_column_name           => 'cust_id',
    target_column_name            => 'affinity_card',
    roc_table_name                => 'nb_roc',
    positive_target_value         => '1',
    score_column_name             => 'PREDICTION',
    score_criterion_column_name   => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
                       ROUND(v_area_under_curve,4));
END;
/
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212
SQL> SELECT probability, true_positive_fraction, false_positive_fraction
          FROM nb_roc;
```

CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

By passing an xform_list to CREATE_MODEL, you can specify a list of transformations to be performed on the input data. If the PREP_AUTO setting is on, the transformations are used in addition to the automatic transformations. If the PREP_AUTO setting is off, the specified transformations are the only ones implemented by the model. In both cases, the transformation definitions are embedded in the model and executed automatically whenever the model is applied. See "Automatic Data Preparation" on page 45-8.

Syntax

```sql
DBMS_DATA_MINING.CREATE_MODEL (  
    model_name            IN VARCHAR2,  
    mining_function       IN VARCHAR2,  
    data_table_name       IN VARCHAR2,  
    case_id_column_name   IN VARCHAR2,  
    target_column_name    IN VARCHAR2 DEFAULT NULL,  
    settings_table_name   IN VARCHAR2 DEFAULT NULL,  
    data_schema_name      IN VARCHAR2 DEFAULT NULL,  
    settings_schema_name  IN VARCHAR2 DEFAULT NULL,  
    xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name].model_name. If you do not specify a schema, your own schema is used. See the Usage Notes for model naming restrictions.</td>
</tr>
<tr>
<td>mining_function</td>
<td>The mining function. Values are listed in Table 45-3, &quot;Mining Functions&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Table or view containing the build data.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case identifier column in the build data.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>For supervised models, the target column in the build data. NULL for unsupervised models.</td>
</tr>
<tr>
<td>settings_table_name</td>
<td>Table containing build settings for the model. NULL if there is no settings table (only default settings are used).</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema hosting the build data. If NULL, the user's schema is assumed.</td>
</tr>
<tr>
<td>settings_schema_name</td>
<td>Schema hosting the settings table. If NULL, the user's schema is assumed.</td>
</tr>
</tbody>
</table>
CREATE_MODEL Procedure

Oracle Database PL/SQL Packages and Types Reference

Usage Notes

1. You can use the attribute_spec field of the xform_list argument to identify an attribute as unstructured text or to disable Automatic Data Preparation for the attribute. The attribute_spec can have the following values:

   - **TEXT** — Indicates that the attribute contains unstructured text. The TEXT value may optionally be followed by an Oracle Text POLICY name. (For information about creating a Text POLICY, see `CTX_DDL.CREATE_POLICY` in Oracle Text Reference.)

   Oracle Data Mining can process columns of VARCHAR2/CHAR, CLOB, BLOB, and BFILE as text. If the column is VARCHAR2 or CHAR and you do not specify TEXT, Oracle Data Mining will process the column as categorical data. If the column is CLOB, Oracle Data Mining will process it as text by default (You do not need to specify it as TEXT). If the column is BLOB or BFILE, you must specify it as TEXT, otherwise CREATE_MODEL will return an error. If you specify TEXT for a nested column or for an attribute in a nested column, CREATE_MODEL will return an error.

   - **NOPREP** — Disables ADP for the attribute. When ADP is off, the NOPREP value is ignored.

   You can specify NOPREP for a nested column, but not for an attribute in a nested column. If you specify NOPREP for an attribute in a nested column when ADP is on, CREATE_MODEL will return an error.

---

Table 45–41 (Cont.) CREATE_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| xform_list  | A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "Automatic Data Preparation" on page 45-8.) The datatype of xform_list is TRANSFORM_LIST, which consists of records of type TRANSFORM.Rec. Each TRANSFORM_REC specifies the transformation information for a single attribute. The expression field stores a SQL expression for transforming the attribute. The reverse_expression field stores a SQL expression for reversing the transformation in model details and, if the attribute is a target, in the results of scoring. The SQL expressions are manipulated by routines in the DBMS_DATA_MINING_TRANSFORM package:  
   - SET_EXPRESSION Procedure  
   - GET_EXPRESSION Function  
   - SET_TRANSFORM Procedure  
   The attribute_spec field identifies individualized treatment for the attribute. See the Usage Notes for details. See Table 46–1, "Datatypes in DBMS_DATA_MINING_TRANSFORM" for details about the TRANSFORM_REC type. |
2. You can obtain information about a model by querying the data dictionary views.

   ALL/USER/DBA_MINING_MODELS
   ALL/USER/DBA_MINING_MODEL_ATTRIBUTES
   ALL/USER/DBA_MINING_MODEL_SETTINGS

3. You can obtain information about model attributes by querying the model details.

   dbms_data_mining.get_model_details_algorithm (model_name)

4. The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

   - It must be 25 or fewer characters long.
   - It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

   Naming requirements for schema objects are fully documented in Oracle Database SQL Language Reference.

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```
-- Create the settings table
CREATE TABLE svm_model_settings (  
   setting_name  VARCHAR2(30),
   setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
BEGIN
   INSERT INTO svm_model_settings (setting_name, setting_value) VALUES  
      (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
   INSERT INTO svm_model_settings (setting_name, setting_value) VALUES  
      (dbms_data_mining.prep_auto,dbms_data_mining.prep_auto_on);
   COMMIT;
END;
/

-- Create the model using the specified settings
BEGIN
 DBMS_DATA_MINING.CREATE_MODEL(  
   model_name          => 'svm_model',
   mining_function     => dbms_data_mining.classification,
   data_table_name     => 'mining_data_build_v',
   case_id_column_name => 'cust_id',
   target_column_name  => 'affinity_card',
   settings_table_name => 'svm_model_settings');
END;
/

You can display the model settings with the following query.

```
SELECT * FROM user_mining_model_settings
   WHERE model_name IN 'SVM_MODEL';
```
The second example creates an anomaly detection model. Anomaly detection uses SVM classification without a target. This example uses the same settings table created for the SVM classification model in the first example.

```
BEGIN
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name          => 'anomaly_detect_model',
        mining_function     => dbms_data_mining.classification,
        data_table_name     => 'mining_data_build_v',
        case_id_column_name => 'cust_id',
        target_column_name  => null,
        settings_table_name => 'svm_model_settings');
END;
/
```

This query shows that the models created in these examples are the only ones in your schema.

```
SELECT model_name, mining_function, algorithm FROM user_mining_models;
```

```
MODEL_NAME              MINING_FUNCTION      ALGORITHM
----------------------  -------------------- ------------------------------
SVM_MODEL               CLASSIFICATION       SUPPORT_VECTOR_MACHINES
ANOMALY_DETECT_MODEL    CLASSIFICATION       SUPPORT_VECTOR_MACHINES
```

This query shows that only the SVM classification model has a target.

```
SELECT model_name, attribute_name, attribute_type, target
FROM user_mining_model_attributes
WHERE target = 'YES';
```

```
MODEL_NAME          ATTRIBUTE_NAME   ATTRIBUTE_TYPE     TARGET
------------------  ---------------  -----------------  ------
SVM_MODEL           AFFINITY_CARD    CATEGORICAL         YES
```
DROP_MODEL Procedure

This procedure deletes the specified mining model.

Syntax

DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,
force      IN BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name].[model_name]. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>force</td>
<td>Forces the mining model to be dropped even if it is invalid. A mining model may be invalid if a serious system error interrupted the model build process.</td>
</tr>
</tbody>
</table>

Usage Note

To drop a mining model, you must be the owner or you must have the DROP ANY MINING MODEL privilege. See Oracle Data Mining User’s Guide for information about privileges for data mining.

Example

You can use the following command to delete a valid mining model named nb_sh_clas_sample that exists in your schema.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');
END;
/
```
EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. To import the models from the dump file set, use the IMPORT_MODEL Procedure. EXPORT_MODEL and IMPORT_MODEL use Oracle Data Pump technology.

When Oracle Data Pump is used to export/import an entire schema or database, the mining models in the schema or database are included. However, EXPORT_MODEL and IMPORT_MODEL are the only utilities that support the export/import of individual models.

See Also:

Oracle Database Utilities for information about Oracle Data Pump

Oracle Data Mining User’s Guide for more information about exporting and importing mining models

Syntax

```sql
DBMS_DATA_MINING.EXPORT_MODEL (
    filename          IN VARCHAR2,
    directory         IN VARCHAR2,
    model_filter      IN VARCHAR2 DEFAULT NULL,
    filesize          IN VARCHAR2 DEFAULT NULL,
    operation         IN VARCHAR2 DEFAULT NULL,
    remote_link       IN VARCHAR2 DEFAULT NULL,
    jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the filesize parameter, or you can use the operation parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to <code>filename01.dmp</code>, even if there is only one file in the dump set. If there are additional files, they are named sequentially as <code>filename02.dmp</code>, <code>filename03.dmp</code>, and so forth.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of a pre-defined directory object that specifies where the dump file set should be created. The exporting user must have read/write privileges on the directory object and on the file system directory that it identifies. See Oracle Database SQL Language Reference for information about directory objects.</td>
</tr>
</tbody>
</table>
Summary of DBMS_DATA_MINING Subprograms

Usage Notes

The model_filter parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the USER_MINING_MODELS view to list the models in your schema.

SQL> describe user_mining_models

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODEL_NAME</td>
<td>NOT NULL</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>MINING_FUNCTION</td>
<td>VARCHAR2(30)</td>
<td></td>
</tr>
<tr>
<td>ALGORITHM</td>
<td>VARCHAR2(30)</td>
<td></td>
</tr>
<tr>
<td>CREATION_DATE</td>
<td>NOT NULL</td>
<td>DATE</td>
</tr>
<tr>
<td>BUILD_DURATION</td>
<td>NUMBER</td>
<td></td>
</tr>
<tr>
<td>MODEL_SIZE</td>
<td>NUMBER</td>
<td></td>
</tr>
<tr>
<td>COMMENTS</td>
<td>VARCHAR2(4000)</td>
<td></td>
</tr>
</tbody>
</table>

Examples of model filters are provided in Table 45–44.
**Examples**

1. The following statement exports all the models in the DMUSER3 schema to a dump file set called models_out in the directory $ORACLE_HOME/rdbms/log. This directory is mapped to a directory object called DATA_PUMP_DIR. The DMUSER3 user has read/write access to the directory and to the directory object.

   ```sql
   SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
   
   You can exit SQL*Plus and list the resulting dump file and log file.
   
   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >DMUSER3_exp_1027.log  models_out01.dmp
   
2. The following example uses the same directory object and is executed by the same user. This example exports the models called NMF_SH_SAMPLE and SVMR_SH_REGR_SAMPLE to a different dump file set in the same directory.

   ```sql
   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ( 'models2_out', 'DATA_PUMP_DIR',
                                                   'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
   
   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >DMUSER3_exp_1027.log  models_out01.dmp
   >DMUSER3_exp_924.log  models2_out01.dmp
   
3. The following examples show how to export models with specific algorithm and mining function names.

   ```sql
   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('algo.dmp','DM_DUMP',
                                            'ALGORITHM_NAME IN (''O_CLUSTER'',''GENERALIZED_LINEAR_MODEL'','
                                            ''SUPPORT_VECTOR_MACHINES'',''NAIVE_BAYES''));
   
   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('func.dmp','DM_DUMP',
                                            'FUNCTION_NAME IN (CLASSIFICATION,CLUSTERING,FEATURE_EXTRACTION)');
   ```

---

**Table 45–44 Sample Values for the Model Filter Parameter**

<table>
<thead>
<tr>
<th>Sample Value</th>
<th>Meaning</th>

<td>Export all classification models. See Table 45–3 for a list of mining functions.</td>
</tr>
</tbody>
</table>
GET_ASSOCIATION_RULES Function

This table function returns the rules produced by an association model. You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the topn parameter.

Syntax

```sql
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (  
    model_name            IN VARCHAR2,  
    topn                  IN NUMBER                 DEFAULT NULL,  
    rule_id               IN NUMBER (38)            DEFAULT NULL,  
    min_confidence        IN NUMBER                 DEFAULT NULL,  
    min_support           IN NUMBER                 DEFAULT NULL,  
    max_rule_length       IN NUMBER (38)            DEFAULT NULL,  
    min_rule_length       IN NUMBER (38)            DEFAULT NULL,  
    sort_order            IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,  
    antecedent_items      IN DM_ITEMS               DEFAULT NULL,  
    consequent_items      IN DM_ITEMS               DEFAULT NULL,  
    min_lift              IN NUMBER                 DEFAULT NULL)  
RETURN DM_RULES PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.</td>
</tr>
<tr>
<td>topn</td>
<td>Return the n top rules ordered by confidence and then support, both descending. If you specify a sort order, the top n rules are derived after the sort is performed. If topn is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are RULE_CONFIDENCE and RULE_SUPPORT. If topn is specified and a maximum or minimum rule length is specified, then RULE_CONFIDENCE, RULE_SUPPORT, and NUMBER_OF_ITEMS are allowed in the sort order.</td>
</tr>
<tr>
<td>rule_id</td>
<td>Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.</td>
</tr>
<tr>
<td>min_confidence</td>
<td>Return the rules with confidence greater than or equal to this number.</td>
</tr>
<tr>
<td>min_support</td>
<td>Return the rules with support greater than or equal to this number.</td>
</tr>
<tr>
<td>max_rule_length</td>
<td>Return the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 45-46). For example, in the rule A=&gt;B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.</td>
</tr>
</tbody>
</table>

<td>attribute_str_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_support NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_confidence NUMBER)</td>
</tr>
</tbody>
</table>
Usage Notes

1. This table function pipes out rows of type `DM_RULES`. For information on Data Mining datatypes and piped output from table functions, see “Datatypes” on page 45-21.

2. The `ORA_MINING_VARCHAR2_NT` type is defined as a table of `VARCHAR2(4000)`.

3. The columns returned by `GET_ASSOCIATION_RULES` are described as follows. (See Table 45–46 for the `DM_RULE` column data types.)

<table>
<thead>
<tr>
<th>Column in DM_RULES</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_id</td>
<td>Unique identifier for the rule</td>
</tr>
</tbody>
</table>
| antecedent         | The independent condition in the rule. When this condition exists, the dependent condition in the consequent also exists.  
|                    | The condition is a combination of attribute values called a predicate (`DM_PREDICATE`). The predicate specifies a condition for each attribute. The condition may specify equality (=), inequality (<>), greater than (>), less than (<), greater than or equal to (=>), or less than or equal to (<=) a given value.  
|                    | Support and confidence for each attribute condition in the antecedent is returned in the predicate. Support is the number of transactions that satisfy the antecedent. Confidence is the likelihood that a transaction will satisfy the antecedent.  
|                    | **Note:** The occurrence of the attribute as a `DM_PREDICATE` indicates the presence of the item in the transaction. The actual value for attribute_num_value or attribute_str_value is meaningless. For example, the following predicate indicates that 'Mouse Pad' is present in the transaction even though the attribute value is NULL.  
|                    | `DM_PREDICATE('PROD_NAME',  
|                    |     'Mouse Pad', ' = ', NULL, NULL, NULL, NULL))  
| consequent         | The dependent condition in the rule. This condition exists when the antecedent exists.  
|                    | The consequent, like the antecedent, is a predicate (`DM_PREDICATE`).  
|                    | Support and confidence for each attribute condition in the consequent is returned in the predicate. Support is the number of transactions that satisfy the consequent. Confidence is the likelihood that a transaction will satisfy the consequent.  
| rule_support       | The number of transactions that satisfy the rule. |
| rule_confidence    | The likelihood of a transaction satisfying the rule. |
| rule_lift          | The degree of improvement in the prediction over random chance when the rule is satisfied. |
| antecedent_support | The ratio of the number of transactions that satisfy the antecedent to the total number of transactions. |
| consequent_support | The ratio of the number of transactions that satisfy the consequent to the total number of transactions. |
| number_of_items    | The total number of attributes referenced in the antecedent and consequent of the rule. |

Examples

The following example demonstrates an Association model build followed by several invocations of the `GET_ASSOCIATION_RULES` table function.

```
-- prepare a settings table to override default settings
```
CREATE TABLE market_settings AS
SELECT *
FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_%';
BEGIN
  -- update the value of the minimum confidence
  UPDATE market_settings
  SET setting_value = TO_CHAR(0.081)
  WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

  -- build an AR model
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name => 'market_model',
    function => DBMS_DATA_MINING.ASSOCIATION,
    data_table_name => 'market_build',
    case_id_column_name => 'item_id',
    target_column_name => NULL,
    settings_table_name => 'market_settings');
END;
/

  -- View the (unformatted) rules
  SELECT rule_id, antecedent, consequent, rule_support,
        rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

  -- View the top 20 (unformatted) rules
  SELECT rule_id, antecedent, consequent, rule_support,
        rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));

The following query uses the association model AR_SH_SAMPLE, which is created from one of the Oracle Data Mining sample programs. (See Oracle Data Mining User’s Guide for information about the sample programs.)

SELECT * FROM TABLE (
           DBMS_DATA_MINING.GET_ASSOCIATION_RULES(
             'AR_SH_SAMPLE', 10, NULL, 0.5, 0.01, 2, 1,
             ORA_MINING_VARCHAR2_NT (
               'NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
             DM_ITEMS(DM_ITEM('CUSTOMPRODS', 'Mouse Pad', 1, NULL),
                     DM_ITEM('CUSTOMPRODS', 'Standard Mouse', 1, NULL)),
             DM_ITEMS(DM_ITEM('CUSTOMPRODS', 'Extension Cable', 1, NULL)));

The query returns three rules, shown as follows.

13 DM_PREDICATES(
  DM_PREDICATE('CUSTOMPRODS', 'Mouse Pad', '=', 1, NULL, NULL, NULL),
  DM_PREDICATE('CUSTOMPRODS', 'Standard Mouse', '=', 1, NULL, NULL, NULL))
DM_PREDICATES(
  DM_PREDICATE('CUSTOMPRODS', 'Extension Cable', '=', 1, NULL, NULL, NULL))
  .15532  .84393  2.7075  .18404  .3117  2

11 DM_PREDICATES(
  DM_PREDICATE('CUSTOMPRODS', 'Standard Mouse', '=', 1, NULL, NULL, NULL))
DM_PREDICATES(
  DM_PREDICATE('CUSTOMPRODS', 'Extension Cable', '=', 1, NULL, NULL, NULL))
  .18085  .56291  1.8059  .32128  .3117  1
9  DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Mouse Pad', '=', 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Extension Cable', '=', 1, NULL, NULL, NULL))
  .17766  .55116  1.7682  .32234  .3117  1
GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult Oracle Data Mining Concepts.

Syntax

```sql
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (  
  model_name          IN VARCHAR2,  
  topn                IN NUMBER DEFAULT NULL,  
  max_itemset_length  IN NUMBER DEFAULT NULL)  
RETURN DM_ITEMSETS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>topn</td>
<td>When not NULL, return the top n rows ordered by support in descending order</td>
</tr>
<tr>
<td>max_itemset_length</td>
<td>Maximum length of an item set.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_ITEMSETS</td>
<td>A set of rows of type DM_ITEMSET. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(itemsets_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER)</td>
</tr>
<tr>
<td></td>
<td>The items column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000))</td>
</tr>
</tbody>
</table>

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

Examples

The following example demonstrates an Association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```sql
-- prepare a settings table to override default settings  
CREATE TABLE market_settings AS
```
SELECT *
FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
  SET setting_value = TO_CHAR(0.081)
  WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;
/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'market_model',
  function             => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name      => 'market_build',
  case_id_column_name  => 'item_id',
  target_column_name   => NULL,
  settings_table_name  => 'market_settings');
END;
/
-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
GET_MODEL_COST_MATRIX Function

This function returns the rows of the default scoring matrix associated with the specified model.

By default, this function returns the scoring matrix that was added to the model with the ADD_COST_MATRIX procedure. If you wish to obtain the cost matrix used to create a model, specify cost_matrix_type_create as the matrix_type. See Table 45–49.

See also ADD_COST_MATRIX Procedure.

Syntax

DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (  
    model_name        IN VARCHAR2,  
    matrix_type       IN VARCHAR2 DEFAULT cost_matrix_type_score)  
RETURN DM_COST_MATRIX PIPELINED;

Parameters

Table 45–49  GET_MODEL_COST_MATRIX Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>matrix_type</td>
<td>The type of cost matrix.</td>
</tr>
<tr>
<td></td>
<td>COST_MATRIX_TYPE_SCORE — cost matrix used for scoring.</td>
</tr>
<tr>
<td></td>
<td>(Default.)</td>
</tr>
<tr>
<td></td>
<td>COST_MATRIX_TYPE_CREATE — cost matrix used to create the model (Decision Tree only).</td>
</tr>
</tbody>
</table>

Return Values

Table 45–50  GET_MODEL_COST_MATRIX Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_COST_MATRIX</td>
<td>A set of rows of type DM_COST_ELEMENT. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>actual VARCHAR2(4000), NUMBER, predicted VARCHAR2(4000), cost NUMBER</td>
</tr>
</tbody>
</table>

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 45–7, "Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can modify the values in the cost matrix table or you can use the REMOVE_COSTMATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.
Example

This example returns the scoring cost matrix associated with the Naive Bayes model 
NB_SH_CLAS_SAMPLE.

column actual format a10
column predicted format a10
SELECT *
FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
ORDER BY predicted, actual;

<table>
<thead>
<tr>
<th>ACTUAL</th>
<th>PREDICTED</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>.00</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>.75</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>.25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>.00</td>
</tr>
</tbody>
</table>
GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (model_name IN VARCHAR2) RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>schema_name.model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_RANKED_ATTRIBUTES</td>
<td>A set of rows of type <code>DM_RANKED_ATTRIBUTE</code>. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td><code>attribute_name</code> VARCHAR2(4000), <code>attribute_subname</code> VARCHAR2(4000), <code>importance_value</code> NUMBER, <code>rank</code> NUMBER(38)</td>
</tr>
</tbody>
</table>

Examples

The following example returns model details for the attribute importance model `AI_SH_sample`, which was created by the sample program `dmaidemo.sql`. For information about the sample programs, see Oracle Data Mining User’s Guide.

```sql
SELECT attribute_name, importance_value, rank
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_AI('AI_SH_sample'))
ORDER BY RANK;
```

<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>
<th>IMPORTANCE_VALUE</th>
<th>RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOUSEHOLD_SIZE</td>
<td>.151685183</td>

</tbody>
</table>
GET_MODELDETAILS_EM Function

This table function returns a set of rows that provide statistics about the clusters produced by an Expectation Maximization model.

By default, the EM algorithm groups components into high-level clusters, and GET_MODELDETAILS_EM returns only the high-level clusters with their hierarchies. Alternatively, you can configure EM to disable the grouping of components into high-level clusters. In this case, GET_MODELDETAILS_EM returns the components themselves as clusters with their hierarchies. See Table 45–10, "Expectation Maximization Settings for Data Preparation and Analysis".

Syntax

```sql
DBMS_DATA_MINING.GET_MODELDETAILS_EM (  
    model_name VARCHAR2,  
    cluster_id NUMBER DEFAULT NULL,  
    attribute VARCHAR2 DEFAULT NULL,  
    centroid NUMBER DEFAULT 1,  
    histogram NUMBER DEFAULT 1,  
    rules NUMBER DEFAULT 2,  
    attribute_subname VARCHAR2 DEFAULT NULL,  
    topn_attributes NUMBER DEFAULT NULL)  
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned.</td>
</tr>
</tbody>
</table>
| centroid      | This parameter accepts the following values:  
|               | ■ 1 — Details about centroids are returned (default)  
|               | ■ 0 — Details about centroids are not returned |
| histogram     | This parameter accepts the following values:  
|               | ■ 1 — Details about histograms are returned (default)  
|               | ■ 0 — Details about histograms are not returned |
| rules         | This parameter accepts the following values:  
|               | ■ 2 — Details about rules are returned (default)  
|               | ■ 1 — Rule summaries are returned  
|               | ■ 0 — No information about rules is returned |
attribute_subname  The name of a nested attribute. The full name of a nested attribute has the form:

\[ \text{attribute_name.attribute_subname} \]

where \text{attribute_name} is the name of the column and \text{attribute_subname} is the name of the nested attribute in that column. If the attribute is not nested, \text{attribute_subname} is null.

topn_attributes  Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the \( n \) attributes with the highest confidence values in the rules are returned.

If the number of attributes included in the rules is less than \( \text{topn} \), then up to \( n \) additional attributes in alphabetical order are returned.

If both the \text{attribute} and \text{topn_attributes} parameters are specified, then \text{topn_attributes} is ignored.

### Table 45–54 GET_MODEL_DETAILS_EM Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{DM_CLUSTERS}</td>
<td>A set of rows of type \text{DM_CLUSTER}. The rows have the following columns:</td>
</tr>
<tr>
<td>(id \text{NUMBER},</td>
<td></td>
</tr>
<tr>
<td>cluster_id \text{VARCHAR2(4000)},</td>
<td></td>
</tr>
<tr>
<td>record_count \text{NUMBER},</td>
<td></td>
</tr>
<tr>
<td>parent \text{NUMBER},</td>
<td></td>
</tr>
<tr>
<td>tree_level \text{NUMBER},</td>
<td></td>
</tr>
<tr>
<td>dispersion \text{NUMBER},</td>
<td></td>
</tr>
<tr>
<td>split_predicate \text{DM_PREDICATES},</td>
<td></td>
</tr>
<tr>
<td>child \text{DM_CHILDREN},</td>
<td></td>
</tr>
<tr>
<td>centroid \text{DM_CENTROIDS},</td>
<td></td>
</tr>
<tr>
<td>histogram \text{DM_HISTOGRAMS},</td>
<td></td>
</tr>
<tr>
<td>rule \text{DM_RULES})</td>
<td></td>
</tr>
<tr>
<td>Note: The Expectation Maximization algorithm uses all the fields except dispersion and split_predicate.</td>
<td></td>
</tr>
</tbody>
</table>

The \text{split_predicate} column of \text{DM.CLUSTER} returns a nested table of type \text{DM_PREDICATES}. Each row, of type \text{DM_PREDICATE}, has the following columns:

\[
(\text{attribute_name \text{VARCHAR2(4000)}, \text{attribute_subname \text{VARCHAR2(4000)}, \text{conditional_operator \text{CHAR(2)}, */=,<,>,<,>,>=*/}}, \text{attribute_num_value \text{NUMBER}, \text{attribute_str_value \text{VARCHAR2(4000)}, \text{attribute_support \text{NUMBER}, \text{attribute_confidence \text{NUMBER)}}})}
\]

The \text{child} column of \text{DM_CLUSTER} returns a nested table of type \text{DM_CHILDREN}. The rows, of type \text{DM_CHILD}, have a single column of type \text{NUMBER}, which contains the identifiers of each child.
GET_MODEL_DETAILS_EM Function

**Usage Notes**

1. This table function pipes out rows of type DM_CLUSTERS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

2. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

3. When cluster statistics are disabled (EMCS_CLUSTER_STATISTICS is set to EMCSCLUS_STATS_DISABLE), GET_MODEL_DETAILS_EM does not return centroids, histograms, or rules. Only taxonomy (hierarchy) and cluster counts are returned.

**Usage Notes**

1. This table function pipes out rows of type DM_CLUSTERS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

2. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

3. When cluster statistics are disabled (EMCS_CLUSTER_STATISTICS is set to EMCSCLUS_STATS_DISABLE), GET_MODEL_DETAILS_EM does not return centroids, histograms, or rules. Only taxonomy (hierarchy) and cluster counts are returned.

**Table 45–54 (Cont.) GET_MODEL_DETAILS_EM Function Return Values**

<table>
<thead>

<tr>
<td>attribute_support NUMBER,</td>
<td></td>
</tr>
<tr>
<td>attribute_confidence NUMBER)</td>
<td></td>
</tr>
</tbody>
</table>
4. For descriptions of predicates (DM_PREDICATE) and rules (DM_RULE), see GET_ASSOCIATION_RULES Function.
GET_MODEL_DETAILS_EM_COMP Function

This table function returns a set of rows that provide details about the parameters of an Expectation Maximization model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_EM_COMP ( model_name VARCHAR2 )
RETURN DM_EM_COMPONENT_SET PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_EM_COMPONENT_SET</td>
<td>A set of rows of type DM_EM_COMPONENT. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>info_type VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>component_id NUMBER,</td>
</tr>
<tr>
<td></td>
<td>cluster_id NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_name VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>covariate_name VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>value NUMBER</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_EM_COMPONENT. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

   The columns in each row returned by GET_MODEL_DETAILS_EM_COMP are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_EM_COMPONENT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>info_type</td>
<td>The type of information in the row. The following information types are supported:</td>
</tr>
<tr>
<td></td>
<td>cluster</td>
</tr>
<tr>
<td></td>
<td>prior</td>
</tr>
<tr>
<td></td>
<td>mean</td>
</tr>
<tr>
<td></td>
<td>covariance</td>
</tr>
<tr>
<td></td>
<td>frequency</td>
</tr>
<tr>
<td>component_id</td>
<td>Unique identifier of a component</td>
</tr>
</tbody>
</table>
The following table shows which fields are used for each info_type. The blank cells represent NULLs.

<table>
<thead>
<tr>
<th>info_type</th>
<th>component_id</th>
<th>cluster_id</th>
<th>attribute_name</th>
<th>covariate_name</th>
<th>attribute_value</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>prior</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>mean</td>
<td>X</td>
<td></td>
<td>X</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>covariance</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>frequency</td>
<td>X</td>
<td></td>
<td>X</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

3. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.
GET_MODELDETAILS_EM_PROJ Function

This table function returns a set of rows that provide statistics about the projections produced by an Expectation Maximization model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODELDETAILS_EM_PROJ ( model_name VARCHAR2 )
RETURN DM_EM_PROJECTION_SET PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>schema_name.model_name</code>. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_EM_PROJECTION_SET</td>
<td>A set of rows of type DM_EM_PROJECTION. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>( feature_name VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER )</td>
</tr>
<tr>
<td></td>
<td>See Usage Notes for details.</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_EM_PROJECTION. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

   The columns in each row returned by GET_MODELDETAILS_EM_PROJ are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_EM_PROJECTION</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature_name</td>
<td>Name of a derived feature. The feature maps to the attribute_name returned by the GET_MODELDETAILS_EM Function.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of a column in the build data</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Subname in a nested column</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Categorical value.</td>
</tr>
<tr>
<td>coefficient</td>
<td>Projection coefficient. The representation is sparse; only the non-zero coefficients are returned.</td>
</tr>
</tbody>
</table>
2. **GET_MODEL_DETAILS** functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want **GET_MODELDETAILS_SVM** to transform the coefficients such that they relate to the original attributes, set the `reverse_coef` parameter to 1.
**GET_MODEL_DETAILS_GLM Function**

This table function returns the coefficient statistics for a Generalized Linear Model.
The same set of statistics is returned for both linear and logistic regression, but
statistics that do not apply to the mining function are returned as NULL. For more
details, see the Usage Notes.

**Syntax**

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLM (  
    model_name             VARCHAR2)  
RETURN DM_GLM_COEFF_SET PIPELINED;
```

**Parameters**

</tbody>
</table>

GET_MODEL_DETAILS_GLM returns a row of statistics for each attribute and one extra row
for the intercept, which is identified by a null value in the attribute name. Each row
has the DM_GLM_COEFF datatyp. The statistics are described in Table 45–61.
### Table 45–61  DM_GLM_COEFF Datatype Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>class</strong></td>
<td>The non-reference target class for logistic regression. The model is built to predict the probability of this class. The other class (the reference class) is specified in the model setting <code>GLMS_REFERENCE_CLASS_NAME</code>. See Table 45–14, &quot;GLM Settings&quot;. For linear regression, class is null.</td>
</tr>
<tr>
<td><strong>attribute_name</strong></td>
<td>The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of attribute_name is also the name of the column in the case table that is the source for this attribute. For the intercept, attribute_name is null. Intercepts are equivalent to the bias term in SVM models.</td>
</tr>
<tr>
<td><strong>attribute_subname</strong></td>
<td>The name of an attribute in a nested table. The full name of a nested attribute has the form: attribute_name.attribute_subname where attribute_name is the name of the nested column in the case table that is the source for this attribute. If the attribute is not nested, attribute_subname is null. If the attribute is an intercept, both the attribute_name and the attribute_subname are null.</td>
</tr>
<tr>
<td><strong>attribute_value</strong></td>
<td>The value of the attribute (categorical attribute only). For numerical attributes, attribute_value is null.</td>
</tr>
<tr>
<td><strong>feature_expression</strong></td>
<td>The feature name constructed by the algorithm when feature selection is enabled. If feature selection is not enabled, the feature name is simply the fully-qualified attribute name (attribute_name.attribute_subname if the attribute is in a nested column). For categorical attributes, the algorithm constructs a feature name that has the following form: fully-qualified_attribute_name.attribute_value For numerical attributes, the algorithm constructs a name for the higher-order feature by subtracting the mean from each of the component attributes and taking the product of the resulting values: (attrib1-mean(attrib1))*(attrib2-mean(attrib2))...... where attrib1 and attrib2 are fully-qualified attribute names.</td>
</tr>
<tr>
<td><strong>coefficient</strong></td>
<td>The linear coefficient estimate.</td>
</tr>
<tr>
<td><strong>std_error</strong></td>
<td>Standard error of the coefficient estimate.</td>
</tr>
<tr>
<td><strong>test_statistic</strong></td>
<td>For linear regression, the t-value of the coefficient estimate. For logistic regression, the Wald chi-square value of the coefficient estimate.</td>
</tr>
<tr>
<td><strong>p-value</strong></td>
<td>Probability of the test_statistic. Used to analyze the significance of specific attributes in the model.</td>
</tr>
<tr>
<td><strong>VIF</strong></td>
<td>Variance Inflation Factor. The value is zero for the intercept. For logistic regression, VIF is null.</td>
</tr>
<tr>
<td><strong>std_coefficient</strong></td>
<td>Standardized estimate of the coefficient.</td>
</tr>
<tr>
<td><strong>lower_coeff_limit</strong></td>
<td>Lower confidence bound of the coefficient.</td>
</tr>
</tbody>
</table>
**Usage Notes**

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, `exp_coefficient` does not apply to linear regression.
- They cannot be computed from a theoretical standpoint. For example, when ridge regression is enabled, the coefficient values are returned with no statistics except VIF if it is enabled. (For information on ridge regression, see Table 45–14, "GLM Settings").
- They cannot be computed because of limitations in system resources.
- Their values would be infinity.

**Examples**

The following example returns some of the model details for the GLM regression model `GLMR_SH_Regr_sample`, which was created by the sample program `dmgldrde.sql`. For information about the sample programs, see *Oracle Data Mining User’s Guide*.

```sql
SQL> SELECT *
    2     FROM (SELECT class, attribute_name, attribute_value, coefficient, std_error
    3            FROM dms_data_mining.get_model_details_glm('GLMR_SH_Regr_sample'))
    4     ORDER BY class, attribute_name, attribute_value
    5     WHERE ROWNUM < 11;
```

GET_MODEL_DETAILS_KM Function

This table function returns a set of rows that provide the details of a $k$-Means clustering model.

You can provide input to GET_MODEL_DETAILS_KM to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_KM returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (  
  model_name          VARCHAR2,  
  cluster_id          NUMBER    DEFAULT NULL,  
  attribute           VARCHAR2  DEFAULT NULL,  
  centroid            NUMBER    DEFAULT 1,  
  histogram           NUMBER    DEFAULT 1,  
  rules               NUMBER    DEFAULT 2,  
  attribute_subname   VARCHAR2  DEFAULT NULL,  
  topn_attributes     NUMBER    DEFAULT NULL)  
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned</td>
</tr>
<tr>
<td>centroid</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>■ 1 — Details about centroids are returned (default)</td>
</tr>
<tr>
<td></td>
<td>■ 0 — Details about centroids are not returned</td>
</tr>
<tr>
<td>histogram</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>■ 1 — Details about histograms are returned (default)</td>
</tr>
<tr>
<td></td>
<td>■ 0 — Details about histograms are not returned</td>
</tr>
<tr>
<td>rules</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>■ 2 — Details about rules are returned (default)</td>
</tr>
<tr>
<td></td>
<td>■ 1 — Rule summaries are returned</td>
</tr>
<tr>
<td></td>
<td>■ 0 — No information about rules is returned</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>The name of a nested attribute. The full name of a nested attribute has the form:</td>
</tr>
<tr>
<td></td>
<td>attribute_name.attribute_subname</td>
</tr>
<tr>
<td></td>
<td>where attribute_name is the name of the column and attribute_subname is the name of the nested attribute in that column.</td>
</tr>
<tr>
<td></td>
<td>If the attribute is not nested, attribute_subname is null.</td>
</tr>
</tbody>
</table>

Summary of DBMS_DATA_MINING Subprograms

Usage Notes

1. The table function pipes out rows of type DM_CLUSTERS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

2. For descriptions of predicates (DM_PREDICATE) and rules (DM_RULE), see GET_ASSOCIATION_RULES Function.

Examples

The following example returns model details for the k-Means clustering model KM_SH_Clus_sample, which was created by the sample program dmkmdemo.sql. For information about the sample programs, see Oracle Data Mining User's Guide.

```
SELECT T.id           clu_id,
       T.record_count rec_cnt,
       T.parent       parent,
       T.tree_level   tree_level,
       T.dispersion   dispersion
FROM (SELECT *
       FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_KM('KM_SH_Clus_sample'))
```

Table 45–70  (Cont.) GET_MODEL_DETAILS_KM Function Return Values

GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
    model_name      IN       VARCHAR2)
RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name:]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| DM_NB_DETAILS | A set of rows of type DM_NB_DETAIL. The rows have the following columns:  
(target_attribute_name VARCHAR2(30),  
target_attribute_str_value VARCHAR2(4000),  
target_attribute_num_value NUMBER,  
prior_probability NUMBER,  
conditionals DM_CONDITIONALS)  
The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns:  
(attribute_name VARCHAR2(4000),  
attribute_subname VARCHAR2(4000),  
attribute_str_value VARCHAR2(4000),  
attribute_num_value NUMBER,  
conditional_probability NUMBER) |

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

Examples

The following query is from the sample program dmnbdemo.sql. It returns model details about the model NB_SH_Clas_sample. For information about the sample programs, see Oracle Data Mining User’s Guide.

The query creates labels from the bin boundary tables that were used to bin the training data. It replaces the attribute values with the labels. For numeric bins, the labels are (lower_boundary,upper_boundary); for categorical bins, the label matches...
the value it represents. (This method of categorical label representation will only work for cases where one value corresponds to one bin.) The target was not binned.

WITH

bin_label_view AS {
  SELECT col, bin, (DECODE(bin,'1','[','(') || lv || ',' || val || '])') label
  FROM (SELECT col, bin,
          LAST_VALUE(val) OVER (PARTITION BY col ORDER BY val

**GET_MODEL_DETAILS_NMF Function**

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

**Syntax**

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF {
    model_name    IN    VARCHAR2
} RETURN DM_NMF_FEATURE_SET PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.model_name]. If you do not specify a schema, your own schema is used.</td>

```
GET_MODEL_DETAILS_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to GET_MODELDETAILS_OC to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODELDETAILS_OC returns all the information about the model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (  
    model_name         VARCHAR2,  
    cluster_id         NUMBER    DEFAULT NULL,  
    attribute          VARCHAR2  DEFAULT NULL,  
    centroid           NUMBER    DEFAULT 1,  
    histogram          NUMBER    DEFAULT 1,  
    rules              NUMBER    DEFAULT 2,  
    topn_attributes    NUMBER    DEFAULT NULL)  
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name:model_name]. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned.</td>
</tr>
</tbody>
</table>
| centroid       | This parameter accepts the following values:  
  ■ 1 — Details about centroids are returned (default)  
  ■ 0 — Details about centroids are not returned |
| histogram      | This parameter accepts the following values:  
  ■ 1 — Details about histograms are returned (default)  
  ■ 0 — Details about histograms are not returned |
| rules          | This parameter accepts the following values:  
  ■ 2 — Details about rules are returned (default)  
  ■ 1 — Rule summaries are returned  
  ■ 0 — No information about rules is returned |
**Return Values**

Summary of DBMS_DATA_MINING Subprograms

Usage Notes

1. The table function pipes out rows of type DM_CLUSTER. For information about Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

2. For descriptions of predicates (DM_PREDICATE) and rules (DM_RULE), see GET_ASSOCIATION_RULES Function.

Examples

The following example returns model details for the clustering model OC_SH_Clus_sample, which was created by the sample program dmocdemo.sql. For information about the sample programs, see Oracle Data Mining User’s Guide.

For each cluster in this example, the split predicate indicates the attribute and the condition used to assign records to the cluster's children during model build. It provides an important piece of information on how the population within a cluster can be divided up into two smaller clusters.

```
SELECT clu_id, attribute_name, op, s_value
FROM (SELECT a.id clu_id, sp.attribute_name, sp.conditional_operator op,
        sp.attribute_str_value s_value
     FROM DM_CLUSTER a
          JOIN DM_PREDICATE sp ON a.id = sp.id)
```
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC('OC_SH_Clus_sample')) a,
    TABLE(a.split_predicate) sp
ORDER BY a.id, op, s_value)
WHERE ROWNUM < 11;

GET_MODELDETAILS_SVD Function

This table function returns a set of rows that provide the details of a Singular Value Decomposition model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODELDETAILS_SVD (model_name VARCHAR2, matrix_type VARCHAR2 DEFAULT NULL) RETURN DM_SVD_MATRIX_SET PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>matrix_type</td>
<td>Specifies which of the three SVD matrix types to return. Values are: U, S, V, and NULL. When matrix_type is null (default), all matrices are returned. The U matrix is only computed when the SVDS_U_MATRIX_OUTPUT setting is enabled. It is not computed by default. If the model does not contain U matrices and you set matrix_type to U, an empty set of rows is returned. See Table 45–20, &quot;Singular Value Decomposition Settings&quot;.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVD_MATRIX_SET</td>
<td>A set of rows of type DM_SVD_MATRIX. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(matrix_type CHAR(1), feature_id NUMBER, mapped_feature_id VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), case_id VARCHAR2(4000), value NUMBER, variance NUMBER, pct_cum_variance NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_SVD_MATRIX. For information on Data Mining datatypes and piped output from table functions, see "Datatypes" on page 45-21.

The columns in each row returned by GET_MODELDETAILS_SVD are described as follows:
2. The output of `GET_MODEL_DETAILS` is in sparse format. Zero values are not returned. Only the diagonal elements of the `S` matrix, the non-zero coefficients in the `V` matrix bases, and the non-zero `U` matrix projections are returned.

   There is one exception: If the data row does not produce non-zero `U` matrix projections, the case ID for that row is returned with nulls for the feature ID and value. This is done to avoid losing any records from the original data.

3. `GET_MODELDETAILS` functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

---

**Column in DM_SVD_MATRIX_SET** | **Description**
--- | ---
`matrix_type` | The type of matrix. Possible values are `S`, `V`, and `U`. This field is never null.
`feature_id` | The feature that the matrix entry refers to.
`mapped_feature_id` | A descriptive name for the feature.
`attribute_name` | Column name in the `V` matrix component bases. This field is null for the `S` and `U` matrices.
`attribute_subname` | Subname in the `V` matrix component bases. This is relevant only in the case of a nested column. This field is null for the `S` and `U` matrices.
`case_id` | Unique identifier of the row in the build data described by the `U` matrix projection. This field is null for the `S` and `V` matrices.
`value` | The matrix entry value.
`variance` | The variance explained by a component. It is non-null only for `S` matrix entries.
`pct_cum_variance` | The percent cumulative variance explained by the components thus far. The components are ranked by the explained variance in descending order.
GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a linear Support Vector Machine (SVM) model. If invoked for nonlinear SVM, it returns ORA-40215. In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET_MODEL_DETAILS_SVM, then the coefficient of this attribute should be interpreted as zero.

Syntax

DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
    model_name        VARCHAR2,
    reverse_coef      NUMBER DEFAULT 0)
RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;

Parameters

Table 45–79  GET_MODEL_DETAILS_SVM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>reverse_coef</td>
<td>Whether or not GET_MODEL_DETAILS_SVM should transform the attribute coefficients using the original attribute transformations. When reverse_coef is set to 0 (default), GET_MODEL_DETAILS_SVM returns the coefficients directly from the model without applying transformations. When reverse_coef is set to 1, GET_MODEL_DETAILS_SVM transforms the coefficients and bias by applying the normalization shifts and scales that were generated using automatic data preparation. See Usage Note 4.</td>
</tr>
</tbody>
</table>

Return Values

Table 45–80  GET_MODEL_DETAILS_SVM Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVM_LINEAR_COEFF_SET</td>
<td>A set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>{class VARCHAR2(4000), attribute_set DM_SVM_ATTRIBUTE_SET}</td>
</tr>
<tr>
<td></td>
<td>The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:</td>
</tr>
<tr>
<td></td>
<td>{attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER}</td>
</tr>
<tr>
<td></td>
<td>See Usage Notes.</td>
</tr>
</tbody>
</table>
**Usage Notes**

1. This table function pipes out rows of type `DM_SVM_LINEAR_COEFF`. For information on Data Mining datatypes and piped output from table functions, see “Datatypes” on page 45-21.

2. The `class` column of `DM_SVM_LINEAR_COEFF` contains classification target values. For SVM regression models, `class` is null. For each classification target value, a set of coefficients is returned. For binary classification, one-class classification, and regression models, only a single set of coefficients is returned.

3. The `attribute_value` column in `DMATTRIBUTE_SET` is used for categorical attributes.

4. `GET_MODELDETAILS` functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want `GET_MODELDETAILS_SVM` to transform the coefficients such that they relate to the original attributes, set the `reverse_coef` parameter to 1.

**Examples**

The following example returns model details for the SVM classification model `SVMC_SH_Clas_sample`, which was created by the sample program `dmsvcdem.sql`. For information about the sample programs, see Oracle Data Mining User’s Guide.

```sql
WITH mod_dtls AS (SELECT * FROM TABLE(DBMS_DATA_MINING.GET_MODELDETAILS_SVM('SVMC_SH_Clas_sample'))),
model_details AS (SELECT D.class, A.attribute_name, A.attribute_value, A.coefficient FROM mod_dtls D, TABLE(D.attribute_set) A ORDER BY D.class, ABS(A.coefficient) DESC)
SELECT class, attribute_name aname, attribute_value aval, coefficient coeff FROM model_details WHERE ROWNUM < 11;

GET_MODEL_DETAILS_XML Function

This function returns an XML object that provides the details of a Decision Tree model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (  
    model_name      IN       VARCHAR2)  
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>

Usage Notes

Special characters that cannot be displayed by Oracle XML are converted to '#'.

Examples

The following statements in SQL*Plus return the details of the decision tree model `dt_sh_clas_sample`. This model is created by the program `dmdatdemo.sql`, one of the sample data mining programs provided with Oracle Database Examples.

Note: The "&quot" characters you will see in the XML output are a result of SQL*Plus behavior. To display the XML in proper format, cut and past it into a file and open the file in a browser.

```sql
column dt_details format a320
SELECT  
    dbms_data_mining.get_model_details_xml('dt_sh_clas_sample')  
AS DT_DETAILS  
FROM dual;
```

```

GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation expressions embedded in the specified model.

See Also:
"About Transformation Lists" in Chapter 46, "DBMS_DATA_MINING_TRANSFORM"
"GET_TRANSFORM_LIST Procedure" on page 45-107
"CREATE_MODEL Procedure" on page 45-53

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (    model_name IN VARCHAR2) RETURN DM_TRANSFORMS PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_TRANSFORMS</td>
<td>The transformation expressions embedded in model_name.</td>
</tr>
<tr>
<td></td>
<td>The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields:</td>
</tr>
<tr>
<td></td>
<td>attribute_name VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>attribute_subname VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>expression CLOB</td>
</tr>
<tr>
<td></td>
<td>reverse_expression CLOB</td>
</tr>
</tbody>
</table>

Usage Notes

When Automatic Data Preparation (ADP) is enabled, both automatic and user-defined transformations may be associated with an attribute. In this case, the user-defined transformations are evaluated before the automatic transformations.

Examples

In this example, several columns in the `SH_CUSTOMERS` table are used to create a Naive Bayes model. A transformation expression is specified for one of the columns. The model does not use ADP.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_income_level, cust_credit_limit
    FROM sh.customers;
```
describe mining_data
Name Null? Type

**GET_TRANSFORM_LIST Procedure**

This procedure converts transformation expressions specified as `DM_TRANSFORMS` to a transformation list (`TRANSFORM_LIST`) that can be used in creating a model. `DM_TRANSFORMS` is returned by the `GET_MODEL_TRANSFORMATIONS` function.

You can also use routines in the `DBMS_DATA_MINING_TRANSFORM` package to construct a transformation list.

**See Also:**

"About Transformation Lists" in Chapter 46, "DBMS_DATA_MINING_TRANSFORM"

"GET_MODEL_TRANSFORMATIONS Function" on page 45-105

"CREATE_MODEL Procedure" on page 45-53

**Syntax**

```sql
DBMS_DATA_MINING.GET_TRANSFORM_LIST (    
  xform_list           OUT NOCOPY TRANSFORM_LIST,    
  model_xforms         IN  DM_TRANSFORMS);
```

**Parameters**

<table>

<tr>
<td></td>
<td>reverse_expression CLOB</td>
</tr>
</tbody>
</table>

**Examples**

In this example, a model `mod1` is trained using several columns in the `SH.CUSTOMERS` table. The model uses ADP, which automatically bins one of the columns.

A second model `mod2` is trained on the same data without ADP, but it uses a transformation list that was obtained from `mod1`. As a result, both `mod1` and `mod2` have the same embedded transformation expression.
CREATE OR REPLACE VIEW mining_data AS

IMPORT_MODEL Procedure

This procedure imports one or more data mining models. The procedure is overloaded. You can call it to import mining models from a dump file set, or you can call it to import a single mining model from a PMML document.

Import from a dump file set
You can import mining models from a dump file set that was created by the EXPORT_MODEL Procedure. IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology to export to and import from a dump file set.

When Oracle Data Pump is used directly to export/import an entire schema or database, the mining models in the schema or database are included. EXPORT_MODEL and IMPORT_MODEL export/import mining models only.

Import from PMML
You can import a mining model represented in Predictive Model Markup Language (PMML). The model must be of type RegressionModel, either linear regression or binary logistic regression.

PMML is an XML-based standard specified by the Data Mining Group (http://www.dmg.org). Applications that are PMML-compliant can deploy PMML-compliant models that were created by any vendor. Oracle Data Mining supports the core features of PMML 3.1 for regression models.

See Also:
Oracle Data Mining User’s Guide for more information about exporting and importing mining models
Oracle Database Utilities for information about Oracle Data Pump
http://www.dmg.org/faq.html for more information about PMML

Syntax

Imports a mining model from a dump file set:

```
DBMS_DATA_MINING.IMPORT_MODEL (
    filename          IN  VARCHAR2,
    directory         IN  VARCHAR2,
    model_filter      IN  VARCHAR2 DEFAULT NULL,
    operation         IN  VARCHAR2 DEFAULT NULL,
    remote_link       IN  VARCHAR2 DEFAULT NULL,
    jobname           IN  VARCHAR2 DEFAULT NULL,
    schema_remap      IN  VARCHAR2 DEFAULT NULL,
    tablespace_remap  IN  VARCHAR2 DEFAULT NULL);
```

Imports a mining model from a PMML document:

```
DBMS_DATA_MINING.IMPORT_MODEL (
    model_name        IN  VARCHAR2,
    pmmldoc           IN  XMLTYPE
    strict_check      IN  BOOLEAN DEFAULT FALSE);
```
Parameters

Table 45–86  IMPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| filename      | Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to "EXPORT_MODEL Procedure" on page 45-58 for details.) If the dump file set contains multiple files, you can specify ‘filename%U’ instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying ‘archive%U’.
| directory     | Name of a pre-defined directory object that specifies where the dump file set is located. Both the exporting and the importing user must have read/write access to the directory object and to the file system directory that it identifies. Note: The target database must also have read/write access to the file system directory.
| model_filter  | Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or ‘ALL’ to import all models. The value of model_filter can be one or more model names. The following are valid filters. ‘mymodel1’
|               | ‘name IN (’’mymodel2’’,’’mymodel3’’)’
| operation     | Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for operation:
|               | ■ ‘IMPORT’ — Import the models (Default)
|               | ■ ‘SQL_FILE’— Write the SQL DDL for creating the models to a text file. The text file is named job_name.sql and is located in the dump set directory.
| remote_link   | Optional parameter that specifies the name of a database link to a remote system. The default value is NULL. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for remote_link, you can import models into the local database from the remote database. The import is fileless; no dump file is involved. The IMP_FULL_DATABASE role is required for importing the remote models. The EXP_FULL_DATABASE privilege, the CREATE DATABASE LINK privilege, and other privileges may also be required. (See Example 2.)
| jobname       | Optional parameter that specifies the name of the import job. By default, the name has the form username_imp_nnnn, where nnnn is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters.
|               | A log file for the import job, named jobname.log, is created in the same directory as the dump file set.
1. This example shows a model being exported and imported within the schema dmuser2. Then the same model is imported into the dmuser3 schema. The dmuser3 user has the IMP_FULL_DATABASE privilege. The dmuser2 user has been assigned the USER2 tablespace; dmuser3 has been assigned the USER3 tablespace.

SQL> connect dmuser2
Enter password: dmuser2_password
Connected.
SQL> select model_name from user_mining_models;

MODEL_NAME
-------------
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL> EXECUTE DBMS_DATA_MINING.EXPORT_MODEL (filename =>'NMF_SH_SAMPLE_out', directory =>'DATA_PUMP_DIR', model_filter => 'name = '''NMF_SH_SAMPLE''');

Table 45–86 (Cont.) IMPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_remap</td>
<td>Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form export_user:import_user. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different schema.</td>
</tr>
<tr>
<td>tablespace_remap</td>
<td>Optional parameter for importing into a different tablespace. By default, models are exported and imported within the same tablespace. If the dump file set belongs to a different tablespace, you must specify a tablespace mapping in the form export_tablespace:import_tablespace. For example, you would specify 'TBLSPC01:TBLSPC02' to import a model that was exported from tablespace TBLSPC01 into tablespace TBLSPC02. Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different tablespace.</td>
</tr>
<tr>
<td>model_name</td>
<td>Name for the new model that will be created in the database as a result of an import from PMML. The name must be unique within the user's schema.</td>
</tr>
<tr>
<td>pmml_doc</td>
<td>The PMML document representing the model to be imported. The PMML document has an XMLTYPE object type. See Chapter 285, &quot;XMLTYPE&quot; for details.</td>
</tr>
<tr>
<td>strict_check</td>
<td>Whether or not an error occurs when the PMML document contains sections that are not part of core PMML (for example, Output or Targets). Oracle Data Mining supports only core PMML; any non-core features may affect the scoring representation. If the PMML does not strictly conform to core PMML and strict_check is set to TRUE, then IMPORT_MODEL returns an error. If strict_check is FALSE (the default), then the error is suppressed. The model may be imported and scored.</td>
</tr>
</tbody>
</table>
-- import the model back into the same schema
SQL> EXECUTE DBMS_DATA_MINING.IMPORT_MODEL {
filename => 'NMF_SH_SAMPLE_out01.dmp',
directory => 'DATA_PUMP_DIR',
model_filter => 'name = ''NMF_SH_SAMPLE'''};

-- connect as different user
-- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL> EXECUTE DBMS_DATA_MINING.IMPORT_MODEL {
filename => 'NMF_SH_SAMPLE_out01.dmp',
directory => 'DATA_PUMP_DIR',
model_filter => 'name = ''NMF_SH_SAMPLE''',
operation =>'IMPORT',
remote_link => NULL,
jobname => 'nmf_imp_job',
schema_remap => 'dmuser2:dmuser3',
tablespace_remap => 'USER2:USER3'};

The following example shows user MARY importing all models from a dump file, model_exp_001.dmp, which was created by user SCOTT. User MARY has been assigned a tablespace named USER2; user SCOTT was assigned the tablespace USERS when the models were exported into the dump file model_exp_001.dmp. The dump file is located in the file system directory mapped to a directory object called DM_DUMP. If user MARY does not have IMP_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

-- import all models
DECLARE
  file_name  VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
    filename=>'file_name',
    directory=>'DM_DUMP',
    model_filter => 'name = 'NMF_SH_SAMPLE'' ,
    operation =>'IMPORT',
    remote_link => NULL,
    jobname => 'nmf_imp_job',
    schema_remap => 'dmuser2:dmuser3',
    tablespace_remap => 'USER2:USER3');
  DBMS_OUTPUT.PUT_LINE ('DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/

2. This example shows how the user xuser could import the model dmuser.r1mod from a remote database. The SQL*Net connection alias for the remote database is R1DB. The user xuser is assigned the SYSAUX tablespace; the user dmuser is assigned the TBS_1 tablespace.

CONNECT / AS SYSDBA;
GRANT CREATE DATABASE LINK TO xuser;
GRANT imp_full_database TO xuser;
CONNECT xuser/xuserpassword
CREATE DATABASE LINK dmuser_link
  CONNECT TO dmuser IDENTIFIED BY dmuserpassword USING 'R1DB';
EXEC dbms_data_mining.import_model {
  NULL,
  'DMUSER_DIR',
  'R1MOD',
  remote_link => 'DMUSER_LINK', schema_remap => 'DMUSER:XUSER',
}
3. This example shows how a PMML document called `SamplePMML1.xml` could be imported from a location referenced by directory object `PMMLDIR` into the schema of the current user. The imported model will be called `PMMLMODEL1`.

```plsql
BEGIN
    dbms_data_mining.import_model ('PMMLMODEL1',
        XMLType (bfilename ('PMMLDIR', 'SamplePMML1.xml'),
        nls_charset_id ('AL32UTF8')));
END;
```

```sql
tablespace_remap => 'TBS_1:SYSAUX' );
SELECT name FROM dm_user_models;
NAME
-----------------------------------------------
R1MOD
```

```sql
3. This example shows how a PMML document called SamplePMML1.xml could be imported from a location referenced by directory object PMMLDIR into the schema of the current user. The imported model will be called PMMLMODEL1.

BEGIN
    dbms_data_mining.import_model ('PMMLMODEL1',
        XMLType (bfilename ('PMMLDIR', 'SamplePMML1.xml'),
        nls_charset_id ('AL32UTF8')));
END;
```
RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```sql
DBMS_DATA_MINING.RANK_APPLY (
  apply_result_table_name        IN VARCHAR2,
  case_id_column_name            IN VARCHAR2,
  score_column_name              IN VARCHAR2,
  score_criterion_column_name    IN VARCHAR2,
  ranked_apply_table_name        IN VARCHAR2,
  top_N                          IN NUMBER (38) DEFAULT 1,
  cost_matrix_table_name         IN VARCHAR2    DEFAULT NULL,
  apply_result_schema_name       IN VARCHAR2    DEFAULT NULL,
  cost_matrix_schema_name        IN VARCHAR2    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test data set (see Usage Notes)</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column. This must be the same as the one used for generating APPLY results.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Name of the prediction column in the apply results table</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Name of the probability column in the apply results table</td>
</tr>
<tr>
<td>ranked_apply_result_tab_name</td>
<td>Name of the table containing the ranked apply results</td>
</tr>
<tr>
<td>top_N</td>
<td>Top N predictions to be considered from the APPLY results for precision recall computation</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the APPLY results table</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Name of the schema hosting the cost matrix table</td>
</tr>
</tbody>
</table>

Usage Notes

You can use RANK_APPLY to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of RANK_APPLY is similar to that of APPLY with respect to other DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from APPLY.

The main intended use of RANK_APPLY is for the generation of the final APPLY results against the scoring data in a production setting. You can apply the model against test
data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will be the same case identifier column as that of the apply results.

Classification Models — NB and SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id VARCHAR2/NUMBER,
prediction NUMBER,
probability NUMBER,
cost NUMBER,
rank INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id VARCHAR2/NUMBER,
prediction VARCHAR2,
probability NUMBER,
cost NUMBER,
rank INTEGER)
```

Clustering using k-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id VARCHAR2/NUMBER,
cluster_id NUMBER,
probability NUMBER,
rank INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id VARCHAR2/NUMBER,
feature_id NUMBER,
match_quality NUMBER,
rank INTEGER)
```

Examples

BEGIN
/* build a model with name census_model. */
*(See example under CREATE_MODEL)*
*/

/* if training data was pre-processed in any manner, */
* perform the same pre-processing steps on apply 
data also. *
*(See examples in the section on DBMS_DATA_MINING_TRANSFORM)*
/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
    apply_result_table_name => 'census_apply_result',
    case_id_column_name    => 'person_id',
    score_column_name      => 'prediction',
    score_criterion_column_name => 'probability',
    ranked_apply_result_tab_name => 'census_ranked_apply_result',
    top_N                  => 3,
    cost_matrix_table_name => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
    FROM census_ranked_apply_result;
REMOVE_COST_MATRIX Procedure

Removes the default scoring matrix from a classification model.

See Also:
- "ADD_COST_MATRIX Procedure" on page 45-26
- "REMOVE_COST_MATRIX Procedure" on page 45-118

Syntax

DBMS_DATA_MINING.REMOVE_COST_MATRIX (  
    model_name   IN  VARCHAR2);

Parameters

Table 45–88  Remove_Cost_Matrix Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

```
SQL>SELECT *  
FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))  
ORDER BY predicted, actual;
```

<table>
<thead>
<tr>
<th>ACTUAL</th>
<th>PREDICTED</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>.75</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>.25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

You can remove the cost matrix with REMOVE_COST_MATRIX.

```
SQL>EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');
```

```
SQL>SELECT *  
FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))  
ORDER BY predicted, actual;
```

no rows selected
RENAME_MODEL Procedure

This procedure changes the name of the mining model indicated by model_name to the name that you specify as new_model_name. If a model with new_model_name already exists, then the procedure optionally renames new_model_name to versioned_model_name before renaming model_name to new_model_name.

The model name is in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see the Usage Notes for "CREATE_MODEL Procedure" on page 45-53.

Syntax

DBMS_DATA_MINING.RENAME_MODEL (
    model_name            IN VARCHAR2,
    new_model_name        IN VARCHAR2,
    versioned_model_name  IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Model to be renamed.</td>
</tr>
<tr>
<td>new_model_name</td>
<td>New name for the model model_name.</td>
</tr>
<tr>
<td>versioned_model_name</td>
<td>New name for the model new_model_name if it already exists.</td>
</tr>
</tbody>
</table>

Usage Notes

If you attempt to rename a model while it is being applied, then the model will be renamed but the apply operation will return indeterminate results.

Examples

1. This example changes the name of model census_model to census_model_2012.

   BEGIN
   DBMS_DATA_MINING.RENAME_MODEL(
       model_name => 'census_model',
       new_model_name => 'census_model_2012');
   END;
   /

2. In this example, there are two classification models in the user’s schema: clas_mod, the working model, and clas_mod_tst, a test model. The RENAME_MODEL procedure preserves clas_mod as clas_mod_old and makes the test model the new working model.

   SELECT model_name FROM user_mining_models;
   MODEL_NAME
   "-----------------------------------------------"
   CLAS_MOD
   CLAS_MOD_TST

   BEGIN
   DBMS_DATA_MINING.RENAME_MODEL(
       model_name => 'clas_mod_tst',
       new_model_name => 'clas_mod_tst',
       versioned_model_name => 'clas_mod_tst_2012');
   END;
RENAME_MODEL Procedure

```sql
new_model_name => 'clas_mod',
versioned_model_name => 'clas_mod_old');
END;
/

SELECT model_name FROM user_mining_models;
MODEL_NAME
------------------
CLAS_MOD
CLAS_MOD_OLD
```
DBMS_DATA_MINING_TRANSFORM implements a set of transformations that are commonly used in data mining.

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics that relate to using the DBMS_DATA_MINING_TRANSFORM package.

- Overview
- Operational Notes
- Security Model
- Datatypes
- Constants
Overview

A transformation is a SQL expression that modifies the data in one or more columns. Data must typically undergo certain transformations before it can be used to build a mining model. Many data mining algorithms have specific transformation requirements.

Data that will be scored must be transformed in the same way as the data that was used to create (train) the model.

External or Embedded Transformations

DBMS_DATA_MINING_TRANSFORM offers two approaches to implementing transformations. For a given model, you can either:

- Create a list of transformation expressions and pass it to the CREATE_MODEL Procedure
- Create a view that implements the transformations and pass the name of the view to the CREATE_MODEL Procedure

If you create a transformation list and pass it to CREATE_MODEL, the transformation expressions are embedded in the model and automatically implemented whenever the model is applied.

If you create a view, the transformation expressions are external to the model. You will need to re-create the transformations whenever you apply the model.

Note: Embedded transformations significantly enhance the model’s usability while simplifying the process of model management.

Automatic Transformations

Oracle Data Mining supports an Automatic Data Preparation (ADP) mode. When ADP is enabled, most algorithm-specific transformations are automatically embedded. Any additional transformations must be explicitly provided in an embedded transformation list or in a view.

If ADP is enabled and you create a model with a transformation list, both sets of transformations are embedded. The model will execute the user-specified transformations from the transformation list before executing the automatic transformations specified by ADP.

Within a transformation list, you can selectively disable ADP for individual attributes.

"About Transformation Lists" on page 46-7

Transformations in DBMS_DATA_MINING_TRANSFORM

The transformations supported by DBMS_DATA_MINING_TRANSFORM are summarized in this section.
Binning
Binning refers to the mapping of continuous or discrete values to discrete values of reduced cardinality.

- Supervised Binning (Categorical and Numerical)
  Binning is based on intrinsic relationships in the data as determined by a decision tree model.
  See "INSERT_BIN_SUPER Procedure" on page 46-51.

- Top-N Frequency Categorical Binning
  Binning is based on the number of cases in each category.
  See "INSERT_BIN_CAT_FREQ Procedure" on page 46-39

- Equi-Width Numerical Binning
  Binning is based on equal-range partitions.
  See "INSERT_BIN_NUM_EQWIDTH Procedure" on page 46-44.

- Quantile Numerical Binning
  Binning is based on quantiles computed using the SQL NTILE function.

Linear Normalization
Normalization is the process of scaling continuous values down to a specific range, often between zero and one. Normalization transforms each numerical value by subtracting a number (the shift) and dividing the result by another number (the scale).

\[ x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}} \]

- Min-Max Normalization
  Normalization is based on the minimum and maximum with the following shift and scale:
  \[ \text{shift} = \min \]
  \[ \text{scale} = \max - \min \]
  See "INSERT_NORM_LIN_MINMAX Procedure" on page 46-67.

- Scale Normalization
  Normalization is based on the minimum and maximum with the following shift and scale:
  \[ \text{shift} = 0 \]
  \[ \text{scale} = \max\{|\max|, |\min|\} \]
  See "INSERT_NORM_LIN_SCALE Procedure" on page 46-70.

- Z-Score Normalization
  Normalization is based on the mean and standard deviation with the following shift and scale:
  \[ \text{shift} = \text{mean} \]
  \[ \text{scale} = \text{standard deviation} \]
  See "INSERT_NORM_LIN_ZSCORE Procedure" on page 46-73.
Outlier Treatment
An outlier is a numerical value that is located far from the rest of the data. Outliers can artificially skew the results of data mining.

- Winsorizing
  Outliers are replaced with the nearest value that is not an outlier.
  See "INSERT_CLIP_WINSOR_TAIL Procedure" on page 46-58

- Trimming
  Outliers are set to NULL.
  See "INSERT_CLIP_TRIM_TAIL Procedure" on page 46-55.

Missing Value Treatment
Missing data may indicate sparsity or it may indicate that some values are missing at random. DBMS_DATA_MINING_TRANSFORM supports the following transformations for minimizing the effects of missing values:

- Missing numerical values are replaced with the mean.
  See "INSERT_MISS_NUM_MEAN Procedure" on page 46-64.

- Missing categorical values are replaced with the mode.
  See "INSERT_MISS_CAT_MODE Procedure" on page 46-61.

Note: Oracle Data Mining also has default mechanisms for handling missing data. See Oracle Data Mining User’s Guide for details.
Operational Notes

The DBMS_DATA_MINING_TRANSFORM package offers a flexible framework for specifying data transformations. If you choose to embed transformations in the model (the preferred method), you will create a transformation list object and pass it to the CREATE_MODEL Procedure. If you choose to transform the data without embedding, you will create a view.

When specified in a transformation list, the transformation expressions are executed by the model. When specified in a view, the transformation expressions are executed by the view.

Transformation Definitions
Transformation definitions are used to generate the SQL expressions that transform the data. For example, the transformation definitions for normalizing a numeric column are the shift and scale values for that data.

With the DBMS_DATA_MINING_TRANSFORM package, you can call procedures to compute the transformation definitions, or you can compute them yourself, or you can do both.

Transformation Definition Tables
DBMS_DATA_MINING_TRANSFORM provides INSERT procedures that compute transformation definitions and insert them in transformation definition tables. You can modify the values in the transformation definition tables or populate them yourself.

XFORM routines use populated definition tables to transform data in external views. STACK routines use populated definition tables to build transformation lists.

To specify transformations based on definition tables, follow these steps:

1. Use CREATE routines to create transformation definition tables.
   The tables have columns to hold the transformation definitions for a given type of transformation. For example, the CREATE_BIN_NUM Procedure creates a definition table that has a column for storing data values and another column for storing the associated bin identifiers.

2. Use INSERT routines to compute and insert transformation definitions in the tables.
   Each INSERT routine uses a specific technique for computing the transformation definitions. For example, the INSERT_BIN_NUM_EQWIDTH Procedure computes bin boundaries by identifying the minimum and maximum values then setting the bin boundaries at equal intervals.

3. Use STACK or XFORM routines to generate transformation expressions based on the information in the definition tables:
   - Use STACK routines to add the transformation expressions to a transformation list. Pass the transformation list to the CREATE_MODEL Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.
   - Use XFORM routines to execute the transformation expressions within a view. The transformations will be external to the model and will need to be re-created whenever the model is applied to new data.
Transformations Without Definition Tables

STACK routines are not the only method for adding transformation expressions to a transformation list. You can also build a transformation list without using definition tables.

To specify transformations without using definition tables, follow these steps:

1. Write a SQL expression for transforming an attribute.
2. Write a SQL expression for reversing the transformation. (See "Reverse Transformations and Model Transparency" on page 46-7.)
3. Determine whether or not to disable ADP for the attribute. By default ADP is enabled for the attribute if it is specified for the model. (See "Disabling Automatic Data Preparation" on page 46-8.)
4. Specify the SQL expressions and ADP instructions in a call to the SET_TRANSFORM Procedure, which adds the information to a transformation list.
5. Repeat steps 1 through 4 for each attribute that you wish to transform.
6. Pass the transformation list to the CREATE_MODEL Procedure. The transformation expressions will be assembled into one long SQL query and embedded in the model.

---

**Note:** SQL expressions that you specify with SET_TRANSFORM must fit within a VARCHAR2. To specify a longer expression, you can use the SET_EXPRESSION Procedure. With SET_EXPRESSION, you can build an expression by appending rows to a VARCHAR2 array.

---

About Transformation Lists

The elements of a transformation list are transformation records. Each transformation record provides all the information needed by the model for managing the transformation of a single attribute.

Each transformation record includes the following fields:

- **attribute_name** — Name of the column of data to be transformed
- **attribute_subname** — Name of the nested attribute if **attribute_name** is a nested column, otherwise NULL
- **expression** — SQL expression for transforming the attribute
- **reverse_expression** — SQL expression for reversing the transformation
- **attribute_spec** — Identifies special treatment for the attribute during the model build. See Table 46–33, "SET_TRANSFORM Procedure Parameters" for details.

See Also:

- Table 46–1 for details about the TRANSFORM_LIST and TRANSFORM_REC object types
- SET_TRANSFORM Procedure
- CREATE_MODEL Procedure

Reverse Transformations and Model Transparency

An algorithm manipulates transformed attributes to train and score a model. The transformed attributes, however, may not be meaningful to an end user. For example,
if attribute x has been transformed into bins 1 — 4, the bin names 1, 2, 3, and 4 are manipulated by the algorithm, but a user is probably not interested in the model details about bins 1 — 4 or in predicting the numbers 1 — 4.

To return original attribute values in model details and predictions, you can provide a reverse expression in the transformation record for the attribute. For example, if you specify the transformation expression \('\log(10, y)\)' for attribute y, you could specify the reverse transformation expression \('\text{power}(10, y)\').

Reverse transformations enable **model transparency**. They make internal processing transparent to the user.

---

**Note:** STACK procedures automatically reverse normalization transformations, but they do not provide a mechanism for reversing binning, clipping, or missing value transformations.

You can use the DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION procedure to specify or update reverse transformations expressions for an existing model.

---

**See Also:**
- Example 46–1, "Stacking a Clipping Transformation"
- "ALTER_REVERSE_EXPRESSION Procedure" on page 45-29
- "Summary of DBMS_DATA_MINING Subprograms" on page 45-24

**Disabling Automatic Data Preparation**

ADP is controlled by a model-specific setting (PREP_AUTO). The PREP_AUTO setting affects all model attributes unless you disable it for individual attributes.

If ADP is enabled and you set attribute_spec to NOPREP, only the transformations that you specify for that attribute will be evaluated. If ADP is enabled and you do not set attribute_spec to NOPREP, the automatic transformations will be evaluated after the transformations that you specify for the attribute.

If ADP is not enabled for the model, the attribute_spec field of the transformation record is ignored.

**See Also:** "Automatic Data Preparation" on page 45-8 for information about the PREP_AUTO setting

**Adding Transformation Records to a Transformation List**

A transformation list is a stack of transformation records. When a new transformation record is added, it is appended to the top of the stack. (See "About Stacking" for details.)

When you use SET_TRANSFORM to add a transformation record to a transformation list, you can specify values for all the fields in the transformation record.

When you use STACK procedures to add transformation records to a transformation list, only the transformation expression field is populated. For normalization transformations, the reverse transformation expression field is also populated.

You can use both STACK procedures and SET_TRANSFORM to build one transformation list. Each STACK procedure call adds transformation records for all the attributes in a
specified transformation definition table. Each SET_TRANSFORM call adds a transformation record for a single attribute.

About Stacking

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

Stack Procedures

STACK procedures create transformation records from the information in transformation definition tables. For example STACK_BIN_NUM builds a transformation record for each attribute specified in a definition table for numeric binning. STACK procedures stack the transformation records as follows:

- If an attribute is specified in the definition table but not in the transformation list, the STACK procedure creates a transformation record, computes the reverse transformation (if possible), inserts the transformation and reverse transformation in the transformation record, and appends the transformation record to the top of the transformation list.
- If an attribute is specified in the transformation list but not in the definition table, the STACK procedure takes no action.
- If an attribute is specified in the definition table and in the transformation list, the STACK procedure stacks the transformation expression from the definition table on top of the transformation expression in the transformation record and updates the reverse transformation. See Example 46–1, “Stacking a Clipping Transformation” and Example 46–4, “Stacking a Nested Normalization Transformation”.

Example 46–1 Stacking a Clipping Transformation

This example shows how STACK_CLIP Procedure would add transformation records to a transformation list. Note that the clipping transformations are not reversed in COL1 and COL2 after stacking (as described in "Reverse Transformations and Model Transparency" on page 46-7).

Refer to:
- CREATE_CLIP Procedure — Creates the definition table
- INSERT_CLIP_TRIM_TAIL Procedure — Inserts definitions in the table
- INSERT_CLIP_WINSOR_TAIL Procedure — Inserts definitions in the table
- Table 46–1 — Describes the structure of the transformation list (TRANSFORM_LIST object)

Assume a clipping definition table populated as follows.

<table>
<thead>
<tr>
<th>col</th>
<th>att</th>
<th>lcut</th>
<th>lval</th>
<th>rcut</th>
<th>rval</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL1</td>
<td>null</td>
<td>-1.5</td>
<td>-1.5</td>
<td>4.5</td>
<td>4.5</td>
</tr>
<tr>
<td>COL2</td>
<td>null</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Assume the following transformation list before stacking.

---------------------------------------------

transformation record #1:
After stacking, the transformation list is as follows.

---
**transformation record #1:**

```
attribute_name = COL1
attribute_subname = null
expression = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
              WHEN log(10, COL1) > 4.5  THEN 4.5
              ELSE log(10, COL1)
              END;
reverse_expression = power(10, COL1)
```

---
**transformation record #2:**

```
attribute_name = COL3
attribute_subname = null
expression = ln(COL3)
reverse_expression = exp(COL3)
```

---
**transformation record #3:**

```
attribute_name = COL2
attribute_subname = null
expression = CASE WHEN COL2 < 0 THEN 0
              WHEN COL2 > 1 THEN 1
              ELSE COL2
              END;
reverse_expression = null
```

### Nested Data Transformations

The `CREATE` routines create transformation definition tables that include two columns, `col` and `att`, for identifying attributes. The column `col` holds the name of a column in the data table. If the data column is not nested, then `att` is null, and the name of the attribute is `col`. If the data column is nested, then `att` holds the name of the nested attribute, and the name of the attribute is `col.att`.

The `INSERT` and `XFORM` routines ignore the `att` column in the definition tables. Neither the `INSERT` nor the `XFORM` routines support nested data.

Only the `STACK` procedures and `SET_TRANSFORM` support nested data. Nested data transformations are always embedded in the model.

Nested columns in Oracle Data Mining can have the following types:

- `DM_NESTED_NUMERICALS`
- `DM_NESTED_CATEGORICALS`
- `DM_NESTED_BINARY_DOUBLES`
Specifying Nested Attributes in a Transformation Record

A transformation record (TRANSFORM_REC) includes two fields, attribute_name and attribute_subname, for identifying the attribute. The field attribute_name holds the name of a column in the data table. If the data column is not nested, then attribute_subname is null, and the name of the attribute is attribute_name. If the data column is nested, then attribute_subname holds the name of the nested attribute, and the name of the attribute is attribute_name.attribute_subname.

Transforming Individual Nested Attributes

You can specify different transformations for different attributes in a nested column, and you can specify a default transformation for all the remaining attributes in the column. To specify a default nested transformation, specify null in the attribute_name field and the name of the nested column in the attribute_subname field as shown in Example 46–2. Note that the keyword VALUE is used to represent the value of a nested attribute in a transformation expression.

Example 46–2  Transforming a Nested Column

The following statement transforms two of the nested attributes in COL_N1. Attribute ATTR1 is transformed with normalization; Attribute ATTR2 is set to null, which causes attribute removal transformation (ATTR2 is not used in training the model). All the remaining attributes in COL_N1 are divided by 10.

```sql
DECLARE
  stk dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(
    stk, 'COL_N1', 'ATTR1', '(VALUE - (-1.5))/20', 'VALUE * 20 + (-1.5)');
  dbms_data_mining_transform.SET_TRANSFORM(
    stk, 'COL_N1', 'ATTR2', NULL, NULL);
  dbms_data_mining_transform.SET_TRANSFORM(
    stk, NULL, 'COL_N1', 'VALUE / 10', 'VALUE * 10');
END;
/
```

The following SQL is generated from this statement.

```sql
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
    "ATTRIBUTE_NAME",
    DECODE("ATTRIBUTE_NAME",
      'ATTR1', ('VALUE' - (-1.5) / 20, 'VALUE' / 10))
  FROM TABLE("COL_N1")
WHERE "ATTRIBUTE_NAME" IS NOT IN ('ATTR2'))
AS DM_NESTED_NUMERICALS)
```

If transformations are not specified for COL_N1.ATTR1 and COL_N1.ATTR2, then the default transformation is used for all the attributes in COL_N1, and the resulting SQL does not include a DECODE.
Since DECODE is limited to 256 arguments, multiple DECODE functions are nested to support an arbitrary number of individual nested attribute specifications.

Adding a Nested Column

You can specify a transformation that adds a nested column to the data, as shown in Example 46–3.

**Example 46–3 Adding a Nested Column to a Transformation List**

```plsql
DECLARE
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(v_xlst, 'YOB_CREDLIM', NULL,
  'dm_nested_numericals(',
    'dm_nested_numerical(',
      'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
    'dm_nested_numerical(',
      'CUST_CREDIT_LIMIT', cust_credit_limit)),
  NULL);
  dbms_data_mining_transform.SET_TRANSFORM(v_xlst, 'CUST_YEAR_OF_BIRTH', NULL, NULL, NULL);

Stacking Nested Transformations

Example 46–4 shows how the STACK_NORM_LIN Procedure would add transformation records for nested column COL_N to a transformation list.

**Refer to:**

- CREATE_NORM_LIN Procedure — Creates the definition table
Using DBMS_DATA_MINING_TRANSFORM

- **INSERT_NORM_LIN_MINMAX Procedure** — Inserts definitions in the table
- **INSERT_NORM_LIN_SCALE Procedure** — Inserts definitions in the table
- **INSERT_NORM_LIN_ZSCORE Procedure** — Inserts definitions in the table
- **Table 46-1** — Describes the structure of the transformation list

**Example 46–4  Stacking a Nested Normalization Transformation**

Assume a linear normalization definition table populated as follows.

<table>
<thead>
<tr>
<th>col</th>
<th>att</th>
<th>shift</th>
<th>scale</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL_N</td>
<td>ATT2</td>
<td>0</td>
<td>20</td>
</tr>
<tr>
<td>null</td>
<td>COL_N</td>
<td>0</td>
<td>10</td>
</tr>
</tbody>
</table>

Assume the following transformation list before stacking.

transformation record #1:

| attribute_name | = COL_N          |
| attribute_subname | = ATT1          |
| expression          | = log(10, VALUE) |
| reverse_expression   | = power(10, VALUE) |

transformation record #2:

| attribute_name | = NULL          |
| attribute_subname | = COL_N        |
| expression          | = ln(VALUE)    |
| reverse_expression   | = exp(VALUE)  |

After stacking, the transformation list is as follows.

transformation record #1:

| attribute_name | = COL_N                  |
| attribute_subname | = ATT1                  |
| expression          | = (log(10, VALUE) - 0)/10 |
| reverse_expression   | = power(10, VALUE *10 + 0) |

transformation record #2:

| attribute_name | = NULL                  |
| attribute_subname | = COL_N               |
| expression          | = (ln(VALUE) - 0)/10    |
| reverse_expression   | = exp(VALUE *10 + 0)     |

transformation record #3:

| attribute_name | = COL_N                  |
| attribute_subname | = ATT2                  |
| expression          | = (ln(VALUE) - 0)/20 |
| reverse_expression   | = exp(VALUE * 20 + 0) |
The DBMS_DATA_MINING_TRANSFORM package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers’ rights (run with the privileges of the current user).

The DBMS_DATA_MINING_TRANSFORM.INSERT_* procedures have a data_table_name parameter that enables the user to provide the input data for transformation purposes. The value of data_table_name can be the name of a physical table or a view. The data_table_name parameter can also accept an inline query.

**Important:** Because an inline query can be used to specify the data for transformation, Oracle strongly recommends that the calling routine perform any necessary SQL injection checks on the input string.

**See Also:** "Operational Notes" on page 46-6 for a description of the DBMS_DATA_MINING_TRANSFORM.INSERT_* procedures
Using DBMS_DATA_MINING_TRANSFORM

Datatypes

DBMS_DATA_MINING_TRANSFORM defines the datatypes described in Table 46–1.

<table>
<thead>
<tr>
<th>List Type</th>
<th>List Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_LIST</td>
<td>VARRAY(1000) OF varchar2(32)</td>
<td>COLUMN_LIST stores quoted and non-quoted identifiers for column names.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>COLUMN_LIST is the datatype of the exclude_list parameter in the INSERT procedures. See &quot;INSERT_AUTOBIN_NUM_EQWIDTH Procedure&quot; on page 46-35 for an example.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>See Oracle Database PL/SQL Language Reference for information about populating VARRAY structures.</td>
</tr>
<tr>
<td>DESCRIPT</td>
<td>DESCRIPT_LIST</td>
<td>DESCRIPT_LIST describes the columns of the data table after the transformation list has been applied. A DESCRIPT_LIST is returned by the DESCRIBE_STACK Procedure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The DESCRIPT and DESCRIPT types are defined in the DBMS_SQL package. See &quot;DESCRIPT Record Type&quot; on page 149-25.</td>
</tr>
<tr>
<td>TRANSFORM</td>
<td>TRANSFORM_LIST</td>
<td>TRANSFORM_LIST is a list of transformations that can be embedded in a model. A TRANSFORM_LIST is accepted as an argument by the CREATE_MODEL Procedure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Each element in a TRANSFORM_LIST is a TRANSFORM_REC that specifies how to transform a single attribute. The attribute_name is a column name. The attribute_subname is the nested attribute name if the column is nested, otherwise attribute_subname is null.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The expression field holds a SQL expression for transforming the attribute. See &quot;About Transformation Lists&quot; on page 46-7 for an explanation of reverse expressions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The attribute_spec field can be used to cause the attribute to be handled in a specific way during the model build. See Table 46–33, &quot;SET_TRANSFORM Procedure Parameters&quot; for details.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2, which is a table of VARCHAR2(32767). The VARCHAR2 datatype allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2 type is defined in the DBMS_SQL package. See &quot;VARCHAR2 Table Type&quot; on page 149-46.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2, which is a table of VARCHAR2(32767). The VARCHAR2 datatype allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2 type is defined in the DBMS_SQL package. See &quot;VARCHAR2 Table Type&quot; on page 149-46.</td>
</tr>
</tbody>
</table>

The expression field holds a SQL expression for transforming the attribute. See "About Transformation Lists" on page 46-7 for an explanation of reverse expressions.

The attribute_spec field can be used to cause the attribute to be handled in a specific way during the model build. See Table 46–33, "SET_TRANSFORM Procedure Parameters" for details.

The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2, which is a table of VARCHAR2(32767). The VARCHAR2 datatype allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2 type is defined in the DBMS_SQL package. See "VARCHAR2 Table Type" on page 149-46.

The ub (upper bound) and lb (lower bound) fields indicate how many rows there are in the VARCHAR2 table. If ub < lb (default) the EXPRESSION_REC is empty; if lb = ub there is one row; if ub = 1 and ub = 2 there are 2 rows, and so on.
**Table 46–2  Constants in DBMS_DATA_MINING_TRANSFORM**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEST_NUM_COL_TYPE</td>
<td>100001</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_NUMERICALS. Nested numerical attributes are defined as follows: attribute_name VARCHAR2(4000) value NUMBER</td>
</tr>
<tr>
<td>NEST_CAT_COL_TYPE</td>
<td>100002</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_CATEGORICALS. Nested categorical attributes are defined as follows: attribute_name VARCHAR2(4000) value VARCHAR2(4000)</td>
</tr>
<tr>
<td>NEST_BD_COL_TYPE</td>
<td>100003</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_BINARY_DOUBLES. Nested binary double attributes are defined as follows: attribute_name VARCHAR2(4000) value BINARY_DOUBLE</td>
</tr>
<tr>
<td>NEST_BF_COL_TYPE</td>
<td>100004</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_BINARY_FLOATS. attribute_name VARCHAR2(4000) value BINARY_FLOAT</td>
</tr>
</tbody>
</table>

</tbody>
</table>
CREATE_BIN_CAT Procedure

This procedure creates a transformation definition table for categorical binning. The columns are described in Table 46–4.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>VARCHAR2(4000)</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (  
    bin_table_name     IN VARCHAR2,  
    bin_schema_name    IN VARCHAR2 DEFAULT NULL );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about categorical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_BIN_CAT_FREQ Procedure — frequency-based binning
   - INSERT_BIN_SUPER Procedure — supervised binning

See Also:

- "Binning" on page 46-4
- "Operational Notes" on page 46-6
The following statement creates a table called `bin_cat_xtbl` in the current schema. The table has columns that can be populated with bin assignments for categorical attributes.

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('bin_cat_xtbl');
END;
/
```

DESCRIBE bin_cat_xtbl

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>VAL</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>BIN</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>
CREATE_BIN_NUM Procedure

This procedure creates a transformation definition table for numerical binning. The columns are described in Table 46–6.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

Syntax

DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (  
  bin_table_name    IN VARCHAR2,  
  bin_schema_name   IN VARCHAR2 DEFAULT NULL );

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_AUTOBIN_NUM_EQWIDTH Procedure — automatic equi-width binning
   - INSERT_BIN_NUM_EQWIDTH Procedure — user-specified equi-width binning
   - INSERT_BIN_NUM_QTILE Procedure — quantile binning
   - INSERT_BIN_SUPER Procedure — supervised binning
See Also:

"Binning" on page 46-4

"Operational Notes" on page 46-6

Examples

The following statement creates a table called `bin_num_xtbl` in the current schema. The table has columns that can be populated with bin assignments for numerical attributes.

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('bin_num_xtbl');
END;
/

DESCRIBE bin_num_xtbl
```

Name          Null?    Type
-------------- -------- -----------------------------
COL            VARCHAR2(30)
ATT            VARCHAR2(4000)
VAL            NUMBER
BIN            VARCHAR2(4000)
CREATE_CLIP Procedure

This procedure creates a transformation definition table for clipping or winsorizing to minimize the effect of outliers. The columns are described in Table 46–8.

Table 46–8  Columns in a Transformation Definition Table for Clipping or Winsorizing

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>lcut</td>
<td>NUMBER</td>
<td>The lowest typical value for the attribute. If the attribute values were plotted on an xy axis, lcut would be the left-most boundary of the range of values considered typical for this attribute. Any values to the left of lcut are outliers.</td>
</tr>
<tr>
<td>lval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the left of lcut.</td>
</tr>
<tr>
<td>rcut</td>
<td>NUMBER</td>
<td>The highest typical value for the attribute. If the attribute values were plotted on an xy axis, rcut would be the right-most boundary of the range of values considered typical for this attribute. Any values to the right of rcut are outliers.</td>
</tr>
<tr>
<td>rval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the right of rcut.</td>
</tr>
</tbody>
</table>

Syntax

DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (clip_table_name IN VARCHAR2, clip_schema_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 46–9  CREATE_CLIP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of clip_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. See “Nested Data Transformations” on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_CLIP_TRIM_TAIL Procedure — replaces outliers with nulls
CREATE_CLIP Procedure

- **INSERT_CLIP_WINSOR_TAIL Procedure** — replaces outliers with an average value

**See Also:**
- "Outlier Treatment" on page 46-5
- "Operational Notes" on page 46-6

**Examples**

The following statement creates a table called `clip_xtbl` in the current schema. The table has columns that can be populated with clipping instructions for numerical attributes.

```sql
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('clip_xtbl');
END;
/
```

```
DESCRIBE clip_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)  
ATT                                                VARCHAR2(4000) 
LCUT                                               NUMBER 
LVAL                                               NUMBER 
RCUT                                               NUMBER 
RVAL                                               NUMBER 
```
CREATE_COL_REM Procedure

This procedure creates a transformation definition table for removing columns from the data table. The columns are described in Table 46–10.

Table 46–10   Columns in a Transformation Definition Table for Column Removal

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is nested (DM_NESTED_NUMERICALS or DM_NESTED_CATEGORICALS). If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (rem_table_name VARCHAR2, rem_schema_name VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–11   CREATE_COL_REM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See "Nested Data Transformations" on page 46-10 for information about transformation definition tables and nested data.

2. See "Operational Notes" on page 46-6.

Examples

The following statement creates a table called rem_att_xtbl in the current schema. The table has columns that can be populated with the names of attributes to exclude from the data to be mined.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('rem_att_xtbl');
END;
/
```

```
DESCRIBE rem_att_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
```
CREATE_MISS_CAT Procedure

This procedure creates a transformation definition table for replacing categorical missing values. The columns are described in Table 46–12.

Table 46–12  Columns in a Transformation Definition Table for Categorical Missing Value Treatment

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_CATEGORICALS. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>VARCHAR2(4000)</td>
<td>Replacement for missing values in the attribute</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
    miss_table_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 46–13  CREATE_MISS_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about categorical data.
2. See “Nested Data Transformations” on page 46-10 for information about transformation definition tables and nested data.
3. You can use the INSERT_MISS_CAT_MODE Procedure to populate the transformation definition table.

See Also:

“Missing Value Treatment” on page 46-5
“Operational Notes” on page 46-6

Examples

The following statement creates a table called miss_cat_xtbl in the current schema. The table has columns that can be populated with values for missing data in categorical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('miss_cat_xtbl');
END;
```
END;
/

DESCRIBE miss_cat_xtbl

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>VAL</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>
CREATE_MISS_NUM Procedure

This procedure creates a transformation definition table for replacing numerical missing values. The columns are described in Table 46–14.

### Table 46–14 Columns in a Transformation Definition Table for Numerical Missing Value Treatment

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the column is not nested, the column name is also the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attribute name. For information about attribute names, see</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Replacement for missing values in the attribute</td>
</tr>
</tbody>
</table>

### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (  
    miss_table_name       IN VARCHAR2,  
    miss_schema_name      IN VARCHAR2 DEFAULT NULL );
```

### Parameters

<table>
<thead>
<tr>
<th>Table 46–15 CREATE_MISS_NUM Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>miss_table_name</td>
</tr>
<tr>
<td>miss_schema_name</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

### Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. See “Nested Data Transformations” on page 46-10 for information about transformation definition tables and nested data.
3. You can use the INSERT_MISS_NUM_MEAN Procedure to populate the transformation definition table.

**See Also:**

- “Missing Value Treatment” on page 46-5
- “Operational Notes” on page 46-6

### Example

The following statement creates a table called miss_num_xtbl in the current schema. The table has columns that can be populated with values for missing data in numerical attributes.

```sql
BEGIN  
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('miss_num_xtbl');
END;
```
END;
/

DESCRIBE miss_num_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                NUMBER
**CREATE_NORM_LIN Procedure**

This procedure creates a transformation definition table for linear normalization. The columns are described in Table 46–16.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>shift</td>
<td>NUMBER</td>
<td>A constant to subtract from the attribute values</td>
</tr>
<tr>
<td>scale</td>
<td>NUMBER</td>
<td>A constant by which to divide the shifted values</td>
</tr>
</tbody>
</table>

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (  
norm_table_name IN VARCHAR2,  
norm_schema_name IN VARCHAR2 DEFAULT NULL );
```

**Parameters**

**Table 46–17** CREATE_NORM_LIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of norm_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. See “Nested Data Transformations” on page 46-10 for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - **INSERT_NORM_LIN_MINMAX Procedure** — Uses linear min-max normalization
   - **INSERT_NORM_LIN_SCALE Procedure** — Uses linear scale normalization
   - **INSERT_NORM_LIN_ZSCORE Procedure** — Uses linear zscore normalization

See Also:

"Linear Normalization” on page 46-4
"Operational Notes” on page 46-6
Examples

The following statement creates a table called norm_xtbl in the current schema. The table has columns that can be populated with shift and scale values for normalizing numerical attributes.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('norm_xtbl');
END;
/
```

```
DESCRIBE norm_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
SHIFT                                              NUMBER
SCALE                                              NUMBER
```
DESCRIBE_STACK Procedure

This procedure describes the columns of the data table after a list of transformations has been applied. Only the columns that are specified in the transformation list are transformed. The remaining columns in the data table are included in the output without changes.

To create a view of the data table after the transformations have been applied, use the XFORM_STACK Procedure.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (  
xform_list           IN  TRANSFORM_LIST,  
data_table_name      IN  VARCHAR2,  
describe_list        OUT DESCRIBE_LIST,  
data_schema_name     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A list of transformations. See Table 46-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>describe_list</td>
<td>Descriptions of the columns in the data table after the transformations specified in xform_list have been applied. See Table 46-1 for a description of the DESCRIBE_LIST object type.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6 for information about transformation lists and embedded transformations.

Examples

This example shows the column name and datatype, the column name length, and the column maximum length for the view dmuser.cust_info after the transformation list has been applied. All the transformations are user-specified. The results of DESCRIBE_STACK do not include one of the columns in the original table, because the SET_TRANSFORM procedure sets that column to NULL.

```sql
CREATE OR REPLACE VIEW cust_info AS  
SELECT a.cust_id, c.country_id, c.cust_year_of_birth,  
CAST(COLLECT(DM_Nested_Numerical(  
    b.prod_name, 1))  
AS DM_Nested_Numericals) custprods  
FROM sh.sales a, sh.products b, sh.customers c  
WHERE a.prod_id = b.prod_id AND  
a.cust_id=c.cust_id and  
a.cust_id between 100001 AND 105000  
GROUP BY a.cust_id, country_id, cust_year_of_birth;

describe cust_info
```
### Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

```
GET_EXPRESSION Function

This function returns a row from a VARCHAR2 array that stores a transformation expression. The array is built by calls to the SET_EXPRESSION Procedure.

The array can be used for specifying SQL expressions that are too long to be used with the SET_TRANSFORM Procedure.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (  
  expression           IN EXPRESSION_REC,  
  chunk_num            IN PLS_INTEGER DEFAULT NULL);  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 46–1 for a description of the EXPRESSION_REC type.</td>
</tr>
<tr>
<td>chunk</td>
<td>A VARCHAR2 chunk (row) to be appended to expression.</td>
</tr>
</tbody>
</table>

Usage Notes

1. Chunk numbering starts with one. For chunks outside of the range, the return value is null. When a chunk number is null the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.

Examples

See the example for the SET_EXPRESSION Procedure.
**INSERT_AUTOBIN_NUM_EQWIDTH Procedure**

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins separately for each column. If you want to use equi-width binning with the same number of bins for each column, use the INSERT_BIN_NUM_EQWIDTH Procedure.

INSERT.AUTOBIN.NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT.AUTOBIN_NUM_EQWIDTH (
    bin_table_name        IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    bin_num               IN PLS_INTEGER DEFAULT 3,
    max_bin_num           IN PLS_INTEGER DEFAULT 100,
    exclude_list          IN COLUMN_LIST DEFAULT NULL,
    round_num             IN PLS_INTEGER DEFAULT 6,
    sample_size           IN PLS_INTEGER DEFAULT 50000,
    bin_schema_name       IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    rem_table_name        IN VARCHAR2 DEFAULT NULL,
    rem_schema_name       IN VARCHAR2 DEFAULT NULL));
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td>VAL NUMBER</td>
</tr>
<tr>
<td></td>
<td>BIN VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_AUTOBIN_NUM_EQWIDTH.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>Minimum number of bins. If bin_num is 0 or NULL, it is ignored. The default value of bin_num is 3.</td>
</tr>
<tr>
<td>max_bin_num</td>
<td>Maximum number of bins. If max_bin_num is 0 or NULL, it is ignored. The default value of max_bin_num is 100.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned.</td>
</tr>
<tr>
<td></td>
<td>The format of exclude_list is: dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln')</td>
</tr>
</tbody>
</table>
### INSERT_AUTOBIN_NUM_EQWIDTH Procedure

#### Table 46–20 (Cont.)  INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>round_num</td>
<td>Specifies how to round the number in the VAL column of the transformation definition table. When round_num is positive, it specifies the most significant digits to retain. When round_num is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example.</td>
</tr>
<tr>
<td>sample_size</td>
<td>Size of the data sample. If sample_size is less than the total number of non-NULL values in the column, then sample_size is used instead of the SQL COUNT function in computing the number of bins. If sample_size is 0 or NULL, it is ignored. See the Usage Notes.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>rem_table_name</td>
<td>Name of a transformation definition table for column removal. The table must have the columns described in &quot;CREATE_COL_REM Procedure&quot; on page 46-25. INSERT_AUTOBIN_NUM_EQWIDTH ignores columns with all nulls or only one unique value. If you specify a value for rem_table_name, these columns are removed from the mining data. If you do not specify a value for rem_table_name, these unbinned columns remain in the data.</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

#### Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.

2. INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins for a column based on the number of non-null values (COUNT), the maximum (MAX), the minimum (MIN), the standard deviation (STDDEV), and the constant C=3.49/0.9:

\[
N = \text{floor}(\text{power}(\text{COUNT}, 1/3) \times (\text{max-min})/(c \times \text{dev}))
\]

If the sample_size parameter is specified, it is used instead of COUNT.

See Oracle Database SQL Language Reference for information about the COUNT, MAX, MIN, STDDEV, FLOOR, and POWER functions.

3. INSERT_AUTOBIN_NUM_EQWIDTH uses absolute values to compute the number of bins. The sign of the parameters bin_num, max_bin_num, and sample_size has no effect on the result.

4. In computing the number of bins, INSERT_AUTOBIN_NUM_EQWIDTH evaluates the following criteria in the following order:

   1. The minimum number of bins (bin_num)
   2. The maximum number of bins (max_bin_num)
   3. The maximum number of bins for integer columns, calculated as the number of distinct values in the range max-min+1.

5. The round_num parameter controls the rounding of column values in the transformation definition table, as follows:
For a value of 308.162:
when round_num =  1       result is 300
when round_num =  2       result is 310
when round_num =  3       result is 308
when round_num =  0       result is 308.162
when round_num = -1       result is 308.16
when round_num = -2       result is 308.2

Examples

In this example, INSERT_AUTOBIN_NUM_EQWIDTH computes the bin boundaries for the
cust_year_of_birth column in sh.customers and inserts the transformations in a
transformation definition table. The STACK_BIN_NUM Procedure creates a
transformation list from the contents of the definition table. The CREATE_MODEL
Procedure embeds the transformation list in a new model called nb_model.

The transformation and reverse transformation expressions embedded in nb_model are
returned by the GET_MODEL_TRANSFORMATIONS Function.

CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_postal_code
    FROM sh.customers;

BEGIN
    dbms_data_mining_transform.CREATE_BIN_NUM(
        bin_table_name   => 'bin_tbl');
    dbms_data_mining_transform.INSERT_AUTOBIN_NUM_EQWIDTH (
        bin_table_name   => 'bin_tbl',
        data_table_name  => 'mining_data',
        bin_num          => 3,
        max_bin_num      => 5,
        exclude_list     => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/

set numwidth 4
column val off
SELECT col, val, bin FROM bin_tbl
ORDER BY val ASC;

**INSERT_BIN_CAT_FREQ Procedure**

This procedure performs categorical binning and inserts the transformation definitions in a transformation definition table. The procedure computes the bin boundaries based on frequency.

INSERT_BIN_CAT_FREQ bins all the CHAR and VARCHAR2 columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (bin_table_name IN VARCHAR2,
data_table_name IN VARCHAR2,
bin_num IN PLS_INTEGER DEFAULT 9,
exclude_list IN COLUMN_LIST DEFAULT NULL,
default_num IN PLS_INTEGER DEFAULT 2,
bin_support IN NUMBER DEFAULT NULL,
bin_schema_name IN VARCHAR2 DEFAULT NULL,
data_schema_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bin_table_name</strong></td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required: COL VARCHAR2(30), VAL VARCHAR2(4000), BIN VARCHAR2(4000). CREATE_BIN_CAT creates an additional column, ATT, which can be used for specifying nested attributes. This column is not used by INSERT_BIN_CAT_FREQ.</td>
</tr>
<tr>
<td><strong>data_table_name</strong></td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td><strong>bin_num</strong></td>
<td>The number of bins to fill using frequency-based binning. The total number of bins will be bin_num+1. The additional bin is the default bin. Classes that are not assigned to a frequency-based bin will be assigned to the default bin. The default binning order is from highest to lowest: the most frequently occurring class is assigned to the first bin, the second most frequently occurring class is assigned to the second bin, and so on. You can reverse the binning order by specifying a negative number for bin_num. The negative sign causes the binning order to be from lowest to highest. If the total number of distinct values (classes) in the column is less than bin_num, then a separate bin will be created for each value and the default bin will be empty. If you specify NULL or 0 for bin_num, no binning is performed. The default value of bin_num is 9.</td>
</tr>
</tbody>
</table>
Usage Notes

1. See Oracle Data Mining User’s Guide for details about categorical data.

2. If values occur with the same frequency, INSERT_BIN_CAT_FREQ assigns them in descending order when binning is from most to least frequent, or in ascending order when binning is from least to most frequent.

Examples

1. In this example, INSERT_BIN_CAT_FREQ computes the bin boundaries for the cust_postal_code and cust_city columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_CAT...
**Procedure** creates a transformation list from the contents of the definition table, and the **CREATE_MODEL Procedure** embeds the transformation list in a new model called nb_model.

The transformation and reverse transformation expressions embedded in nb_model are returned by the **GET_MODEL_TRANSFORMATIONS Function**.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_city
    FROM sh.customers;

DESCRIBE mining_data

</table>
INSERT_BIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_BIN_NUM_EQWIDTH computes a specified number of bins \( (n) \) and assigns \( (\text{max-min})/n \) values to each bin. The number of bins is the same for each column. If you want to use equi-width binning, but you want the number of bins to be calculated on a per-column basis, use the INSERT_AUTOBIN_NUM_EQWIDTH Procedure.

INSERT_BIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (  
    bin_table_name        IN VARCHAR2,  
    data_table_name       IN VARCHAR2,  
    bin_num               IN PLS_INTEGER DEFAULT 10,  
    exclude_list          IN COLUMN_LIST DEFAULT NULL,  
    round_num             IN PLS_INTEGER DEFAULT 6,  
    bin_schema_name       IN VARCHAR2 DEFAULT NULL,  
    data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| bin_table_name | Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:  
  COL   VARCHAR2 (30)  
  VAL   NUMBER  
  BIN   VARCHAR2 (4000)  
  CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_NUM_EQWIDTH. |
| data_table_name | Name of the table containing the data to be transformed                                                                                     |
| bin_num       | Number of bins. No binning occurs if bin_num is 0 or NULL. The default number of bins is 10.                                              |
| exclude_list  | List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned.  
  The format of exclude_list is:  
  dbms_data_mining_transform.COLUMN_LIST('col1', 'col2',  
  ... 'coln')
### Usage Notes

1. See *Oracle Data Mining User’s Guide* for details about numerical data.

2. The `round_num` parameter controls the rounding of column values in the transformation definition table, as follows:

   For a value of 308.162:
   - when `round_num` = 1 result is 300
   - when `round_num` = 2 result is 310
   - when `round_num` = 3 result is 308
   - when `round_num` = 0 result is 308.162
   - when `round_num` = -1 result is 308.16
   - when `round_num` = -2 result is 308.2

3. `INSERT_BIN_NUM_EQWIDTH` ignores columns with all NULL values or only one unique value.

### Examples

In this example, `INSERT_BIN_NUM_EQWIDTH` computes the bin boundaries for the `affinity_card` column in `mining_data_build` and inserts the transformations in a transformation definition table. The `STACK_BIN_NUM` Procedure creates a transformation list from the contents of the definition table. The `CREATE_MODEL Procedure` embeds the transformation list in a new model called `glm_model`.

The transformation and reverse transformation expressions embedded in `glm_model` are returned by the `GET_MODEL_TRANSFORMATIONS Function`.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_income_level, cust_gender, affinity_card
    FROM mining_data_build;

DESCRIBE mining_data
Name               Null?    Type
----------------------- -------- -----------------
CUST_ID              NOT NULL NUMBER
CUST_INCOME_LEVEL      VARCHAR2(30)
CUST_GENDER            VARCHAR2(1)
AFFINITY_CARD          NUMBER(10)

BEGIN

**INSERT_BIN_NUM_QTILE Procedure**

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure calls the SQL `NTILE` function to order the data and divide it equally into the specified number of bins (quantiles).

`INSERT_BIN_NUM_QTILE` bins all the `NUMBER` and `FLOAT` columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (  
    bin_table_name       IN VARCHAR2,  
    data_table_name      IN VARCHAR2,  
    bin_num              IN PLS_INTEGER DEFAULT 10,  
    exclude_list         IN COLUMN_LIST DEFAULT NULL,  
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,  
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bin_table_name</code></td>
<td>Name of the transformation definition table for numerical binning. You can use the <code>CREATE_BIN_NUM</code> Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td><code>COL</code> VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td><code>VAL</code> NUMBER</td>
</tr>
<tr>
<td></td>
<td><code>BIN</code> VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td><code>CREATE_BIN_NUM</code> creates an additional column, <code>ATT</code>, which may be used for specifying nested attributes. This column is not used by <code>INSERT_BIN_NUM_QTILE</code>.</td>
</tr>
<tr>

<td>Number of bins. No binning occurs if <code>bin_num</code> is 0 or NULL. The default number of bins is 10.</td>
</tr>
<tr>
<td><code>exclude_list</code></td>
<td>List of numerical columns to be excluded from the binning process. If you do not specify <code>exclude_list</code>, all numerical columns in the data source are binned. The format of <code>exclude_list</code> is:</td>
</tr>
<tr>
<td></td>
<td><code>COLUMN_LIST('col1','col2',...,'coln')</code></td>
</tr>
<tr>
<td><code>bin_schema_name</code></td>
<td>Schema of <code>bin_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td><code>data_schema_name</code></td>
<td>Schema of <code>data_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

**Usage Notes**

1. See Oracle Data Mining User's Guide for details about numerical data.

2. After dividing the data into quantiles, the `NTILE` function distributes any remainder values one for each quantile, starting with the first. See Oracle Database SQL Language Reference for details.
3. Columns with all NULL values are ignored by INSERT_BIN_NUM_QTILE.

Examples

In this example, INSERT_BIN_NUM_QTILE computes the bin boundaries for the cust_year_of_birth and cust_credit_limit columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in STACK_VIEW. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
    FROM sh.customers;

DESCRIBE mining_data

INSERT_BIN_SUPER Procedure

This procedure performs numerical and categorical binning and inserts the transformation definitions in transformation definition tables. The procedure computes bin boundaries based on intrinsic relationships between predictors and a target.

INSERT_BIN_SUPER uses an intelligent binning technique known as supervised binning. It builds a single-predictor decision tree and derives the bin boundaries from splits within the tree.

INSERT_BIN_SUPER bins all the VARCHAR2, CHAR, NUMBER, and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (  
    num_table_name        IN VARCHAR2,  
    cat_table_name        IN VARCHAR2,  
    data_table_name       IN VARCHAR2,  
    target_column_name    IN VARCHAR2,  
    max_bin_num           IN PLS_INTEGER  DEFAULT 1000,  
    exclude_list          IN COLUMN_LIST  DEFAULT NULL,  
    num_schema_name       IN VARCHAR2     DEFAULT NULL,  
    cat_schema_name       IN VARCHAR2     DEFAULT NULL,  
    data_schema_name      IN VARCHAR2     DEFAULT NULL,  
    rem_table_name        IN VARCHAR2     DEFAULT NULL,  
    rem_schema_name       IN VARCHAR2     DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>

<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Name of a column to be used as the target for the decision tree models</td>
</tr>
</tbody>
</table>
Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical and categorical data.

2. Columns that have no significant splits are not binned. You can remove the unbinned columns from the mining data by specifying a column removal definition table. If you do not specify a column removal definition table, the unbinned columns remain in the mining data.

3. See Oracle Data Mining Concepts to learn more about decision trees in Oracle Data Mining

Examples

In this example, INSERT_BIN_SUPER computes the bin boundaries for predictors of cust_credit_limit and inserts the transformations in transformation definition tables. One predictor is numerical, the other is categorical. (INSERT_BIN_SUPER determines that the cust_postal_code column is not a significant predictor.) STACK procedures create transformation lists from the contents of the definition tables.

The SQL expressions that compute the transformations are shown in the views MINING_DATA_STACK_NUM and MINING_DATA_STACK_CAT. The views are for display purposes only; they cannot be used to embed the transformations in a model.

INSERT_CLIP_TRIM_TAIL Procedure

This procedure replaces numeric outliers with nulls and inserts the transformation definitions in a transformation definition table.

INSERT_CLIP_TRIM_TAIL computes the boundaries of the data based on a specified percentage. It removes the values that fall outside the boundaries (tail values) from the data. If you wish to replace the tail values instead of removing them, use the INSERT_CLIP_WINSOR_TAIL Procedure.

INSERT_CLIP_TRIM_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    tail_frac           IN NUMBER DEFAULT 0.025,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clip_table_name</code></td>
<td>Name of the transformation definition table for numerical clipping. You can use the CREATE_CLIP Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td>CREATE_CLIP creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_CLIP_TRIM_TAIL.</td>
</tr>
<tr>
<td><code>data_table_name</code></td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td><code>tail_frac</code></td>
<td>The percentage of non-null values to be designated as outliers at each end of the data. For example, if <code>tail_frac</code> is .01, then 1% of the data at the low end and 1% of the data at the high end will be treated as outliers.</td>
</tr>
<tr>
<td></td>
<td>If <code>tail_frac</code> is greater than or equal to .5, no clipping occurs.</td>
</tr>
<tr>
<td></td>
<td>The default value of <code>tail_frac</code> is 0.025.</td>
</tr>
<tr>
<td><code>exclude_list</code></td>
<td>List of numerical columns to be excluded from the clipping process. If you do not specify <code>exclude_list</code>, all numerical columns in the data are clipped.</td>
</tr>
<tr>
<td></td>
<td>The format of <code>exclude_list</code> is:</td>
</tr>
<tr>
<td></td>
<td><code>dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln')</code></td>
</tr>
<tr>
<td><code>clip_schema_name</code></td>
<td>Schema of <code>clip_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.

2. The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_TRIM_TAIL and INSERT_CLIP_WINSOR_TAIL. Both procedures compute the boundaries as follows:
   - Count the number of non-null values, \( n \), and sort them in ascending order
   - Calculate the number of outliers, \( t \), as \( n \times \text{tail_frac} \)
   - Define the lower boundary \( lcut \) as the value at position \( 1 + \text{floor}(t) \)
   - Define the upper boundary \( rcut \) as the value at position \( n - \text{floor}(t) \)
     (The SQL \text{FLOOR} function returns the largest integer less than or equal to \( t \).)
   - All values that are \( \leq lcut \) or \( \geq rcut \) are designated as outliers.

   INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.

   INSERT_CLIP_WINSOR_TAIL assigns \( lcut \) to the low outliers and \( rcut \) to the high outliers.

Examples

In this example, INSERT_CLIP_TRIM_TAIL trims 10% of the data in two columns (5% from the high end and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the trimming is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
  FROM sh.customers;
```

```
BEGIN
  dbms_data_mining_transform.CREATE_CLIP(
    clip_table_name => 'clip_tbl');
  dbms_data_mining_transform.INSERT_CLIP_TRIM_TAIL(
    clip_table_name => 'clip_tbl',
    data_table_name => 'mining_data',
    tail_frac => 0.05,
    exclude_list => DBMS_DATA_MINING_TRANSFORM.COLUMN_LIST('cust_id'));
END;
```

INSERT_MISS_CAT_MODE Procedure

This procedure replaces missing categorical values with the value that occurs most frequently in the column (the mode). It inserts the transformation definitions in a transformation definition table.

INSERT_MISS_CAT_MODE replaces missing values in all VARCHAR2 and CHAR columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (  
  miss_table_name    IN VARCHAR2,  
  data_table_name    IN VARCHAR2,  
  exclude_list       IN COLUMN_LIST DEFAULT NULL,  
  miss_schema_name   IN VARCHAR2 DEFAULT NULL,  
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| miss_table_name      | Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The following columns are required:  
  COL VARCHAR2(30)  
  VAL VARCHAR2(4000)  
  CREATE_MISS_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_MISS_CAT_MODE. |
| data_table_name      | Name of the table containing the data to be transformed  
| exclude_list         | List of categorical columns to be excluded from missing value treatment. If you do not specify exclude_list, all categorical columns are transformed.  
  The format of exclude_list is:  
  dbms_data_mining_transform.COLUMN_LIST('col1','col2',  
  ...'coln')                                                                          |
| miss_schema_name     | Schema of miss_table_name. If no schema is specified, the current schema is used.                                                            |
| data_schema_name     | Schema of data_table_name. If no schema is specified, the current schema is used.                                                            |

Usage Notes

1. See Oracle Data Mining User’s Guide for details about categorical data.
2. If you wish to replace categorical missing values with a value other than the mode, you can edit the transformation definition table.

See Also: Oracle Data Mining User’s Guide for information about default missing value treatment in Oracle Data Mining
Example

In this example, `INSERT_MISS_CAT_MODE` computes missing value treatment for `cust_city` and inserts the transformation in a transformation definition table. The `STACK_MISS_CAT Procedure` creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_city
    FROM sh.customers;

describe mining_data
Name                  Null?    Type
---------------------- -------- ------------
CUST_ID               NOT NULL   NUMBER
CUST_YEAR_OF_BIRTH    NOT NULL   NUMBER(4)
CUST_CITY             NOT NULL   VARCHAR2(30)

BEGIN
    dbms_data_mining_transform.create_miss_cat(
        miss_table_name   => 'missc_tbl');
    dbms_data_mining_transform.insert_miss_cat_mode(  
        miss_table_name   => 'missc_tbl',
        data_table_name   => 'mining_data');
END;
/

SELECT stats_mode(cust_city) FROM mining_data;
STATS_MODE(CUST_CITY)
----------------------------------
Los Angeles

SELECT col, val
from missc_tbl;
COL                  VAL
------------------- ------------------
CUST_CITY            Los Angeles

DECLARE
    xforms      dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_MISS_CAT (  
        miss_table_name    => 'missc_tbl',
        xform_list        => xforms);
    dbms_data_mining_transform.XFORM_STACK (  
        xform_list         => xforms,
        data_table_name    => 'mining_data',
        xform_view_name    => 'mining_data_stack');
END;
/

set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';
TEXT
```
SELECT "CUST_ID","CUST_YEAR_OF_BIRTH",NVL("CUST_CITY",'Los Angeles') "CUST_CITY" FROM mining_data
INSERT_MISS_NUM_MEAN Procedure

This procedure replaces missing numerical values with the average (the mean) and inserts the transformation definitions in a transformation definition table.

INSERT_MISS_NUM_MEAN replaces missing values in all NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (  
  miss_table_name    IN VARCHAR2,  
  data_table_name    IN VARCHAR2,  
  exclude_list       IN COLUMN_LIST DEFAULT NULL,  
  round_num          IN PLS_INTEGER DEFAULT 6,  
  miss_schema_name   IN VARCHAR2 DEFAULT NULL,  
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from missing value treatment. If you do not specify exclude_list, all numerical columns are transformed.</td>
</tr>
<tr>
<td>round_num</td>
<td>The number of significant digits to use for the mean. The default number is 6.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. If you wish to replace numerical missing values with a value other than the mean, you can edit the transformation definition table.
Example

In this example, `INSERT_MISS_NUM_MEAN` computes missing value treatment for `cust_year_of_birth` and inserts the transformation in a transformation definition table. The `STACK_MISS_NUM Procedure` creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

**INSERT_NORM_LIN_MINMAX Procedure**

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_MINMAX computes the minimum and maximum values from the data and sets the value of `shift` and `scale` as follows:

\[
\text{shift} = \min \\
\text{scale} = \max - \min
\]

Normalization is computed as:

\[
x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}}
\]

INSERT_NORM_LIN_MINMAX rounds the value of `scale` to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_MINMAX normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
    norm_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

Usage Notes

See Oracle Data Mining User’s Guide for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_MINMAX normalizes the cust_year_of_birth column and inserts the transformation in a transformation definition table. The STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_gender, cust_year_of_birth
    FROM sh.customers;

describe mining_data
Name                                 Null?    Type
------------------------------------ -------- ----------------
CUST_ID                              NOT NULL NUMBER
CUST_GENDER                          NOT NULL CHAR(1)
CUST_YEAR_OF_BIRTH                   NOT NULL NUMBER(4)
BEGIN
    dbms_data_mining_transform.CREATE_NORM_LIN(
        norm_table_name  => 'norm_tbl');
    dbms_data_mining_transform.INSERT_NORM_LIN_MINMAX(
        norm_table_name  => 'norm_tbl',
        data_table_name  => 'mining_data',
        exclude_list     => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
        round_num        => 3);
END;
/

SELECT col, shift, scale FROM norm_tbl;

<table>

<td>77</td>
</tr>
</tbody>
</table>

DECLARE
    xforms      dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_NORM_LIN(
        norm_table_name => 'norm_tbl',
        xform_list      => xforms);
    dbms_data_mining_transform.XFORM_STACK(
        xform_list      => xforms,
        data_table_name => 'mining_data',
        xform_view_name => 'mining_data_stack');
END;
set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

SELECT 'CUST_ID','CUST_GENDER',('CUST_YEAR_OF_BIRTH'-1910)/77 'CUST_YEAR_OF_BIRTH' FROM mining_data
INSERT_NORM_LIN_SCALE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_SCALE computes the minimum and maximum values from the data and sets the value of shift and scale as follows:

\[
\begin{align*}
    \text{shift} &= 0 \\
    \text{scale} &= \max(\text{abs}(\text{max}), \text{abs}(\text{min}))
\end{align*}
\]

Normalization is computed as:

\[
x_{\text{new}} = \frac{x_{\text{old}}}{\text{scale}}
\]

INSERT_NORM_LIN_SCALE rounds the value of scale to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_SCALE normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (  
norm_table_name     IN VARCHAR2,  
data_table_name     IN VARCHAR2,  
exclude_list        IN COLUMN_LIST DEFAULT NULL,  
round_num           IN PLS_INTEGER DEFAULT 6,  
norm_schema_name    IN VARCHAR2 DEFAULT NULL,  
data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Usage Notes

See Oracle Data Mining User’s Guide for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_SCALE normalizes the cust_year_of_birth column and inserts the transformation in a transformation definition table. The STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_gender, cust_year_of_birth
    FROM sh.customers;

DESCRIBE mining_data
Name                               Null?    Type
---------------------------------- -------- ------------------
CUST_ID                            NOT NULL NUMBER
CUST_GENDER                        NOT NULL CHAR(1)
CUST_YEAR_OF_BIRTH                 NOT NULL NUMBER(4)
BEGIN
    dbms_data_mining_transform.CREATE_NORM_LIN(
        norm_table_name  => 'norm_tbl');
    dbms_data_mining_transform.INSERT_NORM_LIN_SCALE(
        norm_table_name  => 'norm_tbl',
        data_table_name  => 'mining_data',
        exclude_list     => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
        round_num        => 3);
END;
/

SELECT col, shift, scale FROM norm_tbl;

COL                  SHIFT SCALE
-------------------- ----- -----  
CUST_YEAR_OF_BIRTH       0  1990

DECLARE
    xforms      dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_NORM_LIN ( 
        norm_table_name    => 'norm_tbl',
        xform_list        => xforms);
    dbms_data_mining_transform.XFORM_STACK ( 
        xform_list         => xforms,
        data_table_name    => 'mining_data',
        xform_view_name    => 'mining_data_stack');
END;
```
set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT

" FROM mining_data
INSERT_NORM_LIN_ZSCORE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table. INSERT_NORM_LIN_ZSCORE computes the mean and the standard deviation from the data and sets the value of *shift* and *scale* as follows:

\[
\begin{align*}
shift &= \text{mean} \\
scale &= \text{stddev}
\end{align*}
\]

Normalization is computed as:

\[
x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}}
\]

INSERT_NORM_LIN_ZSCORE rounds the value of *scale* to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_ZSCORE normalizes all the NUMBER and FLOAT columns in the data unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name IN VARCHAR2,
    data_table_name IN VARCHAR2,
    exclude_list    IN COLUMN_LIST DEFAULT NULL,
    round_num       IN PLS_INTEGER DEFAULT 6,
    norm_schema_name IN VARCHAR2 DEFAULT NULL,
    data_schema_name IN VARCHAR2 DEFAULT NULL);
```

TEXT
--------------------------------------------------------------------------------
SELECT 'CUST_ID','CUST_GENDER',('CUST_YEAR_OF_BIRTH'-1960)/15 'CUST_YEAR_OF_BIRTH' FROM mining_data
SET_EXPRESSION Procedure

This procedure appends a row to a VARCHAR2 array that stores a SQL expression. The array can be used for specifying a transformation expression that is too long to be used with the SET_TRANSFORM Procedure.

The GET_EXPRESSION Function returns a row in the array.

When you use SET_EXPRESSION to build a transformation expression, you must build a corresponding reverse transformation expression, create a transformation record, and add the transformation record to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
    expression IN OUT NOCOPY EXPRESSION_REC,
    chunk VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 46–32 SET_EXPRESSION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 46–1 for a description of the EXPRESSION_REC type.</td>
</tr>
<tr>
<td>chunk</td>
<td>A VARCHAR2 chunk (row) to be appended to expression.</td>
</tr>
</tbody>
</table>

Notes

1. You can pass NULL in the chunk argument to SET_EXPRESSION to clear the previous chunk. The default value of chunk is NULL.

Examples

In this example, two calls to SET_EXPRESSION construct a transformation expression and two calls construct the reverse transformation.

**Note:** This example is for illustration purposes only. It shows how SET_EXPRESSION appends the text provided in chunk to the text that already exists in expression. The SET_EXPRESSION procedure is meant for constructing very long transformation expressions that cannot be specified in a VARCHAR2 argument to SET_TRANSFORM.

Similarly while transformation lists are intended for embedding in a model, the transformation list `v_xlst` is shown in an external view for illustration purposes.
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_credit_limit
    FROM sh.customers;

DECLARE
    v_expr dbms_data_mining_transform.EXPRESSION_REC;
    v_rexp dbms_data_mining_transform.EXPRESSION_REC;
    v_xrec dbms_data_mining_transform.TRANSFORM_REC;
    v_xlst dbms_data_mining_transform.TRANSFORM_LIST :=
        dbms_data_mining_transform.TRANSFORM_LIST(NULL);
BEGIN
    dbms_data_mining_transform.SET_EXPRESSION(
        EXPRESSION => v_expr,
        CHUNK      => '("CUST_YEAR_OF_BIRTH"-1910)');
    dbms_data_mining_transform.SET_EXPRESSION(
        EXPRESSION => v_expr,
        CHUNK      => '/77');
    dbms_data_mining_transform.SET_EXPRESSION(
        EXPRESSION => v_rexp,
        CHUNK      => ""CUST_YEAR_OF_BIRTH"*77");
    dbms_data_mining_transform.SET_EXPRESSION(
        EXPRESSION => v_rexp,
        CHUNK      => '+1910');
    v_xrec := null;
    v_xrec.attribute_name := 'CUST_YEAR_OF_BIRTH';
    v_xrec.expression := v_expr;
    v_xrec.reverse_expression := v_rexp;
    v_xlst.TRIM;
    v_xlst.extend(1);
    v_xlst(1) := v_xrec;
    dbms_data_mining_transform.XFORM_STACK(
        xform_list           =>  v_xlst,
        data_table_name      => 'mining_data',
        xform_view_name      => 'v_xlst_view');
    dbms_output.put_line('====
    FOR i IN 1..v_xlst.count LOOP
        dbms_output.put_line('ATTR: '||v_xlst(i).attribute_name);
        dbms_output.put_line('SUBN: '||v_xlst(i).attribute_subname);
        FOR j IN v_xlst(i).expression.lb..v_xlst(i).expression.ub LOOP
            dbms_output.put_line('EXPR: '||v_xlst(i).expression.lstmt(j));
        END LOOP;
        FOR j IN v_xlst(i).reverse_expression.lb..
            v_xlst(i).reverse_expression.ub LOOP
            dbms_output.put_line('REXP: '||v_xlst(i).reverse_expression.lstmt(j));
        END LOOP;
        dbms_output.put_line('====');
    END LOOP;
END;
SET_TRANSFORM Procedure

This procedure appends the transformation instructions for an attribute to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (    xform_list               IN OUT NOCOPY TRANSFORM_LIST,    attribute_name           VARCHAR2,    attribute_subname        VARCHAR2,    expression               VARCHAR2,    reverse_expression       VARCHAR2,    attribute_spec           VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be transformed</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
<tr>
<td>expression</td>
<td>A SQL expression that specifies the transformation of the attribute.</td>
</tr>
<tr>
<td>reverse_expression</td>
<td>A SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)</td>
</tr>
<tr>
<td>attribute_spec</td>
<td>One or more keywords that identify special treatment for the attribute during model build. Values are:</td>
</tr>
</tbody>
</table>

- **NOPREP** — When ADP is on, prevents automatic transformation of the attribute. If ADP is not on, this value has no effect.
- **TEXT** — Causes the attribute to be treated as unstructured text data
- **FORCE_IN** — Forces the inclusion of the attribute in the model build. Applies only to GLM models with feature selection enabled (`ftr_selection_enable = yes`). Feature selection is disabled by default.

If the model is not using GLM with feature selection, this value has no effect.

See "Specifying Transformation Instructions for an Attribute" in Oracle Data Mining User’s Guide for more information about attribute_spec.

Usage Notes

1. See "Operational Notes" on page 46-6. The following sections are especially relevant:
   - "About Transformation Lists" on page 46-7
   - "Nested Data Transformations" on page 46-10
2. As shown in the following example, you can eliminate an attribute by specifying a null transformation expression and reverse expression. You can also use the STACK interface to remove a column (CREATE_COL_REM Procedure and STACK_COL_REM Procedure).

Examples

This example uses SET_TRANSFORM to append transformations to cust_stack for the data set cust_info and displays one row of the transformed data.

SET_TRANSFORM divides the country_id column by 10, removes the cust_year_of_birth column, and multiplies the nested attribute custprods.mouse pad by 10. (See "DESCRIBE_STACK Procedure" on page 46-32 for the definition of cust_info.)

```
describe cust_info
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
CUST_ID                                   NOT NULL NUMBER
COUNTRY_ID                                NOT NULL NUMBER
CUST_YEAR_OF_BIRTH                        NOT NULL NUMBER(4)
CUSTPRODS                                          SYS.DM_NESTED_NUMERICALS

DECLARE
cust_stack   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
   'country_id', NULL, 'country_id/10', 'country_id*10');
dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
   'cust_year_of_birth', NULL, NULL, NULL);
dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
   'custprods', 'Mouse Pad', 'value*100', 'value/100');
dbms_data_mining_transform.XFORM_STACK (cust_stack,
   'cust_info', 'xform_cust_view');
END;
/
select * from xform_cust_view where cust_id = 100004;
```

CUST_ID  COUNTRY_ID  CUSTPRODS(ATTRIBUTE_NAME, VALUE)
-------  ----------  ----------------------------------------------
100004         5279  DM_NESTED_NUMERICALS(DM_NESTED_NUMERICAL
   ('External 8X CD-ROM', 1),
   DM_NESTED_NUMERICAL('Keyboard Wrist Rest', 1))
STACK_BIN_CAT Procedure

This procedure adds categorical binning transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (  
  bin_table_name     IN            VARCHAR2,  
  xform_list         IN OUT NOCOPY TRANSFORM_LIST,  
  literal_flag       IN            BOOLEAN  DEFAULT FALSE,  
  bin_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 46–4, “Columns in a Transformation Definition Table for Categorical Binning”</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 46-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See “INSERT_BIN_NUM_EQWIDTH Procedure” on page 46-44 for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how a binning transformation for the categorical column cust_postal_code could be added to a stack called mining_data_stack.
CREATE or REPLACE VIEW mining_data AS
SELECT cust_id, cust_postal_code, cust_credit_limit
FROM sh.customers
WHERE cust_id BETWEEN 100050 AND 100100;
BEGIN
    dbms_data_mining_transform.CREATE_BIN_CAT ('bin_cat_tbl');
    dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (
        bin_table_name => 'bin_cat_tbl',
        data_table_name => 'mining_data',
        bin_num =>  3);
END;
/
DECLARE
    MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_BIN_CAT (
        bin_table_name       => 'bin_cat_tbl',
        xform_list           =>  mining_data_stack);
    dbms_data_mining_transform.XFORM_STACK (
        xform_list           =>  mining_data_stack,
        data_table_name      => 'mining_data',
        xform_view_name      => 'mining_data_stack_view');
END;
/
-- Before transformation
column cust_postal_code format a16
SELECT * from mining_data
WHERE cust_id BETWEEN 100050 AND 100053
ORDER BY cust_id;

CUST_ID CUST_POSTAL_CODE CUST_CREDIT_LIMIT
---------- ---------------- -----------------
100050 76486                         1500
100051 73216                         9000
100052 69499                         5000
100053 45704                         7000

-- After transformation
SELECT * FROM mining_data_stack_view
WHERE cust_id BETWEEN 100050 AND 100053
ORDER BY cust_id;

CUST_ID CUST_POSTAL_CODE CUST_CREDIT_LIMIT
---------- ---------------- -----------------
100050 4                             1500
100051 1                             9000
100052 4                             5000
100053 4                             7000

Note: This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
STACK_BIN_NUM Procedure

This procedure adds numerical binning transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (  
    bin_table_name     IN             VARCHAR2,  
    xform_list         IN OUT  NOCOPY TRANSFORM_LIST,  
    literal_flag       IN             BOOLEAN  DEFAULT FALSE,  
    bin_schema_name    IN             VARCHAR2 DEFAULT NULL);
```

Parameters

The following sections are especially relevant:
- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how a binning transformation for the numerical column `cust_credit_limit` could be added to a stack called `mining_data_stack`.

Table 46–35 STACK_BIN_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_NUM. To populate the table, you can use one of the INSERT procedures for numerical binning or you can write your own SQL. See Table 46–6, &quot;Columns in a Transformation Definition Table for Numerical Binning&quot;.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the <code>bin</code> column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; on page 46-44 for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of <code>bin_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
**Note:** This example invokes the `XFORM_STACK` Procedure to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See `INSERT_BIN_NUM_EQWIDTH` Procedure for an example.
| Stack Bin Num | 100055 | 74673 | 3 |
STACK_CLIP Procedure

This procedure adds clipping transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
    clip_table_name     IN            VARCHAR2,
    xform_list          IN OUT NOCOPY TRANSFORM_LIST,
    clip_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table for clipping. You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_CLIP. To populate the table, you can use one of the INSERT procedures for clipping or you can write your own SQL. See Table 46–8, &quot;Columns in a Transformation Definition Table for Clipping or Winsorizing&quot;</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of clip_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how a clipping transformation for the numerical column cust_credit_limit could be added to a stack called mining_data_stack.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_postal_code, cust_credit_limit
    FROM sh.customers
    WHERE cust_id BETWEEN 100050 AND 100100;
```

Note: This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
BEGIN
    dbms_data_mining_transform.create_clip ('clip_tbl');
    dbms_data_mining_transform.insert_clip_winsor_tail {
        clip_table_name => 'clip_tbl',
        data_table_name => 'mining_data',
        tail_frac       => 0.25,
        exclude_list    => dbms_data_mining_transform.COLUMN_LIST('cust_id');
    }
END;
/

100053   45704             7000
100054   88021            11000
STACK_COL_REM Procedure

This procedure adds column removal transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (  
    rem_table_name     IN            VARCHAR2,
    xform_list         IN OUT NOCOPY TRANSFORM_LIST,
    rem_schema_name    IN            VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 46–10, &quot;Columns in a Transformation Definition Table for Column Removal&quot;. The table must be populated with column names before you call STACK_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example shows how the column cust_credit_limit could be removed in a transformation list called mining_data_stack.

```sql
CREATE OR REPLACE VIEW mining_data AS 
    SELECT cust_id, country_id, cust_postal_code, cust_credit_limit 
    FROM sh.customers;
```

Note: This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
BEGIN
    dbms_data_mining_transform.create_col_rem ('rem_tbl');
END;
/

INSERT into rem_tbl VALUES (upper('cust_postal_code'), null);

DECLARE
    MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.stack_col_rem (
        rem_table_name     => 'rem_tbl',
        xform_list         => mining_data_stack);
    dbms_data_mining_transform.xform_stack (
        xform_list         => mining_data_stack,
        data_table_name    => 'mining_data',
        xform_view_name    => 'mining_data_stack_view');
END;
/

</table>
STACK_MISS_CAT Procedure

This procedure adds categorical missing value transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
    miss_table_name     IN       VARCHAR2,
    xform_list          IN OUT   NOCOPY TRANSFORM_LIST,
    miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 46–12, &quot;Columns in a Transformation Definition Table for Categorical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 46–1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

XFORM_BIN_CAT Procedure

This procedure creates a view that implements the categorical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
    bin_table_name       IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    xform_view_name      IN VARCHAR2,
    literal_flag         IN BOOLEAN DEFAULT FALSE,
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 46-4, &quot;Columns in a Transformation Definition Table for Categorical Binning&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in bin_table_name.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; on page 46-44 for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6.
Examples

This example creates a view that bins the `cust_postal_code` column. The data source consists of three columns from `sh.customer`.

```
describe mining_data

XFORM_CLIP Procedure

This procedure creates a view that implements the clipping transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
  clip_table_name       IN VARCHAR2,
  data_table_name       IN VARCHAR2,
  xform_view_name       IN VARCHAR2,
  clip_schema_name      IN VARCHAR2 DEFAULT NULL,
  data_schema_name      IN VARCHAR2 DEFAULT NULL,
  xform_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table for clipping. You can use the CREATE_CLIP Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_CLIP. To populate the table, you can use one of the INSERT procedures for clipping you can write your own SQL. See Table 46–8, &quot;Columns in a Transformation Definition Table for Clipping or Winsorizing&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in clip_table_name.</td>

XFORM_COL_REM Procedure

This procedure creates a view that implements the column removal transformations specified in a definition table. Only the columns that are specified in the definition table are removed; the remaining columns from the data table are present in the view.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
    rem_table_name     IN       VARCHAR2,
    data_table_name    IN       VARCHAR2,
    xform_view_name    IN       VARCHAR2,
    rem_schema_name    IN       VARCHAR2 DEFAULT NULL,
    data_schema_name   IN       VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table for column removal. You can use the CREATE_COL_REM Procedure to create the definition table. See Table 46–10, “Columns in a Transformation Definition Table for Column Removal”. The table must be populated with column names before you call XFORM_COL_REM. The INSERT_BIN_SUPER Procedure and the INSERT_AUTOBIN_NUM_EQWIDTH Procedure can optionally be used to populate the table. You can also use SQL INSERT statements.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents the columns in data_table_name that are not specified in rem_table_name.</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes” on page 46-6.

Examples

This example creates a view that includes all but one column from the table customers in the current schema.

describe customers
Name Null? Type
---------------------------------------- --------- ----------------------------
CUST_ID NOT NULL NUMBER
CUST_MARITAL_STATUS VARCHAR2(20)
OCCUPATION VARCHAR2(21)
AGE NUMBER
YRS_RESIDENCE NUMBER

BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('colrem_xtbl');
END;
/
INSERT INTO colrem_xtbl VALUES('CUST_MARITAL_STATUS', null);

BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
       rem_table_name        => 'colrem_xtbl',
       data_table_name       => 'customers',
       xform_view_name       => 'colrem_view');
END;
/
describe colrem_view

<table>
<thead>
<tr>

<td>VARCHAR2(21)</td>
</tr>
<tr>
<td>AGE</td>
<td></td>
<td>NUMBER</td>
</tr>
<tr>
<td>YRS_RESIDENCE</td>
<td></td>
<td>NUMBER</td>
</tr>
</tbody>
</table>
XFORM_EXPR_NUM Procedure

This procedure creates a view that implements the specified numeric transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
    expr_pattern       IN       VARCHAR2,
    data_table_name    IN       VARCHAR2,
    xform_view_name    IN       VARCHAR2,
    exclude_list       IN       COLUMN_LIST DEFAULT NULL,
    include_list       IN       COLUMN_LIST DEFAULT NULL,
    col_pattern        IN       VARCHAR2 DEFAULT ':col',
    data_schema_name   IN       VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr_pattern</td>
<td>A numeric transformation expression</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>expr_pattern</code> and <code>col_pattern</code>.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to exclude. If NULL, no numerical columns are excluded. The format of <code>exclude_list</code> is: <code>DBMS_DATA_MINING_TRANSFORM.COLUMN_LIST('col1','col2','...','coln')</code></td>
</tr>
<tr>
<td>include_list</td>
<td>List of numeric columns to include. If NULL, all numeric columns are included. The format of <code>include_list</code> is: <code>DBMS_DATA_MINING_TRANSFORM.COLUMN_LIST('col1','col2','...','coln')</code></td>
</tr>
<tr>
<td>col_pattern</td>
<td>The value within <code>expr_pattern</code> that will be replaced with a column name. The value of <code>col_pattern</code> is case-sensitive. The default value of <code>col_pattern</code> is <code>':col'</code></td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of <code>data_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of <code>xform_view_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. The XFORM_EXPR_NUM procedure constructs numeric transformation expressions from the specified expression pattern (`expr_pattern`) by replacing every occurrence of the specified column pattern (`col_pattern`) with an actual column name.
XFORM_EXPR_NUM uses the SQL REPLACE function to construct the transformation expressions.

```
REPLACE (expr_pattern, col_pattern, '"column_name"') || '"column_name"
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

**See:** Oracle Database SQL Language Reference for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM_EXPR_NUM and XFORM_EXPR_STR procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.

3. See "Operational Notes" on page 46-6

### Examples

This example creates a view that transforms the datatype of numeric columns.

```
describe customers
Name                  Null?    Type
----------------------------------- -------- ------------------------
CUST_ID               NOT NULL NUMBER

OCCUPATION                                   VARCHAR2(21)
AGE                                          NUMBER
YRS_RESIDENCE                                NUMBER

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM(
    expr_pattern         => 'to_char(:col)',
    data_table_name      => 'customers',
    xform_view_name      => 'cust_nonum_view',
    exclude_list         => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
    include_list         => null,
    col_pattern          => ':col');
END;
/

describe cust_nonum_view
Name                  Null?    Type
----------------------------------- -------- ------------------------
CUST_ID               NOT NULL NUMBER
CUST_MARITAL_STATUS                           VARCHAR2(20)
OCCUPATION                                   VARCHAR2(21)
AGE                                          VARCHAR2(40)
YRS_RESIDENCE                                VARCHAR2(40)
```
XFORM_EXPR_STR Procedure

This procedure creates a view that implements the specified categorical transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (  
expr_pattern       IN       VARCHAR2,  
data_table_name    IN       VARCHAR2,  
xform_view_name    IN       VARCHAR2,  
exclude_list       IN       COLUMN_LIST DEFAULT NULL,  
include_list       IN       COLUMN_LIST DEFAULT NULL,  
col_pattern        IN       VARCHAR2 DEFAULT ':col',  
data_schema_name   IN       VARCHAR2 DEFAULT NULL,  
xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr_pattern</td>
<td>A character transformation expression</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in expr_pattern and col_pattern.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of categorical columns to exclude. If NULL, no categorical columns are excluded. The format of exclude_list is:</td>
</tr>
<tr>
<td></td>
<td>dbms_data_mining_transform.COLUMN_LIST('col1','col2',</td>
</tr>
<tr>
<td></td>
<td>...'coln')</td>
</tr>
<tr>
<td>include_list</td>
<td>List of character columns to include. If NULL, all character columns are included. The format of include_list is:</td>
</tr>
<tr>
<td></td>
<td>dbms_data_mining_transform.COLUMN_LIST('col1','col2',</td>
</tr>
<tr>
<td></td>
<td>...'coln')</td>
</tr>
<tr>
<td>col_pattern</td>
<td>The value within expr_pattern that will be replaced with a column name. The value of col_pattern is case-sensitive. The default value of col_pattern is ':col'</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. The XFORM_EXPR_STR procedure constructs character transformation expressions from the specified expression pattern (expr_pattern) by replacing every
occurrence of the specified column pattern (col_pattern) with an actual column name.

XFORM_EXPR_STR uses the SQL REPLACE function to construct the transformation expressions.

```
REPLACE (expr_pattern, col_pattern, '"column_name"') || '"column_name"
```

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

See: Oracle Database SQL Language Reference for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM_EXPR_STR and XFORM_EXPR_NUM procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.

3. See "Operational Notes" on page 46-6

Examples

This example creates a view that transforms character columns to upper case.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR(
    expr_pattern            => 'upper(:col)',
    data_table_name         => 'customers',
    xform_view_name         => 'cust_upcase_view');
END;
/
```

```
describe cust_upcase_view
Name                          Null?    Type
----------------------------- -------- -------------------
CUST_ID                       NOT NULL NUMBER
CUST_MARITAL_STATUS           ---------------------
OCCUPATION                    ---------------------
AGE                           ---------------------
YRS_RESIDENCE                 ---------------------
```

```sql
SELECT cust_id, cust_marital_status, occupation FROM customers
WHERE cust_id > 102995
ORDER BY cust_id desc;
```

```
CUST_ID CUST_MARITAL_STATUS  OCCUPATION
------- -------------------- ---------------------
103000 Divorc.              Cleric.
102999 Married              Cleric.
102998 Married              Exec.
102997 Married              Exec.
102996 NeverM               Other
```

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR(
    expr_pattern            => 'upper(:col)',
    data_table_name         => 'customers',
    xform_view_name         => 'cust_upcase_view');
END;
/
```

```
describe cust_upcase_view
Name                          Null?    Type
----------------------------- -------- -------------------
CUST_ID                       NOT NULL NUMBER
```

XFORM_MISS_CAT Procedure

This procedure creates a view that implements the categorical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 46–12, &quot;Columns in a Transformation Definition Table for Categorical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that replaces missing categorical values with the mode.

```sql
SELECT * FROM geog;
```

XFORM_MISS_NUM Procedure

This procedure creates a view that implements the numerical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (  
    miss_table_name IN VARCHAR2,  
    data_table_name IN VARCHAR2,  
    xform_view_name IN VARCHAR2,  
    miss_schema_name IN VARCHAR2 DEFAULT NULL,  
    data_schema_name IN VARCHAR2 DEFAULT NULL,  
    xform_schema_name IN VARCHAR2 DEFAULT NULL;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_NUM. To populate the table, you can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL. See Table 46–14, &quot;Columns in a Transformation Definition Table for Numerical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that replaces missing numerical values with the mean.

```sql
SELECT * FROM items;
```

<table>
<thead>
<tr>
<th>ITEM_ID</th>
<th>QTY</th>
</tr>
</thead>
<tbody>
<tr>
<td>aa</td>
<td>200</td>
</tr>
<tr>
<td>bb</td>
<td>200</td>
</tr>
<tr>
<td>cc</td>
<td>250</td>
</tr>
<tr>
<td>dd</td>
<td></td>
</tr>
</tbody>
</table>
SELECT AVG(qty) FROM items;

AVG(QTY)
--------
   200

BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('missnum_xtbl');
   DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
      miss_table_name => 'missnum_xtbl',
      data_table_name => 'items');
END;
/

SELECT col, val FROM missnum_xtbl;

COL   VAL
------ -----
QTY    200

BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM {
      miss_table_name => 'missnum_xtbl',
      data_table_name => 'items',
      xform_view_name => 'items_view'};
END;
/

SELECT * FROM items_view;

ITEM_ID  QTY
-------- -----
  aa     200
  bb     200
  cc     250
  dd     200
  ee     200
  ff     100
  gg     250
  hh     200
  ii     200
  jj     200
XFORM_NORM_LIN Procedure

This procedure creates a view that implements the linear normalization transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    xform_view_name      IN VARCHAR2,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_NORM_LIN. To populate the table, you can use one of the INSERT procedures for normalization or you can write your own SQL. See Table 46–12, &quot;Columns in a Transformation Definition Table for Categorical Missing Value Treatment&quot;.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6.

Examples

This example creates a view that normalizes the cust_year_of_birth and cust_credit_limit columns. The data source consists of three columns from sh.customer.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_credit_limit
    FROM sh.customers;

describe mining_data
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------------</td>
<td>-------</td>
<td>--------------------</td>
</tr>
</tbody>
</table>

```
XFORM_STACK Procedure

This procedure creates a view that implements the transformations specified by the stack. Only the columns and nested attributes that are specified in the stack are transformed. Any remaining columns and nested attributes from the data table appear in the view without changes.

To create a list of objects that describe the transformed columns, use the DESCRIBE_STACK Procedure.

See Also:

"Overview" on page 46-3

Oracle Data Mining User’s Guide for more information about data mining attributes

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (
  xform_list         IN     TRANSFORM_list,
  data_table_name    IN     VARCHAR2,
  xform_view_name    IN     VARCHAR2,
  data_schema_name   IN     VARCHAR2 DEFAULT NULL,
  xform_schema_name  IN     VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>The transformation list. See Table 46-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view applies the transformations in xform_list to data_table_name.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" on page 46-6. The following sections are especially relevant:

- "About Transformation Lists" on page 46-7
- "About Stacking" on page 46-9
- "Nested Data Transformations" on page 46-10

Examples

This example applies a transformation list to the view dmuser.cust_info and shows how the data is transformed. The CREATE statement for cust_info is shown in "DESCRIBE_STACK Procedure" on page 46-32.

The `DBMS_DATAPUMP` package is used to move all, or part of, a database between databases, including both data and metadata.

**See Also:** *Oracle Database Utilities* for more information on the concepts behind the `DBMS_DATAPUMP` API, how it works, and how it is implemented in the Data Pump Export and Import utilities.

This chapter contains the following topics:

- **Using DBMS_DATAPUMP**
  - Overview
  - Security Model
  - Constants
- **Data Structures**
  - Data Structures - Object Types
- **Summary of DBMS_DATAPUMP Subprograms**
Using DBMS_DATAPUMP

This section contains topics that relate to using the DBMS_DATAPUMP package.

- Overview
- Security Model
- Constants
Overview

The support and functionality provided by DBMS_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, time zones, and versions.
- All object types and datatypes existing in Oracle Database 11g and higher are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, data file names, tablespace names, and data can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.
Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The DATAPUMP_EXP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE roles allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

DATAPUMP_EXP_FULL_DATABASE

The DATAPUMP_EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the DATAPUMP_EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_EXP_FULL_DATABASE role will also grant access to the SYS schema.

DATAPUMP_IMP_FULL_DATABASE

The DATAPUMP_IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the DATAPUMP_IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_IMP_FULL_DATABASE role will also grant access to the SYS schema.
Constants

There are several public constants defined for use with the `DBMS_DATAPUMP.GET_STATUS` procedure. All such constants are defined as part of the `DBMS_DATAPUMP` package. Any references to these constants must be prefixed by `DBMS_DATAPUMP.` and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_STATUS_WIP` CONSTANT BINARY_INTEGER := 1;
- `KU$_STATUS_JOB_DESC` CONSTANT BINARY_INTEGER := 2;
- `KU$_STATUS_JOB_STATUS` CONSTANT BINARY_INTEGER := 4;
- `KU$_STATUS_JOB_ERROR` CONSTANT BINARY_INTEGER := 8;

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_DUMPFILE_TYPE_DISK` CONSTANT BINARY_INTEGER := 0;
- `KU$_DUMPFILE_TYPE_TEMPLATE` CONSTANT BINARY_INTEGER := 3;
The `DBMS_DATAPUMP` package defines `OBJECT` types. The types described in this section are defined in the `SYS` schema for use by the `GET_STATUS` function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the `GET_STATUS` procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 12c, Release 1 (12.1), there is a `sys.ku$Status1210` type, and in the next Oracle Database release, there could be a `sys.ku$Status1310` type defined. Both types could be used with the `GET_STATUS` procedure.

Public synonyms have been defined for each of the types used with the `GET_STATUS` procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym `ku$Status1210` is defined for the `sys.ku$Status1210` type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 12c, Release 1 (12.1), the generic synonym `ku$Status` is defined as `ku$Status1210`. In a future release, there might be a `ku$Status1310` synonym for `sys.ku$Status1310`. Because the `ku$Status` generic synonym always points to the latest definition, it would then point to `ku$Status1310` rather than to `ku$Status1210`.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

---

**Note:** Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

---

**See Also:** `GET_STATUS Procedure` on page 47-30 for additional information about how types are used
Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The percent_done refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```sql
CREATE TYPE sys.ku$WorkerStatus1010 AS OBJECT
{
    worker_number NUMBER, -- Worker process identifier
    process_name VARCHAR2(30), -- Worker process name
    state VARCHAR2(30), -- Worker process state
    schema VARCHAR2(30), -- Schema name
    name VARCHAR2(4000), -- Object name
    object_type VARCHAR2(200), -- Object type
    partition VARCHAR2(30), -- Partition name
    completed_objects NUMBER, -- Completed number of objects
    total_objects NUMBER, -- Total number of objects
    completed_rows NUMBER, -- Number of rows completed
    completed_bytes NUMBER, -- Number of bytes completed
    percent_done NUMBER, -- Percent done current object
    degree NUMBER -- Degree of parallelism
}
CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1010
FOR sys.ku$WorkerStatus1010;

CREATE TYPE sys.ku$WorkerStatus1020 AS OBJECT
{
    worker_number NUMBER, -- Worker process identifier
    process_name VARCHAR2(30), -- Worker process name
    state VARCHAR2(30), -- Worker process state
    schema VARCHAR2(30), -- Schema name
    name VARCHAR2(4000), -- Object name
    object_type VARCHAR2(200), -- Object type
    partition VARCHAR2(30), -- Partition name
    completed_objects NUMBER, -- Completed number of objects
    total_objects NUMBER, -- Total number of objects
    completed_rows NUMBER, -- Number of rows completed
    completed_bytes NUMBER, -- Number of bytes completed
    percent_done NUMBER, -- Percent done current object
    degree NUMBER -- Degree of parallelism
}
```
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1020
FOR sys.ku$_WorkerStatus1020;

CREATE TYPE sys.ku$_WorkerStatus1120 AS OBJECT
{

  instance_id NUMBER, -- Instance ID where running
  instance_name VARCHAR2(60), -- Instance Name where running
  host_name VARCHAR2(64) -- Host name where running
}

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1210
FOR sys.ku$_WorkerStatus1210;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus FOR ku$_WorkerStatus1210;

CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010
CREATE TYPE sys.ku$_WorkerStatusList1020 AS TABLE OF sys.ku$_WorkerStatus1020
CREATE TYPE sys.ku$_WorkerStatusList1120 AS TABLE OF sys.ku$_WorkerStatus1120
CREATE TYPE sys.ku$_WorkerStatusList1210 AS TABLE OF sys.ku$_WorkerStatus1210

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1010
FOR sys.ku$_WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1020
FOR sys.ku$_WorkerStatusList1020;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1120
FOR sys.ku$_WorkerStatusList1120;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1210
FOR sys.ku$_WorkerStatusList1210;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
FOR ku$_WorkerStatusList1210;

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The ku$LogLine.errorNumber type is set to NULL for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
    logLineNumber   NUMBER,
    errorNumber     NUMBER,
    LogText         VARCHAR2(2000))
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (percent_done applies to data only):

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT

    job_name        VARCHAR2(30),           -- Name of the job
    operation       VARCHAR2(30),           -- Current operation
    job_mode        VARCHAR2(30),           -- Current mode
    bytes_processed NUMBER,                 -- Bytes so far
    total_bytes     NUMBER,                 -- Total bytes for job
    percent_done    NUMBER,                 -- Percent done
    degree          NUMBER,                 -- Of job parallelism
    error_count     NUMBER,                 -- #errors so far
    state           VARCHAR2(30),           -- Current job state
    phase           NUMBER,                 -- Job phase
    restart_count   NUMBER,                 -- #Job restarts
    worker_status_list ku$_WorkerStatusList1010, -- For (non-idle) job worker processes
                      files ku$_DumpFileSet1010 -- Dump file info

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1010 FOR sys.ku$_JobStatus1010;
CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT

}

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1210 FOR sys.ku$_JobStatus1210;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1210;
Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```sql
CREATE TYPE sys.ku$_JobDesc1010 IS OBJECT
{
    job_name        VARCHAR2(30), -- The job name
    guid            RAW(16),     -- The job GUID
    operation       VARCHAR2(30), -- Current operation
    job_mode        VARCHAR2(30), -- Current mode
    remote_link     VARCHAR2(4000), -- DB link, if any
    owner           VARCHAR2(30), -- Job owner
    instance        VARCHAR2(16), -- The instance name
    db_version      VARCHAR2(30), -- Version of objects
    creator_privs   VARCHAR2(30), -- Privs of job
    start_time      DATE,         -- This job start time
    max_degree      NUMBER,       -- Max. parallelism
    log_file        VARCHAR2(4000), -- Log file name
    sql_file        VARCHAR2(4000), -- SQL file name
    params          ku$_ParamValues1010 -- Parameter list
}
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT
{
    job_name        VARCHAR2(30), -- The job name
    guid            RAW(16),     -- The job GUID
    operation       VARCHAR2(30), -- Current operation
    job_mode        VARCHAR2(30), -- Current mode
    remote_link     VARCHAR2(4000), -- DB link, if any
    owner           VARCHAR2(30), -- Job owner
    platform        VARCHAR2(101), -- Current job platform
    exp_platform    VARCHAR2(101), -- Export platform
    global_name     VARCHAR2(4000), -- Current global name
    exp_global_name VARCHAR2(4000), -- Export global name
    instance        VARCHAR2(16), -- The instance name
    db_version      VARCHAR2(30), -- Version of objects
    exp_db_version  VARCHAR2(30), -- Export version
    scn             NUMBER,       -- Job SCN
    creator_privs   VARCHAR2(30), -- Privs of job

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1210 FOR sys.ku$_JobDesc1210;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1210;

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the GET_STATUS call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the ku$_LogEntry that is returned has already had its log lines ordered for proper output. That is, the original ku$_LogEntry objects have been ordered from outermost context to innermost.

The status types are defined as follows:

CREATE TYPE sys.ku$_Status1010 IS OBJECT
{
    mask NUMBER, -- Status types present
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010, -- Work in progress
job_description ku$_JobDesc1010, -- Complete job description
job_status ku$_JobStatus1010, -- Detailed job status
error ku$_LogEntry1010 -- Multi-level context errors

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1020 FOR sys.ku$_Status1020;
CREATE TYPE sys.ku$_Status1020 IS OBJECT
{
mask NUMBER, -- Status types present

ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```sql
DBMS_DATAPUMP.ADD_FILE (    handle     IN NUMBER,    filename   IN VARCHAR2,    directory  IN VARCHAR2,    filesize   IN VARCHAR2 DEFAULT NULL,    filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE,    reusefile  IN NUMBER DEFAULT NULL);```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable, %U, which indicates that multiple files may be generated with the specified filename as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as % to avoid ambiguity. Any % in a filename must be followed by either a % or a U.</td>
</tr>
<tr>
<td>directory</td>
<td>The name of a directory object within the database that is used to locate filename. A directory must be specified. See the Data Pump Export chapter in Oracle Database Utilities for information about the DIRECTORY command-line parameter.</td>
</tr>
<tr>
<td>filesize</td>
<td>The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M), number of gigabytes (if followed by G) or number of terabytes (if followed by T). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. A filesize can only be specified for dump files.</td>
</tr>
<tr>
<td>filetype</td>
<td>The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP.:</td>
</tr>
<tr>
<td></td>
<td>- KU$_FILE_TYPE_DUMP_FILE (dump file for a job)</td>
</tr>
<tr>
<td></td>
<td>- KU$_FILE_TYPE_LOG_FILE (log file for a job)</td>
</tr>
<tr>
<td></td>
<td>- KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)</td>
</tr>
</tbody>
</table>
Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** An invalid value was supplied for an input parameter.
- **INVALID_STATE.** The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- **INVALID_OPERATION.** A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and SQL_FILE operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation and reusefile is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the SET_PARALLEL procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (%U) is included in a filename, multiple dump files may be specified through a single call to ADD_FILE. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current SET_PARALLEL value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple ADD_FILEs with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if expa%U, expb%U and expc%U were all specified for a job having a parallelism of 6, the initial dump files created would look like: expa01, expb01, expc01, expa02, expb02, and expc02.
If presented with dump file specifications, expa%U, expb%U, and expc%U, an Import or SQL_FILE operation will begin by attempting to open the dump files, expa01, expb01, and expc01. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, expa02, expb02, and expc02). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.
ATTACH Function

This function gains access to a previously-created job.

Syntax

```sql
DBMS_DATAPUMP.ATTACH(
    job_name    IN VARCHAR2 DEFAULT NULL,
    job_owner   IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).</td>
</tr>
<tr>
<td>job_owner</td>
<td>The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the DATAPUMP_EXP_FULL_DATABASE role (for export operations) or the DATAPUMP_IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.</td>
</tr>
</tbody>
</table>

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.
If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.
DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```sql
DBMS_DATAPUMP.DATA_FILTER (  
    handle      IN NUMBER,  
    name        IN VARCHAR2,  
    value       IN NUMBER,  
    table_name  IN VARCHAR2 DEFAULT NULL,  
    schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle that is returned from the OPEN function</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_ARGVAL.** There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is TRANSPORTABLE, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of schema_name and table_name
- **INVALID_STATE.** The user called DATA_FILTER when the job was not in the Defining state.
- **INCONSISTENT_ARGS.** The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- **PRIVILEGE_ERROR.** A schema name was supplied, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the **INCLUDE_ROWS** filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in Table 47–5.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Operations that Support Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCLUDE_ROWS</td>
<td>NUMBER</td>
<td>EXPORT, IMPORT</td>
<td>If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.</td>
</tr>
<tr>
<td>PARTITION_EXPR</td>
<td>TEXT</td>
<td>EXPORT, IMPORT</td>
<td>For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for PARTITION_EXPR) or are included in the list (for PARTITION_LIST). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. PARTITION_EXPR is not supported on jobs across a network link. Default=All partitions are processed</td>
</tr>
<tr>
<td>PARTITION_LIST</td>
<td></td>
<td></td>
<td>For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.</td>
</tr>
<tr>
<td>Name</td>
<td>Datatype</td>
<td>Operations that Support Filter</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>----------</td>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SUBQUERY</td>
<td>TEXT</td>
<td>EXPORT, IMPORT</td>
<td>Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.</td>
</tr>
</tbody>
</table>
DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```sql
DBMS_DATAPUMP.DATA_REMAP(
    handle          IN NUMBER,
    name            IN VARCHAR2,
    table_name      IN VARCHAR2,
    column          IN VARCHAR2,
    remap_function  IN VARCHAR2,
    schema          IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the current job. The current session must have previously attached to the handle through a call to an OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the remap</td>
</tr>
<tr>
<td>table_name</td>
<td>The table containing the column to be remapped</td>
</tr>
<tr>
<td>column</td>
<td>The name of the column to be remapped</td>
</tr>
<tr>
<td>remap_function</td>
<td>The meaning of remap_function is dependent upon the value of name. See Table 47–7 for a list of possible names.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_ARGVAL. The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- INVALID_OPERATION. Data remaps are only supported for Export and Import operations.
- INVALID_STATE. The DATA_REMAP procedure was called after the job started (that is, it was not in the defining state).
- NO_SUCH_JOB. The job handle is no longer valid.

Usage Notes

- The DATA_REMAP procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is
consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

Note: If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET_PARALLEL value of 1 and no restart operations should be performed.

The Data Remap functions are listed in Table 47–7.

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning of remap_function</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_FUNCTION</td>
<td>String having the format: [schema.]package.function</td>
<td>The name parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.</td>
</tr>
</tbody>
</table>
DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH(
    handle  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the job. The current session must have previously attached to the handle through a call to either an OPEN or ATTACH function.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.
GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```sql
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
    filename    IN VARCHAR2,
    directory   IN VARCHAR2,
    info_table  OUT ku$dumpfile_info,
    filetype    OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>A simple filename with no directory path information</td>
</tr>
<tr>
<td>directory</td>
<td>A directory object that specifies where the file can be found</td>
</tr>
<tr>
<td>info_table</td>
<td>A PL/SQL table for storing information about the dump file</td>
</tr>
<tr>
<td>filetype</td>
<td>The type of file (Data Pump dump file, original Export dump file, external tables dump file, or unknown)</td>
</tr>
</tbody>
</table>

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of 0 (zero) is returned and the dump file info_table remains empty.

A filetype value of 1 indicates a Data Pump dump file. A filetype value of 2 indicates an original Export dump file. A filetype value of 3 indicates an external tables dump file. In all cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```sql
CREATE TYPE sys.ku$dumpfile_item IS OBJECT (
    item_code NUMBER, -- Identifies header item
    value VARCHAR2(2048) -- Text string value)
);

GRANT EXECUTE ON sys.ku$dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$dumpfile_item FOR sys.ku$dumpfile_item;
CREATE TYPE sys.ku$dumpfile_info AS TABLE OF sys.ku$dumpfile_item;
```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;

The item codes, which can easily be extended to provide more information as needed, are currently defined as shown in Table 47–10 (prepended with the package name, DBMS_DATAPUMP). Assume the following with regard to these item codes:

- Unless otherwise stated, all item codes may be returned only for Oracle Data Pump and external tables dump files (filetypes 1 and 3).
- Unless otherwise stated, all item codes have been available since Oracle Database 10g Release 2 (10.2).

<table>
<thead>
<tr>
<th>Item Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KU$_DFHDR_FILE_VERSION</td>
<td>The internal file version of the dump file.</td>
</tr>
<tr>
<td>KU$_DFHDR_MASTER_PRESENT</td>
<td>If the Data Pump master table is present in the dump file, then the value for this item code is 1; otherwise the value is 0. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KU$_DFHDR_GUID</td>
<td>A unique identifier assigned to the Data Pump export job or the external tables unload job that produced the dump file. For a multifile dump set, each file in the set has the same value for this item code.</td>
</tr>
<tr>
<td>KU$_DFHDR_FILE_NUMBER</td>
<td>A numeric identifier assigned to the dump file. Each dump file in a multifile dump set has its own identifier, unique only within the dump set.</td>
</tr>
<tr>
<td>KU$_DFHDR_CHARSET_ID</td>
<td>A numeric code that represents the character set in use at the source system when the dump file was created. Returned for all filetypes.</td>
</tr>
<tr>
<td>KU$_DFHDR_CREATION_DATE</td>
<td>The date and time that the dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_FLAGS</td>
<td>Internal flag values.</td>
</tr>
<tr>
<td>KU$_DFHDR_JOB_NAME</td>
<td>The name assigned to the export job that created the dump file. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KU$_DFHDR_PLATFORM</td>
<td>The operating system name of the source system on which the dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_INSTANCE</td>
<td>The instance name of the source system on which the dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_LANGUAGE</td>
<td>The language name that corresponds to the character set of the source system where the export dump file was created.</td>
</tr>
<tr>
<td>KU$_DFHDR_BLOCKSIZE</td>
<td>The blocksize, in bytes, of the dump file.</td>
</tr>
<tr>
<td>KU$_DFHDR_DIRPATH</td>
<td>If direct path mode was used when the dump file was created, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 2.</td>
</tr>
<tr>
<td>KU$_DFHDR_METADATA_COMPRESSED</td>
<td>If the system metadata is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KU$_DFHDR_DB_VERSION</td>
<td>The database job version used to create the dump file. Returned for all filetypes.</td>
</tr>
</tbody>
</table>

</table>
GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```plsql
DBMS_DATAPUMP.GET_STATUS(
    handle  IN NUMBER,
    mask    IN BINARY_INTEGER,
    timeout IN NUMBER DEFAULT NULL,
    job_state OUT VARCHAR2,
    status  OUT ku$_Status);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. A null handle can be used to retrieve error information after OPEN and ATTACH failures.</td>
</tr>
</tbody>
</table>
| mask      | A bit mask that indicates which of four types of information to return:  
  - KU$_STATUS_WIP  
  - KU$_STATUS_JOB_DESC  
  - KU$_STATUS_JOB_STATUS  
  - KU$_STATUS_JOB_ERROR  
  Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 47-7. |
| timeout   | Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over. |
| job_state | Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status structure. |
| status    | A ku$_Status is returned. The ku$_Status mask indicates what kind of information is included. This could be none if only KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and the timeout period expires. |

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.
Usage Notes

The GET_STATUS procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The KUS_STATUS_JOB_DESC and KUS_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KUS_STATUS_WIP and KUS_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information only is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a maximum of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the job_state returned by GET_STATUS does not indicate a terminating job, it is possible that the job could still terminate before the next call to GET_STATUS. This would result in an INVALID_HANDLE exception. Alternatively, the job could terminate during the call to GET_STATUS, which would result in a NO_SUCH_JOB exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the GET_STATUS procedure:

- Errors resulting from other procedure calls: For example, the SET_PARAMETER procedure may produce an INCONSISTENT_ARGS exception. The client should immediately call GET_STATUS with mask=8 (errors) and timeout=0. The returned KUS_Status.error will contain a KUS_LogEntry that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The KUS_Status.error will contain a KUS_LogEntry with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to GET_STATUS with an infinite timeout (-1) “listening” for KUS_STATUS_WIP and KUS_STATUS_JOB_ERROR messages. If status was requested, then JOB_STATUS information will also be in the request.

When the KUS_Status is interpreted, the following guidelines should be used:

- KUS_Status.kus_JobStatus.percent_done refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - EXPORT or network IMPORT--(bytes_processed/estimated_bytes) * 100
  - IMPORT--(bytes_processed/total_expected_bytes) * 100
  - SQL_FILE or estimate-only EXPORT--0.00 if not done or 100.00 if done

The effects of the QUERY and PARTITION_EXPR data filters are not considered in computing percent_done.
It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

\[((\text{SYSDATE} - \text{start time}) / \text{ku}_\text{Status}.\text{ku}_\text{JobStatus}.\text{percent\_done}) \times 100\]

- The caller should not use \text{ku}_\text{Status}.\text{ku}_\text{JobStatus}.\text{percent\_done} for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in \text{job\_state}. 
LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```sql
DBMS_DATAPUMP.LOG_ENTRY(
    handle         IN NUMBER,
    message        IN VARCHAR2
    log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>message</td>
<td>A text line to be added to the log file</td>
</tr>
<tr>
<td>log_file_only</td>
<td>Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.</td>
</tr>
</tbody>
</table>

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

The message is added to the log file. If `log_file_only` is zero (the default), the message is also broadcast as a `KU$_STATUS_WIP` message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string, ";;".
METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```sql
DBMS_DATAPUMP.METADATA_FILTER(
  handle       IN NUMBER,
  name         IN VARCHAR2,
  value        IN VARCHAR2,
  object_path  IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_FILTER(
  handle       IN NUMBER,
  name         IN VARCHAR2,
  value        IN CLOB,
  object_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from the <strong>OPEN</strong> function</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter. See <strong>Table 47–14</strong> for descriptions of the available filters.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter</td>
</tr>
<tr>
<td>object_path</td>
<td>The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for <strong>DATABASE_EXPORT_OBJECTS</strong>, <strong>SCHEMA_EXPORT_OBJECTS</strong>, and <strong>TABLE_EXPORT_OBJECTS</strong>. (Note that the <strong>TABLE_EXPORT_OBJECTS</strong> view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.</td>
</tr>
</tbody>
</table>

**Table 47–14** describes the name, the object type, and the meaning of the filters available with the **METADATA_FILTER** procedure. The datatype for all the filters is a text expression. All operations support all filters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_EXPR</td>
<td>Named objects</td>
<td>Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.</td>
</tr>
</tbody>
</table>
Summary of DBMS_DATAPUMP Subprograms

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
  - The specified object_path is not supported for the current mode.
  - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- **INVALID_STATE.** The user called the METADATA_FILTER procedure after the job left the defining state.
- **INCONSISTENT_ARGS.** The filter value is of the wrong datatype or is missing.
- **SUCCESS_WITH_INFO.** The procedure succeeded but further information is available through the GET_STATUS procedure.

### Table 47–14 (Cont.) Filters Provided by METADATA_FILTER Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA_EXPR</td>
<td>Schema objects</td>
<td>Restricts the job to objects whose owning schema name is satisfied by the expression.</td>
</tr>
<tr>
<td>SCHEMA_LIST</td>
<td></td>
<td>For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (''SCOTT'')').</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For Schema mode, identifies which users are to be processed.</td>
</tr>
<tr>
<td>TABLESPACE_EXPR</td>
<td>TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT</td>
<td>Restricts the job to objects stored in a tablespace whose name is satisfied by the expression.</td>
</tr>
<tr>
<td>TABLESPACE_LIST</td>
<td>TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT</td>
<td>For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.</td>
</tr>
<tr>
<td>INCLUDE_PATHEXPR</td>
<td>All</td>
<td>Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_<em>) or excluded (EXCLUDE_PATH_</em>) from the operation. The object_path parameter is not supported for these filters.</td>
</tr>
<tr>
<td>INCLUDE_PATHLIST</td>
<td>TABLE_EXPORT</td>
<td>Specifies that no tables are to be exported.</td>
</tr>
<tr>
<td>EXCLUDE_PATHEXPR</td>
<td>TABLE_EXPORT</td>
<td>A comma-separated list of views to be exported as tables: [schema_name.]view_name[:table_name]</td>
</tr>
<tr>
<td>EXCLUDE_PATHLIST</td>
<td></td>
<td>The filter can be called multiple times with multiple values and all values get added to a list. All views on the list are exported as tables.</td>
</tr>
</tbody>
</table>

The filter value is of the wrong datatype or is missing.  

**SUCCESS_WITH_INFO.** The procedure succeeded but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

### Usage Notes
- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for `EXCLUDE_PATH_EXPR` and `INCLUDE_PATH_EXPR`, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter, grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.

- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:
  - `NAME_EXPR`
  - `SCHEMA_EXPR`
  - `TABLESPACE_EXPR`
  - `INCLUDE_PATH_EXPR`
  - `EXCLUDE_PATH_EXPR`

The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:
  - `NAME_LIST`
  - `SCHEMA_LIST`
  - `TABLESPACE_LIST`
  - `INCLUDE_PATH_LIST`
  - `EXCLUDE_PATH_LIST`

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.

- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).

- The same filter name can be specified multiple times within a job. For example, specifying `NAME_EXPR` as `!='EMP'` and `NAME_EXPR` as `!='DEPT'` on a Table mode export would produce a file set containing all of the tables except for EMP and DEPT.
METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```sql
DBMS_DATAPUMP.METADATA_REMAP (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    old_value   IN VARCHAR2,
    value       IN VARCHAR2,
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the remap. See Table 47–16 for descriptions of the available remaps.</td>
</tr>
<tr>
<td>old_value</td>
<td>Specifies which value in the dump file set should be reset to value</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the remap. This signifies the new value that old_value should be translated into.</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.</td>
</tr>
</tbody>
</table>

Table 47–16 describes the remaps provided by the METADATA_REMAP procedure.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMAP_SCHEMA</td>
<td>TEXT</td>
<td>Schema objects</td>
<td>Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE’s objects to SCOTT, but SCOTT cannot remap SCOTT’s objects to BLAKE.</td>
</tr>
</tbody>
</table>
**Exceptions**

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This message can indicate any of the following:
  - The job’s mode does not include the specified `object_type`.
  - The remap has already been specified for the specified `old_value` and `object_type`.
- **INVALID_OPERATION.** Remaps are only supported for SQL_FILE and Import operations. The job’s operation was Export, which does not support the use of metadata remaps.
- **INVALID_STATE.** The user called `METADATA_REMAP` after the job had started (that is, the job was not in the defining state).
- **INCONSISTENT_ARGS.** There was no value supplied or it was of the wrong datatype for the remap.
- **PRIVILEGE_ERROR.** A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user’s schema or a `REMAP_DATAFILE`.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- The `METADATA_REMAP` procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.
Transforms for the DataPump API are a subset of the remaps implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according its parameters. That is, two remaps cannot specify conflicting or redundant remaps.
METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```sql
DBMS_DATAPUMP.METADATA_TRANSFORM(
    handle IN NUMBER,
    name IN VARCHAR2,
    value IN VARCHAR2,
    object_type IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_DATAPUMP.METADATA_TRANSFORM(
    handle IN NUMBER,
    name IN VARCHAR2,
    value IN NUMBER,
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the transformation. See Table 47–18 for descriptions of the available transforms.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the transform</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_</td>
</tr>
<tr>
<td></td>
<td>EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views.</td>
</tr>
<tr>
<td></td>
<td>By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different</td>
</tr>
<tr>
<td></td>
<td>transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to</td>
</tr>
<tr>
<td></td>
<td>all object types.</td>
</tr>
</tbody>
</table>

Table 47–18 describes the transforms provided by the METADATA_TRANSFORM procedure.
<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE_ARCHIVE_LOGGING</td>
<td>NUMBER</td>
<td>TABLE INDEX</td>
<td>Specifies whether to disable archive logging for specified object types during import. A value of zero (FALSE) is the default. It specifies that archive logging will take place. This is the default behavior if this transform parameter is not specified. A non-zero (TRUE) value disables archive logging for the specified object types before data is loaded during import. If no object type is specified, then archive logging is disabled for both TABLE and INDEX object types. All other object types processed during data pump import are logged. <strong>Note</strong>: If the database is in FORCE LOGGING mode, then the DISABLE_ARCHIVE_LOGGING transform does not disable logging when indexes and tables are created.</td>
</tr>
<tr>
<td>INMEMORY NUMBER TABLE</td>
<td>NUMBER</td>
<td>TABLE TABLESPACE MATERIALIZED VIEWS</td>
<td>The INMEMORY transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format. If a non-zero value (TRUE) is specified on import, then Data Pump generates an IM clause that preserves the IM setting those objects had at export time. This is the default. If a value of zero (FALSE) is specified on import, then Data Pump does not include an IM clause for any objects. <strong>Note</strong>: The INMEMORY transform is available only in Oracle Database 12c Release 1 (12.1.0.2) or higher.</td>
</tr>
<tr>
<td>INMEMORY_CLAUSE TEXT TABLE TABLESPACE MATERIALIZED VIEWS</td>
<td>TEXT</td>
<td>TABLE</td>
<td>The INMEMORY_CLAUSE transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format. When you specify this transform, Data Pump uses the contents of the string as the IM clause for all objects being imported that have an IM clause in their DDL. This transform is useful when you want to override the IM clause for an object in the dump file. <strong>Note</strong>: The INMEMORY_CLAUSE transform is available only in Oracle Database 12c Release (12.1.0.2) or higher.</td>
</tr>
<tr>
<td>Name</td>
<td>Datatype</td>
<td>Object Type</td>
<td>Meaning</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>LOB_STORAGE</td>
<td>TEXT</td>
<td>TABLE</td>
<td>Specifies the storage type to use for LOB segments. The options are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- SECUREFILE - LOB storage is returned as SECUREFILE</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- BASICFILE - LOB storage is returned as BASICFILE</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- DEFAULT - The keyword (SECUREFILE or BASICFILE) is omitted in the <code>LOB STORE AS</code> clause.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- NO_CHANGE - LOB segments are created with the same storage they had in the source database. This is the default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Specifying this transform changes the LOB storage for all tables in the job, including tables that provide storage for materialized views.</td>
</tr>
<tr>
<td>OID</td>
<td>NUMBER</td>
<td>TABLE</td>
<td>If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Use of this transform on Object Tables will cause breakage in REF columns that point to the table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Defaults to 1.</td>
</tr>
<tr>
<td>PCTSPACE</td>
<td>NUMBER</td>
<td>TABLE, INDEX</td>
<td>Specifies a percentage multiplier used to alter extent allocations and data file sizes. Used to shrink large tablespaces for testing purposes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>TABLESPACE</td>
<td>Defaults to 100.</td>
</tr>
<tr>
<td>SEGMENT_ATTRIBUTES</td>
<td>NUMBER</td>
<td>TABLE, INDEX</td>
<td>If nonzero (TRUE), emit storage segment parameters.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Defaults to 1.</td>
</tr>
<tr>
<td>SEGMENT_CREATION</td>
<td>NUMBER</td>
<td>TABLE</td>
<td>If nonzero (TRUE), the SQL <code>SEGMENT</code> <code>CREATION</code> clause is added to the <code>CREATE TABLE</code> statement. That is, the <code>CREATE TABLE</code> statement will explicitly say either <code>SEGMENT CREATION DEFERRED</code> or <code>SEGMENT CREATION IMMEDIATE</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If the value is FALSE, then the <code>SEGMENT</code> <code>CREATION</code> clause is omitted from the <code>CREATE TABLE</code> statement. Set this parameter to FALSE to use the default segment creation attributes for the table(s) being loaded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Defaults to nonzero (TRUE).</td>
</tr>
<tr>
<td>STORAGE</td>
<td>NUMBER</td>
<td>TABLE</td>
<td>If nonzero (TRUE), emit storage clause. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is zero.)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Defaults to nonzero (TRUE).</td>
</tr>
</tbody>
</table>
Summary of DBMS_DATAPUMP Subprograms

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- **INVALID_OPERATION.** Transforms are only supported for SQL_FILE and Import operations. The job’s operation was Export which does not support the use of metadata transforms.
- **INVALID_STATE.** The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- **INCONSISTENT_ARGS.** There was no value supplied or it was of the wrong datatype for the transform.
- **PRIVILEGE_ERROR.** A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.

  Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique.

</table>
according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.
OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures (but not to the ATTACH function).

Syntax

```
DBMS_DATAPUMP.OPEN (  
  operation IN VARCHAR2,  
  job_mode IN VARCHAR2,  
  remote_link IN VARCHAR2 DEFAULT NULL,  
  job_name IN VARCHAR2 DEFAULT NULL,  
  version IN VARCHAR2 DEFAULT 'COMPATIBLE')  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>The type of operation to be performed. Table 47–20 contains descriptions of valid operation types.</td>
</tr>
<tr>
<td>job_mode</td>
<td>The scope of the operation to be performed. Table 47–21 contains descriptions of valid modes. Specifying NULL generates an error.</td>
</tr>
<tr>
<td>remote_link</td>
<td>If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.</td>
</tr>
<tr>
<td>job_name</td>
<td>The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: &quot;SYS_&lt;OPERATION&gt;<em>&lt;MODE&gt;</em>%N&quot;. The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, &quot;SYS_IMPORT_FULL_01&quot;). The name supplied for the job will also be used to name the master table and other resources associated with the job.</td>
</tr>

Table 47–20 describes the valid operation types for the OPEN function.

Table 47–20  Valid Operation Types for the OPEN Function

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPORT</td>
<td>Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.</td>
</tr>
<tr>
<td>IMPORT</td>
<td>Restores data and metadata from a dump file set or across a database link.</td>
</tr>
<tr>
<td>SQL_FILE</td>
<td>Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.</td>
</tr>
</tbody>
</table>

Table 47–21 describes the valid modes for the OPEN function.

Table 47–21  Valid Modes for the OPEN Function

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FULL</td>
<td>Operates on the full database or full dump file set except for Oracle Database internal schemas. (Some tables from Oracle Database internal schemas may be registered to be exported and imported in full operations in order to provide consistent metadata during import.) The TRANSPORTABLE parameter can be set to ALWAYS during a full database export in order to move data via transportable tablespaces rather than in the Data Pump dump file.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. In SCHEMA mode, you cannot specify Oracle-internal schemas (for example, SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS).</td>
</tr>
<tr>
<td>TABLE</td>
<td>Operates on a set of selected tables. Defaults to all of the tables in the current user’s schema. Only tables and their dependent objects are processed.</td>
</tr>
</tbody>
</table>
**Return Values**

- An opaque handle for the job. This handle is used as input to the following procedures: `ADD_FILE`, `CREATE_JOB_VIEW`, `DATA_FILTER`, `DETACH`, `GET_STATUS`, `LOG_ENTRY`, `LOG_ERROR`, `METADATA_FILTER`, `METADATA_REMAP`, `METADATA_TRANSFORM`, `SET_PARALLEL`, `SET_PARAMETER`, `START_JOB`, `STOP_JOB`, and `WAIT_FOR_JOB`.

**Exceptions**

- `INVALID_ARGVAL`. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `JOB_EXISTS`. A table already exists with the specified job name.
- `PRIVILEGE_ERROR`. The user does not have the necessary privileges or roles to use the specified mode.
- `INTERNAL_ERROR`. The job was created under the wrong schema or the master table was of the wrong format.
- `SUCCESS_WITH_INFO`. The function succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

**Usage Notes**

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the `ATTACH` function.
- If the call to the `OPEN` function fails, call the `GET_STATUS` procedure with a null handle to retrieve additional information about the failure.
**SET_PARALLEL Procedure**

This procedure adjusts the degree of parallelism within a job.

**Syntax**

```sql
DBMS_DATAPUMP.SET_PARALLEL(
    handle      IN NUMBER,
    degree      IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>degree</td>
<td>The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.</td>
</tr>
</tbody>
</table>

**Exceptions**

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_OPERATION.** The SET_PARALLEL procedure is only valid for export and import operations.
- **INVALID_ARGVAL.** An invalid value was supplied for an input parameter.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of \( n \), the user should supply \( n \) files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.
- SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.
SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

DBMS_DATAPUMP.SET_PARAMETER(
    handle IN NUMBER,
    name   IN VARCHAR2,
    value  IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER);

Parameters

Table 47–23  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the parameter. Table 47–24 describes the valid parameter names.</td>
</tr>
<tr>
<td>value</td>
<td>The value for the specified parameter</td>
</tr>
</tbody>
</table>

Table 47–24 describes the valid options for the name parameter of the SET_PARAMETER procedure.
### Table 47–24  Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_COMMAND TEXT</td>
<td>TEXT</td>
<td>All</td>
<td>An opaque string used to describe the current operation from the client’s perspective. The command-line procedures will use this string to store the original command used to invoke the job.</td>
</tr>
<tr>
<td>COMPRESSION TEXT</td>
<td>TEXT</td>
<td>Export</td>
<td>Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations. The DATA_ONLY option compresses only user data in the dump file set. The METADATA_ONLY option compresses only metadata in the dump file set. The ALL option compresses both user data and metadata. The NONE option stores the dump file set in an uncompressed format. The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later. <strong>Default=METADATA_ONLY</strong></td>
</tr>
<tr>
<td>COMPRESSION_ALGORITHM TEXT</td>
<td>TEXT</td>
<td>Export</td>
<td>Indicates the compression algorithm is to be used when compressing dump file data. The choices are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- BASIC—Offers a good combination of compression ratios and speed; the algorithm used is the same as in previous versions of Oracle Data Pump.</td>
</tr>
<tr>
