RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid1</td>
<td>1st database identifier</td>
</tr>
<tr>
<td>inst_num1</td>
<td>1st instance number</td>
</tr>
<tr>
<td>bid1</td>
<td>1st 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>eid1</td>
<td>1st 'End Snapshot' ID</td>
</tr>
<tr>
<td>dbid2</td>
<td>2nd database identifier</td>
</tr>
<tr>
<td>inst_num2</td>
<td>2nd instance number</td>
</tr>
<tr>
<td>bid2</td>
<td>2nd 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>eid2</td>
<td>2nd 'End Snapshot' ID</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of `VARCHAR2(500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrdrtpt.sql` script which prompts users for the required information.
AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format. The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1        IN    NUMBER,
    inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
    bid1         IN    NUMBER,
    eid1         IN    NUMBER,
    dbid2        IN    NUMBER,
    inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
    bid2         IN    NUMBER,
    eid2         IN    NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1        IN    NUMBER,
    inst_num1    IN    VARCHAR2,
    bid1         IN    NUMBER,
    eid1         IN    NUMBER,
    dbid2        IN    NUMBER,
    inst_num2    IN    VARCHAR2,
    bid2         IN    NUMBER,
    eid2         IN    NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid1</td>
<td>1st database identifier</td>
</tr>
<tr>
<td>inst_num1</td>
<td>1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid1</td>
<td>1st Begin Snap ID</td>
</tr>
<tr>
<td>eid1</td>
<td>1st End Snapshot ID</td>
</tr>
<tr>
<td>dbid2</td>
<td>2nd database identifier</td>
</tr>
<tr>
<td>inst_num2</td>
<td>2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid2</td>
<td>2nd Begin Snap ID</td>
</tr>
<tr>
<td>eid2</td>
<td>2nd End Snapshot ID</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(1500).
AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format. The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1        IN    NUMBER,
    inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
    bid1         IN    NUMBER,
    eid1         IN    NUMBER,
    dbid2        IN    NUMBER,
    inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
    bid2         IN    NUMBER,
    eid2         IN    NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1        IN    NUMBER,
    inst_num1    IN    VARCHAR2,
    bid1         IN    NUMBER,
    eid1         IN    NUMBER,
    dbid2        IN    NUMBER,
    inst_num2    IN    VARCHAR2,
    bid2         IN    NUMBER,
    eid2         IN    NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbid1</td>
<td>1st database identifier</td>
</tr>
<tr>
<td>inst_num1</td>
<td>1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid1</td>
<td>1st Begin Snap ID</td>
</tr>
<tr>
<td>eid1</td>
<td>1st End Snapshot ID</td>
</tr>
<tr>
<td>dbid2</td>
<td>2nd database identifier</td>
</tr>
<tr>
<td>inst_num2</td>
<td>2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>bid2</td>
<td>2nd Begin Snap ID</td>
</tr>
<tr>
<td>eid2</td>
<td>2nd End Snapshot ID</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of `VARCHAR2(320)`. 

179-26 Oracle Database PL/SQL Packages and Types Reference
AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.
The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (  
    l_dbid        IN    NUMBER,  
    l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,   l_bid         IN    NUMBER,  
    l_eid         IN    NUMBER,  
    l_options     IN    NUMBER DEFAULT 0)  
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (  
    l_dbid       IN    NUMBER,  
    l_inst_num   IN    VARCHAR2,   l_bid        IN    NUMBER,  
    l_eid        IN    NUMBER,  
    l_options    IN    NUMBER DEFAULT 0)  
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>l_bid</td>
<td>Begin Snap ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>End Snapshot ID</td>
</tr>
<tr>
<td>l_options</td>
<td>Report level (currently not used)</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(1500).
AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid        IN    NUMBER,
    l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
    l_bid         IN    NUMBER,
    l_eid         IN    NUMBER,
    l_options     IN    NUMBER DEFAULT 0)
RETURN awrdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    VARCHAR2,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

**Table 179–17  AWR_GLOBAL_REPORT_TEXT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.</td>
</tr>
<tr>
<td>l_bid</td>
<td>Begin Snap ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>End Snapshot ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(320).
AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    NUMBER,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>■ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.
**AWR_REPORT_TEXT Function**

This table function displays the AWR report in text.

**Syntax**

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    NUMBER,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, Oracle supports one value:</td>
</tr>
<tr>
<td></td>
<td>- l_options = 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</td>
</tr>
</tbody>
</table>

**Return Values**

The output will be one column of VARCHAR2(80).

**Usage Notes**

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.
**AWR_SET_REPORT_THRESHOLDS Procedure**

This procedure configure specified report thresholds, including the number of rows in the report.

**Syntax**

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS(
    top_n_events         IN   NUMBER DEFAULT NULL,
    top_n_files          IN   NUMBER DEFAULT NULL,
    top_n_segments       IN   NUMBER DEFAULT NULL,
    top_n_services       IN   NUMBER DEFAULT NULL,
    top_n_sql            IN   NUMBER DEFAULT NULL,
    top_n_sql_max        IN   NUMBER DEFAULT NULL,
    top_sql_pct          IN   NUMBER DEFAULT NULL,
    shmem_threshold      IN   NUMBER DEFAULT NULL,
    versions_threshold   IN   NUMBER DEFAULT NULL);
```

**Parameters**

*Table 179–20  AWR_SET_REPORT_THRESHOLDS Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>top_n_events</td>
<td>Number of most significant wait events to be included</td>
</tr>
<tr>
<td>top_n_files</td>
<td>Number of most active files to be included</td>
</tr>
<tr>
<td>top_n_segments</td>
<td>Number of most active segments to be included</td>
</tr>
<tr>
<td>top_n_services</td>
<td>Number of most active services to be included</td>
</tr>
<tr>
<td>top_n_sql</td>
<td>Number of most significant SQL statements to be included</td>
</tr>
<tr>
<td>top_n_sql_max</td>
<td>Number of SQL statements to be included if their activity is greater than that specified by top_sql_pct</td>
</tr>
<tr>
<td>top_sql_pct</td>
<td>Significance threshold for SQL statements between top_n_sql and top_n_sql_max</td>
</tr>
<tr>
<td>shmem_threshold</td>
<td>Shared memory low threshold</td>
</tr>
<tr>
<td>versions_threshold</td>
<td>Plan version count low threshold</td>
</tr>
</tbody>
</table>

**User Notes**

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the `AWR_SET_REPORT_THRESHOLDS` procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

  ```sql
  DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
  ```
**AWR_SQL_REPORT_HTML Function**

This table function displays the AWR SQL Report in HTML format.

**Syntax**

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    NUMBER,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_sqlid      IN    VARCHAR2,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_sqlid</td>
<td>SQL ID of statement to be analyzed</td>
</tr>
<tr>
<td>l_options</td>
<td>A flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

**Return Values**

The output will be one column of `VARCHAR2(500)`.

**Usage Notes**

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.
AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
    l_dbid       IN    NUMBER,
    l_inst_num   IN    NUMBER,
    l_bid        IN    NUMBER,
    l_eid        IN    NUMBER,
    l_sqlid      IN    VARCHAR2,
    l_options    IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l_dbid</td>
<td>Database identifier</td>
</tr>
<tr>
<td>l_inst_num</td>
<td>Instance number</td>
</tr>
<tr>
<td>l_bid</td>
<td>The 'Begin Snapshot' ID</td>
</tr>
<tr>
<td>l_eid</td>
<td>The 'End Snapshot' ID</td>
</tr>
<tr>
<td>l_sqlid</td>
<td>SQL ID of statement to be analyzed</td>
</tr>
<tr>
<td>l_options</td>
<td>Flag to specify to control the output of the report. Currently, not used.</td>
</tr>
</tbody>
</table>

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.
CREATE_BASELINE Functions & Procedures

This function and procedure creates a baseline.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN  NUMBER,
    end_snap_id      IN  NUMBER,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN  NUMBER,
    end_snap_id      IN  NUMBER,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL)
RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_time       IN  DATE,
    end_time         IN  DATE,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_time       IN  DATE,
    end_time         IN  DATE,
    baseline_name    IN  VARCHAR2,
    dbid             IN  NUMBER DEFAULT NULL,
    expiration       IN  NUMBER DEFAULT NULL);
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_snap_id</td>
<td>Start snapshot sequence number for the baseline’</td>
</tr>
<tr>
<td>end_snap_id</td>
<td>End snapshot sequence number for the baseline</td>
</tr>
<tr>
<td>start_time</td>
<td>Start time for the baseline’</td>
</tr>
<tr>
<td>end_time</td>
<td>End time for the baseline</td>
</tr>
<tr>
<td>baseline_name</td>
<td>Name of baseline.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>expiration</td>
<td>Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.</td>
</tr>
</tbody>
</table>

Exceptions

- An error will be returned if this baseline name already exists in the system.
The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
end_snap_id => 107,
baseline_name => 'oltp_peakload_bl');
```

If you query the `DBA_HIST_BASELINE` view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.
CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
    start_time              IN DATE,
    end_time                IN DATE,
    baseline_name           IN VARCHAR2,
    template_name           IN VARCHAR2,
    expiration              IN NUMBER,
    dbid                    IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```sql
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
    day_of_week             IN VARCHAR2,
    hour_in_day             IN NUMBER,
    duration                IN NUMBER,
    start_time              IN DATE,
    end_time                IN DATE,
    baseline_name_prefix    IN VARCHAR2,
    template_name           IN VARCHAR2,
    expiration              IN NUMBER,
    dbid                    IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>Start Time for the baseline to be created</td>
</tr>
<tr>
<td>end_time</td>
<td>End Time for the baseline to be created</td>
</tr>
<tr>
<td>baseline_name</td>
<td>Name of baseline to be created</td>
</tr>
<tr>
<td>template_name</td>
<td>Name for the template</td>
</tr>
<tr>
<td>expiration</td>
<td>Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>day_of_week</td>
<td>Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.</td>
</tr>
<tr>
<td>hour_in_day</td>
<td>Value of 0-23 to specify the Hour in the Day the baseline should start</td>
</tr>
<tr>
<td>duration</td>
<td>Duration (in number of hours) after hour in the day that the baseline should last</td>
</tr>
</tbody>
</table>
Table 179–24 (Cont.) CREATE_BASELINE_TEMPLATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name_prefix</td>
<td>Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.</td>
</tr>
</tbody>
</table>
CREATE_SNAPSHOT Function and Procedure

This function and procedure create snapshots. In the case of the function, the snapshot ID is returned.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL')
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush_level</td>
<td>Flush level for the snapshot is either 'TYPICAL' or 'ALL'</td>
</tr>
</tbody>
</table>

Examples

This example creates a manual snapshot at the TYPICAL level:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA_HIST_SNAPSHOT view after the CREATE_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.
DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
    baseline_name  IN  VARCHAR2,
    cascade        IN  BOOLEAN DEFAULT FALSE,
    dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of baseline to drop from the system</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
</tbody>
</table>

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
    baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.
DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
    template_name IN VARCHAR2,  dbid IN NUMBER
DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template_name</td>
<td>Name of the template to remove</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.</td>
</tr>
</tbody>
</table>
DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
    low_snap_id    IN  NUMBER,
    high_snap_id   IN  NUMBER,
    dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>low_snap_id</td>
<td>Low snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>high_snap_id</td>
<td>High snapshot id of snapshots to drop.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database id (default to local DBID).</td>
</tr>
</tbody>
</table>

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.
MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
 retention   IN  NUMBER    DEFAULT NULL,
 interval    IN  NUMBER    DEFAULT NULL,
 topnsql     IN  NUMBER    DEFAULT NULL,
 dbid        IN  NUMBER    DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
 retention   IN  NUMBER    DEFAULT NULL,
 interval    IN  NUMBER    DEFAULT NULL,
 topnsql     IN  VARCHAR2,
 dbid        IN  NUMBER    DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years). If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting. If NULL is specified, the old value for retention is preserved. NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.</td>
</tr>
<tr>
<td>interval</td>
<td>New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.</td>
</tr>
</tbody>
</table>
Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```sql
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    interval  =>  60,
    retention =>  20160);
```

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.
MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE( 
    window_size    IN   NUMBER, 
    dbid           IN   NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_size</td>
<td>New Window size for the default Moving Window Baseline, in number of days.</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID (default to local DBID)</td>
</tr>
</tbody>
</table>

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.
PURGE_SQLDETAILS Procedure

This procedure purges SQL details, specifically rows from WRH$$_SQLTEXT, WRH$$_SQLPLAN, and WRH$$_SQL_BIND_METADATA that do not have corresponding rows (DBID, SQL_ID) in WRH$$_SQLSTAT.

The subprogram calls for the DBID for which to run the purge. If the DBID is not specified, the database DBID is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

DBMS_WORKLOAD_REPOSITORY.PURGE_SQLDETAILS(
   numrows IN NUMBER DEFAULT NULL,
   dbid    IN NUMBER DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numrows</td>
<td>Number of rows</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID (default to local DBID)</td>
</tr>
</tbody>
</table>
REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
    sql_id     IN VARCHAR2,
    dbid       IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>13-character external SQL ID</td>
</tr>
<tr>
<td>dbid</td>
<td>Optional dbid, defaults to Local DBID</td>
</tr>
</tbody>
</table>
## RENAME_BASELINE Procedure

This procedure renames a baseline.

### Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
    old_baseline_name IN VARCHAR2,
    new_baseline_name IN VARCHAR2,
    dbid IN NUMBER DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_baseline_name</td>
<td>Old baseline name</td>
</tr>
<tr>
<td>new_baseline_name</td>
<td>New baseline name</td>
</tr>
<tr>
<td>dbid</td>
<td>Database ID (default to local DBID)</td>
</tr>
</tbody>
</table>
SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline. The table function will return an object of the AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```sql
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
    baseline_name     IN VARCHAR2,
    dbid              IN NUMBER DEFAULT NULL,
    instance_num      IN NUMBER DEFAULT NULL)
RETURN awr_metric_type_table PIPELINED;
```

Parameters

**Table 179–34  SELECT_BASELINE_METRIC Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline_name</td>
<td>Name of the baseline for which we would like to view metrics</td>
</tr>
<tr>
<td>dbid</td>
<td>Database Identifier for baseline. If NULL, then use the database identifier for the local database. Defaults to NULL.</td>
</tr>
<tr>
<td>instance_num</td>
<td>Instance for which number the user wants to see statistics. If NULL, show statistics for the local instance. Defaults to NULL.</td>
</tr>
</tbody>
</table>
UPDATE_OBJECT_INFO Procedure

This procedure updates rows of WRHS_SEG_STAT_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns. The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
    maxrows   IN  NUMBER  DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxrows</td>
<td>Maximum number of rows to be updated. Default= 0, meaning there is no limit.</td>
</tr>
</tbody>
</table>
The **DBMS_XA** package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

**See Also:** *Oracle Database Advanced Application Developer’s Guide* for more information about “Developing Applications with Oracle XA”

The chapter contains the following topics:

- **Using DBMS_XA**
  - Overview
  - Security Model
  - Constants
  - Operational Notes
- **Data Structures**
  - OBJECT Types
  - TABLE Types
- **Summary of DBMS_XA Subprograms**
Using DBMS_XA

- Overview
- Security Model
- Constants
- Operational Notes
Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (XID) and associate or disassociate the current session with the transaction branch. Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.
Security Model

This package is created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS. Any DBMS_XA subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_XA subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

SELECT or READ privilege on SYS.DBA_PENDING_TRANSACTIONS is required for users who need to execute XA_RECOVER subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.
Constants

The DBMS_XA package uses the constants shown in Table 180–1 for use in the flag field of the XA_START Function and the XA_END Function.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TMNOFLAGS</td>
<td>PLS_INTEGER</td>
<td>00000000</td>
<td>Indicates no flag value is selected.</td>
</tr>
<tr>
<td>TMSUCCESS</td>
<td>PLS_INTEGER</td>
<td>UTL_RAW.CAST_TO_BINARY_INTEGER('04000000')</td>
<td>Dissociates caller from transaction branch.</td>
</tr>
<tr>
<td>TMJOIN</td>
<td>PLS_INTEGER</td>
<td>UTL_RAW.CAST_TO_BINARY_INTEGER('00200000')</td>
<td>Caller is joining existing transaction branch.</td>
</tr>
<tr>
<td>TMSUSPEND</td>
<td>PLS_INTEGER</td>
<td>UTL_RAW.CAST_TO_BINARY_INTEGER('02000000')</td>
<td>Caller is suspending, not ending, association.</td>
</tr>
<tr>
<td>TMRESUME</td>
<td>PLS_INTEGER</td>
<td>UTL_RAW.CAST_TO_BINARY_INTEGER('08000000')</td>
<td>Caller is resuming association with suspended transaction branch.</td>
</tr>
</tbody>
</table>

The DBMS_XA package uses the constants shown in Table 180–2 for Possible Return Values.

<table>
<thead>
<tr>
<th>Name</th>

<td>PLS_INTEGER</td>
<td>-9</td>
<td>Resource manager doing work outside global transaction</td>
</tr>
</tbody>
</table>
Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so that there is not any transaction associated with the current session, the application may call XA_PREPARE/COMMIT/ROLLBACK/FORGET.

XAER_PROTO error is returned from XA_PREPARE/COMMIT/ROLLBACK/FORGET if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.
Data Structures

The DBMS_XA package uses the following OBJECT type and associated TABLE type.

OBJECT Types
- DBMS_XA_XID Object Type

TABLE Types
- DBMS_XA_XID_ARRAY Table Type
DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

**See Also:** For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

### Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
    gtrid     IN   NUMBER)
  RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
    gtrid     IN   RAW,
    bqual     IN   RAW)
  RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
    formatid  IN   NUMBER,
    gtrid     IN   RAW,
    bqual     IN   RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
  RETURN SELF AS RESULT)
```

### Attributes

**Table 180–3  DBMS_XA_XID Object Type**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatid</td>
<td>Format identifier, a number identifying different transaction managers (TM)</td>
</tr>
<tr>
<td>gtrid</td>
<td>Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes</td>
</tr>
<tr>
<td>bqual</td>
<td>Branch qualifier, of which the maximum size is 64 bytes</td>
</tr>
</tbody>
</table>
DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of xid that represent a list of global transaction branches.

Syntax

```sql
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```
### Summary of DBMS_XA Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>

<tbody>
<tr>
<td><strong>DIST_TXN_SYNC Procedure</strong> on page 180-12</td>
<td>Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)</td>
</tr>
<tr>
<td><strong>XA_COMMIT Function</strong> on page 180-13</td>
<td>Commits the global transaction specified by xid</td>
</tr>
<tr>
<td><strong>XA_END Function</strong> on page 180-14</td>
<td>Disassociates the current session from the transaction branch specified by xid</td>
</tr>
<tr>
<td><strong>XA_FORGET Function</strong> on page 180-15</td>
<td>Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.</td>
</tr>
<tr>
<td><strong>XA_GETLASTOER Function</strong> on page 180-16</td>
<td>Obtains the last Oracle error code, in case of failure of previous XA calls.</td>
</tr>
<tr>
<td><strong>XA_PREPARE Function</strong> on page 180-17</td>
<td>Prepares the transaction branch specified in xid for committing the transaction subsequently if possible</td>
</tr>
<tr>
<td><strong>XA_RECOVER Function</strong> on page 180-18</td>
<td>Obtains a list of prepared or heuristically completed transaction branches from a resource manager</td>
</tr>
<tr>
<td><strong>XA_ROLLBACK Function</strong> on page 180-19</td>
<td>Informs the resource manager to roll back work done on behalf of a transaction branch</td>
</tr>
<tr>
<td><strong>XA_SETTIMEOUT Function</strong> on page 180-20</td>
<td>Sets the transaction timeout in seconds for the current session</td>
</tr>
<tr>
<td><strong>XA_START Function</strong> on page 180-21</td>
<td>Associates the current session with the transaction branch specified by xid</td>
</tr>
</tbody>
</table>
This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

DBMS_XA.DIST_TXN_SYNC;
**XA_COMMIT Function**

This function commits the global transaction specified by xid.

**Syntax**

```plsql
DBMS_XA.XA_COMMIT(
  xid       IN  DBMS_XA_XID,
  onePhase  IN  BOOLEAN)
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 180-9</td>
</tr>
<tr>
<td>onePhase</td>
<td>If TRUE, apply single phase commit</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 180–2, "DBMS_XA Constants for Possible Return Values". Possible return values indicating error are: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAERINVAL, or XAER_PROTO. Other possible return values include: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, and XA_HEURMIX.

**Usage Notes**

- An application must not call COMMIT, but instead must call XA_COMMIT to commit the global transaction specified by xid. If a user needs to commit a transaction branch that is created by other users, FORCE ANY TRANSACTION must be granted to the user.
- If onePhase is TRUE, the resource manager should use a one-phase commit protocol to commit the work done on behalf of xid. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding XA_PREPARE call has returned XA_OK, should XA_COMMIT be called.
- The application must make a separate XA_COMMIT call for each of the transaction branches of the global transaction for which XA_PREPARE has returned XA_OK.
- If the resource manager did not commit the transaction and the parameter onePhase is set to TRUE, the resource manager may return one of the XA_RB* code. Upon return, the resource manager has rolled back the branch’s work and has released all held resources.
**XA_END Function**

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists.

**Syntax**

```sql
DBMS_XA.XA_END (  
    xid   IN  DBMS_XA_XID,  
    flag  IN  PLS_INTEGER)  
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xid</code></td>
<td>See DBMS_XA_XID Object Type on page 180-9</td>
</tr>
<tr>
<td><code>flag</code></td>
<td>See Table 180-1, &quot;DBMS_XA Constants for Flag Field of XA_START &amp; XA_END Functions&quot;.</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 180-2, " DBMS_XA Constants for Possible Return Values". Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAERINVAL`, `XAER_PROTO`, or `XA_RB`.*

**Usage Notes**

- **TMSUCCESS** or **TMSUSPEND** may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is **XA_OK**. **TMFAIL** is not supported. **XA_END** may be called with either **TMSUCCESS** or **TMSUSPEND** to disassociate the transaction branch identified by `xid` from the current session.

- **XA_OK** is returned if **XA_END** succeeds. An application must check the return value and handle error cases. Only when **XA_OK** is returned, the application should proceed for other normal operations.

- Executing a **ROLLBACK** statement without calling **XA_END** first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until **XA_END** is called.

- Executing a **COMMIT** statement without calling **XA_END** first will result in **ORA-02089**: **COMMIT** is not allowed in a subordinate session.

- Executing a **COMMIT** or a **ROLLBACK** statement after **XA_END** has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session. To commit the transaction ID or the **XA_ROLLBACK Function** to commit/rollback the transaction specified by the `xid`.  

---

180-14 Oracle Database PL/SQL Packages and Types Reference
**XA_FORGET Function**

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

**Syntax**

```sql
DBMS_XA.XA_FORGET (
    xid   IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

**Parameters**

*Table 180–7  XA_FORGET Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 180-9</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 180-2, "DBMS_XA Constants for Possible Return Values". Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAERINVAL, or XAER_PROTO.
**XA_GETLASTOER Function**

This function obtains the last Oracle error code, in case of failure of previous XA calls.

**Syntax**

```sql
DBMS_XA.XA_GETLASTOER
RETURN PLS_INTEGER;
```

**Return Values**

The return value carries the last Oracle error code.
XA_PREPARE Function

This function prepares the transaction branch specified in xid for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (
   xid   IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

See Table 180–8, "XA_PREPARE Function Parameters".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 180-9</td>
</tr>
</tbody>
</table>

Return Values

See Table 180-2, "DBMS_XA Constants for Possible Return Values". Possible return codes include: XA_OK, XA_RDONLY, XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, FORCE ANY TRANSACTION must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and XA_PREPARE has returned XA_OK, the application may proceed to call XA_COMMIT.
XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```sql
DBMS_XA.XA_RECOVER
RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See DBMS_XA_XID_ARRAY Table Type

Usage Notes

- The flags TMSTARTSCAN, TMENDSCAN, TMNOFLAGS are not supported.
- The privilege SELECT ON DBA_PENDING_TRANSACTIONS must be granted to the user who needs to call XA_RECOVER.
**XA_ROLLBACK Function**

This function informs the resource manager to roll back work done on behalf of a transaction branch.

**Syntax**

```sql
DBMS_XA.XA_ROLLBACK (  
    xid IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 180-9</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 180-2, "DBMS_XA Constants for Possible Return Values". Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

**Usage Notes**

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.
**XA_SETTIMEOUT Function**

This function sets the transaction timeout in seconds for the current session.

**Syntax**

```sql
DBMS_XA.XA_SETTIMEOUT (  
    seconds IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.</td>
</tr>
</tbody>
</table>

**Return Values**

See Table 180–2, "DBMS_XA Constants for Possible Return Values". Possible return values are `XA_OK`, `XAER_RMERR`, `XAER_RMFAIL`, or `XAER_INVAL`.

**Usage Notes**

Only if return value is `XA_OK`, is the timeout value successfully set.
XA_START Function

This function associates the current session with a transaction branch specified by the xid.

Syntax

```sql
DBMS_XA.XA_START (
    xid   IN  DBMS_XA_XID,    flag  IN  PLS_INTEGER)  RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>See DBMS_XA_XID Object Type on page 180-9</td>
</tr>
<tr>
<td>flag</td>
<td>See Table 180–1, &quot; DBMS_XA Constants for Flag Field of XA_START &amp; XA_END Functions&quot;</td>
</tr>
</tbody>
</table>

Return Values

See Table 180–2, " DBMS_XA Constants for Possible Return Values"

Usage Notes

- If TMJOIN or TMRESUME is specified in flag, the start is for joining an existing transaction branch identified by the xid. TMJOIN flag should be used when the transaction is detached with TMSUCCESS flag. TMRESUME should be used when the transaction branch is detached with TMSUSPEND flag. XA_START may be called with either flag to join an existing transaction branch.
- If TMNOFLAGS is specified in flag, and neither TMJOIN nor TMRESUME is specified, a new transaction branch is to be started. If the transaction branch specified in xid already exists, XA_START returns an XAER_DUPID error code.
- Possible return values in error include: XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, and XAER_PROTO.
- XA_OK is returned if XA_START succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. XAER_PROTO will be returned if XA_START is called with an active global transaction branch associated with the session. XAER_OUTSIDE will be returned if XA_START is called with a local transaction associated with the current session.
The DBMS_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

Using DBMS_XDB

This section contains topics which relate to using the DBMS_XDB package.

- Overview
- Deprecated Subprograms
- Security Model
- Constants
Overview

The DBMS_XDB package supports the following features:

- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Function, and CHANGEPRIVILEGES Function for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.

- Configuration Session Management is supported by CFG_REFRESH Procedure, CFG_GET Function and CFG_UPDATE Procedure methods.

- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and the DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction.
Deprecated Subprograms

**Note:** Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

All subprograms in the `DBMS_XDB` package are deprecated with Oracle Database 12c and substituted by the alternative subprograms with the same names in either the `DBMS_XDB_CONFIG` package or the `DBMS_XDB_REPOS` package as listed in the table.

Security Model

Owned by XDB, the DBMS_XDB package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.
Constants

All constants as described in Table 181–2, "DBMS_XDB Constants" are deprecated in Oracle Release 12c in that they are relocated to either the DBMS_XDB_CONFIG package or the DBMS_XDB_REPOS package. The specifics of transference in each case are detailed in the Relocated column.

Oracle recommends that you do not use constants in their DBMS_XDB context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

</tbody>
</table>
ACLCHECKPRIVILEGES Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ACLCHECKPRIVILEGES Function.

This function checks access privileges granted to the current user by specified ACL document by the **OWNER** of the resource. Returns positive integer if all privileges are granted.

**Syntax**

```
DBMS_XDB.ACLCHECKPRIVILEGES(
  acl_path IN VARCHAR2,
  owner   IN VARCHAR2,
  privs   IN xmltype)
RETURN PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL document</td>
</tr>
<tr>
<td>owner</td>
<td>Resource owner name; the pseudo user ”DAV:owner” is replaced by this user during ACL privilege resolution</td>
</tr>
<tr>
<td>privs</td>
<td>An XML/Type instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.</td>
</tr>
</tbody>
</table>
ADDHTTPEXPIREMAPPING Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDHTTPEXPIREMAPPING Procedure.

This procedure adds to xdb$config a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```sql
DBMS_XDB.ADDHTTPEXPIREMAPPING (
    pattern IN VARCHAR2,
    expire IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
</tbody>
</table>
| expire    | Expiration directive, follows the ExpireDefault in Apache's mod_expires: base [plus] (num type)*

- base: now | modification
- type: year|years|month|months|week|weeks|day|days|
- minute|minutes|second|seconds

Examples

```sql
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test2/*', 'modification plus 1 day 30 seconds');
```
ADDMEMAPPING Procedure

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDMEMAPPING Procedure.

This procedure adds the following mime mapping to XDB configuration:

```xml
<mime-mapping>
  <extension>extension</extension>
  <mime-type>mimetype</mime-type>
</mime-mapping>
```

**Syntax**

```sql
DBMS_XDB.ADDMEMEMAPPING(
  extension  IN   VARCHAR2,
  mimetype   IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is being added</td>
</tr>
<tr>
<td>mimetype</td>
<td>Mime type</td>
</tr>
</tbody>
</table>
**ADDSCHEMALLOCMAPPING Procedure**

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDMIMEMAPPING Procedure.

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

**Syntax**

```sql
DBMS_XDB.ADDSCHEMALLOCMAPPING(
    namespace    IN   VARCHAR2,
    element      IN   VARCHAR2,
    schemaURL    IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
<tr>
<td>element</td>
<td>Element</td>
</tr>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>

DBMS_XDB 181-15
ADDSERVLET Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDSERVLET Procedure.

This procedure adds the following servlet to XDB configuration:

```xml
<servlet>
  <servlet-name>name</servlet-name>
  <servlet-language>language</servlet-language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
  <servlet-schema>schema</servlet-schema>
</servlet>
```

### Syntax

```sql
DBMS_XDB.ADDSERVLET(
    name       IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
<tr>
<td>language</td>
<td>Must be one of “C”, ”Java”, ”PL/SQL”</td>
</tr>
<tr>
<td>dispname</td>
<td>Display name</td>
</tr>
<tr>
<td>icon</td>
<td>Icon</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
<tr>
<td>class</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>jspfile</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>plsql</td>
<td>The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>schema</td>
<td>Schema</td>
</tr>
</tbody>
</table>
**ADDSERVLETMAPPING Procedure**

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_CONFIG` package - the `ADDSERVLETMAPPING` Procedure.

This procedure adds the following servlet mapping to XDB configuration:

```xml
<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>
```

**Syntax**

```sql
DBMS_XDB.ADDSERVLETMAPPING(
    pattern   IN   VARCHAR2,     name      IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>Servlet pattern</td>
</tr>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDSERVLETSECROLE Procedure.

This procedure adds the following security role `REF` to a specified servlet in XDB configuration:

```xml
<security-role-ref>
    <role-name>rolename</role-name>
    <role-link>rolelink</role-link>
    <description>descript</description>
</security-role-ref>
```

Syntax

```sql
DBMS_XDB.ADDSERVLETSECROLE(
    servname    IN   VARCHAR2,     rolename    IN   VARCHAR2,     rolelink    IN
    VARCHAR2,     descript    IN   VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Role name</td>
</tr>
<tr>
<td>rolelink</td>
<td>Role link</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
</tbody>
</table>
ADDMEXTENSION Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ADDXMEXTENSION Procedure.

This procedure adds the following XML extension to the XDB configuration under `<xml-extensions>`:

```xml
<extension>extension</extension>
```

**Syntax**

```sql
DBMS_XDB.ADMXMEXTENSION(
    extension   IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be added</td>
</tr>
</tbody>
</table>
APPENDRESOURCEMETADATA Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the APPENDRESOURCEMETADATA Procedure.

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

**Syntax**

```sql
DBMS_XDB.APPENDRESOURCEMETADATA (  
    abspath   IN  VARCHAR2,
    metadata  IN  XMLTYPE);
```

```sql
DBMS_XDB.APPENDRESOURCEMETADATA (  
    abspath   IN  VARCHAR2,
    metadata  IN  REF SYS.XMLTYPE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.

- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.
CFG_GET Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_GET Function.

This function retrieves the session's configuration information as an XMLType instance.

Syntax

DBMS_XDB.CFG_GET
RETURN SYS.XMLType;
CFG_REFRESH Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_REFRESH Procedure.

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```sql
DBMS_XDB.CFG_REFRESH;
```
CFG_UPDATE Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_UPDATE Procedure.

This procedure updates the configuration information and commits the change.

Syntax

DBMS_XDB.CFG_UPDATE(
    xdbconfig   IN  SYS.XMLTYPE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xdbconfig</td>
<td>The new configuration data</td>
</tr>
</tbody>
</table>
CHANGEOWNER Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEOWNER Procedure.

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB.CHANGEOWNER(
    abspath    IN   VARCHAR2,
    owner      IN   VARCHAR2,
    recurse    IN   BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner for the resource</td>
</tr>
<tr>
<td>recurse</td>
<td>If TRUE, recursively change owner of all resources in the folder tree</td>
</tr>
</tbody>
</table>
CHANGEPRIVILEGES Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHANGEPRIVILEGES Function.

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
    res_path   IN    VARCHAR2,
    ace        IN    xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Path name of the resource for which privileges need to be changed</td>
</tr>
<tr>
<td>ace</td>
<td>An XMLType instance of the <code>&lt;ace&gt;</code> element which specifies the <code>&lt;principal&gt;</code>, the operation <code>&lt;grant&gt;</code> and the list of privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.
CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```sql
DBMS_XDB.CHECKPRIVILEGES(
    res_path   IN  VARCHAR2,
    privs      IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if all requested privileges granted.

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CHECKPRIVILEGES Function.
CREATEFOLDER Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEFOLDER Function.

This function creates a new folder resource in the hierarchy.

**Syntax**

```
DBMS_XDB.CREATEFOLDER(
    path   IN  VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

Table 181–17 CREATEFOLDER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name for the new folder</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if operation successful; FALSE, otherwise.

**Usage Notes**

The given path name's parent folder must already exist in the hierarchy: if `/folder1/folder2` is passed as the path parameter, then `/folder1` must already exist.
CREATEOIDPATH Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATEOIDPATH Function.

This function creates a virtual path to the resource based on object ID.

**Syntax**

```sql
DBMS_XDB.CREATEOIDPATH(
    oid    IN   RAW)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>Object ID of the resource</td>
</tr>
</tbody>
</table>

---

181-28 Oracle Database PL/SQL Packages and Types Reference
CREATERESOURCE Functions

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the CREATERESOURCE Functions.

The functions create a new resource. The description of the overload options precede each version of the syntax.

Syntax

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```sql
DBMS_XDB.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    datarow        IN  REF SYS.XMLTYPE,
    createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```sql
DBMS_XDB.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  BLOB,
    csid           IN  NUMBER :=0,
    createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```sql
DBMS_XDB.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  BFILE,
    csid           IN  NUMBER :=0,
    createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```sql
DBMS_XDB.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  CLOB,
    createfolders  IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```sql
DBMS_XDB.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  VARCHAR2,
    schemaurl      IN  VARCHAR2 := NULL,
    elem           IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```
Given an `XMLTYPE` and a schema URL, inserts a new resource into the hierarchy with the `XMLTYPE` as the contents:

```
DBMS_XDB.CREATERESOURCE (  
  abspath        IN  VARCHAR2,  
  data           IN  SYS.XMLTYPE,  
  schemaurl     IN  VARCHAR2 := NULL,  
  elem           IN  VARCHAR2 := NULL)  
RETURN BOOLEAN;
```

### Parameters

**Table 181–19 CREATERESOURCE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.</td>
</tr>
<tr>
<td>data</td>
<td>String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema’s default table. Otherwise, it is saved as binary data.</td>
</tr>
<tr>
<td>datarow</td>
<td>REF to an XMLType row to be used as the contents</td>
</tr>
</tbody>
</table>
| csid      | Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows:  
  - From the abspath extension, determine the resource’s MIME type.  
  - If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at [http://www.w3.org/TR/2000/REC-xml-20001006](http://www.w3.org/TR/2000/REC-xml-20001006);  
  - Otherwise, it is defaulted to the database character set. |
| createfolders | If TRUE, create the parent folders if they do not exist |
| schemaurl | For XML data, schema URL data conforms to (default NULL) |
| elem      | Element name (default NULL) |

### Return Values

`TRUE` if operation successful; `FALSE`, otherwise.
DELETEHTTPEXPIREMAPPING Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETEHTTPEXPIREMAPPING Procedure.

This procedure deletes from xdb$config all mappings of the URL pattern to an expiration date.

### Syntax

```sql
DBMS_XDB.DELETEHTTPEXPIREMAPPING(
    pattern IN VARCHAR2);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
</tbody>
</table>
DELETEMIMEMAPPING Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the CFG_GET Function.

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

**Syntax**

```sql
DBMS_XDB.DELETEMIMEMAPPING(
    extension IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is to be deleted</td>
</tr>
</tbody>
</table>
**DELETERESOURCE Procedure**

This procedure deletes a resource from the hierarchy.

**Syntax**

```sql
DBMS_XDB.DELETERESOURCE(
    path          IN      VARCHAR2,
    delete_option IN      PLS_INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to delete</td>
</tr>
<tr>
<td>delete_option</td>
<td>The option that controls how a resource is deleted; defined in Table 181–2 on page 181-8:</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RESOURCE</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RECURSIVE</td>
</tr>
<tr>
<td></td>
<td>- DELETE_FORCE</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RECURSIVE_FORCE</td>
</tr>
</tbody>
</table>
DELETERESOURCETMETADATA Procedures

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the DELETERESOURCETMETADATA Procedures.

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

**Syntax**

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCETMETADATA (  
  abspath        IN  VARCHAR2,  
  metadata       IN  REF SYS.XMLTYPE,  
  delete_option  IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCETMETADATA (  
  abspath        IN VARCHAR2,  
  mettadatans    IN VARCHAR2,  
  mettadataname  IN VARCHAR2,  
  delete_option  IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>REF to the piece of metadata (schema based) to be deleted</td>
</tr>
<tr>
<td>mettadatans</td>
<td>Namespace of the metadata fragment to be removed</td>
</tr>
<tr>
<td>mettadataname</td>
<td>Local name of the metadata fragment to be removed</td>
</tr>
<tr>
<td>delete_option</td>
<td>Only applicable for schema-based metadata, this can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>▪ DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</td>
</tr>
<tr>
<td></td>
<td>▪ DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</td>
</tr>
</tbody>
</table>
DELETESCHEMALOCMAPPING Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETESCHEMALOCMAPPING Procedure.

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

**Syntax**

```sql
DBMS_XDB.DELETESCHEMALOCMAPPING(
    schemaURL    IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>
DELETESERVLET Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_CONFIG` package - the `DELETESERVLET` Procedure.

This procedure deletes a servlet from the XDB configuration.

**Syntax**

```sql
DBMS_XDB.DELETESERVLET(
    name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
**DELETESERVLETMAPPING Procedure**

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_CONFIG` package - the `DELETESERVLETMAPPING` Procedure.

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

**Syntax**

```
DBMS_XDB.DELETESERVLETMAPPING(
    name     IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
DELETESERVLETSECROLE Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETESERVLETSECROLE Procedure.

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

DBMS_XDB.DELETESERVLETSECROLE(
    servname IN VARCHAR2, rolename IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Name of the role to be deleted</td>
</tr>
</tbody>
</table>
DELETEXMLEXTENSION Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the DELETEXMLEXTENSION Procedure.

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

DBMS_XDB.DELETEXMLEXTENSION(
    extension IN VARCHAR2);

Parameters

Table 181–28  DELETEXMLEXTENSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be deleted</td>
</tr>
</tbody>
</table>
ENABLEDIGESTAUTHENTICATION Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the ENABLEDIGESTAUTHENTICATION Procedure.

This procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
EXISTSRESOURCE Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the EXITSRESOURCE Function.

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```sql
DBMS_XDB.EXISTSRESOURCE(    abspath    IN    VARCHAR2) RETURN BOOLEAN;
```

Parameters

**Table 181–29  EXITSRESOURCE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource is found.
GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
    abspath  IN  VARCHAR2)
RETURN sys.xmltype;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

The XMLType for ACL document.

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETACLDOCUMENT Function.
GETCONTENTBLOB Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTBLOB Function.

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB.GETCONTENTBLOB(
    abspath    IN     VARCHAR2,
    csid       OUT    PLS_INTEGER,
    locksrc    IN     BOOLEAN := FALSE)
RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>csid</td>
<td>If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.</td>
</tr>
<tr>
<td>locksrc</td>
<td>Contents of the resource as a BLOB</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a BLOB.
GETCONTENTCLOB Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTCLOB Function.

This function gets the contents of a resource returned as a CLOB.

Syntax

DBMS_XDB.GETCONTENTCLOB(
   abspath IN VARCHAR2,
   RETURN CLOB;
)

Parameters

Table 181–32 GETCONTENTCLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a CLOB.
GETCONTENTVARCHAR2 Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTVARCHAR2 Function.

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
    abspath    IN     VARCHAR2,
    RETURN BLOB;
```

Parameters

**Table 181–33 GETCONTENTVARCHAR2 Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a string.
GETCONTENTXMLREF Function

**Syntax**

```
DBMS_XDB.GETCONTENTXMLREF(
    abspath    IN     VARCHAR2,
RETURN SYS.XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

The contents of the resource as a `REF` to an `XMLTYPE`.

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the `GETCONTENTXMLREF Function`.

This function retrieves the contents of a resource returned as a `REF` to an `XMLTYPE`. 
GETCONTENTXMLTYPE Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETCONTENTXMLTYPE Function.

This function retrieves the contents of a resource returned as an XMLTYPE.

**Syntax**

```sql
DBMS_XDB.GETCONTENTXMLTYPE(
    abspath IN VARCHAR2,
    RETURN SYS.XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

The contents of the resource as an XMLTYPE.
GETFTPPORT Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the GETFTPPORT Function.

This procedure gets the value of the current FTP port.

Syntax

DBMS_XDB.GETFTPPORT
RETURN NUMBER;
GETHTTPPORT Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the GETHTTPPORT Function.

This procedure gets the value of the current HTTP port.

Syntax

```
DBMS_XDB.GETHTTPPORT
RETURN NUMBER;
```
GETHTTPREQUESTHEADER Function

**Note:** This procedure is deprecated in Release 12c.

This function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

**Syntax**

```sql
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name    IN   VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header_name</td>
<td>Passed header</td>
</tr>
</tbody>
</table>

**Return Values**

Returns NULL in case the header is not present in the request, or for AUTHENTICATION, for security reasons.
GETLISTENERENDPOINT Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the GETLISTENERENDPOINT Procedure.

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

**Syntax**

```sql
DBMS_XDB.GETLISTENERENDPOINT (
    endpoint  IN   NUMBER,
    host      OUT  VARCHAR2,    port      OUT  NUMBER,
    protocol  OUT  NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point listens</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point listens</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol accepted by the listener end point</td>
</tr>
</tbody>
</table>
GETLOCKTOKEN Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETLOCKTOKEN Procedure.

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```sql
DBMS_XDB.GETLOCKTOKEN(
    path     IN      VARCHAR2,
    locktoken OUT     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>locktoken</td>
<td>Logged-in user's lock token for the resource</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have READPROPERTIES privilege on the resource.
GETPRIVILEGES Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETPRIVILEGES Function.

This function gets all privileges granted to the current user on a specified resource.

Syntax

```sql
DBMS_XDB.GETPRIVILEGES(
    res_path    IN     VARCHAR2)
RETURN sys.xmltype;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the hierarchy of the resource</td>
</tr>
</tbody>
</table>

Return Values

An XMLType instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.
GETRESOID Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETRESOID Function.

Returns the object ID of the resource from its absolute path.

Syntax

```sql
DBMS_XDB.GETRESOID(
    abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

NULL if the resource is not present.
GETXDB_TABLESPACE Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the GETXDB_TABLESPACE Function.

This function returns the current tablespace of the XDB (user).

**Syntax**

```sql
DBMS_XDB.GETXDB_TABLESPACE
RETURN VARCHAR2;
```
HASBLOBCONTENT Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASBLOBCONTENT Function.

This function returns TRUE if the resource has BLOB content.

**Syntax**

```sql
DBMS_XDB.HASBLOBCONTENT
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

*Table 181–41 HASBLOBCONTENT Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if the resource has BLOB content.
HASCHARCONTENT Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASCHARCONTENT Function.

This function returns **TRUE** if the resource has character content.

**Syntax**

```sql
DBMS_XDB.HASCHARCONTENT
    abspath    IN     VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

*Table 181–42 HASCHARCONTENT Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

**TRUE** if the resource has character content.
HASXMLCONTENT Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLCONTENT Function.

This function returns TRUE if the resource has XML content.

Syntax

```sql
DBMS_XDB.HASXMLCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has XML content.
HASXMLREFERENCE Function

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the HASXMLREFERENCE Function.

This function returns TRUE if the resource has a REF to XML content.

**Syntax**

```sql
DBMS_XDB.HASXMLREFERENCE
    abspath    IN     VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE resource has a REF to XML content.
ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB.ISFOLDER
   abspath   IN   VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource is a folder or container.

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the ISFOLDER Function.
LINK Procedures

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LINK Procedures.

This procedure creates from a specified folder to a specified resource.

**Syntax**

```sql
DBMS_XDB.LINK(
    srcpath      IN   VARCHAR2,
    linkfolder   IN   VARCHAR2,
    linkname     IN   VARCHAR2);

DBMS_XDB.LINK(
    srcpath      IN   VARCHAR2,
    linkfolder   IN   VARCHAR2,
    linkname     IN   VARCHAR2,
    linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Path name of the resource to which a link is created</td>
</tr>
<tr>
<td>linkfolder</td>
<td>Folder in which the new link is placed</td>
</tr>
<tr>
<td>linkname</td>
<td>Name of the new link</td>
</tr>
<tr>
<td>linktype</td>
<td>Type of link to be created:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDB.LINK_TYPE_HARD (default)</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDB.LINK_TYPE_WEAK</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDB.LINK_TYPE_SYMBOLIC</td>
</tr>
</tbody>
</table>
LOCKRESOURCE Function

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the LOCKRESOURCE Function.

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```sql
DBMS_XDB.LOCKRESOURCE(
    path      IN  VARCHAR2,
    depthzero IN  BOOLEAN,
    shared    IN  BOOLEAN
) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to lock.</td>
</tr>
<tr>
<td>depthzero</td>
<td>Currently not supported</td>
</tr>
<tr>
<td>shared</td>
<td>Passing TRUE obtains a shared write lock</td>
</tr>
</tbody>
</table>

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.
PROCESSLINKS Procedure

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PROCESSLINKS Procedure.

This procedure processes document links in the specified resource.

Syntax

```sql
DBMS_XDB.PURGERESOURCEMETADATA(
    abspath  IN  VARCHAR2,
    recurse  IN  BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource. If the path is a folder, use the recurse flag.</td>
</tr>
<tr>
<td>recurse</td>
<td>Used only if abspath specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.</td>
</tr>
</tbody>
</table>
PURGERESOURCEMETADATA Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the PURGERESOURCEMETADATA Procedure.

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

**Syntax**

```sql
DBMS_XDB.PURGERESOURCEMETADATA(
  abspath  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
RENAMERESOURCE Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the `RENAMERESOURCE Procedure`.

This procedure renames the XDB resource.

**Syntax**

```
DBMS_XDB.RENAMERESOURCE(
    srcpath    IN  VARCHAR2,
    destfolder IN  CARCHAR2,
    newname    IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>srcpath</code></td>
<td>Absolute path in the Hierarchy for the source resource</td>
</tr>
<tr>
<td><code>destfolder</code></td>
<td>Destination folder</td>
</tr>
<tr>
<td><code>newname</code></td>
<td>Name of the child in the destination folder</td>
</tr>
</tbody>
</table>

**Table 181-50**  
RENAMERESOURCE Procedure Parameters
SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```sql
DBMS_XDB.SETACL(
    res_path   IN  VARCHAR2,
    acl_path   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have <write-acl> privileges on the resource.

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the SETACL Procedure.
**SETFTPPORT Procedure**

This procedure sets the FTP port to a new value.

**Syntax**

```
DBMS_XDB.SETFTPPORT(
    new_port  IN  NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the FTP port is set</td>
</tr>
</tbody>
</table>

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the SETFTPPORT Procedure.
This procedure sets the HTTP port to a new value.

**Syntax**

```sql
DBMS_XDB.SETHTTPPORT(
    new_port IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the HTTP port is set</td>
</tr>
</tbody>
</table>
SETLISTENERENDPOINT Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_CONFIG` package - the SETLISTENERENDPOINT Procedure.

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

**Syntax**

```sql
DBMS_XDB.SETLISTENERENDPOINT (
    endpoint IN NUMBER,
    host      IN VARCHAR2,    port      IN NUMBER,
    protocol  IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point is to listen. Its value can be 'LOCALHOST', NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point is to listen</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS</td>
</tr>
</tbody>
</table>
SETLISTENERLOCALACCESS Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_CONFIG package - the SETLISTENERLOCALACCESS Procedure.

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

**Syntax**

```plsql
DBMS_XDB.SETLISTENERLOCALACCESS (l_access BOOLEAN);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>l_access</code></td>
<td>TRUE or FALSE.</td>
</tr>
</tbody>
</table>
SPLITPATH Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the SPLITPATH Procedure.

This procedure splits the path into a parentpath and childpath.

**Syntax**

```sql
DBMS_XDB.SPLITPATH(
    abspath     IN  VARCHAR2,
    parentpath  OUT VARCHAR2,
    childpath   OUT VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path to be split</td>
</tr>
<tr>
<td>parentpath</td>
<td>Parentpath</td>
</tr>
<tr>
<td>childpath</td>
<td>Childpath</td>
</tr>
</tbody>
</table>
TOUCHRESOURCE Procedure

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` package - the TOUCHRESOURCE Procedure.

This procedure changes the modification time of the resource to the current time.

**Syntax**

```sql
DBMS_XDB.TOUCHRESOURCE
    absopath    IN     VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>absopath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
    path     IN  VARCHAR2,
    deltoken IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>deltoken</td>
<td>Lock token to be removed</td>
</tr>
</tbody>
</table>
```

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

Note: This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UNLOCKRESOURCE Function.
UPDATERESOURCEMETADATA Procedures

**Note:** This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the DBMS_XDB_REPOS package - the UPDATERESOURCEMETADATA Procedures.

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

**Syntax**

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath  IN VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath        IN   VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath        IN   VARCHAR2,
    oldns          IN   VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
    abspath       IN   VARCHAR2,
    oldns         IN   VARCHAR2,
    oldname       IN   VARCHAR,
    newmetadata   IN   REF SYS.XMLTYPE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>oldmetadata</td>
<td>REF to the old of metadata</td>
</tr>
<tr>
<td>newmetadata</td>
<td>REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)</td>
</tr>
</tbody>
</table>
Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oldns</td>
<td>Namespace identifying old metadata</td>
</tr>
<tr>
<td>oldname</td>
<td>Local name identifying old metadata</td>
</tr>
</tbody>
</table>
The `DBMS_XDB_ADMIN` package provides an interface to manage the Oracle XML DB repository.

**See Also:** *Oracle XML DB Developer’s Guide* for information about Oracle XML DB Repository

This chapter contains the following topics:

- **Using DBMS_XDB_ADMIN**
  - Overview
  - Deprecated Subprograms
  - Security Model
- **Summary of DBMS_XDB_ADMIN Subprograms**
Using DBMS_XDB_ADMIN

- Deprecated Subprograms
- Security Model
Deprecated Subprograms

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

The following subprograms are deprecated with Oracle Database 11g:

- CREATEREPOSITORYXMLINDEX Procedure
- DROPREPOSITORYXMLINDEX Procedure
- XMLINDEXADDPATH Procedure
- XMLINDEXREMOVEPATH Procedure
Security Model

Owned by XDB, the DBMS_XDB_ADMIN package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB or DBA. Subprograms in this package are executed using the privileges of the current user.
Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

**Table 182–1 DBMS_XDB_ADM Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATENONCEKEY Procedure on page 182-6</td>
<td>Generates a nonce value for use in digest authentication</td>
</tr>
<tr>
<td>CREATEREPOSITORYXMLINDEX Procedure on page 182-7</td>
<td>[Deprecated] Creates an XMLIndex on the XML DB repository</td>
</tr>
<tr>
<td>DROPREPOSITORYXMLINDEX Procedure on page 182-8</td>
<td>[Deprecated] Drops the XMLIndex on the XML DB repository</td>
</tr>
<tr>
<td>INSTALLDEFAULTWALLET Procedure on page 182-9</td>
<td>Installs the default XDB wallet in the default XDB wallet directory</td>
</tr>
<tr>
<td>MOVEXDB_TABLESPACE Procedure on page 182-10</td>
<td>Moves the XDB (user) to the specified tablespace</td>
</tr>
<tr>
<td>REBUILDHIERARCHICALINDEX Procedure on page 182-11</td>
<td>Rebuilds the hierarchical index after import or export operations</td>
</tr>
<tr>
<td>XMLINDEXADDPATH Procedure on page 182-12</td>
<td>[Deprecated] Takes a path in XML DB repository as an input and index all the resources under this given path</td>

<td>[Deprecated] Removes the index for the given path</td>
</tr>
</tbody>
</table>
CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

`DBMS_XDB_ADMIN.CREATENONCEKEY;`
CREATEREPOSITORYXMLINDEX Procedure

**Note:** This procedure is deprecated with Oracle Database 11g.

This procedure creates an XMLIndex on the XML DB repository.

**Syntax**

```sql
DBMS_XDB_ADMIN.CREATEREPOSITORYXMLINDEX;
```
DROPREPOSITORYXMLINDEX Procedure

**Syntax**

```
DBMS_XDB_ADMIN.DROPREPOSITORYXMLINDEX;
```

This procedure drops the XMLIndex on the XML DB repository.

**Note:** This procedure is deprecated in Oracle Database 11g.
INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory. The directory name where the XDB wallet is stored is prefixed either by ORACLE_BASE when it is defined, or ORACLE_HOME. It is then followed by /admin/db_name/xdb_wallet where db_name is the unique database name.

Syntax

DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;

Usage Notes

Only SYS can install or replace the default wallet.
MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(
    new_tablespace   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_tablespace</td>
<td>Name of the tablespace to where the XDB is moved</td>
</tr>
</tbody>
</table>

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If MOVEXDB_TABLESPACE fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the SYSAUX tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to READ ONLY because this might affect various XML operations being executed.
REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
This procedure adds to the repository xmlindex the resource identified by path (when 
recurse is FALSE) or adds to the repository xmlindex the sub-tree of resources rooted 
at path (when recurse is TRUE). The default value for recurse is TRUE.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXADDPATH(
    path    IN  VARCHAR2,
    recurse IN  BOOLEAN);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to a resource</td>
</tr>
<tr>
<td>recurse</td>
<td>TRUE or FALSE</td>
</tr>
</tbody>
</table>
```
XMLINDEXREMOVEPATH Procedure

Note: This procedure is deprecated with Oracle Database 11g.

This procedure removes from the repository xmlindex the resource identified by path (when recurse is FALSE) or removes from the repository xmlindex the sub-tree of resources rooted at path (when recurse is TRUE). The default value for recurse is TRUE.

Syntax

```verbatim
DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(
    path      IN  VARCHAR2,
    isrecursive       IN  BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to a resource</td>
</tr>
<tr>
<td>recurse</td>
<td>TRUE or FALSE</td>
</tr>
</tbody>
</table>
The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- Using DBMS_XDB_CONFIG
  - Overview
  - Security Model
  - Constants
- Summary of DBMS_XDB_CONFIG Subprograms
Using DBMS_XDB_CONFIG

- Overview
- Security Model
- Constants
Overview

PL/SQL package DBMS_XDB_CONFIG is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package DBMS_XDB_CONFIG is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration
Owned by XDB, the DBMS_XDB_CONFIG package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
Constants

The `DBMS_XDB_CONFIG` package uses the constants shown in Table 183–1, "DBMS_XDB_CONFIG Constants".

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XDB_ENDPOINT_HTTP</td>
<td>NUMBER</td>
<td>1</td>
<td>Defining listener for first HTTP port</td>
</tr>
<tr>
<td>XDB_ENDPOINT_HTTP2</td>
<td>NUMBER</td>
<td>2</td>
<td>Defining listener for second HTTP port</td>
</tr>
<tr>
<td>XDB_PROTOCOL_TCP</td>
<td>NUMBER</td>
<td>1</td>
<td>Defining listener for HTTP protocol</td>
</tr>
<tr>
<td>XDB_PROTOCOL_TCPS</td>
<td>NUMBER</td>
<td>2</td>
<td>Defining listener for HTTPS protocol</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XDB_CONFIG Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDHTTPEXPIREMAPPING Procedure on page 183-8</td>
<td>Adds to <code>XDB$CONFIG</code> a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.</td>
</tr>
<tr>
<td>ADDMIMEMAPPING Procedure on page 183-9</td>
<td>Adds a mime mapping to XDB configuration</td>
</tr>
<tr>
<td>ADDSCHEMALOCPMAPPING Procedure on page 183-10</td>
<td>Adds a schema location mapping to the XDB configuration</td>
</tr>
<tr>
<td>ADDSERVLET Procedure on page 183-11</td>
<td>Adds a servlet to XDB configuration</td>
</tr>
<tr>
<td>ADDSERVLETMAPPING Procedure on page 183-12</td>
<td>Adds a servlet mapping to XDB configuration</td>
</tr>
<tr>
<td>ADDSERVLETSECROLE Procedure on page 183-13</td>
<td>Adds a security role <code>REF</code> to a specified servlet in XDB configuration</td>
</tr>
<tr>
<td>ADDXMEXTENSION Procedure on page 183-14</td>
<td>Adds the following XML extension to the XDB configuration under <code>&lt;xml-extensions&gt;</code>: <code>&lt;extension&gt;extension&lt;/extension&gt;</code></td>
</tr>
<tr>
<td>CFG_GET Function on page 183-15</td>

<tr>
<td>SETLISTENERENDPOINT Procedure</td>
<td>Sets the parameters of a listener end point corresponding to the XML DB HTTP server</td>
</tr>
<tr>
<td>SETLISTENERLOCALACCESS Procedure</td>
<td>Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when l_access is set to TRUE) or to listen on both localhost and non-localhost interfaces (when l_access is set to FALSE)</td>
</tr>
<tr>
<td>USEDPORT Procedure</td>
<td>Obtains the port numbers used by other pluggable databases in the same consolidation database</td>
</tr>
</tbody>
</table>
ADDHTTPEXPIREMAPPING Procedure

This procedure adds to XDB$CONFIG a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```sql
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (    pattern IN VARCHAR2,    expire IN VARCHAR2);
```

Parameters

Table 183–3  ADDHTTPEXPIREMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
<tr>
<td>expire</td>
<td>Expiration directive, follows the ExpireDefault in Apache's mod_expires: base [plus] (num type)* -- base: now</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
```

```sql
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (    '/public/test2/*', 'modification plus 1 day 30 seconds');
```
ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```xml
<mime-mapping>
  <extension>extension</extension>
  <mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```sql
DBMS_XDB_CONFIG.ADDMIMEMAPPING(
  extension  IN  VARCHAR2,
  mimetype   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is being added</td>
</tr>
<tr>
<td>mimetype</td>
<td>Mime type</td>
</tr>
</tbody>
</table>
ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```xml
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

**Syntax**

```sql
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING(
    namespace    IN   VARCHAR2,
    element      IN   VARCHAR2,
    schemaURL    IN   VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
<tr>
<td>element</td>
<td>Element</td>
</tr>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>
ADDSERVLET Procedure

This procedure adds the following servlet to XDB configuration:

```xml
<servlet>
  <servlet-name>name</servlet-name>
  <servlet-language>language</servlet-language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
</servlet>
```

Syntax

```sql
DBMS_XDB_CONFIG.ADDSERVLET(
    name       IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
<tr>
<td>language</td>
<td>Must be one of &quot;C&quot;, &quot;Java&quot;, &quot;PL/SQL&quot;</td>
</tr>
<tr>
<td>dispname</td>
<td>Display name</td>
</tr>
<tr>
<td>icon</td>
<td>Icon</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
<tr>
<td>class</td>
<td>The class/jspfile/plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>jspfile</td>
<td>The class/jspfile/plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>plsql</td>
<td>The class/jspfile/plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.</td>
</tr>
<tr>
<td>schema</td>
<td>Schema</td>
</tr>
</tbody>
</table>
ADDSERVLETMAPPING Procedure

This procedure adds the following servlet mapping to XDB configuration:

```xml
<servlet-mapping>
    <servlet-pattern>pattern</servlet-pattern>
    <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```sql
DBMS_XDB_CONFIG.addservletemapping(
    pattern   IN   VARCHAR2,
    name      IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>Servlet pattern</td>
</tr>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
ADDSERVLETSECROLE Procedure

This procedure adds the following security role REF to a specified servlet in XDB configuration:

<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>

Syntax

DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
    servname    IN   VARCHAR2,     rolename    IN   VARCHAR2,     rolelink    IN
    VARCHAR2,     descript    IN   VARCHAR2 := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Role name</td>
</tr>
<tr>
<td>rolelink</td>
<td>Role link</td>
</tr>
<tr>
<td>descript</td>
<td>Description</td>
</tr>
</tbody>
</table>
ADDXMEXTENSION Procedure

This procedure adds the following XML extension to the XDB configuration under
<xml-extensions>:
<extension>extension</extension>

Syntax

```
DBMS_XDB_CONFIG.ADDXMEXTENSION(
    extension IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be added</td>
</tr>
</tbody>
</table>

CFG_GET Function

This function retrieves the session's configuration information as an XMLType instance.

Syntax

DBMS_XDB_CONFIG.CFG_GET
RETURN SYS.XMLType;
CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

DBMS_XDB_CONFIG.CFG_REFRESH;
CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE(
    xdbconfig IN SYS.XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xdbconfig</td>
<td>The new configuration data</td>
</tr>
</tbody>
</table>
DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB$CONFIG all mappings of the URL pattern to an expiration date.

Syntax

```sql
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
    pattern IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>URL pattern (only * accepted as wildcards)</td>
</tr>
</tbody>
</table>
**DELETEMIMEMAPPING Procedure**

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

**Syntax**

```sql
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
    extension IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>Extension for which a mime type is to be deleted</td>
</tr>
</tbody>
</table>
DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```sql
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
    schemaURL IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaURL</td>
<td>Schema URL</td>
</tr>
</tbody>
</table>
DELETEServlet Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```sql
DBMS_XDB_CONFIG.DELETEServlet(
    name   IN       VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING(
    name    IN    VARCHAR2);
```

Parameters

Table 183–15 DELETESERVLETMAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Servlet name</td>
</tr>
</tbody>
</table>
DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE(
    servname   IN   VARCHAR2,     rolename   IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>servname</td>
<td>Servlet name</td>
</tr>
<tr>
<td>rolename</td>
<td>Name of the role to be deleted</td>
</tr>
</tbody>
</table>
DELETEMLEXENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

DBMS_XDB_CONFIG.DELETEMLEXENSION(
    extension IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extension</td>
<td>XML extension to be deleted</td>
</tr>
</tbody>
</table>
ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB_CONFIG.GETFTPPORT
RETURN NUMBER;
```
GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

```sql
DBMS_XDB_CONFIG.GETHTTPPORT
RETURN NUMBER;
```
GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF’s RFC2617.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM
RETURN VARCHAR2;
```
GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT
RETURN NUMBER;
```

Usage Notes

Returns NULL if no port has been configured
GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```sql
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (    endpoint  IN   NUMBER,    host      OUT  VARCHAR2,    port      OUT  NUMBER,    protocol  OUT  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point listens</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point listens</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol accepted by the listener end point</td>
</tr>
</tbody>
</table>
SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```sql
DBMS_XDB_CONFIG.SETFTPPORT(
    new_port IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the FTP port is set</td>
</tr>
</tbody>
</table>
SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(
    new_port  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the HTTP port is set</td>
</tr>
</tbody>
</table>
SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
    realm IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>realm</td>
<td>Realm as defined in IETF’s RFC2617</td>
</tr>
</tbody>
</table>
SETHTTPSPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(
    new_port IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_port</td>
<td>Value to which the HTTPS port is set</td>
</tr>
</tbody>
</table>
SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
  endpoint  IN  NUMBER,
  host      IN  VARCHAR2,    port      IN  NUMBER,
  protocol  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.</td>
</tr>
<tr>
<td>host</td>
<td>Interface on which the listener end point is to listen. Its value can be 'LOCALHOST', 'NULL', or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.</td>
</tr>
<tr>
<td>port</td>
<td>Port on which the listener end point is to listen.</td>
</tr>
<tr>
<td>protocol</td>
<td>Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS.</td>
</tr>
</tbody>
</table>
SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to TRUE) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to FALSE).

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (l_access BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>l_access</code></td>
<td>TRUE or FALSE.</td>
</tr>
</tbody>
</table>
USEDPORT Procedure

This procedure obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT;
```
The `DBMS_XDB_CONSTANTS` package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- Using `DBMS_XDB_CONSTANTS`
  - Security Model
- Summary of `DBMS_XDB_CONSTANTS` Subprograms
Using DBMS_XDB_CONSTANTS

- Security Model
Security Model

 Owned by XDB, the DBMS_XDB_CONSTANTS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
# Summary of DBMS_XDB_CONSTANTS Subprograms

---
ENCODING_DEFAULT Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'
ENCODING_ISO88591 Function

This function returns 'WE8ISO8859P1'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISO88591
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8ISO8859P1'
ENCODING_UTF8 Function

This function returns 'AL32UTF8'.

Syntax

```sql
DBMS_XDB_CONSTANTS.ENCODING_UTF8
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'
ENCODING_WIN1252 Function

This function returns 'WE8MSWIN1252'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8MSWIN1252'
NAMESPACE_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

    DBMS_XDB_CONSTANTS.NAMESPACE_ACL
    RETURN VARCHAR2 DETERMINISTIC;

Return Value

    'http://xmlns.oracle.com/xdb/acl.xsd'
NAMESPACE_METADATA Function

This function returns ‘http://xmlns.oracle.com/xdbuserMetaData’.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

‘http://xmlns.oracle.com/xdbuserMetaData’
NAMESPACE_ORACLE Function

This function returns 'http://xmlns.oracle.com'.

Syntax

```sql
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com'
NAMESPACE_ORACLE_XDB Function

This function returns ‘http://xmlns.oracle.com/ MDB’.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/ MDB'
NAMESPACE_RESOURCE Function

This function returns '/XDBResource.xsd'

Syntax

```sql
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'
NAMESPACE RESOURCE EVENT Function

This function returns 'http://xmlns.oracle.com/resourceEvent'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_Resource_EVENT
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/resourceEvent'
NAMESPACE RESOURCE CONFIG Function

This function returns 'http://xmlns.oracle.com/XDBResConfig.xsd'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/XDBResConfig.xsd'
NAMESPACE_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
NAMESPACE_XMLDIFF Function

This function returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'.

Syntax

DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/xdiff.xsd'
NAMESPACE_XMLINSTANCE Function

This function returns `http://www.w3.org/2001/XMLSchema-instance`.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

`http://www.w3.org/2001/XMLSchema-instance`
NAMESPACE_XMLSCHEMA Function

This function returns 'http://www.w3.org/2001/XMLSchema'.

Syntax

```
DBMS_XDB_CONSTANTS. NAMESPACE_XMLSCHEMA
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://www.w3.org/2001/XMLSchema'
NSPREFIX_ACL_ACL Function

This function returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'.

Syntax

```sql
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'
NSPREFIX_RESCONFIG_RC Function

This function returns
'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'.

Syntax

DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC
RETURN VARCHAR2 DETERMINISTIC;

Return Value

Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'
NSPREFIX_RESOURCE_R Function

This function returns 'xmlns:r=http://xmlns.oracle.com/XDBResource.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:r=http://xmlns.oracle.com/XDBResource.xsd'
NSPREFIX_XDB_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

```sql
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb'
NSPREFIX_XMLINSTANCE_XSI Function

This function returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'
NSPREFIX_XMLDIFF_XD Function

This function returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'
NSPREFIX_XMLSCHEMA_XSD Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'
SCHEMAMURL_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'
SCHEMAELEM_RES_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'.

Syntax

```sql
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd#acl'
SCHEMAELEM_RESCONTENT_BINARY Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'
SCHEMAELEM_RESCONTENT_TEXT Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'.

Syntax

DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'
SCHEMARESOURCE Function

This function returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'
SCHEMAURL_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```sql
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
XDBSCHEMA_PREFIXES Function

This function returns "xmlns:xsd=http://www.w3.org/2001/XMLSchema"
xmlns:xdb=http://xmlns.oracle.com/xdb".

Syntax

DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES
RETURN VARCHAR2 DETERMINISTIC;

Return Value

"xmlns:xsd=http://www.w3.org/2001/XMLSchema"
xmlns:xdb=http://xmlns.oracle.com/xdb"
XSD_ATTRIBUTE Function

This function returns 'attribute'.

Syntax

```plaintext
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'attribute'
XSD_COMPLEX_TYPE Function

This function returns 'complexType'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'complexType'
XSD_ELEMENT Function

This function returns 'element'.

Syntax

```sql
DBMS_XDB_CONSTANTS.XSD_ELEMENT
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'element'
XSD_GROUP Function

This function returns 'group'

Syntax

DBMS_XDB_CONSTANTS.XSD_GROUP
RETURN VARCHAR2 DETERMINISTIC;

Return Value

'group'
The `DBMS_XDB_REPOS` package provides an interface to operate on the Oracle XML database Repository.

**See Also:** Oracle XML DB Developer's Guide for more information regarding:

- Using and managing repository resources
- ACL-based security management (controlling access to repository resources)
- Managing XLink and XInclude links
- Loading documents into the repository
- Creating, deleting, and managing resource metadata

This chapter contains the following topics:

- **Using `DBMS_XDB_REPOS`**
  - Overview
  - Security Model
  - Constants

- **Summary of `DBMS_XDB_REPOS` Subprograms**
Using DBMS_XDB_REPOS

- Overview
- Security Model
- Constants
Overview

The DBMS_XDB_REPOS package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions. Using a combination of PL/SQL packages - DBMS_XDB_REPOS, DBMS_XDBZ, and DBMS_XDB_VERSION - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.
Security Model

Owned by XDB, the DBMS_XDB_REPOS package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.
Constants

The DBMS_XDB_REPOS package uses the constants shown in Table 185–1, "DBMS_XDB_REPOS Constants".

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESOURCE</td>
<td>NUMBER</td>
<td>1</td>
<td>Deletes a resource; fails if the resource has children.</td>
</tr>
<tr>

<td>Sets the ACL on a specified resource</td>
</tr>
<tr>
<td>SPLITPATH Procedure</td>
<td>Splits the path into a parentpath and childpath</td>
</tr>
<tr>
<td>TOUCHRESOURCE Procedure</td>
<td>Changes the modification time of the resource to the current time</td>
</tr>
<tr>
<td>UNLOCKRESOURCE Function</td>
<td>Unlocks the resource given a lock token and resource path</td>
</tr>
<tr>
<td>UPDATERESOURCEMETADATA Procedures</td>
<td>Updates metadata for a resource</td>
</tr>
</tbody>
</table>
ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES(
    acl_path IN VARCHAR2,
    owner IN VARCHAR2,
    privs IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 185–3  ACLCHECKPRIVILEGES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL document</td>
</tr>
<tr>
<td>owner</td>
<td>Resource owner name; the pseudo user “DAV:owner” is replaced by this user during ACL privilege resolution</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.</td>
</tr>
</tbody>
</table>
APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Syntax

```sql
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (  
  abspath   IN  VARCHAR2,  
  metadata  IN  XMLTYPE);
```

```sql
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (  
  abspath   IN  VARCHAR2,  
  metadata  IN  REF SYS.XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.</td>
</tr>
</tbody>
</table>

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.

- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.
CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```sql
DBMS_XDB_REPOS.CHANGEOWNER(
    abspath    IN   VARCHAR2,
    owner      IN   VARCHAR2,
    recurse    IN   BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner for the resource</td>
</tr>
<tr>
<td>recurse</td>
<td>If TRUE, recursively change owner of all resources in the folder tree</td>
</tr>
</tbody>
</table>
CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource’s ACL.

Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES(
    res_path   IN    VARCHAR2,
    ace        IN    xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Path name of the resource for which privileges need to be changed</td>
</tr>
<tr>
<td>ace</td>
<td>An XMLType instance of the <code>&lt;ace&gt;</code> element which specifies the <code>&lt;principal&gt;</code>, the operation <code>&lt;grant&gt;</code> and the list of privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.
CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES(
    res_path   IN  VARCHAR2,
    privs      IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>privs</td>
<td>An XMLType instance of the privilege element specifying the requested set</td>
</tr>
<tr>
<td></td>
<td>of access privileges</td>
</tr>
</tbody>
</table>

Return Values

A positive integer if all requested privileges granted.
CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER(
    path   IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name for the new folder</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.
CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

DBMS_XDB_REPOS.CREATEOIDPATH(
    oid IN RAW
) RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oid</td>
<td>Object ID of the resource</td>
</tr>
</tbody>
</table>
CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax.

Syntax

Creates a new resource with a specified string as its contents:

```plsql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  VARCHAR2)
RETURN BOOLEAN;
```

Creates a new resource with a specified `XMLType` data as its contents:

```plsql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  SYS.XMLTYPE)
RETURN BOOLEAN;
```

Given a `REF` to an existing `XMLType` row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```plsql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    datarow        IN  REF SYS.XMLTYPE)
RETURN BOOLEAN;
```

Creates a resource with a specified `BLOB` as its contents, and specifies character set of the source `BLOB`:

```plsql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  BLOB,
    csid           IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified `BFILE` as its contents, and specifies character set of the source `BFILE`:

```plsql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  BFILE,
    csid           IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified `CLOB` as its contents:

```plsql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  CLOB)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```plsql
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath        IN  VARCHAR2,
    data           IN  VARCHAR2,
    schemaurl      IN  VARCHAR2 := NULL,
    elem           IN  VARCHAR2 := NULL)
```

DBMS_XDB_REPOS  185-15
RETURN BOOLEAN;

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

DBMS_XDB_REPOS.CREATERESOURCE (  
  abspath IN VARCHAR2,  
  data IN SYS.XMLTYPE,  
  schemaurl IN VARCHAR2 := NULL,  
  elem IN VARCHAR2 := NULL)  
RETURN BOOLEAN;

Parameters

Table 185–10  CREATERESOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource to create. The path name’s parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.</td>
</tr>
<tr>
<td>data</td>
<td>String buffer containing new resource’s contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema’s default table. Otherwise, it is saved as binary data.</td>
</tr>
<tr>
<td>datarow</td>
<td>REF to an XMLType row to be used as the contents</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows:</td>
</tr>
<tr>
<td></td>
<td>■ From the abspath extension, determine the resource’s MIME type.</td>
</tr>
<tr>
<td></td>
<td>■ If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</td>
</tr>
<tr>
<td></td>
<td>■ Otherwise, it is defaulted to the database character set.</td>
</tr>
<tr>
<td>schemeurl</td>
<td>For XML data, schema URL data conforms to (default NULL)</td>
</tr>
<tr>
<td>elem</td>
<td>Element name (default NULL)</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful; FALSE, otherwise.
DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

DBMS_XDB_REPOS.DELETERESOURCE(
  path          IN      VARCHAR2,
  delete_option IN      PLS_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to delete</td>
</tr>
<tr>
<td>delete_option</td>
<td>The option that controls how a resource is deleted:</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RESOURCE</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RECURSIVE</td>
</tr>
<tr>
<td></td>
<td>- DELETE_FORCE</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RECURSIVE_FORCE</td>
</tr>
</tbody>
</table>
This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```sql
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (  
  abspath        IN  VARCHAR2,  
  metadata       IN  REF SYS.XMLTYPE,  
  delete_option  IN  pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_  
  CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```sql
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (  
  abspath        IN VARCHAR2,  
  metadatans     IN VARCHAR2,  
  metadataname   IN VARCHAR2,  
  delete_option  IN pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_  
  CASCADE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>metadata</td>
<td>REF to the piece of metadata (schema based) to be deleted</td>
</tr>
<tr>
<td>metadatans</td>
<td>Namespace of the metadata fragment to be removed</td>
</tr>
<tr>
<td>metadataname</td>
<td>Local name of the metadata fragment to be removed</td>
</tr>
<tr>
<td>delete_option</td>
<td>Only applicable for schema-based metadata, this can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</td>
</tr>
<tr>
<td></td>
<td>- DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</td>
</tr>
</tbody>
</table>
EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource is found.
GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```sql
DBMS_XDB_REPOS.GETACLDOCUMENT(
    abspath  IN  VARCHAR2)
RETURN sys.xmltype;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Path name of the resource whose ACL document is required</td>
</tr>
</tbody>
</table>

Return Values

The XMLType for ACL document.
GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(
    abspath    IN     VARCHAR2,
    csid       OUT    PLS_INTEGER,
    locksrc    IN     BOOLEAN := FALSE)
RETURN BLOB;
```

Parameters

Table 185–15  GETCONTENTBLOB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>csid</td>
<td>If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.</td>
</tr>
<tr>
<td>locksrc</td>
<td>Contents of the resource as a BLOB</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a BLOB.
GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```sql
DBMS_XDB_REPOS.GETCONTENTCLOB(
    abspath    IN     VARCHAR2,
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a CLOB.
GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```sql
DBMS_XDB_REPOS.GETCONTENTVARCHAR2 (  
    abspath    IN     VARCHAR2,
    RETURN BLOB;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a string.
GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

Syntax

```sql
DBMS_XDB_REPOS.GETCONTENTXMLREF (
    abspath    IN     VARCHAR2,
    RETURN SYS.XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as a REF to an XMLTYPE.
GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE(
    abspath    IN     VARCHAR2,
    RETURN SYS.XMLTYPE;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

The contents of the resource as an XMLTYPE.
GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource’s lock token for the current user.

Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN(
    path      IN      VARCHAR2,
    locktoken OUT     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>locktoken</td>
<td>Logged-in user’s lock token for the resource</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have READPROPERTIES privilege on the resource.
GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```sql
DBMS_XDB_REPOS.GETPRIVILEGES(
    res_path IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the hierarchy of the resource</td>
</tr>
</tbody>
</table>

Return Values

An XMLType instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.
GETRESOID Function

Returns the object ID of the resource from its absolute path.

Syntax

```sql
DBMS_XDB_REPOS.GETRESOID(
    abs_path IN VARCHAR2)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abs_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

NULL if the resource is not present.
GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```sql
DBMS_XDB_REPOS.GETXDB_TABLESPACE
RETURN VARCHAR2;
```
HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT
    abspath  IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has BLOB content.
HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT
    abspath    IN     VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has character content.
HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```sql
DBMS_XDB_REPOS.HASXMLCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the resource has XML content.
HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

```sql
DBMS_XDB_REPOS.HASXMLREFERENCE
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

Return Values

TRUE resource has a REF to XML content.
ISFOLDER Function

This function returns **TRUE** if the resource is a folder or container.

**Syntax**

```sql
DBMS_XDB_REPOS.ISFOLDER
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>

**Return Values**

**TRUE** if the resource is a folder or container.
LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```sql
DBMS_XDB_REPOS.LINK(
    srcpath IN VARCHAR2,
    linkfolder IN VARCHAR2,
    linkname IN VARCHAR2);
```

```sql
DBMS_XDB_REPOS.LINK(
    srcpath IN VARCHAR2,
    linkfolder IN VARCHAR2,
    linkname IN VARCHAR2,
    linktype IN PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Path name of the resource to which a link is created</td>
</tr>
<tr>
<td>linkfolder</td>
<td>Folder in which the new link is placed</td>
</tr>
<tr>
<td>linkname</td>
<td>Name of the new link</td>
</tr>
<tr>
<td>linktype</td>
<td>Type of link to be created:</td>
</tr>
<tr>
<td></td>
<td>■ DBMS_XDB.LINK_TYPE_HARD (default)</td>
</tr>
<tr>
<td></td>
<td>■ DBMS_XDB.LINK_TYPE_WEAK</td>
</tr>
<tr>
<td></td>
<td>■ DBMS_XDB.LINK_TYPE_SYMBOLIC</td>
</tr>
</tbody>
</table>
LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```sql
DBMS_XDB_REPOS.LOCKRESOURCE(
    path      IN  VARCHAR2,
    depthzero IN  BOOLEAN,
    shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name of the resource to lock.</td>
</tr>
<tr>
<td>depthzero</td>
<td>Currently not supported</td>
</tr>
<tr>
<td>shared</td>
<td>Passing TRUE obtains a shared write lock</td>
</tr>
</tbody>
</table>

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.
**PROCESSLINKS Procedure**

This procedure processes document links in the specified resource.

**Syntax**

```sql
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
    abspath  IN  VARCHAR2,
    recurse  IN  BOOLEAN := FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.</td>
</tr>
<tr>
<td>recurse</td>
<td>Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code>, process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code>, process links of all documents in this folder only.</td>
</tr>
</tbody>
</table>
PURGERESOURCENETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```sql
DBMS_XDB_REPOS.PURGERESOURCENETADATA(
    abspath  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```sql
DBMS_XDB_REPOS.RENAMERESOURCE(
    srcpath IN VARCHAR2,
    destfolder IN VARCHAR2,
    newname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcpath</td>
<td>Absolute path in the Hierarchy for the source resource</td>
</tr>
<tr>
<td></td>
<td>destination folder</td>
</tr>
<tr>
<td>destfolder</td>
<td>Absolute path in the Hierarchy for the destination folder</td>
</tr>
<tr>
<td>newname</td>
<td>Name of the child in the destination folder</td>
</tr>
</tbody>
</table>
SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```sql
DBMS_XDB_REPOS.SETACL(
    res_path   IN  VARCHAR2,
    acl_path   IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res_path</td>
<td>Absolute path in the Hierarchy for resource</td>
</tr>
<tr>
<td>acl_path</td>
<td>Absolute path in the Hierarchy for ACL</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have `<write-acl>` privileges on the resource.
SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```sql
DBMS_XDB_REPOS.SPLITPATH(
    abspath     IN  VARCHAR2,
    parentpath  OUT VARCHAR2,
    childpath   OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path to be split</td>
</tr>
<tr>
<td>parentpath</td>
<td>Parentpath</td>
</tr>
<tr>
<td>childpath</td>
<td>Childpath</td>
</tr>
</tbody>
</table>
TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

DBMS_XDB_REPOS.TOUCHRESOURCE
    abspath IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath_path</td>
<td>Absolute path of the resource</td>
</tr>
</tbody>
</table>
UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE(
    path     IN  VARCHAR2,
    deltoken IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path name to the resource</td>
</tr>
<tr>
<td>deltoken</td>
<td>Lock token to be removed</td>
</tr>
</tbody>
</table>

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.
UPDATERESOURCENAMEMADATA Procedures

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCENAMEMADATA(
    abspath  IN VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCENAMEMADATA(
    abspath        IN   VARCHAR2,
    oldmetadata    IN   REF SYS.XMLTYPE,
    newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCENAMEMADATA(
    abspath        IN   VARCHAR2,
    oldns          IN   VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCENAMEMADATA(
    abspath       IN   VARCHAR2,
    oldns         IN   VARCHAR2,
    oldname       IN   VARCHAR,
    newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abspath</td>
<td>Absolute path of the resource</td>
</tr>
<tr>
<td>oldmetadata</td>
<td>REF to the old of metadata</td>
</tr>
<tr>
<td>newmetadata</td>
<td>REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)</td>
</tr>
<tr>
<td>oldns</td>
<td>Namespace identifying old metadata</td>
</tr>
<tr>
<td>oldname</td>
<td>Local name identifying old metadata</td>
</tr>
</tbody>
</table>
Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.
Oracle XML DB versioning interfaces are found in the DBMS_XBD_VERSION package. Functions and procedures of DBMS_XBD_VERSION help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- **Using DBMS_XBD_VERSION**
  - Security Model
- **Summary of DBMS_XBD_VERSION Subprograms**

**See Also:** Oracle XML DB Developer’s Guide
Using DBMS_XDB_VERSION

- Security Model
Security Model

Owned by XDB, the DBMS_XDB_VERSION package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
# Summary of DBMS_XDB_VERSION Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECKIN Function on page 186-5</td>
<td>Checks in a checked-out VCR and returns the resource id of the newly-created version</td>
</tr>
<tr>
<td>CHECKOUT Procedure on page 186-6</td>
<td>Checks out a VCR before updating or deleting it</td>
</tr>
<tr>
<td>GETCONTENTSBLOBYRESID Function on page 186-7</td>
<td>Obtain contents as a BLOB</td>
</tr>
<tr>
<td>GETCONTENTSCLOBYRESID Function on page 186-8</td>
<td>Obtain contents as a CLOB</td>
</tr>
<tr>
<td>GETCONTENTSXXMLBYRESID Function on page 186-9</td>

<tr>
<td>UNCHECKOUT Function on page 186-16</td>
<td>Checks in a checked-out resource, returns the resource id of the version before the resource is checked out</td>
</tr>
</tbody>
</table>
CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```sql
DBMS_XDB_VERSION.CHECKIN(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the checked-out resource.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.
CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout(
    pathname   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the VCR to be checked out.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, or if the resource doesn’t exist.
**GETCONTENTSBLOBBYRESID Function**

This function obtains contents as a BLOB.

**Syntax**

```sql
DBMS_XDB_VERSION.GETCONTENTSBLOBBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN BLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBBYRESID(
   resid   DBMS_XDB.resid_type)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

```sql
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
    resid    DBMS_XDB.resid_type)
RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Return Values

If the contents are not valid XML, returns NULL.
GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```sql
DBMS_XDB_VERSION.GETPREDECESSORS(
    pathname       VARCHAR2)
RETURN resid_list_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>

Return Values

An exception is raised if `pathname` is illegal.
**GETPREDRESID Function**

This function retrieves the list of predecessors by resource id.

**Syntax**

```sql
DBMS_XDB_VERSION.GETPREDRESID(
    resid resid_type
) RETURN resid_list_type;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Getting predecessors by `RESID` is more efficient than by `pathname`.

**Exceptions**

An exception is raised if the `RESID` is illegal.
GETRESOURCEBYRESID Function

This function obtains the resource as an XMLType, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
    resid resid_type
) RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>
GETSUCCESSIONS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

DBMS_XDB_VERSION.GETSUCCESSORS(
    pathname VARCHAR2)
RETURN resid_list_type;

Parameters

Table 186–10 GETSUCCESSIONS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.
GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```sql
DBMS_XDB_VERSION.GETSUCCSBYRESID(
    resid resid_type)
RETURN resid_list_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resid</td>
<td>The resource id.</td>
</tr>
</tbody>
</table>

Usage Notes

Getting successors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the pathname is illegal.
MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```sql
DBMS_XDB_VERSION.MAKEVERSIONED(
    pathname   VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the resource to be put under version control.</td>
</tr>
</tbody>
</table>

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn’t exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.
UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
    pathname    VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathname</td>
<td>The path name of the checked-out resource.</td>
</tr>
</tbody>
</table>

Usage Notes

This is not an auto-commit SQL operation. The UNCHECKOUT Function does not have to take the same path name that was passed to the operation by the CHECKOUT Procedure. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn’t exist.
The **DBMS_XDBRESOURCE** package provides the interface to operate on the resource's metadata and contents.

Using DBMS_XDBRESOURCE

- Overview
- Security Model
Overview

The **DBMS_XDBRESOURCE** package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in **DBMS_XMLDOM** package, an XDBResource instance could be converted to a DOMDocument type by using **DBMS_XDBRESOURCE.MAKEDOCUMENT** routine.
Security Model

Owned by XDB, the DBMS_XDBRESOURCE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
## Summary of DBMS_XDBRESOURCE Subprograms

### Table 187–1  DBMS_XDBRESOURCE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREERESOURCE Procedure</td>
<td>Frees any memory associated with an XDBResource</td>
</tr>
<tr>
<td>GETACL Function</td>
<td>Given an XDBResource, returns its ACL as string</td>
</tr>
<tr>
<td>GETACLDOCFROMRES Function</td>
<td>Returns the ACL Document for the given resource as XMLType</td>
</tr>
<tr>
<td>GETAUTHOR Function</td>
<td>Given an XDBResource, returns its author</td>
</tr>
<tr>
<td>GETCHARACTERSET Function</td>
<td>Given an XDBResource, returns its character set</td>
</tr>
<tr>
<td>GETCOMMENT Function</td>
<td>Given an XDBResource, returns its comment</td>
</tr>
<tr>
<td>GETCONTENTBLOB Function</td>
<td>Returns the contents of the resource as a BLOB</td>
</tr>
<tr>
<td>GETCONTENTCLOB Function</td>
<td>Returns the contents of the resource as a CLOB</td>
</tr>
<tr>
<td>GETCONTENTREF Function</td>
<td>Returns the contents of the resource as an XMLTypeRef</td>
</tr>
<tr>
<td>GETCONTENTTYPE Function</td>
<td>Given an XDBResource, returns its content-type</td>
</tr>
<tr>
<td>GETCONTENTXML Function</td>
<td>Returns the contents of the resource as XML</td>
</tr>
<tr>
<td>GETCONTENTVARCHAR2 Function</td>
<td>Returns the contents of the resource as a string</td>
</tr>
<tr>
<td>GETCREATIONDATE Function</td>
<td>Given an XDBResource, returns its creation date</td>
</tr>
<tr>
<td>GETCREATOR Function</td>
<td>Given an XDBResource, returns its creator</td>
</tr>
<tr>
<td>GETCUSTOMMETADATA Function</td>
<td>Returns the requested custom metadata given the xpath and namespace to the metadata</td>
</tr>
<tr>
<td>GETDISPLAYNAME Function</td>
<td>Given an XDBResource, returns its display name</td>
</tr>
<tr>
<td>GETLANGUAGE Function</td>
<td>Given an XDBResource, returns its language</td>
</tr>
<tr>
<td>GETLASTMODIFIER Function</td>
<td>Given an XDBResource, returns its last modifier</td>
</tr>
<tr>
<td>GETMODIFICATIONDATE Function</td>
<td>Given an XDBResource, returns its modification date</td>

<td>SAVE Procedure on page 187-50</td>
<td>Updates the resource with any modifications</td>
</tr>
<tr>
<td>SETACL Procedure on page 187-51</td>
<td>Sets the ACL of the given XDBResource to the path specified</td>
</tr>
<tr>
<td>SETAUTHOR Procedure on page 187-52</td>
<td>Sets the author of the given XDBResource to the specified string</td>
</tr>
<tr>
<td>SETCHARACTERSET Procedure on page 187-53</td>
<td>Sets the character set of the given XDBResource to a specified character set</td>
</tr>
<tr>
<td>SETCOMMENT Procedure on page 187-54</td>
<td>Sets a comment associated with the given XDBResource</td>
</tr>
</tbody>
</table>
### Table 187–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETCONTENT Procedures on page 187-55</td>
<td>Replaces the contents of the given resource with the given CLOB</td>
</tr>
<tr>
<td>SETCONTENTTYPE Procedure on page 187-56</td>
<td>Sets the content-type of the given XDBResource</td>
</tr>
<tr>
<td>SETCUSTOMMETADATA Procedure on page 187-57</td>
<td>Sets the custom metadata specified by the XPath and namespace to new data</td>
</tr>
<tr>
<td>SETDISPLAYNAME Procedure on page 187-58</td>
<td>Sets the display name of the given XDBResource</td>
</tr>
<tr>
<td>SETLANGUAGE Procedure on page 187-59</td>
<td>Sets the language of the given XDBResource</td>
</tr>
<tr>
<td>SETOWNER Procedure on page 187-60</td>
<td>Sets the owner of the given XDBResource</td>
</tr>
</tbody>
</table>
FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.FREERESOURCE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource to free</td>
</tr>
</tbody>
</table>
GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```sql
DBMS_XDBRESOURCE.GETACL (
   res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

Syntax

```sql
DBMS_XDBRESEPOUCE.GETACLDOCFROMRES (
    res IN XDBResource
) RETURN SYS.XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```sql
DBMS_XDBRESOURCE.GETAUTHOR (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCHARACTERSET Function

Given an XDBResource, this function returns its characterset.

Syntax

```plsql
DBMS_XDBRESEROUCE.GETCHARACTERSET (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESOURCE.GETCOMMENT (
   res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```sql
DBMS_XDBRESEROUCE.GETCONTENTBLOB (    
    res    IN     XDBResource,    
    csid   OUT    PLS_INTEGER)    
RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>csid</td>
<td>Character set ID of the BLOB returned</td>
</tr>
</tbody>
</table>
**GETCONTENTCLOB Function**

This function returns the contents of the resource as a CLOB.

**Syntax**

```sql
DBMS_XDBRESEROUCE.GETCONTENTCLOB (
    res IN XDBResource)
RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```sql
DBMS_XDBRESEROUCE.GETCONTENTREF (  
    res   IN    XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```sql
DBMS_XDBRESOURCE.GETCONTENTTYPE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```sql
DBMS_XDBRESCENSE.GETCONTENTXML (  
         res   IN    XDBResource)  
RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTVARCHAR2 (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATIONDATE (  
    res  IN    XDBResource)  
RETURN TIMESTAMP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (
    res  IN    XDBResource)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```sql
DBMS_XDBRESEROUCE.GETCUSTOMMETADATA (  
  res        IN    XDBResource,  
  xpath      IN    VARCHAR2,    namespace  IN    VARCHAR2)  
RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath for custom metadata</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

Usage Notes

The first component of the XPath expression must be "Resource".
GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

\[
\text{DBMS\_XDBRESOURCE.\text{GETDISPLAYNAME}(}
\begin{array}{l}
\text{res IN XDBResource)}
\end{array}
\text{RETURN VARCHAR2;}
\]

Parameters

\[
\begin{array}{|c|c|}
\hline
\text{Parameter} & \text{Description} \\
\hline
\text{res} & \text{XDBResource} \\
\hline
\end{array}
\]
GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESEROUCE.GETLANGUAGE (  
   res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

DBMS_XDBRESOURCE.GETLASTMODIFIER (  
    res IN    XDBResource)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```sql
DBMS_XDBRESEROUCE.GETMODIFICATIONDATE (  
    res   IN    XDBResource)  
 RETURN TIMESTAMP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESOURCE.GETOWNER (
    res   IN    XDBResource)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```sql
DBMS_XDBRESEROUCE.GETREFCOUNT (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```plsql
DBMS_XDBRESOURCE.GETVERSIONID (
    res IN XDBResource)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASACLCHANGED Function

This function returns TRUE if the ACL of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASACLCHANGED (
   res   IN    XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASAUTHORCHANGED Function

This function returns **TRUE** if the author of the given resource has changed, **FALSE** otherwise.

**Syntax**

```sql
DBMS_XDBRESEROUCE.HASAUTHORCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```sql
DBMS_XDBRESEROUCE.HASCHANGED (
    res         IN    XDBResource,
    xpath       IN    VARCHAR2,
    namespace   IN    VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath to check</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace to use</td>
</tr>
</tbody>
</table>
HASCHARACTERSETCHANGED Function

This function returns TRUE if the character set of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCOMMENTCHANGED Function

This function returns TRUE if the comment of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCOMMENTCHANGED (  
    res  IN  XDBResource)   
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

Syntax

DBMS_XDBRESOURCE.HASCONTENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;

Parameters

Table 187–29 HASCONTENTCHANGED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise.

Syntax

DBMS_XDBRESEROUCE.HASCONTENTTYPECHANGED (  
  res IN XDBResource)  
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCREATIONDATECHANGED Function

This function returns TRUE if the creation date of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (  
  res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCREATORCHANGED (  
    res   IN    XDBResource)  
RETURN BOOLEAN;
```

Parameters

<p>| Table 187–32 HASCREATORCHANGED Function Parameters |
|-------------------------------------------|------------------|</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCUSTOMMETADATACHANGED (
   res    IN    XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASDISPLAYNAMECHANGED Function

This function returns TRUE if the display name of the given resource has changed, FALSE otherwise.

Syntax

DBMS_XDBRESEROUCE.HASDISPLAYNAMECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASLenguAgeCHANGED Function

This function returns TRUE if the language of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASLenguAgeCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASLASTMODIFIERCHANGED Function

This function returns TRUE if the last modifier of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASLASTMODIFIERCHANGED (    
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASMODIFICATIONDATECHANGED Function

This function returns TRUE if the modification date of the given resource has changed, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESEROUCE.HASMODIFICATIONDATECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASOWNERCHANGED Function

This function returns TRUE if the owner of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASOWNERCHANGED (  
    res IN   XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASREFCOUNTCHANGED Function

This function returns TRUE if the reference count of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASREFCOUNTCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
HASVERSIONIDCHANGED Function

This function returns TRUE if the version ID of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESOURSE.HASVERSIONIDCHANGED (  
    res   IN    XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
ISFOLDER Function

This function returns TRUE if the given resource is a folder, FALSE otherwise.

Syntax

```sql
DBMS_XDBRESOURCE.ISFOLDER (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
ISNULL Function

This function returns TRUE if input resource is NULL.

Syntax

```sql
DBMS_XDBRESEROUCE.ISNULL (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>Input resource</td>
</tr>
</tbody>
</table>
MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also: The DBMS_XMLDOM package

Syntax

```sql
DBMS_XDBRESEROUCE.MAKEDOCUMENT (  
    res IN XDBResource)  
RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
SAVE Procedure

This procedure updates the resource with any modifications.

Syntax

```
DBMS_XDBRESEROUCE.SAVE (
    res IN XDBResource);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
</tbody>
</table>
```
SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

DBMS_XDBRESOURCE.SETACL (
    res IN OUT XDBResource,
    ACLPath IN VARCHAR2);

Parameters

Table 187-45  SETACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>ACLPath</td>
<td>Absolute path of the new ACL</td>
</tr>
</tbody>
</table>
SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESEROUCE.SETAUTHOR (  
    res IN OUT XDBResource,  
    author IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>author</td>
<td>Author</td>
</tr>
</tbody>
</table>
SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```sql
DBMS_XDBRESEROUCE.SETCHARACTERSET (
    res      IN OUT  XDBResource,
    charSet  IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>charSet</td>
<td>New character set</td>
</tr>
</tbody>
</table>
SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

DBMS_XDBRESEROUCE.SETCOMMENT (  
    res     IN OUT   XDBResource,  
    comment IN      VARCHAR2);  

Parameters

Table 187–48  SETCOMMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>comment</td>
<td>New comment</td>
</tr>
</tbody>
</table>
SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

DBMS_XDBRESEROUCE.SETCONTENT (
    res   IN OUT  XDBResource,
    data IN      BFILE,
    csid IN      NUMBER);

DBMS_XDBRESEROUCE.SETCONTENT (
    res   IN OUT  XDBResource,
    data IN      BLOB,
    csid IN      PLS_INTEGER);

DBMS_XDBRESEROUCE.SETCONTENT (
    res   IN OUT  XDBResource,
    data IN      CLOB);

DBMS_XDBRESEROUCE.SETCONTENT (
    res   IN OUT  XDBResource,
    data IN      REF SYS.XMLType,
    sticky IN    BOOLEAN := TRUE);

DBMS_XDBRESEROUCE.SETCONTENT (
    res   IN OUT  XDBResource,
    data IN      VARCHAR2);

DBMS_XDBRESEROUCE.SETCONTENT (
    res   IN OUT  XDBResource,
    data IN      SYS.XMLType);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>data</td>
<td>Data input as BFILE, BLOB, CLOB, string, XMLType</td>
</tr>
<tr>
<td>csid</td>
<td>Character set ID of the BFILE, BLOB</td>
</tr>
<tr>
<td>sticky</td>
<td>If TRUE creates a sticky REF, otherwise non-sticky</td>
</tr>
</tbody>
</table>
SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```sql
DBMS_XDBRESOURCES.SETCONTENTTYPE (  
  res       IN OUT  XDBResource,  
  conttype  IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>conttype</td>
<td>New content-type</td>
</tr>
</tbody>
</table>
SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

\[
\text{DBMS_XDBRESOURCE.SETCUSTOMMETADATA (}
\begin{align*}
\text{res} & \quad \text{IN OUT XDBResource}, \\
\text{xpath} & \quad \text{IN VARCHAR2}, \\
\text{namespace} & \quad \text{IN VARCHAR2}, \\
\text{newMetadata} & \quad \text{IN XMLType});
\end{align*}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>xpath</td>
<td>XPath to change</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace to use</td>
</tr>
<tr>
<td>newMetadata</td>
<td>New data that should replace the metadata at the given XPath</td>
</tr>
</tbody>
</table>

Usage Notes

The first component of the XPath expression must be "Resource".
SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```sql
DBMS_XDBRESEROUCE.SETDISPLAYNAME (
    res      IN OUT  XDBResource,
    name     IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>name</td>
<td>New display name</td>
</tr>
</tbody>
</table>
SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```sql
DBMS_XDBRESOURCE.SETLANGUAGE (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>ACLPath</td>
<td>New path</td>
</tr>
</tbody>
</table>
SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```sql
DBMS_XDBRESOURCE.SETOWNER (
    res       IN OUT  XDBResource,
    owner     IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>res</td>
<td>XDBResource</td>
</tr>
<tr>
<td>owner</td>
<td>New owner</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have the XDBADMIN privilege to call this subprogram.
The DBMS_XDBT package provides a convenient mechanism for administrators to set up a CONTEXT index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the CONTEXT index.

The DBMS_XDBT package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

See Also: Oracle XML DB Developer’s Guide

This chapter contains the following topics:

- Using DBMS_XDBT
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_XDBT Subprograms
Using DBMS_XDBT

- Overview
- Security Model
- Operational Notes
Overview

The DBMS_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- Use the DROPREFERENCES Procedure to drop any existing index preferences
- Create new index preferences using the CREATEPREFERENCES Procedure procedure
- Create the CONTEXT index using the CREATEINDEX Procedure procedure
- Set up automatic synchronization of the index using the CONFIGUREAUTOSYNC Procedure
Security Model

Owned by XDB, the DBMS_XDBT package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB. Subprograms in this package are executed using the privileges of the current user.
Operational Notes

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS_XDBT package.

<p>| Table 188–1 General Indexing Settings for Customizing DBMS_XDBT |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IndexName</td>
<td>XDB$CI</td>
<td>Name of the CONTEXT index.</td>
</tr>
<tr>
<td>IndexTablespace</td>
<td>XDB$RESINFO</td>
<td>Tablespace used by tables and indexes comprising the CONTEXT index.</td>
</tr>
<tr>
<td>IndexMemory</td>
<td>128M</td>
<td>Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).</td>
</tr>
<tr>
<td>LogFile</td>
<td>'XdbCtxLog'</td>
<td>The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AutoSyncPolicy</td>
<td>SYNC_BY_PENDING_COUNT</td>
<td>Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>MaxPendingCount</td>
<td>2</td>
<td>Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>CheckPendingCountInterval</td>
<td>10 minutes</td>
<td>How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
<tr>
<td>SyncInterval</td>
<td>60 minutes</td>
<td>Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.</td>
</tr>
</tbody>
</table>
### Summary of DBMS_XDBT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIGUREAUTOSYNC</td>
<td>Configures the CONTEXT index for automatic maintenance, SYNC</td>
</tr>
<tr>
<td>CREATEDATASTOREPREF</td>
<td>Creates a USER datastore preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEFILTERPREF</td>
<td>Creates a filter preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEINDEX</td>
<td>Creates the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATELEXERPREF</td>
<td>Creates a lexer preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEPREFERENCES</td>
<td>Creates preferences required for the CONTEXT index on the XML DB hierarchy</td>
</tr>
<tr>
<td>CREATESECTIONGROUPPREF</td>
<td>Creates a storage preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATESTOPLISTPREF</td>
<td>Creates a section group for the CONTEXT index</td>
</tr>
<tr>
<td>CREATESTORAGEPREF</td>
<td>Creates a wordlist preference for the CONTEXT index</td>
</tr>
<tr>
<td>CREATEWORLDLISTPREF</td>
<td>Creates a stoplist for the CONTEXT index</td>
</tr>
<tr>
<td>DROPPREFERENCES</td>
<td>Drops any existing preferences</td>
</tr>
</tbody>
</table>

*Table 188–7  DBMS_XDBT Package Subprograms*
CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

```sql
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the `USER_JOBS` catalog views.
- The configuration parameter `AutoSyncPolicy` can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

<table>
<thead>
<tr>
<th>Sync Basis</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SYNC_BY_PENDING_COUNT</code></td>
<td>The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the <code>MaxPendingCount</code> configuration setting on page 188-6). The pending queue is polled at regular intervals (See the <code>CheckPendingCountInterval</code> configuration parameter on page 188-6) to determine if the number of documents exceeds the threshold.</td>
</tr>
<tr>
<td><code>SYNC_BY_TIME</code></td>
<td>The SYNC is triggered at regular intervals. (See the <code>SyncInterval</code> configuration parameter on page 188-6).</td>
</tr>
<tr>
<td><code>SYNC_BY_PENDING_COUNT_AND_TIME</code></td>
<td>A combination of both of the preceding options.</td>
</tr>
</tbody>
</table>
CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEDATASTOREPREF;

Usage Notes

- The name of the datastore preference can be modified; see the DatastorePref configuration setting.
- The default USER datastore procedure also filters the incoming document. The DBMS_XDBT package provides a set of configuration settings that control the filtering process.
- The SkipFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
- The NullFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
- All other documents use the INSO filter through the IFILTER API.
CREATEFILTERPREF Procedure

This procedure creates a NULL filter preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEFILTERPREF;

Usage Notes

- The name of the filter preference can be modified; see FilterPref configuration setting.
- The USER datastore procedure filters the incoming document; see CREATEDATASTOREPREF Procedure for more details.
CREATEINDEX Procedure

This procedure creates the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATEINDEX;

Usage Notes

- The name of the index can be changed; see the IndexName configuration setting.
- Set the LogFile configuration parameter to enable ROWID logging during index creation.
- Set the IndexMemory configuration parameter to determine the amount of memory that index creation, and later SYNCs, will use.
CREATELEXERPREF Procedure

This procedure creates a BASIC lexer preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.CREATELEXERPREF;

Usage Notes

- The name of the lexer preference can be modified; see LexerPref configuration setting. No other configuration settings are provided.
- MultiLexer preferences are not supported.
- Base letter translation is turned on by default.
**CREATEPREFERENCES Procedure**

This procedure creates a set of default preferences based on the configuration settings.

**Syntax**

```sql
DBMS_XDBT.CREATEPREFERENCES;
```
CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

Usage Notes

- The name of the section group can be changed; see the SectiongroupPref configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the AUTO_SECTION_GROUP or the PATH_SECTION_GROUP; see the SectionGroup configuration setting.
**CREATESTOPLISTPREF Procedure**

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

**Syntax**

```sql
DBMS_XDBT.CREATESTOPLISTPREF;
```

**Usage Notes**

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`. 
CREATESTORAGEPREF Procedure

This procedure creates a BASIC_STORAGE preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```plsql
DBMS_XDBT.CREATESTORAGEPREF;
```

Usage Notes

- The name of the storage preference can be modified; see the StoragePref configuration setting.
- A tablespace can be specified for the tables and indexes comprising the CONTEXT index; see the IndexTablespace configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The I_INDEX_CLAUSE uses key compression.
CREATEWORLDLISTPREF Procedure

This procedure creates a word list preference for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDB.T.CREATENGLISTPREF;

Usage Notes

- The name of the word list preference can be modified; see the WordlistPref configuration setting. No other configuration settings are provided.
- FUZZY_MATCH and STEMMER attributes are set to AUTO (auto-language detection)
DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the CONTEXT index on the XML DB hierarchy.

Syntax

DBMS_XDBT.DROPPREFERENCES;
The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- **Using DBMS_XDBZ**
  - Security Model
  - Constants
- **Summary of DBMS_XDBZ Subprograms**
Using DBMS_XDBZ

This section contains topics which relate to using the DBMS_XDBZ package.

- Security Model
- Constants
Security Model

Owned by XDB, the DBMS_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
The `DBMS_XDBZ` package uses the constants shown in following tables.

- **DBMS_XDBZ Constants - Name Format** on page 189-4
- **DBMS_XDBZ Constants - Enable Option** on page 189-4
- **DBMS_XDBZ Constants - Enable Option Exercised** on page 189-4

### Table 189–1  DBMS_XDBZ Constants - Name Format

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_FORMAT_SHORT</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>DB user name or LDAP nickname</td>
</tr>
<tr>
<td>NAME_FORMAT_DISTINGUISHED</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>LDAP distinguished name</td>
</tr>
</tbody>
</table>

### Table 189–2  DBMS_XDBZ Constants - Enable Option

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Enables hierarchy for contents and is used by users when calling the <code>ENABLE_HIERARCHY</code> Procedure</td>
</tr>
<tr>
<td>ENABLE_RESMETADATA</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</td>
</tr>
</tbody>
</table>

### Table 189–3  DBMS_XDBZ Constants - Enable Option Exercised

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_ENABLED_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>If hierarchy was enabled for contents, that is, the <code>ENABLE_HIERARCHY</code> Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code></td>
</tr>
<tr>
<td>IS_ENABLED_RESMETADATA</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>If hierarchy was enabled for resource metadata, that is, the <code>ENABLE_HIERARCHY</code> Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code></td>
</tr>
</tbody>
</table>
Summary of DBMS_XDBZ Subprograms

Table 189–4   DBMS_XDBZ Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE_HIERARCHY Procedure on page 189-7</td>
<td>Disables repository support for the specified XMLTYPE table or view</td>
</tr>
<tr>
<td>ENABLE_HIERARCHY Procedure on page 189-8</td>
<td>Enables repository support for the specified XMLType table or view</td>
</tr>
<tr>
<td>GET_ACLOID Function on page 189-9</td>
<td>Retrieves the ACL Object ID for the specified resource</td>
</tr>
<tr>
<td>GET_USERID Function on page 189-10</td>
<td>Retrieves the user ID for the specified user</td>
</tr>
<tr>
<td>IS_HIERARCHY_ENABLED Function on page 189-11</td>
<td>Determines if repository support for the specified XMLType table or view is enabled</td>
</tr>
<tr>
<td>PURGELDAPCACHE Function on page 189-12</td>
<td>Purges the LDAP nickname cache</td>
</tr>
</tbody>
</table>
CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDB2.CREATENONCEKEY;
```
DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```
DBMS_XDB2.DISABLE_HIERARCHY(
    object_schema IN VARCHAR2,
    object_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the XMLType table or view</td>
</tr>
</tbody>
</table>
ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

See Also: Oracle XML DB Developer’s Guide for more information about

Syntax

```sql
DBMS_XDBZ.ENABLE_HIERARCHY(
    object_schema   IN   VARCHAR2,
    object_name     IN   VARCHAR2,
    hierarchy_type  IN   PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the XMLType table or view</td>
</tr>
<tr>
<td>hierarchy_type</td>
<td>How to enable the hierarchy.</td>
</tr>
<tr>
<td></td>
<td>■ ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository</td>
</tr>
<tr>
<td></td>
<td>■ ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</td>
</tr>
</tbody>
</table>

If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.
GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```sql
DBMS_XDBZ.GET_ACLOID(
    aclpath   IN   VARCHAR2,
    acloid    OUT  RAW
) RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aclpath</td>
<td>ACL resource path for the repository</td>
</tr>
<tr>
<td>acloid</td>
<td>Returned Object ID</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.
GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```sql
DBMS_XDBZ.GET_USERID(
    username IN VARCHAR2,
    userid   OUT RAW,
    format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Name of the database or LDAP user.</td>
</tr>
<tr>
<td>userid</td>
<td>Return parameter for the matching user id.</td>
</tr>
<tr>
<td>format</td>
<td>Format of the specified user name; valid options are:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname</td>
</tr>
<tr>
<td></td>
<td>- DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if successful.
**IS_HIERARCHY_ENABLED Function**

This function determines if repository support for the specified XMLType table or view is enabled.

**Syntax**

```sql
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
    object_schema   IN  VARCHAR2,
    object_name     IN  VARCHAR2,
    hierarchy_type  IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema name of the XMLType table or view</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the XMLType table or view</td>
</tr>
<tr>
<td>hierarchy_type</td>
<td>Type of hierarchy to check for:</td>
</tr>
<tr>
<td></td>
<td>- IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS</td>
</tr>
<tr>
<td></td>
<td>- IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA</td>
</tr>
</tbody>
</table>

**Return Values**

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.
This function purges the LDAP nickname cache. Returns `TRUE` if successful.

**Syntax**

```sql
DBMS_XDBZ.PURGELDAPCACHE
RETURN BOOLEAN;
```
The DBMS_XEVENT package provides event-related types and supporting subprograms.

- **Summary of DBMS_XEVENT Subprograms**
Using DBMS_XEVENT

- Security Model
- Constants
Security Model

Owned by XDB, the DBMS_XEVENT package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
The DBMS_XEVENT package uses the constants shown in Table 190–1:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENDER_EVENT</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>PRE_CREATE_EVENT</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>POST_CREATE_EVENT</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td></td>
</tr>
<tr>
<td>PRE_DELETE_EVENT</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>POST_DELETE_EVENT</td>
<td>PLS_INTEGER</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td>PRE_UPDATE_EVENT</td>
<td>PLS_INTEGER</td>
<td>6</td>
<td></td>
</tr>
<tr>
<td>POST_UPDATE_EVENT</td>
<td>PLS_INTEGER</td>
<td>7</td>
<td></td>
</tr>
<tr>
<td>PRE_LOCK_EVENT</td>
<td>PLS_INTEGER</td>
<td>8</td>
<td></td>
</tr>
<tr>
<td>POST_LOCK_EVENT</td>
<td>PLS_INTEGER</td>
<td>9</td>
<td></td>
</tr>
<tr>
<td>PRE_UNLOCK_EVENT</td>
<td>PLS_INTEGER</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>POST_UNLOCK_EVENT</td>
<td>PLS_INTEGER</td>
<td>11</td>
<td></td>
</tr>
<tr>
<td>PRE_LINKIN_EVENT</td>
<td>PLS_INTEGER</td>
<td>12</td>
<td></td>
</tr>
<tr>
<td>POST_LINKIN_EVENT</td>

Subprogram Groups

- XDBEvent Type Subprograms
- XDBRepositoryEvent Type Subprograms
- XDBHandlerList Type Subprograms
- XDBHandler Type Subprograms
- XDBPath Type Subprograms
- XDBLink Type Subprograms
XDBEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBEvent type.

Table 190–2  XDBEvent Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCURRENTUSER Function on page 190-18</td>
<td>Returns the name of the user executing the operation that triggers the event</td>
</tr>
<tr>
<td>GETEVENT Function on page 190-19</td>
<td>Returns a value identifying the triggering event</td>
</tr>
<tr>
<td>ISNULL Functions on page 190-46</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETAPPLICATIONDATA Function on page 190-16</td>
<td>Returns the &lt;applicationData&gt; element extracted from the resource configuration that defines the invoking handler</td>
</tr>
<tr>
<td>GETHANDLERLIST Function on page 190-21</td>
<td>Returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler</td>
</tr>
<tr>
<td>GETINTERFACE Function on page 190-22</td>
<td>Returns the top-level interface used to initiate the operation that triggered the event</td>
</tr>
<tr>
<td>GETLINK Function on page 190-24</td>
<td>Returns an XDBLink object for the target resource</td>
</tr>
<tr>
<td>GETLOCK Function on page 190-26</td>
<td>Returns the lock object corresponding to the current operation</td>
</tr>
<tr>
<td>GETOLDRESOURCE Function on page 190-30</td>
<td>Returns the original XDBResource object before the operation was executed</td>
</tr>
<tr>
<td>GETOPENACCESSMODE Function on page 190-31</td>
<td>Returns the access mode for the open operation</td>
</tr>
<tr>
<td>GETOPENDENYMODE Function on page 190-32</td>
<td>Returns the deny mode for the open operation</td>
</tr>
<tr>
<td>GETOUTPUTSTREAM Function on page 190-33</td>
<td>Returns the output BLOB in which the handler can write the rendered data</td>
</tr>
<tr>
<td>GETPARAMETER Function on page 190-34</td>
<td>Returns the value of a request or session-specific parameter</td>
</tr>
<tr>
<td>GETPARENT Function on page 190-35</td>
<td>Returns the resource object corresponding to a parent folder of the target resource</td>
</tr>
<tr>
<td>GETPATH Function on page 190-39</td>
<td>Returns the XDBPath object representing the path of the resource for which the event was fired</td>
</tr>
<tr>
<td>GETRESOURCE Function on page 190-40</td>
<td>Returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource</td>
</tr>
<tr>
<td>GETUPDATEBYTECOUNT Function on page 190-43</td>
<td>If the current operation is a byte-range write, returns the byte count</td>
</tr>
<tr>
<td>GETUPDATEBYTEOFFSET Function on page 190-44</td>
<td>If the current operation is a byte-range write, function returns the byte offset at which the range begins</td>
</tr>
<tr>
<td>GETXDBEVENT Function on page 190-45</td>
<td>Converts an XDBRepositoryEvent object to an XDBEvent type</td>
</tr>
<tr>
<td>ISNULL Functions on page 190-46</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
<tr>
<td>SETRENDERPATH Procedure on page 190-49</td>
<td>Specifies the path of the resource that contains the rendered contents</td>
</tr>
<tr>
<td>SETRENDERSTREAM Procedure on page 190-50</td>
<td>sets the BLOB from which the rendered contents can be read</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

Table 190–4  XDBHandlerList Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR Procedure on page 190-15</td>
<td>Clears the handler list</td>
</tr>
<tr>

<tr>
<td>REMOVE Procedure on page 190-48</td>
<td>Removes the specified handler from the handler list</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETLANGUAGE Function on page 190-23</td>
<td>Returns the implementation language of the handler</td>
</tr>
<tr>
<td>GETSCHEMA Function on page 190-41</td>
<td>Returns the schema of the handler’s source</td>
</tr>
<tr>
<td>GETSOURCE Function on page 190-42</td>
<td>Returns the name of the Java class, PL/SQL package or object type implementing the handler</td>
</tr>
<tr>
<td>ISNULL Functions on page 190-46</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETNAME Function on page 190-28</td>
<td>Returns the string representation of the path</td>
</tr>
<tr>
<td>GETPARENTPATH Function on page 190-38</td>
<td>Returns the parent's path</td>
</tr>
<tr>
<td>ISNULL Functions on page 190-46</td>
<td>Returns TRUE if input argument is NULL</td>
</tr>
</tbody>
</table>

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.
XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 190–7  XDBLink Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCHILDROID Function</td>
<td>Returns the OID of the resource to which the link is pointing</td>
</tr>
<tr>

</tbody>
</table>
CLEAR Procedure

this procedure clears the handler list.

See Also: XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.CLEAR (hl IN OUT XDBHandlerList);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>
GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETAPPLICATIONDATA (ev IN XDBRepositoryEvent)
RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETCHILDROID Function

This function returns the OID of the resource to which the link is pointing.

See Also: XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETCHILDROID (
   link    IN   XDBLink)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>
GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

**See Also:** XDBEvent Type Subprograms on page 190-6 for other subprograms in this group

**Syntax**

```sql
DBMS_XEVENT.GETCURRENTUSER (ev   IN   XDBEvent)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBEvent type</td>
</tr>
</tbody>
</table>
GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

See Also: XDBEvent Type Subprograms on page 190-6 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETEVENT (
   ev   IN   XDBEvent)
RETURN XDBEventID;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBEvent type</td>
</tr>
</tbody>
</table>
GETFIRST Function

This function returns the first handler in the list.

See Also: XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
  hl   IN   XDBHandlerList)
RETURN XDBHandler;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
</tbody>
</table>

GETHANDLERLIST Function

This function returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler. The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (  
    ev   IN   XDBRepositoryEvent)  
RETURN XDBHandlerList;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

DBMS_XEVENT.GETINTERFACE (    ev IN XDBRepositoryEvent)    RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Table 190–16 GETINTERFACE Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>ev</td>
</tr>
</tbody>
</table>

GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also: XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler
) RETURN VARCHAR2;
```

Parameters

Table 190–17 GETLANGUAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETLINK Function

This function returns an XDBLink object for the target resource. For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, ParentName, ParentOID, ChildOID and LinkName.

**See Also:** [XDBRepositoryEvent Type Subprograms](#) on page 190-7 for other subprograms in this group

Syntax

```plsql
DBMS_XEVENT.GETLINK (
    ev   IN   XDBRepositoryEvent)
RETURN XDBLink;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETLINKNAME Function

This function returns the name of the link.

See Also: XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

DBMS_XEVENT.GETLINKNAME (link IN XDBLink) RETURN VARCHAR2;

Parameters

Table 190–19 GETLINKNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>
GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK  (
    ev   IN   XDBRepositoryEvent)
RETURN XDBLock;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also: XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETLANGUAGE (handler IN XDBHandler) RETURN VARCHAR2;
```

Parameters

Table 190–21 GETLANGUAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETNAME Function

This function returns the string representation of the path.

See Also: XDBPath Type Subprograms on page 190-10 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETNAME (    path IN  XDBPath)    RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
</tbody>
</table>
GETNEXT Function

This function returns the next handler in the list.

See Also: XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (  
    hl   IN   XDBHandlerList)  
RETURN XDBHandler;
```

Parameters

<table>
<thead>
<tr>

</tbody>
</table>
GETOLDRESOURCE Function

This function returns the original XDBResource object before the operation was executed. This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

DBMS_XEVENT.GETOLDRESOURCE (ev IN XDBRepositoryEvent)
RETURN XDBResource;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

DBMS_XEVENT.GETOPENACCESSMODE (  
    ev  IN  XDBRepositoryEvent)  
RETURN PLS_INTEGER;

Parameters

Table 190–25  GETOPENACCESSMODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)
GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

DBMS_XEVENT.GETOPENDENYMODE (ev IN XDBRepositoryEvent) RETURN PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)
GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```plsql
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev IN XDBRepositoryEvent
) RETURN BLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the key parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

**See Also:** XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

**Syntax**

```sql
DBMS_XEVENT.GETPARAMETER (
    ev   IN   XDBRepositoryEvent,
    key  IN   VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
<tr>
<td>key</td>
<td>Supported parameters:</td>
</tr>
<tr>
<td></td>
<td>- ACCEPT</td>
</tr>
<tr>
<td></td>
<td>- ACCEPT-LANGUAGE</td>
</tr>
<tr>
<td></td>
<td>- ACCEPT-CHARSET</td>
</tr>
<tr>
<td></td>
<td>- ACCEPT_ENCODING</td>
</tr>
</tbody>
</table>
GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link’s parent folder.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETPARENT (    ev IN XDBRepositoryEvent)    RETURN XDBResource;
```

Parameters

<table>
<thead>
<tr>
<th>Table 190–29 GETPARENT Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>ev</td>
</tr>
</tbody>
</table>
GETPARENTNAME Function

This function returns the link's parent folder's name.

**See Also:** [XDBLink Type Subprograms](#) on page 190-11 for other subprograms in this group

**Syntax**

```sql
DBMS_XEVENT.GETPARENTNAME (
    link   IN   XDBLink
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>
GETPARENTOID Function

This function returns the link's parent folder's OID.

See Also: XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link IN XDBLink)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link</td>
<td>Link</td>
</tr>
</tbody>
</table>

Table 190–31  GETPARENTOID Function Parameters
GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a NULL is returned.

See Also: XDBPath Type Subprograms on page 190-10 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETPARENTPATH (  
    path   IN   XDBPath,
    level   IN   INTEGER)  
RETURN XDBPath;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
<tr>
<td>level</td>
<td>Number of levels up the hierarchy</td>
</tr>
</tbody>
</table>

GETPATH Function

This function returns the XDBPath object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.GETPATH (  
   ev IN XDBRepositoryEvent)  
RETURN XDBPath;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETRESOURCE Function

This function returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```dbms_xevent.getresource (  ev IN XDBRepositoryEvent)  RETURN XDBResource;```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETSCHEMA Function

This function returns the schema of the handler's source.

See Also: XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

Syntax

DBMS_XEVENT.GETSCHEMA (  
  handler  IN  XDBHandler)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

**See Also:** XDBHandler Type Subprograms on page 190-9 for other subprograms in this group

**Syntax**

```sql
DBMS_XEVENT.GETSOURCE (handler IN XDBHandler)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the function returns the byte count. It is only valid for the inconsistent-update event.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

DBMS_XEVENT.GETUPDATEBYTECOUNT (ev IN XDBRepositoryEvent)
RETURN NUMBER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```plsql
DBMS_XEVENT.GETUPDATEBYTEOFFSET (ev IN XDBRepositoryEvent)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
GETXDBEVENT Function

This function converts an XDBRepositoryEvent object to an XDBEvent type.

See Also: XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

Syntax

DBMS_XEVENT.GETXDBEVENT (ev IN XDBRepositoryEvent) RETURN XDBEvent;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of XDBRepositoryEvent type</td>
</tr>
</tbody>
</table>
ISNULL Functions

This function returns TRUE if input argument is NULL.

See Also:

- XDBEvent Type Subprograms on page 190-6 for other subprograms in this group
- XDBRepositoryEvent Type Subprograms on page 190-7 for other subprograms in this group

- XDBPath Type Subprograms on page 190-10 for other subprograms in this group
- XDBLink Type Subprograms on page 190-11 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.ISNULL (ev         IN   XDBEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (ev         IN   XDBRepositoryEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (hl         IN   XDBHandlerList)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (handler    IN   XDBHandler)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (path       IN   XDBPath)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (link       IN   XDBLink)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>Event of specified type</td>
</tr>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>

Table 190–40  ISNULL Function Parameters
### Table 190–40 (Cont.) ISNULL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path</td>
</tr>
</tbody>
</table>
REMOVE Procedure

This procedure removes the specified handler from the handler list.

See Also: XDBHandlerList Type Subprograms on page 190-7 for other subprograms in this group

Syntax

```sql
DBMS_XEVENT.REMOVE (
    hl       IN OUT   XDBHandlerList,
    handler  IN       XDBHandler);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hl</td>
<td>Handler list</td>
</tr>
<tr>
<td>handler</td>
<td>Handler</td>
</tr>
</tbody>
</table>
**SETRENDERPATH Procedure**

This procedure specifies the path of the resource that contains the rendered contents. This should not be called after the stream returned by `GETOUTPUTSTREAM Function` is written to or after the `SETRENDERSTREAM Procedure` is called; doing so will result in an error. This is only valid for the render event.

**Syntax**

```
DBMS_XEVENT.SETRENDERPATH (  
    ev     IN   XDBRepositoryEvent,  
    path   IN   VARCHAR2);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ev</td>
<td>XDB Repository Event object</td>
</tr>
<tr>
<td>path</td>
<td>Path of the resource containing the rendered contents</td>
</tr>
</tbody>
</table>
This procedure sets the BLOB from which the rendered contents can be read. This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (  
    ev    IN   XDBRepositoryEvent,  
    istr  IN   BLOB);  
```

Table 190–43  SETRENDERSTREAM Procedure Parameters

Using DBMS_XMLDOM

- Overview
- Security Model
- Constants
- Types
- Exceptions
- Subprogram Groups
Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

Note:

- Before database startup, the read-from and write-to directories in the `init.ORA` file must be specified; for example: `UTL_FILE_DIR=/mypath/insidemypath`.
- Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform `APPENDCHILD Function` on a `DOMNode`, the `APPENDCHILD Function` PL/SQL function on page 191-42 is provided.
- To perform `setAttribute` on a `DOMElement` `elem` `setAttribute Procedure`, use PL/SQL procedure on page 191-142.

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see Figure 191–1). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNode`s can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.
The implementation of this interface follows the REC-DOM-Level-1-19981001.
Security Model

Owned by XDB, the DBMS_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
Defined constants of DBMS_XMLDOM are listed in Table 191–1.

**Table 191–1  Defined Constants for DBMS_XMLDOM**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELEMENT_NODE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>The Node is an Element.</td>
</tr>
<tr>
<td>ATTRIBUTE_NODE</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>The Node is an Attribute.</td>
</tr>
<tr>
<td>TEXT_NODE</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>The Node is a Text node.</td>
</tr>
<tr>
<td>CDATA_SECTION_NODE</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>The Node is a CDataSection.</td>
</tr>
<tr>
<td>ENTITY_REFERENCE_NODE</td>
<td>PLS_INTEGER</td>
<td>5</td>
<td>The Node is an Entity Reference.</td>
</tr>
<tr>
<td>ENTITY_NODE</td>
<td>PLS_INTEGER</td>
<td>6</td>
<td>The Node is an Entity.</td>
</tr>
<tr>
<td>PROCESSING_INSTRUCTION_NODE</td>
<td>PLS_INTEGER</td>

<td>PLS_INTEGER</td>
<td>11</td>
<td>The Node is a Document fragment.</td>
</tr>
<tr>
<td>NOTATION_NODE</td>
<td>PLS_INTEGER</td>
<td>12</td>
<td>The Node is a Notation.</td>
</tr>
</tbody>
</table>
The following types for `DBMS_XMLDOM.DOMTYPE` are defined in Table 191–2:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMATTR</td>
<td>Implements the DOM Attribute interface.</td>
</tr>
<tr>
<td>DOMCDATASECTION</td>
<td>Implements the DOM CDataSection interface.</td>
</tr>
<tr>
<td>DOMCHARACTERDATA</td>
<td>Implements the DOM Character Data interface.</td>
</tr>
<tr>
<td>DOMCOMMENT</td>
<td>Implements the DOM Comment interface.</td>
</tr>
<tr>
<td>DOMDOCUMENT</td>
<td>Implements the DOM Document interface.</td>
</tr>
<tr>
<td>DOMDOCUMENTFRAGMENT</td>
<td>Implements the DOM DocumentFragment interface.</td>
</tr>
<tr>
<td>DOMDOCUMENTTYPE</td>
<td>Implements the DOM Document Type interface.</td>
</tr>
<tr>
<td>DOMELEMENT</td>
<td>Implements the DOM Element interface.</td>
</tr>
<tr>
<td>DOMENTITY</td>
<td>Implements the DOM Entity interface.</td>
</tr>
<tr>
<td>DOMENTITYREFERENCE</td>
<td>Implements the DOM EntityReference interface.</td>
</tr>
<tr>
<td>DOMIMPLEMENTATION</td>
<td>Implements the DOM Implementation interface.</td>
</tr>
<tr>
<td>DOMNAMEDNODEMAP</td>
<td>Implements the DOM Named Node Map interface.</td>
</tr>
<tr>
<td>DOMNODE</td>
<td>Implements the DOM Node interface.</td>
</tr>
<tr>
<td>DOMNODELIST</td>
<td>Implements the DOM NodeList interface.</td>
</tr>
<tr>
<td>DOMNOTATION</td>
<td>Implements the DOM Notation interface.</td>
</tr>
<tr>
<td>DOMPROCESSINGINSTRUCTION</td>
<td>Implements the DOM Processing instruction interface.</td>
</tr>
<tr>
<td>DOMTEXT</td>
<td>Implements the DOM Text interface.</td>
</tr>
</tbody>
</table>
Exceptions

The exceptions listed in Table 191–3 are defined for DBMS_XMLDOM:

**Table 191–3 Exceptions for DBMS_XMLDOM**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOMSTRING_SIZE_ERR</td>
<td>If the specified range of text does not fit into a DOMString.</td>
</tr>
<tr>
<td>HIERARCHY_REQUEST_ERR</td>
<td>If any node is inserted somewhere it doesn't belong.</td>
</tr>
<tr>
<td>INDEX_SIZE_ERR</td>
<td>If index or size is negative, or greater than the allowed value.</td>
</tr>
<tr>
<td>INUSE_ATTRIBUTE_ERR</td>
<td>If an attempt is made to add an attribute that is already in use elsewhere.</td>
</tr>
<tr>
<td>INVALID_CHARACTER_ERR</td>
<td>If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.</td>
</tr>
<tr>
<td>NO_DATA_ALLOWED_ERROR</td>
<td>If data is specified for a node that does not support data.</td>
</tr>
<tr>
<td>NOT_FOUND_ERR</td>
<td>If an attempt is made to reference a node in a context where it does not exist.</td>
</tr>
<tr>
<td>NO_MODIFICATION_ALLOWED_ERR</td>
<td>If an attempt is made to modify an object where modifications are not allowed.</td>
</tr>
<tr>
<td>NOT_SUPPORTED_ERR</td>
<td>If the implementation does not support the requested type of object or operation.</td>
</tr>
<tr>
<td>WRONG_DOCUMENT_ERR</td>
<td>If a node is used in a different document than the one that created it (that doesn't support it).</td>
</tr>
</tbody>
</table>
Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms on page 191-11
- DOMAttr Subprograms on page 191-13
- DOMCDataSection Subprograms on page 191-14
- DOMCharacterData Subprograms on page 191-15
- DOMComment Subprograms on page 191-16
- DOMDocument Subprograms on page 191-17
- DOMDocumentFragment Subprograms on page 191-19
- DOMDocumentType Subprograms on page 191-20
- DOMElement Subprograms on page 191-21
- DOMEntity Subprograms on page 191-22
- DOMEntityReference Subprograms on page 191-23
- DOMImplementation Subprograms on page 191-24
- DOMNamedNodeMap Subprograms on page 191-25
- DOMNodeList Subprograms on page 191-26
- DOMNotation Subprograms on page 191-27
- DOMProcessingInstruction Subprograms on page 191-28
- DOMText Subprograms on page 191-29
## DOMNode Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADOPTNODE Function</strong> on page 191-41</td>
<td>Adopts a node from another document</td>
</tr>
<tr>
<td><strong>APPENDCHILD Function</strong> on page 191-42</td>
<td>Appends a new child to the node</td>
</tr>
<tr>
<td><strong>CLONENODE Function</strong> on page 191-44</td>
<td>Clones the node</td>
</tr>
<tr>
<td><strong>FREENODE Procedure</strong> on page 191-60</td>
<td>Frees all resources associated with the node</td>
</tr>
<tr>
<td><strong>GETATTRIBUTES Function</strong> on page 191-64</td>
<td>Retrieves the attributes of the node</td>
</tr>
<tr>
<td><strong>GETCHILDNODES Function</strong> on page 191-66</td>
<td>Retrieves the children of the node</td>
</tr>
<tr>
<td><strong>GETEXPANDEDNAME Procedure and Functions</strong> on page 191-73</td>
<td>Retrieves the expanded name of the node</td>
</tr>
<tr>
<td><strong>GETFIRSTCHILD Function</strong> on page 191-74</td>
<td>Retrieves the first child of the node</td>
</tr>
<tr>
<td><strong>GETLASTCHILD Function</strong> on page 191-76</td>
<td>Retrieves the last child of the node</td>
</tr>
<tr>
<td><strong>GETLOCALNAME Procedure and Functions</strong> on page 191-78</td>
<td>Retrieves the local part of the qualified name</td>
</tr>
<tr>
<td><strong>GETNAMESPACE Procedure and Functions</strong> on page 191-81</td>
<td>Retrieves the node's namespace URI</td>
</tr>
<tr>
<td><strong>GETNEXTSIBLING Function</strong> on page 191-82</td>
<td>Retrieves the next sibling of the node</td>
</tr>
<tr>
<td><strong>GETNODENAME Function</strong> on page 191-84</td>
<td>Retrieves the Name of the Node</td>
</tr>
<tr>
<td><strong>GETNODETYPE Function</strong> on page 191-83</td>
<td>Retrieves the Type of the node</td>
</tr>
<tr>
<td><strong>GETNODEVALUE Function</strong> on page 191-85</td>
<td>Retrieves the Value of the Node</td>
</tr>
<tr>
<td><strong>GETNODEVALUEASBINARYSTREAM Function &amp; Procedure</strong> on page 191-86</td>
<td>Retrieves Node Value as binary stream</td>
</tr>
<tr>
<td><strong>GETNODEVALUEASCCHARACTERSTREAM Function &amp; Procedure</strong> on page 191-87</td>
<td>Retrieves Node Value as character stream</td>
</tr>
<tr>
<td><strong>GETOWNERDOCUMENT Function</strong> on page 191-91</td>
<td>Retrieves the owner document of the node</td>
</tr>
<tr>
<td><strong>GETPARENTNODE Function</strong> on page 191-93</td>
<td>Retrieves the parent of this node</td>
</tr>
<tr>
<td><strong>GETPREFIX Function</strong> on page 191-94</td>
<td>Retrieves the namespace prefix</td>
</tr>
<tr>
<td><strong>GETPREVIOUSSIBLING Function</strong> on page 191-95</td>
<td>Retrieves the previous sibling of the node</td>
</tr>
<tr>
<td><strong>GETSCHEMANODE Function</strong> on page 191-98</td>
<td>Retrieves the associated schema URI</td>
</tr>
<tr>
<td><strong>HASATTRIBUTES Function</strong> on page 191-107</td>
<td>Tests if the node has attributes</td>
</tr>
<tr>
<td><strong>HASCHILDNODES Function</strong> on page 191-108</td>
<td>Tests if the node has child nodes</td>
</tr>
<tr>
<td><strong>IMPORTNODE Function</strong> on page 191-110</td>
<td>Imports a node from another document</td>
</tr>
<tr>
<td><strong>INSERTBEFORE Function</strong> on page 191-111</td>
<td>Inserts a child before the reference child</td>
</tr>
<tr>
<td><strong>ISNULL Functions</strong> on page 191-113</td>
<td>Tests if the node is NULL</td>
</tr>
<tr>
<td><strong>MAKEATTR Function</strong> on page 191-117</td>
<td>Casts the node to an Attribute</td>
</tr>
<tr>
<td><strong>MAKEDATASECTION Function</strong> on page 191-118</td>
<td>Casts the node to a CData Section</td>
</tr>
<tr>
<td><strong>MAKECHARACTERDATA Function</strong> on page 191-119</td>
<td>Casts the node to Character Data</td>
</tr>
</tbody>
</table>

</tbody>
</table>
ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

**See Also:** [DOMNode Subprograms](#) on page 191-11 for other subprograms in this group

**Syntax**

```sql
DBMS_XMLDOM.ADOPTNODE(
    doc IN DOMDocument,
    importedNode IN DOMNode)
RETURN DOMNODE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Document that is adopting the node</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to adopt</td>
</tr>
</tbody>
</table>

**Usage Notes**

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.
APPENDCHILD Function

This function adds the node newchild to the end of the list of children of this node, and returns the newly added node. If the newchild is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS.XMLDOM.APPENDCHILD(
    n          IN  DOMNode,
    newchild   IN  DOMNode)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>newchild</td>
<td>The child to be appended to the list of children of node n</td>
</tr>
</tbody>
</table>
APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

DBMS_XMLDOM.APPENDDATA (   
    cd      IN    DOMCHARACTERDATA,   
    arg     IN    VARCHAR2);   

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>arg</td>
<td>The data to append to the existing data</td>
</tr>
</tbody>
</table>
CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLODOM.CLONENODE(
    n       IN    DOMNODE,
    deep    IN    BOOLEAN)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>deep</td>
<td>Determines if children are to be cloned</td>
</tr>
</tbody>
</table>

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.
CREATEATTRIBUTE Functions

This function creates a DOMATTN node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

Creates a DOMATTN with the specified name:

```
CREATEATTRIBUTE (doc IN DOMDOCUMENT, name IN VARCHAR2) RETURN DOMATTN;
```

Creates a DOMATTN with the specified name and namespace URI:

```
CREATEATTRIBUTE (doc IN DOMDOCUMENT, qname IN VARCHAR2, ns IN VARCHAR2) RETURN DOMATTN;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>qname</td>
<td>New attribute qualified name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
```

CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

See Also:  DOMDocument Subprograms on page 191-17

Syntax

DBMS_XMLDOM.CREATECDATASECTION(
    doc    IN    DOMDOCUMENT,
    data   IN    VARCHAR2)
RETURN DOMCDATASECTION;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMCDATASECTION node</td>
</tr>
</tbody>
</table>
CREATECOMMENT Function

This function creates a DOMCOMMENT node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLODOM.CREATECOMMENT(
    doc      IN      DOMDOCUMENT,
    data     IN      VARCHAR2)
RETURN DOMCOMMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Table 191–28 CREATECOMMENT Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>doc</td>
</tr>
<tr>
<td>data</td>
</tr>
</tbody>
</table>
CREATEDOCUMENT Function

This function creates a DOMDocument with specified namespace URI, root element name, DTD.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```sql
DBMS_XMLDOM.CREATEDOCUMENT(
    namespaceURI      IN     VARCHAR2,
    qualifiedName     IN     VARCHAR2,
    doctype           IN     DOMTYPE := NULL)
RETURN DOMDOCUMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespaceURI</td>
<td>Namespace URI</td>
</tr>
<tr>
<td>qualifiedName</td>
<td>Root element name</td>
</tr>
<tr>
<td>doctype</td>
<td>Document type</td>
</tr>
</tbody>
</table>
CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```sql
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
    doc IN DOMDOCUMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDocument</td>
</tr>
</tbody>
</table>
CREATEELEMENT Functions

This function creates a DOMElement.

**See Also:** [DOMDocument Subprograms](#) on page 191-17

**Syntax**

Creates a DOMElement with specified name:

```sql
DBMS_XMLDOM.CREATEELEMENT(
    doc IN DOMDOCUMENT,
    tagName IN VARCHAR2)
RETURN DOMELEMENT;
```

Creates a DOMElement with specified name and namespace URI:

```sql
DBMS_XMLDOM.CREATEELEMENT(
    doc IN DOMDOCUMENT,
    tagName IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMELEMENT;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>tagName</td>
<td>Tagname for new DOMELEMENT</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
    doc        IN     DOMDOCUMENT,
    name       IN     VARCHAR2)
RETURN DOMENTITYREFERENCE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>name</td>
<td>New entity reference name</td>
</tr>
</tbody>
</table>
CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

**See Also:** [DOMDocument Subprograms](#) on page 191-17

**Syntax**

```sql
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
    doc IN DOMDocument,
    target IN VARCHAR2,
    data IN VARCHAR2)
RETURN DOMPROCESSINGINSTRUCTION;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>target</td>
<td>Target of the new processing instruction</td>
</tr>
<tr>
<td>data</td>
<td>Content data of the new processing instruction</td>
</tr>
</tbody>
</table>
CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
    doc IN   DOMDocument,
    data IN VARCHAR2)
RETURN DOMTEXT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>data</td>
<td>Content of the DOMText node</td>
</tr>
</tbody>
</table>
DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

```sql
DBMS_XMLDOM.DELETEDATA(
    cd        IN     DOMCHARACTERDATA,
    offset    IN     NUMBER,
    cnt       IN     NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset from which to delete the data</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (starting from offset) to delete</td>
</tr>
</tbody>
</table>
**FINDENTITY Function**

This function finds an entity in the specified DTD, and returns that entity if found.

*See Also:* [DOMDocumentType Subprograms](#) on page 191-20

**Syntax**

```sql
DBMS_XMLDOM.FINDENTITY(
    dt IN DOMDOCUMENTTYPE,
    name IN VARCHAR2,
    par IN BOOLEAN)
RETURN DOMENTITY;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>name</td>
<td>Entity to find</td>
</tr>
<tr>
<td>par</td>
<td>Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity</td>
</tr>
</tbody>
</table>
FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

See Also:  DOMDocumentType Subprograms on page 191-20

Syntax

DBMS_XMLDOM.FINDNOTATION(
    dt        IN     DOMDocumentType,
    name      IN     VARCHAR2)
RETURN DOMNOTATION;

Parameters

Table 191–37  FINDNOTATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>name</td>
<td>The notation to find</td>
</tr>
</tbody>
</table>
FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

See Also:  DOMDocument Subprograms on page 191-17 and
DOMDocumentFragment Subprograms on page 191-19

Syntax

DBMS_XMLODOM.FREEDOCFRAG(
    df    IN    DOMDOCUMENTFRAGMENT);

Parameters

Table 191–38  FREEDOCFRAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>df</td>
<td>DOM document fragment</td>
</tr>
</tbody>
</table>
FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```sql
DBMS_XMLDOM.FREEDOCUMENT(
    doc IN DOMDOCUMENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
FREEELEMENT Procedure

This procedure frees memory allocated to a DOMElement handle.

See Also: DOMElement Subprograms on page 191-21

Syntax

\[
\text{DBMS.XMLDOM.FREEELEMENT(}
  \text{elem} \text{ IN DOMELEMENT)};
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>Of type DOMELEMENT</td>
</tr>
</tbody>
</table>
FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLODOM.FREENODE(
    n IN DOMNODE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
**FREENODELIST Procedure**

This procedure frees all resources associated with a nodelist.

**See Also:** [DOMNodeList Subprograms on page 191-26](#)

**Syntax**

```
DBMS_XMLDOM.FREENODE(
    nl   IN   DOMNodeList);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nl</td>
<td>Of type DOMNODELIST</td>
</tr>
</tbody>
</table>
GETATTRIBUTE Functions

This function returns the value of an attribute of a DOMElement by name.

See Also: DOMElement Subprograms on page 191-21

Syntax

Returns the value of a DOMElement's attribute by name:

```sql
DBMS_XMLDOM.GETATTRIBUTE(
    elem       IN      DOMElement,
    name       IN      VARCHAR2)
RETURN VARCHAR2;
```

Returns the value of a DOMElement's attribute by name and namespace URI:

```sql
DBMS_XMLDOM.GETATTRIBUTE(
    elem      IN     DOMElement,
    name      IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN VARCHAR2;
```

Parameters

**Table 191–43 GETATTRIBUTE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
**GETATTRIBUTENODE Functions**

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**See Also:** DOMElemet Subprograms on page 191-21

**Syntax**

Returns an attribute node from the DOMELEMENT by name:

```sql
DBMS_XMLDOM.GETATTRIBUTENODE(
    elem      IN     DOMElement,
    name      IN     VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```sql
DBMS_XMLDOM.GETATTRIBUTENODE(
    elem      IN     DOMElement,
    name      IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN DOMATTR;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
GETATTRIBUTES Function

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.GETATTRIBUTES(
    n        IN        DOMNode)
RETURN DOMNAMEDNODEMAP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETCHARSET Function

This function retrieves the characterset of the DOM document.

**See Also:** [DOMDocument Subprograms](#) on page 191-17

**Syntax**

```
DBMS_XMLDOM.GETCHARSET(
   doc IN   DOMDocument)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Table 191–46</th>
<th>GETCHARSET Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>doc</td>
<td>DOM document</td>
</tr>
</tbody>
</table>

**Usage Notes**

For a newly parsed document, we return the database characterset. Once the `SETCHARSET` Procedure is called with a non-NULL value for charset, that charset is returned.
GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.GETCHILDNODES(
    n IN DOMNode)
RETURN DOMNodeList;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
## GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

**See Also:** [DOMElement Subprograms](#) on page 191-21

### Syntax

Returns children of the `DOMELEMENT` given the tag name:

```sql
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem      IN      DOMElement,
    name      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```sql
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
    elem      IN      DOMElement,
    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td><code>DOMELEMENT</code></td>
</tr>
<tr>
<td>name</td>
<td>Tag name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

---
This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 191-15):

```sql
DBMS_XMLDOM.GETDATA(
    cd      IN    DOMCHARACTERDATA)
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: DOMProcessingInstruction Subprograms on page 191-28):

```sql
DBMS_XMLDOM.GETDATA(
    pi      IN    DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>pi</td>
<td>The DOMPROCESSINGINSTRUCTION</td>
</tr>
</tbody>
</table>
GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

DBMS_XMLDOM.GETDOCTYPE(
    doc IN DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```sql
DBMS(XMLDOM).GETDOCUMENTELEMENT(
    doc       IN       DOMDOCUMENT)
RETURN DOMELEMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    doc         IN      DOMDOCUMENT,
    tagname     IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem      IN     DOMELEMENT,
    name      IN     VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem      IN     DOMELEMENT,
    name      IN     VARCHAR2,
    ns        IN     VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>tagname</td>
<td>Name of the tag to match on</td>
</tr>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Tag name; using a wildcard(*) would match any tag</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

See Also:  DOMDocumentType Subprograms on page 191-20

Syntax

```
DBMS_XMLDOM.GETENTITIES(
    dt      IN     DOMDocumentType)
RETURN DOMNAMEDNODEMAP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the Node if is in an Element or Attribute type; otherwise, returns NULL (See Also: DOMNode Subprograms on page 191-11)

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    n       IN      DOMNODE
    data    OUT     VARCHAR);
```

Returns the expanded name of the DOMAttr (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    a       IN     DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the DOMElement (See Also: DOMElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    elem    IN    DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>data</td>
<td>Returned expanded name of the Node</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>
GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

**See Also:** [DOMNode Subprograms](#) on page 191-11

**Syntax**

```sql
DBMS_XMLDOM.GETFIRSTCHILD(
    n IN DOMNODE
) RETURN DOMNODE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

DBMS_XMLDOM.GETIMPLEMENTATION(
    doc IN DOMDOCUMENT)
RETURN DOMIMPLEMENTATION;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.GETLASTCHILD(
    n     IN   DOMNODE)
RETURN DOMNODE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.GETLENGTH(
    cd IN DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: DOMNamedNodeMap Subprograms on page 191-25):

```
DBMS_XMLDOM.GETLENGTH(
    nnm IN DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also:DOMNodeList Subprograms on page 191-26):

```
DBMS_XMLDOM.GETLENGTH(
    nl IN DOMNODELIST)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>nnm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNODELIST</td>
</tr>
</tbody>
</table>
GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms on page 191-11):

```sql
DBMS_XMLDOM.GETLOCALNAME(
  n       IN     DOMNODE,
  data    OUT    VARCHAR2);
```

Returns the local name of the DOMAttr (See Also: DOMAttr Subprograms on page 191-13):

```sql
DBMS_XMLDOM.GETLOCALNAME(
  a       IN     DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the DOMElement (See Also: DOMElement Subprograms on page 191-21)

```sql
DBMS_XMLDOM.GETLOCALNAME(
  elem       IN     DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>data</td>
<td>Returned local name.</td>
</tr>
<tr>
<td>a</td>
<td>DOMAttr.</td>
</tr>
<tr>
<td>elem</td>
<td>DOMElemet.</td>
</tr>
</tbody>
</table>
GETNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms on page 191-13):

```sql
DBMS_XMLDOM.GETNAME(
    a IN DOMATTR)
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: DOMDocumentSubprograms on page 191-20):

```sql
DBMS_XMLDOM.GETNAME(
    dt IN DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
GETNAMEDITEM Function

This function retrieves a node specified by name.

See Also:  DOMNamedNodeMap Subprograms on page 191-25

Syntax

Retrieves a node specified by name:

```sql
DBMS_XMLDOM.GETNAMEDITEM(
    nnm    IN  DOMNAMEDNODEMAP,
    name   IN  VARCHAR2)
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```sql
DBMS_XMLDOM.GETNAMEDITEM(
    nnm    IN  DOMNAMEDNODEMAP,
    name   IN  VARCHAR2,
    ns     IN  VARCHAR2)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>name</td>
<td>Name of the item to be retrieved</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms on page 191-11):

```plaintext
DBMS_XMLDOM.GETNAMESPACE(
    n       IN     DOMNODE,
    data    OUT    VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: DOMAttr Subprograms on page 191-13):

```plaintext
DBMS_XMLDOM.GETNAMESPACE(
    a       IN     DOMATTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: DOMElement Subprograms on page 191-21):

```plaintext
DBMS_XMLDOM.GETNAMESPACE(
    elem       IN     DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>data</td>
<td>Returned namespace URI</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>
GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLElement.GETNEXTSIBLING(
    n IN DOMNODE)
RETURN DOMNode;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

**See Also:** DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.GETNODETYPE(
    n       IN     DOMNODE)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>

Table 191–64 GETNODETYPE Function Parameters
GETNODENAME Function

This function gets the name of the node depending on its type.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETNODENAME(
    n       IN     DOMNODE
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.GETNODEVALUE(
  n       IN     DOMNODE)
RETURN VARCHAR2;*

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also:  DOMNode Subprograms on page 191-11

Syntax

This function returns an instance of the PL/SQL XMLBinaryInputStream. The node datatype must be RAW or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n      IN     DOMNODE)
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be RAW or CLOB – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n        in   DOMNODE,
    value    in   SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>BINARYOUTPUTSTREAM</td>
</tr>
</tbody>
</table>
GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 191-11

Syntax

This function returns an instance of the PL/SQL XMLCharacterInputStream. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```plaintext
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (n        IN     DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the SYS.UTL_CHARACTEROUTPUTSTREAM.

```plaintext
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (n        IN     DOMNODE,
value    IN     SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>CHARACTEROUTPUTSTREAM</td>
</tr>
</tbody>
</table>

Table 191–68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters
GETNOTATIONNAME Function

This function returns the notation name of the DOMENTITY.

See Also: DOMEntity Subprograms on page 191-22

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
    ent       IN     DOMENTITY)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ent</td>
<td>DOMENTITY</td>
</tr>
</tbody>
</table>
GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

See Also: DOMDocumentType Subprograms on page 191-20

Syntax

```sql
DBMS_XMLDOM.GETNOTATIONS(
    dt       IN     DOMDOCUMENTTYPE)
RETURN DOMNAMEDNODEMAP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE</td>
</tr>
</tbody>
</table>
GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

See Also: DOMProcessingInstruction Subprograms on page 191-28

Syntax

```
DBMS_XMLDOM.GETTARGET(
    pi          IN     DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION</td>
</tr>
</tbody>
</table>
GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
   n       IN     DOMNODE)
RETURN DOMDOCUMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also: DOMAttr Subprograms on page 191-13

Syntax

```plsql
DBMS_XMLDOM.GETOWNERELEMENT(
    a IN DOMATTR
) RETURN DOMElement;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Attribute</td>
</tr>
</tbody>
</table>
GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except Attr, Document, DocumentFragment, Entity, and Notation may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.GETPARENTNODE(
    n IN DOMNODE)
RETURN DOMNODE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.GETPREFIX(
   n       IN     DOMNODE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETPREVIOUSSibling Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.GETPREVIOUSSibling(
    n       IN     DOMNODE)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: DOMDocumentType Subprograms on page 191-20):

```sql
DBMS_XMLDOM.GETPUBLICID(
    dt IN DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 191-22):

```sql
DBMS_XMLDOM.GETPUBLICID(
    ent IN DOMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 191-27):

```sql
DBMS_XMLDOM.GETPUBLICID(
    n IN DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Table 191–77</th>
<th>GETPUBLICID Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>dt</td>
<td>The DTD</td>
</tr>
<tr>
<td>ent</td>
<td>DOMENTITY</td>
</tr>
<tr>
<td>n</td>
<td>DOMNOTATION</td>
</tr>
</tbody>
</table>
GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Returns the qualified name of the `DOMATTR` (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
    a        IN     DOMATTR)
RETURN VARCHAR2;
```

Returns the qualified name of the `DOMELEMENT` (See Also: DOMEElement Subprograms on page 191-21):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
    elem     IN     DOMELEMENT)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT</td>
</tr>
</tbody>
</table>
GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.GETSCHEMANODE(
    n IN DOMNODE)
RETURN DOMNODE;

Parameters

Table 191–79 GETSCHEMANODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

**See Also:** DOMAttr Subprograms on page 191-13

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
    a   IN    DOMATTR)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
</tbody>
</table>
GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```sql
DBMS_XMLDOM.GETSTANDALONE(
    doc       IN     DOMDOCUMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.GETSYSTEMID(
    dt       IN     DOMDOCUMENTTYPE
) RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 191-22):

```
DBMS_XMLDOM.GETSYSTEMID(
    ent      IN     DOMENTITY
) RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 191-27):

```
DBMS_XMLDOM.GETSYSTEMID(
    n        IN     DOMNOTATION
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dt</td>
<td>The DTD.</td>
</tr>
<tr>
<td>ent</td>
<td>DOMEntity.</td>
</tr>
<tr>
<td>n</td>
<td>DOMNotation.</td>
</tr>
</tbody>
</table>
GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also: DOMElement Subprograms on page 191-21

Syntax

DBMS_XMLDOM.GETTAGNAME(
    elem    IN    DOMELEMENT)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
</tbody>
</table>
GETVALUE Function

This function retrieves the value of the attribute.

See Also: DOMAttr Subprograms on page 191-13

Syntax

```sql
DBMS_XMLDOM.GETVALUE(
    a IN DOMATTR
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
</tbody>
</table>
GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```
DBMS_XMLDOM.GETVERSION(
   doc       IN     DOMDOCUMENT)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
GETXMLTYPE Function

This function returns the XMLType associated with the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

DBMS_XMLDOM.GETXMLTYPE (doc IN DOMDOCUMENT) RETURN SYS.XMLTYPE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMElement, or has a default value.

See Also: DOMElement Subprograms on page 191-21

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

```sql
DBMS_XMLDOM.HASATTRIBUTE(
    elem     IN  DOMElement,
    name     IN  VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for DOMElement; namespace enabled:

```sql
DBMS_XMLDOM.HASATTRIBUTE(
    elem     IN  DOMElement,
    name     IN  VARCHAR2,
    ns       IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMElement</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name; * matches any attribute</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(
    n    IN    DOMNODE)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
HASCHILDNODES Function

This function determines whether this node has any children.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.HASCHILDNODES (  
   n IN DOMNODE)  
RETURN BOOLEAN;

Parameters

Table 191–89 HASCHILDNODES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

See Also: DOMImplementation Subprograms on page 191-24

Syntax

DBMS_XMLDOM.HASFEATURE(
    di       IN     DOMIMPLEMENTATION,
    feature  IN     VARCHAR2,
    version  IN     VARCHAR2)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>di</td>
<td>DOMIMPLEMENTATION</td>
</tr>
<tr>
<td>feature</td>
<td>The feature to check for</td>
</tr>
<tr>
<td>version</td>
<td>The version of the DOM to check in</td>
</tr>
</tbody>
</table>
IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also: DOMNode Subprograms on page 191-11

Syntax

```plaintext
DBMS_XMLEMPORTNODE(
    doc            IN  DOMDOCUMENT,
    importedNode   IN  DOMNODE,
    deep           IN  BOOLEAN)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Document from which the node is imported</td>
</tr>
<tr>
<td>importedNode</td>
<td>Node to import</td>
</tr>
<tr>
<td>deep</td>
<td>Setting for recursive import.</td>
</tr>
<tr>
<td></td>
<td>■ If this value is TRUE, the entire subtree of the node will be imported with the node.</td>
</tr>
<tr>
<td></td>
<td>■ If this value is FALSE, only the node itself will be imported.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.
INSERTBEFORE Function

This function inserts the node newchild before the existing child node refchild. If refchild is NULL, insert newchild at the end of the list of children.

If newchild is a DOCUMENTFRAGMENT object, all of its children are inserted, in the same order, before refchild. If the newchild is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(
    n          IN     DOMNODE,
    newchild   IN     DOMNODE,
    refchild   IN     DOMNODE)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>newChild</td>
<td>The child to be inserted in the DOMNODE</td>
</tr>
<tr>
<td>refChild</td>
<td>The reference node before which the newchild is to be inserted</td>
</tr>
</tbody>
</table>
INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

```
DBMS_XMLDOM.INSERTDATA(
   cd       IN     DOMCHARACTERDATA,
   offset   IN     NUMBER,
   arg      IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to insert the data</td>
</tr>
<tr>
<td>arg</td>
<td>The value to be inserted</td>
</tr>
</tbody>
</table>
ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.ISNULL (
    n        IN     DOMNODE)
RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.ISNULL (
    a       IN     DOMATTR)
RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms on page 191-14):

```
DBMS_XMLDOM.ISNULL (
    cds      IN     DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.ISNULL (
    cd       IN     DOMCHARACTERDATA)
RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms on page 191-16):

```
DBMS_XMLDOM.ISNULL (
    com      IN     DOMCOMMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.ISNULL (
    doc      IN     DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms on page 191-19):

```
DBMS_XMLDOM.ISNULL (
    df       IN     DOMDOCUMENTFRAGMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.ISNULL (
    dt       IN     DOMDOCUMENTTYPE)
```
FUNCTIONS

ISNULL Functions

RETURN BOOLEAN;

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms on page 191-21):

DBMS_XMLDOM.ISNULL(
    elem IN DOMELEMENT)
RETURN BOOLEAN;

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms on page 191-22):

DBMS_XMLDOM.ISNULL(
    ent IN DOMENTITY)
RETURN BOOLEAN;

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms on page 191-23):

DBMS_XMLDOM.ISNULL(
    EREF IN DOMENTITYREFERENCE)
RETURN BOOLEAN;

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms on page 191-24):

DBMS_XMLDOM.ISNULL(
    di IN DOMIMPLEMENTATION)
RETURN BOOLEAN;

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms on page 191-25):

DBMS_XMLDOM.ISNULL(
    nmm IN DOMNAMEDNODEMAP)
RETURN BOOLEAN;

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also:DOMNodeList Subprograms on page 191-26):

DBMS_XMLDOM.ISNULL(
    nl IN DOMNODELIST)
RETURN BOOLEAN;

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms on page 191-27):

DBMS_XMLDOM.ISNULL(
    n IN DOMNOTATION)
RETURN BOOLEAN;

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms on page 191-28):

DBMS_XMLDOM.ISNULL(
    pi IN DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms on page 191-29):

DBMS_XMLDOM.ISNULL(
### Parameters

**Table 191–94  ISNULL Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to check</td>
</tr>
<tr>
<td>a</td>
<td>DOMATTR to check</td>
</tr>
<tr>
<td>cds</td>
<td>DOMCDATASECTION to check</td>
</tr>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA to check</td>
</tr>
<tr>
<td>com</td>
<td>DOMCOMMENT to check</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT to check</td>
</tr>
<tr>
<td>dF</td>
<td>DOMDOCUMENTFRAGMENT to check</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE to check</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT to check</td>
</tr>
<tr>

</tbody>
</table>
ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: `DOMNamedNodeMap Subprograms` on page 191-25):

```sql
DBMS_XMLDOM.ITEM(
    nmm       IN     DOMNAMEDNODEMAP,
    index     IN     NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: `DOMNodeList Subprograms` on page 191-26):

```sql
DBMS_XMLDOM.ITEM(
    nl       IN     DOMNODELIST,
    index    IN     NUMBER)
RETURN DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nmm</td>
<td>DOMNAMEDNODEMAP</td>
</tr>
<tr>
<td>index</td>
<td>The index in the node map at which the item is to be retrieved</td>
</tr>
<tr>
<td>nl</td>
<td>DOMNODELIST</td>
</tr>
<tr>
<td>index</td>
<td>The index in the NodeList used to retrieve the item</td>
</tr>
</tbody>
</table>
MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also: DOMNode Subprograms on page 191-11

Syntax

\[
\text{DBMS_XMLDOM.MAKEATTR(n IN DOMNODE) RETURN DOMATTR;}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.MAKECDATASECTION(
    n       IN     DOMNODE)
RETURN DOMCDATASECTION;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
**MAKECHARACTERDATA Function**

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

**See Also:** DOMNode Subprograms on page 191-11

**Syntax**

```sql
DBMS_XMLDOM.MAKECHARACTERDATA(
    n IN DOMNode)
RETURN DOMCharacterData;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.MAKECOMMENT(
    n       IN     DOMNODE)
RETURN DOMCOMMENT;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEDOCUMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.MAKEDOCUMENT (  
   n       IN     DOMNODE)  
RETURN DOMDocument;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEDOCUMENTFRAGMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
    n       IN     DOMNODE)
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
**MAKEDOCUMENTTYPE Function**

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

**See Also:** DOMNode Subprograms on page 191-11

**Syntax**

```sql
DBMS_XMLDOM.MAKEDOCUMENTTYPE(
    n       IN     DOMNODE)
RETURN DOMDOCUMENTTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast.</td>
</tr>
</tbody>
</table>
MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEELEMENT(
    n       IN     DOMNODE)
RETURN DOMELEMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEENTITY Function

This function casts a specified DOMNODE to a DOMENTITY, and returns the DOMENTITY.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.MAKEENTITY (  
n IN   DOMNODE)  
RETURN DOMENTITY;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DOMENTITYREFERENCE, and returns the DOMENTITYREFERENCE.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.MAKEENTITYREFERENCE (
    n       IN     DOMNODE)
RETURN DOMENTITYREFERENCE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms on page 191-13):

```
DBMS_XMLDOM.MAKENODE(
    a        IN     DOMATTR)
RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms on page 191-14):

```
DBMS_XMLDOM.MAKENODE(
    cds      IN     DOMCDATASECTION)
RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms on page 191-15):

```
DBMS_XMLDOM.MAKENODE(
    cd       IN     DOMCHARACTERDATA)
RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms on page 191-16):

```
DBMS_XMLDOM.MAKENODE(
    com      IN     DOMCOMMENT)
RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.MAKENODE(
    doc      IN     DOMDOCUMENT)
RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms on page 191-19):

```
DBMS_XMLDOM.MAKENODE(
    df       IN     DOMDOCUMENTFRAGMENT)
RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms on page 191-20):

```
DBMS_XMLDOM.MAKENODE(
    dt       IN     DOMDOCUMENTTYPE)
RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMElem Subprograms on page 191-21):

```
DBMS_XMLDOM.MAKENODE(
    elem      IN     DOMELEMENT)
```
RETURN DOMNODE;

Casts specified DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms on page 191-22):

DBMS_XMLDOM.MAKENODE(
    ent       IN     DOMENTITY)
RETURN DOMNODE;

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms on page 191-23):

DBMS_XMLDOM.MAKENODE(
    eref       IN     DOMENTITYREFERENCE)
RETURN DOMNODE;

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms on page 191-27):

DBMS_XMLDOM.MAKENODE(
    n       IN     DOMNOTATION)
RETURN DOMNODE;

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms on page 191-28):

DBMS_XMLDOM.MAKENODE(
    pi       IN     DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms on page 191-29):

DBMS_XMLDOM.MAKENODE(
    t       IN     DOMTEXT)
RETURN DOMNODE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR to cast</td>
</tr>
<tr>
<td>cds</td>
<td>DOMCDATASECTION to cast</td>
</tr>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA to cast</td>
</tr>
<tr>
<td>com</td>
<td>DOMCOMMENT to cast</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT to cast</td>
</tr>
<tr>
<td>df</td>
<td>DOMDOCUMENTFRAGMENT to cast</td>
</tr>
<tr>
<td>dt</td>
<td>DOMDOCUMENTTYPE to cast</td>
</tr>
<tr>
<td>elem</td>
<td>DOMELEMENT to cast</td>
</tr>
<tr>
<td>ent</td>
<td>DOMENTITY to cast</td>
</tr>
<tr>
<td>eref</td>
<td>DOMENTITYREFERENCE to cast</td>
</tr>
<tr>
<td>n</td>
<td>DOMNOTATION to cast</td>
</tr>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION to cast</td>
</tr>
</tbody>
</table>
## Table 191–106 (Cont.) MAKENODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>DOMTEXT to cast</td>
</tr>
</tbody>
</table>
MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also:  DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.MAKENOTATION(
    n       IN     DOMNODE)
RETURN DOMNOTATION;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also: DOMNode Subprograms on page 191-11

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
    n       IN     DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.MAKETEXT (n IN DOMNODE) RETURN DOMTEXT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE to cast</td>
</tr>
</tbody>
</table>
NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also: DOMDocument Subprograms on page 191-17

Syntax

Returns a new DOMDOCUMENT instance:

```sql
DBMS_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```sql
DBMS_XMLDOM.NEWDOMDOCUMENT(
  xmldoc    IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```sql
DBMS_XMLDOM.NEWDOMDOCUMENT(
  cl       IN    CLOB)
RETURN DOMDOCUMENT;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldoc</td>
<td>XMLType source for the DOMDOCUMENT</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB source for the DOMDOCUMENT</td>
</tr>
</tbody>
</table>
NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 191-21

Syntax

DBMS_XMLDOM.NORMALIZE(
    elem IN DOMELEMENT);

Parameters

Table 191–111 NORMALIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
</tbody>
</table>
REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also: DOMElement Subprograms on page 191-21

Syntax

Removes the value of a DOMELEMENT’s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem     IN    DOMELEMENT,
    name     IN    VARCHAR2);
```

Removes the value of a DOMELEMENT’s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
    elem     IN    DOMELEMENT,
    name     IN    VARCHAR2,
    ns       IN    VARCHAR2);
```

Parameters

Table 191–112 REMOVEATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

**REMOVEATTRIBUTENODE Function**

This function removes the specified attribute node from the \texttt{DOMELEMENT}. The method returns the removed node.

**See Also:**  \texttt{DOMElement Subprograms} on page 191-21

**Syntax**

```sql
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
  elem       IN     DOMELEMENT,
  oldAttr    IN     DOMATTR)
RETURN DOMAttr;
```

**Parameters**

**Table 191–113  REMOVEATTRIBUTENODE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The \texttt{DOMELEMENT}.</td>
</tr>
<tr>
<td>oldAttr</td>
<td>The old \texttt{DOMATTR}.</td>
</tr>
</tbody>
</table>
REMOVEDCHILD Function

This function removes the child node indicated by oldchild from the list of children, and returns it.

**See Also:** [DOMNode Subprograms on page 191-11](#)

**Syntax**

```sql
DBMS_XMLDOM.REMOVECHILD(
    n          IN     DOMNode,
    oldchild   IN     DOMNode)
RETURN DOMNODE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>oldChild</td>
<td>The child of the node n to be removed</td>
</tr>
</tbody>
</table>

---

The function `REMOVECHILD` from the `DBMS_XMLDOM` package is used to remove a child node from a DOM node. It takes two parameters: `n`, the node, and `oldchild`, the child node to be removed. The function returns the removed child node.

**Syntax**

```sql
DBMS_XMLDOM.REMOVECHILD(
    n          IN     DOMNode,
    oldchild   IN     DOMNode)
RETURN DOMNODE;
```

**Parameters**

- `n`: The DOM node from which the child node will be removed.
- `oldchild`: The child node to be removed from the list of children of `n`.

**See Also:** [DOMNode Subprograms on page 191-11](#)
REMOVEDITEM Function

This function removes from the map a node specified by name, and returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also: DOMNamedNodeMap Subprograms on page 191-25

Syntax

Removes a node specified by name:

```sql
DBMS_XMLDOM.REMOVEDITEM(
    nnm IN DOMNamedNodeMap,
    name IN VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```sql
DBMS_XMLDOM.REMOVEDITEM(
    nnm IN DOMNamedNodeMap,
    name IN VARCHAR2,
    ns IN VARCHAR2)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnm</td>
<td>DOMNamedNodeMap</td>
</tr>
<tr>
<td>name</td>
<td>The name of the item to be removed from the map</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node. If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.REPLACECHILD(
  n          IN     DOMNode,
  newchild   IN     DOMNode,
  oldchild   IN     DOMNode)
RETURN DOMNode;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>n</code></td>
<td>DOMNode</td>
</tr>
<tr>
<td><code>newchild</code></td>
<td>The new child which is to replace the old child</td>
</tr>
<tr>
<td><code>oldchild</code></td>
<td>The child of the node <code>n</code> which is to be replaced</td>
</tr>
</tbody>
</table>
REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 191-15

Syntax

DBMS_XMLDOM.REPLACEDATA(
    cd        IN     DOMCHARACTERDATA,
    offset    IN     NUMBER,
    cnt       IN     NUMBER,
    arg       IN     VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The offset at which to replace</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters to replace</td>
</tr>
<tr>
<td>arg</td>
<td>The value to replace with</td>
</tr>
</tbody>
</table>
RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also: DOMElement Subprograms on page 191-21

Syntax

DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
    elem    IN    DOMELEMENT,
    prefix  IN    VARCHAR2)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>prefix</td>
<td>Namespace prefix</td>
</tr>
</tbody>
</table>
SETATTRIBUTE Procedures

Sets the value of a DOMELEMENT’s attribute by name.

See Also: DOMElement Subprograms on page 191-21

Syntax

Sets the value of a DOMELEMENT’s attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
  elem       IN  DOMELEMENT,
  name       IN  VARCHAR2,
  newvalue   IN  VARCHAR2);
```

Sets the value of a DOMElement’s attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
  elem       IN  DOMELEMENT,
  name       IN  VARCHAR2,
  newvalue   IN  VARCHAR2,
  ns         IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>name</td>
<td>Attribute name</td>
</tr>
<tr>
<td>newvalue</td>
<td>Attribute value</td>
</tr>
<tr>
<td>ns</td>
<td>Namespace</td>
</tr>
</tbody>
</table>
SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMELEMENT.

See Also: DOMElement Subprograms on page 191-21

Syntax

Adds a new attribute node to the DOMELEMENT:

DBMS_XMLDOM.SETATTRIBUTENODE(
   elem     IN  DOMELEMENT,
   newAttr  IN  DOMATTR
RETURN DOMATTR;

Adds a new attribute node to the DOMElement; namespace enabled:

DBMS_XMLDOM.SETATTRIBUTENODE(
   elem     IN  DOMELEMENT,
   newAttr  IN  DOMATTR,
   ns       IN  VARCHAR2)
RETURN DOMATTR;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>The DOMELEMENT</td>
</tr>
<tr>
<td>newAttr</td>
<td>The new DOMATTR</td>
</tr>
<tr>
<td>ns</td>
<td>The namespace</td>
</tr>
</tbody>
</table>
SETCHARSET Procedure

This function sets the character set of the DOM document.

See Also: DOMDocument Subprograms on page 191-17

Syntax

```sql
DBMS_XMLODOM.SETCHARSET(
    doc IN DOMDocument,
    charset IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOM document</td>
</tr>
<tr>
<td>charset</td>
<td>Character set</td>
</tr>
</tbody>
</table>

Usage Notes

This is used for WRITETOFI LE Procedures if not explicitly specified at that time.
SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 191-15):

DBMS_XMLDOM.SETDATA(
    cd IN DOMCHARACTERDATA,
    data IN VARCHAR2);

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms on page 191-15):

DBMS_XMLDOM.SETDATA(
    pi IN DOMPROCESSINGINSTRUCTION,
    data IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>data</td>
<td>The data to which the node is set</td>
</tr>
<tr>
<td>pi</td>
<td>DOMPROCESSINGINSTRUCTION</td>
</tr>
<tr>
<td>data</td>
<td>New processing instruction content data</td>
</tr>
</tbody>
</table>
SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document. This DTD can later be retrieved using the GETDOCTYPE Function.

Syntax

```sql
DBMS_XMLDOM.SETDOCTYPE(
    doc IN DOMDocument,
    name IN VARCHAR2,
    sysid IN VARCHAR2,
    pubid IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>The document whose DTD has to be set</td>
</tr>
<tr>
<td>name</td>
<td>The name that the doctype needs to be initialized with</td>
</tr>
<tr>
<td>sysid</td>
<td>The system ID that the doctype needs to be initialized with</td>
</tr>
<tr>
<td>pubid</td>
<td>The public ID that the doctype needs to be initialized with</td>
</tr>
</tbody>
</table>
**SETNAMEDITEM Function**

This function adds a node using its `NodeName` attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `NodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

*See Also:* [DOMNamedNodeMap Subprograms on page 191-25](#)

**Syntax**

Adds a node using its `NodeName` attribute:

```sql
DBMS_XMLDOM.SETNAMEDITEM(
    nnm IN DOMNAMEDNODEMAP,
    arg IN DOMNODE
) RETURN DOMNode;
```

Adds a node using its `NodeName` attribute and namespace URI:

```sql
DBMS_XMLDOM.SETNAMEDITEM(
    nnm IN DOMNAMEDNODEMAP,
    arg IN DOMNODE,
    ns IN VARCHAR2
) RETURN DOMNode;
```

**Parameters**

<table>
<thead>
<tr>
<th>Table 191–124</th>
<th>SETNAMEDITEM Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td><code>nnm</code></td>
<td><code>DOMNAMEDNODEMAP</code></td>
</tr>
<tr>
<td><code>arg</code></td>
<td>The Node to be added using its <code>NodeName</code> attribute</td>
</tr>
<tr>
<td><code>ns</code></td>
<td>Namespace</td>
</tr>
</tbody>
</table>

SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.SETNODEVALUE(
    n         IN     DOMNODE,
    nodeValue IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNode</td>
</tr>
<tr>
<td>nodeValue</td>
<td>The value to which node is set</td>
</tr>
</tbody>
</table>

Table 191–125  SETNODEVALUE Procedure Parameters
SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 191-11

Syntax

This function returns an instance of the PL/SQL XMLBINARYOUTPUTSTREAM into which the caller can write the node value. The datatype of the node must be RAW or BLOB – if not, an exception is raised.

DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (n IN DOMNODE) RETURN SYS.UTL_BINARYOUTPUTSTREAM;

Using this procedure, the application passes in an implementation of sys.utl_BinaryInputStream from which XDB reads data to populate the node. The datatype of the node must be RAW or BLOB – if not an exception is raised.

DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (n in DOMNODE, value in SYS.UTL_BINARYINPUTSTREAM);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>BINARYINPUTSTREAM</td>
</tr>
</tbody>
</table>
**SETNODEVALUEASCHARACTERSTREAM Function & Procedure**

The operation of these subprograms is described with each syntax implementation.

**See Also:** [DOMNode Subprograms](#) on page 191-11

**Syntax**

This function returns an instance of the PL/SQL XMLCHARACTEROUTPUTSTREAM type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or CLOB, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or CLOB, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (n        IN     DOMNODE)
  RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of SYS.UTL_CHARACTERINPUTSTREAM from which XDB reads to populate the node. The datatype of the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (n IN DOMNODE, value IN SYS.UTL_CHARACTERINPUTSTREAM);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>value</td>
<td>CHARACTERINPUTSTREAM</td>
</tr>
</tbody>
</table>
SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

See Also: DOMNode Subprograms on page 191-11

Syntax

```sql
DBMS_XMLDOM.SETPREFIX(
    n       IN     DOMNODE,
    prefix  IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>prefix</td>
<td>The value for the namespace prefix of the node</td>
</tr>
</tbody>
</table>
SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

DBMS_XMLDOM.SETSTANDALONE(
  doc IN DOMDOCUMENT,
  newvalue IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>newvalue</td>
<td>Value of the standalone property of the document</td>
</tr>
</tbody>
</table>
SETVALUE Procedure

This procedure sets the value of the attribute.

See Also: DOMAttr Subprograms on page 191-13

Syntax

```sql
DBMS_XMLODOM.SETVALUE(
    a       IN     DOMATTR,
    value   IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>DOMATTR</td>
</tr>
<tr>
<td>value</td>
<td>The value to which to set the attribute</td>
</tr>
</tbody>
</table>
SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 191-17

Syntax

DBMS_XMLDOM.SETVERSION(
    doc        IN     DOMDOCUMENT,
    version    IN     VARCHAR2);

Parameters

Table 191–131 SETVERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>version</td>
<td>The version of the document</td>
</tr>
</tbody>
</table>
**SPLITTEXT Function**

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

**See Also:** [DOMText Subprograms](#) on page 191-29

**Syntax**

```sql
DBMS_XMLDOM.SPLITTEXT(
    t   IN     DOMTEXT,
    offset  IN     NUMBER
)
RETURN DOMText;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>DOMTEXT</td>
</tr>
<tr>
<td>offset</td>
<td>Offset at which to split</td>
</tr>
</tbody>
</table>
**SUBSTRINGDATA Function**

This function extracts a range of data from the node.

*See Also:* [DOMCharacterData Subprograms](#) on page 191-15

**Syntax**

```sql
DBMS_XMLDOM.SUBSTRINGDATA(
    cd        IN     DOMCHARACTERDATA,
    offset    IN     NUMBER,
    cnt       IN     NUMBER)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cd</td>
<td>DOMCHARACTERDATA</td>
</tr>
<tr>
<td>offset</td>
<td>The starting offset of the data from which to get the data</td>
</tr>
<tr>
<td>cnt</td>
<td>The number of characters (from the offset) of the data to get</td>
</tr>
</tbody>
</table>
USEBINARYSTREAM Function

This function returns TRUE if the datatype of the node is RAW or BLOB so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM. If a value of FALSE is returned, the node value may only be accessed through an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM.

See Also: DOMNode Subprograms on page 191-11

Syntax

DBMS_XMLDOM.USEBINARYSTREAM   (  
   n        IN     DOMNODE)  
RETURN BOOLEAN;

Parameters

Table 191–134 USEBINARYSTREAM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
</tbody>
</table>
WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.WRITETOBUFFER(
    n           IN      DOMNODE,
    buffer      IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.WRITETOBUFFER(
    doc         IN      DOMDOCUMENT,
    buffer      IN OUT  VARCHAR2);
```

 Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms on page 191-19):

```
DBMS_XMLDOM.WRITETOBUFFER(
    df          IN      DOMDOCUMENTFRAGMENT,
    buffer      IN OUT  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to which to write</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>df</td>
<td>DOM document fragment</td>
</tr>
</tbody>
</table>
WRITETOCLOB Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: DOMNode Subprograms on page 191-11):

```
DBMS_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    cl      IN OUT  CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: DOMDocument Subprograms on page 191-17):

```
DBMS_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    cl      IN OUT  CLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB to which to write</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
</tbody>
</table>
WRITETOFILE Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(
  n          IN      DOMNODE,
  fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(
  n          IN      DOMNODE,
  fileName   IN      VARCHAR2,
  charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(
  doc        IN   DOMDOCUMENT,
  filename   IN   VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: DOMDocument Subprograms):

```sql
DBMS_XMLDOM.WRITETOFILE(
  doc       IN   DOMDOCUMENT,
  fileName  IN   VARCHAR2,
  charset   IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>DOMNODE</td>
</tr>
<tr>
<td>fileName</td>
<td>File to which to write. The filename should be in standard directory to filename format, for example /root/folder1/filename (on windows, use \ instead of /).</td>
</tr>
<tr>
<td>charset</td>
<td>specified character set</td>
</tr>
<tr>
<td>doc</td>
<td>DOMDOCUMENT</td>
</tr>
<tr>
<td>charset</td>
<td>Character set</td>
</tr>
</tbody>
</table>
The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Using `DBMS_XMLGEN`
- Summary of `DBMS_XMLGEN` Subprograms

See Also: *Oracle XML DB Developer’s Guide*, for more information on XML support and on examples of using `DBMS_XMLGEN`
Using DBMS_XMLGEN

- Security Model
Security Model

Owned by XDB, the DBMS_XMLGEN package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

</tr>
</tbody>
</table>
CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```plsql
DBMS_XMLGEN.CLOSECONTEXT (ctx  IN ctxHandle);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle to close.</td>
</tr>
</tbody>
</table>
CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several versions of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
    xmlData IN VARCHAR2,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
    xmlData IN CLOB,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The XML CLOB data to be encoded or decoded.</td>
</tr>
<tr>
<td>flag</td>
<td>The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.</td>
</tr>
</tbody>
</table>

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character `<` is `&lt;`. Unescaping is the reverse transformation.
GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML. Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```sql
DBMS_XMLGEN.GETNUMROWSPROCESSED (
    ctx     IN    ctxHandle)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call on page 192-10.</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.
GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functions call is potentially more efficient:

```sql
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    tmpclob      IN OUT NCOPY CLOB,  
    dtdOrSchema  IN number := NONE)  
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```sql
DBMS_XMLGEN.GETXML (  
    ctx          IN ctxHandle,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```sql
DBMS_XMLGEN.GETXML (  
    sqlQuery     IN VARCHAR2,  
    dtdOrSchema  IN number := NONE)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>tmpclob</td>
<td>The CLOB to which the XML document is appended.</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>The SQL query string.</td>
</tr>
<tr>
<td>dtdOrSchema</td>
<td>Generate a DTD or a schema? Only NONE is supported.</td>
</tr>
</tbody>
</table>

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the maximum number of rows as specified by the SETMAXROWS Procedure call (or the entire result if not specified) is fetched and converted to XML. Use the GETNUMROWSPROCESSED Function to check if any rows were retrieved.
GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results. This function is overloaded.

Syntax

Generates the XML document and returns it as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE (
    ctx           IN ctxhandle,
    dtdOrSchema   IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```sql
DBMS_XMLGEN.GETXMLTYPE (
    sqlQuery     IN VARCHAR2,
    dtdOrSchema  IN number := NONE)
RETURN sys.XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the newContext call.</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>The SQL query string.</td>
</tr>
<tr>
<td>dtdOrSchema</td>
<td>Generate a DTD or a schema? Only NONE is supported.</td>
</tr>
</tbody>
</table>
NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (  
    query     IN VARCHAR2)  
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (  
    queryString  IN SYS_REFCURSOR)  
RETURN ctxHandle;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>The query, in the form of a VARCHAR, the result of which must be converted to XML.</td>
</tr>
<tr>
<td>queryString</td>
<td>The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.</td>
</tr>
</tbody>
</table>
NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (  
    queryString IN VARCHAR2)  
RETURN ctxHandle;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryString</td>
<td>The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a CONNECT BY clause, and the result must have the same property as the result set generated by a CONNECT BY query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.</td>
</tr>
</tbody>
</table>
RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

Syntax

```sql
DBMS_XMLGEN.RESTARTQUERY (
  ctx  IN ctxHandle);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the current query.</td>
</tr>
</tbody>
</table>
SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the `<` sign is converted to `&lt;`. The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as `<`, `>`, `"`, `'`, which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (  
    ctx   IN ctxHandle,  
    conv  IN BOOLEAN);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from one of the NEWCONTEXT Functions call on page 192-10.</td>
</tr>
<tr>
<td>conv</td>
<td>TRUE indicates that conversion is needed.</td>
</tr>
</tbody>
</table>
SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the maxrows parameter.

Syntax

```sql
DBMS_XMLGEN.SETMAXROWS (ctx IN ctxHandle, maxRows IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>maxRows</td>
<td>The maximum number of rows to get for each call to GETXML Functions</td>
</tr>
</tbody>
</table>

**SETNULLHANDLING Procedure**

This procedure sets NULL handling options, handled through the flag parameter setting.

**Syntax**

```pascal
DBMS_XMLGEN.SETNULLHANDLING(
ctx  IN ctx,
flag IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>flag</td>
<td>The NULL handling option set.</td>
</tr>
<tr>
<td></td>
<td>- DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements.</td>
</tr>
<tr>
<td></td>
<td>- NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil=&quot;true&quot;.</td>
</tr>
<tr>
<td></td>
<td>- EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, &lt;foo/&gt;.</td>
</tr>
</tbody>
</table>
SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

Syntax

```sql
DBMS_XMLGEN.SETROWSETTAG (
ctx            IN ctxHandle,
rowSetTagName  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call on page 192-10.</td>
</tr>
<tr>
<td>rowSetTagName</td>
<td>The name of the document element. Passing NULL indicates that you do not want the <code>ROWSET</code> element present.</td>
</tr>
</tbody>
</table>

Usage Notes

The user can set the `rowSetTag` to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.
SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

Syntax

```sql
DBMS_XMLGEN.SETROWTAG (  
  ctx         IN ctxHandle,  
  rowTagName  IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle obtained from the NEWCONTEXT Functions call on page 192-10.</td>
</tr>
<tr>
<td>rowTagName</td>
<td>The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.</td>
</tr>
</tbody>
</table>

Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.
SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set skiprows to zero. For the next set, set the skiprows to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function on page 192-7.

Syntax

```sql
DBMS_XMLGEN.SETSKIPROWS (     ctx       IN ctxHandle,     skipRows  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>The context handle corresponding to the query executed.</td>
</tr>
<tr>
<td>skipRows</td>
<td>The number of rows to skip for each call to getXML.</td>
</tr>
</tbody>
</table>
USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
    ctx  IN ctxHandle);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The context handle.</td>
</tr>
</tbody>
</table>

Usage Notes

Using this procedure, you can override the default to use the name of the column with the _ITEM tag appended to it. If there is a collection of NUMBER, the default tag name for the collection elements is NUMBER.
USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the SETNULLHANDLING Procedure.

Syntax

DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
  ctx       IN   ctxType,
  attrind   IN   BOOLEAN := TRUE);

Parameters

Table 192–17 USENULLATTRIBUTEINDICATOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrind</td>
<td>Use attribute to indicate NULL?</td>
</tr>
</tbody>
</table>
The DBMS_XMLINDEX package provides an interface to implement asynchronous indexing.

See Also: Oracle XML DB Developer’s Guide for more information about "XMLIndex"

This chapter contains the following topics:

- Using DBMS_XMLINDEX
  - Overview
  - Security Model
- Summary of DBMS_XMLINDEX Subprograms
Using DBMS_XMLINDEX

- Overview
- Security Model
Overview

Asynchronous Index Maintenance
The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a convenient time, for example to a time when the load on the database is low. Thus a mechanism for asynchronous index maintenance is provided.
Security Model

Owned by XDB, the DBMS_XMLINDEX package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
Summary of DBMS_XMLINDEX Subprograms

This table lists the package subprograms in alphabetical order.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEDATEINDEX Procedure</td>
<td>Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex</td>
</tr>
<tr>
<td>CREATENUMBERINDEX Procedure</td>
<td>Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex</td>
</tr>
<tr>
<td>DROPINDEXPARAMETER Procedure</td>
<td>Drops the XMLIndex parameter string that is associated with a given parameter identifier.</td>
</tr>
<tr>
<td>MODIFYINDEXPARAMETER Procedure</td>
<td>Modifies the XMLIndex parameter string that is associated with a given parameter name</td>
</tr>
<tr>
<td>PROCESS_PENDING Procedure</td>
<td>Processes pending rows for a NONBLOCKING ALTER INDEX OPERATION on an XMLIndex</td>
</tr>
<tr>
<td>REGISTERINDEXPARAMETER Procedure</td>
<td>Registers a parameter string and XMLIndex parameter string pair in XDB</td>
</tr>
<tr>
<td>SYNCINDEX Procedure</td>
<td>Synchronizes the index manually</td>
</tr>
</tbody>
</table>
CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```sql
DBMS_XMLINDEX.CREATEDATEINDEX (  
    xml_index_schema   IN   VARCHAR2,  
    xml_index_name     IN   VARCHAR2,  
    date_index_name    IN   VARCHAR2,  
    xmltypename        IN   VARCHAR2,  
    date_index_clause  IN   VARCHAR2);  

DBMS_XMLINDEX.CREATEDATEINDEX (  
    xml_index_schema   IN   VARCHAR2,  
    xml_index_name     IN   VARCHAR2,  
    date_index_name    IN   VARCHAR2,  
    xmltypename        IN   VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>date_index_name</td>
<td>Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema</td>
</tr>
<tr>
<td>xmltypename</td>
<td>The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.</td>
</tr>
<tr>
<td>date_index_clause</td>
<td>Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index</td>
</tr>
</tbody>
</table>
CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```sql
DBMS_XMLINDEX.CREATENUMBERINDEX (  
    xml_index_schema   IN   VARCHAR2,  
    xml_index_name     IN   VARCHAR2,  
    num_index_name     IN   VARCHAR2,  
    num_index_clause   IN   VARCHAR2,  
    xmltypename        IN   VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>num_index_name</td>
<td>Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema</td>
</tr>
<tr>
<td>num_index_clause</td>
<td>Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.</td>
</tr>
<tr>
<td>xmltypename</td>
<td>The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.</td>
</tr>
</tbody>
</table>
DROPPARAMETER Procedure

This procedure drops the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```sql
DBMS_XMLINDEX.DROPPARAMETER ( 
  name    IN    VARCHAR2); 
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_XMLINDEX.DROPPARAMETER ( 
  'myIndexParam');
```
MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    name        IN      VARCHAR2,
    parameter   IN      CLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
<tr>
<td>parameter</td>
<td>XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement</td>
</tr>
</tbody>
</table>

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    'myIndexParam',
    'PATH TABLE po_ptab
     PATH ID INDEX po_pidx
     ORDER KEY INDEX po_oidx
     VALUE INDEX po_vidx');
```
PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN operation on an XMLIndex.

Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (  
  xml_index_schema    IN     VARCHAR2,  
  xml_index_name      IN     VARCHAR2,  
  pending_row_count   OUT    BINARY_INTEGER,  
  error_row_count     OUT    BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_index_name</td>
<td>Name of the XMLIndex to be altered using NONBLOCKING ALTER INDEX OPERATION</td>
</tr>
<tr>
<td>pending_row_count</td>
<td>Number of pending rows to be processed</td>
</tr>
<tr>
<td>error_row_count</td>
<td>Number of rows for which indexing may have failed because of an error</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the NONBLOCKING ALTER INDEX OPERATION.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in SYS_AIXSXI_######_PENDINGTAB and errors in SYS_AIXSXI_#####_ERRORTAB. Keeping track of rows and the errors is useful in triaging issues.

Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(  
  'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```
REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (    
    name        IN      VARCHAR2,
    parameter   IN      CLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Identifier for parameter string</td>
</tr>
<tr>
<td>parameter</td>
<td>XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement</td>
</tr>
</tbody>
</table>

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (    
    'myIndexParam',    
    'PATH TABLE po_ptab
      PATH ID INDEX po_pidx
      ORDER KEY INDEX po_oidx
      VALUE INDEX po_vidx
      PATHS (NAMESPACE MAPPING (xmlns:p="http://www.example.com/IPO") )
      GROUP MASTERGROUP XMLTABLE PO_TAB
    (''/p:PurchaseOrder''
      COLUMNS
      REFERENCE VARCHAR2(30) PATH ''p:Reference'',
      REQUESTOR VARCHAR2(30) PATH ''p:Requestor'' )
    GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
    (''/p:PurchaseOrder/p:LineItems/p:LineItem''
      COLUMNS
      LINENUMBER NUMBER(38) PATH ''@p:ItemNumber'',
      QUANTITY NUMBER(38) PATH ''@p:Quantity'',
      DESCRIPTION VARCHAR2(256) PATH ''p:Description'' ));
```
SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex. It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (    xml_index_schema      IN VARCHAR2,
    xml_index_name        IN VARCHAR2,
    partition_name        IN VARCHAR2 DEFAULT NULL,
    reindex               IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_index_schema</td>
<td>Name of the owner of the XMLIndex</td>
</tr>
<tr>
<td>xml_schema_name</td>
<td>Name of the XMLIndex</td>
</tr>
<tr>
<td>partition_name</td>
<td>[Currently not supported]</td>
</tr>
<tr>
<td>reindex</td>
<td>Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulk-loaded.</td>
</tr>
</tbody>
</table>

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```
Using **DBMS_XMLPARSER**, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- **Using DBMS_XMLPARSER**
- **Summary of DBMS_XMLPARSER Subprograms**

**See Also:** *Oracle XML DB Developer’s Guide*
Using DBMS_XMLPARSER

- Security Model
Security Model

Owned by XDB, the DBMS_XDB_XMLPARSER package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
## Summary of DBMS_XMLPARSER Subprograms

Table 194–1  DBMS_XMLPARSER Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREEPARSER on page 194-5</td>
<td>Frees a parser object.</td>
</tr>
<tr>
<td>GETDOCTYPE on page 194-6</td>
<td>Gets parsed DTD.</td>
</tr>
<tr>
<td>GETDOCUMENT on page 194-7</td>
<td>Gets DOM document.</td>
</tr>
<tr>
<td>GETRELEASEVERSION on page 194-7</td>
<td>Returns the release version of Oracle XML Parser for PL/SQL.</td>
</tr>
<tr>
<td>GETVALIDATIONMODE on page 194-9</td>
<td>Returns validation mode.</td>
</tr>
<tr>
<td>NEWPARSER on page 194-10</td>
<td>Returns a new parser instance</td>
</tr>
<tr>
<td>PARSE on page 194-11</td>
<td>Parses XML stored in the given url/file.</td>
</tr>
<tr>
<td>PARSEBUFFER on page 194-12</td>
<td>Parses XML stored in the given buffer</td>
</tr>
<tr>
<td>PARSECLOB on page 194-12</td>
<td>Parses XML stored in the given clob</td>
</tr>
<tr>
<td>PARSEDDTD on page 194-14</td>
<td>Parses DTD stored in the given url/file</td>
</tr>
<tr>
<td>PARSEDTDBUFFER on page 194-15</td>
<td>Parses DTD stored in the given buffer</td>
</tr>
<tr>
<td>PARSEDTDTCLOB on page 194-16</td>
<td>Parses DTD stored in the given clob</td>
</tr>
<tr>
<td>SETBASEDIR on page 194-17</td>
<td>Sets base directory used to resolve relative URLs.</td>
</tr>
<tr>
<td>SETDOCTYPE on page 194-18</td>
<td>Sets DTD.</td>
</tr>
<tr>
<td>SETERRORLOG on page 194-19</td>
<td>Sets errors to be sent to the specified file</td>
</tr>
<tr>
<td>SETPRESERVEWHITESPACE on page 194-20</td>
<td>Sets white space preserve mode</td>
</tr>
<tr>
<td>SETVALIDATIONMODE on page 194-21</td>
<td>Sets validation mode.</td>
</tr>
<tr>
<td>SHOWWARNINGS on page 194-22</td>
<td>Turns warnings on or off.</td>
</tr>
</tbody>
</table>
**FREEPARSER**

Frees a parser object.

**Syntax**

```plaintext
PROCEDURE freeParser(
    p Parser);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
GETDOCTYPE

Returns the parsed DTD; this function must be called only after a DTD is parsed.

Syntax

FUNCTION getDoctype(
  p Parser)
RETURN DOMDocumentType;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

Syntax

```java
FUNCTION GETDOCUMENT(
p Parser)
RETURN DOMDocument;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

Syntax

FUNCTION getReleaseVersion
RETURN VARCHAR2;
GETVALIDATIONMODE

Retrieves validation mode; TRUE for validating, FALSE otherwise.

Syntax
FUNCTION GETVALIDATIONMODE(
  p Parser)
RETURN BOOLEAN;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

**Syntax**

```sql
FUNCTION newParser
RETURN Parser;
```
PARSE

Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION parse(url VARCHAR2) RETURN DOMDocument;</td>
<td>Returns the built DOM Document. This is meant to be used when the default parser behavior is acceptable and just a url/file needs to be parsed.</td>
</tr>
<tr>
<td>PROCEDURE parse(p Parser, url VARCHAR2);</td>
<td>Any changes to the default parser behavior should be effected before calling this procedure.</td>
</tr>
</tbody>
</table>

Parameter IN / OUT Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>Complete path of the url/file to be parsed.</td>
</tr>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
</tbody>
</table>
PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```plsql
PROCEDURE PARSEBUFFER(
p   Parser,
doc VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>doc</td>
<td>(IN)</td>
<td>XML document buffer to parse.</td>
</tr>
</tbody>
</table>
PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior
should be effected before calling this procedure. An application error is raised if
parsing fails.

Syntax

PROCEDURE PARSECLOB(
p   Parser,
doc CLOB);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>doc</td>
<td>(IN)</td>
<td>XML document buffer to parse.</td>
</tr>
</tbody>
</table>
PARSEDTD

PARSEDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

PROCEDURE PARSEDTD(
p    Parser,
url   VARCHAR2,
root  VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>url</td>
<td>(IN)</td>
<td>Complete path of the URL or file to be parsed.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
PARSEDTDBUFFER

 Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

**Syntax**

```sql
PROCEDURE PARSEDTDBUFFER(
p    Parser,
dtd  VARCHAR2,
root VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD buffer to parse.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
PARSERDTDCLOB

 Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

**Syntax**

```plsql
PROCEDURE PARSERDTDCLOB(
p    Parser,
dtd  CLOB,
root VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD Clob to parse.</td>
</tr>
<tr>
<td>root</td>
<td>(IN)</td>
<td>Name of the root element.</td>
</tr>
</tbody>
</table>
SETBASEDIR

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax
PROCEDURE setBaseDir(
  p Parser,
  dir VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dir</td>
<td>(IN)</td>
<td>Directory used as a base directory.</td>
</tr>
</tbody>
</table>
SETDOCTYPE

Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

**Syntax**

PROCEDURE setDoctype(  
  p   Parser,  
  dtd DOMDocumentType);  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>dtd</td>
<td>(IN)</td>
<td>DTD to set.</td>
</tr>
</tbody>
</table>
**SETERRORLOG**

Sets errors to be sent to the specified file.

**Syntax**

```sql
PROCEDURE setErrorLog(
  p      Parser,
  fileName VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>fileName</td>
<td>(IN)</td>
<td>Complete path of the file to use as the error log.</td>
</tr>
</tbody>
</table>
Sets whitespace preserving mode.

**Syntax**

```plsql
PROCEDURE setPreserveWhitespace(
p   Parser,
yes BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - preserve, FALSE - don't preserve.</td>
</tr>
</tbody>
</table>
SETVALIDATIONMODE

Sets validation mode.

Syntax
PROCEDURE setValidationMode(
  p    Parser,
  yes BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - validate, FALSE - don't validate.</td>
</tr>
</tbody>
</table>
SHOWWARNINGS

Turns warnings on or off.

**Syntax**

```plsql
PROCEDURE showWarnings(
p    Parser,
yes  BOOLEAN);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(IN)</td>
<td>Parser instance.</td>
</tr>
<tr>
<td>yes</td>
<td>(IN)</td>
<td>Mode to set: TRUE - show warnings, FALSE - don't show warnings.</td>
</tr>
</tbody>
</table>
**DBMS_XMLQUERY**

DBMS_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

**See Also:** Oracle XML DB Developer’s Guide

This chapter contains the following topics:

- Using DBMS_XMLQUERY
  - Security Model
  - Constants
  - Types
- Summary of DBMS_XMLQUERY Subprograms
Using DBMS_XMLQUERY

Security Model

Owned by XDB, the DBMS_XMLQUERY package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
### Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB_ENCODING</td>
<td>Used to signal that the DB character encoding is to be used.</td>
</tr>
<tr>
<td>DEFAULT_ROWSETTAG</td>
<td>The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.</td>
</tr>
<tr>
<td>DEFAULT_ERRORTAG</td>
<td>The default tag to enclose raised errors -- ERROR.</td>
</tr>
<tr>
<td>DEFAULT_ROWIDATTR</td>
<td>The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM</td>
</tr>
<tr>
<td>DEFAULT_ROWTAG</td>
<td>The default tag name for the element corresponding to db.records -- ROW</td>
</tr>
<tr>
<td>DEFAULT_DATE_FORMAT</td>
<td>Default date mask -- 'MM/dd/yyyy HH:mm:ss'</td>
</tr>
<tr>
<td>ALL_ROWS</td>
<td>Indicates that all rows are needed in the output.</td>
</tr>
<tr>
<td>NONE</td>
<td>Used to specify that the output should not contain any XML metadata (for example, no DTD).</td>
</tr>
<tr>
<td>DTD</td>
<td>Used to specify that the generation of the DTD is desired.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Used to specify that the generation of the XML Schema is desired.</td>
</tr>
<tr>
<td>LOWER_CASE</td>
<td>Use lower case tag names.</td>
</tr>
<tr>
<td>UPPER_CASE</td>
<td>Use upper case tag names.</td>
</tr>
</tbody>
</table>
Types

Table 195–2 Types of DBMS_XMLQUERY

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. This is the return type of NEWCONTEXT</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XMLQUERY Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSECONTEXT on page 195-8</td>
<td>Closes or deallocates a particular query context.</td>
</tr>
<tr>
<td>GETDTD on page 195-9</td>
<td>Generates the DTD.</td>
</tr>
<tr>
<td>GETEXCEPTIONCONTENT on page 195-10</td>
<td>Returns the thrown exception's error code and error message.</td>
</tr>
<tr>
<td>GETNUMROWSPROCESSED on page 195-11</td>
<td>Returns the number of rows processed for the query.</td>
</tr>
<tr>
<td>GETVERSION on page 195-12</td>
<td>Prints the version of the XSU in use.</td>
</tr>
<tr>
<td>GETXML on page 195-13</td>
<td>Generates the XML document.</td>
</tr>
<tr>
<td>NEWCONTEXT on page 195-14</td>
<td>Creates a query context and it returns the context handle.</td>
</tr>
<tr>
<td>PROPAGATEORIGINALEXCEPTION on page 195-15</td>
<td>Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an OracleXMLSQLException.</td>
</tr>
<tr>
<td>REMOVEXSLTPARAM on page 195-16</td>
<td>Removes a particular top-level stylesheet parameter.</td>
</tr>
<tr>
<td>SETCOLLIDATTRNAME on page 195-18</td>
<td>Sets the name of the id attribute of the collection element's separator tag.</td>
</tr>
<tr>
<td>SETDATAHEADER on page 195-18</td>
<td>Sets the XML data header.</td>
</tr>
<tr>
<td>SETDATEFORMAT on page 195-20</td>
<td>Sets the format of the generated dates in the XML document.</td>
</tr>
<tr>
<td>SETENCODINGTAG on page 195-21</td>
<td>Sets the encoding processing instruction in the XML document.</td>
</tr>
<tr>
<td>SETERRORTAG on page 195-22</td>
<td>Sets the tag to be used to enclose the XML error documents.</td>
</tr>
<tr>
<td>SETMAXROWS on page 195-23</td>
<td>Sets the maximum number of rows to be converted to XML.</td>
</tr>
<tr>
<td>SETMETAHEADER on page 195-24</td>
<td>Sets the XML meta header.</td>
</tr>
<tr>
<td>SETRAISEEXCEPTION on page 195-25</td>
<td>Tells the XSU to throw the raised exceptions.</td>
</tr>
<tr>
<td>SETRAISENOROWSEXCEPTION on page 195-26</td>
<td>Tells the XSU to throw or not to throw an OracleXMLNoRowsException in the case when for one reason or another, the XML document generated is empty.</td>
</tr>
<tr>
<td>SETROWIDATTRNAME on page 195-27</td>
<td>Sets the name of the id attribute of the row enclosing tag.</td>
</tr>
<tr>
<td>SETROWIDATTRVALUE on page 195-28</td>
<td>Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.</td>
</tr>
<tr>
<td>SETROWSETTAG on page 195-29</td>
<td>Sets the tag to be used to enclose the XML dataset.</td>
</tr>
<tr>
<td>SETROWTAG on page 195-30</td>
<td>Sets the tag to be used to enclose the XML element.</td>
</tr>
<tr>
<td>SETSKIPROWS on page 195-31</td>
<td>Sets the number of rows to skip.</td>
</tr>
</tbody>
</table>

---
### Table 195–3  (Cont.) DBMS_XMLQUERY Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETSQLTOXMLNAMEESCAPING on page 195-32</td>
<td>This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.</td>
</tr>
<tr>
<td>SETstylesheetheader on page 195-33</td>
<td>Sets the stylesheet header.</td>
</tr>
<tr>
<td>SETTAGCASE on page 195-34</td>
<td>Specified the case of the generated XML tags.</td>
</tr>
<tr>
<td>SETXSLT on page 195-35</td>
<td>Registers a stylesheet to be applied to generated XML.</td>
</tr>
<tr>
<td>SETXSLTPARAM on page 195-36</td>
<td>Sets the value of a top-level stylesheet parameter.</td>
</tr>
<tr>
<td>USENULLATTRIBUTEINDICATOR on page 195-37</td>
<td>Specifies weather to use an XML attribute to indicate NULLness.</td>
</tr>
<tr>
<td>USETYPEFORCOLLELEMTag on page 195-38</td>
<td>Tells the XSU to use the collection element’s type name as the collection element tag name.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

Closes or deallocates a particular query context

Syntax

PROCEDURE CLOSECONTEXT(
  ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

## Syntax

**FUNCTION GETDTD**

```sql
FUNCTION GETDTD(
  ctxHdl IN ctxType,
  withVer IN BOOLEAN := false)
RETURN CLOB;
```

Function that generates the DTD based on the SQL query used to initialize the context.

**PROCEDURE GETDTD**

```sql
PROCEDURE GETDTD(
  ctxHdl IN ctxType,
  xDoc IN CLOB,
  withVer IN BOOLEAN := false);
```

Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output CLOB for XML document result.

## Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>withVer</td>
<td>(IN)</td>
<td>Generate the version information? TRUE for yes.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>
GETEXCEPTIONCONTENT

Returns the thrown exception’s SQL error code and error message through the procedure’s OUT parameters. This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

Syntax

PROCEDURE GETEXCEPTIONCONTENT(
  ctxHdl IN ctxType,
  errNo OUT NUMBER,
  errMsg OUT VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>errNo</td>
<td>(OUT)</td>
<td>Error number.</td>
</tr>
<tr>
<td>errMsg</td>
<td>(OUT)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>
GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

FUNCTION GETNUMROWSPROCESSED(
  ctxHdl IN ctxType)
RETURN NUMBER;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
GETVERSION

Prints the version of the XSU in use.

Syntax

PROCEDURE GETVERSION();
GETXML

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn't have to be explicitly opened or closed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION GETXML(
   sqlQuery IN VARCHAR2,
   metaType IN NUMBER := NONE
) RETURN CLOB; | This function uses a SQL query in string form. |
| FUNCTION GETXML(
   sqlQuery IN CLOB,
   metaType IN NUMBER := NONE
) RETURN CLOB; | This function uses a SQL query in CLOB form. |
| FUNCTION GETXML(
   ctxHdl IN ctxType,
   metaType IN NUMBER := NONE
) RETURN CLOB; | This function generates the XML document based on a SQL query used to initialize the context. |
| PROCEDURE GETXML(
   ctxHdl IN ctxType,
   xDoc IN CLOB,
   metaType IN NUMBER := NONE
); | This procedure generates the XML document based on the SQL query used to initialize the context. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>metaType</td>
<td>(IN)</td>
<td>XML metadatatype (NONE, DTD, or SCHEMA).</td>
</tr>
<tr>
<td>sqlQuery</td>
<td>(IN)</td>
<td>SQL query.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>CLOB into which to write the generated XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION NEWCONTEXT(
  sqlQuery IN VARCHAR2)
RETURN ctxType; | Creates a query context from a string. |
| FUNCTION NEWCONTEXT(
  sqlQuery IN CLOB)
RETURN ctxType; | Creates a query context from a CLOB. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlQuery</td>
<td>(IN)</td>
<td>SQL query, the results of which to convert to XML.</td>
</tr>
</tbody>
</table>
**PROPAGATEORIGINALEXCEPTION**

Specifies whether to throw every original exception raised or to wrap it in an OracleXMLSQLException.

**Syntax**

PROCEDURE PROPAGATEORIGINALEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>TRUE if want to propagate original exception, FALSE to wrap in OracleXMLException.</td>
</tr>
</tbody>
</table>
REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

PROCEDURE REMOVEXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
</tbody>
</table>
SETBINDVALUE

Sets a value for a particular bind name.

Syntax
PROCEDURE SETBINDVALUE(
ctxHdl IN ctxType,
bindName IN VARCHAR2,
bindValue IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>bindName</td>
<td>(IN)</td>
<td>Bind name.</td>
</tr>
<tr>
<td>bindValue</td>
<td>(IN)</td>
<td>Bind value.</td>
</tr>
</tbody>
</table>
Sets the name of the id attribute of the collection element’s separator tag. Passing NULL or an empty string for the tag causes the row id attribute to be omitted.

Syntax

PROCEDURE SETCOLLIDATTRNAME(
  ctxHdl IN ctxType,
  attrName IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrName</td>
<td>(IN)</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>
## SETDATAHEADER

Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the rowset. The two entities are enclosed by the docTag argument. The last data header specified is used. Passing in NULL for the header parameter unsets the data header.

### Syntax

```
PROCEDURE SETDATAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null,
tag IN VARCHAR2 := null);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>header</td>
<td>(IN)</td>
<td>Header.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag used to enclose the data header and the rowset.</td>
</tr>
</tbody>
</table>
Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the java.text.SimpleDateFormat class. Setting the mask to NULL or an empty string sets the default mask -- DEFAULT_DATE_FORMAT.

Syntax
PROCEDURE SETDATEFORMAT(
    ctxHdl IN ctxType,
    mask IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>mask</td>
<td>(IN)</td>
<td>The date mask.</td>
</tr>
</tbody>
</table>
SETENCODINGTAG

Sets the encoding processing instruction in the XML document.

Syntax

PROCEDURE SETENCODINGTAG(
ctxHdl IN ctxType,
enc IN VARCHAR2 := DB_ENCODING);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>enc</td>
<td>(IN)</td>
<td>The encoding to use.</td>
</tr>
</tbody>
</table>
SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

Syntax

PROCEDURE SETERRORTAG(
  ctxHdl IN ctxType,
  tag IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax

PROCEDURE SETMAXROWS (  
ctxHdl IN ctxType,  
rows IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>rows</td>
<td>(IN)</td>
<td>Maximum number of rows to generate.</td>
</tr>
</tbody>
</table>
Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in NULL for the header parameter unsets the meta header.

**Syntax**

```plaintext
PROCEDURE SETMETAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>Header</td>
<td>(IN)</td>
<td>Header.</td>
</tr>
</tbody>
</table>
SETRAISEEXCEPTION

Specifies whether to throw raised exceptions. If this call isn’t made or if FALSE is passed to the flag argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

PROCEDURE SETRAISEEXCEPTION(
  ctxHdl IN ctxType,
  flag IN BOOLEAN:=true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Throw raised exceptions? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>
SETRAISENOROWSEXCEPTION

Specifies whether to throw an OracleXMLNoRowsException when the generated XML document is empty. By default, the exception is not thrown.

Syntax
PROCEDURE SETRAISENOROWSEXCEPTION(
    ctxHdl IN ctxType,
    flag IN BOOLEAN:=false);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Throws an OracleXMLNoRowsException if set to TRUE.</td>
</tr>
</tbody>
</table>
**SETROWIDATTRNAME**

Sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

**Syntax**

```sql
PROCEDURE SETROWIDATTRNAME(
ctxHdl IN ctxType,
attrName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>attrName</td>
<td>(IN)</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>
Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing NULL or an empty string for the colName assigns the row count value (0, 1, 2 and so on) to the row id attribute.

**Syntax**

```plsql
PROCEDURE SETROWIDATTRVALUE(
  ctxHdl IN ctxType,
  colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column whose value is to be assigned to the row id attribute.</td>
</tr>
</tbody>
</table>
SETROWSETTAG

Sets the tag to be used to enclose the XML dataset.

Syntax

PROCEDURE SETROWSETTAG(
  ctxHdl IN ctxType,
  tag IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETROWTAG

Sets the tag to be used to enclose the XML element corresponding to a `db.record`.

**Syntax**

```
PROCEDURE SETROWTAG(
  ctxHdl IN ctxType,
  tag IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETSKIPROWS

Sets the number of rows to skip. By default, 0 rows are skipped.

Syntax
PROCEDURE SETSKIPROWS(
ctxHdl IN ctxType,
rows IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>rows</td>
<td>(IN)</td>
<td>Maximum number of rows to skip.</td>
</tr>
</tbody>
</table>
This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax
PROCEDURE SETSQLTOXMLNAMEESCAPING(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on escaping? TRUE for yes, otherwise FALSE.</td>
</tr>
</tbody>
</table>
**SETSTYLESHEETHEADER**

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing `NULL` for the `uri` argument will unset the stylesheet header and the stylesheet type.

**Syntax**

```sql
PROCEDURE SETSTYLESHEETHEADER(
  ctxHdl IN ctxType,
  uri IN VARCHAR2,
  type IN VARCHAR2 := 'text/xsl');
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>Stylesheet URI.</td>
</tr>
<tr>
<td>type</td>
<td>(IN)</td>
<td>Stylesheet type; defaults to &quot;text/xsl&quot;.</td>
</tr>
</tbody>
</table>
SETTAGCASE

Specifies the case of the generated XML tags.

**Syntax**

```
PROCEDURE SETTAGCASE(
  ctxHdl IN ctxType,
  tCase IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tCase</td>
<td>(IN)</td>
<td>The tag’s case:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 0 for as are</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 1 for lower case</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 2 for upper case</td>
</tr>
</tbody>
</table>
**SETXSLT**

Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing `NULL` for the `uri` argument or an empty string for the `stylesheet` argument will unset the stylesheet header and type.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| PROCEDURE SETXSLT(  
  ctxHdl IN ctxType,  
  uri IN VARCHAR2,  
  ref IN VARCHAR2 := null);  
PROCEDURE SETXSLT(  
  ctxHdl IN ctxType,  
  stylesheet CLOB,  
  ref IN VARCHAR2 := null); | To un-register the stylesheet pass in a null for the uri.  
To un-register the stylesheet pass in a null or an empty string for the stylesheet. |

**Parameter**  
**IN / OUT**  
**Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>Stylesheet URL.</td>
</tr>
<tr>
<td>stylesheet</td>
<td>(IN)</td>
<td>Stylesheet.</td>
</tr>
<tr>
<td>ref</td>
<td>(IN)</td>
<td>URL to include, imported and external entities.</td>
</tr>
</tbody>
</table>
Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax
PROCEDURE SETXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2,
value IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Name of the top level stylesheet parameter.</td>
</tr>
<tr>
<td>value</td>
<td>(IN)</td>
<td>Value to be assigned to the stylesheet parameter.</td>
</tr>
</tbody>
</table>
USENULLATTRIBUTEINDICATOR

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

PROCEDURE SETNULLATTRIBUTEINDICATOR(
    ctxHdl IN ctxType,
    flag IN BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Sets attribute to NULL if TRUE, omits from XML document if FALSE.</td>
</tr>
</tbody>
</table>
USETYPEFORCOLLELEMTAG

Specifies whether to use the collection element's type name as its element tag name. By default, the tag name for elements of a collection is the collection's tag name followed by _item.

Syntax
PROCEDURE USETYPEFORCOLLELEMTAG(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on use of the type name?</td>
</tr>
</tbody>
</table>
DBMS_XMLSAVE provides XML to database-type functionality.

Security Model

Owned by XDB, the DBMS_XMLSAVE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
## Constants

Table 196–1  Constants of DBMS_XMLSAVE

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_ROWTAG</td>
<td>The default tag name for the element corresponding to database records -- ROW</td>
</tr>
<tr>
<td>DEFAULT_DATE_FORMAT</td>
<td>Default date mask: 'MM/dd/yyyy HH:mm:ss'</td>
</tr>
<tr>
<td>MATCH_CASE</td>
<td>Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.</td>
</tr>
<tr>
<td>IGNORE_CASE</td>
<td>Used to specify that when mapping XML elements to database entities the XSU should be case insensitive.</td>
</tr>
</tbody>
</table>
### Types

**Table 196–2 Types of DBMS_XMLSAVE**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. The type of the query context handle. This the return type of NEWCONTEXT.</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XMLSAVE Subprograms

### Table 196–3 DBMS_XMLSAVE Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEARKEYCOLUMNLIST on page 196-7</td>
<td>Clears the key column list.</td>
</tr>
<tr>
<td>CLEARUPDATECOLUMNLIST on page 196-8</td>
<td>Clears the update column list.</td>
</tr>
<tr>
<td>CLOSECONTEXT on page 196-9</td>
<td>It closes/deallocates a particular save context.</td>
</tr>
<tr>
<td>DELETEXML on page 196-10</td>
<td>Deletes records specified by data from the XML document, from the table specified at the context creation time.</td>
</tr>
<tr>
<td>GETEXCEPTIONCONTENT on page 196-11</td>
<td>Returns the thrown exception's error code and error message.</td>
</tr>
<tr>
<td>INSERTXML on page 196-12</td>
<td>Inserts the XML document into the table specified at the context creation time.</td>
</tr>
<tr>
<td>NEWCONTEXT on page 196-13</td>
<td>Creates a save context, and returns the context handle.</td>
</tr>
<tr>
<td>PROPAGATEORIGINALEXCEPTION on page 196-14</td>
<td>Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an OracleXMLSQLException.</td>
</tr>
<tr>
<td>REMOVEXSLTPARAM on page 196-15</td>
<td>Removes the value of a top-level stylesheet parameter</td>
</tr>
<tr>
<td>SETBATCHSIZE on page 196-16</td>
<td>Changes the batch size used during DML operations.</td>
</tr>
<tr>
<td>SETCOMMITBATCH on page 196-18</td>
<td>Sets the commit batch size.</td>
</tr>
<tr>
<td>SETDATEFORMAT on page 196-18</td>
<td>Sets the format of the generated dates in the XML document.</td>
</tr>
<tr>
<td>SETIGNORECASE on page 196-19</td>
<td>The XSU does mapping of XML elements to database.</td>
</tr>
<tr>
<td>SETKEYCOLUMN on page 196-20</td>
<td>This methods adds a column to the key column list.</td>
</tr>
<tr>
<td>SETPRESERVEWHITESPACE on page 196-21</td>
<td>Tells the XSU whether to preserve whitespace or not.</td>
</tr>
<tr>
<td>SETROWTAG on page 196-22</td>
<td>Names the tag used in the XML document to enclose the XML elements corresponding to database.</td>
</tr>
<tr>
<td>SETSQLTOXMLNAMEESCAPING on page 196-23</td>
<td>This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.</td>
</tr>
<tr>
<td>SETUPDATECOLUMN on page 196-24</td>
<td>Adds a column to the update column list.</td>
</tr>
<tr>
<td>SETXSLT on page 196-25</td>
<td>Registers a XSL transform to be applied to the XML to be saved.</td>
</tr>
<tr>
<td>SETXSLTPARAM on page 196-26</td>
<td>Sets the value of a top-level stylesheet parameter.</td>
</tr>
<tr>
<td>UPDATEXML on page 196-27</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>
CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLEARUPDATECOLUMNLIST

Clears the update column list.

**Syntax**

PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax
PROCEDURE closeContext(
   ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION deleteXML(</td>
<td></td>
</tr>
<tr>
<td>ctxHdl IN ctxType,</td>
<td></td>
</tr>
<tr>
<td>xDoc IN CLOB)</td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td>Uses a CLOB type for the xDoc parameter.</td>
</tr>
<tr>
<td>FUNCTION deleteXML(</td>
<td></td>
</tr>
<tr>
<td>ctxHdl IN ctxPType,</td>
<td></td>
</tr>
<tr>
<td>xDoc IN VARCHAR2)</td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td>Uses a VARCHAR2 type for the xDoc parameter.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

Syntax

PROCEDURE getExceptionContent(
   ctxHdl IN ctxType,
   errNo OUT NUMBER,
   errMsg OUT VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>errNo</td>
<td>(IN)</td>
<td>Error number.</td>
</tr>
<tr>
<td>errMsg</td>
<td>(IN)</td>
<td>Error message.</td>
</tr>
</tbody>
</table>
Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION insertXML(  
  ctxHdl IN ctxType,  
  xDoc IN VARCHAR2)  
RETURN NUMBER; | Passes in the xDoc parameter as a VARCHAR2. |
| FUNCTION insertXML(  
  ctxHdl IN ctxType,  
  xDoc IN CLOB)  
RETURN NUMBER; | Passes in the xDoc parameter as a CLOB. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a save context, and returns the context handle.

**Syntax**

```sql
FUNCTION newContext(
    targetTable IN VARCHAR2)
RETURN ctxType;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetTable</td>
<td>(IN)</td>
<td>The target table into which to load the XML document.</td>
</tr>
</tbody>
</table>
Tell the XSU that if an exception is raised, and is being thrown, the XSU should throw
the very exception raised; rather then, wrapping it with an OracleXMLSQLException.

Syntax

PROCEDURE propagateOriginalException(
    ctxHdl IN ctxType,
    flag IN BOOLEAN);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Propagate the original exception? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>
REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter.

Syntax

PROCEDURE removeXSLTParam(
    ctxHdl IN ctxType,
    name IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
</tbody>
</table>

DBMS_XMLSAVE 196-15
SETBATCHSIZE

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

PROCEDURE setBatchSize(
    ctxHdl IN ctxType,
    batchSize IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>batchSize</td>
<td>(IN)</td>
<td>Batch size.</td>
</tr>
</tbody>
</table>
**SETCOMMITBATCH**

Sets the commit batch size. The commit batch size refers to the number or records inserted after which a commit should follow. If `batchSize` is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is 0.

**Syntax**

```sql
PROCEDURE setCommitBatch(
    ctxHdl IN ctxType,
    batchSize IN NUMBER);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>batchSize</td>
<td>(IN)</td>
<td>Commit batch size.</td>
</tr>
</tbody>
</table>
Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the class java.text.SimpleDateFormat. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

**Syntax**

```sql
PROCEDURE setDateFormat(
    ctxHdl IN ctxType,
    mask IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>mask</td>
<td>(IN)</td>
<td>Syntax of the date format pattern.</td>
</tr>
</tbody>
</table>
SETIGNORECASE

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

Syntax

PROCEDURE setIgnoreCase(
    ctxHdl IN ctxType,
    flag IN NUMBER);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.</td>
</tr>
</tbody>
</table>
This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

**Syntax**

```sql
PROCEDURE setKeyColumn(
  ctxHdl IN ctxType,
  colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>
SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

Syntax
PROCEDURE setPreserveWhitespace(
  ctxHdl IN ctxType,
  flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Should XSU preserve whitespace?</td>
</tr>
</tbody>
</table>
SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

```sql
PROCEDURE setRowTag(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

PROCEDURE setSQLToXMLNameEscaping(
  ctxHdl IN ctxType,
  flag IN BOOLEAN := true);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>Turn on escaping?</td>
</tr>
</tbody>
</table>
SETUPUPDATECOLUMNM

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

PROCEDURE setUpdateColumn(
  ctxHdl IN ctxType,
  colName IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the update column list.</td>
</tr>
</tbody>
</table>
### SETXSLT

Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| PROCEDURE setXSLT(  
  ctxHdl IN ctxType,  
  uri IN VARCHAR2,  
  ref IN VARCHAR2 := null);  
PROCEDURE setXSLT(  
  ctxHdl IN ctxType,  
  stylesheet IN CLOB,  
  ref IN VARCHAR2 := null);  
| Passes in the stylesheet through a URI. |
| Passes in the stylesheet through a CLOB. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>URI to the stylesheet to register.</td>
</tr>
<tr>
<td>ref</td>
<td>(IN)</td>
<td>URL for include, import, and external entities.</td>
</tr>
<tr>
<td>stylesheet</td>
<td>(IN)</td>
<td>CLOB containing the stylesheet to register.</td>
</tr>
</tbody>
</table>
SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

Syntax

PROCEDURE setXSLTParam(
   ctxHdl IN ctxType,
   name IN VARCHAR2,
   value IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>name</td>
<td>(IN)</td>
<td>Parameter name.</td>
</tr>
<tr>
<td>value</td>
<td>(IN)</td>
<td>Parameter value as an XPath expression</td>
</tr>
</tbody>
</table>
UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION updateXML(</td>
<td></td>
</tr>
<tr>
<td>ctxHdl IN ctxType,</td>
<td></td>
</tr>
<tr>
<td>xDoc IN VARCHAR2)</td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a VARCHAR2.</td>
</tr>
<tr>
<td>FUNCTION updateXML(</td>
<td></td>
</tr>
<tr>
<td>ctxHdl IN ctxType,</td>
<td></td>
</tr>
<tr>
<td>xDoc IN CLOB)</td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a CLOB.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
DBMS_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script dbmsxsch.sql during Oracle database installation.

This chapter contains the following topics:

- Using DBMS_XMLSCHEMA
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Constants
  - Views
  - Operational Notes

- Summary of DBMS_XMLSCHEMA Subprograms
Using DBMS_XMLSCHEMA

This section contains topics which relate to using the DBMS_XMLSCHEMA package.

- Overview
- Deprecated Subprograms
- Security Model
- Constants
- Views
- Operational Notes
Overview

This package provides subprograms to
- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema
Deprecation Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with release Oracle Database 12c:

- GENERATESCHEMA Function
- GENERATESCHEMAS Function
Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
The DBMS_XMLSCHEMA package uses the constants shown in following tables.

- **DBMS_XMLSCHEMA Constants - Delete Option**
- **DBMS_XMLSCHEMA Constants - Enable Hierarchy**
- **DBMS_XMLSCHEMA Constants - Register CSID**

### Table 197–1  DBMS_XMLSCHEMA Constants - Delete Option

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_RESTRICT</td>
<td>NUMBER</td>
<td>1</td>
<td>Deletion of an XML schema fails if there are any tables or XML schemas that depend on it</td>
</tr>
<tr>
<td>DELETE_INVALIDATE</td>
<td>NUMBER</td>
<td>2</td>
<td>Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.</td>
</tr>
<tr>
<td>DELETE.CASCADE</td>
<td>NUMBER</td>
<td>3</td>
<td>Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if gentypes argument was set to TRUE during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.</td>
</tr>
<tr>
<td>DELETE.CASCADE_FORCE</td>
<td>NUMBER</td>
<td>4</td>
<td>This option is similar to DELETE.Cascade except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.</td>
</tr>
</tbody>
</table>

### Table 197–2  DBMS_XMLSCHEMA Constants - Enable Hierarchy

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_HIERARCHY_NONE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will not be called on any tables created while registering that schema</td>
</tr>
<tr>
<td>ENABLE_HIERARCHY_CONTENTS</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS</td>
</tr>
</tbody>
</table>
The `ENABLE_HIERARCHY_RESMETADATA` procedure of the `DBMS_XDBZ` package will be called on all tables created during schema registration with `hierarchy_type` as `DBMS_XDBZ.ENABLE_RESMETADATA`. Users should pass in `DBMS_XMLSCHEMA.ENABLE_RESMETADATA` for schemas they intend to use as resource metadata tables.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ENABLE_HIERARCHY_RESMETADATA</code></td>
<td><code>PLS_INTEGER</code></td>
<td>3</td>
<td>The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will be called on all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_RESMETADATA</code>. Users should pass in <code>DBMS_XMLSCHEMA.ENABLE_RESMETADATA</code> for schemas they intend to use as resource metadata tables.</td>
</tr>
</tbody>
</table>

Table 197–3  DBMS_XMLSCHEMA Constants - Register CSID

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>REGISTER_NODOCID</code></td>
<td><code>NUMBER</code></td>
<td>1</td>
<td>If a schema is registered for metadata use (using the value <code>ENABLE_HIER_RESMETADATA</code> for parameter <code>enablehierarchy</code> during registration), a column named <code>DOCID</code> is added to all tables created during schema registration. This constant can be used in the options argument of <code>REGISTERSCHEMA</code> to prevent the creation of this column if the user wishes to optimize on storage.</td>
</tr>
<tr>
<td><code>REGISTER_CSID_NULL</code></td>
<td><code>NUMBER</code></td>
<td>-1</td>
<td>If user wishes to not specify the character set of the input schema document when invoking <code>REGISTERSCHEMA</code>, this value can be used for the <code>csid</code> parameter.</td>
</tr>
</tbody>
</table>
Views

The DBMS_XMLSCHEMA package uses the views shown in Table 197–4. The columns of these views are described in detail in the Oracle Database Reference.

Table 197–4 Summary of Views used by DBMS_XMLSCHEMA

<table>
<thead>
<tr>
<th>Schema</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_XML_SCHEMAS</td>
<td>All registered XML Schemas owned by the user</td>
</tr>
<tr>
<td>ALL_XML_SCHEMAS</td>
<td>All registered XML Schemas usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_SCHEMAS</td>
<td>All registered XML Schemas in the database</td>
</tr>
<tr>
<td>DBA_XML_TABLES</td>
<td>All XMLType tables in the system</td>
</tr>
<tr>
<td>USER_XML_TABLES</td>
<td>All XMLType tables owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_TABLES</td>
<td>All XMLType tables usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_TAB_COLS</td>
<td>All XMLType table columns in the system</td>
</tr>
<tr>
<td>USER_XML_TAB_COLS</td>
<td>All XMLType table columns owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_TAB_COLS</td>
<td>All XMLType table columns in tables usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_VIEWS</td>
<td>All XMLType views in the system</td>
</tr>
<tr>
<td>USER_XML_VIEWS</td>
<td>All XMLType views owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_VIEWS</td>
<td>All XMLType views usable by the current user</td>
</tr>
<tr>
<td>DBA_XML_VIEW_COLS</td>
<td>All XMLType view columns in the system</td>
</tr>
<tr>
<td>USER_XML_VIEW_COLS</td>
<td>All XMLType view columns in views owned by the current user</td>
</tr>
<tr>
<td>ALL_XML_VIEW_COLS</td>
<td>All XMLType view columns in views usable by the current user</td>
</tr>
</tbody>
</table>
Operational Notes

Guidelines for Using In-Place XML Schema Evolution

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.

2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only INPLACE_TRACE. Do not also use INPLACE_EVOLVE. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.
## Summary of DBMS_XMLSCHEMA Subprograms

### Table 197–5  DBMS_XMLSCHEMA Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPILESCHEMA Procedure</td>
<td>Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.</td>
</tr>
<tr>
<td>COPYEVOLVE Procedure</td>
<td>Evolves registered schemas so that existing XML instances remain valid</td>
</tr>
<tr>
<td>DELETESCHEMA Procedure</td>
<td>Removes the schema from the database</td>
</tr>
<tr>
<td>GENERATESCHEMAG Function</td>
<td>Generates an XML schema from an oracle type name</td>
</tr>
<tr>
<td>GENERATESCHEMAGS Function</td>
<td>Generates several XML schemas from an oracle type name</td>
</tr>
<tr>
<td>INPLACEEVOLVE Procedure</td>
<td>Evolves registered schemas by propagating schema changes to object types and tables</td>
</tr>
<tr>
<td>PURGESCHEMAG Procedure</td>
<td>Removes the XML schema</td>
</tr>
<tr>
<td>REGISTERSCHEMAG Procedures</td>
<td>Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.</td>
</tr>
<tr>
<td>REGISTERURI Procedure</td>
<td>Registers an XML schema specified by a URI name</td>
</tr>
</tbody>
</table>
**COMPILESHEMA Procedure**

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a ORA-31001 exception: invalid resource handle or path name.

**Syntax**

```sql
DBMS_XMLSCHEMA.COMPILESCHEMA(
    schemaurl IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL identifying the schema</td>
</tr>
</tbody>
</table>
COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure’s parameters):

- copies data in schema based XMLType tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new XMLType tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:

- “Schema Evolution” chapter of the Oracle XML DB Developer’s Guide for examples on how to evolve existing schemas
- Oracle Database Error Messages for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```sql
DBMS_XMLSCHEMA.COPYEVOLVE(
  schemaurls       IN  XDB$STRUBG_LIST_T,
  newschemas       IN  XMLSequenceType,
  transforms       IN  XMLSequenceType :=NULL,
  preserveolddocs  IN  BOOLEAN :=FALSE,
  maptablename     IN  VARCHAR2 :=NULL,
  generatetables   IN  BOOLEAN :=TRUE,
  force            IN  BOOLEAN :=FALSE,
  schemaowners     IN  XDB$STRING_LIST_T :=NULL,
  parallelDegree   IN  PLS_INTEGER := 0,
  options          IN  PLS_INTEGER := 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurls</td>
<td>VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.</td>
</tr>
<tr>
<td>newschemas</td>
<td>VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.</td>
</tr>
<tr>
<td>transforms</td>
<td>VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.</td>
</tr>
</tbody>
</table>
Usage Notes

You should back up all schemas and documents prior to invocation because **COPYEVOLVE Procedure** deletes all conforming documents prior to implementing the schema evolution.
DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```sql
DBMS_XMLSCHEMA.DELETESCHEMA(
    schemaurl IN VARCHAR2,
    delete_option IN PLS_INTEGER := DELETE_RESTRICT);
```

See Also: "XMLSCHEMA Storage and Query: Basic" chapter of the Oracle XML DB Developer's Guide

Parameters

Table 197–8 DELETESCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL identifying the schema to be deleted</td>
</tr>
<tr>
<td>delete_option</td>
<td>Delete options:</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects.</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema.</td>
</tr>
<tr>
<td></td>
<td>■ DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.</td>
</tr>
</tbody>
</table>

Exceptions

Table 197–9 DELETESCHEMA Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31001</td>
<td>Invalid resource handle or path name</td>
</tr>
</tbody>
</table>
GENERATESCHEMA Function

**Note:** This subprogram is deprecated with Oracle Database 12c.

This function generates XML schema(s) from an Oracle type name. It inlines all in one schema (XMLType).

*See Also:* "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer’s Guide*

**Syntax**

```sql
DBMS_XMLSCHEMA.GENERATESCHEMA(
    schemaname    IN  VARCHAR2,
    typename      IN  VARCHAR2,
    elementname   IN  VARCHAR2 := NULL,
    recurse       IN  BOOLEAN  := TRUE,
    annotate      IN  BOOLEAN  := TRUE,
    embedcoll     IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaname</td>
<td>Name of the database schema containing the type</td>
</tr>
<tr>
<td>typename</td>
<td>Name of the Oracle type</td>
</tr>
<tr>
<td>elementname</td>
<td>The name of the top level element in the XML Schema. Defaults to typename.</td>
</tr>
<tr>
<td>recurse</td>
<td>Whether or not to also generate schema for all types referred to by the type specified</td>
</tr>
<tr>
<td>annotate</td>
<td>Whether or not to put the SQL annotations in the XML Schema</td>
</tr>
<tr>
<td>embedcoll</td>
<td>Determines whether the collections should be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on</td>
</tr>
</tbody>
</table>

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31001</td>
<td>Invalid resource handle or path name</td>
</tr>
</tbody>
</table>
GENERATESCHEMAS Function

Note: This subprogram is deprecated with Oracle Database 12c.

This function generates XML schema(s) from an Oracle type name. It returns a collection of XMLTypes, one XML Schema document for each database schema.

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the Oracle XML DB Developer's Guide

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS(
    schemaname   IN  VARCHAR2,
    typename     IN  VARCHAR2,
    elementname  IN  VARCHAR2 := NULL,
    schemaurl    IN  VARCHAR2 := NULL,
    annotate     IN  BOOLEAN := TRUE,
    embedcoll    IN  BOOLEAN := TRUE
) RETURN SYS.XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaname</td>
<td>Name of the database schema containing the type</td>
</tr>
<tr>
<td>typename</td>
<td>Name of the Oracle type</td>
</tr>
<tr>
<td>elementname</td>
<td>The name of the top level element in the XML Schema defaults to typeName</td>
</tr>
<tr>
<td>schemaurl</td>
<td>Specifies base URL where schemas will be stored, needed by top level schema for import statement</td>
</tr>
<tr>
<td>annotate</td>
<td>Whether or not to put the SQL annotations in the XML Schema</td>
</tr>
<tr>
<td>embedcoll</td>
<td>Determines whether the collections be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31001</td>
<td>Invalid resource handle or path name</td>
</tr>
</tbody>
</table>
INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
  schemaURL   IN   VARCHAR2,
  diffXML    IN   XMLType,
  flags      IN   NUMBER);
```

Parameters

Table 197–14 INPLACEEVOLVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaURL</td>
<td>URL of the schema to evolve</td>
</tr>
<tr>
<td>diffXML</td>
<td>Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.</td>
</tr>
<tr>
<td>flags</td>
<td>The following bits may be set in this parameter to control the behavior of this procedure:</td>
</tr>
<tr>
<td></td>
<td>- INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new.</td>
</tr>
<tr>
<td></td>
<td>- INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file.</td>
</tr>
</tbody>
</table>

That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:

- Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. |
- Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps) |

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema. |
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error. |
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.
Usage Notes

- Any errors resulting from CREATE TYPE, ALTER TYPE and like commands will generate error messages.

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.

- A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.
PURGESCHEMA Procedure

This procedure removes the XML schema.

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the Oracle XML DB Developer’s Guide

Syntax

DBMS_XMLSCHEMA.PURGESCHEMA(
   schemaid   IN  RAW);

Parameters

Table 197–15  PURGESCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaid</td>
<td>ID of the schema to be purged</td>
</tr>
</tbody>
</table>

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the HIDE mode.
- Once a schema has been deleted in HIDE mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.
REGISTERSCHEM A Procedures

This procedure registers the specified schema for use by the database. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

**Note:** As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

**See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the Oracle XML DB Developer’s Guide

**Syntax**

Registers a schema specified as a VARCHAR2:

```
DBMS_XMLSCHEMA.REGISTERSCHEM A(
    schemaurl IN VARCHAR2,
    schemadoc IN VARCHAR2,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEM A(
    schemaurl IN VARCHAR2,
    schemadoc IN BFILE,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := FALSE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := FALSE,
    owner IN VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEM A(
    schemaurl IN VARCHAR2,
    schemadoc IN BFILE,
    local IN BOOLEAN := TRUE,
    gentypes IN BOOLEAN := TRUE,
    genbean IN BOOLEAN := TRUE,
    gentables IN BOOLEAN := TRUE,
    force IN BOOLEAN := TRUE,
    owner IN VARCHAR2 := '',
    csid IN NUMBER,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options IN PLS_INTEGER := 0);
```
Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  BLOB,
    local            IN  BOOLEAN := TRUE,
    genTypes         IN  BOOLEAN := TRUE,
    genBean          IN  BOOLEAN := FALSE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  BLOB,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := TRUE,
    gentables        IN  BOOLEAN := TRUE,
    force            IN  BOOLEAN := TRUE,
    owner            IN  VARCHAR2 := '',
    csid             IN  NUMBER,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a CLOB

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  CLOB,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := FALSE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as an XMLTYPE.

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  SYS.XMLTYPE,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := FALSE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```sql
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  BLOB,
    local            IN  BOOLEAN := TRUE,
    genTypes         IN  BOOLEAN := TRUE,
    genBean          IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```
schemadoc   IN  SYS.URIType,
local       IN  BOOLEAN := TRUE,
gentypes    IN  BOOLEAN := TRUE,
genbean     IN  BOOLEAN := FALSE,
force       IN  BOOLEAN := FALSE,
owner       IN  VARCHAR2 := NULL,
enablehierarchy IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options     IN  PLS_INTEGER := 0);

Parameters

Table 197–16 REGSITERSCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaurl</td>
<td>URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside schemalocation attribute of XML Schema import element.</td>
</tr>
<tr>
<td>schemadoc</td>
<td>A valid XML schema document</td>
</tr>
<tr>
<td>local</td>
<td>Is this a local or global schema?</td>
</tr>
<tr>
<td>genotypes</td>
<td>Determines whether the schema compiler generates object types. By default, TRUE. If you use binary XML, you must be set gentypes to FALSE.</td>
</tr>
<tr>
<td>genbean</td>
<td>Determines whether the schema compiler generates Java beans. By default, FALSE. Oracle recommends that this parameter always be set to FALSE.</td>
</tr>
<tr>
<td>gentables</td>
<td>Determines whether the schema compiler generates default tables. By default, TRUE</td>
</tr>
<tr>
<td>force</td>
<td>If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.</td>
</tr>
<tr>
<td>owner</td>
<td>This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.</td>
</tr>
<tr>
<td>csid</td>
<td>Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for &quot;text/xml&quot; MIME type.</td>
</tr>
</tbody>
</table>
 enablehierarchy

- **ENABLE_HIERARCHY_NONE** - enable hierarchy will not be called on any tables created while registering that schema.
- **ENABLE_HIERARCHY_CONTENTS** - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default.
- **ENABLE_HIERARCHY_RESMETADATA** - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

**options**

Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:
- **REGISTER_NODOCID** - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)
- **REGISTER_BINARYXML** - Register the schema for Binary XML
- **REGISTER_NT_AS_IOT** - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

### Table 197–16  (Cont.) REGSITERSHEMA Procedure Parameters

</thead>
</table>
| enablehierarchy | - ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema.
- ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default.
- ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables. |
| options         | Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:
- REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)
- REGISTER_BINARYXML - Register the schema for Binary XML
- REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables |
REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

**Note:** As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

### Syntax

```sql
DBMS_XMLSCHEMA.REGISTERURI(
  schemaurl IN VARCHAR2,
  schemadocuri IN VARCHAR2,
  local     IN BOOLEAN := TRUE,
  gentypes  IN BOOLEAN := TRUE,
  genbean   IN BOOLEAN := FALSE,
  gentables IN BOOLEAN := TRUE,
  force     IN BOOLEAN := FALSE,
  owner     IN VARCHAR2 := NULL,
  options   IN PLS_INTEGER := 0);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schemaurl</code></td>
<td>Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element.</td>
</tr>
<tr>
<td><code>schemadocuri</code></td>
<td>Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code>, and invokes the <code>REGIERTSCHEMA Procedures</code>.</td>
</tr>
<tr>
<td><code>local</code></td>
<td>Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/ &lt;username&gt;/...</code> If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> The user needs write privileges on the directory to register a global schema.</td>
</tr>
<tr>
<td><code>gentypes</code></td>
<td>Determines whether the compiler generate object types. By default, TRUE.</td>
</tr>
<tr>
<td><code>genbean</code></td>
<td>Determines whether the compiler generate Java beans. By default, FALSE.</td>
</tr>
<tr>
<td><code>gentables</code></td>
<td>Determines whether the compiler generate default tables. TRUE by default.</td>
</tr>
<tr>
<td><code>force</code></td>
<td>TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.</td>
</tr>
<tr>
<td><code>owner</code></td>
<td>This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.</td>
</tr>
</tbody>
</table>
options

Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a \texttt{BITOR} of the desired bits. Possible bits:

- \texttt{REGISTER\_NODCID} - this will suppress the creation of the \texttt{DOCID} column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the \texttt{DOCID} column)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a \texttt{BITOR} of the desired bits. Possible bits: \texttt{REGISTER_NODCID} - this will suppress the creation of the \texttt{DOCID} column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the \texttt{DOCID} column)</td>
</tr>
</tbody>
</table>
The `DBMS_XMLSCHEMA_ANNOTATE` package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Using DBMS_XMLSCHEMA_ANNOTATE

- Overview
- Security Model
Overview

The **DBMS_XMLSCHEMA_ANNOTATE** package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations. Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.
Security Model

Owned by XDB, the DBMS_XMLSCHEMA_ANNOTATE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
## Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDXDBNAMESPACE Procedure</td>
<td>Adds the XDB namespace required for XDB annotation</td>
</tr>
<tr>
<td>DISABLEDEFAULTTABLECREATION Procedure</td>
<td>Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element</td>
</tr>
<tr>
<td>DISABLEMAINTAINDOM Procedure</td>
<td>Sets the DOM fidelity attribute to FALSE</td>
</tr>
<tr>
<td>ENABLEDEFAULTTABLECREATION Procedure</td>
<td>Enables the creation of ALL top level tables by removing the empty default table name annotation</td>
</tr>
<tr>
<td>ENABLEMAINTAINDOM Procedure</td>
<td>Sets the DOM fidelity attribute to TRUE</td>
</tr>
<tr>
<td>GETSCHEMAANNOTATIONS Function</td>
<td>Creates a document containing the differences between the annotated XML schema and the original XML schema</td>
</tr>
<tr>
<td>GETSIDXDEFFROMVIEW Function</td>
<td>Takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table</td>
</tr>
<tr>
<td>PRINTWARNINGS Procedure</td>
<td>Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema</td>
</tr>
<tr>
<td>REMOVEANYSTORAGE Procedure</td>
<td>Removes the setting of the SQL type from the ANY child of the complex type with the given name</td>
</tr>
<tr>
<td>REMOVEDEFAULTTABLE Procedure</td>
<td>Removes any default table attribute given for the element. After calling this procedure, the system generates table names</td>
</tr>
<tr>
<td>REMOVEMAINTAINDOM Procedure</td>
<td>Removes all annotations used to maintain DOM from the given schema</td>
</tr>
<tr>
<td>REMOVEOUTOFLINE Procedure</td>
<td>Removes any existing SQLinline attributes to prevent out-of-line storage</td>
</tr>
<tr>
<td>REMOVESQLCOLLTYPE Procedure</td>
<td>Removes a SQL collection type.</td>
</tr>
<tr>
<td>REMOVESQLNAME Procedure</td>
<td>Removes a SQLNAME from a global element</td>
</tr>
<tr>
<td>REMOVESQLTYPE Procedure</td>
<td>Removes a SQL type</td>
</tr>
<tr>
<td>REMOVESQLTYPEPMAPPING Procedure</td>
<td>Removes the SQL type mapping for the given schema type.</td>
</tr>
<tr>
<td>REMOVETABLEPROPS Procedure</td>
<td>Removes the table storage properties from the CREATE TABLE statement</td>
</tr>
<tr>
<td>REMOVETIMESTAMPWITHTIMEZONE Procedure</td>
<td>Removes he setting of the TimestampWithTimeZone datatype from all dateTime typed elements in the XML schema</td>
</tr>
<tr>
<td>SETANYSTORAGE Procedure</td>
<td>Assigns a SQL datatype to the ANY child of the complex type with the given name</td>
</tr>
<tr>
<td>SETDEFAULTTABLE Procedure</td>
<td>Sets the name of the table for the specified global element</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SETOUTOFLINE Procedure on page 198-27</td>
<td>Sets the SQLInline attribute to FALSE</td>
</tr>
<tr>
<td>SETSCHEMAANNOTATIONS Procedure on page 198-29</td>
<td>Takes the annotated differences resulting from a call to DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema</td>
</tr>
<tr>
<td>SETSQLCOLLTYPE Procedure on page 198-30</td>
<td>Assigns a SQL type name for a collection</td>
</tr>
<tr>
<td>SETSQLNAME Procedure on page 198-31</td>
<td>Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema</td>
</tr>
<tr>
<td>SETSQLTYPE Procedure on page 198-32</td>
<td>Assigns a SQL type to a global object</td>
</tr>
<tr>
<td>SETSQLTYPEMAPPING Procedure on page 198-34</td>
<td>Defines a mapping of schema type and SQL type</td>
</tr>
<tr>
<td>SETTABLEPROPS Procedure on page 198-35</td>
<td>Specifies properties in the TABLE storage clause that is appended to the default CREATE TABLE statement</td>
</tr>
<tr>
<td>SETTIMESTAMPWITHTIMEZONEN Procedure on page 198-36</td>
<td>Sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema</td>
</tr>
</tbody>
</table>
**ADDXDBNAMESPACE Procedure**

This procedure adds the XDB namespace required for XDB annotation.

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (xmlschema IN OUT XMLTYPE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xmlschema</code></td>
<td>Gets an XML Schema as <code>XMLTYPE</code>, performs the annotation and returns it</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.
DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The procedure always overwrites. This is equivalent to using the schema annotation xdb:defaultTable="" for the top-level element or elements.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
    xmlschema IN OUT XMLType,
    globalElementName IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
</tbody>
</table>

Example

The purchaseOrder element will have an annotation similar to xdb:defaultTable="".

```
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
        'purchaseOrder');

    UPDATE annotation_tab SET out = xml_schema;
END;
/
```
DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to false.

There are two overloads. The first sets DOM fidelity attribute to false for all complex types, and the second sets it to false for the named complex type. This is equivalent to adding xdb:maintainDOM="false" on all or specified complex types respectively.

Syntax

DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (xmlschema IN OUT XMLType, overwrite IN BOOLEAN default TRUE);

DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (xmlschema IN OUT XMLType, complexTypeName IN VARCHAR2, overwrite IN BOOLEAN default TRUE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>The name of the complex type</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE</td>
</tr>
</tbody>
</table>
ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema            IN OUT  XMLTYPE);

DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema            IN OUT  XMLTYPE,
    globalElementName    IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xmlschema</code></td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td><code>globalElementName</code></td>
<td>Name of the global element in the schema</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not affect elements that have a default table name.
ENABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to TRUE. There are two overloads. The first sets DOM fidelity attribute to TRUE for all complex types, and the second sets it to TRUE for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (  
    xmlschema       IN OUT XMLType,  
    overwrite       IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (  
    xmlschema        IN OUT XMLType,  
    complexTypeName  IN VARCHAR2,  
    overwrite        IN BOOLEAN default TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>The name of the complex type</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE</td>
</tr>
</tbody>
</table>
GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
    xmlschema IN xmlType)
RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The original XML schema</td>
</tr>
</tbody>
</table>

Return Values

This function returns the document annotations.xml as an XMLType.

Usage Notes

This function saves all annotations in one document, named annotations, and returns it. With this document, you can apply all annotations to a non-annotated schema, using DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS.

DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also: SETSCHEMAANNOTATIONS Procedure on page 29

Example

For an example of DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS, see the example in SETSCHEMAANNOTATIONS Procedure on page 29.
GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (  
    viewName   IN xmlType)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>viewName</td>
<td>The original XML schema</td>
</tr>
</tbody>
</table>

Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.
PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (   
    value       IN   BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed, and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.
**REMOVEANYSTORAGE Procedure**

This procedure removes the setting of the SQL type from the `ANY` child of the complex type with the given name.

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (  
    xmlschema  IN OUT XMLType,  
    complexTypeName IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated.</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>The name of the complex type.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure reverses the `SETANYSTORAGE Procedure`. 
REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element. After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (  
    xmlschema          IN OUT XMLTYPE,  
    globalElementName  IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
</tbody>
</table>

Example

Annotations can be verified anytime using "select out from annotation_tab".

```sql
--The purchaseOrder element will have no annotation for defaultTable.
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                                'purchaseOrder');

    UPDATE annotation_tab SET out = xml_schema;
END;
/```
REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
    xmlschema    IN OUT XMLType);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
</tbody>
</table>
REMOVEOUTOFLINE Procedure

This procedure removes any existing SQLInline attributes to prevent out-of-line storage. There are three overloads.

Syntax

Removes the SQLInline attribute for the named element.

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema IN OUT XMLType,
    elementName IN VARCHAR2,
    elementType IN VARCHAR2,
    overwrite IN BOOLEAN default TRUE);
```

Removes the SQLInline attribute for the object specified by its global object and local element names.

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema IN OUT XMLType,
    globalObject IN VARCHAR2,
    globalObjectName IN VARCHAR2,
    localElementName IN VARCHAR2);
```

Removes the SQLInline attribute for the referenced global element.

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema IN OUT XMLType,
    reference IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>elementName</td>
<td>The element name</td>
</tr>
<tr>
<td>elementType</td>
<td>The element type</td>
</tr>
<tr>
<td>globalObject</td>
<td>The global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>The name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>The name of a local element that descends from the global element</td>
</tr>
<tr>
<td>reference</td>
<td>A reference to a global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses SETOUTOFLINE Procedure.
REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type. The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema   IN OUT XMLType,
    elementName IN VARCHAR2);
```

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
    xmlschema        IN OUT XMLType,
    globalObject     IN VARCHAR2,
    globalName       IN VARCHAR2,
    localElementName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xmlschema</code></td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td><code>elementName</code></td>
<td>The element name</td>
</tr>
<tr>
<td><code>globalObject</code></td>
<td>The global object (global complex type or global element)</td>
</tr>
<tr>
<td><code>globalName</code></td>
<td>The name of the global object</td>
</tr>
<tr>
<td><code>localElementName</code></td>
<td>The name of a local element that descends from the global element</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the SETSQLCOLLTYPE Procedure.
REMOVESQLNAME Procedure

This procedure removes a SQLNAME from a global element.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (  
  xmlschema          IN OUT  XMLType,  
  globalObject       IN      VARCHAR2,  
  globalObjectName   IN      VARCHAR2,  
  localObject        IN      VARCHAR2,  
  localObjectName    IN      VARCHAR2,  
  sqlName            IN      VARCHAR2,  
  overwrite          IN      BOOLEAN DEFAULT TRUE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object</td>
</tr>
<tr>
<td>sqlName</td>
<td>Name of the SQL attribute that corresponds to the element defined in the XML schema</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```sql
DECLARE  
  xml_schema    XMLTYPE;  
BEGIN  
  SELECT out INTO xml_schema FROM annotation_tab;  
  DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,  
    'element', 'purchaseOrder',  
    'element', 'shipTo',  
    'SHIPTO_SQLNAME');  
  UPDATE annotation_tab SET out = xml_schema;  
END;  
/  
```
REMOVESQLTYPE Procedure

This procedure removes a SQL type. The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (  
    xmlschema in out XMLType,  
    globalElementName IN VARCHAR2);
```

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (  
    xmlschema           IN OUT  XMLTYPE,  
    globalObject        IN VARCHAR2,  
    globalObjectName    IN VARCHAR2,  
    localObject         IN VARCHAR2,  
    localObjectName     IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated.</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element.</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object.</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the SETSQLTYPE Procedure.
REMOVESQLTYPEMAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPEMAPPING (
    xmlschema IN OUT XMLTYPE,
    schemaTypeName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>schemaTypeName</td>
<td>Name of the schema type</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses the SETSQLTYPEMAPPING Procedure.
REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the `CREATE TABLE` statement. This procedure is overloaded. Each overload has different parameter requirements as indicated.

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (    
    xmlschema            IN OUT  XMLTYPE, 
    globalElementName    IN      VARCHAR2);
```

```sql
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (    
    xmlschema            IN OUT  XMLTYPE, 
    globalObject         IN      VARCHAR2, 
    globalObjectName     IN      VARCHAR2, 
    localElementName     IN      VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xmlschema</code></td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td><code>globalElementName</code></td>
<td>Name of the global element in the schema</td>
</tr>
<tr>
<td><code>globalObject</code></td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td><code>globalObjectName</code></td>
<td>Name of the global object</td>
</tr>
<tr>
<td><code>localElementName</code></td>
<td>Name of a local element that descends from the global element</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure reverses the `SETTABLEPROPS Procedure`. 
This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

**Syntax**

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (  
  xmlschema IN OUT XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (  
  xmlschema IN OUT XMLTYPE,  
  schemaTypeName IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>schemaTypeName</td>
<td>Name of the schema type</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure reverses the `SETTIMESTAMPWITHTIMEZONE` Procedure.
**SETANYSTORAGE Procedure**

This procedure assigns a SQL datatype to the *any* child of the complex type with the given name.

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE (xmlschema IN OUT XMLType,
complexTypeName IN VARCHAR2,
sqlTypeName IN VARCHAR2,
overwrite IN BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>complexTypeName</td>
<td>Name of the complex type</td>
</tr>
<tr>
<td>sqlTypeName</td>
<td>Name of the SQL type</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

**Example**

The `xsd:any` child of complex type `Items` is assigned an annotation similar to `xdb:SQLType="VARCHAR"`.

```sql
DECLARE xml_schema XMLTYPE; BEGIN
SELECT INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage (xml_schema, 'Items', 'VARCHAR');
UPDATE annotation_tab SET out = xml_schema; END;
```

SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
  xmlschema        IN  OUT  XMLTYPE,
  globalElementName IN       VARCHAR2,
  tableName         IN       VARCHAR2,
  overwrite         IN       BOOLEAN   DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
<tr>
<td>tableName</td>
<td>Name being assigned to the table</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites</td>
</tr>
<tr>
<td></td>
<td>element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>
SETOUTOFLINE Procedure

This procedure sets the SQLInline attribute to FALSE, that is, it sets xdb:SQLInline=FALSE.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate XMLType table. XDB stores references to each row of the XMLType table in a link table that is maintained by the main table.

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '1000 column limit' errors during XML schema registration, when some elements have complex types with many elements.

Also See: Oracle XML DB Developer’s Guide

There are three overloads.

Syntax

Sets the SQLInline attribute to FALSE, forcing out-of-line storage for the named element.

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (  
  xmlschema            IN OUT  XMLType,  
  elementName          IN      VARCHAR2,  
  elementType          IN      VARCHAR2,  
  defaultTableName     IN      VARCHAR2,  
  overwrite            IN      BOOLEAN DEFAULT TRUE);
```

Sets the SQLInline attribute to FALSE, forcing out-of-line storage for the element specified by its local and global name.

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (  
  xmlschema            IN OUT  XMLType,  
  globalObject         IN      VARCHAR2,  
  globalObjectName     IN      VARCHAR2,  
  localElementName     IN      VARCHAR2,  
  defaultTableName     IN      VARCHAR2,  
  overwrite            IN      BOOLEAN DEFAULT TRUE);
```

Sets the SQLInline attribute to FALSE to force out-of-line storage and sets the default table name for all references to a particular global element.

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (  
  xmlschema            IN OUT  XMLType,  
  reference            IN      VARCHAR2,  
  defaultTableName     IN      VARCHAR2,  
  overwrite            IN      BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated.</td>
</tr>
<tr>
<td>elementName</td>
<td>The element name</td>
</tr>
</tbody>
</table>
Usage Notes

After XML schema registration and before loading XML instance data, use `DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES()` to make these references scope to the out-of-line table only. This ensures better query performance later on.

Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to `xdb:defaultTable="CMMNT_DEFAULT_TABLE"`

```sql
DECLARE
    xml_schema xmltype;
BEGIN
    SELECT OUT INTO xml_schema FROM annotation_tab;

    DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
        'ipo:comment',
        'CMMNT_DEFAULT_TABLE');

    UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```
SETSHEMAANNOTATIONS Procedure

This procedure takes the annotated differences resulting from a call to `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` and patches them into the provided XML schema.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (    xmlschema     IN OUT xmlType,    annotations   IN VARCHAR2);
```

Parameters

Table 198–23  SETSCHEMAANNOTATIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>An XML schema to be patched.</td>
</tr>
<tr>
<td>annotations</td>
<td>The differences document produced by calling <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> on the original XML schema and an annotated XML schema.</td>
</tr>
</tbody>
</table>

Usage Notes

`DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:  `GETSCHEMAANNOTATIONS Function`

Example

The following example illustrates `DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS` shown here and `GETSCHEMAANNOTATIONS Function`.

```sql
-- test getannotations and apply them
declare
    xml_schema xmltype;
    xml_schema2 xmltype;
    annotations xmltype;
begin
    select out into xml_schema from annotation_tab;

    -- get the annotations from the schema
    annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

    -- apply the annotations to the schema
    select inp into xml_schema2 from annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

    update annotation_tab t set t.out = xml_schema2;
end;
/
This procedure assigns a SQL type name for a collection. A collection is a global or local element with \( \text{maxOccurs} > 1 \). Using this procedure, XDB creates SQLTypes with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

**Syntax**

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (  
    xmlschema             IN OUT   XMLTYPE,  
    elementName           IN       VARCHAR2,  
    sqlCollType           IN       VARCHAR2,  
    overwrite             IN       BOOLEAN DEFAULT TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (  
    xmlschema             IN OUT XMLType,  
    globalObject          IN VARCHAR2,  
    globalObjectName      IN VARCHAR2,  
    localElementName      IN VARCHAR2,  
    sqlCollType           IN VARCHAR2,  
    overwrite             IN BOOLEAN default TRUE ) ;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>The XML schema to be annotated</td>
</tr>
<tr>
<td>elementName</td>
<td>The element name</td>
</tr>
<tr>
<td>sqlCollType</td>
<td>The SQL collection type</td>
</tr>
<tr>
<td>globalObject</td>
<td>The global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>The name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>The name of a local element that descends from the global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

**Example**

The `item` element will have an annotation similar to `xdb:SQLCollType="ITEM_SQL_COL_TYPE"`.

```
declare
    xml_schema xmltype;
begin
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                'item',
                'ITEM_SQL_COL_TYPE',TRUE);
    UPDATE annotation_tab SET out = xml_schema;
end;
```
**SETSQLNAME Procedure**

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
    xmlschema          IN OUT  XMLType,
    globalObject       IN      VARCHAR2,
    globalObjectName   IN      VARCHAR2,
    localObject        IN      VARCHAR2,
    localObjectName    IN      VARCHAR2,
    sqlName            IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object</td>
</tr>
<tr>
<td>sqlName</td>
<td>Name of the SQL attribute that corresponds to the element defined in the XML schema</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

**Example**

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```sql
DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
        'element', 'purchaseOrder',
        'element', 'shipTo',
        'SHIPTO_SQLNAME');
    UPDATE annotation_tab SET out = xml_schema;
END;
/```
SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (xmlschema IN OUT XMLTYPE,
    globalElementName IN VARCHAR2,
    sqlType IN VARCHAR2,
    overwrite IN BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (xmlschema IN OUT XMLTYPE,
    globalObject IN VARCHAR2,
    globalObjectName IN VARCHAR2,
    localObject IN VARCHAR2,
    localObjectName IN VARCHAR2,
    sqlType IN VARCHAR2,
    overwrite IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element</td>
</tr>
<tr>
<td>localObject</td>
<td>Object descended from the global object</td>
</tr>
<tr>
<td>localObjectName</td>
<td>Name of the local object</td>
</tr>
<tr>
<td>sqlType</td>
<td>SQL type assigned to the named global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

Example

The `purchaseOrder` element will have an annotation similar to `xdb:SQLType="PO_SQLTYPE"` and the `shipTo` element has one similar to `xdb:SQLType="VARCHAR"`.

```sql
DECLARE
    xml_schema xmltype;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
        'purchaseOrder',
        'PO_SQLTYPE');

    UPDATE annotation_tab SET out = xml_schema;
END;
/```
DECLARE xml_schema xmltype;
BEGIN
SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
    'element','purchaseOrder',
    'element',
    'shipTo',
    'VARCHAR');
UPDATE annotation_tab
SET out = xml_schema;
END;
/
SETSQLTYPEMAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the SETSQLTYPE procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPEMAPPING (  
  xmlschema         IN OUT   XMLType,  
  schemaTypeName    IN       VARCHAR2,  
  sqlTypeName       IN       VARCHAR2,  
  overwrite         IN       BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>schemaTypeName</td>
<td>Schema type</td>
</tr>
<tr>
<td>sqlTypeName</td>
<td>Name of the SQL type</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE</td>
</tr>
</tbody>
</table>

Example

The attribute orderDate will have an annotation similar to xdb:SQLType="DATE".

```
declare  xml_schema xmltype;beginSELECT out INTO xml_schema FROM annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping (xml_schema,  
  'date',  
  'DATE');UPDATE annotation_tab SET  
  out = xml_schema;end;
/```

SETTABLEPROPS Procedure

This procedure specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement. There are two overloads with different parameter requirements, as indicated:

**Syntax**

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS ( 
    xmlschema            IN OUT  XMLType,
    globalElementName    IN      VARCHAR2,
    tableProps           IN      VARCHAR2,
    overwrite            IN      BOOLEAN DEFAULT TRUE);

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS ( 
    xmlschema            IN OUT  XMLTYPE,
    globalObject         IN      VARCHAR2,
    globalObjectName     IN      VARCHAR2,
    localElementName     IN      VARCHAR2,
    tableProps           IN      VARCHAR2,
    overwrite            IN      BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>globalElementName</td>
<td>Name of the global element in the schema</td>
</tr>
<tr>
<td>tableProps</td>
<td>Table properties</td>
</tr>
<tr>
<td>globalObject</td>
<td>Global object (global complex type or global element)</td>
</tr>
<tr>
<td>globalObjectName</td>
<td>Name of the global object</td>
</tr>
<tr>
<td>localElementName</td>
<td>Name of a local element that descends from the global element</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>

**Example**

The `purchaseOrder` element will have an annotation similar to `xdb:tableProps="CACHE"`.

```sql
DECLARE xml_schema XMLTYPE; BEGIN SELECT out INTO xml_schema FROM annotation_tab; DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema, 'purchaseOrder', 'CACHE'); UPDATE annotation_tab SET out = xml_schema;END; /
```
SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the TIMESTAMPWITHTIMEZONE datatype to all dateTime typed elements in the XML schema. This is equivalent to adding xdb:SQLType="TIMESTAMP WITH TIME ZONE" to all dateTime objects.

Syntax

```sql
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (  
  xmlschema IN OUT XMLTYPE,  
  overwrite IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlschema</td>
<td>XML schema to be annotated</td>
</tr>
<tr>
<td>overwrite</td>
<td>Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.</td>
</tr>
</tbody>
</table>
The `DBMS_XMLSTORAGE_MANAGE` package provides an interface to manage and modify XML storage after schema registration has been completed.

**See Also:** Oracle XML DB Developer’s Guide

This chapter contains the following topics:

- **Using DBMS_XMLSTORAGE_MANAGE**
  - Overview
  - Security Model
- **Summary of DBMS_XMLSTORAGE_MANAGE Subprograms**
Using DBMS_XMLSTORAGE_MANAGE

- Overview
- Security Model
Overview

DBMS_XMLSTORAGE_MANAGE contains procedures to manage and modify XML storage after schema registration has been completed. Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.
Security Model

Owned by XDB, the DBMS_XMLSTORAGE_MANAGE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
## Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLEINDEXESANDCONSTRAINTS Procedure</td>
<td>Disables the indexes and constraints for XMLType tables and XMLType columns</td>
</tr>
<tr>
<td>ENABLEINDEXESANDCONSTRAINTS Procedure</td>
<td>Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables</td>
</tr>
<tr>
<td>EXCHANGEPOSTPROC Procedure</td>
<td>Enable constraints after exchange partition</td>
</tr>
<tr>
<td>EXCHANGEPREPROC Procedure</td>
<td>Disable constraints before exchange partition</td>
</tr>
<tr>
<td>INDEXXMLREFERENCES Procedure</td>
<td>Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table</td>
</tr>
<tr>
<td>RENAMECOLLECTIONTABLE Procedure</td>
<td>Renames a collection table to the given table name</td>
</tr>
<tr>
<td>SCOPEXMLREFERENCES Procedure</td>
<td>Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types</td>
</tr>
<tr>
<td>XPATH2TABCOLMAPPING Function</td>
<td>Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name</td>
</tr>
</tbody>
</table>
DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (  
    owner_name    IN  VARCHAR2  DEFAULT USER,  
    table_name    IN  VARCHAR2,  
    column_name   IN  VARCHAR2  DEFAULT NULL,  
    clear         IN  BOOLEAN  DEFAULT FALSE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the XMLType table that the procedure is being performed on</td>
</tr>
<tr>
<td>column_name</td>
<td>XMLType column name</td>
</tr>
<tr>
<td>clear</td>
<td>Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them.</td>
</tr>
</tbody>
</table>

Usage Notes

Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

Using clear to Enable and Disable Indexes and Constraints

**Note:** If the DISABLEINDEXESANDCONSTRAINTS procedure is called with clear set to TRUE, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the DISABLEINDEXESANDCONSTRAINTS procedure with clear set to TRUE.

Ideally, it is recommended that you set clear set to TRUE for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) clear should be set to FALSE, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with clear set to TRUE for the next bulk load operation.
Example

The following example illustrates the use of `clear` in the `DISABLEINDEXESANDCONSTRAINTS` procedure and the `ENABLEINDEXESANDCONSTRAINTS` procedure.

First, add a not-NULL constraint on `comment` element of the `PURCHASEORDER_TAB` table:

```sql
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check ('XMLDATA'."comment" IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the `clear` as `TRUE`, by calling the `DISABLEINDEXESANDCONSTRAINTS` procedure:

```sql
BEGIN
   XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
      ( USER,'PURCHASEORDER_TAB',NULL,TRUE );
END;
/
```

Next, perform a bulk load operation (such as datapump import) which violates constraint `c1` in the `ALTER` table statement. This does not raise an error because the constraint is disabled:

```bash
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

NOTE: To view the disabled constraints and indexes use:

```sql
SELECT constraint_name,table_name,status FROM all_constraints
   WHERE owner = user;
```

Finally, try to enable the constraint using the `ENABLEINDEXESANDCONSTRAINTS` procedure. It raises an error because `c1`, the not null constraint, is violated by the bulk load operation:

```sql
BEGIN
   XDB.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
      ( USER,'PURCHASEORDER_TAB');
END;
/
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear` = `FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully). Note: `clear` = `FALSE` by default, so we do not need to pass it explicitly in the next call.

```sql
BEGIN
   xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
      ( USER,'PURCHASEORDER_TAB');
END;
/
```

Then, delete the incorrect rows entered into the table

```sql
DELETE FROM purchaseorder_tab p
   WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```sql
BEGIN
   xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
```
DISABLEINDEXESANDCONSTRAINTS Procedure

END;
/

( USER, 'PURCHASEORDER_TAB');
ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables. When column_name is passed, it does the same for this XMLType column.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (
    owner_name   IN VARCHAR2 DEFAULT USER,
    table_name   IN VARCHAR2,
    column_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_user</td>
<td>Owner’s name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table that the indexes and constraints are being removed from</td>
</tr>
<tr>
<td>column_name</td>
<td>Column name</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure reverses DISABLEINDEXESANDCONSTRAINTS Procedure.

Example

See DISABLEINDEXESANDCONSTRAINTS Procedure.
EXCHANGEPOSTPROC Procedure

This procedure enables constraints after exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (
  owner_name   IN VARCHAR2 DEFAULT USER,
  table_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_user</td>
<td>Owner’s name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table that the indexes and constraints are being removed from</td>
</tr>
</tbody>
</table>
EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (  
    owner_name   IN VARCHAR2 DEFAULT USER,  
    table_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_user</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table that the indexes and constraints are being removed from</td>
</tr>
</tbody>
</table>
INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends _1, _2, and so on to their names.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
    owner_name    IN VARCHAR2 DEFAULT USER,
    table_name    IN VARCHAR2,
    column_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>The owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>The table being indexed</td>
</tr>
<tr>
<td>column_name</td>
<td>A column name. Not needed for XML type tables.</td>
</tr>
<tr>
<td>index_name</td>
<td>The name of the newly created index</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is only used if the REFs are scoped. See SCOPEXMLREFERENCES Procedure.

Indexed REFs lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFs.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFs recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML_OUT_OF_LINE_TABLES or XML_NESTED_TABLES view. This creates the index names from the current value of a column in the view.

---

**Note:** This procedure is limited to the structured storage model.
RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.
An XPath expression specifies the collection table, starting from the XMLtype base table or an XMLType column of the base table.
This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

```sql
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (  
  owner_name IN VARCHAR2 DEFAULT USER,  
  table_name IN VARCHAR2,  
  column_name IN VARCHAR2 DEFAULT NULL,  
  xpath IN VARCHAR2,  
  collection_table_name IN VARCHAR2,  
  namespaces IN VARCHAR2 default NULL);  // For release 11.2 only
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>The name of the owner</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of a base table that can be used as the starting point for specifying the collection table</td>
</tr>
<tr>
<td>column_name</td>
<td>An XMLType column that can be the starting point for specifying the collection table</td>
</tr>
<tr>
<td>xpath</td>
<td>The XPath expression that specifies the collection table</td>
</tr>
<tr>
<td>collection_table_name</td>
<td>The name of the collection table</td>
</tr>
<tr>
<td>namespaces</td>
<td>For Oracle Database 11g Release 2 (11.2) and higher. The namespaces used in XPath.</td>
</tr>
</tbody>
</table>

Usage Notes

Call this procedure after registering the XML schema.
The table name serves as a prefix to the index names.
Oracle recommends using this function because it makes query execution plans more readable.
Report errors that occur while this procedure runs to the user that called the procedure.

**Note:** This procedure is limited to the structured storage model.

For Oracle Database 11g Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a namespaces parameter may also be required.
Example

The collection table name will be EMP_TAB_NAMELIST. You can verify this using `SELECT * FROM user_nested_tables`.

**Using DOT Notation:**
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE {
    USER,
    'EMP_TAB',
    NULL,
    '"XMLDATA"."EMPLOYEE"."NAME"',
    '"EMP_TAB_NAMELIST');

**Using XPath Notation:**
XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE {
    USER,
    'EMP_TAB',
    NULL,
    '/e:Employee/Name',
    'EMP_TAB_NAMELIST',
    '''http://www.oracle.com/emp.xsd'' as "e"');
SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types.

Syntax

DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;

Usage Notes

- If you have used SETOUTOFLINE Procedure in the DBMS_XMLSTORAGE_MANAGE package to avoid raising '1000 column limit' errors during XML schema registration, you should also use SCOPEXMLREFERENCES Procedure.
- Using SCOPEXMLREFERENCES after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

Note: This procedure is limited to the structured storage model.
**XPATH2TABCOLMAPPING Function**

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

**Syntax**

```sql
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
    owner_name   IN  VARCHAR2 DEFAULT USER,
    table_name   IN  VARCHAR2,
    column_name  IN  VARCHAR2 DEFAULT NULL,
    xpath        IN  VARCHAR2,
    namespaces   IN  VARCHAR2 DEFAULT NULL)
RETURN XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner's name</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the base table</td>
</tr>
<tr>
<td>column_name</td>
<td>Optional name of the XML type column if <code>table_name</code> is not an XMLType table. If <code>table_name</code> refers to XMLType table then <code>column_name</code> should be NULL.</td>
</tr>
<tr>
<td>xpath</td>
<td>Path expression in DOT notation or XPath notation (see examples below)</td>
</tr>
<tr>
<td>namespaces</td>
<td>Optional namespace definitions for path expression</td>
</tr>
</tbody>
</table>

**Examples**

**XPath2TabColMapping evaluated on XMLType table with XPath Notation, namespaces provided**

```sql
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (  
    USER, 'XML_TAB', '', '//n1:item/n1:location','''xdbXmark'' as "n1")
FROM DUAL;
```

This produces a result, for example:

```xml
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table `SYS_NT12345` and column `location`.

**XPath2TabColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation**

```sql
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (  
    USER,'PurchaseOrderTab','XMLCOL','xmldata.LineItems.LineItem', '')
FROM DUAL;
```
DBMS_XMLSTORE provides the ability to store XML data in relational tables.

Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
## Types

### Table 200–1 Types of DBMS_XMLSTORE

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxType</td>
<td>The type of the query context handle. This is the return type of NEWCONTEXT.</td>
</tr>
</tbody>
</table>
## Summary of DBMS_XMLSTORE Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEARKEYCOLUMNLIST</td>
<td>Clears the key column list.</td>
</tr>
<tr>
<td>CLEARUPDATECOLUMNLIST</td>
<td>Clears the update column list.</td>
</tr>
<tr>
<td>CLOSECONTEXT</td>
<td>It closes/deallocates a particular save context.</td>
</tr>
<tr>
<td>DELETEXML</td>
<td>Deletes records specified by data from the XML document, from the table specified at the context creation time.</td>
</tr>
<tr>
<td>INSERTXML</td>
<td>Inserts the XML document into the table specified at the context creation time.</td>
</tr>
<tr>
<td>NEWCONTEXT</td>
<td>Creates a save context, and returns the context handle.</td>
</tr>
<tr>
<td>SETKEYCOLUMN</td>
<td>This method adds a column to the key column list.</td>
</tr>
<tr>
<td>SETROWTAG</td>
<td>Names the tag used in the XML document, to enclose the XML elements corresponding to the database.</td>
</tr>
<tr>
<td>SETUPDATECOLUMN</td>
<td>Adds a column to the &quot;update column list&quot;.</td>
</tr>
<tr>
<td>UPDATEXML</td>
<td>Updates the table given the XML document.</td>
</tr>
</tbody>
</table>
Clears the key column list.

**Syntax**

```plsql
PROCEDURE clearKeyColumnList(
    ctxHdl IN ctxType);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLEARUPDATECOLUMNLIST

Clears the update column list.

**Syntax**

PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax
PROCEDURE closeContext(
    ctxHdl IN ctxType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
</tbody>
</table>
DELETExML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

### Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FUNCTION deleteXML(</code></td>
<td>Uses a <code>VARCHAR2</code> type for the <code>xDoc</code> parameter.</td>
</tr>
<tr>
<td><code>ctxHdl IN ctxPType,</code></td>
<td></td>
</tr>
<tr>
<td><code>xDoc IN VARCHAR2)</code></td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td></td>
</tr>
<tr>
<td><code>FUNCTION deleteXML(</code></td>
<td>Uses a <code>CLOB</code> type for the <code>xDoc</code> parameter.</td>
</tr>
<tr>
<td><code>ctxHdl IN ctxType,</code></td>
<td></td>
</tr>
<tr>
<td><code>xDoc IN CLOB)</code></td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td></td>
</tr>
<tr>
<td><code>FUNCTION deleteXML(</code></td>
<td>Uses an <code>XMLType</code> type for the <code>xDoc</code> parameter.</td>
</tr>
<tr>
<td><code>ctxHdl IN ctxType,</code></td>
<td></td>
</tr>
<tr>
<td><code>xDoc IN XMLType)</code></td>
<td></td>
</tr>
<tr>
<td>RETURN NUMBER;</td>
<td></td>
</tr>
</tbody>
</table>

### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ctxHdl</code></td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td><code>xDoc</code></td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
**INSERTXML**

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `SETUPDATECOLUMN` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| FUNCTION insertXML(  
  ctxHdl IN ctxType,  
  xDoc IN VARCHAR2)  
RETURN NUMBER; | Passes in the `xDoc` parameter as a VARCHAR. |
| FUNCTION insertXML(  
  ctxHdl IN ctxType,  
  xDoc IN CLOB)  
RETURN NUMBER; | Passes in the `xDoc` parameter as a CLOB. |
| FUNCTION insertXML(  
  ctxHdl IN ctxType,  
  xDoc IN XMLType)  
RETURN NUMBER; | Passes in the `xDoc` parameter as an XMLType. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```sql
FUNCTION newContext(
    targetTable IN VARCHAR2)
RETURN ctxType;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetTable</td>
<td>(IN)</td>
<td>The target table into which to load the XML document.</td>
</tr>
</tbody>
</table>
This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

**Syntax**

```java
PROCEDURE setKeyColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the key column list; cannot be NULL.</td>
</tr>
</tbody>
</table>
SETROWTAG

Names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

PROCEDURE setRowTag(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>tag</td>
<td>(IN)</td>
<td>Tag name.</td>
</tr>
</tbody>
</table>
SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the *ROW* element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for INSERTXML to DBMS_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

**Syntax**

```plsql
PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>colName</td>
<td>(IN)</td>
<td>Column to be added to the update column list.</td>
</tr>
</tbody>
</table>
**UPDATEXML**

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a VARCHAR2.</td>
</tr>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a CLOB.</td>
</tr>
<tr>
<td>FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;</td>
<td>Passes in the xDoc parameter as a XMLType.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxHdl</td>
<td>(IN)</td>
<td>Context handle.</td>
</tr>
<tr>
<td>xDoc</td>
<td>(IN)</td>
<td>String containing the XML document.</td>
</tr>
</tbody>
</table>
The DBMS.XMLTRANSLATIONS package provides an interface to perform translations so that strings can be searched or displayed in various languages.

</tr>
</tbody>
</table>
DISABLETRANSLATION Procedure

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

Syntax

DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
ENABLETRANSLATION Procedure

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This procedure enables translations in the current session. This is the default behavior.

Syntax

```
DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
```
EXTRACTXLIFF Function & Procedure

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This function and procedure extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository.

Syntax

```sql
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
    doc       IN  XMLTYPE,
    xpath     IN  VARCHAR2,
    namespace IN  VARCHAR2 := NULL)
RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
    abspath   IN  XMLTYPE,
    xpath     IN  VARCHAR2,
    namespace IN  VARCHAR2 := NULL)
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Table 201–2 EXTRACTXLIFF Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>doc</td>
</tr>
<tr>
<td>xpath</td>
</tr>
<tr>
<td>namespace</td>
</tr>
<tr>
<td>abspath</td>
</tr>
</tbody>
</table>

Return Values

The translations in the XLIFF format

Examples

Extracting the Translation from an XMLTYPE

Let doc =

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
</securityClass>
```

Let the xpath = '/securityClass/title'. The output of EXTRACTXML will be as follows:

```xml
<xliff version='1.1'>
  <file original='' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

### Extracting the Translation from a Resource

Let the resource '/public/security.xml' =

```xml
<securityClass xmlns='http://xmlns.oracle.com/xdb/security.xsd'
xmli:is='xmlns.oracle.com/iStore'
xmli:oa='xmlns.oracle.com/OracleApps'
targetNamespace='xmlns.oracle.com/example'>
  <name>
    securityClassExample
  </name>
  <title xml:lang='en' xdb:srclang='true'>
    Security Class Example
  </title>
  <title xml:lang='es'>
    Security Class Example - ES
  </title>
  <title xml:lang='fr'>
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
    <privilege name='privilege1'/>
    <aggregatePrivilege name='iStorePOApprover'>
      <title>
        iStore Purchase Order Approver
      </title>
      <privilegeRef name='is:privilege1'/>
      <privilegeRef name='oa:submitPO'/>
      <privilegeRef name='oa:privilege3'/>
    </aggregatePrivilege>
    <privilege name='privilege2'>
      <title xml:lang='en'>
        secondary privilege
      </title>
```
<title xml:lang="fr" xdb:srclang="true">
  secondary privilege - FR
</title>
<columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
<columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
</privilege>
</privlist>
</securityClass>

And let XPATH = ", then the extracted XLIFF is

<xlf version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>

<xlf version='1.1'>
  <file original='/public/security.xml' source-language='fr' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]/title'>
        <source>secondary privilege - FR</source>
        <alt-trans>
          <target xml:lang='en'>secondary privilege</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
GETBASEDOCUMENT Function

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This function returns the base document with all the translations.

Syntax

```
DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT(
    doc    IN  XMLTYPE)
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>Input XMLTYPE</td>
</tr>
</tbody>
</table>

Return Values

The XMLTYPE which contains the base document with all the translations

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:i="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
     <name>
            securityClassExample
     </name>
     <title xml:lang="en" xdb:srclang="true">
            Security Class Example
     </title>
     <title xml:lang="fr">
            Security Class Example - FR
     </title>
     <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:i="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
     <name>
            securityClassExample
     </name>
     <title xml:lang="en" xdb:srclang="true">
            Security Class Example
     </title>
</securityClass>
```
<title xml:lang="fr">
    Security Class Example - FR
</title>

<inherits-from>is:iStorePurchaseOrder</inherits-from>

</securityClass>
MERGEXLIFF Functions

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This function merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository.

Syntax

DBMS_XMLTRANSLATIONS.MERGEXLIFF(
    doc       IN  XMLTYPE,
    xliff     IN  XMLTYPE)
RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.MERGEXLIFF(
    xliff     IN  XMLTYPE);

Parameters

Table 201–4 MERGEXLIFF Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE from which the XLIFF is to be merged</td>
</tr>
<tr>
<td>xliff</td>
<td>Translations in the XLIFF format</td>
</tr>
</tbody>
</table>

Return Values

The result of merging 'xliff' into 'doc' at 'xpath'

Examples

Merge Translations into an XMLTYPE

Consider the following input XMLTYPE:

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srcLang="true">
        Security Class Example
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
        <privilege name="privilege1"/>
```
Let the input XLIFF be as follows:

```xml
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

The output of merge will be as follows:

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">  
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">Security Class Example Modified</title>
  <title xml:lang="es">Security Class Example Mod - ES</title>
  <title xml:lang="fr">Security Class Example Mod - FR</title>
  <inherits-from is:iStorePurchaseOrder/>
</securityClass>
```
<privlist>
<privilege name='privilege1'/>
<aggregatePrivilege name='iStorePOApprover'>
<title>
  iStore Purchase Order Approver
</title>
<privilegeRef name='is:privilege1'/>
<privilegeRef name='oa:submitPO'/>
<privilegeRef name='oa:privilege3'/>
</aggregatePrivilege>
<privilege name='privilege2'>
<title xml:lang='en' xdb:srclang='true'>
  secondary privilege modified
</title>
<title xml:lang='fr'>
  secondary privilege mod - FR
</title>
<columnRef schema='APPS' table='PurchaseOrder' column='POId'/>
<columnRef schema='APPS' table='PurchaseOrder' column='Amount'/>
</privilege>
</privlist>

Merge XLIFF Translations into a Resource

If the input document in the above example were to be stored in the repository at '/public/security.xml', then merging the above XLIFF will have the same effect.
SETSOURCELANG Function

Note: The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This function sets the source language to a particular language at the specified XPATH.

Syntax

DBMS_XMLTRANSLATIONS.SETSOURCELANG ( doc IN XMLTYPE, xpath IN VARCHAR2, lang IN VARCHAR2, namespace IN VARCHAR2 := NULL) RETURN XMLTYPE;

Parameters

Table 201–5 SETSOURCELANG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE for which the source language is to be set</td>
</tr>
<tr>
<td>xpath</td>
<td>XPATH at which the source language is to be set</td>
</tr>
<tr>
<td>lang</td>
<td>Source language</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

Return Values

The updated document

Examples

For example, if doc =

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

the statement

```sql
setSourceLang ( doc, '/securityClass/title', 'fr' )
```
produces

<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en">
        Security Class Example
    </title>
    <title xml:lang="fr" xdb:srclang="true">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
**TRANSLATEXML Function**

**Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This function returns the document in the specified language.

### Syntax

```sql
DBMS_XMLTRANSLATIONS.TRANSLATEXML(
    doc IN XMLTYPE,
    lang IN VARCHAR2)
RETURN XMLTYPE;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>doc</code></td>
<td>Input XMLTYPE</td>
</tr>
<tr>
<td><code>lang</code></td>
<td>Language</td>
</tr>
</tbody>
</table>

### Return Values

The XMLTYPE which contains the document in the specified language.

### Examples

For example, for `doc` =

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">

    <name>
        securityClassExample
    </name>

    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>

    <title xml:lang="fr">
        Security Class Example - FR
    </title>

    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

`TRANSLATEXML(doc,'fr')` will return:

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">

    <name>
        securityClassExample
    </name>

    <title xml:lang="fr">
        Security Class Example - FR
    </title>
</securityClass>
```
Security Class Example - FR
</title>
<br />
&lt;inherits-from&gt;is:iStorePurchaseOrder&lt;/inherits-from&gt;
&lt;/securityClass&gt;
UPDATETRANSLATION Function

**Note:** The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

This function updates the translation in a particular language at the specified XPath.

**Syntax**

```sql
DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
    doc IN XMLTYPE,
    xpath IN VARCHAR2,
    lang IN VARCHAR2,
    value IN VARCHAR2,
    namespace IN VARCHAR2 := NULL
) RETURN XMLTYPE;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>XMLTYPE for which the translation is to be updated</td>
</tr>
<tr>
<td>xpath</td>
<td>XPATH at which the translation is to be updated</td>
</tr>
<tr>
<td>lang</td>
<td>Language for which the translation is to be updated</td>
</tr>
<tr>
<td>value</td>
<td>New translation</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
</tbody>
</table>

**Return Values**

The updated document

**Examples**

For example,

```sql
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```xml
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
    xmlns:is="xmlns.oracle.com/iStore"
    xmlns:oa="xmlns.oracle.com/OracleApps"
    targetNamespace="xmlns.oracle.com/example">
  <name>securityClassExample</name>
  <title xml:lang="en" xdb:srclang="true">Security Class Example</title>
  <title xml:lang="fr">Oracle</title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```
The DBMS_XPLAN package provides an easy way to display the output of the EXPLAIN PLAN command in several, predefined formats. You can also use the DBMS_XPLAN package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the V$SQL_PLAN and V$SQL_PLAN_STATISTICS_ALL fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the EXPLAIN PLAN command, the AWR, and SQL tuning set, see Oracle Database SQL Tuning Guide.
- For more information on the V$SQL_PLAN and V$SQL_PLAN_STATISTICS fixed views, see Oracle Database Reference.

This chapter contains the following topics:

- Using DBMS_XPLAN
  - Overview
  - Security Model
  - Examples
- Summary of DBMS_XPLAN Subprograms
Using DBMS_XPLAN

- Overview
- Security Model
- Examples
Overview

The DBMS_XPLAN package supplies five table functions:

- **DISPLAY** - to format and display the contents of a plan table.
- **DISPLAY_AWR** - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- **DISPLAY_CURSOR** - to format and display the contents of the execution plan of any loaded cursor.
- **DISPLAY_SQL_PLAN_BASELINE** - to display one or more execution plans for the SQL statement identified by SQL handle.
- **DISPLAY_SQLSET** - to format and display the contents of the execution plan of statements stored in a SQL tuning set.
Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires SELECT or READ privileges on the following fixed views: V$SQL_PLAN, V$SESSION and V$SQL_PLAN_STATISTICS_ALL.

Using the DISPLAY_AWR Function requires the user to have SELECT or READ privileges on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE.

Using the DISPLAY_SQLSET Function requires the user to have the SELECT or READ privilege on ALL_SQLSET_STATEMENTS and ALL_SQLSET_PLANS.

Using DISPLAY_SQL_PLAN_BASELINE Function requires the user to have the SELECT or READ privilege on DBA_SQL_PLAN_BASELINES as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

All these privileges are automatically granted as part of the SELECT_CATALOG role.
Examples

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename='benoit';

Display the plan using the DBMS_XPLAN.DISPLAY table function

SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);

This query produces the following output:

Plan hash value: 3693697075

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td>57</td>
<td>6</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 1</td>
<td>HASH JOIN</td>
<td></td>
<td>57</td>
<td>6</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 2</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>37</td>
<td>3</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>80</td>
<td>3</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):

<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - access('E'.DEPTNO='D'.DEPTNO)</td>
</tr>
<tr>
<td>2 - filter('E'.ENAME='benoit')</td>
</tr>
</tbody>
</table>

15 rows selected.

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

SELECT ename FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.empno=7369;

ENAME
---------
SMITH

To display the execution plan of the last executed statement for that session:

SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);

This query produces the following output:

Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td>57</td>
<td>6</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 1</td>
<td>HASH JOIN</td>
<td></td>
<td>57</td>
<td>6</td>
<td>6 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>* 2</td>
<td>TABLE ACCESS FULL</td>
<td>EMP</td>
<td>37</td>
<td>3</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>3</td>
<td>TABLE ACCESS FULL</td>
<td>DEPT</td>
<td>80</td>
<td>3</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>
Predicate Information (identified by operation id):

1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."EMPNO"=7369)

You can also use the table function DISPLAY_CURSOR to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get sql_id and child_number for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

```
SQL_ID         CHILD_NUMBER
------------     -----------------------------
gwp663cqh5qbf   0
```

Display the execution plan for the cursor:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0));
```

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

Predicate Information (identified by operation id):

```
2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR('TOTO',0));
```
Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and `display_cursor` table functions. In Displaying a Plan Table Using `DBMS_XPLAN.DISPLAY` on page 202-5, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```sql
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename    = 'hermann'
ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```sql
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
<th>TQ</th>
<th>INOUT</th>
<th>PQ Distrib</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Predicate Information (identified by operation id):

6 - access('E'. 'DEPTNO'='D'. 'DEPTNO')
10 - filter('E'. 'ENAME'='hermann')

When the query is parallel, information related to parallelism is reported: table queue number (`TQ` column), table queue type (`INOUT`) and table queue distribution method (`PQ Distrib`).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for
individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the EXPLAIN PLAN command:

**Using a View to Display Last Explain Plan**

```sql
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```
Summary of DBMS_XPLAN Subprograms

Table 202–1  DBMS_XPLAN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIFF_PLAN Function on page 202-10</td>
<td>Compares plans</td>
</tr>
<tr>
<td>DISPLAY Function on page 202-11</td>
<td>Displays the contents of the plan table</td>
</tr>
<tr>
<td>DISPLAY_AWR Function on page 202-14</td>
<td>Displays the contents of an execution plan stored in the AWR</td>
</tr>
<tr>
<td>DISPLAY_CURSOR Function on page 202-17</td>
<td>Displays the execution plan of any cursor in the cursor cache</td>
</tr>
<tr>
<td>DISPLAY_PLAN Function on page 202-21</td>
<td>Displays the contents of the plan table in a variety of formats with CLOB output type</td>
</tr>
<tr>
<td>DISPLAY_SQL_PLAN_BASELINE Function on page 202-24</td>
<td>Displays one or more execution plans for the specified SQL handle of a SQL plan baseline</td>
</tr>
<tr>
<td>DISPLAY_SQLSET Function on page 202-26</td>
<td>Displays the execution plan of a given statement stored in a SQL tuning set</td>
</tr>
</tbody>
</table>
DIFF_PLAN Function

This function compares plans.

Syntax

```sql
DBMS_XPLAN.DIFF_PLAN(
    plan1    IN   SPC_SRC,
    plan2    IN   SPC_SRC)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan_1</td>
<td>First plan</td>
</tr>
<tr>
<td>plan_2</td>
<td>Second plan</td>
</tr>
</tbody>
</table>
**DISPLAY Function**

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

**Syntax**

```sql
DBMS_XPLAN.DISPLAY(
    table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
    statement_id  IN  VARCHAR2  DEFAULT  NULL,
    format        IN  VARCHAR2  DEFAULT  'TYPICAL',
    filter_preds  IN  VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code>, which is the default plan table for the EXPLAIN PLAN command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code>.</td>
</tr>
<tr>
<td>statement_id</td>
<td>Specifies the statement_id of the plan to be displayed. This parameter defaults to <code>NULL</code>, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause. If no statement_id is specified, the function shows you the plan of the most recent explained statement.</td>
</tr>
</tbody>
</table>
DISPLAY Function

Table 202–3  (Cont.) DISPLAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts four values:</td>
</tr>
<tr>
<td></td>
<td>■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation ID, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
<tr>
<td></td>
<td>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</td>
</tr>
<tr>
<td></td>
<td>■ ROWS - if relevant, shows the number of rows estimated by the optimizer</td>
</tr>
<tr>
<td></td>
<td>■ BYTES - if relevant, shows the number of bytes estimated by the optimizer</td>
</tr>
<tr>
<td></td>
<td>■ COST - if relevant, shows optimizer cost information</td>
</tr>
<tr>
<td></td>
<td>■ PARTITION - if relevant, shows partition pruning information</td>
</tr>
<tr>
<td></td>
<td>■ PARALLEL - if relevant, shows PX information (distribution method and table queue information)</td>
</tr>
<tr>
<td></td>
<td>■ PREDICATE - if relevant, shows the predicate section</td>
</tr>
<tr>
<td></td>
<td>■ PROJECTION - if relevant, shows the projection section</td>
</tr>
<tr>
<td></td>
<td>■ ALIAS - if relevant, shows the &quot;Query Block Name / Object Alias&quot; section</td>
</tr>
<tr>
<td></td>
<td>■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</td>
</tr>
<tr>
<td></td>
<td>■ NOTE - if relevant, shows the note section of the explain plan</td>
</tr>
<tr>
<td></td>
<td>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '−PROJECTION' excludes projection information.</td>
</tr>
<tr>
<td></td>
<td>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).</td>
</tr>
</tbody>
</table>
### Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

**WARNING:** Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

### Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='foo'`:

```sql
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```
DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```sql
DBMS_XPLAN.DISPLAY_AWR(
    sql_id            IN      VARCHAR2,
    plan_hash_value   IN      NUMBER DEFAULT NULL,
    db_id             IN      NUMBER DEFAULT NULL,
    format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.</td>
</tr>
<tr>
<td>db_id</td>
<td>Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V$DATABASE.</td>
</tr>
</tbody>
</table>
| format        | Controls the level of details for the plan. It accepts four values:  
  - **BASIC**: Displays the minimum information in the plan—the operation ID, the operation name and its option.  
  - **TYPICAL**: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).  
  - **SERIAL**: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.  
  - **ALL**: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). |
Summary of DBMS_XPLAN Subprograms

To use the DISPLAY_AWR functionality, the calling user must have SELECT or READ privilege on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE, otherwise it shows an appropriate error message.

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Usage Notes

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
```
(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null, 'ALL')) tf
WHERE ht.sql_text like '%TOTO%';
**DISPLAY_CURSOR Function**

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as, I/O, memory and timing) can be reported (based on the `V$SQL_PLAN_STATISTICS_ALL` VIEWS).

**Syntax**

```sql
DBMS_XPLAN.DISPLAY_CURSOR(
    sql_id            IN  VARCHAR2  DEFAULT  NULL,
    cursor_child_no   IN  NUMBER    DEFAULT  0,
    format            IN  VARCHAR2  DEFAULT  'TYPICAL');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Specifies the <code>SQL_ID</code> of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column <code>SQL_ID</code> in <code>V$SQL</code> or <code>V$SQLAREA</code>. Alternatively, you could choose the column <code>PREV_SQL_ID</code> for a specific session out of <code>V$SESSION</code>. This parameter defaults to <code>NULL</code> in which case the plan of the last cursor executed by the session is displayed.</td>
</tr>
<tr>
<td>cursor_child_no</td>
<td>Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied <code>sql_id</code> parameter are displayed. The <code>child_number</code> can be specified only if <code>sql_id</code> is specified.</td>
</tr>
</tbody>
</table>
DISPLAY_CURSOR Function

**Table 202–5 (Cont.) DISPLAY_CURSOR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts five values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>BASIC</strong>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>TYPICAL</strong>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>- <strong>SERIAL</strong>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>- <strong>ALL</strong>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
<tr>
<td></td>
<td>- <strong>ADAPTIVE</strong>:</td>
</tr>
<tr>
<td></td>
<td>- Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join.</td>
</tr>
<tr>
<td></td>
<td>- Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans.</td>
</tr>
<tr>
<td></td>
<td>- Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this.</td>
</tr>
<tr>
<td></td>
<td>- Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer.</td>
</tr>
</tbody>
</table>

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).
To use the DISPLAY_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V$SQL_PLAN_STATISTICS_ALL, V$SQL and V$SQL_PLAN, otherwise it shows an appropriate error message.

Here are some ways you might use variations on the format parameter:
DISPLAY_CURSOR Function

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use 'BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```sql
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```sql
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```sql
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST'));
```
DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```sql
DBMS_XPLAN.DISPLAY_PLAN (  
    table_name       IN    VARCHAR2   DEFAULT 'PLAN_TABLE',  
    statement_id     IN    VARCHAR2   DEFAULT NULL,  
    format           IN    VARCHAR2   DEFAULT 'TYPICAL',  
    filter_preds     IN    VARCHAR2   DEFAULT NULL,  
    type             IN    VARCHAR2   DEFAULT 'TEXT')  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.</td>
</tr>
<tr>
<td>statement_id</td>
<td>Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause. If no statement_id is specified, the function shows you the plan of the most recent explained statement.</td>
</tr>
</tbody>
</table>
| filter_preds| SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10'
Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes)) |
DISPLAY PLAN Function

**Table 202–6 (Cont.) DISPLAY_PLAN Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts five values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>BASIC</strong>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>TYPICAL</strong>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>- <strong>SERIAL</strong>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>- <strong>ALL</strong>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
<tr>
<td></td>
<td>- <strong>ADAPTIVE</strong>: Displays the default plan, and for each dynamic subplan (if stipulated):</td>
</tr>
<tr>
<td></td>
<td>- A list of the rowsources from the original which may be replaced, and the rowsources to replace them</td>
</tr>
<tr>
<td></td>
<td>- If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed</td>
</tr>
</tbody>
</table>

For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:

- **ROWS** - if relevant, shows the number of rows estimated by the optimizer
- **BYTES** - if relevant, shows the number of bytes estimated by the optimizer
- **COST** - if relevant, shows optimizer cost information
- **PARTITION** - if relevant, shows partition pruning information
- **PARALLEL** - if relevant, shows PX information (distribution method and table queue information)
- **PREDICATE** - if relevant, shows the predicate section
- **PROJECTION** - if relevant, shows the projection section
- **ALIAS** - if relevant, shows the "Query Block Name / Object Alias" section
- **REMOTE** - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)
- **NOTE** - if relevant, shows the note section of the explain plan

Format keywords can be prefixed by the sign ‘-’ to exclude the specified information. For example, ‘-PROJECTION’ excludes projection information.
Summary of DBMS_XPLAN Subprograms

**Return Values**

Returns the requested report as **CLOB**

**Usage Notes**

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

**WARNING:** Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.
DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (  
sql_handle      IN VARCHAR2 := NULL,  
plan_name       IN VARCHAR2 := NULL,  
format          IN VARCHAR2 := 'TYPICAL')  
RETURN dbms_xplan_type_table;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.</td>
</tr>
<tr>
<td>format</td>
<td>Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.</td>
</tr>
</tbody>
</table>

Return Values

A PL/SQL type table

Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans. It is possible that the plan_id stored in the SQL management base may not match with the plan_id of the generated plan. A mismatch between stored plan_id and generated plan_id means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle 'SYS_SQL_b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150  
SET PAGESIZE 2000  
SELECT t.*  
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af')) t;
```

Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150  
SET PAGESIZE 2000  
SELECT t.*  
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
      WHERE sql_sentence LIKE '%HR2%') t;
```
WHERE sql_text like '%HR2%') pb,
  TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
    'BASIC')) t;
DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```sql
DBMS_XPLAN.DISPLAY_SQLSET(
    sqlset_name      IN  VARCHAR2,
    sql_id           IN  VARCHAR2,
    plan_hash_value  IN  NUMBER := NULL,
    format           IN  VARCHAR2  := 'TYPICAL',
    sqlset_owner     IN  VARCHAR2  := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the SQL Tuning Set</td>
</tr>
<tr>
<td>sql_id</td>
<td>Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function <code>DBMS_SQLTUNE.SELECT_SQLSET</code></td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.</td>
</tr>
<tr>
<td>format</td>
<td>Controls the level of details for the plan. It accepts four values:</td>
</tr>
<tr>
<td></td>
<td>■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</td>
</tr>
<tr>
<td></td>
<td>■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</td>
</tr>
<tr>
<td></td>
<td>■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</td>
</tr>
<tr>
<td></td>
<td>■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</td>
</tr>
</tbody>
</table>
For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as `PARTITION`) or logical additions to the base plan table output (such as `PREDICATE`). Format keywords must be separated by either a comma or a space:

- **ROWS** - if relevant, shows the number of rows estimated by the optimizer.
- **BYTES** - if relevant, shows the number of bytes estimated by the optimizer.
- **COST** - if relevant, shows optimizer cost information.
- **PARTITION** - if relevant, shows partition pruning information.
- **PARALLEL** - if relevant, shows PX information (distribution method and table queue information).
- **PREDICATE** - if relevant, shows the predicate section.
- **PROJECTION** - if relevant, shows the projection section.
- **ALIAS** - if relevant, shows the "Query Block Name / Object Alias" section.
- **REMOTE** - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL).
- **NOTE** - if relevant, shows the note section of the explain plan.
- **IOSTATS** - assuming that basic plan statistics are collected when SQL statements are executed (either by using the `gather_plan_statistics` hint or by setting the parameter `statistics_level` to `ALL`), this format shows IO statistics for all (or only for the last as shown below) executions of the cursor.
- **MEMSTATS** - assuming that PGA memory management is enabled (that is, `pga_aggregate_target` parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.
- **ALLSTATS** - A shortcut for ‘IOSTATS MEMSTATS’
- **LAST** - By default, plan statistics are shown for all executions of the cursor. The keyword `LAST` can be specified to see only the statistics for the last execution.

The following two formats are deprecated but supported for backward compatibility:

- **RUNSTATS_TOT** - Same as `IOSTATS`, that is, displays IO statistics for all executions of the specified cursor.
- **RUNSTATS_LAST** - Same as `IOSTATS_LAST`, that is, displays the runtime statistics for the last execution of the cursor.

Format keywords can be prefixed by the sign ‘-’ to exclude the specified information. For example, ‘-PROJECTION’ excludes projection information.

**sqlset_owner**

The owner of the SQL tuning set. The default is the current user.
Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP_optimization_0405':

```sql
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_SQLSET(
        'OLTP_optimization_0405', 'gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```sql
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_SQLSET(
        'OLTP_optimization_0405', 'gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```sql
SELECT * FROM table (
    DBMS_XPLAN.DISPLAY_SQLSET(
        'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST'));
```
The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- **Using DBMS_XSLPROCESSOR**
  - Overview
  - Security Model

- **Summary of DBMS_XSLPROCESSOR Subprograms**

  **See Also:**

  - *Oracle XML DB Developer’s Guide*
Using DBMS_XSLPROCESSOR

This section contains topics which relate to using the DBMS_XSLPROCESSOR package.

- Overview
- Security Model
Overview

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails
Owned by XDB, the DBMS_XSLPROCESSOR package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.
## Summary of DBMS_XSLPROCESSOR Subprograms

### Table 203–1  DBMS_XSLPROCESSOR Package Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOB2FILE Procedure on page 203-6</td>
<td>Writes content of a CLOB into a file</td>

</tbody>
</table>
CLOB2FILE Procedure

This procedure writes content of a CLOB into a file.

Syntax

```sql
DBMS_XSLPROCESSOR.CLOB2FILE(
  cl          IN  CLOB;
  flocation   IN  VARCHAR2,
  fname       IN  VARCHAR2,
  csid        IN  NUMBER:=0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOB</td>
<td>File directory</td>
</tr>
<tr>
<td>flocation</td>
<td>File directory</td>
</tr>
<tr>
<td>fname</td>
<td>File name</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the file</td>
</tr>
<tr>
<td></td>
<td>■ Must be a valid Oracle id; otherwise returns an error</td>
</tr>
<tr>
<td></td>
<td>■ If 0, content of the output file will be in the database character set</td>
</tr>
</tbody>
</table>
FREEPROCESSOR Procedure

This procedure Frees a Processor object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
    p IN Processor);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor</td>
</tr>
</tbody>
</table>
FREESTYLESHEET Procedure

This procedure frees a Stylesheet object.

Syntax

```sql
DBMS_XSLPROCESSOR.FREESTYLESHEET(
  ss  IN  Stylesheet);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet</td>
</tr>
</tbody>
</table>
**NEWPROCESSOR Function**

This function returns a new Processor instance. The function must be called before the default behavior of Processor can be changed and if other processor methods need to be used.

**Syntax**

DBMS_XSLPROCESSOR.NEWPROCESSOR
RETURN Processor;
NEWSTYLESHEET Functions

This function creates and returns a new Stylesheet instance. The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given DOMDOCUMENT and reference URLs:

```sql
DBMS_XSLPROCESSOR.NEWSTYLESHEET (  
    xmldoc IN DOMDOCUMENT,  
    ref IN VARCHAR2) 
RETURN Stylesheet;
```

Creates and returns a new Stylesheet instance using the given input and reference URLs:

```sql
DBMS_XSLPROCESSOR.NEWSTYLESHEET (  
    inp IN VARCHAR2,  
    ref IN VARCHAR2) 
RETURN Stylesheet;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldoc</td>
<td>DOMDocument to use for construction</td>
</tr>
<tr>
<td>inp</td>
<td>Input URL to use for construction</td>
</tr>
<tr>
<td>ref</td>
<td>Reference URL</td>
</tr>
</tbody>
</table>

Table 203–5  NEWSTYLESHEET Function Parameters
**PROCESSXSL Functions and Procedures**

This function transforms input XMLDocument. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

**Syntax**

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
    p      IN   Processor,
    ss     IN   Stylesheet,
    xmldoc IN   DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
    p     IN   Processor,
    ss    IN   Stylesheet,
    url   IN   VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
    p     IN   Processor,
    ss    IN  Stylesheet,
    clb   IN  CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDocument and the stylesheet, and writes the output to the specified file:

```sql
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
    p           IN    Processor,
    ss          IN    Stylesheet,
    xmldoc      IN    DOMDOCUMENT,
    dir         IN    VARCHAR2,
    fileName    IN    VARCHAR2);
```

Transforms input XMLDocument using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
    p          IN    Processor,
    ss         IN    Stylesheet,
    url        IN    VARCHAR2,
    dir        IN    VARCHAR2,
    fileName   IN    VARCHAR2);
```

Transforms input XMLDocument using given DOMDocument and the stylesheet, and writes the output to a CLOB:

```sql
DBMS_XSLPROCESSOR.PROCESSXSL(
    p          IN      Processor,
```
ss         IN      Stylesheet,
xmldoc     IN      DOMDOCUMENT,
c1         IN OUT  CLOB);

Transforms input XMLDocument using given DOMDOCUMENTFRAGMENT and the stylesheet, and returns the resultant document fragment:

DBMS_XSLPROCESSOR.PROCESSXSL(
  p         IN    Processor,
  ss        IN    Stylesheet,
  xmldoc    IN    DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to the specified file in a specified directory:

DBMS_XSLPROCESSOR.PROCESSXSL(
  p         IN    Processor,
  ss        IN    Stylesheet,
  xmldf     IN    DOMDOCUMENTFRAGMENT,
  dir       IN    VARCHAR2,
  filename  IN    VARCHAR2);

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to a buffer:

DBMS_XSLPROCESSOR.PROCESSXSL(
  p         IN    Processor,
  ss        IN    Stylesheet,
  xmldf     IN    DOMDOCUMENTFRAGMENT,
  buf       IN OUT  VARCHAR2);

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to a CLOB:

DBMS_XSLPROCESSOR.PROCESSXSL(
  p         IN    Processor,
  ss        IN    Stylesheet,
  xmldf     IN    DOMDOCUMENTFRAGMENT,
  cl        IN OUT  CLOB);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor instance</td>
</tr>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>xmldoc</td>
<td>XML document being transformed</td>
</tr>
<tr>
<td>url</td>
<td>URL for the information being transformed</td>
</tr>
<tr>
<td>clb</td>
<td>CLOB containing information to be transformed</td>
</tr>
<tr>
<td>dir</td>
<td>Directory where processing output file is saved</td>
</tr>
<tr>
<td>filename</td>
<td>Processing output file</td>
</tr>
<tr>
<td>cl</td>
<td>CLOB to which the processing output is saved</td>
</tr>
<tr>
<td>xmldf</td>
<td>XMLDocumentFragment being transformed</td>
</tr>
</tbody>
</table>
READ2CLOB Function

This function reads content of a file into a CLOB.

Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(
    flocation IN VARCHAR2,
    fname    IN VARCHAR2,
    csid     IN NUMBER:=0)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flocation</td>
<td>File directory</td>
</tr>
<tr>
<td>fname</td>
<td>File name</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the file</td>
</tr>
<tr>
<td></td>
<td>■ Must be a valid Oracle id; otherwise returns an error</td>
</tr>
<tr>
<td></td>
<td>■ If 0, input file is assumed to be in the database character set</td>
</tr>
</tbody>
</table>
REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```sql
DBMS_XSLPROCESSOR.REMOVEPARAM(
    ss    IN Stylesheet,
    name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>name</td>
<td>Name of the parameter</td>
</tr>
</tbody>
</table>
RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
    ss  IN   Stylesheet);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
</tbody>
</table>
SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```sql
DBMS_XSLPROCESSOR.SELECTNODES(
    n           IN   DBMS_XMLDOM.DOMNODE,
    pattern     IN   VARCHAR2,
    namespace   IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Root DOMNode of the tree</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to use</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace declared</td>
</tr>
</tbody>
</table>
SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```sql
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
    n           IN   DBMS_XMLDOM.DOMNODE,
    pattern     IN   VARCHAR2,
    namespace   IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Root DOMNode of the tree</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to use</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace declared</td>
</tr>
</tbody>
</table>
SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Note: This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
    p IN Processor,
    fileName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor instance</td>
</tr>
<tr>
<td>fileName</td>
<td>Complete path of the file to use as the error log</td>
</tr>
</tbody>
</table>
### SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet. The parameter value must be a valid XPath expression. Literal string values must be quoted.

### Syntax

```sql
DBMS_XSLPROCESSOR.SETPARAM(
    ss      IN   Stylesheet,
    name    IN   VARCHAR2,
    value   IN   VARCHAR2);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ss</td>
<td>Stylesheet instance</td>
</tr>
<tr>
<td>name</td>
<td>Name of the parameter</td>
</tr>
<tr>
<td>value</td>
<td>Value of the parameter</td>
</tr>
</tbody>
</table>
SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```sql
DBMS_XSLPROCESSOR.SHOWWARNINGS(
    p     IN   Processor,
    yes   IN   BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Processor instance</td>
</tr>
<tr>
<td>yes</td>
<td>Mode to set: TRUE to show warnings, FALSE otherwise</td>
</tr>
</tbody>
</table>
TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a DOMDocumentFragment.

Syntax

```sql
DBMS_XSLPROCESSOR.TRANSFORMNODE(
    n    IN  DOMNODE,
    ss   IN  Stylesheet)
RETURN DOMDocumentFragment;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>n</code></td>
<td>DOMNode to transform</td>
</tr>
<tr>
<td><code>ss</code></td>
<td>Stylesheet to use</td>
</tr>
</tbody>
</table>
VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

DBMS_XSLPROCESSOR.VALUEOF(
    n           IN    DBMS_XMLDOM.DOMNODE,
    pattern     IN    VARCHAR2,
    namespace   IN    VARCHAR2 := NULL)
RETURN VARCHAR2;

DBMS_XSLPROCESSOR.VALUEOF(
    n           IN    DBMS_XMLDOM.DOMNODE,
    pattern     IN    VARCHAR2,
    val         OUT   VARCHAR2,
    namespace   IN    VARCHAR2 := NULL);

Parameters

<table>
<thead>
<tr>
<th>Table 203–16 VALUEOF Function and Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>n</td>
</tr>
<tr>
<td>pattern</td>
</tr>
<tr>
<td>val</td>
</tr>
<tr>
<td>namespace</td>
</tr>
</tbody>
</table>
This DBMS_XSTREAM_ADM package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- **Using DBMS_XSTREAM_ADM**
  - Overview
  - Security Model
  - Operational Notes

- **Summary of DBMS_XSTREAM_ADM Subprograms**

**See Also:**

- *Oracle Database XStream Guide*
- *Oracle Call Interface Programmer’s Guide*
- *Oracle Database XStream Java API Reference*
Using DBMS_XSTREAM_ADM

This section contains topics which relate to using the DBMS_XSTREAM_ADM package.

- Overview
- Security Model
- Operational Notes
Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database. In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:

- Oracle Database XStream Guide, Chapter 4, "XStream Out"
- Oracle Database XStream Guide
- Oracle Database Concepts for more information about CDBs and PDBs
Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the **DBA** role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the **DBA** role is not required.

**See Also:**

- `GRANT_ADMIN_PRIVILEGE` Procedure on page 205-6
- Oracle Database XStream Guide, Chapter 4, "XStream Out and Security" for more information about XStream and security.
Operational Notes

Some subprograms in the DBMS_APPLY_ADM package can manage XStream outbound servers, and some subprograms in the DBMS_APPLY_ADM package can manage XStream inbound servers.

See Also: Chapter 23, "DBMS_APPLY_ADM" for details about which subprograms can manage outbound servers and inbound servers.
## Summary of DBMS_XSTREAM_ADM Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_COLUMN Procedure</strong> on page 204-9</td>
<td>Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.</td>
</tr>

ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The column_value and column_function parameters are mutually exclusive.

Note:
- **ADD_COLUMN** transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REPs, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

See Also: *Oracle Database XStream Guide* for more information about declarative rule-based transformations

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_COLUMN(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA,
    value_type    IN  VARCHAR2     DEFAULT 'NEW',
    step_number   IN  NUMBER       DEFAULT 0,
    operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_XSTREAM_ADM.ADD_COLUMN(
    rule_name        IN  VARCHAR2,
    table_name       IN  VARCHAR2,
    column_name      IN  VARCHAR2,
    column_function  IN  VARCHAR2,
    value_type       IN  VARCHAR2     DEFAULT 'NEW',
    step_number      IN  NUMBER       DEFAULT 0,
    operation        IN  VARCHAR2     DEFAULT 'ADD');
```
Parameters

Table 204–2 ADD_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current</td>
</tr>
<tr>
<td></td>
<td>user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table to which the column is added in the row LCR, specified as [schema_name.]object_name. For example, hr.employees.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column added to each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the</td>
</tr>
<tr>
<td></td>
<td>datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function.</td>
</tr>
<tr>
<td></td>
<td>This parameter cannot be specified if the column_function parameter is specified.</td>
</tr>
<tr>
<td>column_function</td>
<td>Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function.</td>
</tr>
<tr>
<td></td>
<td>The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the</td>
</tr>
<tr>
<td></td>
<td>returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter.</td>
</tr>
<tr>
<td></td>
<td>The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database</td>
</tr>
<tr>
<td></td>
<td>resides. The return type is TIMESTAMP WITH TIME ZONE.</td>
</tr>
<tr>
<td></td>
<td>The function executes when the rule evaluates to TRUE.</td>
</tr>
<tr>
<td></td>
<td>This parameter cannot be specified if the column_value parameter is specified.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to add the column to the new values in the row LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify 'OLD' to add the column to the old values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>

</tbody>
</table>
ADD_GLOBAL_PROPAGATIONRULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
The name of the source queue, specified as `[schema_name.]queue_name`. The current database must contain the source queue, and the queue must be ANYDATA type.

For example, to specify a source queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter.

If the schema is not specified, then the current user is the default.

destination_queue_name

The name of the destination queue, including a database link, specified as `[schema_name.]queue_name[@dblink_name]`, if the destination queue is in a remote database. The queue must be ANYDATA type.

For example, to specify a destination queue named `streams_queue` in the `strmadmin` schema and use a database link named `dbs2.net`, enter `strmadmin.streams_queue@dbs2.net` for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.

Note: Connection qualifiers are not allowed.

include_dml

If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

include_ddl

If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

include_tagged_lcr

If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NONE tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NONE tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.

Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.
ADD_GLOBAL_PROPAGATION_RULES Procedure

Table 204–3 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>and_condition</td>
<td>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (system_condition) AND (and_condition)</td>
</tr>
</tbody>
</table>

The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of ‘02’, specify the following condition:

:lcr.get_tag() = HEXTORAW('02')

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

See Also: Chapter 275, "Logical Change Record TYPES"
Summary of DBMS_XSTREAM_ADM Subprograms

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

### Usage Notes

The procedure cannot change the queue to queue property of an existing propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:

- If `TRUE` and the specified propagation is not a queue to queue propagation, then the procedure raises an error.
- If `FALSE` and the specified propagation is a queue to queue propagation, then the procedure raises an error.
- If `NULL`, then the procedure does not change the queue to queue property of the propagation.

**See Also:** Oracle Streams Concepts and Administration for more information about queue-to-queue propagations.

### Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```
ADD_GLOBAL_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to an entire database.
  
  This procedure creates the specified capture process if it does not exist.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.
  
  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Caution: If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name          OUT  VARCHAR2,
    ddl_rule_name          OUT  VARCHAR2,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN   VARCHAR2  DEFAULT NULL,
    source_container_name  IN   VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN   VARCHAR2  DEFAULT NULL,
    source_container_name  IN   VARCHAR2  DEFAULT NULL);
```
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 204–4 ADD_GLOBAL_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| streams_type | The type of XStream client:  
  ■ Specify capture for a capture process.  
  ■ Specify apply for an apply process. |
| streams_name | The name of the capture process or apply process. Do not specify an owner.  
If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used.  
If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.  
If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:  
  ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.  
  ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.  
If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.  
If NULL and multiple relevant apply processes exist, then the procedure raises an error.  
Each apply process must have a unique name. |
| queue_name  | The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type.  
For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.  
For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions. |
| include_dml | If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted. |
| include_ddl | If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. |
### Table 204-4 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. See Also: Oracle Streams Replication Administrator’s Guide for more information about tags.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>

</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the
sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

**See Also:**
- "Operational Notes" on page 204-5
- "Security Model" on page 204-4

**Examples**

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```
ADD_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the CREATE_OUTBOUND Procedure.

To create the capture process individually, use one of the following packages:

- DBMS_XSTREAM_ADM
- DBMS_CAPTURE_ADM

To create a queue individually, use the SET_UP_QUEUE procedure in the DBMS_XSTREAM_ADM package.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

---

**Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See Oracle Call Interface Programmer’s Guide and Oracle Database XStream Java API Reference for information about attaching to an outbound server.

- Starting with Oracle Database 11g Release 2 (11.2.0.2), the capture_name, start_scn, and start_time parameters are included in this procedure.

---

**Syntax**

```sql
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
    server_name            IN  VARCHAR2,
    queue_name             IN  VARCHAR2   DEFAULT NULL,
    source_database        IN  VARCHAR2   DEFAULT NULL,
    table_names            IN  DBMS_UTILITY.UNCL_ARRAY,
    schema_names           IN  DBMS_UTILITY.UNCL_ARRAY,
    connect_user           IN  VARCHAR2   DEFAULT NULL,
    comment                IN  VARCHAR2   DEFAULT NULL,
    capture_name           IN  VARCHAR2   DEFAULT NULL,
    start_scn              IN  NUMBER     DEFAULT NULL,
    start_time             IN  TIMESTAMP  DEFAULT NULL,
    include_dml            IN  BOOLEAN   DEFAULT TRUE,
    include_ddl            IN  BOOLEAN   DEFAULT FALSE,
    source_root_name       IN  VARCHAR2  DEFAULT NULL,
    source_container_name  IN  VARCHAR2  DEFAULT NULL);
```
server_name            IN  VARCHAR2,
queue_name             IN  VARCHAR2 DEFAULT NULL,
source_database        IN  VARCHAR2 DEFAULT NULL,
table_names            IN  VARCHAR2 DEFAULT NULL,
schema_names           IN  VARCHAR2 DEFAULT NULL,
connect_user           IN  VARCHAR2 DEFAULT NULL,
comment                IN  VARCHAR2 DEFAULT NULL,
capture_name           IN  VARCHAR2 DEFAULT NULL,
start_scn              IN  NUMBER DEFAULT NULL,
start_time             IN  TIMESTAMP DEFAULT NULL,
include_dml            IN  BOOLEAN DEFAULT TRUE,
include_ddl            IN  BOOLEAN DEFAULT FALSE,
source_root_name       IN  VARCHAR2 DEFAULT NULL,
source_container_name  IN  VARCHAR2 DEFAULT NULL);

Parameters

Table 204–5  ADD_OUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. <strong>Note:</strong> The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which the outbound server dequeues LCRs, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named xstream_queue in the xstrmadmin schema, enter xstrmadmin.xstream_queue for this parameter. If the schema is not specified, then the current user is the default. If NULL, the procedure raises an error.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
</tbody>
</table>
The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways:

- Comma-delimited list of type VARCHAR2.
- A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.

Each table should be specified as `{schema_name.}table_name`. For example, you can specify `hr.employees`. If the schema is not specified, then the current user is the default.

**See Also:** "Usage Notes" on page 204-24 for more information about this parameter.

The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:

- Comma-delimited list of type VARCHAR2.
- A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.

**Note:** This procedure does not concatenate the `schema_names` parameter with the `table_names` parameter. To specify tables, enter fully qualified table names in the `table_names` parameter (`{schema_name.}table_name`).

**See Also:** "Usage Notes" on page 204-24 for more information about this parameter.

The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" on page 204-66 for information about the privileges required by a connect user.

If NULL, then the current user is the default.

An optional comment associated with the outbound server.

The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.

If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.

If the specified name matches the name of an existing capture process for an apply process, then an error is raised.

If the specified name does not match the name of an existing capture process, then an error is raised.

If NULL, then the outbound server is created without a capture process.

A valid system change number (SCN) for the database from which the capture process starts capturing changes.

If the `capture_name` parameter is NULL, then this parameter is ignored.

If NULL and the `capture_name` parameter is non-NULL, then the start SCN of the capture process is not changed.

An error is returned if an invalid SCN is specified.

The `start_scn` and `start_time` parameters are mutually exclusive.
ADD_OUTBOUND Procedure

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.
  
  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.

- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.

- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.
Summary of DBMS_XSTREAM_ADM Subprograms

Note: An empty array includes one NULL entry.
ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name             IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name             IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 204–6  ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
### Table 204–6  (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>source_queue_name</code></td>
<td>The name of the source queue, specified as <code>{schema_name}.queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td><code>destination_queue_name</code></td>
<td>The name of the destination queue, including a database link, specified as <code>{schema_name}.queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</td>
</tr>
<tr>
<td></td>
<td>If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td><code>include_dml</code></td>
<td>If <code>TRUE</code>, then the procedure creates a rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</td>
</tr>
<tr>
<td><code>include_ddl</code></td>
<td>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</td>
</tr>
<tr>
<td><code>include_tagged_lcr</code></td>
<td>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <code>NULL</code> tag. Usually, specify <code>TRUE</code> for this parameter if the inclusion_rule parameter is set to <code>FALSE</code>.</td>
</tr>
</tbody>
</table>

**See Also:** *Oracle Streams Replication Administrator’s Guide* for more information about tags.
source_database | The global name of the source database. The source database is where the change originated. If NULL, the procedure does not add a condition regarding the source database to the generated rules.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Oracle recommends that you specify a source database for propagation rules.

dml_rule_name | If include_dml is TRUE, then this parameter contains the DML rule name.

If include_dml is FALSE, then this parameter contains a NULL.

ddl_rule_name | If include_ddl is TRUE, then this parameter contains the DDL rule name.

If include_ddl is FALSE, then this parameter contains a NULL.

inclusion_rule | If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation.

If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation.

In either case, the system creates the rule set if it does not exist.

and_condition | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:

\[(\text{system\_condition}) \text{ AND } \{\text{and\_condition}\}\]

The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:

\[\text{:lcr\_get\_tag()} = \text{HEXTORAW}('02')\]

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

See Also: Chapter 275, "Logical Change Record TYPES"
Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```sql
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```
ADD_SCHEMA_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a specified schema.

  This procedure creates the specified capture process if it does not exist.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

  This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

---

**Caution:** If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Streams. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

---

**Syntax**

```sql
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
    schema_name            IN   VARCHAR2,
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name          OUT  VARCHAR2,
    ddl_rule_name          OUT  VARCHAR2,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN  VARCHAR2  DEFAULT NULL,
    source_container_name  IN  VARCHAR2  DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
    schema_name            IN   VARCHAR2,
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
```
Parameters

Table 204–7  ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of XStream client: Specify capture for a capture process. Specify apply for an apply process.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
include_ddl

If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

include_tagged_lcr

If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.

Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

source_database

The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.

In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

dml_rule_name

If include_dml is TRUE, then this parameter contains the DML rule name.

If include_dml is FALSE, then this parameter contains a NULL.
If `include_ddl` is `TRUE`, then this parameter contains the DDL rule name. If `include_ddl` is `FALSE`, then this parameter contains a NULL.

If `inclusion_rule` is `TRUE`, then the procedure adds the rules to the positive rule set for the XStream client. If `inclusion_rule` is `FALSE`, then the procedure adds the rules to the negative rule set for the XStream client. In either case, the system creates the rule set if it does not exist.

If non-NULL, appends the specified condition to the system-generated rule condition using an `AND` clause in the following way:

\[(\text{system\_condition}) \text{ AND } (\text{and\_condition})\]

The variable in the specified condition must be `:lcr`. For example, to specify that the schema rules generated by the procedure evaluate to `TRUE` only if the Oracle Streams tag is the hexadecimal equivalent of `'02'`, specify the following condition:

`:lcr.get_tag() = HEXTORAW('02')`

The `:lcr` in the specified condition is converted to `:dml` or `:ddl`, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify `TRUE` for the `include_dml` parameter and `FALSE` for the `include_ddl` parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify `FALSE` for the `include_dml` parameter and `TRUE` for the `include_ddl` parameter.

See Also: Chapter 275, "Logical Change Record TYPES"

The global name of the root in the source CDB. For example, `mycdb.example.com`. If this parameter is `NULL`, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `EXAMPLE.COM`, then the procedure specifies `DBS1.EXAMPLE.COM` automatically.

Note: This parameter only applies to a CDB.

The short name of the source container. The container can be the root or a PDB. For example, `CDB$ROOT` or `hrpdb`. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.

Note: This parameter only applies to a CDB.
Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

- "Operational Notes" on page 204-5
- "Security Model" on page 204-4

Examples

The following is an example of a schema rule condition created for DML changes:

```sql
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```
ADD_SUBSET_OUTBOUND_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One column_list parameter is type VARCHAR2 and the other column_list parameter is type DBMS_UTILITY.LNAME_ARRAY. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

**Note:** This procedure does not add rules to the outbound server's capture process.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
    server_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    condition        IN VARCHAR2  DEFAULT NULL,
    column_list      IN DBMS_UTILITY.LNAME_ARRAY,
    keep             IN BOOLEAN   DEFAULT TRUE,
    source_database  IN VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
    server_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    condition        IN VARCHAR2  DEFAULT NULL,
    column_list      IN VARCHAR2  DEFAULT NULL,
    keep             IN BOOLEAN   DEFAULT TRUE,
    source_database  IN VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database.</td>
</tr>
<tr>
<td></td>
<td>The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</td>
</tr>
<tr>
<td>condition</td>
<td></td>
</tr>
<tr>
<td>column_list</td>
<td></td>
</tr>
<tr>
<td>keep</td>
<td></td>
</tr>
<tr>
<td>source_database</td>
<td></td>
</tr>
</tbody>
</table>
Usage Notes

When the keep parameter is set to TRUE, this procedure creates a keep columns declarative rule-based transformation for the columns listed in column_list.

When the keep parameter is set to FALSE, this procedure creates a delete column declarative rule-based transformation for each column listed in column_list.
See Also: *Oracle Database XStream Guide* for information about declarative rule-based transformations
ADD_SUBSET_PROPAGATION_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
  table_name               IN   VARCHAR2,
  dml_condition            IN   VARCHAR2,
  streams_name             IN   VARCHAR2  DEFAULT NULL,
  source_queue_name        IN   VARCHAR2,
  destination_queue_name   IN   VARCHAR2,
  include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
  source_database          IN   VARCHAR2  DEFAULT NULL,
  insert_rule_name         OUT  VARCHAR2,
  update_rule_name         OUT  VARCHAR2,
  delete_rule_name         OUT  VARCHAR2,
  queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
  table_name               IN   VARCHAR2,
  dml_condition            IN   VARCHAR2,
  streams_name             IN   VARCHAR2  DEFAULT NULL,
  source_queue_name        IN   VARCHAR2,
  destination_queue_name   IN   VARCHAR2,
  include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
  source_database          IN   VARCHAR2  DEFAULT NULL,
  insert_rule_name         OUT  VARCHAR2,
  update_rule_name         OUT  VARCHAR2,
  delete_rule_name         OUT  VARCHAR2,
  queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

Parameters

**Table 204–9   ADD_SUBSET_PROPAGATION_RULES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: <code>salary &gt; 4000 and job_id = 'SA_MAN'</code></td>
</tr>
</tbody>
</table>

**Note:** The quotation marks in the preceding example are all single quotation marks.
The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.

For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.

If the schema is not specified, then the current user is the default.

The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type.

For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.

Note: Connection qualifiers are not allowed.

If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.

If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Oracle recommends that you specify a source database for propagation rules.
ADD_SUBSET_PROPAGATION_RULES Procedure

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

### Table 204–9 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert_rule_name</td>
<td>Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.</td>
</tr>
<tr>
<td>update_rule_name</td>
<td>Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.</td>
</tr>
<tr>
<td>delete_rule_name</td>
<td>Contains the system-generated DELETE rule name. This rule handles deletes and updates that must be converted into deletes.</td>
</tr>
</tbody>
</table>
| queue_to_queue       | If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:
  - If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.
  - If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.
  - If NULL, then the procedure does not change the queue to queue property of the propagation. |

See Also: *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations.
A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

---

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

---

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table name is hr.regions, and the source_database is dbs1.net:

:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table. This procedure creates the specified capture process if it does not exist.

- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified streams_name. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
  table_name             IN   VARCHAR2,
  dml_condition          IN   VARCHAR2,
  streams_type           IN   VARCHAR2 DEFAULT 'apply',
  streams_name           IN   VARCHAR2 DEFAULT NULL,
  queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr     IN   BOOLEAN DEFAULT FALSE,
  source_database        IN   VARCHAR2 DEFAULT NULL,
  insert_rule_name       OUT  VARCHAR2,
  update_rule_name       OUT  VARCHAR2,
  delete_rule_name       OUT  VARCHAR2,
  source_root_name       IN   VARCHAR2  DEFAULT NULL,
  source_container_name  IN   VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
  table_name             IN   VARCHAR2,
  dml_condition          IN   VARCHAR2,
  streams_type           IN   VARCHAR2 DEFAULT 'apply',
  streams_name           IN   VARCHAR2 DEFAULT NULL,
  queue_name             IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr     IN   BOOLEAN DEFAULT FALSE,
  source_database        IN   VARCHAR2 DEFAULT NULL,
  source_root_name       IN   VARCHAR2 DEFAULT NULL,
  source_container_name  IN   VARCHAR2 DEFAULT NULL);
```
Parameters

Table 204–10  ADD_SUBSET_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</td>
</tr>
<tr>
<td>dml_condition</td>
<td>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary &gt; 4000 and job_id = 'SA_MAN'' Note: The quotation marks in the preceding example are all single quotation marks.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of XStream client: Specify capture for a capture process. Specify apply for an apply process.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process must have a unique name.</td>
</tr>
</tbody>
</table>
ADD_SUBSET_RULES Procedure

Table 204–10 (Cont.) ADD_SUBSET_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</td>
</tr>
</tbody>
</table>
| include_tagged_lcr | If `TRUE`, then the XStream client performs its action regardless of the tag:  
  - A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.  
  - An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag.  
If `FALSE`, then an XStream client performs its action only when the tag is `NULL`:  
  - A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.  
  - An LCR is considered for apply by an apply process only if the LCR contains a NULL tag.  
A setting of `FALSE` is often specified in update-anywhere configurations to avoid sending a change back to its source database. See Also: Oracle Streams Replication Administrator’s Guide for more information about tags |
| source_database    | The global name of the source database. If `NULL`, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify `NULL` or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, `mycdb.example.com` or `hrpdb.example.com`. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify `DBS1` and the domain is `.NET`, then the procedure specifies `DBS1.NET` automatically. |
| insert_rule_name   | Contains the system-generated `INSERT` rule name. This rule handles inserts and updates that must be converted into inserts. |
Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the

### Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured or applied. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_XSTREAM_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the
table name plus the sequence number is too long, then the table name is truncated. The
ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for
INSERT, UPDATE, and DELETE statements are returned.

**Attention:** Subset rules should only reside in positive rule sets.
You should not add subset rules to negative rule sets. Doing so
might have unpredictable results because row migration would not
be performed on LCRs that are not discarded by the negative rule
set.

**Examples**

The following is an example of a rule condition created for filtering DML changes
containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```sql
:dml.get_object_owner() = 'HR' AND :dml.get_object_name() = 'REGIONS'
AND :dml.is_null_tag() = 'Y' AND :dml.get_source_database_name() = 'DBS1.NET'
AND :dml.get_command_type() = 'UPDATE'
AND (:dml.get_value('NEW', '"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD', '"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD', '"REGION_ID"').AccessNumber() = 2)
AND (:dml.get_value('NEW', '"REGION_ID"').AccessNumber() = 2)
```
### ADD_TABLE_PROPAGATION_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

#### Syntax

```sql
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
    table_name              IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

```sql
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
    table_name              IN   VARCHAR2,
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table_name</code></td>
<td>The name of the table specified as <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>streams_name</code></td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code> and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</td>
</tr>
<tr>
<td></td>
<td>If <code>NULL</code> and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
</tbody>
</table>
The name of the source queue, specified as [schema_name].queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.

For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.

If the schema is not specified, then the current user is the default.

The name of the destination queue, including a database link, specified as [schema_name.]queue_name[dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type.

For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter.

If the schema is not specified, then the current user is the default.

If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.

Note: Connection qualifiers are not allowed.

If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.
include_tagged_lcr

If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.

If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.

Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

source_database

The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Oracle recommends that you specify a source database for propagation rules.

dml_rule_name

If include_dml is TRUE, then this parameter contains the DML rule name.

If include_dml is FALSE, then this parameter contains a NULL.

ddl_rule_name

If include_ddl is TRUE, then this parameter contains the DDL rule name.

If include_ddl is FALSE, then this parameter contains a NULL.

inclusion_rule

If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation.

If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation.

In either case, the system creates the rule set if it does not exist.
This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| and_condition | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:  

\[(\text{system_condition}) \text{ AND } (\text{and_condition})\]  

The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:  

\[:lcr.get\_tag() = \text{HEXTORAW(''02'')}\]  

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the `include_dml` parameter and FALSE for the `include_ddl` parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the `include_dml` parameter and TRUE for the `include_ddl` parameter.

See Also: Chapter 275, "Logical Change Record TYPES"

queue_to_queue | If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.

If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.

This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:

- If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.
- If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.
- If NULL, then the procedure does not change the queue to queue property of the propagation.

See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations
sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

Examples

The following is an example of a table rule condition created for filtering DML statements:

```sql
(((dml.get_object_owner() = 'HR' and dml.get_object_name() = 'LOCATIONS'))
and dml.is_null_tag() = 'Y' and dml.get_source_database_name() = 'DBS1.NET')
```
ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table. This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```sql
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
    table_name             IN   VARCHAR2,
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name          OUT  VARCHAR2,
    ddl_rule_name          OUT  VARCHAR2,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN  VARCHAR2   DEFAULT NULL,
    source_container_name  IN  VARCHAR2   DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
    table_name             IN   VARCHAR2,
    streams_type           IN   VARCHAR2,
    streams_name           IN   VARCHAR2  DEFAULT NULL,
    queue_name             IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml            IN   BOOLEAN   DEFAULT TRUE,
    include_ddl            IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database        IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
    and_condition          IN   VARCHAR2  DEFAULT NULL,
    source_root_name       IN  VARCHAR2   DEFAULT NULL,
    source_container_name  IN  VARCHAR2   DEFAULT NULL);
```
Parameters

Table 204–12 ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.].object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of XStream client:</td>
</tr>
<tr>
<td></td>
<td>■ Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>■ Specify apply for an apply process.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process or apply process. Do not specify an owner. If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</td>
</tr>
<tr>
<td></td>
<td>■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td></td>
<td>■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as [schema_name.].queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
ADD_TABLE_RULES Procedure

Table 204–12 (Cont.) ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>

<tr>
<td></td>
<td>■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag.</td>
</tr>
<tr>
<td></td>
<td>■ An LCR is considered for apply by an apply process only if the LCR contains a NULL tag.</td>
</tr>
<tr>
<td></td>
<td>If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a NULL tag.</td>
</tr>
<tr>
<td></td>
<td>A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</td>
</tr>
<tr>
<td></td>
<td>Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Streams Replication Administrator’s Guide for more information about tags</td>
</tr>
</tbody>
</table>
source_database

The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.

For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.

For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.

In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client.</td>
</tr>
</tbody>
</table>

In either case, the system creates the rule set if it does not exist.
ADD_TABLE_RULES Procedure

204-56
Oracle Database PL/SQL Packages and Types Reference

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

Table 204–12  (Cont.)  ADD_TABLE_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| and_condition     | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: 

\[(system\_condition) \text{ AND } (and\_condition)\]  

The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: 

\[:lcr.get\_tag() = HEXTORAW('02')\]  

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. 

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. 

See Also: Chapter 275, "Logical Change Record TYPES"

source_root_name | The global name of the root in the source CDB. For example, mycdb.example.com.  

If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.  

If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.  

Note: This parameter only applies to a CDB.

source_container_name | The short name of the source container. The container can be the root or a PDB. For example, CDB$ROOT or hrpdb. See Oracle Database XStream Guide for more information about setting this parameter in a CDB.  

Note: This parameter only applies to a CDB.
Examples

The following is an example of a table rule condition created for DML changes:

```sql
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET'
```
ALTER_INBOUND Procedure

This procedure modifies an XStream inbound server.

Syntax

```sql
DBMS_XSTREAM_ADMIN.ALTER_INBOUND(
    server_name IN VARCHAR2,
    apply_user  IN VARCHAR2  DEFAULT NULL,
    comment     IN VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.</td>
</tr>
<tr>
<td>apply_user</td>
<td>The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs</td>
</tr>
<tr>
<td></td>
<td>custom rule-based transformations configured for inbound server rules.</td>
</tr>
<tr>
<td></td>
<td>The client application must attach to the inbound server as the apply user.</td>
</tr>
<tr>
<td></td>
<td>Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS</td>
</tr>
<tr>
<td></td>
<td>user can set the apply_user to SYS.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the apply user is not changed.</td>
</tr>
<tr>
<td>comment</td>
<td>An optional comment associated with the inbound server. If non-NULL, then the specified comment replaces the existing comment.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the existing comment is not changed.</td>
</tr>
</tbody>
</table>
ALTER_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server’s capture process when either of the following conditions is met:

- The capture process was created by the CREATE_OUTBOUND procedure in this package.
- The queue used by the capture process was created by the CREATE_OUTBOUND procedure.

To check whether this procedure can alter the outbound server’s capture process, query the CAPTURE_NAME column in the ALL_XSTREAM_OUTBOUND view. When the name of the capture process appears in the CAPTURE_NAME column of this view, the ALTER_OUTBOUND procedure can manage the capture process’s rules or change the capture user for the capture process. When the CAPTURE_NAME column of this view is NULL, the ALTER_OUTBOUND procedure cannot manage the capture process.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note: Starting with Oracle Database 11g Release 2 (11.2.0.2), the start_scn and start_time parameters are included in this procedure.

Syntax

DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
    server_name IN VARCHAR2,
    table_names IN DBMS_UTILITY.UNCL_ARRAY,
    schema_names IN DBMS_UTILITY.UNCL_ARRAY,
    add IN BOOLEAN DEFAULT TRUE,
    capture_user IN VARCHAR2 DEFAULT NULL,
    connect_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    start_scn IN NUMBER DEFAULT NULL,
    start_time IN TIMESTAMP DEFAULT NULL,
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    source_container_name IN VARCHAR2 DEFAULT NULL);

DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
    server_name IN VARCHAR2,
    table_names IN VARCHAR2 DEFAULT NULL,
    schema_names IN VARCHAR2 DEFAULT NULL,
    add IN BOOLEAN DEFAULT TRUE,
    capture_user IN VARCHAR2 DEFAULT NULL,
    connect_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL,
    inclusion_rule IN BOOLEAN DEFAULT TRUE,
    start_scn IN NUMBER DEFAULT NULL,
    start_time IN TIMESTAMP DEFAULT NULL,
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 204–14 ALT_EOUTBOUND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.</td>
</tr>
<tr>
<td>table_names</td>
<td>The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the add parameter. The tables can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2. ■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as (schema_name.table_name). For example, hr.employees. If the schema is not specified, then the current user is the default. See Also: &quot;Usage Notes&quot; on page 204-63 for more information about this parameter.</td>
</tr>
<tr>
<td>schema_names</td>
<td>The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the add parameter. The schemas can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2. ■ A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL. Note: This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name). See Also: &quot;Usage Notes&quot; on page 204-63 for more information about this parameter.</td>
</tr>
<tr>
<td>add</td>
<td>If TRUE, then the procedure adds to the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter. If FALSE, then the procedure removes from the XStream Out configuration the tables specified in the table_names parameter and the schemas specified in the schema_names parameter.</td>
</tr>
</tbody>
</table>
The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules.

Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.

If NULL, then the capture user is not changed.

If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.

Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" on page 204-66 for information about the privileges required by a capture user.

The capture process is stopped and restarted automatically when you change the value of this parameter.

Note: If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.

The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user.

Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS.

If NULL, then the connect user is not changed.

If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.

Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" on page 204-66 for information about the privileges required by a connect user.

An optional comment associated with the outbound server.

If non-NULL, then the specified comment replaces the existing comment.

If NULL, then the existing comment is not changed.

<tr>
<td>capture_user</td>
<td>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If NULL, then the capture user is not changed. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user. Ensure that the capture user is granted the other required privileges. See &quot;CREATE_OUTBOUND Procedure&quot; on page 204-66 for information about the privileges required by a capture user. The capture process is stopped and restarted automatically when you change the value of this parameter. Note: If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.</td>
</tr>
<tr>
<td>connect_user</td>
<td>The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user. Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS. If NULL, then the connect user is not changed. If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user. Ensure that the connect user is granted the other required privileges. See &quot;CREATE_OUTBOUND Procedure&quot; on page 204-66 for information about the privileges required by a connect user.</td>
</tr>
<tr>
<td>comment</td>
<td>An optional comment associated with the outbound server. If non-NULL, then the specified comment replaces the existing comment. If NULL, then the existing comment is not changed.</td>
</tr>
</tbody>
</table>
If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application.

If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the positive rule sets in the XStream Out configuration.

If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application.

If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the table_names parameter and the schemas specified in the schema_names parameter from the negative rule sets in the XStream Out configuration.

A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process.

An error is returned if an invalid SCN is specified.

If NULL and the start_time parameter is NULL, then the start SCN is not changed.

If NULL and the start_time parameter is non-NULL, then the start time is changed to match the specified start time.

The start_scn and start_time parameters are mutually exclusive.

Note: If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_scn parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_scn parameter is non-NULL.

A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process.

An error is returned if an invalid time is specified.

If NULL and the start_scn parameter is NULL, then the start time is not changed.

If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN.

The start_scn and start_time parameters are mutually exclusive.

Note: If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.
Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.

- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the add parameter. The existing rules for schemas are not changed for the XStream Out configuration.

- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the DBMS_UTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note: This parameter only applies to a CDB.
CREATE_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

---

**Note:** A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer’s Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

---

**Syntax**

```sql
DBMS_XSTREAM_ADM.CREATE_INBOUND(
    server_name  IN VARCHAR2,
    queue_name IN VARCHAR2,
    apply_user IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the inbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. <strong>Note:</strong> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue used by the inbound server, specified as <code>[{schema_name.}]queue_name</code>. If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it. For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default. <strong>Note:</strong> An inbound server's queue is used only to store error transactions.</td>
</tr>
</tbody>
</table>
By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the `DBMS_XSTREAM_ADM` and `DBMS_RULE_ADM` packages.

In a CDB, you can execute the `CREATE_INBOUND` procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

See Also:  *Oracle Database XStream Guide*
CREATE_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

This procedure is overloaded. One table_names parameter is type VARCHAR2 and the other table_names parameter is type DBMS_UTILITY.UNCL_ARRAY. Also, one schema_names parameter is type VARCHAR2 and the other schema_names parameter is type DBMS_UTILITY.UNCL_ARRAY. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

Note:
- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the Oracle Call Interface Programmer’s Guide and Oracle Database XStream Java API Reference for information about attaching to an outbound server.
- If the capture_name parameter is NULL, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the capture_name parameter is included in this procedure.

Syntax

DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
    server_name            IN VARCHAR2,
    source_database        IN VARCHAR2 DEFAULT NULL,
    table_names            IN DBMS_UTILITY.UNCL_ARRAY,
    schema_names           IN DBMS_UTILITY.UNCL_ARRAY,
    capture_user           IN VARCHAR2 DEFAULT NULL,
    connect_user           IN VARCHAR2 DEFAULT NULL,
    comment                IN VARCHAR2 DEFAULT NULL,
    capture_name           IN VARCHAR2 DEFAULT NULL,
    include_dml            IN BOOLEAN DEFAULT TRUE,
    include_ddl            IN BOOLEAN DEFAULT FALSE,
    source_root_name       IN VARCHAR2 DEFAULT NULL,
    source_container_name  IN VARCHAR2 DEFAULT NULL);

DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
    server_name            IN VARCHAR2,
    source_database        IN VARCHAR2 DEFAULT NULL,
    table_names            IN VARCHAR2 DEFAULT NULL,
    schema_names           IN VARCHAR2 DEFAULT NULL,
    capture_user           IN VARCHAR2 DEFAULT NULL,
    connect_user           IN VARCHAR2 DEFAULT NULL,
    comment                IN VARCHAR2 DEFAULT NULL,
    capture_name           IN VARCHAR2 DEFAULT NULL,
    include_dml            IN BOOLEAN DEFAULT TRUE,
    include_ddl            IN BOOLEAN DEFAULT FALSE,
    source_root_name       IN VARCHAR2 DEFAULT NULL,
    source_container_name  IN VARCHAR2 DEFAULT NULL);
include_dml               IN BOOLEAN   DEFAULT TRUE,
include_ddl               IN BOOLEAN   DEFAULT FALSE,
source_root_name          IN  VARCHAR2   DEFAULT NULL,
source_container_name     IN  VARCHAR2   DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client. Note: The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes to be captured originated. If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See Oracle Database XStream Guide for more information about setting this parameter in a CDB. In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the CREATE_OUTBOUND procedure. See Oracle Database XStream Guide for instructions. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</td>
</tr>
</tbody>
</table>
| table_names    | The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways:  
  - Comma-delimited list of type VARCHAR2.  
  - A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL. Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default. See Also: "Usage Notes" on page 204-70 for more information about this parameter |
**CREATE_OUTBOUND Procedure**

**schema_names**

The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:

- Comma-delimited list of type VARCHAR2.
- A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.

**Note:** This procedure does not concatenate the `schema_names` parameter with the `table_names` parameter. To specify tables, enter fully qualified table names in the `table_names` parameter (`schema_name.table_name`).

**See Also:** "Usage Notes" on page 204-70 for more information about this parameter.

**capture_user**

The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the current user is the default.

This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.

In addition, ensure that the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process
- EXECUTE privilege on all rule-based transformation functions used in the positive rule set

You can grant these privileges directly to the apply user, or you can grant them through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

Only a user who is granted the DBA role can set a capture user. Only the SYS user can set the `capture_user` to SYS.

A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user.

If NULL, then the current user is the default.

The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.

In addition to the privileges granted by this procedure, grant the following privileges to the connect user:

- EXECUTE privilege on the rule sets used by the outbound server
- EXECUTE privilege on all rule-based transformation functions used in the rule set

You can grant these privileges directly to the connect user, or you can grant them through roles.

In addition, the connect user must be granted EXECUTE privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.

An optional comment associated with the outbound server.

The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.

The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised.

If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name.

If NULL, then the system creates a new capture process with a system-generated name.

Note: The capture process name cannot be altered after the capture process is created.

If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.

If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
The following list describes the behavior of the outbound server for various combinations of the table_names and schema_names parameters:

- If both the table_names and schema_names parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.

  This procedure is overloaded. The table_names and schema_names parameters are defaulted to NULL. Do not specify NULL for both table_names and schema_names in the same call; otherwise, error PLS-00307 is returned.

- If both the table_names and schema_names parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.

- If the table_names parameter is specified and the schema_names parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.

- If the table_names parameter is NULL or empty and the schema_names parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the DBMSUTILITY.UNCL_ARRAY type for the table_names and schema_names parameters, both parameters must be specified. To specify only tables, the schema_names parameter must be specified and empty. To specify only schemas, the table_names parameter must be specified and empty.

Note: An empty array includes one NULL entry.
DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which
deletes a column from a row logical change record (LCR) that satisfies the specified
rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the
rule must be in the positive rule set of an XStream client. XStream clients include
capture processes, propagations, and apply processes.

---

**Note:**
- The DELETE_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- The DELETE_COLUMN procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the KEEP_COLUMNS procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

---

**See Also:**
- Oracle Database XStream Guide for more information about declarative rule-based transformations and about the data types supported by capture processes
- KEEP_COLUMNS Procedure on page 204-80

**Syntax**

```sql
DBMS_XSTREAM_ADM.DELETE_COLUMN(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    value_type    IN  VARCHAR2   DEFAULT '*',
    step_number   IN  NUMBER     DEFAULT 0,
    operation     IN  VARCHAR2   DEFAULT 'ADD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table from which the column is deleted in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified column_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified table_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified column_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified table_name and column_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all delete column transformations with the specified table_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>

See Also: Oracle Database XStream Guide for more information about transformation ordering.
**DROP_INBOUND Procedure**

This procedure removes an inbound server configuration. This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the CREATE_INBOUND procedure created the queue.
- The inbound server is the only subscriber to the queue.

**See Also:** "CREATE_INBOUND Procedure" on page 204-64

**Syntax**

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
    server_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner.</td>
</tr>
</tbody>
</table>
DROP_OUTBOUND Procedure

This procedure removes an outbound server configuration. This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the CREATE_OUTBOUND procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the DROP_OUTBOUND procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the CREATE_OUTBOUND procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

See Also:
- "ADD_OUTBOUND Procedure" on page 204-21
- "CREATE_OUTBOUND Procedure" on page 204-66

Syntax

DBMS_XSTREAM_ADM.DROP_OUTBOUND(
    server_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner.</td>
</tr>
</tbody>
</table>
**ENABLE_GG_XSTREAM_FOR_STREAMS Procedure**

This procedure enables XStream optimizations and performance optimizations for Oracle Streams components.

This procedure is intended for users of Oracle Streams who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Streams replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Streams components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply
- Dependency computation and scheduling
- Capture process parallelism

**Syntax**

```sql
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS(
   enable IN BOOLEAN  TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>If TRUE, then enable XStream performance optimizations for Oracle Streams components. If FALSE, then disable XStream performance optimizations for Oracle Streams components.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.

- After you run this procedure, the PURPOSE column in the following views displays XStream Streams:
  - ALL APPLY
  - DBA APPLY
  - ALL_CAPTURE
  - DBA_CAPTURE
A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Streams components.

See Also:

- IS_GG_XSTREAM_FOR_STREAMS Function on page 204-79
- Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream
GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

See Also: SET_MESSAGE_TRACKING Procedure on page 204-105

Syntax

DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

**See Also:**
- "SET_TAG Procedure" on page 204-108
- Oracle Streams Replication Administrator’s Guide for more information about tags

**Syntax**

```
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

**Examples**

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
    raw_tag RAW(2000);
BEGIN
    raw_tag := DBMS_STREAMS_ADM.GET_TAG();
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```
**IS_GG_XSTREAM_FOR_STREAMS Function**

This function returns **TRUE** if XStream performance optimizations are enabled for Oracle Streams components, or this function returns **FALSE** if XStream performance optimizations are disabled for Oracle Streams components.

*See Also:* "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" on page 204-75

**Syntax**

```sql
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```
KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The column_list parameter is type VARCHAR2 and the column_table parameter is type DBMS_UTILITY.LNAME_ARRAY. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

---

**Note:**

- The KEEP_COLUMNS procedure supports the same data types supported by Oracle Streams capture processes.
- The KEEP_COLUMNS procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the DELETE_COLUMN procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

---

**See Also:**

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- **DELETE_COLUMN Procedure** on page 204-71

**Syntax**

```sql
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_list   IN  VARCHAR2,
    value_type    IN  VARCHAR2 DEFAULT '*' ,
    step_number   IN  NUMBER DEFAULT 0,
    operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_XSTREAM_ADM.KEEP_COLUMNS(
    rule_name     IN  VARCHAR2,
    table_name    IN  VARCHAR2,
    column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
    value_type    IN  VARCHAR2 DEFAULT '*' ,
    step_number   IN  NUMBER DEFAULT 0,
    operation     IN  VARCHAR2 DEFAULT 'ADD');
```
Parameters

Table 204–21  KEEP_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table for which the columns are kept in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>column_table</td>
<td>The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL.</td>
</tr>
<tr>
<td></td>
<td>The transformation removes columns that are not in the table from the row LCR.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify ’NEW’ to keep the columns in the new values in the row LCR. Specify ’OLD’ to keep the columns in the old values in the row LCR.</td>
</tr>
<tr>
<td></td>
<td>Specify ’*’ to keep the columns in both the old and new values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify ’ADD’ to add the transformation to the rule. Specify ’REMOVE’ to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When ’REMOVE’ is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>column_list/column_table</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all keep columns transformations for the specified rule.</td>
</tr>
<tr>

</table>
MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The CAPTURE_MESSAGE_CREATE_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.
5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:
- MERGE_STREAMS Procedure on page 204-83
- SPLIT_STREAMS Procedure on page 204-111

Syntax

```sql
DBMS_XSTREAM_ADM.MERGE_STREAMS(
    cloned_propagation_name  IN  VARCHAR2,
    propagation_name         IN  VARCHAR2  DEFAULT NULL,
    queue_name               IN  VARCHAR2  DEFAULT NULL,
    perform_actions          IN  BOOLEAN   DEFAULT TRUE,
    script_name              IN  VARCHAR2  DEFAULT NULL,
    script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
| propagation_name      | The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. If a non-NULL value is specified, then an error is raised under either of the following conditions:  
  - The queue specified in the queue_name parameter does not exist.  
  - The queue specified in the queue_name parameter exists but is not used by a capture process. |
| queue_name            | The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. |
Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

### Table 204–22 (Cont.) MERGE_STREAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>perform_actions</td>
<td>If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform these actions directly.</td>
</tr>
<tr>
<td></td>
<td>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</td>
</tr>
<tr>
<td></td>
<td>- script_name</td>
</tr>
<tr>
<td></td>
<td>- script_directory_object</td>
</tr>
<tr>
<td>script_name</td>
<td>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</td>
</tr>
<tr>
<td></td>
<td>If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</td>
</tr>
<tr>
<td>script_directory_object</td>
<td>The directory object for the directory on the local computer system into which the generated script is placed.</td>
</tr>
<tr>
<td></td>
<td>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</td>
</tr>
</tbody>
</table>

Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:
- MERGE_STREAMS Procedure on page 204-83
- SPLIT_STREAMS Procedure on page 204-111
- Oracle Streams Replication Administrator’s Guide for instructions on using the MERGE_STREAMS_JOB procedure

Syntax

```sql
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB(
    cloned_propagation_name IN VARCHAR2,
    propagation_name        IN VARCHAR2 DEFAULT NULL,
    queue_name              IN VARCHAR2 DEFAULT NULL,
    merge_threshold         IN NUMBER,
    schedule_name           IN VARCHAR2 DEFAULT NULL,
    merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</td>
</tr>
<tr>
<td></td>
<td>You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
You can use the **MERGE_STREAMS_JOB** procedure to merge two streams that were not split using the **SPLIT_STREAMS** procedure. Merging streams in this way can save
resources and improve performance when a single database is running two or more capture processes.

After the **MERGE_STREAMS_JOB** procedure completes, you can query the **DBA_CAPTURE** and **DBA_PROPAGATION** views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the **schedule_name** and **merge_job_name** parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The **DBA_STREAMS_SPLIT_MERGE** view contains information about split and merge operations.
PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG(
    source_database     IN  VARCHAR2,
    source_object_name  IN  VARCHAR2,
    source_object_type  IN  VARCHAR2,
    source_root_name    IN  VARCHAR2);
```

Parameters

**Table 204–24**  PURGE_SOURCE_CATALOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| source_database          | In a non-CDB, specify the global name of the source database containing the database object.  
                          | In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB.  
                          | If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. |
| source_object_name       | The name of the object specified as [schema_name.]object_name.  
                          | For example, hr.employees. If the schema is not specified, then the current user is the default. |
| source_object_type       | Type of the object. Currently, TABLE is the only possible object type. |
| source_root_name         | The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB.  
                          | If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.  
                          | If the source_root_name parameter is NULL, then the global name of the local root is the default. |

**Note:** This parameter only applies to a CDB.

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_
**SOURCE_CATALOG** procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstating the object.

---

**Note:** These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.
RECOVER_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the split_threshold and merge_threshold capture process parameters set to non-NULL values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- DBA_RECOVERABLE_SCRIPT
- DBA_RECOVERABLE_SCRIPT_PARAMS
- DBA_RECOVERABLE_SCRIPT_BLOCKS
- DBA_RECOVERABLE_SCRIPT_ERRORS

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views, DBA_RECOVERABLE_SCRIPT_PARAMS, DBA_RECOVERABLE_SCRIPT_BLOCKS, and DBA_RECOVERABLE_SCRIPT_ERRORS, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the RECOVER_OPERATION procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in DBA_RECOVERABLE_SCRIPT_ERRORS before proceeding.

Run the RECOVER_OPERATION procedure at the database that contains the capture process.

---

**Note:** To run the RECOVER_OPERATION procedure, both databases must be Oracle Database 10g Release 2 or later databases.

---

**See Also:**
- "SPLIT_STREAMS Procedure" on page 204-111
- "MERGE_STREAMS Procedure" on page 204-83
- "MERGE_STREAMS_JOB Procedure" on page 204-86
- *Oracle Streams Replication Administrator's Guide*

**Syntax**

```sql
DBMS_XSTREAM_ADM.RECOVER_OPERATION( 
    script_id       IN  RAW, 
    operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script_id</td>
<td>The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.</td>
</tr>
</tbody>
</table>
| operation_mode | If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation.  
If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days.  
If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days. |
**REMOVE_QUEUE Procedure**

This procedure removes the specified ANYDATA queue. Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the XStream clients that are using the queue.

---

**Note:** The specified queue must be a ANYDATA queue.

---

**Syntax**

```sql
DBMS_XSTREAM_ADM.REMOVE_QUEUE(
    queue_name               IN  VARCHAR2,
    cascade                  IN  BOOLEAN  DEFAULT FALSE,
    drop_unused_queue_table  IN  BOOLEAN  DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue to remove, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the procedure drops any XStream clients that use the queue. If FALSE, then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no XStream clients are using the queue currently.</td>
</tr>
<tr>
<td>drop_unused_queue_table</td>
<td>If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.</td>
</tr>
</tbody>
</table>
**REMOVE_RULE Procedure**

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

---

**Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

---

**Syntax**

```sql
DBMS_XSTREAM_ADM.REMOVE_RULE(
    rule_name         IN  VARCHAR2,
    streams_type      IN  VARCHAR2,
    streams_name      IN  VARCHAR2,
    drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
    inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule to remove, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set.</td>
</tr>
<tr>
<td></td>
<td>For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>streams_type</td>
<td>The type of XStream client:</td>
</tr>
<tr>
<td></td>
<td>■ Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>■ Specify propagation for a propagation.</td>
</tr>
<tr>
<td></td>
<td>■ Specify apply for an apply process.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata.</td>
</tr>
<tr>
<td></td>
<td>If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</td>
</tr>
<tr>
<td>drop_unused_rule</td>
<td>If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database.</td>
</tr>
<tr>
<td></td>
<td>If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not drop the rule from the database.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the XStream client.</td>
</tr>
<tr>
<td></td>
<td>If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the XStream client.</td>
</tr>
</tbody>
</table>
REMOVE_SUBSET_OUTBOUND_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the ADD_SUBSET_OUTBOUND_RULES procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
FROM ALL_XSTREAM_RULES
WHERE SUBSETTING_OPERATION IS NOT NULL;
```

---

**Note:**

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

---

**See Also:** "ADD_SUBSET_OUTBOUND_RULES Procedure" on page 204-35

**Syntax**

```sql
DBMS_XSTREAMADM.REMOVE_SUBSET_OUTBOUND_RULES(
    server_name  IN VARCHAR2,
    insert_rule_name IN VARCHAR2,
    update_rule_name IN VARCHAR2,
    delete_rule_name IN VARCHAR2);
```
REMOVE_XSTREAM_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

Syntax

```sql
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
    container IN VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB. If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. <strong>Note:</strong> This parameter only applies to a CDB.</td>
</tr>
</tbody>
</table>

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_XSTREAM_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
Summary of DBMS_XSTREAM_ADM Subprograms

- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_XSTREAM_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_XSTREAM_ADM` package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them. This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

---

**Attention:** Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Streams configuration exists at the database, then this procedure also removes the entire Oracle Streams configuration.

---

**Note:**

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.
RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule. For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

---

Note:

- The RENAME_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

---

See Also: Oracle Database XStream Guide for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

Syntax

```sql
DBMS_XSTREAM_ADM.RENAME_COLUMN(  
  rule_name         IN  VARCHAR2,  
  table_name        IN  VARCHAR2,  
  from_column_name  IN  VARCHAR2,  
  to_column_name    IN  VARCHAR2,  
  value_type        IN  VARCHAR2  DEFAULT '*',  
  step_number       IN  NUMBER    DEFAULT 0,  
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table in which the column is renamed in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_column_name</td>
<td>The name of the column to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new name of the column in each row LCR that satisfies the rule.</td>
</tr>
</tbody>
</table>
When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>table_name</th>
<th>from_column_name</th>
<th>to_column_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>

<td>Remove all rename column transformations with the specified <code>table_name</code>, <code>column_name</code>, and <code>step_number</code> for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all rename column transformations with the specified <code>table_name</code>, <code>column_name</code>, and <code>step_number</code> for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename column transformations with the specified <code>table_name</code>, <code>column_name</code>, and <code>step_number</code> for the specified rule.</td>
</tr>
</tbody>
</table>
RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

---

**Note:** Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

---

**See Also:** *Oracle Database XStream Guide* for more information about declarative rule-based transformations

### Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA(
  rule_name         IN  VARCHAR2,
  from_schema_name  IN  VARCHAR2,
  to_schema_name    IN  VARCHAR2,
  step_number       IN  NUMBER    DEFAULT 0,
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_schema_name</td>
<td>The name of the schema to be renamed in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>to_schema_name</td>
<td>The new name of the schema in each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule.</td>
</tr>
<tr>
<td></td>
<td>Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

### Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified from_schema_name, to_schema_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:
<table>
<thead>
<tr>
<th>from_schema_name</th>
<th>to_schema_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified to_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>
RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

**Note:** Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

**See Also:** Oracle Database XStream Guide for more information about declarative rule-based transformations

**Syntax**

```sql
DBMS_XSTREAM_ADM.RENAME_TABLE(
    rule_name        IN  VARCHAR2,
    from_table_name  IN  VARCHAR2,
    to_table_name    IN  VARCHAR2,
    step_number      IN  NUMBER  DEFAULT 0,
    operation        IN  VARCHAR2  DEFAULT 'ADD');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>from_table_name</td>
<td>The name of the table to be renamed in each row LCR that satisfies the rule, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>to_table_name</td>
<td>The new name of the table in each row LCR that satisfies the rule, specified as [schema_name.]object_name. For example, humres.staff. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation. See Also: Oracle Database XStream Guide for more information about transformation ordering</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

---

204-103
Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

<table>
<thead>
<tr>
<th>from_table_name</th>
<th>to_table_name</th>
<th>step_number</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename table transformations for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename table transformations with the specified step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>non-NULL</td>
<td>Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.</td>
</tr>
<tr>
<td>NULL</td>

<td>NULL</td>
<td>Remove all rename table transformations with the specified to_table_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>NULL</td>
<td>Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>NULL</td>
<td>NULL</td>
<td>Remove all rename table transformations with the specified from_table_name for the specified rule.</td>
</tr>
<tr>
<td>non-NULL</td>
<td>non-NULL</td>
<td>non-NULL</td>
<td>Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.</td>
</tr>
</tbody>
</table>
**SET_MESSAGE_TRACKING Procedure**

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

---

**Note:** The tracking label set by this procedure does not track non-LCR messages.

---

**See Also:** KAWGET_MESSAGE_TRACKING

**Syntax**

```sql
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
    tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
    actions        IN NUMBER    DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tracking_label</td>
<td>The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.</td>
</tr>
<tr>
<td>actions</td>
<td>When DBMS_XSTREAM_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs. Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter. The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.</td>
</tr>
</tbody>
</table>
SET_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

Syntax

```sql
DBMS_XSTREAM_ADM.SET_PARAMETER(
    streams_name IN VARCHAR2,
    streams_type IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN VARCHAR2 DEFAULT NULL,
    no_wait IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_type</td>
<td>The type of XStream client:</td>
</tr>
<tr>
<td></td>
<td>- Specify capture for a capture process.</td>
</tr>
<tr>
<td></td>
<td>- Specify apply for an outbound server or inbound server.</td>
</tr>
<tr>
<td>streams_name</td>
<td>The name of the capture process, outbound server, or inbound server. Do not</td>
</tr>
<tr>
<td></td>
<td>specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Capture Process Parameters&quot; on page 34-42 for information about capture</td>
</tr>
<tr>
<td></td>
<td>process parameters.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Apply Component Parameters&quot; on page 23-56 for information about outbound</td>
</tr>
<tr>
<td></td>
<td>server and inbound server parameters.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the parameter is set to its default value.</td>
</tr>
<tr>
<td>no_wait</td>
<td>If TRUE, then the parameter is set immediately.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the parameter is set after synchronizing with the running</td>
</tr>
<tr>
<td></td>
<td>capture process, inbound server, or outbound server.</td>
</tr>
<tr>
<td></td>
<td>When you modify multiple parameters for the same process consecutively,</td>
</tr>
<tr>
<td></td>
<td>setting this parameter to TRUE speeds up each call.</td>
</tr>
<tr>
<td></td>
<td>However, if the process is currently running, you must set this</td>
</tr>
<tr>
<td></td>
<td>parameter to FALSE in the last to the procedure to ensure that the</td>
</tr>
<tr>
<td></td>
<td>process uses the modified parameter values. If the no_wait parameter is</td>
</tr>
<tr>
<td></td>
<td>set to TRUE for the last call to the procedure, the running process might</td>
</tr>
<tr>
<td></td>
<td>not detect the parameter changes.</td>
</tr>
</tbody>
</table>
Table 204–33 (Cont.) SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| source_database | If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.  
If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root.  
If a container name, then the parameter is set in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.  
Note: This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters:  
- include_objects capture parameter  
- excludetag capture or apply parameter  
- excludetrans capture or apply parameter  
- excludeuser capture or apply parameter  
- excludeuserid capture or apply parameter  
- getreplicates capture or apply parameter  
- getapplops capture or apply parameter |
SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
    tag IN RAW DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits.</td>
</tr>
<tr>
<td></td>
<td>By default, the tag for a session is NULL.</td>
</tr>
<tr>
<td></td>
<td>The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of ‘17’ in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 34-18
SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE(
    queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
    storage_clause  IN  VARCHAR2  DEFAULT NULL,
    queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
    queue_user      IN  VARCHAR2  DEFAULT NULL,
    comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Table 204–35</th>
<th>SET_UP_QUEUE Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>queue_table</td>
<td>The name of the queue table specified as [schema_name.]queue_table_name. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>The storage clause for queue table</td>
</tr>
<tr>
<td>storage Clause is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause.</td>
<td></td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the queue that will function as the ANYDATA queue, specified as [schema_name.]queue_name. For example, strmadmin.streams_queue.</td>
</tr>
<tr>
<td>queue_user</td>
<td>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</td>
</tr>
<tr>
<td>comment</td>
<td>If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default.</td>
</tr>
</tbody>
</table>

Queue names can be a maximum of 24 bytes.
**Usage Notes**

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the `CREATE_QUEUE_TABLE` procedure in the `DBMS_AQADM` package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer `ANYDATA` queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release before Oracle Database 10g release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.

- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.

- This procedure starts the queue.

- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

**Note:** If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

**See Also:** *Oracle Streams Concepts and Administration* for more information about secure queue users
SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.

2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.

3. Stops the capture process.

4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.

6. Drops the original propagation.

7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.

8. If the auto_merge_threshold parameter is set to a positive number, then creates an Oracle Scheduler job to run the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the MERGE_STREAMS_JOB procedure runs the MERGE_STREAMS procedure to merge the streams automatically.

After the SPLIT_STREAMS procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the START_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

The DBA_STREAMS_SPLIT_MERGE view contains the name of each cloned component and information about the split and merge operation.
SPLIT_STREAMS Procedure

**Note:** If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:
- "MERGE_STREAMS Procedure" on page 204-83
- "MERGE_STREAMS_JOB Procedure" on page 159-133
- Oracle Streams Replication Administrator’s Guide for instructions on using the SPLIT_STREAMS procedure

Syntax

```sql
DBMS_XSTREAM_ADM.SPLIT_STREAMS(
  propagation_name IN VARCHAR2,
  cloned_propagation_name IN VARCHAR2 DEFAULT NULL,
  cloned_queue_name IN VARCHAR2 DEFAULT NULL,
  cloned_capture_name IN VARCHAR2 DEFAULT NULL,
  perform_actions IN BOOLEAN DEFAULT TRUE,
  script_name IN VARCHAR2 DEFAULT NULL,
  script_directory_object IN VARCHAR2 DEFAULT NULL,
  auto_merge_threshold IN NUMBER DEFAULT NULL,
  schedule_name IN OUT VARCHAR2,
  merge_job_name IN OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>cloned_propagation_name</td>
<td>The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.</td>
</tr>
<tr>
<td>cloned_queue_name</td>
<td>The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.</td>
</tr>
<tr>
<td>cloned_capture_name</td>
<td>The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.</td>
</tr>
</tbody>
</table>
perform_actions

If TRUE, then the procedure performs the necessary actions to split the stream directly.

If FALSE, then the procedure does not perform the necessary actions to split the stream directly.

Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:

- script_name
- script_directory_object

script_name

If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.

If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.

If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script.

If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.

script_directory_object

The directory object for the directory on the local computer system into which the generated script is placed.

If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.

If NULL and the script_name parameter is non-NULL, then the procedure raises an error.

Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. The value of the `CAPTURE_MESSAGE_CREATE_TIME` column for each capture process in the `GV$STREAMS_CAPTURE` dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between `CAPTURE_MESSAGE_CREATE_TIME` of the cloned capture process and the original capture process is less than or equal to the value specified for the `auto_merge_threshold` parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.

If `NULL` or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the `MERGE_STREAM` procedure manually when the `CAPTURE_MESSAGE_CREATE_TIME` of the cloned capture process catches up to, or nearly catches up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process.

The `CAPTURE_MESSAGE_CREATE_TIME` records the time when a captured change was recorded in the redo log.

If `auto_merge_threshold` is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.

If `NULL` and `auto_merge_threshold` is a non-NULL positive number, then the system generates a schedule name.

If `auto_merge_threshold` is `NULL` or 0 (zero), then this parameter must be `NULL`.

If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.

If an existing schedule name is specified, an error is raised.

The Oracle Scheduler job name, specified as `[schema_name.]merge_job_name`. For example, `strmadmin.merge_job`. If the schema is not specified, then the current user is the default.

If `auto_merge_threshold` is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.

If `NULL` and `auto_merge_threshold` is a non-NULL positive number, then the system generates a job name.

If `auto_merge_threshold` is `NULL` or 0 (zero), then this parameter must be `NULL`.

If an existing job name is specified, an error is raised.
See Also: Oracle Database Administrator’s Guide for information about Oracle Scheduler
START_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
    server_name    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>
**STOP_OUTBOUND Procedure**

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

**Syntax**

```sql
DBMS_XSTREAM_ADM.STOP_OUTBOUND(
    server_name  IN  VARCHAR2,
    force   IN  BOOLEAN   DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server_name</td>
<td>The name of the outbound server being stopped. A NULL specification is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the outbound server and its capture process as soon as possible. If FALSE, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter.</td>
</tr>
</tbody>
</table>
The `DBMS_XSTREAM_AUTH` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- **Using DBMS_XSTREAM_AUTH**
  - Overview
  - Security Model

- **Summary of DBMS_XSTREAM_AUTH Subprograms**

  **See Also:** [GRANT_ADMIN_PRIVILEGE Procedure on page 205-6]
Using DBMS_XSTREAM_AUTH

This section contains topics which relate to using the DBMS_XSTREAM_AUTH package.

- Overview
- Security Model
Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.
Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.
Summary of DBMS_XSTREAM_AUTH Subprograms

</tr>
</tbody>
</table>

Note: All subprograms commit unless specified otherwise.
GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

See Also:  "GRANT_ADMIN_PRIVILEGE Procedure" on page 205-6

Syntax

```sql
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE(
  grantee                    IN  VARCHAR2,
  privilege_type             IN  VARCHAR2  DEFAULT '*',
  grant_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
  do_grants                  IN  BOOLEAN   DEFAULT TRUE,
  file_name                  IN  VARCHAR2  DEFAULT NULL,
  directory_name             IN  VARCHAR2  DEFAULT NULL,
  grant_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
  container                  IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user to whom privileges are granted</td>
</tr>
<tr>
<td>privilege_type</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>■ CAPTURE</td>
</tr>
<tr>
<td></td>
<td>Specifying CAPTURE grants the minimum privileges required by the user to administer capture processes.</td>
</tr>
<tr>
<td></td>
<td>■ APPLY</td>
</tr>
<tr>
<td></td>
<td>Specifying APPLY grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes.</td>
</tr>
<tr>
<td></td>
<td>■ *</td>
</tr>
<tr>
<td></td>
<td>Specifying * grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.</td>
</tr>
<tr>
<td>grant_select_privileges</td>
<td>If TRUE, then the procedure grants a set of privileges, including SELECT_CATALOG_ROLE, to the user.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not grant the set of privileges to the user.</td>
</tr>
<tr>
<td></td>
<td>SELECT_CATALOG_ROLE enables the user to select from the data dictionary. Set this parameter to TRUE for the XStream trusted user model. Set this parameter to FALSE for the XStream untrusted user model.</td>
</tr>
</tbody>
</table>
Summary of DBMS_XSTREAM_AUTH Subprograms

205-7

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege
- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
GRANT_ADMIN_PRIVILEGE Procedure

- DBMS_AQADM
- DBMS_AQIN
- DBMS_AQELM
- DBMS_CAPTURE_ADM
- DBMS_FLASHBACK
- DBMS_LOCK
- DBMS_PROPAGATION_ADM
- DBMS_RULE_ADM
- DBMS_STREAMS_ADM
- DBMS_STREAMS_ADVISOR_ADM
- DBMS_STREAMS_HANDLER_ADM
- DBMS_STREAMS_MESSAGING
- DBMS_TRANSFORM
- DBMS_XSTREAM_ADM

- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT or READ privilege on data dictionary views related to XStream and Oracle Streams
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

---

**Note:**

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.
See Also:

- "GRANT_REMOTE_ADMIN_ACCESS Procedure" on page 205-10
- Oracle Database SQL Language Reference for information about the CREATE DIRECTORY SQL statement
GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```sql
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.</td>
</tr>
</tbody>
</table>

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

Note: The GRANT_ADMIN_PRIVILEGE procedure in this package runs this procedure.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 205-6
REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE(
    grantee                     IN  VARCHAR2,
    privilege_type              IN  VARCHAR2  DEFAULT ' *
    revoke_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
    do_revokes                  IN  BOOLEAN   DEFAULT TRUE,
    file_name                   IN  VARCHAR2  DEFAULT NULL,
    directory_name              IN  VARCHAR2  DEFAULT NULL,
    revoke_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
    container                   IN  VARCHAR2  DEFAULT 'CURRENT'
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user from whom privileges are revoked</td>
</tr>
<tr>
<td>privilege_type</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>■ CAPTURE</td>
</tr>
<tr>
<td></td>
<td>Specifying CAPTURE revokes the minimum privileges required by the user</td>
</tr>
<tr>
<td></td>
<td>to administer capture processes.</td>
</tr>
<tr>
<td></td>
<td>■ APPLY</td>
</tr>
<tr>
<td></td>
<td>Specifying APPLY revokes the minimum privileges required by the user</td>
</tr>
<tr>
<td></td>
<td>to administer outbound servers, inbound servers, and apply processes.</td>
</tr>
<tr>
<td></td>
<td>■ *</td>
</tr>
<tr>
<td></td>
<td>Specifying * revokes the minimum privileges required by the user to</td>
</tr>
<tr>
<td></td>
<td>administer capture processes, outbound servers, inbound servers, and</td>
</tr>
<tr>
<td></td>
<td>apply processes.</td>
</tr>
<tr>
<td>revoke_select_privileges</td>
<td>If TRUE, then the procedure revokes a set of privileges, including SELECT_</td>
</tr>
<tr>
<td></td>
<td>CATALOG_ROLE, to the user.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure does not revoke the set of privileges to the</td>
</tr>
<tr>
<td></td>
<td>user.</td>
</tr>
<tr>
<td></td>
<td>SELECT_CATALOG_ROLE enables the user to select from the data dictionary.</td>
</tr>
<tr>
<td>directory_name</td>
<td></td>
</tr>
<tr>
<td>container</td>
<td></td>
</tr>
</tbody>
</table>
REVOKE_ADMIN_PRIVILEGE Procedure

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
See Also:

- "GRANT_ADMIN_PRIVILEGE Procedure" on page 205-6
- Oracle Database SQL Language Reference for information about the CREATE DIRECTORY SQL statement
**REVOKE_REMOTE_ADMIN_ACCESS Procedure**

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

---

**Note:** The `REVOKE_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

---

**See Also:** "REVOKE_ADMIN_PRIVILEGE Procedure" on page 205-11

**Syntax**

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
    grantee  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user for whom access from a remote XStream administrator is disabled.</td>
</tr>
<tr>
<td></td>
<td>If a row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure updates the <code>ACCESS_FROM_REMOTE</code> column for the grantee to <code>NO</code>. If, after this update, both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column are <code>NO</code> for the grantee, then the procedure removes the grantee from the view.</td>
</tr>
<tr>
<td></td>
<td>If no row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure does not update the view and does not raise an error.</td>
</tr>
</tbody>
</table>

The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- Using DEBUG_EXTPROC
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of DEBUG_EXTPROC Subprograms
Using DEBUG_EXTPROC

- Security Model
- Operational Notes
- Rules and Limits
Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.
Operational Notes

To install the package, run the script DBGEXTP.SQL.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package DEBUG_EXTPROC:
  ```sql
  SELECT SUBSTR(OBJECT_NAME, 1, 20)
  FROM USER_OBJECTS
  WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
  ```
- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

Note: These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
- Execute procedure DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT to startup the extproc agent in this session; for example, execute DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb).

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.
Rules and Limits

Note: DEBUG_EXTPROC works only on platforms with debuggers that can attach to a running process.
### Summary of DEBUG_EXTPROC Subprograms

**Table 206–1  DEBUG_EXTPROC Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARTUP_EXTPROC_AGENT Procedure</td>
<td>Starts up the extproc agent process in the session</td>
</tr>
</tbody>
</table>
STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```
The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, `<A>`.

**See Also:** For more information about implementation of this package:
- *Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User’s Guide for mod_plsql*

This chapter contains the following topics:
- **Using HTF**
  - Deprecated Subprograms
  - Operational Notes
  - Rules and Limits
  - Examples
- **Summary of Tags**
- **Summary of HTF Subprograms**
Using HTF

- Deprecated Subprograms
- Operational Notes
- Rules and Limits
- Examples
Deprecation Subprograms

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprogram is deprecated with Oracle Database 10g:

- **ESCAPE_URL Function**
For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF PRINT function. It then prints its parameters to the generated Web page.
Rules and Limits

If you use values of the LONG datatype in functions such as HTF.PRINT, HTF.PRN, HTF.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the function.
The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.P (HTF.HTMLOPEN); -- generates <HTML>
    HTP.P (HTF.HEADOPEN); -- generates <HEAD>
    HTP.P (HTF.TITLE('Hello')) ; -- generates <TITLE>Hello</TITLE>
    HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
    HTP.P (HTF.BODYOPEN); -- generates <BODY>
    HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
    HTP.P (HTF.BODYCLOSE); -- generates </BODY>
    HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```
Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Function, HTMLCLOSE Function - generate <HTML> and </HTML>
HEADOPEN Function, HEADCLOSE Function - generate <HEAD> and </HEAD>
BODYOPEN Function, BODYCLOSE Function - generate <BODY> and </BODY>

</tr>
<tr>
<td>BODYOPEN Function on page 207-29</td>
<td>Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document</td>
</tr>
<tr>
<td>BOLD Function on page 207-30</td>
<td>Generates the <code>&lt;B&gt;</code> and <code>&lt;/B&gt;</code> tags which direct the browser to display the text in boldface</td>
</tr>
<tr>
<td>BR Function on page 207-31</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>CENTER Function on page 207-32</td>
<td>Generates the <code>&lt;CENTER&gt;</code> and <code>&lt;/CENTER&gt;</code> tags which center a section of text within a Web page</td>
</tr>
<tr>
<td>CENTERCLOSE Function on page 207-33</td>
<td>Generates the <code>&lt;/CENTER&gt;</code> tag which marks the end of a section of text to center</td>
</tr>
<tr>
<td>CENTEROPEN Function on page 207-34</td>
<td>Generates the <code>&lt;CENTER&gt;</code> tag which mark the beginning of a section of text to center</td>
</tr>
<tr>
<td>CITE Function on page 207-35</td>
<td>Generates the <code>&lt;CITE&gt;</code> and <code>&lt;/CITE&gt;</code> tags which direct the browser to render the text as a citation</td>
</tr>
<tr>
<td>CODE Function on page 207-36</td>
<td>Generates the <code>&lt;CODE&gt;</code> and <code>&lt;/CODE&gt;</code> tags which direct the browser to render the text in monospace font or however &quot;code&quot; is defined stylistically</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>COMMENT Function on page 207-37</td>
<td>Generates the comment tags &lt;!-- ctext --&gt;</td>
</tr>
<tr>
<td>DFN Function on page 207-38</td>
<td>Generates the &lt;DFN&gt; and &lt;/DFN&gt; tags which direct the browser to mark the text as italics or however “definition” is defined stylistically</td>
</tr>
<tr>
<td>DIRLISTCLOSE Function on page 207-39</td>
<td>Generates the &lt;/DIR&gt; tag which ends a directory list section</td>
</tr>
<tr>
<td>DIRLISTOPEN Function on page 207-40</td>
<td>Generates the &lt;DIR&gt; which starts a directory list section</td>
</tr>
<tr>
<td>DIV Function on page 207-41</td>
<td>Generates the &lt;DIV&gt; tag which creates document divisions</td>
</tr>
<tr>
<td>DLISTCLOSE Function on page 207-42</td>
<td>Generates the &lt;/DL&gt; tag which ends a definition list</td>
</tr>
<tr>
<td>DLISTDEF Function on page 207-43</td>
<td>Generates the &lt;DD&gt; tag, which inserts definitions of terms</td>
</tr>
<tr>
<td>DLISTOPEN Function on page 207-44</td>
<td>Generates the &lt;DL&gt; tag which starts a definition list</td>
</tr>
<tr>
<td>DLISTTERM Function on page 207-45</td>
<td>Generates the &lt;DT&gt; tag which defines a term in a definition list</td>
</tr>
<tr>
<td>EM Function on page 207-46</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>EMPHASIS Function on page 207-47</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>ESCAPE_SC Function on page 207-48</td>
<td>Replaces characters that have special meaning in HTML with their escape sequences</td>
</tr>
<tr>
<td>ESCAPE_URL Function on page 207-49</td>
<td>Replaces characters that have special meaning in HTML and HTTP with their escape sequences</td>
</tr>
<tr>
<td>FONTCLOSE Function on page 207-51</td>
<td>Generates the &lt;/FONT&gt; tag which marks the end of a section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FONTOPEN Function on page 207-51</td>
<td>Generates the &lt;FONT&gt; tag which marks the beginning of section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FORMAT_CELL Function on page 207-52</td>
<td>formats column values inside an HTML table using the TABLEDATA Function</td>
</tr>
<tr>
<td>FORMCHECKBOX Function on page 207-53</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;checkbox&quot; which inserts a checkbox element in a form</td>
</tr>
<tr>
<td>FORMCLOSE Function on page 207-54</td>
<td>Generates the &lt;/FORM&gt; tag which marks the end of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMFILE Function on page 207-55</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;file&quot; which inserts a file form element, and is used for file uploading for a given page</td>
</tr>
<tr>
<td>FORMHIDDEN Function on page 207-56</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;hidden&quot; which inserts a hidden form element</td>
</tr>
<tr>
<td>FORMIMAGE Function on page 207-57</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;image&quot; which creates an image field that the user clicks to submit the form immediately</td>
</tr>
<tr>
<td>FORMOPEN Function on page 207-58</td>
<td>Generates the &lt;FORM&gt; tag which marks the beginning of a form section in an HTML document</td>
</tr>
</tbody>
</table>
### Table 207–1 (Cont.) HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMPASSWORD Function on page 207-59</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;password&quot; which creates a single-line text entry field</td>
</tr>
<tr>
<td>FORMRADIO Function on page 207-60</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;radio&quot;, which creates a radio button on the HTML form</td>
</tr>
<tr>
<td>FORMRESET Function on page 207-61</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;reset&quot; which creates a button that, when selected, resets the form fields to their initial values</td>
</tr>
<tr>
<td>FORMSELECTCLOSE Function on page 207-62</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the end of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPEN Function on page 207-63</td>
<td>Generates the <code>&lt;SELECT&gt;</code> tag which marks the beginning of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPTION Function on page 207-64</td>
<td>Generates the <code>&lt;OPTION&gt;</code> tag which represents one choice in a Select element</td>
</tr>
<tr>
<td>FORMSUBMIT Function on page 207-65</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;submit&quot; which creates a button that, when clicked, submits the form</td>
</tr>
<tr>
<td>FORMTEXT Function on page 207-66</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with TYPE=&quot;text&quot;, which creates a field for a single line of text</td>
</tr>
<tr>
<td>FORMTEXTAREA Function on page 207-67</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area</td>
</tr>
<tr>
<td>FORMTEXTAREA2 Function on page 207-68</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FORMTEXTAREACLOSE Function on page 207-69</td>
<td>Generates the <code>&lt;/TEXTAREA&gt;</code> tag which ends a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOPEN Function on page 207-70</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOPEN2 Function on page 207-71</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FRAME Function on page 207-72</td>
<td>Generates the <code>&lt;FRAME&gt;</code> tag which defines the characteristics of a frame created by a <code>&lt;FRAMESET&gt;</code> tag</td>
</tr>
<tr>
<td>FRAMESETCLOSE Function on page 207-73</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which ends a frameset section</td>
</tr>
<tr>
<td>FRAMESETOPEN Function on page 207-74</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which begins a frameset section</td>
</tr>
<tr>
<td>HEADCLOSE Function on page 207-75</td>
<td>Generates the <code>&lt;/HEAD&gt;</code> tag which marks the end of an HTML document head section</td>
</tr>
<tr>
<td>HEADER Function on page 207-76</td>
<td>Generates opening heading tags (&lt;H1&gt; to &lt;H6&gt;) and their corresponding closing tags (&lt;H1&gt; to &lt;/H6&gt;)</td>
</tr>
<tr>
<td>HEADOPEN Function on page 207-77</td>
<td>Generates the <code>&lt;HEAD&gt;</code> tag which marks the beginning of the HTML document head section</td>
</tr>
<tr>
<td>HR Function on page 207-78</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>HTMLCLOSE Function on page 207-80</td>
<td>Generates the <code>&lt;/HTML&gt;</code> tag which marks the end of an HTML document</td>
</tr>
<tr>
<td>HTMLOPEN Function on page 207-80</td>
<td>Generates the <code>&lt;HTML&gt;</code> tag which marks the beginning of an HTML document</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IMG Function on page 207-81</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page</td>
</tr>
<tr>
<td>IMG2 Function on page 207-82</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute</td>
</tr>
<tr>
<td>ISINDEX Function on page 207-83</td>
<td>Creates a single entry field with a prompting text, such as &quot;enter value,&quot; then sends that value to the URL of the page or program</td>
</tr>
<tr>
<td>ITALIC Function on page 207-84</td>
<td>Generates the <code>&lt;I&gt;</code> and <code>&lt;I&gt;</code> tags which direct the browser to render the text in italics</td>
</tr>
<tr>
<td>KBD Function on page 207-85</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;KBD&gt;</code> tags which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>KEYBOARD Function on page 207-86</td>
<td>Generates the <code>&lt;KBD&gt;</code> and <code>&lt;KBD&gt;</code> tags, which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>LINE Function on page 207-87</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>LINKREL Function on page 207-88</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the <code>REL</code> attribute which delineates the relationship described by the hypertext link from the anchor to the target</td>
</tr>
<tr>
<td>LINKREV Function on page 207-89</td>
<td>Generates the <code>&lt;LINK&gt;</code> tag with the <code>REV</code> attribute which delineates the relationship described by the hypertext link from the target to the anchor</td>
</tr>
<tr>
<td>LISTHEADER Function on page 207-90</td>
<td>Generates the <code>&lt;LH&gt;</code> and <code>&lt;LH&gt;</code> tags which print an HTML tag at the beginning of the list</td>
</tr>
<tr>
<td>LISTINGCLOSE Function on page 207-91</td>
<td>Generates the <code>&lt;/LISTING&gt;</code> tags which marks the end of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTINGOPEN Function on page 207-92</td>
<td>Generates the <code>&lt;LISTING&gt;</code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTITEM Function on page 207-93</td>
<td>Generates the <code>&lt;LI&gt;</code> tag, which indicates a list item</td>
</tr>
<tr>
<td>MAILTO Function on page 207-94</td>
<td>Generates the <code>&lt;A&gt;</code> tag with the <code>HREF</code> set to ‘mailto’ prepended to the mail address argument</td>
</tr>
<tr>
<td>MAPCLOSE Function on page 207-95</td>
<td>Generates the <code>&lt;/MAP&gt;</code> tag which marks the end of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MAPOPEN Function on page 207-96</td>
<td>Generates the <code>&lt;MAP&gt;</code> tag which mark the beginning of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MENULISTCLOSE Function on page 207-97</td>
<td>Generates the <code>&lt;/MENU&gt;</code> tag which ends a list that presents one line for each item</td>
</tr>
<tr>
<td>MENULISTOPEN Function on page 207-98</td>
<td>Generates the <code>&lt;/MENU&gt;</code> tag which begins a list that presents one line for each item</td>
</tr>
<tr>
<td>META Function on page 207-99</td>
<td>Generates the <code>&lt;META&gt;</code> tag, which embeds meta-information about the document and also specifies values for HTTP headers</td>
</tr>
<tr>
<td>NL Function on page 207-87</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>NOBR Function on page 207-101</td>
<td>Generates the <code>&lt;NOBR&gt;</code> and <code>&lt;NOBR&gt;</code> tags which turn off line-breaking in a section of text</td>
</tr>
<tr>
<td>NOFRAMESCLOSE Function on page 207-102</td>
<td>Generates the <code>&lt;/NOFRAMES&gt;</code> tag which marks the end of a no-frames section</td>
</tr>
</tbody>
</table>
### Summary of HTF Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOFRAMESOPEN Function</td>
<td>Generates the <code>&lt;NOFRAMES&gt;</code> tag which marks the beginning of a no-frames section</td>
</tr>
<tr>
<td>OLISTCLOSE Function</td>
<td>Generates the <code>&lt;/OL&gt;</code> tag which defines the end of an ordered list</td>
</tr>
<tr>
<td>OLISTOPEN Function</td>
<td>Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list</td>
</tr>
<tr>
<td>PARA Function</td>
<td>Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph</td>
</tr>
<tr>
<td>PARAGRAPH Function</td>
<td>Adds attributes to the <code>&lt;P&gt;</code> tag</td>
</tr>
<tr>
<td>PARAM Function</td>
<td>Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets</td>
</tr>
<tr>
<td>PLAINTEXT Function</td>
<td>Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type</td>
</tr>
<tr>
<td>PRECLOSE Function</td>
<td>Generates the <code>&lt;/PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PREOPEN Function</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PRINT Functions</td>
<td>Generates the specified parameter as a string terminated with the \n newline character</td>
</tr>
<tr>
<td>PRN Functions</td>
<td>Generates the specified parameter as a string</td>
</tr>
<tr>
<td>S Function</td>
<td>Generates the <code>&lt;S&gt;</code> and <code>&lt;/S&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>SAMPLE Function</td>
<td>Generates the <code>&lt;SAMP&gt;</code> and <code>&lt;/SAMP&gt;</code> tags which direct the browser to render the text they surround in monospace font or however &quot;sample&quot; is defined stylistically</td>
</tr>
<tr>
<td>SCRIPT Function</td>
<td>Generates the <code>&lt;SCRIPT&gt;</code> and <code>&lt;/SCRIPT&gt;</code> tags which contain a script written in languages such as JavaScript and VBscript</td>
</tr>
<tr>
<td>SMALL Function</td>
<td>Generates the <code>&lt;SMALL&gt;</code> and <code>&lt;/SMALL&gt;</code> tags, which direct the browser to render the text they surround using a small font</td>
</tr>
<tr>
<td>STRIKE Function</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>STRONG Function</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however &quot;strong&quot; is defined stylistically</td>
</tr>
<tr>
<td>STYLE Function</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
<tr>
<td>SUB Function</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Function</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
<tr>
<td>TABLECAPTION Function</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLECLOSE Function</td>
<td>Generates the <code>&lt;/TABLE&gt;</code> tag which marks the end of an HTML table</td>
</tr>
</tbody>
</table>
Table 207–1  (Cont.)  HTF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLEDATA Function</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Function</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table.</td>
</tr>
<tr>
<td>TABLEOPEN Function</td>
<td>Generates the <code>&lt;TABLE&gt;</code> tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Function</td>
<td>Generates the <code>&lt;/TR&gt;</code> tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Function</td>
<td>Generates the <code>&lt;TR&gt;</code> tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYPE Function</td>
<td>Generates the <code>&lt;TT&gt;</code> and <code>&lt;/TT&gt;</code> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Function</td>
<td>Generates the <code>&lt;TITLE&gt;</code> and <code>&lt;/TITLE&gt;</code> tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Function</td>
<td>Generates the <code>&lt;/UL&gt;</code> tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Function</td>
<td>Generates the <code>&lt;UL&gt;</code> tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Function</td>
<td>Generates the <code>&lt;U&gt;</code> and <code>&lt;/U&gt;</code> tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Function</td>
<td>Generates the <code>&lt;VAR&gt;</code> and <code>&lt;/VAR&gt;</code> tags which direct the browser to render the text they surround in italics or however &quot;variable&quot; is defined stylistically.</td>
</tr>
<tr>
<td>WBR Function</td>
<td>Generates the <code>&lt;WBR&gt;</code> tag, which inserts a soft line break within a section of <code>NOBR</code> text</td>
</tr>
</tbody>
</table>
ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```sql
HTF.ADDRESS ( 
    cvalue IN VARCHAR2, 
    cnowrap IN VARCHAR2 DEFAULT NULL, 
    cclear IN VARCHAR2 DEFAULT NULL, 
    cattributes IN VARCHAR2 DEFAULT NULL) 
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the &lt;ADDRESS&gt; and &lt;/ADDRESS&gt; tags.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```
ANCHOR Function

This function and the ANCHOR2 Function functions generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR Function provides a target and therefore can be used for a frame.

Syntax

```sql
HTF.ANCHOR (
    curl IN VARCHAR2,
    ctext IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<A HREF='curl' NAME='cname' cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.
ANCHOR2 Function

This function and the ANCHOR Function generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (  
curl IN VARCHAR2,  
ctext IN VARCHAR2,  
cname IN VARCHAR2 DEFAULT NULL,  
ctarget in varchar2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```
APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag. You must first invoke the a Java applet using APPLETOPEN Function on page 207-20

Syntax

HTF.APPLETCLOSE
RETURN VARCHAR2;
APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Function on page 207-19 which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (  
  ccode IN VARCHAR2,  
  cheight IN NUMBER,  
  cwidth IN NUMBER,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function on page 207-108.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.
AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
    ccoords IN VARCHAR2,
    cshape IN VARCHAR2 DEFAULT NULL,
    chref IN VARCHAR2 DEFAULT NULL,
    cnohref IN VARCHAR2 DEFAULT NULL,
    ctarget IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The value for the COORDS attribute.</td>
</tr>
<tr>
<td>cshape</td>
<td>The value for the SHAPE attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```
**BASE Function**

This function generates the `<BASE>` tag which records the URL of the document.

**Syntax**

```
HTF.BASE (  
  ctarget IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<Base HREF="<current URL>" TARGET="ctarget" cattributes>
```
BASEFONT Function

This function generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

Syntax

```sql
HTF.BASEFONT ( nsize IN INTEGER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<Basefont size="nsize">
```
BGSOUND Function

This function generates the `<BGSOUND>` tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND ( 
    csrc IN VARCHAR2, 
    cloop IN VARCHAR2 DEFAULT NULL, 
    cattributes IN VARCHAR2 DEFAULT NULL) 
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```
**BIG Function**

This function generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

**Syntax**

```
HTF.BIG (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<BIG cattributes>ctext</BIG>
```
BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```
HTF.BLOCKQUOTECLOSE
RETURN VARCHAR2;
```

Examples

This function generates

</BLOCKQUOTE>
BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (  
    cnwrap IN VARCHAR2 DEFAULT NULL,  
    cclear IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnwrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```
BODYCLOSE Function

This function generates the </BODY> tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```sql
HTP.BODYCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

```html
</BODY>
```
BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

HTF.BODYOPEN (  
    cbackground  IN VARCHAR2 DEFAULT NULL,  
    cattributes  IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<BODY background="cbackground" cattributes>
```

so that

```sql
HTF.BODYOPEN('/img/background.gif')
  RETURN VARCHAR2;
```

generates:

```html
<BODY background="/img/background.gif">
```
BOLD Function

This function generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (  
  ctext     IN      VARCHAR2, 
  cattributes IN      VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<B cattributes>ctext</B>
```
BR Function

This function generates the \(<BR>\) tag which begins a new line of text. It performs the same operation as the NL Function.

Syntax

```
HTF.BR(
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

\(<BR \text{ CLEAR='cclear' cattributes}>\)
CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```sql
HTF.CENTER (ctext IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CENTER>ctext</CENTER>
```
CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the CENTEROPEN Function.

Syntax

```
HTF.CENTERCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

</CENTER>
**CENTEROPEN Function**

This function generates the `<CENTER>` tag which mark the beginning of a section of text to center. You mark the beginning of a section of text to center by means of the CENTERCLOSE Function.

**Syntax**

```
HTP.CENTEROPEN
     RETURN VARCHAR2;
```

**Examples**

This function generates

```
<CENTER>
```
CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```
CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

`<CODE cattributes>ctext</CODE>`
COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (  
    ctext IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples

This function generates

`<!-- ctext -->`
DFN Function

This function generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (ctext IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<DFN>ctext</DFN>
```
DIRLISTCLOSE Function

This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DILOGHTFOPEN Function.

Syntax

HTF.DIRLISTCLOSE
RETURN VARCHAR2;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

</DIR>
DIRLISTOPEN Function

This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```sql
HTP.DIRLISTOPEN
    RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the LISTITEM Function so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
<DIR>
```
DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```sql
HTF.DIV(
    calign  IN VARCHAR2 DEFAULT NULL,
    cattributes  IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<DIV ALIGN="calign" cattributes>
```
DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTP.DLISTCLOSE
RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

</DL>
DLISTDEF Function

This function generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

**Syntax**

```
HTF.DLISTDEF (
  ctext IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```
DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTP.DLISTOPEN (cclear IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```
**DLISTTERM Function**

This function generates the `<DT>` tag which defines a term in a definition list `<DL>`.

**Syntax**

```
HTF.DLISTTERM {
  ctext     IN    VARCHAR2 DEFAULT NULL,
  cclear    IN    VARCHAR2 DEFAULT NULL,
  cattributes IN  VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```
EM Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EMPHASIS Function.

Syntax

```sql
HTP.EM(
    ctext    IN    VARCHAR2,
    cattributes  IN    VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<EM cattributes>ctext</EM>
```
EMPHASIS Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EM Function.

Syntax

HTF.EMPHASIS(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<EM cattributes>ctext</EM>
```
ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This function performs the same operation as HTP. PRINTS Procedure and HTP. PS Procedure.

Syntax

```
HTF.ESCAPE_SC(
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>
ESCAPE_URL Function

**Note:** This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the ESCAPE Function in the UTL_URL package.

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- & to `&amp;`
- " to `&quot;`
- < to `&lt;`
- > to `&gt;`
- % to `&25`

**Syntax**

```
HTF.ESCAPE_URL(
    p_url IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_url</td>
<td>The string to convert.</td>
</tr>
</tbody>
</table>
**FONTCLOSE Function**

This function generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the **FONTOPEN Function**.

**Syntax**

```
HTP.FONTCLOSE
    RETURN VARCHAR2;
```

**Examples**

This function generates

`<FONT>`
FONTOPEN Function

This function generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```
HTF.FONTOPEN(
  ccolor IN VARCHAR2 DEFAULT NULL,
  cface IN VARCHAR2 DEFAULT NULL,
  csize IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
    columnValue IN VARCHAR2,
    format_numbers IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnValue</td>
<td>The value that needs to be formatted in an HTML table.</td>
</tr>
<tr>
<td>format_numbers</td>
<td>The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TD >columnValue</TD>
```
FORMCHECKBOX Function

This function generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

**Syntax**

```
HTF.FORMCHECKBOX(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT 'ON',
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>CHECKED</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```sql
HTF.FORMCLOSE
   RETURN VARCHAR2;
```

Examples

This function generates

</FORM>
FORMFILE Function

This function generates the `<INPUT>` tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
    cname IN VARCHAR2,
    caccept IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>caccept</td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```
FORMHIDDEN Function

This function generates the `<INPUT>` tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```
FORMIMAGE Function

This function generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTF.FORMIMAGE(
    cname IN VARCHAR2,
    csrc IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the <code>SRC</code> attribute that specifies the image file.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```
FORMOPEN Function

This function generates the `<FORM>` tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```sql
HTF.FORMOPEN(
    curl IN VARCHAR2,
    cmethod IN VARCHAR2 DEFAULT 'POST',
    ctarget IN VARCHAR2 DEFAULT NULL,
    cenctype IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cenctype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```
FORMPASSWORD Function

This function generates the `<INPUT>` tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```sql
HTF.FORMPASSWORD(
    cname IN VARCHAR2,
    csize IN VARCHAR2,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue" cattributes>
```
FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2,
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>CHECKED</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(
    cvalue IN VARCHAR2 DEFAULT 'Reset',
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<input type="reset" value="cvalue" cattributes>
```
FORMSELECTCLOSE Function

This function generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function. The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTP.FORMSELECTCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.
FORMSELECTOPEN Function

This function generates the `<SELECT>` tags which begins a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function. The values are inserted using FORMSELECTOPTION Function.

Syntax

```plaintext
HTF.FORMSELECTOPEN(
    cname IN VARCHAR2,
    cprompt IN VARCHAR2 DEFAULT NULL,
    nsize IN INTEGER DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```plaintext
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes> 
</SELECT>
```

so that

```plaintext
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
(SELECT NAME="greatest_player">
 <OPTION>Messier
 <OPTION>Howe
 <OPTION>Gretzky
</SELECT>
```
FORMSELECTOPTION Function

This function generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
  cvalue IN VARCHAR2,
  cselected IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The text for the option.</td>
</tr>
<tr>
<td>cvalue</td>
<td>If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<option selected cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Function.
FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```sql
HTF.FORMSUBMIT(
    cname IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT 'Submit',
    cattributes IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
&lt;INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes&gt;
```
FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```sql
HTP.FORMTEXT(
    cname IN VARCHAR2,
    csize IN VARCHAR2 DEFAULT NULL,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the <code>MAXLENGTH</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue" cattributes>
```
FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Function which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```
FORMTEXTAREA2 Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```sql
HTF.FORMTEXTAREA2 (    name IN VARCHAR2,
    nRows IN INTEGER,
    nColumns IN INTEGER,
    alignment IN VARCHAR2 DEFAULT NULL,
    wrap IN VARCHAR2 DEFAULT NULL,
    attributes IN VARCHAR2 DEFAULT NULL)    RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>nRows</code></td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>nColumns</code></td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>alignment</code></td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td><code>wrap</code></td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td><code>attributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TEXTAREA NAME="name" ROWS="nRows" COLS="nColumns" ALIGN="alignment" WRAP="wrap" attributes>
</TEXTAREA>
```
FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

HTF.FORMTEXTAREACLOSE
    RETURN VARCHAR2;

Examples

This function generates

</TEXTAREA>
FORMTEXTAREAOPEN Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```sql
HTF.FORMTEXTAREAOPEN2(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap" cattributes>
```

FRAME Function

This function generates the `<FRAME>` tag which begins the characteristics of a frame created by a `<FRAMESET>` tag.

Syntax

```
HTP.FRAME(
    csrc IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cmarginwidth IN VARCHAR2 DEFAULT NULL,
    cmarginheight IN VARCHAR2 DEFAULT NULL,
    cscrolling IN VARCHAR2 DEFAULT NULL,
    cnoresize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cmarginwidth</td>
<td>The value for the MARGINWIDTH attribute.</td>
</tr>
<tr>
<td>cscrolling</td>
<td>The value for the SCROLLING attribute.</td>
</tr>
<tr>
<td>cnoresize</td>
<td>If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```
FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```
FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```
HTP.FRAMESETOPEN(
    crows IN VARCHAR2 DEFAULT NULL,
    ccols IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```
HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```sql
HTF.HEADCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```html
</HEAD>
```
HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```sql
HTF.HEADER(
    nsize IN INTEGER,
    cheader IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The the heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>The value for the NOWRAP attribute.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

```sql
HTF.header (1, 'Overview')
RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```
HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
    RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```
HR Function

This function generates the `<HR>` tag, which generates a line in the HTML document. This subprogram performs the same operation as the LINE Function.

Syntax

```sql
HTP.HR(
    cclear IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<HR CLEAR='cclear' SRC='csrc' cattributes>
```
HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```sql
HTF.HTMLCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```html
</HTML>
```
HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Function to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```
IMG Function

This function generates the `<IMG>` tag which directs the browser to load an image onto the HTML page. The IMG2 Function performs the same operation but additionally uses the cusemap parameter.

Syntax

```sql
HTF.IMG(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 207–50  IMG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```
**IMG2 Function**

This function generates the `<IMG>` tag, which directs the browser to load an image onto the HTML page. The **IMG Function** performs the same operation but does not use the `cusemap` parameter.

**Syntax**

```sql
HTF.IMG2 (curl IN VARCHAR2 DEFAULT NULL,
calign IN VARCHAR2 DEFAULT NULL,
calt IN VARCHAR2 DEFAULT NULL,
cismap IN VARCHAR2 DEFAULT NULL,
cusemap IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cusemap</td>
<td>The value for the USEMAP attribute which specifies a client-side imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```
ISINDEX Function

This function creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```sql
HTF.ISINDEX(
    cprompt IN VARCHAR2 DEFAULT NULL,
    curl IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<ISINDEX PROMPT="cprompt" HREF="curl">`
ITALIC Function

This function generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ctext</code></td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<I cattributes>ctext</I>
```
KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```sql
HTF.KBD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

*Table 207–54  KBD Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```
KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Function.

Syntax

```sql
HTP.KEYBOARD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<KBD cattributes>ctext</KBD>
```
LINE Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
  cclear IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<HR CLEAR="cclear" SRC="csrc" cattributes>
```
LINKREL Function

This function generates the `<LINK>` tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREL(
  crel IN VARCHAR2,
  curl IN VARCHAR2,
  ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the REL attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the URL attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the TITLE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```
**LINKREV Function**

This function generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

**Syntax**

```
HTF.LINKREV(
    crev IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crev</td>
<td>The value for the <code>REV</code> attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the <code>URL</code> attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the <code>TITLE</code> attribute.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<Link rev='crev' href='curl' title='ctitle'>
```
LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```sql
HTF.LISTHEADER(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code></td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<LH cattributes>ctext</LH>
```
LISTINGCLOSE Function

This function generates the <LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

HTF.LISTINGCLOSE
RETURN VARCHAR2;

Examples

This function generates

</LISTING>
LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```sql
HTF.LISTINGOPEN
RETURN VARCHAR2;
```

Examples

This function generates

```html
<Listing>
```
LISTITEM Function

This function generates the `<LI>` tag, which indicates a list item.

Syntax

```sql
HTF.LISTITEM(
    ctext IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cdingbat IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```
MAILTO Function

This function generates the `<A>` tag with the `HREF` set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
    caddress  IN VARCHAR2,
    ctext     IN VARCHAR2,
    cname     IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```
MAPCLOSE Function

This function generates the \texttt{</MAP>} tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

\footnotesize
\begin{verbatim}
HTF.MAPCLOSE
  RETURN VARCHAR2;
\end{verbatim}

Examples

This function generates

\texttt{</MAP>\textbackslash n}
MAPOPEN Function

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```sql
HTP.MAPOPEN(
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<MAP NAME="cname" cattributes>
```
MENULISTCLOSE Function

This function generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

</MENU>
MENULISTOPEN Function

This function generates the `<MENU>` tag which begins a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```
META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```sql
HTF.META(
    chttp_equiv IN VARCHAR2,
    cname IN VARCHAR2,
    ccontent IN VARCHAR2
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the CHTTP_EQUIV attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the CONTENT attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```sql
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT="120">
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.
NL Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the BR Function.

Syntax

```
HTP.NL( cclear IN VARCHAR2 DEFAULT NULL, cattributes IN VARCHAR2 DEFAULT NULL) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<BR CLEAR='cclear' cattributes>
```
NOBR Function

This function generates the `<NOBR> and </NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
  ctext        IN        VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<NOBR>ctext</NOBR>
```
NOFRAMESCLOSE Function

This function generates the `<NOFRAMES>` tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTP.NOFramesClose
RETURN VARCHAR2;
```

Examples

This function generates

`</NOFRAMES>`
NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESOPEN
    RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```
OLISTCLOSE Function

This function generates the </ol> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTP.OLISTCLOSE
RETURN VARCHAR2;
```

Examples

This function generates

```
</ol>
```
**OLISTOPEN Function**

This function generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the **OLISTCLOSE Function**. Numbered items are added using **LISTITEM Function**.

**Syntax**

```sql
HTF.OLISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```
PARA Function

This function generates the <p> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Function.

Syntax

```
HTF.PARA
    RETURN VARCHAR2;
```

Examples

This function generates

<p>
PARAGRAPHS Function

You can use this function to add attributes to the <p> tag created by the PARA Function.

Syntax

```sql
HTF.PARAGRAPH(
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<p ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```
PARAM Function

This function generates the `<PARAM>` tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use `APPLETOPEN Function` to begin the invocation. Use one `PARAM Function` for each desired name-value pair, and use `APPLETCLOSE Function` to end the applet invocation.

Syntax

```sql
HTF.PARAM(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<PARAM NAME=cname VALUE='cvalue'>
```
PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT (  
  ctext IN VARCHAR2,  
  cattributes IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

**Table 207-69  PLAINTEXT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```
**PRECLOSE Function**

This function generates the `<PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the `PREOPEN Function`.

**Syntax**

```
HTF.PRECLOSE
    RETURN VARCHAR2;
```

**Examples**

This function generates

`</PRE>`
PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```
HTF.PREOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwidth IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```
PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

 HTF.PRINT (  
  cbuf      IN       VARCHAR2)  
  RETURN VARCHAR2;

 HTF.PRINT (  
  dbuf      IN       DATE)  
  RETURN VARCHAR2;

 HTF.PRINT (  
  nbuf      IN       NUMBER)  
  RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.
PRN Functions

These functions generate the specified parameter as a string. Unlike the PRINT Functions, the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (        
cbuf      IN VARCHAR2)
RETURN VARCHAR2;

HTF.PRN (        
dbuf      IN DATE)
RETURN VARCHAR2;

HTF.PRN (        
nbuf      IN NUMBER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
</tbody>
</table>

Usage Notes

These functions do not have function equivalents.
This function generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as `STRIKE` Function.

**Syntax**

```sql
HTF.S (  
  ctext         IN VARCHAR2,  
  cattributes   IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```sql
<S cattributes>ctext</S>
```
SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (  
  ctext  IN  VARCHAR2,  
  cattributes  IN  VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```
This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (  
cscript  IN   VARCHAR2,  
clanguage IN  VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```html
<SCRIPT LANGUAGE=Javascript>'script text here'</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.
**SMALL Function**

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

**Syntax**

```sql
HTF.SMALL ( ctext IN VARCHAR2, cattributes IN VARCHAR2 DEFAULT NULL) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag,</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```
<SMALL cattributes>ctext</SMALL>
```
STRIKE Function

This function generates the `<STRIKE>` and `<\/STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Function.

Syntax

```
STRIKE (  
    ctext     IN      VARCHAR2,  
    cattributes IN   VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```
**STRONG Function**

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

**Syntax**

```sql
HTF.STRONG(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<STRONG cattributes>ctext</STRONG>
```
**STYLE Function**

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page. You can get more information about style sheets at [http://www.w3.org](http://www.w3.org). This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```sql
HTP.STYLE(
    cstyle IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The the style information to include.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<STYLE>cstyle</STYLE>
```
**SUB Function**

This function generates the `<SUB>` and `<SUB>` tags which direct the browser to render the text they surround as subscript.

**Syntax**

```sql
HTF.SUB(
    ctext IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This function generates

```html
<SUB ALIGN='calign' cattributes>ctext</SUB>
```
SUP Function

This function generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

### Syntax

```
HTF.SUP(
  ctext IN VARCHAR2,
  calign in VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

### Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```
TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(
    caption IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<CAPTION ALIGN='calign' cattributes>ccaption</CAPTION>
```
TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Function on page 207-127.

Syntax

```sql
HTF.TABLECLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```html
</TABLE>
```
TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnwrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 207–83  TABLEDATA Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnwrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crowspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TD ALIGN='calign' DP='cdp' ROWSPAN='crowspan' COLSPAN='ccolspan' NOWRAP cattributes>cvalue</TD>
```
TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```sql
HTF.TABLEHEADER (    cvalue IN VARCHAR2 DEFAULT NULL,    calign IN VARCHAR2 DEFAULT NULL,    cdp IN VARCHAR2 DEFAULT NULL,    cnowrap IN VARCHAR2 DEFAULT NULL,    crowspan IN VARCHAR2 DEFAULT NULL,    ccolspan IN VARCHAR2 DEFAULT NULL,    cattributes IN VARCHAR2 DEFAULT NULL) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crowspan</td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes>cvalue</TH>
```
TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```sql
HTF.TABLEOPEN(
    cborder IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cnnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>border</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```
**TABLEROWCLOSE Function**

This function generates the `</TR>` tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the **TABLEROWOPEN Function**.

**Syntax**

```sql
HTP.TABLEROWCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```html
</TABLE>
```
TABLEROWOPEN Function

This function generates the `<TR>` tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```sql
HTF.TABLEROWOPEN(
    calign IN VARCHAR2 DEFAULT NULL,
    cvalign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the VALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```
TELETYPE Function

This function generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<TT cattributes>ctext</TT>
```
TITLE Function

This function generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

Syntax

```sql
HTF.TITLE(
    ctitle IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<TITLE>ctitle</TITLE>
```
ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

```sql
HTF.ULISTCLOSE
    RETURN VARCHAR2;
```

Examples

This function generates

```html</ul>```
ULISTOPEN Function

This function generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cdingbat IN VARCHAR2 DEFAULT NULL,
    csrc IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```
UNDERLINE Function

This function generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```sql
HTF.UNDERLINE(
  ctext IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<U cattributes>ctext</U>
```
VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```sql
HTF.VARIABLE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This function generates

```html
<VAR cattributes>ctext</VAR>
```
WBR Function

This function generates the `<WBR>` tag, which inserts a soft line break within a section of `NOBR` text.

Syntax

```
HTF.WBR
    RETURN VARCHAR2;
```

Examples

This function generates

`<WBR>`
The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, `<A>`. 

**See Also:** For more information about implementation of this package:

Using HTP

- Operational Notes
- Rules and Limits
- Examples
Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is an ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.

- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP PRINT procedure. It then prints its parameters to the generated Web page.
Rules and Limits

If you use values of the LONG datatype in procedures such as HTP.PRINT, HTP.PRNT, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.
Examples

The following commands generate a simple HTML document:

CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN; -- generates <HTML>
    HTP.HEADOPEN; -- generates <HEAD>
    HTP.TITLE('Hello'); -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE; -- generates </HEAD>
    HTP.BODYOPEN; -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE; -- generates </BODY>
    HTP.HTMLCLOSE; -- generates </HTML>
END;
Summary of Tags

**HTML, HEAD, and BODY Tags**

- **HTMLOPEN** Procedure, **HTMLCLOSE** Procedure - generate `<HTML>` and `</HTML>`
- **HEADOPEN** Procedure, **HEADCLOSE** Procedure - generate `<HEAD>` and `</HEAD>`
- **BODYOPEN** Procedure, **BODYCLOSE** Procedure - generate `<BODY>` and `</BODY>`

**Comment Tag**

- **COMMENT** Procedure - generates `<!--` and `-->`

**Tags in the <HEAD> Area**

- **BASE** Procedure - generates `<BASE>`
- **LINKREL** Procedure - generates `<LINK>` with the `REL` attribute
- **LINKREV** Procedure - generates `<LINK>` with the `REV` attribute
- **TITLE** Procedure - generates `<TITLE>`
- **META** Procedure - generates `<META>`
- **SCRIPT** Procedure - generates `<SCRIPT>`
- **STYLE** Procedure - generates `<STYLE>`
- **ISINDEX** Procedure - generates `<ISINDEX>`

**Applet Tags**

- **APPLETOPEN** Procedure, **APPLETCLOSE** Procedure - generate `<APPLET>` and `</APPLET>`
- **PARAM** Procedure - generates `<PARAM>`

**List Tags**

- **OLISTOPEN** Procedure, **OLISTCLOSE** Procedure - generate `<OL>` and `</OL>`
- **ULISTOPEN** Procedure, **ULISTCLOSE** Procedure - generate `<UL>` and `</UL>`
- **DLISTOPEN** Procedure, **DLISTCLOSE** Procedure - generate `<DL>` and `</DL>`
- **DLISTTERM** Procedure - generates `<DT>`
- **DLISTDEF** Procedure - generates `<DD>`
- **DIRLISTOPEN** Procedure, **DIRLISTCLOSE** Procedure - generate `<DIR>` and `</DIR>`
- **LISTHEADER** Procedure - generates `<LH>`
- **LISTINGOPEN** Procedure, **LISTINGCLOSE** Procedure - generate `<LISTING>` and `</LISTING>`
- **MENULISTOPEN** Procedure - generate `<MENU>` and `</MENU>`
- **LISTITEM** Procedure - generates `<LI>`

**Form Tags**

- **FORMOPEN** Procedure, **FORMCLOSE** Procedure - generate `<FORM>` and `</FORM>`
FORMCHECKBOX Procedure - generates `<INPUT TYPE="CHECKBOX">`
FORMHIDDEN Procedure - generates `<INPUT TYPE="HIDDEN">`
FORMIMAGE Procedure - generates `<INPUT TYPE="IMAGE">`
FORMPASSWORD Procedure - generates `<INPUT TYPE="PASSWORD">`
FORMRADIO Procedure - generates `<INPUT TYPE="RADIO">`
FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate `<SELECT>` and `</SELECT>`
FORMSELECTOPTION Procedure - generates `<OPTION>`
FORMTEXT Procedure - generates `<INPUT TYPE="TEXT">`
FORMTEXTAREA Procedure - generate `<TEXTAREA>`
FORMTEXTAREAOOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate `<TEXTAREA>` and `</TEXTAREA>`
FORMRESET Procedure - generates `<INPUT TYPE="RESET">`
FORMSUBMIT Procedure - generates `<INPUT TYPE="SUBMIT">`

Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate `<TABLE>` and `</TABLE>`
TABLECAPTION Procedure - generates `<CAPTION>`
TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate `<TR>` and `</TR>`
TABLEHEADER Procedure - generates `<TH>`
TABLEDATA Procedure - generates `<TD>`

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate `<HR>`
IMG Procedure, IMG2 Procedure - generate `<IMG>`
ANCHOR Procedure, ANCHOR2 Procedure - generate `<A>`
MAPOPEN Procedure, MAPCLOSE Procedure - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (`<H1>` to `<H6>`)
PARA Procedure, PARAGRAPH Procedure - generate `<P>`
PRN Procedures, PRINT Procedures - generate any text that is passed in
PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped
PREOPEN Procedure, PRECLOSE Procedure - generate `<PRE>` and `</PRE>`
BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`
DIV Procedure - generates `<DIV>`
NL Procedure, BR Procedure - generate `<BR>`
NOBR Procedure - generates <NOBR>
WBR Procedure - generates <WBR>
PLAINTEXT Procedure - generates <PLAINTEXT>
ADDRESS Procedure - generates <ADDRESS>
MAILTO Procedure - generates <A> with the MAILTO attribute
AREA Procedure - generates <AREA>
BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags
BASEFONT Procedure - generates <BASEFONT>
BIG Procedure - generates <BIG>
BOLD Procedure - generates <B>
CENTER Procedure - generates <CENTER> and </CENTER>
CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>
CITE Procedure - generates <CITE>
CODE Procedure - generates <CODE>
DFN Procedure - generates <DFN>
EM Procedure, EMPHASIS Procedure - generate <EM>
FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>
ITALIC Procedure - generates <I>
KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>
S Procedure - generates <S>
SAMPLE Procedure - generates <SAMP>
SMALL Procedure - generates <SMALL>
STRIKE Procedure - generates <STRIKE>
STRONG Procedure - generates <STRONG>
SUB Procedure - generates <SUB>
SUP Procedure - generates <SUP>
TELETYPE Procedure - generates <TT>
UNDERLINE Procedure - generates <U>
VARIABLE Procedure - generates <VAR>

Frame Tags
FRAME Procedure - generates <FRAME>
FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>
NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>
## Summary of HTP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDRESS Procedure on page 208-15</td>
<td>Generates the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags which specify the address, author and signature of a document</td>
</tr>
<tr>
<td>ANCHOR Procedure on page 208-16</td>
<td>Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>ANCHOR2 Procedure on page 208-17</td>
<td>Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link</td>
</tr>
<tr>
<td>APPLETCLOSE Procedure on page 208-18</td>
<td>Closes the applet invocation with the <code>&lt;/APPLET&gt;</code> tag</td>
</tr>
<tr>
<td>APPLETOPEN Procedure on page 208-19</td>
<td>Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet</td>
</tr>
<tr>
<td>AREA Procedure on page 208-20</td>
<td>Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map</td>
</tr>
<tr>
<td>BASE Procedure on page 208-21</td>
<td>Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document</td>
</tr>
<tr>
<td>BASEFONT Procedure on page 208-22</td>
<td>Generates the <code>&lt;BASEFONT&gt;</code> tag which specifies the base font size for a Web page</td>
</tr>
<tr>
<td>BGSOUND Procedure on page 208-23</td>
<td>Generates the <code>&lt;BGSOUND&gt;</code> tag which includes audio for a Web page</td>
</tr>
<tr>
<td>BIG Procedure on page 208-24</td>
<td>Generates the <code>&lt;BIG&gt;</code> and <code>&lt;/BIG&gt;</code> tags which direct the browser to render the text in a bigger font</td>
</tr>
<tr>
<td>BLOCKQUOTECLOSE Procedure on page 208-25</td>
<td>Generates the <code>&lt;/BLOCKQUOTE&gt;</code> tag which mark the end of a section of quoted text</td>
</tr>
<tr>
<td>BLOCKQUOTEOPEN Procedure on page 208-26</td>
<td>Generates the <code>&lt;BLOCKQUOTE&gt;</code> tag, which marks the beginning of a section of quoted text</td>
</tr>
<tr>
<td>BODYCLOSE Procedure on page 208-27</td>
<td>Generates the <code>&lt;/BODY&gt;</code> tag which marks the end of a body section of an HTML document</td>
</tr>
<tr>
<td>BODYOPEN Procedure on page 208-28</td>
<td>Generates the <code>&lt;BODY&gt;</code> tag which marks the beginning of the body section of an HTML document</td>
</tr>
<tr>
<td>BOLD Procedure on page 208-29</td>
<td>Generates the <code>&lt;B&gt;</code> and <code>&lt;/B&gt;</code> tags which direct the browser to display the text in boldface</td>
</tr>
<tr>
<td>BR Procedure on page 208-30</td>
<td>Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text</td>
</tr>
<tr>
<td>CENTER Procedure on page 208-31</td>
<td>Generates the <code>&lt;CENTER&gt;</code> and <code>&lt;/CENTER&gt;</code> tags which center a section of text within a Web page</td>
</tr>
<tr>
<td>CENTERCLOSE Procedure on page 208-32</td>
<td>Generates the <code>&lt;/CENTER&gt;</code> tag which marks the end of a section of text to center</td>
</tr>
<tr>
<td>CENTEROPEN Procedure on page 208-33</td>
<td>Generates the <code>&lt;CENTER&gt;</code> tag which mark the beginning of a section of text to center</td>
</tr>
<tr>
<td>CITE Procedure on page 208-34</td>
<td>Generates the <code>&lt;CITE&gt;</code> and <code>&lt;/CITE&gt;</code> tags which direct the browser to render the text as a citation</td>
</tr>
<tr>
<td>CODE Procedure on page 208-35</td>
<td>Generates the <code>&lt;CODE&gt;</code> and <code>&lt;/CODE&gt;</code> tags which direct the browser to render the text in monospace font or however &quot;code&quot; is defined stylistically</td>
</tr>
</tbody>
</table>
### Table 208–1 (Cont.)  HTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMENT Procedure on page 208-36</td>
<td>Generates procedure generates the comment tags &lt;!--ctext --&gt;</td>
</tr>
<tr>
<td>DFN Procedure on page 208-37</td>
<td>Generates the &lt;DFN&gt; and &lt;/DFN&gt; tags which direct the browser to mark the text as italics or however “definition” is defined stylistically</td>
</tr>
<tr>
<td>DIRLISTCLOSE Procedure on page 208-38</td>
<td>Generates the &lt;/DIR&gt; tag which ends a directory list section</td>
</tr>
<tr>
<td>DIRLISTOPEN Procedure on page 208-39</td>
<td>Generates the &lt;DIR&gt; which starts a directory list section</td>
</tr>
<tr>
<td>DIV Procedure on page 208-40</td>
<td>Generates the &lt;DIV&gt; tag which creates document divisions</td>
</tr>
<tr>
<td>DLISTCLOSE Procedure on page 208-41</td>
<td>Generates the &lt;/DL&gt; tag which ends a definition list</td>
</tr>
<tr>
<td>DLISTDEF Procedure on page 208-42</td>
<td>Generates the &lt;DD&gt; tag, which inserts definitions of terms</td>
</tr>
<tr>
<td>DLISTOPEN Procedure on page 208-43</td>
<td>Generates the &lt;DL&gt; tag which starts a definition list</td>
</tr>
<tr>
<td>DLTERM Procedure on page 208-44</td>
<td>Generates the &lt;DT&gt; tag which defines a term in a definition list &lt;DL&gt;</td>
</tr>
<tr>
<td>EM Procedure on page 208-45</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>EMPHASIS Procedure on page 208-46</td>
<td>Generates the &lt;EM&gt; and &lt;/EM&gt; tags, which define text to be emphasized</td>
</tr>
<tr>
<td>ESCAPE_SC Procedure on page 208-47</td>
<td>Replaces characters that have special meaning in HTML with their escape sequences</td>
</tr>
<tr>
<td>FONTCLOSE Procedure on page 208-48</td>
<td>Generates the &lt;/FONT&gt; tag which marks the end of a section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FONTOPEN Procedure on page 208-49</td>
<td>Generates the &lt;FONT&gt; which marks the beginning of section of text with the specified font characteristics</td>
</tr>
<tr>
<td>FORMCHECKBOX Procedure on page 208-50</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;checkbox&quot; which inserts a checkbox element in a form</td>
</tr>
<tr>
<td>FORMCLOSE Procedure on page 208-51</td>
<td>Generates the &lt;/FORM&gt; tag which marks the end of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMOPEN Procedure on page 208-52</td>
<td>Generates the &lt;FORM&gt; tag which marks the beginning of a form section in an HTML document</td>
</tr>
<tr>
<td>FORMFILE Procedure on page 208-53</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;file&quot; which inserts a file form element, and is used for file uploading for a given page</td>
</tr>
<tr>
<td>FORMHIDDEN Procedure on page 208-54</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;hidden&quot; which inserts a hidden form element</td>
</tr>
<tr>
<td>FORMIMAGE Procedure on page 208-55</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;image&quot; which creates an image field that the user clicks to submit the form immediately</td>
</tr>
<tr>
<td>FORMPASSWORD Procedure on page 208-56</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;password&quot; which creates a single-line text entry field</td>
</tr>
<tr>
<td>FORMRADIO Procedure on page 208-57</td>
<td>Generates the &lt;INPUT&gt; tag with TYPE=&quot;radio&quot;, which creates a radio button on the HTML form</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FORMRESET Procedure on page 208-58</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;reset&quot;</code> which creates a button that, when selected, resets the form fields to their initial values</td>
</tr>
<tr>
<td>FORMSELECTCLOSE Procedure on page 208-59</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the end of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPEN Procedure on page 208-60</td>
<td>Generates the <code>&lt;/SELECT&gt;</code> tag which marks the beginning of a Select form element</td>
</tr>
<tr>
<td>FORMSELECTOPTION Procedure on page 208-61</td>
<td>Generates the <code>&lt;OPTION&gt;</code> tag which represents one choice in a Select element</td>
</tr>
<tr>
<td>FORMSUBMIT Procedure on page 208-62</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;submit&quot;</code> which creates a button that, when clicked, submits the form</td>
</tr>
<tr>
<td>FORMTEXT Procedure on page 208-63</td>
<td>Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE=&quot;text&quot;</code>, which creates a field for a single line of text</td>
</tr>
<tr>
<td>FORMTEXTAREA Procedure on page 208-64</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area</td>
</tr>
<tr>
<td>FORMTEXTAREA2 Procedure on page 208-65</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FORMTEXTAREACLOSE Procedure on page 208-66</td>
<td>Generates the <code>&lt;/TEXTAREA&gt;</code> tag which ends a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOPEN Procedure on page 208-67</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element</td>
</tr>
<tr>
<td>FORMTEXTAREAOPEN2 Procedure on page 208-68</td>
<td>Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element with the ability to specify a wrap style</td>
</tr>
<tr>
<td>FRAME Procedure on page 208-69</td>
<td>Generates the <code>&lt;FRAME&gt;</code> tag which begins the characteristics of a frame created by a <code>&lt;FRAMESET&gt;</code> tag</td>
</tr>
<tr>
<td>FRAMESETCLOSE Procedure on page 208-70</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which ends a frameset section</td>
</tr>
<tr>
<td>FRAMESETOPEN Procedure on page 208-71</td>
<td>Generates the <code>&lt;/FRAMESET&gt;</code> tag which begins a frameset section</td>
</tr>
<tr>
<td>HEADCLOSE Procedure on page 208-72</td>
<td>Generates the <code>&lt;/HEAD&gt;</code> tag which marks the end of an HTML document head section</td>
</tr>
<tr>
<td>HEADER Procedure on page 208-73</td>
<td>Generates opening heading tags <code>&lt;H1&gt;</code> to <code>&lt;H6&gt;</code> and their corresponding closing tags <code>&lt;/H1&gt;</code> to <code>&lt;/H6&gt;</code></td>
</tr>
<tr>
<td>HEADOPEN Procedure on page 208-74</td>
<td>Generates the <code>&lt;HEAD&gt;</code> tag which marks the beginning of the HTML document head section</td>
</tr>
<tr>
<td>HR Procedure on page 208-75</td>
<td>Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>HTMLCLOSE Procedure on page 208-76</td>
<td>Generates the <code>&lt;/HTML&gt;</code> tag which marks the end of an HTML document</td>
</tr>
<tr>
<td>HTMLOPEN Procedure on page 208-77</td>
<td>Generates the <code>&lt;HTML&gt;</code> tag which marks the beginning of an HTML document</td>
</tr>
<tr>
<td>IMG Procedure on page 208-78</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page</td>
</tr>
<tr>
<td>IMG2 Procedure on page 208-79</td>
<td>Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ISINDEX Procedure on page 208-80</td>
<td>Creates a single entry field with a prompting text, such as &quot;enter value,&quot; then sends that value to the URL of the page or program</td>
</tr>
<tr>
<td>ITALIC Procedure on page 208-81</td>
<td>Generates the &lt;I&gt; and &lt;/I&gt; tags which direct the browser to render the text in italics</td>
</tr>
<tr>
<td>KBD Procedure on page 208-82</td>
<td>Generates the &lt;KBD&gt; and &lt;/KBD&gt; tags which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>KEYBOARD Procedure on page 208-83</td>
<td>Generates the &lt;KBD&gt; and &lt;/KBD&gt; tags, which direct the browser to render the text in monospace font</td>
</tr>
<tr>
<td>LINE Procedure on page 208-84</td>
<td>Generates the &lt;HR&gt; tag, which generates a line in the HTML document</td>
</tr>
<tr>
<td>LINKREL Procedure on page 208-85</td>
<td>Generates the &lt;LINK&gt; tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target</td>
</tr>
<tr>
<td>LINKREV Procedure on page 208-86</td>
<td>Generates the &lt;LINK&gt; tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor</td>
</tr>
<tr>
<td>LISTHEADER Procedure on page 208-87</td>
<td>Generates the &lt;LH&gt; and &lt;/LH&gt; tags which print an HTML tag at the beginning of the list</td>
</tr>
<tr>
<td>LISTINGCLOSE Procedure on page 208-88</td>
<td>Generates the &lt;/LISTING&gt; tags which marks the end of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTINGOPEN Procedure on page 208-89</td>
<td>Generates the &lt;LISTING&gt; tag which marks the beginning of a section of fixed-width text in the body of an HTML page</td>
</tr>
<tr>
<td>LISTITEM Procedure on page 208-90</td>
<td>Generates the &lt;LI&gt; tag, which indicates a list item</td>
</tr>
<tr>
<td>MAILTO Procedure on page 208-91</td>
<td>Generates the &lt;A&gt; tag with the HREF set to 'mailto' prepended to the mail address argument</td>
</tr>
<tr>
<td>MAPCLOSE Procedure on page 208-92</td>
<td>Generates the &lt;/MAP&gt; tag which marks the end of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MAPOPEN Procedure on page 208-93</td>
<td>Generates the &lt;MAP&gt; tag which mark the beginning of a set of regions in a client-side image map</td>
</tr>
<tr>
<td>MENULISTCLOSE Procedure on page 208-94</td>
<td>Generates the &lt;/MENU&gt; tag which ends a list that presents one line for each item</td>
</tr>
<tr>
<td>MENULISTOPEN Procedure on page 208-95</td>
<td>Generates the &lt;MENU&gt; tag which begins a list that presents one line for each item</td>
</tr>
<tr>
<td>META Procedure on page 208-96</td>
<td>Generates the &lt;META&gt; tag, which embeds meta-information about the document and also specifies values for HTTP headers</td>
</tr>
<tr>
<td>NL Procedure on page 208-97</td>
<td>Generates the &lt;BR&gt; tag which begins a new line of text</td>
</tr>
<tr>
<td>NOBR Procedure on page 208-98</td>
<td>Generates the &lt;NOBR&gt; and &lt;/NOBR&gt; tags which turn off line-breaking in a section of text</td>
</tr>
<tr>
<td>NOFRAMESCLOSE Procedure on page 208-99</td>
<td>Generates the &lt;/NOFRAMES&gt; tag which marks the end of a no-frames section</td>
</tr>
<tr>
<td>NOFRAMESOPEN Procedure on page 208-100</td>
<td>Generates the &lt;NOFRAMES&gt; tag which mark the beginning of a no-frames section</td>
</tr>
<tr>
<td>OLISTCLOSE Procedure on page 208-101</td>
<td>Generates the &lt;/OL&gt; tag which defines the end of an ordered list</td>
</tr>
</tbody>
</table>
### Summary of HTP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OLISTOPEN Procedure on page 208-102</td>
<td>Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list</td>
</tr>
<tr>
<td>PARA Procedure on page 208-103</td>
<td>Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph</td>
</tr>
<tr>
<td>PARAGRAPH Procedure on page 208-104</td>
<td>Adds attributes to the <code>&lt;P&gt;</code> tag</td>
</tr>
<tr>
<td>PARAM Procedure on page 208-105</td>
<td>Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets</td>
</tr>
<tr>
<td>PLAINTEXT Procedure on page 208-106</td>
<td>Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type</td>
</tr>
<tr>
<td>PRECLOSE Procedure on page 208-107</td>
<td>Generates the <code>&lt;/PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PREOPEN Procedure on page 208-108</td>
<td>Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page</td>
</tr>
<tr>
<td>PRINT Procedures on page 208-109</td>
<td>Generates the specified parameter as a string terminated with the <code>\n</code> newline character</td>
</tr>
<tr>
<td>PRINTS Procedure on page 208-110</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence</td>
</tr>
<tr>
<td>PRN Procedures on page 208-111</td>
<td>Generates the specified parameter as a string</td>
</tr>
<tr>
<td>PS Procedure on page 208-112</td>
<td>Generates a string and replaces the following characters with the corresponding escape sequence.</td>
</tr>
<tr>
<td>S Procedure on page 208-113</td>
<td>Generates the <code>&lt;S&gt;</code> and <code>&lt;/S&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>SAMPLE Procedure on page 208-114</td>
<td>Generates the <code>&lt;SAMP&gt;</code> and <code>&lt;/SAMP&gt;</code> tags which direct the browser to render the text they surround in monospace font or however &quot;sample&quot; is defined stylistically</td>
</tr>
<tr>
<td>SCRIPT Procedure on page 208-115</td>
<td>Generates the <code>&lt;SCRIPT&gt;</code> and <code>&lt;/SCRIPT&gt;</code> tags which contain a script written in languages such as JavaScript and VBscript</td>
</tr>
<tr>
<td>SMALL Procedure on page 208-116</td>
<td>Generates the <code>&lt;SMALL&gt;</code> and <code>&lt;/SMALL&gt;</code> tags, which direct the browser to render the text they surround using a small font</td>
</tr>
<tr>
<td>STRIKE Procedure on page 208-117</td>
<td>Generates the <code>&lt;STRIKE&gt;</code> and <code>&lt;/STRIKE&gt;</code> tags which direct the browser to render the text they surround in strikethrough type</td>
</tr>
<tr>
<td>STRONG Procedure on page 208-118</td>
<td>Generates the <code>&lt;STRONG&gt;</code> and <code>&lt;/STRONG&gt;</code> tags which direct the browser to render the text they surround in bold or however &quot;strong&quot; is defined stylistically</td>
</tr>
<tr>
<td>STYLE Procedure on page 208-119</td>
<td>Generates the <code>&lt;STYLE&gt;</code> and <code>&lt;/STYLE&gt;</code> tags which include a style sheet in a Web page</td>
</tr>
<tr>
<td>SUB Procedure on page 208-120</td>
<td>Generates the <code>&lt;SUB&gt;</code> and <code>&lt;/SUB&gt;</code> tags which direct the browser to render the text they surround as subscript</td>
</tr>
<tr>
<td>SUP Procedure on page 208-121</td>
<td>Generates the <code>&lt;SUP&gt;</code> and <code>&lt;/SUP&gt;</code> tags which direct the browser to render the text they surround as superscript</td>
</tr>
<tr>
<td>TABLECAPTION Procedure on page 208-122</td>
<td>Generates the <code>&lt;CAPTION&gt;</code> and <code>&lt;/CAPTION&gt;</code> tags which place a caption in an HTML table</td>
</tr>
<tr>
<td>TABLECLOSE Procedure on page 208-123</td>
<td>Generates the <code>&lt;/TABLE&gt;</code> tag which marks the end of an HTML table</td>
</tr>
</tbody>
</table>
### Table 208–1 (Cont.) HTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLEDATA Procedure on page 208-124</td>
<td>Generates the <code>&lt;TD&gt;</code> and <code>&lt;/TD&gt;</code> tags which insert data into a cell of an HTML table</td>
</tr>
<tr>
<td>TABLEHEADER Procedure on page 208-125</td>
<td>Generates the <code>&lt;TH&gt;</code> and <code>&lt;/TH&gt;</code> tags which insert a header cell in an HTML table.</td>
</tr>
<tr>
<td>TABLEOPEN Procedure on page 208-126</td>
<td>Generates the <code>&lt;TABLE&gt;</code> tag which marks the beginning of an HTML table</td>
</tr>
<tr>
<td>TABLEROWCLOSE Procedure on page 208-127</td>
<td>Generates the <code>&lt;/TR&gt;</code> tag which marks the end of a new row in an HTML table</td>
</tr>
<tr>
<td>TABLEROWOPEN Procedure on page 208-128</td>
<td>Generates the <code>&lt;TR&gt;</code> tag which marks the beginning of a new row in an HTML table</td>
</tr>
<tr>
<td>TELETYPING Procedure on page 208-129</td>
<td>Generates the <code>&lt;TT&gt;</code> and <code>&lt;/TT&gt;</code> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font</td>
</tr>
<tr>
<td>TITLE Procedure on page 208-130</td>
<td>Generates the <code>&lt;TITLE&gt;</code> and <code>&lt;/TITLE&gt;</code> tags which specify the text to display in the titlebar of the browser window</td>
</tr>
<tr>
<td>ULISTCLOSE Procedure on page 208-131</td>
<td>Generates the <code>&lt;/UL&gt;</code> tag which marks the end of an unordered list</td>
</tr>
<tr>
<td>ULISTOPEN Procedure on page 208-132</td>
<td>Generates the <code>&lt;UL&gt;</code> tag which marks the beginning of an unordered list</td>
</tr>
<tr>
<td>UNDERLINE Procedure on page 208-133</td>
<td>Generates the <code>&lt;U&gt;</code> and <code>&lt;/U&gt;</code> tags, which direct the browser to render the text they surround with an underline</td>
</tr>
<tr>
<td>VARIABLE Procedure on page 208-134</td>
<td>Generates the <code>&lt;VAR&gt;</code> and <code>&lt;/VAR&gt;</code> tags which direct the browser to render the text they surround in italics or however &quot;variable&quot; is defined stylistically.</td>
</tr>
<tr>
<td>WBR Procedure on page 208-135</td>
<td>Generates the <code>&lt;WBR&gt;</code> tag, which inserts a soft line break within a section of <code>NOBR</code> text</td>
</tr>
</tbody>
</table>

---

Summary of HTP Subprograms
ADDRESS Procedure

This procedure generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

Syntax

```sql
HTP.ADDRESS (
  cvalue IN VARCHAR2
  cnowrap IN VARCHAR2 DEFAULT NULL
  cclear IN VARCHAR2 DEFAULT NULL
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The string that goes between the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<Address CLEAR='cclear' NOWRAP cattributes>cvalue</Address>
```
ANCHOR Procedure

This procedure and the **ANCHOR2 Procedure** procedures generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the **ANCHOR2 Procedure** provides a target and therefore can be used for a frame.

**Syntax**

```sql
HTP.ANCHOR (
    curl IN VARCHAR2,
    ctext IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

**Usage Notes**

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.
ANCHOR2 Procedure

This procedure and the ANCHOR Procedure generate the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (  
curl IN VARCHAR2,  
ctext IN VARCHAR2,  
cname IN VARCHAR2 DEFAULT NULL,  
ctarget in varchar2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>ctext</td>
<td>The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<A HREF='curl' NAME='cname' TARGET = "ctarget" cattributes>ctext</A>
```
APPLETCLOSE Procedure

This procedure closes the applet invocation with the </APPLET> tag. You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

HTP.APPLETCLOSE;
APPLETOPEN Procedure

This procedure generates the `<APPLET>` tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Procedure which generates the `</APPLET>` tag.

Syntax

```
HTP.APPLETOPEN (   
code   IN VARCHAR2,  
cheight IN NUMBER,  
cwidth  IN NUMBER,  
cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 208–5  APPLETOPEN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccode</td>
<td>The value for the CODE attribute which specifies the name of the applet class.</td>
</tr>
<tr>
<td>cheight</td>
<td>The value for the HEIGHT attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Procedure.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.
AREA Procedure

This procedure generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
    ccoords IN VARCHAR2,
    cshape IN VARCHAR2 DEFAULT NULL,
    chref IN VARCHAR2 DEFAULT NULL,
    cnohref IN VARCHAR2 DEFAULT NULL,
    ctarget IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccoords</td>
<td>The value for the COORDS attribute.</td>
</tr>
<tr>
<td>cshape</td>
<td>The value for the SHAPE attribute.</td>
</tr>
<tr>
<td>chref</td>
<td>The value for the HREF attribute.</td>
</tr>
<tr>
<td>cnohref</td>
<td>If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```
BASE Procedure

This procedure generates the `<BASE>` tag which records the URL of the document.

Syntax

```
HTP.BASE (
    ctarget IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctarget</td>
<td>The value for the <code>TARGET</code> attribute which establishes a window name to which all links in this document are targeted.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<Base HREF='current URL' TARGET='ctarget' cattributes>
```
BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (nsize IN INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The value for the SIZE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```
**BGSOUND Procedure**

This procedure generates the `<BGSOUND>` tag which includes audio for a Web page.

**Syntax**

```sql
HTP.BGSOUND (    
csrc IN VARCHAR2,  
cloop IN VARCHAR2 DEFAULT NULL,  
cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cloop</td>
<td>The value for the LOOP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<BGSOUND SRC='csrc' LOOP='cloop' cattributes>
```
BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The the text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BIG cattributes>ctext</BIG>
```
BLOCKQUOTECLOSE Procedure

This procedure generates the \texttt{</BLOCKQUOTE>} tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the \texttt{BLOCKQUOTEOPEN} Procedure.

Syntax

\texttt{HTP.BLOCKQUOTECLOSE;}

Examples

This procedure generates

\texttt{</BLOCKQUOTE>}

BLOCKQUOTEOPEN Procedure

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Procedure.

Syntax

```
HTP.BLOCKQUOTEOPEN(
  cnowrap IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```
BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

HTP.BODYCLOSE;

Examples

This procedure generates

</BODY>
BODYOPEN Procedure

This procedure generates the &lt;BODY&gt; tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

HTP.BODYOPEN (  
  cbackground IN VARCHAR2 DEFAULT NULL,  
  cattributes IN VARCHAR2 DEFAULT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbackground</td>
<td>The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

&lt;BODY background='cbackground' cattributes&gt;

so that

HTP.BODYOPEN('/img/background.gif');

generates:

&lt;BODY background='/img/background.gif'&gt;
BOLD Procedure

This procedure generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<B cattributes>ctext</B>
```
BR Procedure

This procedure generates the `<BR>` tag which begins a new line of text. It performs the same operation as the NL Procedure.

Syntax

```sql
HTP.BR(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<BR CLEAR="cclear" cattributes>
```
CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

Syntax

```plaintext
HTP.CENTER (  
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that goes between the tags.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```
CENTERCLOSE Procedure

This procedure generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the CENTEROPEN Procedure.

Syntax

```plaintext
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```plaintext
</CENTER>
```
CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center. You mark the beginning of a section of text to center by means of the CENTERCLOSE Procedure.

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```
CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as citation.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<CITE cattributes>ctext</CITE>
```
CODE Procedure

This procedure generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render as code.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```<CODE cattributes>ctext</CODE>```
COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (
   ctext      IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The comment.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<!-- ctext -->
```
DFN Procedure

This procedure generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN ( 
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

`<DFN>ctext</DFN>`
DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

HTP.DIRLISTCLOSE;

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

</DIR>
**DIRLISTOPEN Procedure**

This procedure generates the `<DIR>` which starts a directory list section. You end a directory list section with the **DIRLISTCLOSE Procedure**.

**Syntax**

```
HTP.DIRLISTOPEN;
```

**Usage Notes**

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the **LISTITEM Procedure** so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

**Examples**

This procedure generates

```
<DIR>
```
DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (
   calign IN VARCHAR2 DEFAULT NULL,
   cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```
DLISTCLOSE Procedure

This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

Syntax

HTP.DLISTCLOSE;

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

</DL>
DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

Syntax

```
HTP.DLISTDEF (  
    ctext IN VARCHAR2 DEFAULT NULL,  
    cclear IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The definition of the term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```
**DLISTOPEN Procedure**

This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

**Syntax**

```sql
HTP.DLISTOPEN (  
    cclear  IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

**Examples**

This procedure generates

```html
<DL CLEAR="cclear" cattributes>
```
DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```plsql
HTP.DLISTTERM (
  ctext IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The term.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```xml
<DT CLEAR="cclear" cattributes>ctext
```
EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Procedure.

Syntax

```sql
HTP.EM(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<EM cattributes>ctext</EM>
```
EMPHASIS Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the EM Procedure.

Syntax

```sql
HTP.EMPHASIS(
    ctext IN VARCHAR2,
    attributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to emphasize.</td>
</tr>
<tr>
<td>attributes</td>
<td>The other attributes to be included as-is in the tag,</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<EM attributes>ctext</EM>
```
ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```sql
HTP.ESCAPE_SC(
    ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text string to convert.</td>
</tr>
</tbody>
</table>
FONTCLOSE Procedure

This procedure generates the </FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

HTP.FONTCLOSE;

Examples

This procedure generates

</FONT>
FONTOPEN Procedure

This procedure generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```
HTP.FONTOPEN(
    ccolor IN VARCHAR2 DEFAULT NULL,
    cface IN VARCHAR2 DEFAULT NULL,
    csize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccolor</td>
<td>The value for the COLOR attribute.</td>
</tr>
<tr>
<td>cface</td>
<td>The value for the FACE attribute</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```
FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT 'ON',
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>CHECKED</code> attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
FORMCLOSE Procedure

This procedure generates the </FORM> tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

HTP.FORMCLOSE;

Examples

This procedure generates

</FORM>
FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
    curl IN VARCHAR2,
    cmethod IN VARCHAR2 DEFAULT 'POST',
    ctarget IN VARCHAR2 DEFAULT NULL,
    cenctype IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.</td>
</tr>
<tr>
<td>cmethod</td>
<td>The value for the METHOD attribute. The value can be &quot;GET&quot; or &quot;POST&quot;.</td>
</tr>
<tr>
<td>ctarget</td>
<td>The value for the TARGET attribute.</td>
</tr>
<tr>
<td>cenctype</td>
<td>The value for the ENCTYPE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```
FORMFILE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
    cname IN VARCHAR2,
    caccept IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>caccept</td>
<td>A comma-delimited list of MIME types for upload.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```
FORMHIDDEN Procedure

This procedure generates the `<INPUT>` tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```
FORMIMAGE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any `VALUE` attribute is ignored.

Syntax

```sql
HTP.FORMIMAGE(
    cname IN VARCHAR2,
    csrc IN VARCHAR2,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the <code>SRC</code> attribute that specifies the image file.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```
FORMPASSWORD Procedure

This procedure generates the `<INPUT>` tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```plaintext
HTP.FORMPASSWORD(
    cname IN VARCHAR2,
    csize IN VARCHAR2,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the SIZE attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the MAXLENGTH attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```plaintext
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```
FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```sql
HTP.FORMRADIO(
    cname IN VARCHAR2,
    cvalue IN VARCHAR2,
    cchecked IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
<tr>
<td>cchecked</td>
<td>If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```
FORMRESET Procedure

This procedure generates the \(<\text{INPUT}>\) tag with \(\text{TYPE}="\text{reset}"\) which creates a button that, when selected, resets the form fields to their initial values.

Syntax

\[
\begin{align*}
\text{HTP.FORMRESET(} & \\
\text{cvalue IN VARCHAR2 DEFAULT 'Reset',} & \\
\text{cattributes IN VARCHAR2 DEFAULT NULL);} & \\
\end{align*}
\]

Parameters

\begin{table}
\centering
\begin{tabular}{|l|l|}
\hline
Parameter & Description \\
\hline
\text{cvalue} & The value for the \text{VALUE} attribute. \\
\text{cattributes} & The other attributes to be included as-is in the tag. \\
\hline
\end{tabular}
\end{table}

Examples

This procedure generates

\[
\text{<INPUT TYPE="reset" VALUE='cvalue' cattributes>}
\]
FORMSELECTCLOSE Procedure

This procedure generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure. The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

</SELECT>

as shown under Examples of the FORMSELECTOPEN Procedure.
FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the `FORMSELECTCLOSE Procedure`. The values are inserted using `FORMSELECTOPTION Procedure`.

Syntax

```
FORMSELECTOPEN(
    cname IN VARCHAR2,
    cprompt IN VARCHAR2 DEFAULT NULL,
    nsize IN INTEGER DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cprompt</td>
<td>The string preceding the list box.</td>
</tr>
<tr>
<td>nsize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

Pick the greatest player:
```
<SELECT NAME="greatest_player">
    <OPTION>Messier
    <OPTION>Howe
    <OPTION>Gretzky
</SELECT>
```
FORMSELECTOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
    cvalue IN VARCHAR2,
    cselected IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The text for the option.</td>
</tr>
<tr>
<td>cvalue</td>
<td>If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is</td>
</tr>
<tr>
<td></td>
<td>added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<Option SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Procedure.
FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```sql
HTP.FORMSUBMIT(cname IN VARCHAR2 DEFAULT NULL, cvalue IN VARCHAR2 DEFAULT 'Submit', cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 208–38  FORMSUBMIT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```
FORMTEXT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT(
    cname IN VARCHAR2,
    csize IN VARCHAR2 DEFAULT NULL,
    cmaxlength IN VARCHAR2 DEFAULT NULL,
    cvalue IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>csize</td>
<td>The value for the <code>SIZE</code> attribute.</td>
</tr>
<tr>
<td>cmaxlength</td>
<td>The value for the <code>MAXLENGTH</code> attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the <code>VALUE</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```
FORMTEXTAREA Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```sql
HTP.FORMTEXTAREA(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign , IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```
FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```plaintext
HTP.FORMTEXTAREA2(
  cname IN VARCHAR2,
  nrows IN INTEGER,
  ncolumns IN INTEGER,
  calign IN VARCHAR2 DEFAULT NULL,
  cwrap IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the <code>WRAP</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```plaintext
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap" cattributes> </TEXTAREA>
```
FORMTEXTAREACLOSE Procedure

This procedure generates the <TEXTAREA> tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

HTP.FORMTEXTAREACLOSE;

Examples

This procedure generates

</TEXTAREA>
FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cname</code></td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td><code>nrows</code></td>
<td>The value for the <code>ROWS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>ncolumns</code></td>
<td>The value for the <code>COLS</code> attribute. This is an integer.</td>
</tr>
<tr>
<td><code>calign</code></td>
<td>The value for the <code>ALIGN</code> attribute.</td>
</tr>
<tr>
<td><code>cattributes</code></td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```
FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```plsql
HTP.FORMTEXTAREAOPEN2(
    cname IN VARCHAR2,
    nrows IN INTEGER,
    ncolumns IN INTEGER,
    calign   IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>nrows</td>
<td>The value for the ROWS attribute. This is an integer.</td>
</tr>
<tr>
<td>ncolumns</td>
<td>The value for the COLS attribute. This is an integer.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap" cattributes>
```
FRAME Procedure

This procedure generates the `<FRAME>` tag which begins the characteristics of a frame created by a `<FRAMESET>` tag.

Syntax

```
HTP.FRAME(
    csrc IN VARCHAR2,
    cname IN VARCHAR2 DEFAULT NULL,
    cmarginwidth IN VARCHAR2 DEFAULT NULL,
    cmarginheight IN VARCHAR2 DEFAULT NULL,
    cscrolling IN VARCHAR2 DEFAULT NULL,
    cnoresize IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csrc</td>
<td>The URL to display in the frame.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cmarginwidth</td>
<td>The value for the <code>MARGINWIDTH</code> attribute.</td>
</tr>
<tr>
<td>cscrolling</td>
<td>The value for the <code>SCROLLING</code> attribute.</td>
</tr>
<tr>
<td>cnoresize</td>
<td>If the value for this parameter is not <code>NULL</code>, the <code>NORESIZE</code> attribute is</td>
</tr>
<tr>
<td></td>
<td>added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
        MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```
FRAMESETCLOSE Procedure

This procedure generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

HTP.FRAMESETCLOSE;

Examples

This procedure generates

</FRAMESET>
FRAMESETOPEN Procedure

This procedure generates the `<FRAMESET>` tag which defines a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```
HTP.FRAMESETOPEN(
    crows IN VARCHAR2 DEFAULT NULL,
    ccols IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crows</td>
<td>The value for the ROWS attribute.</td>
</tr>
<tr>
<td>ccols</td>
<td>The value for the COLS attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```
HEADCLOSE Procedure

This procedure generates the \texttt{</HEAD>} tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the \texttt{HEADOPEN} Procedure.

Syntax

\texttt{HTP.HEADCLOSE;}

Examples

This procedure generates

\texttt{</HEAD>
**HEADER Procedure**

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (<H1> to </H6>).

**Syntax**

```
HTP.HEADER(
  nsize IN INTEGER,
  cheader IN VARCHAR2,
  calign IN VARCHAR2 DEFAULT NULL,
  cnwrap IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsize</td>
<td>The heading level. This is an integer between 1 and 6.</td>
</tr>
<tr>
<td>cheader</td>
<td>The text to display in the heading.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnwrap</td>
<td>The value for the NOWRAP attribute.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

```
HTP.header (1,'Overview');
```

produces:

```
<H1>Overview</H1>
```
HEADOPEN Procedure

This procedure generates the `<HEAD>` tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```
HR Procedure

This procedure generates the \(<HR>\) tag, which generates a line in the HTML document. This subprogram performs the same operation as the LINE Procedure.

Syntax

```
HTP.HR(
  cclear IN VARCHAR2 DEFAULT NULL,
  csrr IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrr</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

\(<HR CLEAR='cclear' SRC='csrr' cattributes>\)
HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document. You use the HTP.HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

HTP.HTMLCLOSE;

Examples

This procedure generates

</HTML>
**HTMLOPEN Procedure**

This procedure generates the `<HTML>` tag which marks the beginning of an HTML document. You use the [HTMLCLOSE Procedure](#) to mark the end of the an HTML document.

**Syntax**

```
HTP.HTMLOPEN;
```

**Examples**

This procedure generates

```
<HTML>
```
IMG Procedure

This procedure generates the `<IMG>` tag which directs the browser to load an image onto the HTML page. The IMG2 Procedure performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTP.IMG(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```
IMG2 Procedure

This procedure generates the &lt;IMG&gt; tag, which directs the browser to load an image onto the HTML page. The IMG Procedure performs the same operation but does not use the cusemap parameter.

Syntax

```
HTP.IMG2(
    curl IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    calt IN VARCHAR2 DEFAULT NULL,
    cismap IN VARCHAR2 DEFAULT NULL,
    cusemap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>calt</td>
<td>The value for the ALT attribute which specifies alternative text to display if the browser does not support images.</td>
</tr>
<tr>
<td>cismap</td>
<td>If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.</td>
</tr>
<tr>
<td>cusemap</td>
<td>The value for the USEMAP attribute which specifies a client-side imagemap.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
&lt;IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes&gt;
```
ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

HTP.ISINDEX(
    cprompt IN VARCHAR2 DEFAULT NULL,
    curl IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cprompt</td>
<td>The value for the PROMPT attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the HREF attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<ISINDEX PROMPT="cprompt" HREF="curl">
ITALIC Procedure

This procedure generates the <i> and </i> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
    ctext  IN   VARCHAR2,
    cattributes  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>
```

Examples

This procedure generates

```
<i cattributes>ctext</i>
```
KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```sql
HTP.KBD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<KBD cattributes>ctext</KBD>
```
KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Procedure.

Syntax

```
HTP.KEYBOARD(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in monospace.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<KBD cattributes>ctext</KBD>
```
LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Procedure.

Syntax

HTP.LINE(
  cclear IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute which specifies a custom image as the source of the line.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

<HR CLEAR="cclear" SRC="csrc" cattributes>
LINKREL Procedure

This procedure generates the `<LINK>` tag with the `REL` attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the `HREF` attribute is present. This is the opposite of `LINKREV Procedure`. This tag indicates a relationship between documents but does not create a link. To create a link, use the `ANCHOR Procedure`.

Syntax

```
HTP.LINKREL(
  crel IN VARCHAR2,
  curl IN VARCHAR2,
  ctitle IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crel</td>
<td>The value for the <code>REL</code> attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the <code>URL</code> attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the <code>TITLE</code> attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```
LINKREV Procedure

This procedure generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```plsql
HTP.LINKREV(
    crev IN VARCHAR2,
    curl IN VARCHAR2,
    ctitle IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>crev</td>
<td>The value for the <code>REV</code> attribute.</td>
</tr>
<tr>
<td>curl</td>
<td>The value for the <code>URL</code> attribute.</td>
</tr>
<tr>
<td>ctitle</td>
<td>The value for the <code>TITLE</code> attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```
LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code>.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```
LISTINGCLOSE Procedure

This procedure generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

HTP.LISTINGCLOSE;

Examples

This procedure generates

</LISTING>
LISTINGOPEN Procedure

This procedure generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

HTP.LISTINGOPEN;

Examples

This procedure generates

<LISTING>
LISTITEM Procedure

This procedure generates the `<LI>` tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
  ctext IN VARCHAR2 DEFAULT NULL,
  cclear IN VARCHAR2 DEFAULT NULL,
  cdingbat IN VARCHAR2 DEFAULT NULL,
  csdc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the list item.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csdc" cattributes>ctext
```
MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
    caddress  IN     VARCHAR2,
    ctext    IN      VARCHAR2,
    cname    IN      VARCHAR2,
    cattributes IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddress</td>
<td>The email address of the recipient.</td>
</tr>
<tr>
<td>ctext</td>
<td>The clickable portion of the link.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

`<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>`

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

`<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>`
MAPCLOSE Procedure

This procedure generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

HTP.MAPCLOSE;

Examples

This procedure generates

</MAP>
MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```sql
HTP.MAPOPEN(
    cname IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<MAP NAME="cname" cattributes>
```
MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

HTP.MENULISTCLOSE;

Examples

This procedure generates

</MENU>
MENULISTOPEN Procedure

This procedure generates the `<MENU>` tag which begins a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

HTP.MENULISTOPEN;

Examples

This procedure generates

`<MENU>`
META Procedure

This procedure generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
    chttp_equiv IN VARCHAR2,
    cname IN VARCHAR2,
    ccontent IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chttp_equiv</td>
<td>The value for the <code>CHTTP_EQUIV</code> attribute.</td>
</tr>
<tr>
<td>cname</td>
<td>The value for the <code>NAME</code> attribute.</td>
</tr>
<tr>
<td>ccontent</td>
<td>The value for the <code>CONTENT</code> attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.
NL Procedure

This procedure generates the `<BR>` tag which begins a new line of text. It performs the same operation as the BR Procedure.

Syntax

```
HTP.NL(
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<BR CLEAR='cclear' cattributes>
```
**NOBR Procedure**

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

**Syntax**

```
HTP.NOBR(
  ctext  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text that is to be rendered on one line.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```
<NOBR>ctext</NOBR>
```
N CFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

HTP.NOFramesClose;

Examples

This procedure generates

</NOFRAMES>
NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```plsql
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```html
<NOFRAMES>
```
OLISTCLOSE Procedure

This procedure generates the </ol> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

HTP.OLISTCLOSE;

Examples

This procedure generates

</ol>
OLISTOPEN Procedure

This procedure generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```
PARA Procedure

This procedure generates the <p> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPh Procedure.

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```html
<p>
```
PARAGRAPh Procedure

You can use this procedure to add attributes to the <p> tag created by the PARA Procedure.

Syntax

```
HTP.PARAGRAPH(
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```
PARAM Procedure

This procedure generates the `<PARAM>` tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```
HTP.PARAM(
  cname IN VARCHAR2,
  cvalue IN VARCHAR2);
```

Parameters

**Table 208–66 PARAM Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The value for the NAME attribute.</td>
</tr>
<tr>
<td>cvalue</td>
<td>The value for the VALUE attribute.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```
PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in fixed-width font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```
**PRECLOSE Procedure**

This procedure generates the `<PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the **PREOPEN Procedure**.

**Syntax**

```
HTP.PRECLOSE;
```

**Examples**

This procedure generates

```
</PRE>
```
PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

Syntax

```
HTP.PREOPEN(
    cclear IN VARCHAR2 DEFAULT NULL,
    cwidth IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwidth</td>
<td>The value for the WIDTH attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```
PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (  
cbuf      IN       VARCHAR2);  
HTP.PRINT (  
dbuf      IN       DATE);  
HTP.PRINT (  
nbuf      IN       NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate terminated by a newline.</td>
</tr>
</tbody>
</table>
nbuf       | The string to generate terminated by a newline. |

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use \n to control how the browser renders the HTML source.
- These procedures do not have function equivalents.
PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `&lt;`
- `>` to `&gt;`
- `"` to `&quot;`
- `&` to `&amp;`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```sql
HTP.PRINTS (cText IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 208-3 for the HTF implementation).
PRN Procedures

These procedures generate the specified parameter as a string. Unlike the PRINT Procedures the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (cbuf      IN       VARCHAR2);
HTP.PRN (dbuf      IN       DATE);
HTP.PRN (nbuf      IN       NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>dbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
<tr>
<td>nbuf</td>
<td>The string to generate (not terminated by a newline).</td>
</tr>
</tbody>
</table>

Usage Notes

These procedures do not have function equivalents.
PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `&lt;`
- `>` to `&gt;`
- `"` to `&quot;`
- `&` to `&amp;`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (  
   ctext IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The string where to perform character substitution.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 208-3 for the HTF implementation).
S Procedure

This procedure generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Procedure.

Syntax

```
HTP.S (  
    ctext IN VARCHAR2,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in strikethrough type.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<S cattributes>ctext</S>
```
SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (cText IN VARCHAR2, cAttributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cText</td>
<td>The text to be rendered in monospace font.</td>
</tr>
<tr>
<td>cAttributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SAMP cAttributes>cText</SAMP>
```
SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (cscript IN VARCHAR2,
clanguage IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cscript</td>
<td>The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.</td>
</tr>
<tr>
<td>clanguage</td>
<td>The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.
SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be rendered in small font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<SMALL cattributes>ctext</SMALL>
```
STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as \textit{S Procedure}.

Syntax

```
HTP.STRIKE ( cnstext IN VARCHAR2,
               cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

\begin{table}[h]
\centering
\caption{STRIKE Procedure Parameters}
\begin{tabular}{ll}
\hline
Parameter & Description \\
\hline
ctext & The text to be rendered in strikethrough type. \\
cattributes & The other attributes to be included as-is in the tag. \\
\hline
\end{tabular}
\end{table}

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```
STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```plsql
HTP.STRONG(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to be emphasized.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<STRONG cattributes>ctext</STRONG>
```
STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
    cstyle IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cstyle</td>
<td>The style information to include.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```
**SUB Procedure**

This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

**Syntax**

```sql
HTP.SUB(
  ctext IN VARCHAR2,
  calign in VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in subscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
&lt;SUB ALIGN="calign" cattributes&gt;ctext&lt;/SUB&gt;
```
SUP Procedure

This procedure generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript.

Syntax

```sql
HTP.SUP(
    ctext IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in superscript.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<SUP ALIGN="calign" cattributes>ctext</SUP>
```
TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

Syntax

```sql
HTP.TABLECAPTION(
    ccaption IN VARCHAR2,
    calign in VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text for the caption.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```
TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

HTP.TABLECLOSE;

Examples

This procedure generates

</TABLE>
TABLEDATA Procedure

This procedure generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

**Syntax**

```sql
HTP.TABLEDATA(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

*Table 208–83  TABLEDATA Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to</td>
</tr>
<tr>
<td></td>
<td>the tag.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

**Examples**

This procedure generates

```html
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes> cvalue </TD>
```
TABLEHEADER Procedure

This procedure generates the `<TH>` and `</TH>` tags which insert a header cell in an HTML table. The `<TH>` tag is similar to the `<TD>` tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```plaintext
HTP.TABLEHEADER(
    cvalue IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    crowspan IN VARCHAR2 DEFAULT NULL,
    ccolspan IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cvalue</td>
<td>The data for the cell in the table.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>crispen</td>
<td>The value for the ROWSPAN attribute.</td>
</tr>
<tr>
<td>ccolspan</td>
<td>The value for the COLSPAN attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP cattributes">cvalue</TH>
```
TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```plaintext
HTP.TABLEOPEN(
    cborder IN VARCHAR2 DEFAULT NULL,
    calign IN VARCHAR2 DEFAULT NULL,
    cnowrap IN VARCHAR2 DEFAULT NULL,
    cclear IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cborder</td>
<td>The value for the BORDER attribute.</td>
</tr>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cclear</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TABLE *cborder* NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```
**TABLEROWCLOSE Procedure**

This procedure generates the `<TR>` tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

**Syntax**

```
HTP.TABLEROWCLOSE;
```

**Examples**

This procedure generates

```
</TABLE>
```
TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```
HTP.TABLEROWOPEN(
    calign IN VARCHAR2 DEFAULT NULL,
    cvalign IN VARCHAR2 DEFAULT NULL,
    cdp IN VARCHAR2 DEFAULT NULL,
    cnnowrap IN VARCHAR2 DEFAULT NULL,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calign</td>
<td>The value for the ALIGN attribute.</td>
</tr>
<tr>
<td>cvalign</td>
<td>The value for the VALIGN attribute.</td>
</tr>
<tr>
<td>cdp</td>
<td>The value for the DP attribute.</td>
</tr>
<tr>
<td>cnnowrap</td>
<td>If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>>
```
TELETYPE Procedure

This procedure generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```sql
HTP.TELETYPE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in a fixed width typewriter font.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```
TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```sql
HTP.TITLE(
    ctitle IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctitle</td>
<td>The text to display in the titlebar of the browser window.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<TITLE>ctitle</TITLE>
```
ULISTCLOSE Procedure

This procedure generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

HTP.ULISTCLOSE;

Examples

This procedure generates

</TABLE>
ULISTOPEN Procedure

This procedure generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```sql
HTP.ULISTOPEN(
  cclear IN VARCHAR2 DEFAULT NULL,
  cwrap IN VARCHAR2 DEFAULT NULL,
  cdingbat IN VARCHAR2 DEFAULT NULL,
  csrc IN VARCHAR2 DEFAULT NULL,
  cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cclean</td>
<td>The value for the CLEAR attribute.</td>
</tr>
<tr>
<td>cwrap</td>
<td>The value for the WRAP attribute.</td>
</tr>
<tr>
<td>cdingbat</td>
<td>The value for the DINGBAT attribute.</td>
</tr>
<tr>
<td>csrc</td>
<td>The value for the SRC attribute.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Procedure

This procedure generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

Syntax

```sql
HTP.UNDERLINE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render with an underline.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```html
<U cattributes>ctext</U>
```
VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(
    ctext IN VARCHAR2,
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctext</td>
<td>The text to render in italics.</td>
</tr>
<tr>
<td>cattributes</td>
<td>The other attributes to be included as-is in the tag.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```
WBR Procedure

This procedure generates the &lt;WBR&gt; tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
&lt;WBR&gt;
```
This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type. See Oracle Multimedia DICOM Developer’s Guide for a complete description of the ORDDicom object type.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content, such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia ORD Dicom package provides functions and procedures in the DICOM relational interface to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

The Oracle Multimedia ORD Dicom package also provides functions and procedures in the DICOM data model utility interface to operate on the DICOM data model repository. See Oracle Multimedia DICOM Developer’s Guide for a complete description of the DICOM data model utility interface.

- Documentation of ORD_DICOM
Documentation of ORD_DICOM

For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM in the Oracle Multimedia DICOM Developer’s Guide.
This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia ORD_DICOM_ADMIN package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

- Documentation of ORD_DICOM_ADMIN
For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM_ADMIN in the *Oracle Multimedia DICOM Developer’s Guide*.
The OWA_CACHE package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

</tr>
<tr>
<td>SET_SURROGATE_CONTROL</td>
<td>Sets up the headers for a surrogate-control header for Web cache</td>
</tr>
</tbody>
</table>
DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

OWA_CACHE.DISABLE;
GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG
RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise NULL.
GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
  RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.
SET_CACHE Procedure

This sets up the cache headers for validation model cache type.

Syntax

```sql
OWA_CACHE.SET_CACHE(
    p_etag       IN       VARCHAR2,
    p_level      IN       VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_etag</td>
<td>The etag associated with this content</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>

Exceptions

`VALUE_ERROR` is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'
SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

OWA_CACHE.SET_EXPIRES(
    p_expires IN NUMBER,
    p_level  IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_expires</td>
<td>The number of minutes this content is valid.</td>
</tr>
<tr>
<td>p_level</td>
<td>The caching level ('USER' or 'SYSTEM').</td>
</tr>
</tbody>
</table>

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)
SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

OWA_CACHE.SET_NOT_MODIFIED;

Exceptions

VALUE_ERROR is thrown if the etag was not passed in
SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
    p_value        IN       VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_value</td>
<td>The value to be passed as the Surrogate-Control header.</td>
</tr>
</tbody>
</table>

Exceptions

`VALUE_ERROR` is thrown if `p_value` is greater than 55 in length.
The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

**See Also:** For more information about implementation of this package:
- *Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User’s Guide for mod_plsql*

The chapter contains the following topics:

- **Using OWA_COOKIE**
  - Overview
  - Types
  - Rules and Limits
- **Summary of OWA_COOKIE Subprograms**
Using OWA_COOKIE

- Overview
- Types
- Rules and Limits
Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client’s sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.
This datatype contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
    name VARCHAR2(4000),
    vals vc_arr,
    num_vals INTEGER);
```
Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.
### Summary of OWA_COOKIE Subprograms

<table>
<thead>
<tr>
<th>Table 212-1</th>
<th>OWA_COOKIE Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>GET Function on page 212-7</td>
<td>Gets the value of the specified cookie</td>
</tr>
<tr>
<td>GET_ALL Procedure on page 212-8</td>
<td>Gets all cookie name-value pairs</td>
</tr>
<tr>
<td>REMOVE Procedure on page 212-9</td>
<td>Removes the specified cookie</td>
</tr>
<tr>
<td>SEND procedure on page 212-10</td>
<td>Generates a &quot;Set-Cookie&quot; line in the HTTP header</td>
</tr>
</tbody>
</table>
GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

OWA_COOKIE.GET(
    name IN VARCHAR2
) RETURN COOKIE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
</tbody>
</table>

Return Values

OWA_COOKIE.COOKIE DATA TYPE.
GET_ALL Procedure

This procedure returns all cookie names and their values from the client’s browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(
    names OUT vc_arr,
    vals OUT vc_arr,
    num_vals OUT INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>The names of the cookies.</td>
</tr>
<tr>
<td>vals</td>
<td>The values of the cookies.</td>
</tr>
<tr>
<td>num_vals</td>
<td>The number of cookie-value pairs.</td>
</tr>
</tbody>
</table>
**REMOVE Procedure**

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

**Syntax**

```sql
OWA_COOKIE.REMOVE(
    name IN VARCHAR2,
    val IN VARCHAR2,
    path IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie to expire.</td>
</tr>
<tr>
<td>val</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>path</td>
<td>[Currently unused]</td>
</tr>
</tbody>
</table>
SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

Syntax

```plsql
OWA_COOKIE.SEND(
    name in varchar2,
    value in varchar2,
    expires in date DEFAULT NULL,
    path in varchar2 DEFAULT NULL,
    domain in varchar2 DEFAULT NULL,
    secure in varchar2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the cookie.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the cookie.</td>
</tr>
<tr>
<td>expires</td>
<td>The date at which the cookie will expire</td>
</tr>
<tr>
<td>path</td>
<td>The value for the path field.</td>
</tr>
<tr>
<td>domain</td>
<td>The value for the domain field.</td>
</tr>
<tr>
<td>secure</td>
<td>If the value of this parameter is not NULL, the &quot;secure&quot; field is added to the line.</td>
</tr>
</tbody>
</table>
The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

Using OWA_IMAGE

- Overview
- Types
- Variables
- Examples
Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.
Types

This datatype (point) contain the X and Y values of a coordinate, and so provides the coordinates of a user’s click on an imagemap. It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```
Variables

This package variable (null_point) of TYPE POINT is used to default point parameters. Both the X and the Y fields of this variable are NULL.
CREATE OR REPLACE PROCEDURE process_image
    (my_img in OWA_IMAGE.POINT)
    AS
    x integer := OWA_IMAGE.GET_X(my_img);
    y integer := OWA_IMAGE.GET_Y(my_img);
    BEGIN
    /* process the coordinate */
    END
# Summary of OWA_IMAGE Subprograms

## Table 214–1  OWA_IMAGE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_X Function on page 214-8</td>
<td>Gets the X value of a point type</td>
</tr>
<tr>
<td>GET_Y Function on page 214-9</td>
<td>Gets the Y value of a point type</td>
</tr>
</tbody>
</table>
GET_X Function

This function returns the x coordinate of the point where the user clicked on an image map.

Syntax

```sql
OWA_IMAGE.GET_X(
p        IN        point)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

Return Values

The X coordinate as an integer.
GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(
    p        IN        point)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>The point where the user clicked.</td>
</tr>
</tbody>
</table>

Return Values

The Y coordinate as an integer.
The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

**See Also:** For more information about implementation of this package:

This chapter contains the following topics:
- **Using OWA_OPT_LOCK**
  - Overview
  - Types
- **Summary of OWA OPT LOCK Subprograms**
Using OWA_OPT_LOCK

- Overview
- Types
Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The OWA_OPT_LOCK package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.

- The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.
This datatype is a PL/SQL table intended to hold ROWIDs.

```plaintext
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR` DATA TYPE.
## Summary of OWA_OPT_LOCK Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECKSUM Functions on page 215-6</td>
<td>Returns the checksum value</td>
</tr>
<tr>
<td>GET_ROWID Function on page 215-7</td>
<td>Returns the ROWID value</td>
</tr>
<tr>
<td>STORE_VALUES Procedure on page 215-8</td>
<td>Stores unmodified values in hidden fields for later verification</td>
</tr>
<tr>
<td>VERIFY_VALUES Function on page 215-9</td>
<td>Verifies the stored values against modified values</td>
</tr>
</tbody>
</table>
CHECKSUM Functions

This function returns a checksum value for a specified string, or for a row in a table. For a row in a table, the function calculates the checksum value based on the values of the columns in the row. This function comes in two versions.

The first version returns a checksum based on the specified string. This is a "pure" 32-bit checksum executed by the database and based on the Internet 1 protocol.

The second version returns a checksum based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

**OWA_OPT_LOCK.CHECKSUM**(
  p_buff IN VARCHAR2
) RETURN NUMBER;

**OWA_OPT_LOCK.CHECKSUM**(
  p_owner IN VARCHAR2,
  p_tname IN VARCHAR2,
  p_rowid IN ROWID
) RETURN NUMBER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_buff</td>
<td>The nstring where you want to calculate the checksum.</td>
</tr>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The table name.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row in p_tname where you want to calculate the checksum value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids.</td>
</tr>
</tbody>
</table>
GET_ROWID Function

This function returns the ROWID datatype from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```plaintext
OWA_OPT_LOCK.GET_ROWID(
    p_old_values IN vcarray)
RETURN ROWID;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_old_values</td>
<td>This parameter is usually passed in from an HTML form.</td>
</tr>
</tbody>
</table>
STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```sql
OWA_OPT_LOCK.STORE_VALUES(
    p_owner IN VARCHAR2,
    p_tname IN VARCHAR2,
    p_rowid IN ROWID);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_owner</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>p_tname</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>p_rowid</td>
<td>The row where you want to store values.</td>
</tr>
</tbody>
</table>

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.
VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query. Use this function with the STORE_VALUES Procedure.

Syntax

OWA_OPT_LOCK.VERIFY_VALUES(
    p_old_values IN vcarray)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_old_values</td>
<td>A PL/SQL table containing the following information:</td>
</tr>
<tr>
<td></td>
<td>■ p_old_values(1) specifies the owner of the table.</td>
</tr>
<tr>
<td></td>
<td>■ p_old_values(2) specifies the table.</td>
</tr>
<tr>
<td></td>
<td>■ p_old_values(3) specifies the rowid of the row to verify.</td>
</tr>
<tr>
<td></td>
<td>The remaining indexes contain values for the columns in the table.</td>
</tr>
<tr>
<td></td>
<td>Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if no other update has been performed, otherwise FALSE.
The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

See Also: For more information about implementation of this package:

- Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server
- Oracle Fusion Middleware User’s Guide for mod_plsql

The chapter contains the following topics:

- Using OWA_PATTERN
  - Types
  - Operational Notes
- Summary of OWA_PATTERN Subprograms
Using OWA_PATTERN

- Types
- Operational Notes
Using OWA_PATTERN

Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to OWA_PATTERN function calls, and it only has to be parsed once.

- OWA_PATTERN.PATTERN
The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions
of MATCH, and four each of AMATCH and CHANGE. The subprograms use the following
parameters:

- **line** - This is the target to be examined for a match. It can be more than one line of
text or a owa_text.multi_line datatype.

- **pat** - This is the pattern that the subprograms attempt to locate in line. The pattern
can contain regular expressions. In the owa_pattern.change function and
procedure, this parameter is called from_str.

- **flags** - This specifies whether the search is case-sensitive or if substitutions are
done globally.

Use regular expressions with the subprograms in this package. You Specify a regular
expression by creating the string you want to match interspersed with various
wildcard tokens and quantifiers.

- **Wildcards**
- **Quantifiers**
- **Flags**

**Wildcards**

Wildcard tokens match something other than themselves:

<table>
<thead>
<tr>
<th>Token</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches newline or the beginning of the target</td>
</tr>
<tr>
<td>$</td>
<td>Matches newline or the end of the target</td>
</tr>
<tr>
<td>\n</td>
<td>Matches newline</td>
</tr>
<tr>
<td>.</td>
<td>Matches any character except newline</td>
</tr>
<tr>
<td>\t</td>
<td>Matches tab</td>
</tr>
<tr>
<td>\d</td>
<td>Matches digits [0-9]</td>
</tr>
<tr>
<td>\D</td>
<td>Matches non-digits [not 0-9]</td>
</tr>
<tr>
<td>\w</td>
<td>Matches word characters (0-9, a-z, A-Z, or _)</td>
</tr>
<tr>
<td>\W</td>
<td>Matches non-word characters (not 0-9, a-z, A-Z, or _)</td>
</tr>
<tr>
<td>\s</td>
<td>Matches whitespace characters (blank, tab, or newline).</td>
</tr>
<tr>
<td>\S</td>
<td>Matches non-whitespace characters (not blank, tab, or newline)</td>
</tr>
<tr>
<td>\b</td>
<td>Matches &quot;word&quot; boundaries (between \w and \W)</td>
</tr>
<tr>
<td>\x&lt;HEX&gt;</td>
<td>Matches the value in the current character set of the two hexadecimal digits</td>
</tr>
<tr>
<td>&lt;OCT&gt;</td>
<td>Followed by any character not covered by another case matches that character</td>
</tr>
</tbody>
</table>
| \    | Applies only to CHANGE. This causes the string that matched the regular
expression to be included in the string that replaces it. This differs from the
other tokens in that it specifies how a target is changed rather than how it is
matched. This is explained further under CHANGE Functions and Procedures. |
Quantifiers

Any tokens except `&` can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

**Table 216–2  Quantifiers**

<table>
<thead>
<tr>
<th>Quantifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>0 or 1 occurrence(s)</td>
</tr>
<tr>
<td>*</td>
<td>0 or more occurrences</td>
</tr>
<tr>
<td>+</td>
<td>1 or more occurrence(s)</td>
</tr>
<tr>
<td>(n)</td>
<td>Exactly <code>n</code> occurrences</td>
</tr>
<tr>
<td>(n, )</td>
<td>At least <code>n</code> occurrences</td>
</tr>
<tr>
<td>(n, m)</td>
<td>At least <code>n</code>, but not more than <code>m</code>, occurrences</td>
</tr>
</tbody>
</table>

Flags

In addition to targets and regular expressions, the `OWA_PATTERN` functions and procedures use flags to affect how they are interpreted.

**Table 216–3  Flags**

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>This indicates a case-insensitive search.</td>
</tr>
<tr>
<td>g</td>
<td>This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.</td>
</tr>
</tbody>
</table>
### Summary of OWA_PATTERN Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMATCH Function on page 216-7</td>
<td>Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur</td>
</tr>
<tr>
<td>CHANGE Functions and Procedures on page 216-9</td>
<td>Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced</td>
</tr>
<tr>
<td>GETPAT Procedure on page 216-11</td>
<td>Generates a pattern datatype from a VARCHAR2 type</td>
</tr>
<tr>
<td>MATCH Function on page 216-12</td>
<td>Determines if a string contains the specified pattern</td>
</tr>
</tbody>
</table>
**AMATCH Function**

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern datatype.

- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern datatype.

---

**Note:** If multiple overlapping strings match the regular expression, this function takes the longest match.

---

**Syntax**

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2,
    from_loc IN INTEGER,
    pat IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2,
    from_loc IN INTEGER,
    pat IN OUT PATTERN,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2
    from_loc IN INTEGER
    pat in varchar2
    backrefs OUT owa_text.vc_arr
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```sql
OWA_PATTERN.AMATCH(
    line IN VARCHAR2
    from_loc IN INTEGER
    pat IN OUT PATTERN
    backrefs OUT owa_text.vc_arr
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The text to search in.</td>
</tr>
</tbody>
</table>
### Table 216–5 (Cont.) AMATCH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_loc</td>
<td>The location (in number of characters) in line where the search is to begin.</td>
</tr>
<tr>
<td>pat</td>
<td>The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.</td>
</tr>
<tr>
<td>backrefs</td>
<td>The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.</td>
</tr>
<tr>
<td>flags</td>
<td>Whether or not the search is case-sensitive. If the value of this parameter is &quot;I&quot;, the search is case-insensitive. Otherwise the search is case-sensitive.</td>
</tr>
</tbody>
</table>

### Return Values

The index of the character after the end of the match, counting from the beginning of line. If there was no match, the function returns 0.
CHANGE Functions and Procedures

This function or procedure searches and replaces a string or multi_line datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE(
    line IN OUT VARCHAR2,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
owa_pattern.change(
    mline IN OUT owa_text.multi_line,
    from_str IN VARCHAR2,
    to_str IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>The text to search in. The output value of this parameter is the altered string.</td>
</tr>
<tr>
<td>mline</td>
<td>The text to search in. This is a owa_text.multi_line datatype. The output value of this parameter is the altered string.</td>
</tr>
<tr>
<td>from_str</td>
<td>The regular expression to replace.</td>
</tr>
<tr>
<td>to_str</td>
<td>The substitution pattern.</td>
</tr>
<tr>
<td>flags</td>
<td>Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If &quot;i&quot; is specified, the search is case-insensitive. If &quot;g&quot; is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.</td>
</tr>
</tbody>
</table>

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.
Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red". If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found     INTEGER;
BEGIN
    theline := 'what is the goal?';
    num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
    HTP.PRINT(num_found); -- num_found is 1
    HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```
GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

```sql
OWA_PATTERN.GETPAT (
    arg      IN      VARCHAR2,
    pat      IN OUT  pattern);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg</td>
<td>The string to convert.</td>
</tr>
<tr>
<td>pat</td>
<td>the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.</td>
</tr>
</tbody>
</table>
MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```sql
owa_pattern.match(
    line IN VARCHAR2,
    pat IN VARCHAR2,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    line IN VARCHAR2,
    pat IN OUT PATTERN,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    line IN VARCHAR2,
    pat IN VARCHAR2,
    backrefs OUT owa_text.vc_arr,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
    line IN VARCHAR2,
    pat IN OUT PATTERN,
    backrefs OUT owa_text.vc_arr,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    mline IN owa_text.multi_line,
    pat IN VARCHAR2,
    rlist OUT owa_text.row_list,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
    mline IN owa_text.multi_line,
    pat IN OUT pattern,
    rlist OUT owa_text.row_list,
    flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Table 216–8  MATCH Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>line</td>
</tr>
<tr>
<td>mline</td>
</tr>
</tbody>
</table>
### Return Values

TRUE if a match was found, FALSE otherwise.

### Examples

**KAZOO** is the target where it is searching for the *zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of **zoo**, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```plaintext
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in `sometext`. If found,

```plaintext
sometext VARCHAR2(256);
pat VARCHAR2(256);
sometext := 'what is the goal?'
pat := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
    HTP.PRINT('Match found');
ELSE
    HTP.PRINT('Match not found');
END IF;
```

### Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create an OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.

- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.
If the line is a string and not a multi_line, you can add an optional output parameter called backrefs. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
The OWA_SEC package provides an interface for custom authentication.

Operational Notes

Parameters that have default values are optional.
### Summary of OWA_SEC Subprograms

<table>
<thead>
<tr>
<th>Table 217–1</th>
<th>OWA_SEC Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>GET_CLIENT_HOSTNAME Function on page 217-5</td>
<td>Returns the client’s hostname</td>
</tr>
<tr>
<td>GET_CLIENT_IP Function on page 217-6</td>
<td>Returns the client’s IP address</td>
</tr>
<tr>
<td>GET_PASSWORD Function on page 217-7</td>
<td>Returns the password that the user entered</td>
</tr>
<tr>
<td>GET_USER_ID Function on page 217-8</td>
<td>Returns the username that the user entered</td>
</tr>
<tr>
<td>SET_AUTHORIZATION Procedure on page 217-9</td>
<td>Enables the PL/SQL application to use custom authentication</td>
</tr>
<tr>
<td>SET_PROTECTION_REALM Procedure on page 217-10</td>
<td>Defines the realm that the page is in</td>
</tr>
</tbody>
</table>
GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

OWA_SEC.GET_CLIENT_HOSTNAME
RETURN VARCHAR2;

Return Values

The hostname.
GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```sql
OWA_SEC.GET_CLIENT_IP
    RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address` datatype is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is `123.45.67.89` and the variable `ipaddr` is of the `owa_util.ip_address` datatype, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```
**GET_PASSWORD Function**

This function returns the password that the user used to log in.

**Syntax**

```
OWA_SEC.GET_PASSWORD
RETURN VARCHAR2;
```

**Return Values**

The password.

**Usage Notes**

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.
GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```plsql
OWA_SEC.GET_USER_ID
RETURN VARCHAR2;
```

Return Values

The username.
SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway. This implements your authorize function, which authorizes the user before his requested procedure is run. The placement of the authorize function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme         IN       INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheme</td>
<td>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</td>
</tr>
<tr>
<td>OWA_SEC.NO_CHECK</td>
<td>Specifies that the PL/SQL application is not to do any custom authentication. This is the default.</td>
</tr>
<tr>
<td>OWA_SEC.GLOBAL</td>
<td>Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the &quot;sys&quot; schema.</td>
</tr>
<tr>
<td>OWA_SEC.PER_PACKAGE</td>
<td>Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.AUTHORIZE function in the user’s schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user’s schema is called.</td>
</tr>
<tr>
<td>OWA_SEC.CUSTOM</td>
<td>Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user’s schema is called to authorize the user. If the user’s schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the &quot;sys&quot; schema. The custom authorize function has the following signature:</td>
</tr>
<tr>
<td>FUNCTION AUTHORIZE</td>
<td></td>
</tr>
<tr>
<td>RETURN BOOLEAN;</td>
<td></td>
</tr>
</tbody>
</table>

If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.
SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
    realm     IN     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>realm</td>
<td>The realm where the page belongs. This string is displayed to the user.</td>
</tr>
</tbody>
</table>
The OWA_TEXT package contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.

**See Also:** For more information about implementation of this package:

- Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server
- Oracle Fusion Middleware User’s Guide for mod_plsql

The chapter contains the following topics:

- Using OWA_TEXT
  - Types
- Summary of OWA_TEXT Subprograms
Using OWA_TEXT

- Types
Types

- MULTI_LINE DATA TYPE
- ROW_LIST DATA TYPE
- VC_ARR DATA TYPE

MULTI_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT, contains the text data in the record.

```
TYPE multi_line IS RECORD ( rows vc_arr, num_rows INTEGER, partial_row BOOLEAN);
```

ROW_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD ( rows int_arr, num_rows INTEGER);

int_arr IS DEFINED AS:

TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```
## Summary of OWA_TEXT Subprograms

Table 218–1  OWA_TEXT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD2MULTI Procedure on page 218-5</td>
<td>Adds text to an existing multi_line type</td>
</tr>
<tr>
<td>NEW_ROW_LIST Function and Procedure on page 218-6</td>
<td>Creates a new row_list</td>
</tr>
<tr>
<td>PRINT_MULTI Procedure on page 218-7</td>
<td>Prints out the contents of a multi_list</td>
</tr>
<tr>
<td>PRINT_ROW_LIST Procedure on page 218-8</td>
<td>Prints out the contents of a row_list</td>
</tr>
<tr>
<td>STREAM2MULTI Procedure on page 218-9</td>
<td>Converts a varchar2 to a multi_line type</td>
</tr>
</tbody>
</table>
ADD2MULTI Procedure

This procedure adds content to an existing MULTI_LINE DATA TYPE.

Syntax

```sql
OWA_TEXT.ADD2MULTI (  
    stream IN VARCHAR2,  
    mline IN OUT multi_line,  
    continue IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>The text to add.</td>
</tr>
<tr>
<td>mline</td>
<td>The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <code>stream</code>.</td>
</tr>
<tr>
<td>continue</td>
<td>If TRUE, the procedure appends <code>stream</code> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <code>stream</code> in a new row.</td>
</tr>
</tbody>
</table>
NEW_ROW_LIST Function and Procedure

This function or procedure creates a new OWA_TEXT.ROW_LIST DATA TYPE. The function version uses no parameters and returns a new empty row_list. The procedure version creates the row_list datatype as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
RETURN ROW_LIST;
```

```
OWA_TEXT.NEW_ROW_LIST(
    rlist    OUT     row_list);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rlist</td>
<td>This is an output parameter containing the new row_list datatype</td>
</tr>
</tbody>
</table>

Return Values

The function version returns the new row_list datatype.
PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_MULTI(
  mline       IN       multi_line);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mline</td>
<td>The multi_line datatype to print.</td>
</tr>
</tbody>
</table>

Return Values

The contents of the multi_line.
PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.ROW_LIST DATA TYPE.

Syntax

```plsql
OWA_TEXT.PRINT_ROW_LIST(
    rlist       IN       multi_line);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rlist</td>
<td>The row_list datatype to print.</td>
</tr>
</tbody>
</table>

Return Values

The contents of the row_list.
**STREAM2MULTI Procedure**

This procedure converts a string to a `multi_line` datatype.

**Syntax**

```
OWA_TEXT.STREAM2MULTI(
    stream IN VARCHAR2,
    mline OUT multi_line);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>The string to convert.</td>
</tr>
<tr>
<td>mline</td>
<td>The stream in <code>OWA_TEXT.MULTI_LINE</code> data type format</td>
</tr>
</tbody>
</table>
The OWA_UTIL package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator’s Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User’s Guide for mod_plsql*

This chapter contains the following topics:

- **Using OWA_UTIL**
  - Overview
  - Types
- **Summary of OWA_UTIL Subprograms**
Using OWA_UTIL

- Overview
- Types
Overview

The OWA_UTIL package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.
Types

- DATETYPE Datatype
- IDENT_ARR Datatype
- IP_ADDRESS Datatype

DATETYPE Datatype

The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```sql
TYPE dateType IS Table OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

IDENT_ARR Datatype

This datatype is used for an array.

```sql
TYPE ident_arr IS Table OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

IP_ADDRESS Datatype

This datatype is used by the GET_CLIENT_IP Function in the "OWA_SEC" package on page 217-1.

```sql
TYPE ip_address IS Table OF INTEGER INDEX BY BINARY_INTEGER;
```
## Summary of OWA_UTIL Subprograms

### Table 219–1  OWA_UTIL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BIND_VARIABLES Function</strong> on page 219-6</td>
<td>Prepares a SQL query and binds variables to it</td>

<td>Converts dateType data to the standard PL/SQL date type</td>
</tr>
<tr>
<td><strong>WHO_CALLED_ME Procedure</strong> on page 219-27</td>
<td>Returns information on the caller of the procedure.</td>
</tr>
</tbody>
</table>
BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```sql
OWA_UTIL.BIND_VARIABLES(
  theQuery IN VARCHAR2 DEFAULT NULL,
  bv1Name IN VARCHAR2 DEFAULT NULL,
  bv1Value IN VARCHAR2 DEFAULT NULL,
  bv2Name IN VARCHAR2 DEFAULT NULL,
  bv2Value IN VARCHAR2 DEFAULT NULL,
  bv3Name IN VARCHAR2 DEFAULT NULL,
  bv3Value IN VARCHAR2 DEFAULT NULL,
  ...
  bv25Name IN VARCHAR2 DEFAULT NULL,
  bv25Value IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>theQuery</td>
<td>The SQL query statement which must be a SELECT statement</td>
</tr>
<tr>
<td>bv1Name</td>
<td>The name of the variable</td>
</tr>
<tr>
<td>bv1Value</td>
<td>The value of the variable</td>
</tr>
</tbody>
</table>

Return Values

An integer identifying the opened cursor.
CALENDARPRINT Procedures

These procedures create a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.
- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

OWA_UTIL.CALENDARPRINT(
  p_query IN VARCHAR2,
  p_mf_only IN VARCHAR2 DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
  p_cursor IN INTEGER,
  p_mf_only IN VARCHAR2 DEFAULT 'N');

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_query</td>
<td>A PL/SQL query.</td>
</tr>
<tr>
<td>p_cursor</td>
<td>A PL/SQL cursor containing the same format as p_query.</td>
</tr>
<tr>
<td>p_mf_only</td>
<td>If &quot;N&quot; (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.</td>
</tr>
</tbody>
</table>

Usage Notes

Design your query as follows:
- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.
CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the "HTF" package on page 207-1.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```sql
OWL_UTIL.CELLSPRINT(
  p_colCnt IN INTEGER,
  p_resultTbl IN vc_arr,
  p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWL_UTIL.CELLSPRINT(
  p_theQuery IN VARCHAR2,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWL_UTIL.CELLSPRINT(
  p_theCursor IN INTEGER,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL);

OWL_UTIL.CELLSPRINT(
  p_theQuery IN VARCHAR2,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL,
  p_skip_rec IN NUMBER DEFAULT 0,
  p_more_data OUT BOOLEAN);

OWL_UTIL.CELLSPRINT(
  p_theCursor IN INTEGER,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL,
  p_skip_rec IN NUMBER DEFAULT 0,
  p_more_data OUT BOOLEAN);

OWL_UTIL.CELLSPRINT(
  p_theQuery IN VARCHAR2,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL,
  p_reccnt OUT NUMBER);

OWL_UTIL.CELLSPRINT(
  p_theCursor IN INTEGER,
  p_max_rows IN NUMBER DEFAULT 100,
  p_format_numbers IN VARCHAR2 DEFAULT NULL,
  p_reccnt OUT NUMBER);
```
Summary of OWA_UTIL Subprograms

```sql
p_theCursor IN INTEGER,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_reccnt OUT NUMBER);
```

```sql
OWA_UTIL.CELLSPRINT(
p_theQuery IN VARCHAR2,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_skip_rec IN NUMBER DEFAULT 0,
p_more_data OUT BOOLEAN
p_reccnt OUT NUMBER);
```

```sql
OWA_UTIL.CELLSPRINT(
p_theCursor IN INTEGER,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_skip_rec IN NUMBER DEFAULT 0,
p_more_data OUT BOOLEAN,
p_reccnt OUT NUMBER);
```

## Parameters

**Table 219–4  CELLSPRINT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_query</td>
<td>A PL/SQL query.</td>
</tr>
<tr>
<td>p_colCnt</td>
<td>The number of columns in the table.</td>
</tr>
<tr>
<td>p_theQuery</td>
<td>A SQL SELECT statement.</td>
</tr>
<tr>
<td>p_theCursor</td>
<td>A cursor ID. This can be the return value from the BIND_VARIABLES Function.</td>
</tr>
<tr>
<td>p_max_rows</td>
<td>The maximum number of rows to print.</td>
</tr>
<tr>
<td>p_format_numbers</td>
<td>If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.</td>
</tr>
<tr>
<td>p_skip_rec</td>
<td>The number of rows to exclude from the HTML table.</td>
</tr>
<tr>
<td>p_more_data</td>
<td>TRUE if there are more rows in the query or cursor, FALSE otherwise.</td>
</tr>
<tr>
<td>p_reccnt</td>
<td>The number of rows that have been returned by the query. This value does not include skipped rows (if any).</td>
</tr>
<tr>
<td>p_resultTbl</td>
<td>The index table which will contain the result of the query. Each entry in the query will correspond to one column value.</td>
</tr>
</tbody>
</table>

## Examples

This procedure generates

```html
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```
CHOUSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```sql
OWA_UTIL.CHOOSE_DATE(
  p_name  IN  VARCHAR2,
  p_date  IN  DATE DEFAULT SYSDATE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_name</td>
<td>The name of the form elements.</td>
</tr>
<tr>
<td>p_date</td>
<td>The initial date that is selected when the HTML page is displayed.</td>
</tr>
</tbody>
</table>

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a `GET_CGI_ENV Function`.
- Use the `TODATE Function` to convert the `GET_CGI_ENV Function` value to the standard Oracle DATE datatype.

Examples

```html
<SELECT NAME="p_name" SIZE="1">
  <OPTION value="01">1
    ...
  <OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
  <OPTION value="01">JAN
    ...
  <OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
  <OPTION value="1992">1992
    ...
  <OPTION value="2002">2002
</SELECT>
```
GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```sql
OWA_UTIL.GET_CGI_ENV(
    param_name     IN      VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param_name</td>
<td>The name of the CGI environment variable. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.
GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```plsql
OWA_UTIL.GET_OWA_SERVICE_PATH
RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.
GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```sql
OWA_UTIL.GET_PROCEDURE
RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.
**HTTP_HEADER_CLOSE Procedure**

This procedure generates a newline character to close the HTTP header.

**Syntax**

```sql
OWA_UTIL.HTTP_HEADER_CLOSE;
```

**Return Values**

A newline character, which closes the HTTP header.

**Usage Notes**

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as `MIME_HEADER Procedure`, `REDIRECT_URL Procedure`, or `STATUS_LINE Procedure`.
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRNT` calls.
LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the `BIND_VARIABLES` Function.

Syntax

```sql
OWA_UTIL.LISTPRINT(
    p_theQuery IN VARCHAR2,
    p_cname IN VARCHAR2,
    p_nsize IN NUMBER,
    p_multiple IN BOOLEAN DEFAULT FALSE);
```

```sql
OWA_UTIL.LISTPRINT(
    p_theCursor IN INTEGER,
    p_cname IN VARCHAR2,
    p_nsize IN NUMBER,
    p_multiple IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_theQuery</td>
<td>The SQL query.</td>
</tr>
<tr>
<td>p_theCursor</td>
<td>The cursor ID. This can be the return value from the <code>BIND_VARIABLES</code> Function.</td>
</tr>
<tr>
<td>p_cname</td>
<td>The name of the HTML form element.</td>
</tr>
<tr>
<td>p_nsize</td>
<td>The size of the form element (this controls how many items the user can see without scrolling).</td>
</tr>
<tr>
<td>p_multiple</td>
<td>Whether multiple selection is permitted.</td>
</tr>
</tbody>
</table>

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the `VALUE` attribute of the `OPTION` tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as `SELECTED` in the `OPTION` tag. If the value is not `NULL`, the row is selected.

Examples

```html
<SELECT NAME="p_cname" SIZE="p_nsize">
  <OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
  <OPTION value='value_from_the_first_column'>value_from_the_second_column
  ...
</SELECT>
```
MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any \texttt{HTP.PRINT} or \texttt{HTP.PRN} calls to direct the script not to use the default MIME header.

Syntax

\begin{verbatim}
OWA_UTIL.MIME_HEADER(
    ccontent_type   IN VARCHAR2 DEFAULT 'text/html',
    bclose_header   IN BOOLEAN DEFAULT TRUE,
    ccharset   IN VARCHAR2 DEFAULT NULL);
\end{verbatim}

Parameters

\begin{table}[h]
\centering
\caption{MIME_HEADER Procedure Parameters}
\begin{tabular}{ll}
\hline
Parameter   & Description                                                                 \\
\hline
ccontent_type & The MIME type to generate                                                   \\
bclose_header & Whether or not to close the HTTP header. If \texttt{TRUE}, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open. \\
ccharset & The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on. \\
\hline
\end{tabular}
\end{table}

Examples

\texttt{Content-type: <ccontent_type>; charset=<ccharset>}

so that

\begin{verbatim}
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
\end{verbatim}

generates

\texttt{Content-type: text/plain; charset=ISO-8859-4\n}
PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

OWA_UTIL.PRINT_CGI_ENV;

Examples

This procedure generates a list in the following format:

cgi_env_var_name = value

REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

Syntax

```sql
OWA_UTIL.REDIRECT_URL(
    curl IN VARCHAR2,
    bclose_header IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>curl</td>
<td>The URL to visit.</td>
</tr>
<tr>
<td>bclose_header</td>
<td>Whether or not to close the HTTP header. If <code>TRUE</code>, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

```
Location: <curl>
```
SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

OWA_UTIL.SHOWPAGE;

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the DBMS_OUTPUT package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.
SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```sql
OWA_UTIL.SHOWSOURCE (  
cname IN VARCHAR2) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The function or procedure whose source you want to show.</td>
</tr>
</tbody>
</table>
**SIGNATURE procedure**

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

**Syntax**

```sql
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (cname IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cname</td>
<td>The function or procedure whose source you want to show.</td>
</tr>
</tbody>
</table>

**Examples**

Without a parameter, the procedure generates a line that looks like the following:

This page was produced by the **PL/SQL Agent** on August 9, 2001 09:30.

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

This page was produced by the **PL/SQL Agent** on 8/09/01 09:30
View PL/SQL Source
STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```plsql
OWA_UTIL.STATUS_LINE(
    nstatus IN INTEGER,
    creason IN VARCHAR2 DEFAULT NULL,
    bclose_header IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nstatus</td>
<td>The status code.</td>
</tr>
<tr>
<td>creason</td>
<td>The string for the status code.</td>
</tr>
<tr>
<td>bclose_header</td>
<td>Whether or not to close the HTTP header. If <code>TRUE</code>, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.</td>
</tr>
</tbody>
</table>

Examples

This procedure generates

```
Status: <nstatus> <creason>
```

TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```sql
OWA_UTIL.TABLEPRINT(
  ctable IN VARCHAR2,
  cattributes IN VARCHAR2 DEFAULT NULL,
  ntable_type IN INTEGER DEFAULT HTML_TABLE,
  ccolumns IN VARCHAR2 DEFAULT '*',
  cclauses IN VARCHAR2 DEFAULT NULL,
  ccolAliases IN VARCHAR2 DEFAULT NULL,
  nrow_min IN NUMBER DEFAULT 0,
  nrow_max IN NUMBER DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctable</td>
<td>The database table.</td>
</tr>
<tr>
<td>cattributes</td>
<td>Other attributes to be included as-is in the tag.</td>
</tr>
<tr>
<td>ntable_type</td>
<td>How to generate the table. Specify HTML_TABLE to generate the table using <code>&lt;TABLE&gt;</code> tags or PRE_TABLE to generate the table using the <code>&lt;PRE&gt;</code> tags. These are constants:</td>
</tr>
<tr>
<td></td>
<td>- HTML_TABLE CONSTANT INTEGER := 1;</td>
</tr>
<tr>
<td></td>
<td>- PRE_TABLE CONSTANT INTEGER := 2;</td>
</tr>
<tr>
<td>ccolumns</td>
<td>A comma-delimited list of columns from ctable to include in the generated table.</td>
</tr>
<tr>
<td>cclauses</td>
<td>WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.</td>
</tr>
<tr>
<td>ccolAliases</td>
<td>A comma-delimited list of headings for the generated table.</td>
</tr>
<tr>
<td>nrow_min</td>
<td>The first row, of those retrieved, to display.</td>
</tr>
<tr>
<td>nrow_max</td>
<td>The last row, of those retrieved, to display.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, cattributes is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:
CREATE OR REPLACE PROCEDURE showemps IS 
  ignore_more BOOLEAN;
BEGIN 
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;

Requesting a URL such as
http://myhost:7777/pls/hr/showemps

returns to the following to the client:

<pre>
<table>
<thead>
<tr>
<th>EMPNO</th>
<th>ENAME</th>
<th>JOB</th>
<th>HIREDATE</th>
<th>SAL</th>
<th>COMM</th>
<th>DEPTNO</th>
</tr>
</thead>
<tbody>
<tr>
<td>7369</td>
<td>SMITH</td>
<td>CLERK</td>
<td>17-DEC-80</td>
<td>800</td>
<td></td>
<td>20</td>
</tr>
<tr>
<td>7499</td>
<td>ALLEN</td>
<td>SALESMAN</td>
<td>20-FEB-81</td>
<td>1600</td>
<td>300</td>
<td>30</td>
</tr>
<tr>

</table>
</pre>

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

CREATE OR REPLACE PROCEDURE showemps_10 IS 
  ignore_more BOOLEAN;
begin 
  ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
    'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
    'Employee Number, Name, Salary');
END;

A request for a URL like
http://myhost:7777/pls/hr/showemps_10

would return the following to the client:

<pre>
<table>
<thead>
<tr>
<th>Employee Number</th>
<th>Name</th>
<th>Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>7782</td>
<td>CLARK</td>
<td>2450</td>
</tr>
<tr>
<td>7839</td>
<td>KING</td>
<td>5000</td>
</tr>
<tr>
<td>7934</td>
<td>MILLER</td>
<td>1300</td>
</tr>
</tbody>
</table>
</pre>
For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
    ignore_more BOOLEAN;
BEGIN
    ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

http://myhost:7777/pls/hr/showdept

would return the following to the client:

```
<TABLE BORDER>
<TR>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
</TR>
<TR>
<td ALIGN="LEFT">10</td>
<td ALIGN="LEFT">ACCOUNTING</td>
<td ALIGN="LEFT">NEW YORK</td>
</TR>
<TR>
<td ALIGN="LEFT">20</td>
<td ALIGN="LEFT">RESEARCH</td>
<td ALIGN="LEFT">DALLAS</td>
</TR>
<TR>
<td ALIGN="LEFT">30</td>
<td ALIGN="LEFT">SALES</td>
<td ALIGN="LEFT">CHICAGO</td>
</TR>
<TR>
<td ALIGN="LEFT">40</td>
<td ALIGN="LEFT">OPERATIONS</td>
<td ALIGN="LEFT">BOSTON</td>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

<table>
<thead>
<tr>
<th>DEPTNO</th>
<th>DNAME</th>
<th>LOC</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>ACCOUNTING</td>
<td>NEW YORK</td>
</tr>
<tr>
<td>20</td>
<td>RESEARCH</td>
<td>DALLAS</td>
</tr>
<tr>
<td>30</td>
<td>SALES</td>
<td>CHICAGO</td>
</tr>
</tbody>
</table>
TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

Syntax

```sql
OWA_UTIL.TODATE(
    p_dateArray      IN     dateType)
RETURN DATE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_dateArray</td>
<td>The value to convert.</td>
</tr>
</tbody>
</table>
WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME (
    owner OUT VARCHAR2,
    name OUT VARCHAR2,
    lineno OUT NUMBER,
    caller_t OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>The owner of the program unit.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.</td>
</tr>
<tr>
<td>lineno</td>
<td>The line number within the program unit where the call was made.</td>
</tr>
<tr>
<td>caller_t</td>
<td>The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.</td>
</tr>
</tbody>
</table>
WHO_CALLED_ME Procedure
The SDO_CS package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

- Documentation of SDO_CS
Documentation of SDO_CS

For a complete description of this package within the context of Oracle Spatial, see SDO_CS in the Oracle Spatial and Graph Developer’s Guide.
The SDO_CSW_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

- Documentation of SDO_CSW_PROCESS
For a complete description of this package within the context of Oracle Spatial, see SDO_CSW_PROCESS in the Oracle Spatial and Graph Developer’s Guide.
The SDO_GCDR package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

- Documentation of SDO_GCDR
Documentation of SDO_GCDR

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in Oracle Spatial and Graph Developer’s Guide.
The SDO_GEOM package contains the geometry functions, which can be grouped into the following categories (with examples of each):

- **Relationship (True/False) between two objects**: RELATE, WITHIN_DISTANCE
- **Validation**: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- **Single-object operations**: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- **Two-object operations**: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

This chapter contains the following topic:

- **Documentation of SDO_GEOM**
Documentation of SDO_GEOM

For a complete description of this package within the context of Oracle Spatial, see SDO_GEOM in the Oracle Spatial and Graph Developer’s Guide.
The SDO_GEOR package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

- Documentation of SDO_GEOR
Documentation of SDO_GEOR

For complete description of this package within the context of Oracle Spatial, see SDO_GEOR in the Oracle Spatial and Graph GeoRaster Developer’s Guide.
The SDO_GEOR_ADMIN package contains subprograms for administrative operations related to GeoRaster.

- Documentation of SDO_GEOR_ADMIN
For a complete description of this package within the context of Oracle Spatial, see SDO_GEOR_ADMIN in the Oracle Spatial and Graph GeoRaster Developer’s Guide.
The SDO_GEOR_AGGR package provides an interface to the SDO_GEOR_AGGR package for performing aggregate operations on GeoRaster objects.

- Documentation of SDO_GEOR_AGGR
For a complete description of this package within the context of Oracle Spatial, see SDO_GEOR_AGGR in the Oracle Spatial and Graph GeoRaster Developer’s Guide.
The SDO_GEOR_RA package provides an interface to the SDO_GEOR_RA package for performing raster algebra and analytic operations related to GeoRaster.

- Documentation of SDO_GEOR_RA
For a complete description of this package within the context of Oracle Spatial, see SDO_GEOR_RA in the Oracle Spatial and Graph GeoRaster Developer’s Guide.
The `SDO_GEOR_UTL` package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

- Documentation of `SDO_GEOR_UTL`
For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer’s Guide*. 
The SDO_LRS package contains functions that create, modify, query, and convert linear referencing elements.

- Documentation of SDO_LRS
Documentation of SDO_LRS

For a complete description of this package within the context of Oracle Spatial, see SDO_LRS in the Oracle Spatial and Graph Developer’s Guide.
The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- Documentation of SDO_MIGRATE
For a complete description of this package within the context of Oracle Spatial, see SDO_MIGRATE in the Oracle Spatial and Graph Developer’s Guide.
The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- Documentation of SDO_NET
For a complete description of this package within the context of Oracle Spatial, see
SDO_NET in the Oracle Spatial and Graph Topology Data Model and Network Data Model
Graph Developer’s Guide.
The SDO_OLS package contains subprograms for Spatial OpenLS support.

- Documentation of SDO_OLS
For a complete description of this package within the context of Oracle Spatial, see SDO_OLS in the Oracle Spatial and Graph Developer’s Guide.
The SDO_PC_PKG package contains subprograms to support the use of point clouds in Spatial.

- Documentation of SDO_PC_PKG
For a complete description of this package within the context of Oracle Spatial, see SDO_PC_PKG in the Oracle Spatial and Graph Developer’s Guide.
The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

- Documentation of SDO_SAM
Documentation of SDO_SAM

For a complete description of this package within the context of Oracle Spatial, see SDO_SAM in the Oracle Spatial and Graph Developer’s Guide.
The SDO_TIN_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

- Documentation of SDO_TIN_PKG
Documentation of SDO_TIN_PKG

For a complete description of this package within the context of Oracle Spatial, see SDO_TIN_PKG in the Oracle Spatial and Graph Developer’s Guide.
The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

- Documentation of SDO_TOPO
For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO in the Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide.
The SDO_TOPO_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

- Documentation of SDO_TOPO_MAP
For a complete description of this package within the context of Oracle Spatial, see \texttt{SDO\_TOPO\_MAP} in the \textit{Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide}. 
The SDO_TUNE package contains Spatial tuning functions and procedures.

- Documentation of SDO_TUNE
Documentation of SDO_TUNE

For complete description of this package within the context of Oracle Spatial, see SDO_TUNE in the Oracle Spatial and Graph Developer’s Guide.
The SDO_UTIL package contains the utility functions and procedures for Oracle Spatial.

- Documentation of SDO_UTIL
Documentation of SDO_UTIL

For complete description of this package within the context of Oracle Spatial, see SDO_UTIL in the Oracle Spatial and Graph Developer’s Guide.
The SDO_WFS_LOCK package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

- Documentation of SDO_WFS_LOCK
Documentation of SDO_WFS_LOCK

For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_LOCK in the Oracle Spatial and Graph Developer’s Guide.
The `SDO_WFS_PROCESS` package contains subprograms for various processing operations related to support for Web Feature Services.

- Documentation of SDO_WFS_PROCESS
Documentation of SDO_WFS_PROCESS

For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_PROCESS in the Oracle Spatial and Graph Developer’s Guide.
The SEM_APIS package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

- Documentation of SEM_APIS
Documentation of SEM_APIS

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_APIS in the Oracle Spatial and Graph RDF Semantic Graph Developer’s Guide.
The SEM_OLS package provides an interface to the SEM_OLS package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

- Documentation of SEM_OLS
Documentation of SEM_OLS

For a complete description of this package, see SEM_OLS in the Oracle Spatial and Graph RDF Semantic Graph Developer’s Guide.
The SEM_PERF package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

- Documentation of SEM_PERF
Documentation of SEM_PERF

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_PERF in the Oracle Spatial and Graph RDF Semantic Graph Developer’s Guide.
The SEM_RDFCTX package contains subprograms for managing extractor policies and semantic indexes created for documents.

- Documentation of SEM_RDFCTX
Documentation of SEM_RDFCTX

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_RDFCTX in the Oracle Spatial and Graph RDF Semantic Graph Developer’s Guide.
The SEM_RDFSA package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

- Documentation of SEM_RDFSA
Documentation of SEM_RDFSA

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_RDFSA in the Oracle Spatial and Graph RDF Semantic Graph Developer’s Guide.
The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms. Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

**See Also:**
- *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
- *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

This chapter contains the following topics:
- **Using UTL_CALL_STACK**
  - Overview
  - Security Model
- **Data Structures**
- **Summary of UTL_CALL_STACK Subprograms**
Using UTL_CALL_STACK

- Overview
- Security Model
Overview

The UTL_CALL_STACK package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks. Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively:

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.
- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

A B C D E F E
7 6 5 4 3 2 1

Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

BEGIN
  BEGIN
    ... (1)
    raise zero_divide;
  EXCEPTION
    when others then
    raise no_data_found;
  END;
  EXCEPTION
  WHEN others THEN
    ... (2)
END;

The error depth at (1) is zero and at (2) is two.
**Backtrace**

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.
Security Model

EXECUTE on UTL_CALL_STACK is granted to PUBLIC.

The UTL_CALL_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls UTL_CALL_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list only shows program unit C.
Operational Notes

Compiler optimizations can change lexical, dynamic and backtrace depth. 

**UTL_CALL_STACK** is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using **UTL_CALL_STACK**.

Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through **UTL_CALL_STACK**.
Exceptions

The following table lists the exceptions raised by UTL_CALL_STACK.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_DEPTH_INDICATOR</td>
<td>64610</td>
<td>This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception.</td>
</tr>
</tbody>
</table>
The `UTL_CALL_STACK` package defines a VARRAY type, `UNIT_QUALIFIED_NAME`.

**VARRAY Type**

- `UNIT_QUALIFIED_NAME`
UNIT_QUALIFIED_NAME

TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

Example
Consider the following contrived PL/SQL procedure:

PROCEDURE topLevel IS
  FUNCTION localFunction(...) RETURNS VARCHAR2 IS
  FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
    BEGIN
      DECLARE
        localVar PLS_INTEGER;
      BEGIN
        ... (1)
      END;
    END;
  BEGIN
    ...
  END;

The unit qualified name at (1) would be
['topLevel', 'localFunction', 'innerFunction']

If the unit were an anonymous block, the unit name would be '__anonymous_block'
## Summary of UTL_CALL_STACK Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BACKTRACE_DEPTH Function on page 247-11</td>

</tbody>
</table>
BACKTRACE_DEPTH Function

This function returns the number of backtrace items in the backtrace.

Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
RETURN PLS_INTEGER;
```

Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.
BACKTRACE_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (  
   backtrace_depth   IN   PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backtrace_depth</td>
<td>Depth in backtrace</td>
</tr>
</tbody>
</table>

Return Values

The line number of the unit at the specified backtrace depth
BACKTRACE_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (
    backtrace_depth   IN   PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backtrace_depth</td>
<td>Depth in backtrace</td>
</tr>
</tbody>
</table>

Return Values

The name of the unit at the specified backtrace depth
CURRENT_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (    
    dynamic_depth   IN    PLS_INTEGER)    
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic_depth</td>
<td>Depth in the error stack</td>
</tr>
</tbody>
</table>

Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth
CONCATENATE_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

Syntax

UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (  
  qualified_name  IN  UNIT_QUALIFIED_NAME)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>qualified_name</td>
<td>A unit-qualified name</td>
</tr>
</tbody>
</table>

Return Values

A string of the form `UNIT.SUBPROGRAM.LOCAL_SUBPROGRAM`
**DYNAMIC_DEPTH Function**

This function returns the number of subprograms on the call stack.

**Syntax**

```sql
UTL_CALL_STACK.DYNAMIC_DEPTH
RETURN PLS_INTEGER;
```

**Return Values**

The number of subprograms on the call stack
**ERROR_DEPTH Function**

This function returns the number of errors on the error stack.

**Syntax**

```
UTL_CALL_STACK.ERROR_DEPTH
RETURN PLS_INTEGER;
```

**Return Values**

The number of errors on the error stack
ERROR_MSG Function

This function returns the error message of the error at the specified error depth.

Syntax

```PL/SQL
UTL_CALL_STACK.ERROR_MSG (    error_depth    IN    PLS_INTEGER)    RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_depth</td>
<td>Depth in the error stack</td>
</tr>
</tbody>
</table>

Return Values

The error message of the error at the specified error depth.
ERROR_NUMBER Function

This function returns the error number of the error at the specified error depth.

Syntax

```plaintext
UTL_CALL_STACK.ERROR_NUMBER (  
     error_depth   IN    PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_depth</td>
<td>Depth in the call stack</td>
</tr>
</tbody>
</table>

Return Values

The error number of the error at the specified error depth
LEXICAL_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

Syntax

```sql
UTL_CALL_STACK.LEXICAL_DEPTH (  
    dynamic_depth IN    PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic_depth</td>
<td>Depth in the call stack</td>
</tr>
</tbody>
</table>

Return Values

The lexical nesting level of the subprogram at the specified dynamic depth
**OWNER Function**

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

**Syntax**

```lisp
UTL_CALL_STACK.OWNER ( 
    dynamic_depth    IN    PLS_INTEGER) 
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic_depth</td>
<td>Depth in the call stack</td>
</tr>
</tbody>
</table>

**Return Values**

The owner name of the unit of the subprogram at the specified dynamic depth.
UNIT_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

Syntax

```sql
UTL_CALL_STACK.UNIT_LINE (  
    dynamic_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic_depth</td>
<td>Depth in the call stack</td>
</tr>
</tbody>
</table>

Return Values

The line number of the unit of the subprogram at the specified dynamic depth
**SUBPROGRAM Function**

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

**Syntax**

```
UTL_CALL_STACK.SUBPROGRAM (
   dynamic_depth    IN    PLS_INTEGER)
RETURN UNIT_QUALIFIED_NAME;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic_depth</td>
<td>Depth in the call stack</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the unit-qualified name of the subprogram at the specified dynamic depth.
The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- Summary of UTL_COLL Subprograms
### Summary of UTL_COLL Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_LOCATOR Function on page 248-3</td>
<td>Determines whether a collection item is actually a locator or not</td>
</tr>
</tbody>
</table>
**IS_LOCATOR Function**

This function determines whether a collection item is actually a locator or not.

**Syntax**

```sql
UTL_COLL.IS_LOCATOR (  
   coln IN STANDARD)  
RETURNS BOOLEAN;
```

**Pragmas**

Asserts WNDs, WNPs and RNPs pragmas

**Parameters**

**Table 248–2  IS_LOCATOR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coln</td>
<td>Nested table or varray item.</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 248–3  IS_LOCATOR Function Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Collection item is indeed a locator.</td>
</tr>
<tr>
<td>0</td>
<td>Collection item is not a locator.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20); /

CREATE OR REPLACE TYPE phone_book_t AS OBJECT {  
   pno number,  
   ph   list_t ;
} /

CREATE TABLE phone_book OF phone_book_t  
NESTED TABLE ph STORE AS nt_ph;  
CREATE TABLE phone_book1 OF phone_book_t  
NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS  
   plist list_t;  
   plist1 list_t;  
BEGIN  
   SELECT ph INTO plist FROM phone_book WHERE pno=1;  
   SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;  
   IF (UTL_COLL.IS_LOCATOR(plist)) THEN
```
IS_LOCATOR Function

```sql
BEGIN
    IF (UTL_COLL.IS_LOCATOR(plist)) THEN
        DBMS_OUTPUT.PUT_LINE('plist is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist is not a locator');
    END IF;

    IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
        DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
    END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```
The UTL_COMPRESS package provides a set of data compression utilities. This chapter contains the following topics:

- Using UTL_COMPRESS
  - Constants
  - Exceptions
  - Operational Notes
- Summary of UTL_COMPRESS Subprograms
Using UTL_COMPRESS

- Constants
- Exceptions
- Operational Notes
Constants

Define max number of handles for piecewise operations:

\[\text{UTLCOMP\_MAX\_HANDLE}\ \ \text{CONSTANT}\ \ \text{PLS\_INTEGER} \::=\ 5;\]
## Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER TOO SMALL</td>
<td>The compressed representation is too big.</td>
</tr>
<tr>
<td>DATA_ERROR</td>
<td>The input or output data stream was found to be an invalid format.</td>
</tr>
<tr>
<td>INVALID_ARGUMENT</td>
<td>One of the arguments was an invalid type or value.</td>
</tr>
<tr>
<td>INVALID_HANDLE</td>
<td>Invalid handle for piecewise compress or uncompress.</td>
</tr>
<tr>
<td>STREAM_ERROR</td>
<td>An error occurred during compression or uncompression of the data stream</td>
</tr>
</tbody>
</table>
Operational Notes

- It is the caller's responsibility to free the temporary LOB returned by the LZ* functions with DBMS_LOB.FREETEMPORARY call.
- A BFILE passed into LZ_COMPRESS* or LZ_UNCOMPRESS* has to be opened by DBMS_LOB.FILEOPEN.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the UTL_COMPRESS subprograms may be the same size, or even slightly larger than, the input.
- The output of the UTL_COMPRESS compressed data is compatible with gzip(with -n option)/gunzip on a single file.
### Summary of UTL_COMPRESS Subprograms

</tbody>
</table>
ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

UTL_COMPRESS.ISOPEN(
    handle in binary_integer)
RETURN BOOLEAN;

Parameters

Table 249–3 ISOPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;

Alternatively:

IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (  
    src       IN           RAW,  
    quality   IN           BINARY_INTEGER DEFAULT 6)  
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (  
    src       IN           BLOB,  
    quality   IN           BINARY_INTEGER DEFAULT 6)  
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (  
    src      IN            BLOB,  
    dst      IN OUT NOCOPY BLOB,  
    quality  IN            BINARY_INTEGER DEFAULT 6)  
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (  
    src     IN            BFILE,  
    quality IN            BINARY_INTEGER DEFAULT 6)  
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (  
    src     IN            BFILE,  
    dst     IN OUT NOCOPY BLOB,  
    quality IN            BINARY_INTEGER DEFAULT 6)  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Data (RAW, BLOB or BFILE) to be compressed.</td>
</tr>
<tr>
<td>dst</td>
<td>Destination for compressed data</td>
</tr>
<tr>
<td>quality</td>
<td>An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6</td>
</tr>
</tbody>
</table>
Usage Notes

- quality is an optional compression tuning value. It allows the UTL_COMPRESS user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.
LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```sql
UTL_COMPRESS.LZ_COMPRESS_ADD (
  handle IN             BINARY_INTEGER,
  dst    IN OUT NOCOPY  BLOB,
  src    IN             RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise compress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The opened LOB from LZ_COMPRESS_OPEN to store compressed data.</td>
</tr>
<tr>
<td>src</td>
<td>The input data to be compressed.</td>
</tr>
</tbody>
</table>

Exceptions

- **invalid_handle** - out of range invalid or unopened handle.
- **invalid_argument** - NULL handle, src, dst, or invalid dst.
LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

\[
\text{LZ_COMPRESS_CLOSE} \left\{ \right. \\
\quad \text{handle IN BINARY_INTEGER,} \\
\quad \text{dst \ IN OUT NOCOPY BLOB}; \\
\}
\]

Parameters

Table 249–6  LZ_COMPRESS_CLOSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise compress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The opened LOB from LZ_COMPRESS_OPEN to store compressed data.</td>
</tr>
</tbody>
</table>

Exceptions

- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle, dst, or invalid dst.
This function initializes a piecewise context that maintains the compress state and data.

**Syntax**

```sql
UTL_COMPRESS.LZ_COMPRESS_OPEN (
    dst       IN OUT NOCOPY BLOB,
    quality   IN            BINARY_INTEGER DEFAULT 6)
RETURN BINARY_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>User supplied LOB to store compressed data.</td>
</tr>
<tr>
<td>quality</td>
<td>Speed versus efficiency of resulting compressed output.</td>
</tr>
<tr>
<td></td>
<td>■ Valid values are the range 1..9, with a default value of 6.</td>
</tr>
<tr>
<td></td>
<td>■ 1=fastest compression, 9=slowest compression and best compressed file size.</td>
</tr>
</tbody>
</table>

**Return Values**

A handle to an initialized piecewise compress context.

**Exceptions**

- invalid_handle - invalid handle, too many open handles.
- invalid_argument - NULL dst or invalid quality specified.

**Usage Notes**

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.
LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, unpacks it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BLOB,
    dst  IN  OUT  NOCOPY  BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
    src  IN  BFILE,
    dst  IN  OUT  NOCOPY  BLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Compressed data.</td>
</tr>
<tr>
<td>dst</td>
<td>Destination for uncompressed data.</td>
</tr>
</tbody>
</table>
LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
    handle IN BINARY_INTEGER,
    dst OUT NOCOPY RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
<tr>
<td>dst</td>
<td>The uncompressed data.</td>
</tr>
</tbody>
</table>

Exceptions

- no_data_found - finished uncompress.
- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle.
LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
    src  IN  BLOB)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The input data to be uncompressed.</td>
</tr>
</tbody>
</table>

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- invalid_handle - invalid handle, too many open handles.
- invalid_argument - NULL src.

Usage Notes

Close the opened handle with LZ_UNCOMPRESS_CLOSE

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process
because lack of doing so will cause these handles to leak.
LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
    handle  IN   BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle to a piecewise uncompress context.</td>
</tr>
</tbody>
</table>

Exceptions

- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle.
The UTL_ENCODE package provides functions that encode raw data into a standard encoded format so that the data can be transported between hosts. You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- Summary of UTL_ENCODE Subprograms
### Summary of UTL_ENCODE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

</tr>
</tbody>
</table>
BASE64_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

Syntax

```sql
UTL_ENCODE.BASE64_DECODE (    r IN RAW)    RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing base 64-encoded data. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the decoded string</td>
</tr>
</tbody>
</table>
BASE64_ENCODE Function

This function encodes the binary representation of the **RAW** value into base 64 elements and returns it in the form of a **RAW** string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (  
    r  IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDs, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The <strong>RAW</strong> value to be encoded. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RAW</strong></td>
<td>Contains the encoded base 64 elements</td>
</tr>
</tbody>
</table>
MIMEHEADER_DECODE Function

This function accepts as input an "encoded word" of the form:

=?<charset>?<encoding>?<encoded text>?=
=ISO-8859-1?Q?Here is some encoded text?==

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

UTL_ENCODE.MIMEHEADER_DECODE (buf IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;

Parameters

Table 250–6 MIMEHEADER_DECODE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The encoded text data with mime header format tags.</td>
</tr>
</tbody>
</table>

Return Values

Table 250–7 MIMEHEADER_DECODE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>The encoded text data with mime header format tags</td>
</tr>
</tbody>
</table>

Examples

v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word" of the form:

=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?q?Here is some text?==

The buf input parameter is the text to be encoded and becomes the <encoded text>. The <encoding> value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values UTL_ENCODE.QUOTED_PRINTABLE or UTL_ENCODE.BASE64 or NULL. If NULL, quoted-printable encoding is selected as a default value.

The <charset> value is specified as the input parameter encode_charset. If NULL, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the buf input string to the character set specified by the encode_charset parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (  
    buf            IN  VARCHAR2 CHARACTER SET ANY_CS,  
    encode_charset IN  VARCHAR2 DEFAULT NULL,  
    encoding       IN  PLS_INTEGER DEFAULT NULL)  
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The target character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 encoded string with mime header format tags.</td>
</tr>
</tbody>
</table>
QUOTED_PRINTABLE_DECODE Function

This function reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (  
    r  IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing a quoted printable data string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The decoded string</td>
</tr>
</tbody>
</table>
QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
    r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the quoted printable string</td>
</tr>
</tbody>
</table>
TEXT_DECODE Function

This function converts the input text to the target character set as specified by the encode_charset parameter, if not NULL. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If encode_charset is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
    buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN  VARCHAR2 DEFAULT NULL,
    encoding       IN  PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The encoded text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The source character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are UTL_ENCODE.BASE64,</td>
</tr>
<tr>
<td></td>
<td>UTL_ENCODE.QUOTED_PRINTABLE and NULL.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 decoded text string.</td>
</tr>
</tbody>
</table>

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
    'Here is some text',
    WE8ISO8859P1,
    UTL_ENCODE.BASE64);
```
TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the encode_charset parameter, if not NULL. The text is encoded to either base64 or quoted-printable format, as specified by the encoding parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```sql
UTL_ENCODE.TEXT_ENCODE (  
    buf IN VARCHAR2 CHARACTER SET ANY_CS,  
    encode_charset IN VARCHAR2 DEFAULT NULL,  
    encoding IN PLS_INTEGER DEFAULT NULL)  
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buf</td>
<td>The text data.</td>
</tr>
<tr>
<td>encode_charset</td>
<td>The target character set.</td>
</tr>
<tr>
<td>encoding</td>
<td>The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A VARCHAR2 encoded string with mime header format tags.</td>
</tr>
</tbody>
</table>

Examples

```sql
v2:=utl_encode.text_encoding(  
    'Here is some text',  
    'WE8ISO8859P1',  
    UTL_ENCODE.BASE64);
```
UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See "UUENCODER Function" on page 250-12 for discussion of the cumulative nature of UUENCODER and UUDECODE for data streams.

Syntax

```plaintext
UTL_ENCODE.UUDECODE ( r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 250–18 UUDECODE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The RAW string containing the uuencoded data string. There are no defaults or optional parameters.</td>
</tr>
</tbody>
</table>

Return Values

**Table 250–19 UUDECODE Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The decoded RAW string</td>
</tr>
</tbody>
</table>
UUENCOD Exunction

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```sql
UTL_ENCODE.UUENCODE (  
  r          IN RAW,  
  type       IN PLS_INTEGER DEFAULT 1, 
  filename   IN VARCHAR2 DEFAULT NULL, 
  permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW string</td>
</tr>
<tr>
<td>type</td>
<td>Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece</td>
</tr>
<tr>
<td>filename</td>
<td>Optional VARCHAR2 parameter containing the uuencode filename; the default is uuencode.txt</td>
</tr>
<tr>
<td>permission</td>
<td>Optional VARCHAR2 parameter containing the permission mode; the default is 0 (a text string zero).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Contains the uuencode format string</td>
</tr>
</tbody>
</table>
With the UTL_FILE package, PL/SQL programs can read and write operating system text files. UTL_FILE provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- Using UTL_FILE
  - Security Model
  - Operational Notes
  - Rules and Limits
  - Exceptions
  - Examples
- Data Structures
- Summary of UTL_FILE Subprograms
Using UTL_FILE

- Security Model
- Operational Notes
- Rules and Limits
- Exceptions
- Examples
Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user. The nature of directory objects is discussed in the Oracle Database SQL Language Reference.

Assuming the user has both READ and WRITE access to the directory object USER_DIR, the user can open a file located in the operating system directory described by USER_DIR, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

In the past, accessible directories for the UTL_FILE functions were specified in the initialization file using the UTL_FILE_DIR parameter. However, UTL_FILE_DIR access is no longer recommended. Oracle recommends that you instead use the directory object feature, which replaces UTL_FILE_DIR. Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

Note: Use the CREATE DIRECTORY feature instead of UTL_FILE_DIR for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

Caution: The privileges needed to access files in a directory object are operating system specific. UTL_FILE directory object privileges give you read and write access to all files within the specified directory.
Operational Notes

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN_NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.
Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

**Note:** The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.
Exceptions

Table 251–1 UTL_FILE Package Exceptions

<table>
<thead>
<tr>
<th>Exception Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_PATH</td>
<td>File location is invalid.</td>
</tr>
<tr>
<td>INVALID_MODE</td>
<td>The open_mode parameter in FOPEN is invalid.</td>
</tr>
<tr>
<td>INVALID_FILEHANDLE</td>
<td>File handle is invalid.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File could not be opened or operated on as requested.</td>
</tr>
<tr>
<td>READ_ERROR</td>
<td>Destination buffer too small, or operating system error occurred during the read operation</td>
</tr>
<tr>
<td>WRITE_ERROR</td>
<td>Operating system error occurred during the write operation.</td>
</tr>
<tr>
<td>INTERNAL_ERROR</td>
<td>Unspecified PL/SQL error</td>
</tr>
<tr>
<td>CHARSETMISMATCH</td>
<td>A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.</td>
</tr>
<tr>
<td>FILE_OPEN</td>
<td>The requested operation failed because the file is open.</td>
</tr>
<tr>
<td>INVALID_MAXLINESIZE</td>
<td>The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.</td>
</tr>
<tr>
<td>INVALID_FILENAME</td>
<td>The filename parameter is invalid.</td>
</tr>
<tr>
<td>ACCESS_DENIED</td>
<td>Permission to access to the file location is denied.</td>
</tr>
<tr>
<td>INVALID_OFFSET</td>
<td>Causes of the INVALID_OFFSET exception:</td>
</tr>
<tr>
<td></td>
<td>■ ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or</td>
</tr>
<tr>
<td></td>
<td>■ ABSOLUTE_OFFSET &lt; 0, or</td>
</tr>
<tr>
<td></td>
<td>■ Either offset caused a seek past the end of the file</td>
</tr>
<tr>
<td>DELETE_FAILED</td>
<td>The requested file delete operation failed.</td>
</tr>
<tr>
<td>RENAME_FAILED</td>
<td>The requested file rename operation failed.</td>
</tr>
</tbody>
</table>

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.
Examples

Example 1

---

Note: The examples are UNIX-specific.

---

Given the following:

SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;

The following file locations and filenames are valid and accessible as follows:

<table>
<thead>
<tr>
<th>File Location</th>
<th>Filename</th>
<th>READ and WRITE</th>
</tr>
</thead>
<tbody>
<tr>
<td>/appl/gl/log</td>
<td>L12345.log</td>
<td>Users with DBA privilege</td>
</tr>
<tr>
<td>/appl/gl/user</td>
<td>u12345.tmp</td>
<td>All users</td>
</tr>
</tbody>
</table>

The following file locations and filenames are invalid:

<table>
<thead>
<tr>
<th>File Location</th>
<th>Filename</th>
<th>Invalid Because</th>
</tr>
</thead>
<tbody>
<tr>
<td>/appl/gl/log/backup</td>
<td>L12345.log</td>
<td># subdirectories are not accessible</td>
</tr>
<tr>
<td>/APPL/gl/log</td>
<td>L12345.log</td>
<td># directory strings must follow case sensitivity rules as required by the O/S</td>
</tr>
<tr>
<td>/appl/gl/log</td>
<td>backup/L1234.log</td>
<td># filenames may not include portions of directory paths</td>
</tr>
<tr>
<td>/user/tmp</td>
<td>L12345.log</td>
<td># no corresponding CREATE DIRECTORY command has been issued</td>
</tr>
</tbody>
</table>

Example 2

DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R',256);
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1,32767);
UTL_FILE.FCLOSE(F1);

-- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
-- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
defaults to 1024.
-- So the number of bytes returned will be 1024 or less if a line terminator is
seen.
F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
UTL_FILE.GET_LINE(F1,V1);
UTL_FILE.FCLOSE(F1);
END;
Data Structures

The `UTL_FILE` package defines a RECORD type.

Record Types

- `FILETYPE` Record Type
FILETYPE Record Type

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
  id          BINARY_INTEGER,
  datatype    BINARY_INTEGER,
  byte_mode   BOOLEAN);
```

### Fields

**Table 251–2 FILE_TYPE Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>A numeric value indicating the internal file handle number</td>
</tr>
<tr>
<td>datatype</td>
<td>Indicates whether the file is a CHAR file, Nchar file or other (binary)</td>
</tr>
<tr>
<td>byte_mode</td>
<td>Indicates whether the file was open as a binary file, or as a text file</td>
</tr>
</tbody>
</table>

**Caution:** Oracle does not guarantee the persistence of FILE_TYPE values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.
## Summary of UTL_FILE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCLOSE Procedure on page 251-13</td>
<td>Closes a file</td>
</tr>
<tr>
<td>FCLOSE_ALL Procedure on page 251-14</td>
<td>Closes all open file handles</td>
</tr>
<tr>
<td>FCOPY Procedure on page 251-15</td>
<td>Copies a contiguous portion of a file to a newly created file</td>
</tr>
<tr>
<td>FFLUSH Procedure on page 251-16</td>
<td>Physically writes all pending output to a file</td>
</tr>
<tr>
<td>FGETATTR Procedure on page 251-17</td>
<td>Reads and returns the attributes of a disk file</td>
</tr>
<tr>
<td>FGETPOS Function on page 251-18</td>
<td>Returns the current relative offset position within a file, in bytes</td>
</tr>
<tr>
<td>FOPEN Function on page 251-19</td>
<td>Opens a file for input or output</td>
</tr>
<tr>
<td>FOPEN_NCHAR Function on page 251-21</td>
<td>Opens a file in Unicode for input or output</td>
</tr>
<tr>
<td>FREMOVE Procedure on page 251-22</td>
<td>Deletes a disk file, assuming that you have sufficient privileges</td>
</tr>
<tr>
<td>FRENAME Procedure on page 251-23</td>
<td>Renames an existing file to a new name, similar to the UNIX mv function</td>
</tr>
<tr>
<td>FSEEK Procedure on page 251-24</td>
<td>Adjusts the file pointer forward or backward within the file by the number of bytes specified</td>
</tr>
<tr>
<td>GET_LINE Procedure on page 251-25</td>
<td>Reads text from an open file</td>
</tr>
<tr>
<td>GET_LINE_NCHAR Procedure on page 251-26</td>
<td>Reads text in Unicode from an open file</td>
</tr>
<tr>
<td>GET_RAW Procedure on page 251-27</td>
<td>Reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read</td>
</tr>
<tr>
<td>IS_OPEN Function on page 251-28</td>
<td>Determines if a file handle refers to an open file</td>
</tr>
<tr>
<td>NEW_LINE Procedure on page 251-29</td>
<td>Writes one or more operating system-specific line terminators to a file</td>
</tr>
<tr>
<td>PUT Procedure on page 251-30</td>
<td>Writes a string to a file</td>
</tr>
<tr>
<td>PUT_LINE Procedure on page 251-31</td>
<td>Writes a line to a file, and so appends an operating system-specific line terminator</td>
</tr>
<tr>
<td>PUT_LINE_NCHAR Procedure on page 251-32</td>
<td>Writes a Unicode line to a file</td>
</tr>
<tr>
<td>PUT_NCHAR Procedure on page 251-33</td>
<td>Writes a Unicode string to a file</td>
</tr>
<tr>
<td>PUTF Procedure on page 251-34</td>
<td>A PUT procedure with formatting</td>
</tr>
</tbody>
</table>
### Table 251–3  (Cont.) UTL_FILE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUTF_NCHAR Procedure</td>
<td>A PUT_NCHAR procedure with formatting, and writes a Unicode string to a file, with formatting</td>
</tr>
<tr>
<td>PUT_RAW Procedure</td>
<td>Accepts as input a RAW data value and writes the value to the output buffer</td>
</tr>
</tbody>
</table>
FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
    file IN OUT FILE_TYPE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an OPEN or OPEN_NCHAR call</td>
</tr>
</tbody>
</table>

Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE_ERROR exception when closing a file.

Exceptions

- WRITE_ERROR
- INVALID_FILEHANDLE
FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

UTL_FILE.FCLOSE_ALL;

Usage Notes

**Note:** FCLOSE_ALL does not alter the state of the open file handles held by the user. This means that an IS_OPEN test on a file handle after an FCLOSE_ALL call still returns TRUE, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE_ALL.

Exceptions

WRITE_ERROR
FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the start_line and end_line parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (    
  src_location    IN VARCHAR2,    
  src_filename    IN VARCHAR2,    
  dest_location   IN VARCHAR2,    
  dest_filename   IN VARCHAR2,    
  start_line      IN BINARY_INTEGER DEFAULT 1,    
  end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_location</td>
<td>Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>src_filename</td>
<td>Source file to be copied</td>
</tr>
<tr>
<td>dest_location</td>
<td>Destination directory where the destination file is created</td>
</tr>
<tr>
<td>dest_filename</td>
<td>Destination file created from the source file</td>
</tr>
<tr>
<td>start_line</td>
<td>Line number at which to begin copying. The default is 1 for the first line</td>
</tr>
<tr>
<td>end_line</td>
<td>Line number at which to stop copying. The default is NULL, signifying end of file</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILENAME
- INVALID_PATH
- INVALID_OPERATION
- INVALID_OFFSET
- READ_ERROR
- WRITE_ERROR
FFLUSH Procedure

**FFLUSH** physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The **FFLUSH** procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

**Syntax**

```sql
UTL_FILE.FFLUSH (
    file  IN FILE_TYPE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an <strong>FOPEN</strong> or <strong>FOPEN_NCHAR</strong> call</td>
</tr>
</tbody>
</table>

**Exceptions**

- INVALID_FILENAME
- INVALID_MAXLINESIZE
- INVALID_OPERATION
- WRITE_ERROR
FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(
    location     IN VARCHAR2,
    filename     IN VARCHAR2,
    fexists      OUT BOOLEAN,
    file_length  OUT NUMBER,
    block_size   OUT BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>filename</td>
<td>Name of the file to be examined</td>
</tr>
<tr>
<td>fexists</td>
<td>A BOOLEAN for whether or not the file exists</td>
</tr>
<tr>
<td>file_length</td>
<td>Length of the file in bytes. NULL if file does not exist.</td>
</tr>
<tr>
<td>block_size</td>
<td>File system block size in bytes. NULL if the file does not exist.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_PATH
- INVALID_FILENAME
- INVALID_OPERATION
- READ_ERROR
- ACCESS_DENIED
FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (    
      file IN FILE_TYPE) 
RETURN PLS_INTEGER;
```

Parameters

Table 251–8  FGETPOS Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Directory location of the source file</td>
</tr>
</tbody>
</table>

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- READ_ERROR

Usage Notes

If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also FOPEN_NCHAR Function on page 251-21.

Syntax

```
U TL_FILE.FOPEN (    
  location    IN VARCHAR2,    
  filename    IN VARCHAR2,    
  open_mode   IN VARCHAR2,    
  max_linesize IN BINARY_INTEGER DEFAULT 1024)    
RETURN FILE_TYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.</td>
</tr>
<tr>
<td>filename</td>
<td>File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.</td>
</tr>
<tr>
<td>open_mode</td>
<td>Specifies how the file is opened. Modes include:</td>
</tr>
<tr>
<td></td>
<td>• r -- read text</td>
</tr>
<tr>
<td></td>
<td>• w -- write text</td>
</tr>
<tr>
<td></td>
<td>• a -- append text</td>
</tr>
<tr>
<td></td>
<td>• rb -- read byte mode</td>
</tr>
<tr>
<td></td>
<td>• wb -- write byte mode</td>
</tr>
<tr>
<td></td>
<td>• ab -- append byte mode</td>
</tr>
<tr>
<td></td>
<td>If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.</td>
</tr>
<tr>
<td>max_linesize</td>
<td>Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.</td>
</tr>
</tbody>
</table>

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE_TYPE</td>
<td>Handle to open file</td>
</tr>
</tbody>
</table>
Exceptions

INVALID_MAXILINESIZE
INVALID_MODE
INVALID_OPERATION
INVALID_PATH
INVALID_FILENAME

Usage Notes

The file location and file name parameters must be supplied to the `FOPEN` function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects.
FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database character set.

Even though the contents of an NVARCHAR2 buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. UTL_FILE converts between UTF8 and AL16UTF16 as necessary.

See also FOPEN Function on page 251-19.

Syntax

```sql
UTL_FILE.FOPEN_NCHAR (    location IN VARCHAR2,
    filename IN VARCHAR2,
    open_mode IN VARCHAR2,
    max_linesize IN BINARY_INTEGER DEFAULT 1024)    RETURN FILE_TYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of file</td>
</tr>
<tr>
<td>filename</td>
<td>File name (including extension)</td>
</tr>
<tr>
<td>open_mode</td>
<td>Open mode (r,w,a,r,b,w,b,a,b)</td>
</tr>
<tr>
<td>max_linesize</td>
<td>Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)</td>
</tr>
</tbody>
</table>

Return Values

FOPEN_NCHAR returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE_TYPE</td>
<td>Handle to open file</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_MAXILINESIZE
INVALID_MODE
INVALID_OPERATION
INVALID_PATH
FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

\[
\text{UTL\_FILE.FREMOVE} \{ \\
\quad \text{location \ IN \ VARCHAR2,} \\
\quad \text{filename \ IN \ VARCHAR2}\};
\]

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Directory location of the file, a DIRECTORY_NAME from ALL DIRECTORIES (case sensitive)</td>
</tr>
<tr>
<td>filename</td>
<td>Name of the file to be deleted</td>
</tr>
</tbody>
</table>

Exceptions

ACCESS_DENIED
DELETE_FAILED
INVALID_FILENAME
INVALID_OPERATION
INVALID_PATH

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.
**FRENAME Procedure**

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

**Syntax**

```sql
UTL_FILE.FRENAME (  
    src_location     IN   VARCHAR2,  
    src_filename     IN   VARCHAR2,  
    dest_location    IN   VARCHAR2,  
    dest_filename    IN   VARCHAR2,  
    overwrite        IN   BOOLEAN DEFAULT FALSE);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_location</td>
<td>Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>src_filename</td>
<td>Source file to be renamed</td>
</tr>
<tr>
<td>dest_location</td>
<td>Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)</td>
</tr>
<tr>
<td>dest_filename</td>
<td>New name of the file</td>
</tr>
<tr>
<td>overwrite</td>
<td>Default is FALSE. Permission on both the source and destination directories must be granted. You can use the overwrite parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite.</td>
</tr>
</tbody>
</table>

**Exceptions**

- ACCESS_DENIED
- INVALID_FILENAME
- INVALID_PATH
- RENAME_FAILED
FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```sql
UTL_FILE.FSEEK (  
    file             IN OUT  UTL_FILE.FILE_TYPE,  
    absolute_offset  IN      PL_INTEGER DEFAULT NULL,  
    relative_offset  IN      PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File handle</td>
</tr>
<tr>
<td>absolute_offset</td>
<td>Absolute location to which to seek; default = NULL</td>
</tr>
<tr>
<td>relative_offset</td>
<td>Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OFFSET
- INVALID_OPERATION
- READ_ERROR

Usage Notes

- Using FSEEK, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If relative_offset, the procedure seeks forward. If relative_offset > 0, or backward, if relative_offset < 0, the procedure seeks through the file by the number of relative_offset bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an INVALID_OFFSET error is raised.
- If absolute_offset, the procedure seeks to an absolute location specified in bytes. If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the len parameter. It cannot exceed the max_linesize specified in FOPEN.

Syntax

```
UTL_FILE.GET_LINE (  
    file        IN  FILE_TYPE,  
    buffer      OUT VARCHAR2,  
    len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call. The file must be open for reading (mode r); otherwise an INVALID_OPERATION exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Data buffer to receive the line read from the file</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
NO_DATA_FOUND
READ_ERROR

Usage Notes

If the line does not fit in the buffer, a READ_ERROR exception is raised. If no text was read due to end of file, the NO_DATA_FOUND exception is raised. If the file is opened for byte mode operations, the INVALID_OPERATION exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure" on page 251-26.
GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype, such as NCHAR, NCLOB, or VARCHAR2 is specified, PL/SQL will perform standard implicit conversion from NVARCHAR2 after the text is read.

See also GET_LINE Procedure on page 251-25

Syntax

```sql
UTL_FILE.GET_LINE_NCHAR (  
  file        IN  FILE_TYPE,  
  buffer      OUT NVARCHAR2,  
  len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Data buffer to receive the line read from the file</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- NO_DATA_FOUND
- READ_ERROR
GET_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators.

Syntax

```plaintext
UTL_FILE.GET_RAW (  
file       IN            UTL_FILE.FILE_TYPE,  
buffer     OUT NOCOPY    RAW,  
len        IN            PLS_INTEGER DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File handle</td>
</tr>
<tr>
<td>buffer</td>
<td>RAW data</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- LENGTH_MISMATCH
- NO_DATA_FOUND
- READ_ERROR

Usage Notes

The subprogram will raise No_Data_Found when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```plaintext
PROCEDURE Sys.p (n IN VARCHAR2) IS  
h UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);  
Buf RAW(32767);  
Amnt CONSTANT PLS_INTEGER := 32767;  
BEGIN  
LOOP  
BEGIN  
Utl_File.Get_Raw(h, Buf, Amnt);  
-- Do something with this chunk  
EXCEPTION WHEN No_Data_Found THEN EXIT; END;  
END LOOP;  
UTL_FILE.FCLOSE (h);  
END;
```
IS_OPEN Function

This function tests a file handle to see if it identifies an open file. IS_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

UTL_FILE.IS_OPEN (
    file  IN FILE_TYPE
) RETURN BOOLEAN;

Parameters

Table 251–19 IS_OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call</td>
</tr>
</tbody>
</table>

Return Values

TRUE or FALSE

Exceptions

INVALID_FILEHANDLE
NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```plaintext
UTL_FILE.NEW_LINE (  
    file   IN FILE_TYPE,  
    lines IN BINARY_INTEGER := 1);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN or FOPEN_NCHAR call</td>
</tr>
<tr>
<td>lines</td>
<td>Number of line terminators to be written to the file</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR
PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure" on page 251-33.

Syntax

UTL_FILE.PUT (  
    file IN FILE_TYPE,  
    buffer IN VARCHAR2);  

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an OPEN_NCHAR call. The file must be open for writing.</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "PUT_LINE_NCHAR Procedure" on page 251-32.

Syntax

```sql
UTL_FILE.PUT_LINE (    
    file      IN FILE_TYPE,    
    buffer    IN VARCHAR2,    
    autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 251–22 PUT_LINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call</td>
</tr>
<tr>
<td>buffer</td>
<td>Text buffer that contains the lines to be written to the file</td>
</tr>
<tr>
<td>autoflush</td>
<td>Flushes the buffer to disk after the WRITE</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set. This procedure is equivalent to the PUT_NCHAR Procedure, except that the line separator is appended to the written text. See also PUT_LINE Procedure on page 251-31.

Syntax

UTL_FILE.PUT_LINE_NCHAR (file IN FILE_TYPE, buffer IN NVARCHAR2);

Parameters

Table 251–23 PUT_LINE_NCHAR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.</td>
</tr>
<tr>
<td>buffer</td>
<td>Text buffer that contains the lines to be written to the file</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to NVARCHAR2 before writing the text.

See also PUT Procedure on page 251-30

Syntax

```
UTL_FILE.PUT_NCHAR (   
    file      IN FILE_TYPE,   
    buffer    IN NVARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
PUTF Procedure

This procedure is a formatted PUT procedure. It works like a limited printf(). See also PUTF_NCHAR Procedure on page 251-36.

Syntax

```sql
UTL_FILE.PUTF (
    file    IN FILE_TYPE,
    format  IN VARCHAR2,
    [arg1   IN VARCHAR2  DEFAULT NULL,
    . . .
    arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN call</td>
</tr>
<tr>
<td>format</td>
<td>Format string that can contain text as well as the formatting characters \n and %s</td>
</tr>
<tr>
<td>arg1..arg5</td>
<td>From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.</td>
</tr>
</tbody>
</table>

Usage Notes

- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.
- The format string can contain any text, but the character sequences %s and \n have special meaning.

<table>
<thead>
<tr>
<th>Character Sequence</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>%s</td>
<td>Substitute this sequence with the string value of the next argument in the argument list.</td>
</tr>
<tr>
<td>\n</td>
<td>Substitute with the appropriate platform-specific line terminator.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_FILEHANDLE
- INVALID_OPERATION
- WRITE_ERROR

Examples

The following example writes the lines:

Hello, world!
I come from Zork with greetings for all earthlings.
my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!
I come from %s with %s.
',
my_world,
'greetings for all earthlings');

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.
PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure. Using PUTF_NCHAR, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements \n and %s, and up to five arguments to be substituted for consecutive instances of %s in the format string. The expected datatype of the format string and the arguments is NVARCHAR2.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to NVARCHAR2 before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

UTL_FILE.PUTF_NCHAR (
    file    IN FILE_TYPE,
    format  IN NVARCHAR2,
    [arg1   IN NVARCHAR2  DEFAULT NULL,
     . . .
    arg5    IN NVARCHAR2  DEFAULT NULL];

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.</td>
</tr>
<tr>
<td>format</td>
<td>Format string that can contain text as well as the formatting characters \n and %s</td>
</tr>
<tr>
<td>arg1..arg5</td>
<td>Argument strings are substituted, in order, for the %s formatters in the format string.</td>
</tr>
</tbody>
</table>

If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID_OPERATION exception is raised.
PUT_RAW Procedure

This procedure accepts as input a RAW data value and writes the value to the output buffer.

Syntax

UTL_FILE.PUT_RAW ( file          IN    UTL_FILE.FILE_TYPE,
                   buffer        IN    RAW,
                   autoflush     IN    BOOLEAN DEFAULT FALSE);

Parameters

Table 251–27 PUT_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>File handle</td>
</tr>
<tr>
<td>buffer</td>
<td>The RAW data written to the buffer</td>
</tr>
<tr>
<td>autoflush</td>
<td>If TRUE, then performs a flush after writing the value to the output buffer; default is FALSE.</td>
</tr>
</tbody>
</table>

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to TRUE.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
The **UTL_HTTP** package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the orapki utility. Non-HTTPS fetches do not require an Oracle wallet.

Using UTL_HTTP

This section contains topics which relate to using the UTL_HTTP package.

- Overview
- Security Model
- Constants
- Datatypes
- Operational Notes
- Exceptions
- Examples
Overview

With the UTL_HTTP package, you can write PL/SQL programs that communicate with Web (HTTP) servers. And UTL_HTTP contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.
Security Model

This package is an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the use-client-certificates or the use-passwords privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide
Constants

The UTL_HTTP package uses the constants shown in following tables.

- UTL_HTTP Constants - HTTP Versions
- UTL_HTTP Constants - Default Ports
- UTL_HTTP Constants - HTTP 1.1 Status Codes

Table 252–1  UTL_HTTP Constants - HTTP Versions

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_VERSION_1_0</td>
<td>VARCHAR2</td>
<td>'HTTP/1.0'</td>
<td>Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.</td>
</tr>
<tr>
<td>HTTP_VERSION_1_1</td>
<td>VARCHAR2</td>
<td>'HTTP/1.1'</td>
<td>Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.</td>
</tr>
</tbody>
</table>

Table 252–2  UTL_HTTP Constants - Default Ports

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_HTTP_PORT</td>
<td>PLS_INTEGER</td>
<td>80</td>
<td>The default TCP/IP port (80) at which a Web server or proxy server listens</td>
</tr>
<tr>
<td>DEFAULT_HTTPS_PORT</td>
<td>PLS_INTEGER</td>
<td>443</td>
<td>The default TCP/IP port (443) at which an HTTPS Web server listens</td>
</tr>
</tbody>
</table>

Table 252–3  UTL_HTTP Constants - HTTP 1.1 Status Codes

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_CONTINUE</td>
<td>PLS_INTEGER</td>
<td>100</td>
<td>The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.</td>
</tr>
<tr>
<td>HTTP_SWITCHING_PROTOCOLS</td>
<td>PLS_INTEGER</td>
<td>101</td>
<td>The server understands and is willing to comply with the client’s request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response’s Upgrade header field immediately after the empty line which terminates the 101 response.</td>
</tr>
<tr>
<td>HTTP_OK</td>
<td>PLS_INTEGER</td>
<td>200</td>
<td>The request has succeeded. The information returned with the response is dependent on the method used in the request</td>
</tr>
<tr>
<td>HTTP_CREATED CONSTANT</td>
<td>PLS_INTEGER</td>
<td>201</td>
<td>The request has been fulfilled and resulted in a new resource being created.</td>
</tr>
<tr>
<td>HTTP_ACCEPTED</td>
<td>PLS_INTEGER</td>
<td>202</td>
<td>The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.</td>
</tr>
</tbody>
</table>
### Table 252–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_NON_AUTHORITATIVE_INFO</td>
<td>PLS_INTEGER</td>
<td>203</td>
<td>The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.</td>
</tr>
<tr>
<td>HTTP_NO_CONTENT</td>
<td>PLS_INTEGER</td>
<td>204</td>
<td>The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.</td>
</tr>
<tr>
<td>HTTP_RESET_CONTENT</td>
<td>PLS_INTEGER</td>
<td>205</td>
<td>The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.</td>
</tr>
<tr>
<td>HTTP_PARTIAL_CONTENT</td>
<td>PLS_INTEGER</td>
<td>206</td>
<td>The server has fulfilled the partial GET request for the resource.</td>
</tr>
<tr>
<td>HTTP_MULTIPLE_CHOICES</td>
<td>PLS_INTEGER</td>
<td>300</td>
<td>The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.</td>
</tr>
<tr>
<td>HTTPMOVED_PERMANENTLY</td>
<td>PLS_INTEGER</td>
<td>301</td>
<td>The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.</td>
</tr>
<tr>
<td>HTTP_FOUND_CONSTANT</td>
<td>PLS_INTEGER</td>
<td>302</td>
<td>The requested resource resides temporarily under a different URI.</td>
</tr>
<tr>
<td>HTTP_SEE_OTHER</td>
<td>PLS_INTEGER</td>
<td>303</td>
<td>The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.</td>
</tr>
<tr>
<td>HTTP_NOT_MODIFIED</td>
<td>PLS_INTEGER</td>
<td>304</td>
<td>If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.</td>
</tr>
<tr>
<td>HTTP_USE_PROXY</td>
<td>PLS_INTEGER</td>
<td>305</td>
<td>The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.</td>
</tr>
<tr>
<td>HTTP_TEMPORARY_REDIRECT</td>
<td>PLS_INTEGER</td>
<td>307</td>
<td>The requested resource resides temporarily under a different URI.</td>
</tr>
<tr>
<td>HTTP_BAD_REQUEST</td>
<td>PLS_INTEGER</td>
<td>400</td>
<td>The request could not be understood by the server due to malformed syntax.</td>
</tr>
<tr>
<td>HTTP_UNAUTHORIZED</td>
<td>PLS_INTEGER</td>
<td>401</td>
<td>The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.</td>
</tr>
<tr>
<td>HTTP_PAYMENT_REQUIRED</td>
<td>PLS_INTEGER</td>
<td>402</td>
<td>This code is reserved for future use.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP_NOTIMPLEMENTED</td>
<td>PLS_INTEGER</td>
<td>501</td>
<td>The server does not support the functionality required to fulfill the request.</td>
</tr>
<tr>
<td>HTTP_BAD_GATEWAY</td>
<td>PLS_INTEGER</td>
<td>502</td>
<td>The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request.</td>
</tr>
<tr>
<td>HTTP_SERVICE_UNAVAILABLE</td>
<td>PLS_INTEGER</td>
<td>503</td>
<td>The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.</td>
</tr>
<tr>
<td>HTTP_GATEWAY_TIME_OUT</td>
<td>PLS_INTEGER</td>
<td>504</td>
<td>The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.</td>
</tr>
<tr>
<td>HTTP_VERSION_NOT_SUPPORTED</td>
<td>PLS_INTEGER</td>
<td>505</td>
<td>The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.</td>
</tr>
</tbody>
</table>
Datatypes

- REQ Type
- RESP Type
- COOKIE and COOKIE_TABLE Types
- CONNECTION Type
- REQUEST_CONTEXT_KEY Type

REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
    url VARCHAR2(32767),
    method VARCHAR2(64),
    http_version VARCHAR2(64));
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the HTTP request. It is set after the request is created by \texttt{BEGIN_REQUEST}.</td>
</tr>
<tr>
<td>method</td>
<td>The method to be performed on the resource identified by the URL. It is set after the request is created by \texttt{BEGIN_REQUEST}.</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version used to send the request. It is set after the request is created by \texttt{BEGIN_REQUEST}.</td>
</tr>
</tbody>
</table>

Usage Notes

The information returned in \texttt{REQ} from the interface \texttt{begin_request} is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in \texttt{REQ} record type whose names begin with the prefix \texttt{private_}. The fields are private and are intended for use by implementation of the \texttt{UTL_HTTP} package. You should not modify the fields.

REQUEST_CONTEXT_KEY Type

This type is used to represent the key to a request context. A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

Usage Notes

To provide enhanced security, \texttt{UTL_HTTP} allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when
making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

**RESP Type**

This PL/SQL record type is used to represent an HTTP response.

**Syntax**

```plsql
TYPE resp IS RECORD (  
    status_code    PLS_INTEGER,  
    reason_phrase  VARCHAR2(256),  
    http_version   VARCHAR2(64));
```

**Parameters**

**Table 252–5  RESP Type Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status_code</td>
<td>The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.</td>
</tr>
<tr>
<td>reason_phrase</td>
<td>The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The information returned in RESP from the interface GET_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix private_. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

**COOKIE and COOKIE_TABLE Types**

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

**Syntax**

```plsql
TYPE cookie IS RECORD (  
    name  VARCHAR2(256),  
    value VARCHAR2(1024),  
    domain VARCHAR2(256),  
    expire TIMESTAMP WITH TIME ZONE,  
    path  VARCHAR2(1024),  
    secure BOOLEAN,  
    version PLS_INTEGER,  
    comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```
Fields of COOKIE Record Type

Table 252–6 shows the fields for the COOKIE and COOKIE_TABLE record types.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the HTTP cookie</td>
</tr>
<tr>
<td>value</td>
<td>The value of the cookie</td>
</tr>
<tr>
<td>domain</td>
<td>The domain for which the cookie is valid</td>
</tr>
<tr>
<td>expire</td>
<td>The time by which the cookie will expire</td>
</tr>
<tr>
<td>path</td>
<td>The subset of URLs to which the cookie applies</td>
</tr>
<tr>
<td>secure</td>
<td>Should the cookie be returned to the Web server using secured means only.</td>
</tr>
<tr>
<td>version</td>
<td>The version of the HTTP cookie specification the cookie conforms.</td>
</tr>
<tr>
<td>comment</td>
<td>The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.</td>
</tr>
</tbody>
</table>

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the UTL_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using GET_COOKIES, store them persistently in a database table, and re-store the cookies back in the package using ADD_COOKIES in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies" on page 252-21.

CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection_table is a PL/SQL table of connection.

For a direct HTTP persistent connection to a Web server, the host and port fields contain the host name and TCP/IP port number of the Web server. The proxy_host and proxy_port fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the proxy_host and proxy_port fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The SSL field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and
the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

**Syntax**

```plsql
TYPE connection IS RECORD (
    host  VARCHAR2(256),
    port  PLS_INTEGER,
    proxy_host  VARCHAR2(256),
    proxy_port  PLS_INTEGER,
    ssl  BOOLEAN);

TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```
Operational Notes

- Operational Flow

- HTTP Requests
- HTTP Responses
- HTTP Persistent Connections
- Error Conditions
- Session Settings
- Request Context
- External Password Store

Operational Flow

The UTL_HTTP package provides access to the HTTP protocol. The interfaces must be called in the order shown in Figure 252–1, or an exception will be raised.
The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - GET_COOKIE_COUNT
  - GET_COOKIES
  - ADD_COOKIES
  - CLEAR_COOKIES

- Persistent connections
  - GET_PERSISTENT_CONN_COUNT
  - GET_PERSISTENT_CONNS
  - CLOSE_PERSISTENT_CONN
  - CLOSE_PERSISTENT_CONNS
**Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session**
- `SET_PROXY`
- `GET_PROXY`
- `SET_COOKIE_SUPPORT`
- `GET_COOKIE_SUPPORT`
- `SET_FOLLOW_REDIRECT`
- `GET_FOLLOW_REDIRECT`
- `SET_BODY_CHARSET`
- `GET_BODY_CHARSET`
- `SET_PERSISTENT_CONN_SUPPORT`
- `GET_PERSISTENT_CONN_SUPPORT`
- `SET_DETAILED_EXCP_SUPPORT`
- `GET_DETAILED_EXCP_SUPPORT`
- `SET_WALLET`
- `SET_TRANSFER_TIMEOUT`
- `GET_TRANSFER_TIMEOUT`

**Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session**
- `GET_DETAILED_SQLCODE`
- `GET_DETAILED_SQLERRM`

---

**NOTE:** Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

---

**Simple HTTP Fetches**

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.
HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

See Also: HTTP Requests Subprograms on page 252-27

HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

See Also: HTTP Responses Subprograms on page 252-29

HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

See Also: HTTP Cookies Subprograms on page 252-30

HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.

See Also: HTTP Persistent Connections Subprograms on page 252-31

Error Conditions

The UTL_HTTP package provides subprograms to retrieve error information.

See Also: Error Conditions Subprograms on page 252-32

Session Settings

Session settings manipulate the configuration and default behavior of UTL_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body
character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also: Session Settings Subprograms on page 252-26

Request Context

The UTL_HTTP package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

See Also: HTTP Requests Subprograms on page 252-27

External Password Store

The UTL_HTTP package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

See Also: SET_AUTHENTICATION_FROM_WALLET Procedure on page 252-79
Exceptions

Table 252–7 lists the exceptions that the UTL_HTTP package interface can raise. By default, UTL_HTTP raises the exception request_failed when a request fails to execute. If the package is set to raise a detailed exception by set_detailed_excp_support, the rest of the exceptions will be raised directly (except for the exception end_of_body, which will be raised by READ_TEXT, READ_LINE, and READ_RAW regardless of the setting).

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
<th>Where Raised</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>29261</td>
<td>The argument passed to the interface is bad</td>
<td>Any HTTP request or response interface when detailed_exception is enabled</td>
</tr>
<tr>
<td>BAD_URL</td>
<td>29262</td>
<td>The requested URL is badly formed</td>
<td>BEGIN_REQUEST, when detailed_exception is enabled</td>
</tr>
<tr>
<td>END_OF_BODY</td>
<td>29266</td>
<td>The end of HTTP response body is reached</td>

</tr>
<tr>
<td>HEADER_NOT_FOUND</td>
<td>29265</td>
<td>The header is not found</td>
<td>GET_HEADER, GET_HEADER_BY_NAME, when detailed_exception is enabled</td>
</tr>
<tr>
<td>HTTP_CLIENT_ERROR</td>
<td>29268</td>
<td>From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.</td>
<td>GET_RESPONSE, BEGIN_REQUEST, when detailed_exception is enabled</td>
</tr>
<tr>
<td>HTTP_SERVER_ERROR</td>
<td>29269</td>
<td>From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.</td>
<td>GET_RESPONSE, BEGIN_REQUEST, when detailed_exception is enabled</td>
</tr>
<tr>
<td>PARTIAL_MULTIBYTE_EXCEPTION</td>
<td>29275</td>
<td>No complete character is read and a partial multibyte character is found at the end of the response body</td>
<td>READ_TEXT and READ_LINE, when detailed_exception is enabled</td>
</tr>
<tr>
<td>PROTOCOL_ERROR</td>
<td>29263</td>
<td>An HTTP protocol error occurs when communicating with the Web server</td>
<td>SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled</td>
</tr>
</tbody>
</table>
### Table 252–7 (Cont.) UTL_HTTP Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
<th>Where Raised</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQUEST_FAILED</td>
<td>29273</td>
<td>The request fails to executes</td>
<td>Any HTTP request or response interface when detailed_exception is disabled</td>
</tr>
<tr>
<td>TOO_MANY_REQUESTS</td>
<td>29270</td>
<td>Too many requests or responses are open</td>
<td>BEGIN_REQUEST, when detailed_exception is enabled</td>
</tr>
<tr>
<td>TRANSFER_TIMEOUT</td>
<td>29276</td>
<td>No data is read and a read timeout occurred</td>
<td>READ_TEXT and READ_LINE, when detailed_exception is enabled</td>
</tr>
<tr>
<td>UNKNOWN_SCHEME</td>
<td>29264</td>
<td>The scheme of the requested URL is unknown</td>
<td>BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled</td>
</tr>
</tbody>
</table>

**NOTE:** The partial_multibyte_char and transfer_timeout exceptions are duplicates of the same exceptions defined in UTL_TCP. They are defined in this package so that the use of this package does not require the knowledge of the UTL_TCP. As those exceptions are duplicates, an exception handle that catches the partial_multibyte_char and transfer_timeout exceptions in this package also catch the exceptions in the UTL_TCP.

For REQUEST and REQUESTPieces, the request_failed exception is raised when any exception occurs and detailed_exception is disabled.
Examples

The following examples demonstrate how to use UTL_HTTP.

- General Usage
- Retrieving HTTP Response Headers
- Handling HTTP Authentication
- Retrieving and Restoring Cookies
- Making HTTP Request with Private Wallet and Cookie Table

General Usage

```sql
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req   UTL_HTTP.REQ;
    resp  UTL_HTTP.RESP;
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    LOOP
        UTL_HTTP.READ_LINE(resp, value, TRUE);
        DBMS_OUTPUT.PUT_LINE(value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving HTTP Response Headers

```sql
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req   UTL_HTTP.REQ;
    resp  UTL_HTTP.RESP;
    name  VARCHAR2(256);
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```
Handling HTTP Authentication

```
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url      IN VARCHAR2,
                                      username IN VARCHAR2 DEFAULT NULL,
                                      password IN VARCHAR2 DEFAULT NULL,
                                      realm    IN VARCHAR2 DEFAULT NULL) AS

  req       UTL_HTTP.REQ;
  resp      UTL_HTTP.RESP;
  my_scheme VARCHAR2(256);
  my_realm  VARCHAR2(256);
  name      VARCHAR2(256);
  value     VARCHAR2(256);

BEGIN
  -- Turn off checking of status code. We will check it by ourselves.
  UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
  req := UTL_HTTP.BEGIN_REQUEST(url);
  IF (username IS NOT NULL) THEN
    UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic Authen. Scheme
  END IF;
  resp := UTL_HTTP.GET_RESPONSE(req);
  IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
    DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
    DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the proxy server.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
    DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
    DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the Web page.');
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  END IF;
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving and Restoring Cookies

```
CREATE TABLE my_cookies (
  session_id  INTEGER,
  name        VARCHAR2(256),
  value       VARCHAR2(1024),
  domain      VARCHAR2(256),
  expire      DATE,
  path        VARCHAR2(1024),
  secure      VARCHAR2(1),
  version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000
```
REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
  cookies UTL_HTTP.COOKIE_TABLE;
  my_session_id PLS_INTEGER;
  secure VARCHAR2(1);
BEGIN
  /* assume that some cookies have been set in previous HTTP requests. */
  UTL_HTTP.GET_COOKIES(cookies);
  SELECT session_id.nextval INTO my_session_id FROM DUAL;
  FOR i in 1..cookies.count LOOP
    IF (cookies(i).secure) THEN
      secure := 'Y';
    ELSE
      secure := 'N';
    END IF;
    INSERT INTO my_cookies
      VALUES (my_session_id, cookies(i).name, cookies(i).value,
              cookies(i).domain,
              cookies(i).expire, cookies(i).path, secure, cookies(i).version);
  END LOOP;
  RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER) AS
  cookies UTL_HTTP.COOKIE_TABLE;
  cookie UTL_HTTP.COOKIE;
  i PLS_INTEGER := 0;
CURSOR c (c_session_id PLS_INTEGER) IS
  SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name := r.name;

Subprogram Groups

UTL_HTTP subprograms are grouped by function:

- Simple HTTP Fetches in a Single Call Subprograms
- Session Settings Subprograms
- HTTP Requests Subprograms
- HTTP Request Contexts Subprograms
- HTTP Responses Subprograms
- HTTP Cookies Subprograms
- HTTP Persistent Connections Subprograms
- Error Conditions Subprograms
Simple HTTP Fetches in a Single Call Subprograms

REQUEST and REQUESTPieces take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 252–8  UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQUEST Function on page 252-73</td>
<td>Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.</td>
</tr>
<tr>
<td>REQUESTPieces Function on page 252-75</td>
<td>Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.</td>
</tr>
</tbody>
</table>
### Session Settings Subprograms

**Table 252–9  UTL_HTTP Subprograms—Session Settings**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_BODY_CHARSET Procedure on page 252-50</td>
<td>Retrieves the default character set of the body of all future HTTP requests when the media type is text and the character set is not specified in the Content-Type header</td>
</tr>
<tr>
<td>GET_COOKIE_SUPPORT Procedure on page 252-52</td>
<td>Retrieves the current cookie support settings</td>
</tr>
<tr>
<td>GET_DETAILED_EXCP_SUPPORT Procedure on page 252-54</td>
<td>Checks if the UTL_HTTP package will raise a detailed exception or not</td>
</tr>
<tr>
<td>GET_FOLLOW_REDIRECT Procedure on page 252-57</td>
<td>Retrieves the follow-redirect setting in the current session</td>
</tr>
<tr>
<td>GET_PERSISTENT_CONN_SUPPORT Procedure on page 252-62</td>
<td>Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session</td>
</tr>
<tr>
<td>GET_PROXY Procedure on page 252-64</td>
<td>Retrieves the current proxy settings</td>
</tr>
<tr>
<td>GET_RESPONSE_ERROR_CHECK Procedure on page 252-67</td>
<td>Checks if the response error check is set or not</td>
</tr>
<tr>
<td>GET_TRANSFER_TIMEOUT Procedure on page 252-68</td>
<td>Retrieves the current network transfer timeout value</td>
</tr>
<tr>
<td>SET_TRANSFER_TIMEOUT Procedure on page 252-94</td>
<td>Sets the default character set of the body of all future HTTP requests when the media type is text and the character set is not specified in the Content-Type header</td>
</tr>
<tr>
<td>SET_COOKIE_SUPPORT Procedures on page 252-83</td>
<td>Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session</td>
</tr>
<tr>
<td>SET_DETAILED_EXCP_SUPPORT Procedure on page 252-85</td>
<td>Sets the UTL_HTTP package to raise a detailed exception</td>
</tr>
<tr>
<td>SET_FOLLOW_REDIRECT Procedures on page 252-86</td>
<td>Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function</td>
</tr>
<tr>
<td>SET_PERSISTENT_CONN_SUPPORT Procedure on page 252-88</td>
<td>Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session</td>
</tr>
<tr>
<td>SET_PROXY Procedure on page 252-92</td>
<td>Sets the proxy to be used for requests of HTTP or other protocols</td>
</tr>
<tr>
<td>SET_RESPONSE_ERROR_CHECK Procedure on page 252-93</td>
<td>Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges</td>
</tr>
<tr>
<td>SET_TRANSFER_TIMEOUT Procedure on page 252-94</td>
<td>Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server</td>
</tr>
<tr>
<td>SET_WALLET Procedure on page 252-95</td>
<td>Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS</td>
</tr>
</tbody>
</table>
## HTTP Requests Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BEGIN_REQUEST Function</strong> on page 252-38</td>
<td>Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.</td>
</tr>
<tr>
<td><strong>SET_HEADER Procedure</strong> on page 252-87</td>
<td>Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.</td>
</tr>
<tr>
<td><strong>SET_AUTHENTICATION Procedure</strong> on page 252-78</td>
<td>Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.</td>
</tr>
<tr>
<td><strong>SET_AUTHENTICATION_FROM_WALLET Procedure</strong> on page 252-79</td>
<td>Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.</td>
</tr>
<tr>
<td><strong>SET_BODY_CHARSET Procedures</strong> on page 252-81</td>
<td>Sets the character set of the request body when the media type is text but the character set is not specified in the Content-Type header.</td>
</tr>
<tr>
<td><strong>SET_COOKIE_SUPPORT Procedures</strong> on page 252-83</td>
<td>Enables or disables support for the HTTP cookies in the request.</td>
</tr>
<tr>
<td><strong>SET_FOLLOW_REDIRECT Procedures</strong> on page 252-86</td>
<td>Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function on page 252-65.</td>
</tr>
<tr>
<td><strong>SET_PERSISTENT_CONN_SUPPORT Procedure</strong> on page 252-88</td>
<td>Enables or disables support for the HTTP 1.1 persistent-connection in the request.</td>
</tr>
<tr>
<td><strong>SET_PROXY Procedure</strong> on page 252-92</td>
<td>Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP).</td>
</tr>
<tr>
<td><strong>WRITE_RAW Procedure</strong> on page 252-97</td>
<td>Writes some binary data in the HTTP request body.</td>
</tr>
<tr>
<td><strong>WRITE_TEXT Procedure</strong> on page 252-98</td>
<td>Writes some text data in the HTTP request body.</td>
</tr>
</tbody>
</table>
## HTTP Request Contexts Subprograms

### Table 252–11 UTL_HTTP Subprograms—HTTP Request Contexts

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CREATE_REQUEST_CONTEXT</code> Function</td>
<td>Creates a request context in UTL_HTTP for a wallet and a cookie table</td>
</tr>
<tr>
<td><code>DESTROY_REQUEST_CONTEXT</code> Procedure</td>
<td>Destroys a request context in UTL_HTTP</td>
</tr>
</tbody>
</table>
# HTTP Responses Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>END_RESPONSE Procedure on page 252-48</td>
<td>Ends the HTTP response. It completes the HTTP request and response.</td>
</tr>
<tr>
<td>GET_AUTHENTICATION Procedure on page 252-49</td>
<td>Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.</td>
</tr>
<tr>
<td>GET_HEADER Procedure on page 252-58</td>
<td>Returns the nth HTTP response header name and value returned in the response.</td>
</tr>
<tr>
<td>GET_HEADER_BY_NAME Procedure on page 252-59</td>
<td>Returns the HTTP response header value returned in the response given the name of the header.</td>
</tr>
<tr>
<td>GET_HEADER_COUNT Function on page 252-60</td>
<td>Returns the number of HTTP response headers returned in the response.</td>
</tr>
<tr>
<td>GET_RESPONSE Function on page 252-65</td>
<td>Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.</td>
</tr>
<tr>
<td>READ_LINE Procedure on page 252-69</td>
<td>Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.</td>
</tr>
<tr>
<td>READ_RAW Procedure on page 252-70</td>
<td>Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.</td>
</tr>
<tr>
<td>READ_TEXT Procedure on page 252-71</td>
<td>Reads the HTTP response body in text form and returns the output in the caller-supplied buffer.</td>
</tr>
<tr>
<td>SET_BODY_CHARSET Procedures on page 252-81</td>
<td>Sets the character set of the response body when the media type is &quot;text&quot; but the character set is not specified in the Content-Type header.</td>
</tr>
</tbody>
</table>
## HTTP Cookies Subprograms

**Table 252–13**  
**UTL_HTTP Subprograms—HTTP Cookies**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_COOKIES Procedure</strong> on page 252-37</td>
<td>Add the cookies either to a request context or to the UTL_HTTP package’s session state</td>
</tr>
<tr>
<td><strong>CLEAR_COOKIES Procedure</strong> on page 252-40</td>
<td>Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state</td>
</tr>
<tr>
<td><strong>GET_COOKIE_COUNT Function</strong> on page 252-51</td>
<td>Returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session states</td>
</tr>
<tr>
<td><strong>GET_COOKIES Function</strong> on page 252-53</td>
<td>Returns all the cookies maintained either in a request context or in the UTL_HTTP package’s session state.</td>
</tr>
</tbody>
</table>
## HTTP Persistent Connections Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSE_PERSISTENT_CONN Procedure on page 252-41</td>
<td>Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session</td>
</tr>
<tr>
<td>CLOSE_PERSISTENT_CONNS Procedure on page 252-42</td>
<td>Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session</td>
</tr>
<tr>
<td>GET_PERSISTENT_CONN_COUNT Function on page 252-61</td>
<td>Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers</td>
</tr>
<tr>
<td>GET_PERSISTENT_CONNS Procedure on page 252-63</td>
<td>Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers</td>
</tr>
</tbody>

<td><strong>WRITE_TEXT Procedure</strong> on page 252-98</td>
<td>Writes some text data in the HTTP request body</td>
<td>HTTP Requests Subprograms on page 252-27</td>
</tr>
</tbody>
</table>
ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

See Also: HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```sql
UTL_HTTP.ADD_COOKIES (  
  cookies          IN  cookie_table,  
  request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies to be added</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.</td>
</tr>
</tbody>
</table>

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.
BEGIN_REQUEST Function

This function begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

`scheme://[user[:password]@[host[:port]]/...`

**See Also:** HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

**Syntax**

```sql
UTL_HTTP.BEGIN_REQUEST (url IN VARCHAR2,
method IN VARCHAR2 DEFAULT 'GET',
http_version IN VARCHAR2 DEFAULT NULL,
request_context IN request_context_key DEFAULT NULL)
RETURN req;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the HTTP request</td>
</tr>
<tr>
<td>method</td>
<td>The method performed on the resource identified by the URL</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See Chapter 266, "UTL_URL" for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

- BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the GET_RESPONSE Function will raise the PROTOCOL_
ERROR exception.

A URL will be long when its QUERY_STRING (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the POST method.

```sql
req := UTL_HTTP.BEGIN_REQUEST (url=>$the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r => req,
        name => 'Content-Type',
        value => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r => req,
        name => 'Content-Length',
        value => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r => req,
        data => 'p1 = value1&p2=value2...
resp := UTL_HTTP.GET_RESPONSE
        [r => req];
```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the `SET_WALLET Procedure` procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the Oracle Database Security Guide to grant the privilege.

- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the UTL_HTTP must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.
CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

**See Also:** HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```sql
UTL_HTTP.CLEAR_COOKIES ( request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to clear the cookies. If NULL, the cookies maintained in the UTL_HTTP package's session state will be cleared instead.</td>
</tr>
</tbody>
</table>
CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session.

See Also: HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

Syntax

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONN (conn IN connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conn</td>
<td>The HTTP persistent connection to close</td>
</tr>
</tbody>
</table>
CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the foobar at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                 proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

**See Also:** HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

```sql
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
    host        IN VARCHAR2 DEFAULT NULL,
    port        IN PLS_INTEGER DEFAULT NULL,
    proxy_host  IN VARCHAR2 DEFAULT NULL,
    proxy_port  IN PLS_INTEGER DEFAULT NULL,
    ssl         IN BOOLEAN DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>port</td>
<td>The port number for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_host</td>
<td>The proxy host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_port</td>
<td>The proxy port for which persistent connections are to be closed</td>
</tr>
<tr>
<td>ssl</td>
<td>Close persistent SSL connection</td>
</tr>
</tbody>
</table>

**Usage Notes**

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL.
of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the CLOSE_PERSISTENT_CONN procedure that closes a specific persistent connection.
CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

See Also: Request Context on page 252-17 and HTTP Request Contexts Subprograms on page 252-28

Syntax

```sql
UTL_HTTP.CREATE_REQUEST_CONTEXT (  
  wallet_path          IN VARCHAR2 DEFAULT NULL,  
  wallet_password      IN VARCHAR2 DEFAULT NULL,  
  enable_cookies       IN BOOLEAN  DEFAULT TRUE,  
  max_cookies          IN PLS_INTEGER DEFAULT 300,  
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20)  
RETURN request_context_key;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>Directory path that contains the Oracle wallet. The format is file:directory-path</td>
</tr>
<tr>
<td>wallet_password</td>
<td>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the Oracle Database Enterprise User Security Administrator’s Guide for detailed information about wallets.</td>
</tr>
<tr>
<td>enable_cookies</td>
<td>Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it.</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Sets the maximum total number of cookies that will be maintained in this request context</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Sets the maximum number of cookies per each Web site that will be maintained in this request context</td>
</tr>
</tbody>
</table>

Return Values

The request context created.

Examples

```sql
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
  req              utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
    wallet_path => 'file:/oracle/wallets/test_wallets',
    wallet_password => NULL,
    enable_cookies => TRUE,
    max_cookies => 300,
    max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
```

See Also: Request Context on page 252-17 and HTTP Request Contexts Subprograms on page 252-28
url => 'http://www.example.com/',
request_context => request_context);
END;
DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in UTL_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

See Also: Request Context on page 252-17 and HTTP Request Contexts Subprograms on page 252-28

Syntax

UTL_HTTP.DESTROY_REQUEST_CONTEXT (request_context request_context_key);

Parameters

Table 252–23 DESTROY_REQUEST_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to destroy</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);
    ...
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

See Also: HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

UTL_HTTP.END_REQUEST (  
   r IN OUT NOCOPY req);

Parameters

Table 252–24 END_REQUEST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
</tbody>
</table>
END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

See Also: HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.END_RESPONSE (  
  r  IN OUT NOCOPY resp);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>
GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also: HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
    r          IN OUT NOCOPY resp,
    scheme     OUT VARCHAR2,
    realm      OUT VARCHAR2,
    for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>scheme</td>
<td>The scheme for the required HTTP authentication</td>
</tr>
<tr>
<td>realm</td>
<td>The realm for the required HTTP authentication</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE</td>
</tr>
</tbody>
</table>

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.
GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

**See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

**Syntax**

```sql
UTL_HTTP.GET_BODY_CHARSET (;
    charset OUT NOCOPY VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>The default character set of the body of all future HTTP requests</td>
</tr>
</tbody>
</table>
GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also: HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (   
    request_context  IN  request_context_key DEFAULT NULL) 
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.</td>
</tr>
</tbody>
</table>
GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
    enable            OUT BOOLEAN,
    max_cookies       OUT PLS_INTEGER,
    max_cookies_per_site OUT PLS_INTEGER);
```

Parameters

```
Table 252–29  GET_COOKIE_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Indicates the maximum total number of cookies maintained in the current session</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Indicates the maximum number of cookies maintained in the current session for each Web site</td>
</tr>
</tbody>
</table>
```
GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also: HTTP Cookies on page 252-16 and HTTP Cookies Subprograms on page 252-30

Syntax

```
UTL_HTTP.GET_COOKIES (
    cookies IN OUT NOCOPY cookie_table,
    request_context IN request_context_key DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies returned</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.</td>
</tr>
</tbody>
</table>
GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```sql
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
   enable   OUT BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE</td>
</tr>
</tbody>
</table>
GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

See Also:  Error Conditions on page 252-16 and Error Conditions Subprograms on page 252-32

Syntax

UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
GET_DETAILED_SQLERRM Function

This function retrieves the detailed SQLERRM of the last exception raised.

See Also: Error Conditions on page 252-16 and Error Conditions Subprograms on page 252-32

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```
GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

UTL_HTTP.GET_FOLLOW_REDIRECT ( 
    max_redirects OUT PLS_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirections for all future HTTP requests</td>
</tr>
</tbody>
</table>
GET_HEADER Procedure

This procedure returns the n<sup>th</sup> HTTP response header name and value returned in the response.

**See Also:** [HTTP Responses](#) on page 252-16 and [HTTP Responses Subprograms](#) on page 252-29

**Syntax**

```plsql
UTL_HTTP.GET_HEADER (r      IN OUT NOCOPY resp,
                       n      IN PLS_INTEGER,
                       name   OUT NOCOPY VARCHAR2,
                       value  OUT NOCOPY VARCHAR2);
```

**Parameters**

**Table 252–33 GET_HEADER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>n</td>
<td>The n&lt;sup&gt;th&lt;/sup&gt; header to return</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response
given the name of the header.

See Also: HTTP Responses on page 252-16 and HTTP Responses
Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
  r      IN OUT NOCOPY resp,
  name   IN VARCHAR2,
  value  OUT NOCOPY VARCHAR2,
  n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header for which the value is to return</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header</td>
</tr>
<tr>
<td>n</td>
<td>The n&lt;sup&gt;th&lt;/sup&gt; occurrence of an HTTP response header by the specified name to return. The default is 1.</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

See Also: HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (  
    r  IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

Syntax

UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.
GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks:

- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
   enable     OUT BOOLEAN,
   max_conns  OUT PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if persistent connection support is enabled; otherwise FALSE</td>
</tr>
<tr>
<td>max_conns</td>
<td>the maximum number of persistent connections maintained in the current session</td>
</tr>
</tbody>
</table>
GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: HTTP Persistent Connections on page 252-16 and HTTP Persistent Connections Subprograms on page 252-31

Syntax

UTL_HTTP.get_persistent_conns (  
 connections   IN OUT NOCOPY connection_table);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connections</td>
<td>The network connections kept persistent</td>
</tr>
</tbody>
</table>

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.
GET_PROXY Procedure

This procedure retrieves the current proxy settings.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.GET_PROXY (  
  proxy             OUT NOCOPY VARCHAR2,  
  no_proxy_domains  OUT NOCOPY VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) currently used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy is used for all requests</td>
</tr>
</tbody>
</table>
GET_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

See Also: HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```sql
UTL_HTTP.GET_RESPONSE (  
    r                       IN OUT NOCOPY req,  
    return_info_response    IN BOOLEAN DEFAULT FALSE)  
RETURN resp;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>The HTTP response</td>
</tr>
<tr>
<td><code>return_info_response</code></td>
<td>Return 100 informational response or not.</td>
</tr>
<tr>
<td></td>
<td>- TRUE means <code>get_response</code> should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned.</td>
</tr>
<tr>
<td></td>
<td>- FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.</td>
</tr>
</tbody>
</table>

Exceptions

- When detailed-exception is disabled:
  - ORA-29273 REQUEST_FAILED - the request fails to execute. Use the GET_DETAILED_EXCP_SUPPORT Procedure and the GET_DETAILED_SQLERRM Function to get the detailed error message.
- When detailed-exception is enabled:
  - ORA-29261 BAD_ARGUMENT - some arguments passed are not valid
- When response error check is enabled:
  - ORA-29268 HTTP_CLIENT_ERROR - the response code is in 400 range
  - ORA-29269 HTTP_SERVER_ERROR - the response code is in 500 range

Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the END_REQUEST Procedure.
- If URL redirection occurs, the URL and method fields in the `req` record will be updated to the last redirected URL and the method used to access the URL.
Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to `GET_RESPONSE` to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to `GET_RESPONSE` to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional `EXPECT: 100-CONTINUE` request header, and check for `100 CONTINUE` response from the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```sql
DECLARE
    data VARCHAR2(1024) := '...';
    req utl_http.req;
    resp utl_http.resp;
BEGIN
    req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
    utl_http.set_header(req, 'Content-Length', length(data));
    -- Ask HTTP server to return '100 Continue' response
    utl_http.set_header(req, 'Expect', '100-continue');
    resp := utl_http.get_response(req, TRUE);

    -- Check for and dispose '100 Continue' response
    IF (resp.status_code <> 100) THEN
        utl_http.end_response(resp);
        raise_application_error(20000, 'Request rejected');
    END IF;
    utl_http.end_response(resp);

    -- Now, send the request body
    utl_http.write_text(req, data);

    -- Get the regular response
    resp := utl_http.get_response(req);
    utl_http.read_text(resp, data);

    utl_http.end_response(resp);
END;
```
GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

UTL_HTTP.GET_RESPONSE_ERROR_CHECK (enable OUT BOOLEAN);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if the response error check is set; otherwise FALSE</td>
</tr>
</tbody>
</table>
GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

UTL_HTTP.GET_TRANSFER_TIMEOUT (  
    timeout  OUT PLS_INTEGER);  

Parameters

<table>
<thead>
<tr>
<th>Table 252–41</th>
<th>GET_TRANSFER_TIMEOUT Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds</td>
</tr>
</tbody>
</table>
READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function read_line of UTL_TCP. The end_of_body exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also: HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

UTL_HTTP.READ_LINE(
    r            IN OUT NOCOPY resp,
    data         OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
    remove_crlf  IN  BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>Removes the newline characters if set to TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_line waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_line stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the Content-Type response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.
READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The end_of_body exception will be raised if the end of the HTTP response body is reached.

See Also:  HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

UTL_HTTP.READ_RAW(
  r IN OUT NOCOPY resp,
  data OUT NOCOPY RAW,
  len IN PLS_INTEGER DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in binary form</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_raw waits for each data packet to be ready to read until timeout occurs. If it occurs, read_raw stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.
READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The end_of_body exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

**See Also:** HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29

Syntax

```sql
UTL_HTTP.READ_TEXT(
    r     IN OUT NOCOPY resp,
    data  OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>len</td>
<td>The maximum number of characters of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_text waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_text stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the Content-Type response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body.
as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.
REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[username[:password]@]host[:port]/[
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][username[:password]@]host[:port]///
```

See Also: Simple HTTP Fetches on page 252-15 and Simple HTTP Fetches in a Single Call Subprograms on page 252-25

Syntax

```
UTL_HTTP.REQUEST (  
url              IN VARCHAR2,  
proxy            IN VARCHAR2 DEFAULT NULL,  
wallet_path      IN VARCHAR2 DEFAULT NULL,  
wallet_password  IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file://WINNT/Profiles/username/WALLETS, and in Unix is, for example, file://home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</td>
</tr>
<tr>
<td>wallet_password</td>
<td>(Optional) Specifies the password required to open the wallet</td>
</tr>
</tbody>
</table>

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.
Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```html
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
</BODY>
</HTML>
```

Examples

```sql
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
```

If you are behind a firewall, include the proxy parameter. For example, from within the Oracle firewall, where there might be a proxy server named www-proxy.my-company.com:

```sql
SQLPLUS> SELECT
```
REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

**See Also:** Simple HTTP Fetches on page 252-15 and Simple HTTP Fetches in a Single Call Subprograms on page 252-25

### Syntax

```sql
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (url             IN VARCHAR2,
                         max_pieces      IN NATURAL DEFAULT 32767,
                         proxy           IN VARCHAR2 DEFAULT NULL,
                         wallet_path     IN VARCHAR2 DEFAULT NULL,
                         wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 252–46 REQUEST_PIECES Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator</td>
</tr>
<tr>
<td><code>max_pieces</code></td>
<td>(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request.</td>
</tr>
<tr>
<td></td>
<td>The format of wallet_path on a PC is, for example, file: c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file: /home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</td>
</tr>
<tr>
<td>wallet_password</td>
<td>(Optional) Specifies the password required to open the wallet</td>
</tr>
</tbody>
</table>

### Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL
table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```html
<html>
<head>
<title>Error Message</title>
</head>
<body>
<h1>Fatal Error 500</h1>
<p>
Reason:</b> Can't locate remote host:  home.nothing.comm.
</p>
</body>
</html>
```

Examples

```sql
SET SERVEROUTPUT ON
DECLARE
  x  UTL_HTTP.HTML_PIECES;
  len PLS_INTEGER;
BEGIN
  x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
  DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved.');
  DBMS_OUTPUT.PUT_LINE('with total length ');
  IF x.count < 1 THEN
      DBMS_OUTPUT.PUT_LINE('0');
  ELSE
      len := 0;
      FOR i in 1..x.count LOOP
          len := len + length(x[i]);
      END LOOP;
  END IF;
END;
```

252-76  Oracle Database PL/SQL Packages and Types Reference
END LOOP;
    DBMS_OUTPUT.PUT_LINE(len);
END IF;
END;
/

-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

See Also:  HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
    r         IN OUT NOCOPY req,
    username  IN VARCHAR2,
    password  IN VARCHAR2,
    scheme    IN VARCHAR2 DEFAULT 'Basic',
    for_proxy IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>HTTP request</td>
</tr>
<tr>
<td>username</td>
<td>Username for the HTTP authentication</td>
</tr>
<tr>
<td>password</td>
<td>Password for the HTTP authentication</td>
</tr>
<tr>
<td>scheme</td>
<td>HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.
SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

See Also: External Password Store on page 252-17, and HTTP Requests Subprograms on page 252-27

Syntax

UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
    r         IN OUT NOCOPY req,
    alias     IN VARCHAR2,
    scheme    IN VARCHAR2 DEFAULT 'Basic',
    for_proxy IN BOOLEAN  DEFAULT FALSE);

Parameters

Table 252–48  SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>alias</td>
<td>Alias to identify and retrieve the username and password credential stored in the Oracle wallet</td>
</tr>
<tr>
<td>scheme</td>
<td>HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

- To use the password credentials in a wallet, the UTL_HTTP user must have the use-passwords privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: ******
Enter password again: ******
> mkstore –wrl /oracle/wallets/test_wallet –createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: ******

Granting the use-passwords privilege on the wallet to a user by the database administrator

BEGIN
    DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
acl => 'wallet-acl.xml',
description => 'Wallet ACL',
principal => 'SCOTT',
is_grant => TRUE,
privilege => 'use-passwords');
DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl{
  acl => 'wallet-acl.xml',
  wallet_path => 'file: /oracle/wallets/test_wallet');
END;

Using username and password from the wallet
DECLARE
  req  UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(...);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  ...
END;
**SET_BODY_CHARSET Procedures**

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

**See Also:**
- HTTP Responses on page 252-16 and HTTP Responses Subprograms on page 252-29
- Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

**Syntax**

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is `ISO-8859-1` in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```sql
UTL_HTTP.SET_BODY_CHARSET {    
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```sql
UTL_HTTP.SET_BODY_CHARSET{    
    r IN OUT NOCOPY req,    
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```sql
UTL_HTTP.SET_BODY_CHARSET{    
    r IN OUT NOCOPY resp,    
    charset IN VARCHAR2 DEFAULT NULL);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
<tr>
<td>charset</td>
<td>The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If charset is NULL, the database character set is assumed.</td>
</tr>
</tbody>
</table>
SET_COOKIE_SUPPORT Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

This procedure

**See Also:**
- HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27
- Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

**Syntax**

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```sql
UTL_HTTP.SET_COOKIE_SUPPORT(
    r       IN OUT NOCOPY REQ,
    enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```sql
UTL_HTTP.SET_COOKIE_SUPPORT (,
    enable       IN BOOLEAN,
    max_cookies  IN PLS_INTEGER DEFAULT 300,
    max_cookies_per_site  IN PLS_INTEGER DEFAULT 20);
```

**Parameters**

**Table 252–50 SET_COOKIE_SUPPORT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>enable</td>
<td>Set enable to TRUE to enable HTTP cookie support; FALSE to disable</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Sets the maximum total number of cookies maintained in the current session</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Sets the maximum number of cookies maintained in the current session for each Web site</td>
</tr>
</tbody>
</table>

**Usage Notes**

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the Set-Cookie HTTP headers can still be retrieved from the response.
Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other \texttt{SET_COOKIE\_SUPPORT} procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" on page 252-20 for how to use \texttt{GET\_COOKIES} and \texttt{ADD\_COOKIES} to retrieve, save, and restore cookies.
SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the UTL_HTTP package to raise a detailed exception. By default, UTL_HTTP raises the request_failed exception when an HTTP request fails. Use GET_DETAILED_SQLCODE and GET_DETAILED_SQLERM for more detailed information about the error.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```sql
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE</td>
</tr>
</tbody>
</table>
This procedure sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the `GET_RESPONSE` function.

**See Also:**
- HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27
- Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

**Syntax**

Use this procedure to set the maximum number of redirections:

```plsql
UTL_HTTP.SET_FOLLOW_REDIRECT (  
    max_redirects  IN PLS_INTEGER DEFAULT 3);  
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```plsql
UTL_HTTP.SET_FOLLOW_REDIRECT(  
    r              IN OUT NOCOPY req,  
    max_redirects  IN PLS_INTEGER DEFAULT 3);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirects. Set to zero to disable redirects.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If `max_redirects` is set to a positive number, the `GET_RESPONSE` function will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the `REQ` record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The `SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.
**SET_HEADER Procedure**

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

**See Also:** [HTTP Requests](#) on page 252-16 and [HTTP Requests Subprograms](#) on page 252-27

**Syntax**

```sql
UTL_HTTP.SET_HEADER (
    r      IN OUT NOCOPY req,
    name   IN VARCHAR2,
    value  IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP request header</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP request header</td>
</tr>
</tbody>
</table>

**Usage Notes**

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, `UTL_HTTP` sets the Host header automatically for you.

When you set the `Content-Type` header with this procedure, `UTL_HTTP` looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the `SET_BODY_CHARSET` procedure.

When you set the `Transfer-Encoding` header with the value `chunked`, `UTL_HTTP` automatically encodes the request body written by the `WRITE_TEXT`, `WRITE_LINE` and `WRITE_RAW` procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.
SET_PERSISTENT_CONN_SUPPORT Procedure

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

**See Also:**  [HTTP Requests](#) on page 252-16 and [HTTP Requests Subprograms](#) on page 252-27

Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    enable      IN BOOLEAN DEFAULT FALSE,
    max_conns   IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    r           IN OUT NOCOPY req,
    enable      IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE to keep the network connection persistent. FALSE otherwise.</td>
</tr>
<tr>
<td>maximum_conns</td>
<td>Maximum number of connections</td>
</tr>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.
Users should note that while the use of persistent connections in \texttt{UTL_HTTP} may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in “Examples” on page 252-89.

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the \texttt{maximum\_conns} parameter prior to calling the \texttt{BEGIN\_REQUEST} Function, otherwise persistent connections will not be enabled for the current request even if the other form of \texttt{SET\_PERSISTENT\_CONN\_SUPPORT} is called.

\section*{Examples}

\subsection*{Using \texttt{SET\_PERSISTENT\_CONN\_SUPPORT} in http requests at the session level, showing the active persistent connection after each request}

\begin{verbatim}
DECLARE
    pieces utl_http.html_pieces;
    conns  utl_http.connection_table;
BEGIN
    -- Turns on persistent connection support for the request\_pieces call.
    utl_http.set_persistent_conn_support(true, 1);

    FOR i IN 1..10 LOOP
        pieces := utl_http.request_pieces('http://www.example.com/');

        -- Shows the active persistent connection
        utl_http.get_persistent_conns(conns);
        FOR j IN 1..conns.count LOOP
            dbms_output.put_line('Persistent connection '||j||': '||conns(j).host||':'||conns(j).port);
        END LOOP;
    END LOOP;

    -- Turns off persistent connection support. Set active max persistent connection
    to 0 to close all active connections.
    utl_http.set_persistent_conn_support(false, 0);
END;
/\end{verbatim}
Using SET_PERSISTENT_CONN_SUPPORT in HTTP requests showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

DECLARE
  -- Table to store the URLs
  TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
  paths VC2_TABLE;

PROCEDURE fetch_pages(paths IN vc2_table) AS
  req UTL_HTTP.REQ;
  resp UTL_HTTP.RESP;
  data VARCHAR2(1024);
BEGIN
  -- Set the proxy server
  UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

  FOR i IN 1..paths.count LOOP
    req := UTL_HTTP.BEGIN_REQUEST(paths(i));
    -- Use persistent connections except for the last request
    IF (i < paths.count) THEN
      -- Use a persistent connection for the current request
      UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
    END IF;
    resp := UTL_HTTP.GET_RESPONSE(req);
    -- Display the results of the response
    DBMS_OUTPUT.PUT_LINE('-');
    DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
    DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code:   ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
    DBMS_OUTPUT.PUT_LINE('HTTP Response Version:       ' || resp.http_version);
    BEGIN
      LOOP
        UTL_HTTP.READ_TEXT(resp, data);
        -- do something with the data
      END LOOP;
      EXCEPTION
        WHEN UTL_HTTP.END_OF_BODY THEN
          NULL;
    END;
    UTL_HTTP.END_RESPONSE(resp);
  END LOOP;
END;

BEGIN
  -- Set a maximum of 1 persistent connection, but start with persistent connections
  -- off
  UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

  -- Create a list of URLs
  paths(1) := 'http://www.example.com/technetwork/index.html';
  paths(2) := 'http://www.example.com/us/products/index.html';

  fetch_pages(paths);

END;
/

SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in no_proxy_domains. no_proxy_domains is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

UTL_HTTP.SET_PROXY (proxy             IN VARCHAR2,  
                      no_proxy_domains  IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) to be used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy should be used for all requests</td>
</tr>
</tbody>
</table>

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is [http://]host[:port][/], for example, www-proxy.my-company.com:80. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, corp.my-company.com, eng.my-company.com:80. When no_proxy_domains is NULL and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is [http://]user[:password]@host[:port][/]

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables http_proxy and no_proxy are assumed. Proxy settings set by this procedure override the initial settings.
SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

**See Also:** Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 252–56** SET_RESPONSE_ERROR_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE to check for response errors; otherwise FALSE</td>
</tr>
</tbody>
</table>

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, GET_RESPONSE will raise the HTTP_CLIENT_ERROR or HTTP_SERVER_ERROR exception. If SET_RESPONSE_ERROR_CHECK is set to FALSE, GET_RESPONSE will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The GET_RESPONSE function can raise other exceptions when SET_RESPONSE_ERROR_CHECK is set to FALSE.
SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

See Also: Session Settings on page 252-16 and Session Settings Subprograms on page 252-26

Syntax

UTL_HTTP.SET_TRANSFER_TIMEOUT (timeout  IN PLS_INTEGER DEFAULT 60);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds.</td>
</tr>
</tbody>
</table>

Usage Notes

The default value of the time out is 60 seconds.
**SET_WALLET Procedure**

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the **UTL_HTTP** package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the **UTL_HTTP** package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the **UTL_HTTP** package. An Oracle wallet is required to make an HTTPS request.

See Also:
- **Session Settings** on page 252-16 and **Session Settings Subprograms** on page 252-26

**Syntax**

```
UTL_HTTP.SET_WALLET (
    path      IN VARCHAR2,
    password  IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>. The format of wallet_path on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code>, and in Unix is, for example, <code>file:/home/username/wallets</code>. When the <strong>UTL_HTTP</strong> package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</td>
</tr>
<tr>
<td>password</td>
<td>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See &quot;Using Wallets with Automatic Login Enabled&quot; in the <strong>Oracle Database Advanced Security Guide</strong> for information about using Oracle Wallet Manager and the ORAPKI utility to create an auto-login wallet</td>
</tr>
</tbody>
</table>

**Usage Notes**

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager.

See Also:  **Oracle Database Advanced Security Guide** for more information on Wallet Manager
WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.WRITE_LINE(
    r     IN OUT NOCOPY req,
    data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The text line to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The UTL_HTTP package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.
WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also: HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```
UTL_HTTP.WRITE_RAW(
    r     IN OUT NOCOPY REQ,
    data  IN            RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The binary data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding:chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.
WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 252-16 and HTTP Requests Subprograms on page 252-27

Syntax

```sql
UTL_HTTP.WRITE_TEXT(
    r     IN OUT NOCOPY REQ,
    data  IN            VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The text data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.
UTL_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

Using UTL_I18N

This section contains topics which relate to using the UTL_I18N package.

- Overview
- Security Model
- Constants
Overview

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.
The functions of the UTL_I18N package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to PUBLIC by default.
## Constants

The **UTL_I18N** package uses the constants shown in Table 253–1.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GENERIC_CONTEXT</td>
<td>PLS_INTEGER</td>
<td>0</td>
<td>Returns the default character set for general cases.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document. Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, \&#xe5; is the numeric character reference for the small letter “a” with a ring above, whereas \&aring; is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, \&lt; represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str            IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
<tr>
<td>page_cs_name</td>
<td>Specifies the character set of the document. If page_cs_name is NULL, then</td>
</tr>
<tr>
<td></td>
<td>the database character set is used for CHAR data and the national character</td>
</tr>
<tr>
<td></td>
<td>set is used for NCHAR data.</td>
</tr>
</tbody>
</table>
```

Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < |chr(229),'us7ascii')
```

This returns 'hello &lt; &#xe5;'.

GET_COMMON_TIME_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```sql
UTL_I18N.GET_COMMON_TIME_ZONES
RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```sql
DECLARE
    retval UTL_I18N.STRING_ARRAY;
BEGIN
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
```
GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

See Also: "MAP_CHARSET Function" on page 253-21 for an explanation of an e-mail safe character set

Syntax

```sql
UTL_I18N.GET_DEFAULT_CHARSET(
  language  IN VARCHAR2,
  context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
  iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: Returns the default character set for general cases</td>
</tr>
<tr>
<td></td>
<td>MAIL_CONTEXT: Returns the default e-mail safe character set name</td>
</tr>
<tr>
<td>iswindows</td>
<td>If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE.</td>
</tr>
<tr>
<td></td>
<td>iswindows has no effect if context is set as GENERIC_CONTEXT.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

Examples

**GENERIC_CONTEXT, iswindows=FALSE**

```sql
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

**MAIL_CONTEXT, iswindows=TRUE**

```sql
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

**MAIL_CONTEXT, iswindows=FALSE**

```sql
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.
GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (  
    territory    IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

```
DECLARE
    retval VARCHAR2(50);
BEGIN
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/```
GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (  
    language  IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE    
    retval VARCHAR2(50);    
BEGIN    
    SELECT value INTO retval FROM nls_session_parameters    
        WHERE parameter = 'NLS_LANGUAGE';    
    retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);    
    DBMS_OUTPUT.PUT_LINE(retval);    
END;    
/
```
**GET_LOCAL_LANGUAGES Function**

This function returns the local language names for the specified territory.

**Syntax**

```sql
UTL_I18N.GET_LOCAL_LANGUAGES (territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the user specifies an invalid territory name, then the function returns a `NULL` string.

**Examples**

Returns the list of local languages used in Belgium.

```sql
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
```

... Count = 2
DUTCH
FRENCH
GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A BINARY sort is included for all languages.

Syntax

```sql
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (    language  IN VARCHAR2 CHARACTER SET ANY_CS) RETURN STRING_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the local linguistic sort names for JAPANESE.

```sql
DECLARE    retval UTL_I18N.STRING_ARRAY;    cnt INTEGER;
BEGIN    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');    DBMS_OUTPUT.PUT('Count = ');    DBMS_OUTPUT.PUT_LINE(retval.COUNT);    cnt := retval.FIRST;    WHILE cnt IS NOT NULL LOOP    DBMS_OUTPUT.PUT_LINE(retval(cnt));    cnt := retval.NEXT(cnt);    END LOOP;
END;
/ ...

Count = 2
JAPANESE_M
BINARY
GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (  
    language  IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN STRING_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
    retval  UTL_I18N.STRING_ARRAY;
    cnt     INTEGER;
BEGIN
    retval  := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt));
    END LOOP;
END;
...
```

Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```sql
UTL_I18N.GET_LOCAL_TIME_ZONES (  
    territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)  
RETURN STRING_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user’s territory is known and the application still allows the user to choose other time zones as a user’s preference.

```sql
CREATE OR REPLACE FUNCTION get_time_zones  
(territory IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN utl_i18n.string_array  
IS  
    retval  utl_i18n.string_array;  
    retval2 utl_i18n.string_array;  
    stpos   INTEGER;  
BEGIN  
    retval  := utl_i18n.get_local_time_zones(  
        territory);  
    retval2 := utl_i18n.get_common_time_zones;  
    stpos := retval.LAST + 1;  
    retval(stpos) := '-----'; -- a separator  
    FOR i IN retval2.FIRST..retval2.LAST LOOP  
        stpos := stpos + 1;  
        retval(stpos) := retval2(i);  
    END LOOP;  
    RETURN retval;  
END;  
/
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).
cnt := retval.FIRST;
WHILE cnt IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE(retval(cnt));
    cnt := retval.NEXT(cnt);
END LOOP;
END;
/

GET_MAX_CHARACTER_SIZE Function

This function returns the maximum character size of a given character set.

Syntax

```sql
UTL_I18N.GET_MAX_CHARACTER_SIZE(
    charset_name       IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset_name</td>
<td>Specifies a valid character set name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

Examples

```sql
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');

This returns 4.
```
GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```sql
UTL_I18N.GET_TRANSLATION (    parameter        IN VARCHAR2 CHARACTER SET ANY_CS,    trans_language   IN VARCHAR2 'AMERICAN',    flag             IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)    RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Specifies a valid language name, territory name, or a combined string in the form of language_territory. It is case-insensitive.</td>
</tr>
<tr>
<td>trans_language</td>
<td>Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.</td>
</tr>
<tr>
<td>flag</td>
<td>Specifies the translation type:</td>
</tr>
<tr>
<td></td>
<td>- LANGUAGE_TRANS: The function returns the language translation.</td>
</tr>
<tr>
<td></td>
<td>- TERRITORY_TRANS: The function returns the territory translation.</td>
</tr>
<tr>
<td></td>
<td>- LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation.</td>
</tr>
</tbody>
</table>

The default translation type is LANGUAGE_TRANS.

Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```sql
DECLARE
    CURSOR c1 IS
        SELECT value FROM V$NLS_VALID_VALUES
        WHERE parameter = 'LANGUAGE'
        ORDER BY value;
    retval NVARCHAR2(100);
BEGIN
    FOR item IN c1 LOOP
        retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
    END LOOP;
END;
```
MAP_CHARSET Function

This function maps the following:

■ An Oracle character set name to an IANA character set name.
■ An IANA character set name to an Oracle character set name.
■ An Oracle character set to an e-mail safe character set name.

Syntax

```sql
UTL_I18N.MAP_CHARSET(
    charset   IN VARCHAR2,
    context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>Specifies the character set name to be mapped. The mapping is case-insensitive.</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.</td>
</tr>
<tr>
<td>flag</td>
<td>ORACLE_TO_IANA</td>
</tr>
<tr>
<td></td>
<td>ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default.</td>
</tr>
<tr>
<td></td>
<td>IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name.</td>
</tr>
<tr>
<td></td>
<td>MAIL_GENERIC</td>
</tr>
<tr>
<td></td>
<td>MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform.</td>
</tr>
<tr>
<td></td>
<td>MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.</td>
</tr>
</tbody>
</table>

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WB8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:
1. Call the `MAP_CHARSET` function with the `MAIL_CONTEXT | MAIL_GENERIC` option with the database character set name, `WE8DEC`. The result is `WE8ISO8859P1`.

2. Convert the contents stored in the database to `WE8ISO8859P1`.

3. Call the `MAP_CHARSET` function with the `ORACLE_TO_IANA | GENERIC_CONTEXT` option with the e-mail safe character set, `WE8ISO8859P1`. The result is `ISO-8859-1`.

4. Specify `ISO-8859-1` in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns `NULL`.

---

**Note:** Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

---

**Examples**

**Generic Context**

```sql
UTL_I18N.MAP_CHARSET('iso-8859-1', UTL_I18N.GENERIC_CONTEXT, UTL_I18N.IANA_TO_ORACLE)
```

This returns `'WE8ISO8859P1'`.

**Context**

```sql
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns `'WE8ISO8859P1'`.

**See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets.
MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```sql
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (  
    language           IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid short language name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table customers is from the oe user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the GET_DEFAULT_LINGUISTIC_SORT procedure.

```sql
DECLARE
    short_n VARCHAR2(10);
    ling_n VARCHAR2(50);
BEGIN
    SELECT nls_language INTO short
    FROM customers WHERE customer_id = 9000;
    ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (  
        UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
    DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```sql
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
    isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, en_ instead of en_US), then the function returns the default language name for the specified language (for example, American).

Examples

```sql
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

See Also: Oracle Database Globalization Support Guide for a list of valid Oracle languages
MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (  
  ora_language   IN VARCHAR2,  
  ora_territory  IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ora_language</td>
<td>Specifies an Oracle language name. It is case-insensitive.</td>
</tr>
<tr>
<td>ora_territory</td>
<td>Specifies an Oracle territory name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid string, then the function returns a NULL string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en_US'.

See Also: Oracle Database Globalization Support Guide for a list of valid Oracle languages and territories
MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (  
isolocale IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 253–17  MAP_TERRITORY_FROM_ISO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the territory (for example, _fr instead of fr_fr), then the function returns the default territory name for the specified territory (for example, France).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

See Also: Oracle Database Globalization Support Guide for a list of valid Oracle territories.
MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

UTL_I18N.MAP_TO_SHORT_LANGUAGE (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid full language name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

DECLARE  retval VARCHAR2(100);BEGIN  retval := UTL_I18N.MAP_TO_SHORT_  
LANGUAGE('american');  DBMS_OUTPUT.PUT_LINE(retval);END;/US
RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.
The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```sql
UTL_I18N.RAW_TO_CHAR(
    data IN RAW,
    src_charset IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```sql
UTL_I18N.RAW_TO_CHAR (  
data IN RAW,
    src_charset IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to a VARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
<tr>
<td>shift_status</td>
<td>Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion.</td>
</tr>
</tbody>
</table>

**Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. `shift_status` cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```sql
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:
'abcde'||chr(170)

**Piecewise Conversion**

UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)

This expression returns the following string in the database character set:

'abcde'||chr(170)

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the database character set:

```plaintext
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len   PLS_INTEGER;
rttemp  RAW(10) = '';
conn   utl.tcp.connection;
tlen PLS_INTEGER;

... 

conn := utl_tcp.open_connection ( remote_host => 'localhost',
remote_port => 2000);
LOOP
  tlen := utl_tcp.read_raw(conn, rvalue, 1024);
  rvalue := utl_raw.concat(rtemp, rvalue);
  nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
  if (converted_len < utl_raw.length(rvalue))
  then
    rtemp := utl_raw.substr(rvalue, converted_len+1);
  else
    rtemp := '';
  end if;
  /* do anything you want with nvalue */
  /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
  WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn);
END;
```
RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR (data IN RAW, src_charset IN VARCHAR2 DEFAULT NULL) RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR (data IN RAW, src_charset IN VARCHAR2 DEFAULT NULL, scanned_length OUT PLS_INTEGER, shift_status IN OUT PLS_INTEGER) RETURN NVARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to an NVARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
<tr>
<td>shift_status</td>
<td>Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion.</td>
</tr>
</tbody>
</table>

Note: ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR('hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:
'abcde'||chr(170)

**Piecewise Conversion**

```sql
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'), 'utf8', shf, slen)
```

This expression returns the following string in the national character set:

'abcde'||chr(170)

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the national character set:

```sql
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;
...
conn := utl_tcp.open_connection (remote_host => 'localhost',
   remote_port => 2000);
LOOP
  tlen := utl_tcp.read_raw(conn, rvalue, 1024);
rvalue := utl_raw.concat(rtemp, rvalue);
nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
  if (converted_len < utl_raw.length(rvalue) )
    then
      rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
      rtemp := '';
    end if;
/* do anything you want with nvalue */
/* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
  WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn);
END;
```
STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW(
   data          IN VARCHAR2 CHARACTER SET ANY_CS,
   dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the VARCHAR2 or NVARCHAR2 string to convert.</td>
</tr>
<tr>
<td>dst_charset</td>
<td>Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE
   r raw(50);
   s varchar2(20);
BEGIN
   s:='abcdef'||chr(170);
   r:=utl_i18n.string_to_raw(s,'utf8');
   dbms_output.put_line(rawtohex(r));
end;
/
```

This returns a hex value of '616263646566C2AA'.
TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

Syntax

```sql
UTL_I18N.TRANSLITERATE (
    data IN VARCHAR2 CHARACTER SET ANY_CS,
    name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the data to be converted. Either CHAR or NCHAR datatype can be specified.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the transliteration name string. For a list of valid names, see Table 253–23.</td>
</tr>
</tbody>
</table>

Constants

These options specify Japanese Kana conversions.

<table>
<thead>
<tr>
<th>Constant Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KANA_FWKATAKANA</td>
<td>'kana_fwkatakana'</td>
<td>Converts any type of Kana character to a fullwidth Katakana character.</td>
</tr>
<tr>
<td>KANA_HWKATAKANA</td>
<td>'kana_hwkatakana'</td>
<td>Converts any type of Kana character to a halfwidth Katakana character.</td>
</tr>
<tr>
<td>KANA_HIRAGANA</td>
<td>'kana_hiragana'</td>
<td>Converts any type of Kana character to a fullwidth Hiragana character.</td>
</tr>
<tr>
<td>FWKATAKANA_</td>
<td>'fwkatakana_'</td>
<td>Converts only fullwidth Katakana characters to fullwidth Katakana characters.</td>
</tr>
<tr>
<td>HWKATAKANA</td>
<td>'hwkatakana'</td>
<td>Converts only halfwidth Katakana characters to fullwidth Katakana characters.</td>
</tr>
<tr>
<td>FWKATAKANA_</td>
<td>'fwkatakana_'</td>
<td>Converts only fullwidth Katakana characters to fullwidth Hiragana characters.</td>
</tr>
<tr>
<td>HIRAGANA</td>
<td>'hiragana'</td>
<td>Converts only halfwidth Katakana characters to fullwidth Hiragana characters.</td>
</tr>
<tr>
<td>HWKATAKANA_</td>
<td>'hwkatakana_'</td>
<td>Converts only fullwidth Katakana characters to halfwidth Katakana characters.</td>
</tr>
<tr>
<td>FWKATAKANA</td>
<td>'fwkatakana'</td>
<td>Converts only fullwidth Katakana characters to halfwidth Hiragana characters.</td>
</tr>
<tr>
<td>HIRAGANA_</td>
<td>'hiragana_'</td>
<td>Converts only fullwidth Hiragana characters to fullwidth Katakana characters.</td>
</tr>
<tr>
<td>HIRAGANA</td>
<td>'hiragana'</td>
<td>Converts only fullwidth Hiragana characters to halfwidth Katakana characters.</td>
</tr>
</tbody>
</table>

Usage Notes

The function returns the converted string.
Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```sql
UPDATE japanese_emp
SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

Figure shows how this output might look.

**Figure 253–1  Loading Locale-Specific Data to the Database**

The following statement normalizes one kana name to hiragana:

```sql
DECLARE
    Name  japanese_emp.ename%TYPE;
    Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
    SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
    name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
    UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
    WHEN  UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
        DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```
UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

See Also: "ESCAPE_REFERENCE Function" on page 253-9 for more information about escape sequences

Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (
    str IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies a NULL string or a string whose length is 0, then the function returns a NULL string. If the function fails, then it returns the original string.

Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &amp;#xe5;')
```

This returns 'hello <' || chr(229).
The UTL_INADDR package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- Using UTL_INADDR
  - Security Model
  - Exceptions
  - Examples
- Summary of UTL_INADDR Subprograms
Using UTL_INADDR

- Security Model
- Exceptions
- Examples
Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

---

**Note:** For more information about managing fine-grained access, see *Oracle Database Security Guide.*
## Exceptions

### Table 254–1 Exception - Internet Address Package

<table>
<thead>
<tr>
<th>Number</th>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24247</td>
<td>NETWORK_ACCESS_DENIED</td>
<td>Access to network is denied.</td>
</tr>
<tr>
<td>ORA-29257</td>
<td>UNKNOWN_HOST</td>
<td>The host is unknown.</td>
</tr>
</tbody>
</table>
Examples

Retrieve the local host name and IP address.

SET serveroutput on
BEGIN
    DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
    DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
/

## Table 254–2  UTL_INADDR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_HOST_ADDRESS Function on page 254-7</td>
<td>Retrieves the IP address of the local or remote host given its name</td>
</tr>
<tr>
<td>GET_HOST_NAME Function on page 254-8</td>
<td>Retrieves the name of the local or remote host given its IP address</td>
</tr>
</tbody>
</table>
GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```sql
UTL_INADDR.GET_HOST_ADDRESS (
    host  IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The name of the host to retrieve the IP address.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_address</td>
<td>The IP address of the specified host, or that of the local host if host is NULL.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the resolve privilege on LOCALHOST.
GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```sql
UTL_INADDR.GET_HOST_NAME (  
ip  IN VARCHAR2 DEFAULT NULL)  
RETURN host_name VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_name</td>
<td>The name of the local or remote host of the specified IP address.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the resolve privilege granted through DBMS_NETWORK_ACL_ADMIN on LOCALHOST.
The UTL_IDENT package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- **Using UTL_IDENT**
  - Overview
  - Security Model
  - Constants
This section contains topics which relate to using the **UTL_IDENT** package.

- **Overview**
- **Security Model**
- **Constants**
Overview

The UTL_IDENT package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.
Security Model

The UTL_IDENT package runs as the package owner SYS. The public synonym UTL_IDENT, and EXECUTE permission on this package is granted to PUBLIC.
Constants

The UTL_IDENT package uses the constants shown in Table 255–1, "UTL_IDENT Constants".

Table 255–1 UTL_IDENT Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_ORACLE_SERVER</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if Oracle Server or not</td>
</tr>
<tr>
<td>IS_ORACLE_CLIENT</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if Oracle Client or not</td>
</tr>
<tr>
<td>IS_TIMESTEN</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if TimesTen or not</td>
</tr>
<tr>
<td>IS_ORACLE_FORMS</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if Oracle Forms or not</td>
</tr>
</tbody>
</table>
UTL_LMS retrieves and formats error messages in different languages.

SYS.
## Summary of UTL_LMS Subprograms

### Table 256–1  UTL_LMS Package Subprograms

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMAT_MESSAGE Function</td>
<td>Formats a retrieved error message</td>
</tr>
<tr>
<td>GET_MESSAGE Function</td>
<td>Retrieves an error message based on error number, product, facility, language, and message specified</td>
</tr>
</tbody>
</table>

---

---
**FORMAT_MESSAGE Function**

This function formats a message retrieved by the `GET_MESSAGE` function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

<table>
<thead>
<tr>
<th>Special Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>%s</code></td>
<td>Substitute the next string argument</td>
</tr>
<tr>
<td><code>%d</code></td>
<td>Substitute the next integer argument</td>
</tr>
<tr>
<td><code>%%</code></td>
<td>Represents the special character %</td>
</tr>
</tbody>
</table>

**Syntax**

```
UTL_LMS.FORMAT_MESSAGE (  
    format IN VARCHAR2 CHARACTER SET ANY_CS,  
    args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)  
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

**Parameters**

**Table 256–2  FORMAT_MESSAGE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Specifies the string to format</td>
</tr>
<tr>
<td>args</td>
<td>Specifies the list of arguments</td>
</tr>
</tbody>
</table>

**Examples**

```declare
    s varchar2(200);
    i pls_integer;
begin
    i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
    dbms_output.put_line('before format, message is: '||s);
    dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9, 'my_column_name');
end;
/
```

The following is an unformatted message:

Type %d non pris en charge pour l'expression SQL sur la colonne %s.

The following is the formatted message:

Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the lmsgen utility.

It returns 0 when it is successful. It returns -1 when it fails.

See Also: Oracle Database Globalization Support Guide for more information about the lmsgen utility

Syntax

```
UTL_LMS.GET_MESSAGE (    errnum IN PLS_INTEGER,
                          product IN VARCHAR2,
                          facility IN VARCHAR2,
                          language IN VARCHAR2,
                          message OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 256–3 GET_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errnum</td>
<td>Specifies the error number. Example: '972' (for ORA-00972)</td>
</tr>
<tr>
<td>product</td>
<td>Specifies the product to which the error message applies Example: 'rdbms'</td>
</tr>
<tr>
<td>facility</td>
<td>Specifies the error message prefix Example: 'ora'</td>
</tr>
<tr>
<td>language</td>
<td>Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter.</td>
</tr>
<tr>
<td>message</td>
<td>Specifies the output buffer for the retrieved message</td>
</tr>
</tbody>
</table>

Usage Notes

If the language parameter is set to NULL, then the value of the NLS_LANGUAGE session parameter is used as the default.

Examples

```
DECLARE
    s varchar2(200);
    i pls_integer;
BEGIN
    i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
    dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

OCI--00601 is: Echec du processus de nettoyage.
The **UTL_MAIL** package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- **Using UTL_MAIL**
  - Security Model
  - Operational Notes
  - Rules and Limits
- **Summary of UTL_MAIL Subprograms**
Using UTL_MAIL

- Security Model
- Operational Notes
- Rules and Limits
**Security Model**

**UTL_MAIL** is not installed by default because of the `SMTP_OUT_SERVER` configuration requirement and the security exposure this involves. In installing **UTL_MAIL**, you should take steps to prevent the port defined by `SMTP_OUT_SERVER` being swamped by data transmissions.

This package is now an invoker’s rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

---

**Note:** For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide
Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

■ To install UTL_MAIL:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

■ You define the SMTP_OUT_SERVER parameter in the init.ora rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.
Rules and Limits

Use UTL_MAIL only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.
## Summary of UTL_MAIL Subprograms

<table>
<thead>
<tr>
<th>Table 257–1</th>
<th>UTL_MAIL Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>SEND Procedure on page 257-7</td>
<td>Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients</td>

</tr>
<tr>
<td>SEND_ATTACH_VARCHAR2 Procedure on page 257-9</td>
<td>Represents the SEND Procedure overloaded for VARCHAR2 attachments</td>
</tr>
</tbody>
</table>
### SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

#### Syntax

```sql
UTL_MAIL.SEND (  
    sender      IN    VARCHAR2 CHARACTER SET ANY_CS,  
    recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,  
    cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
    bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
    subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
    message     IN    VARCHAR2 CHARACTER SET ANY_CS,  
    mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',  
    priority    IN    PLS_INTEGER DEFAULT 3,  
    replyto     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>
</tr>
<tr>
<td>cc</td>
<td>Email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>Email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>String to be included as email subject string, default is NULL</td>
</tr>
<tr>
<td>message</td>
<td>Text message body</td>
</tr>
<tr>
<td>mime_type</td>
<td>Mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>
<td>Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.</td>
</tr>
<tr>
<td>replyto</td>
<td>Defines to whom the reply email is to be sent</td>
</tr>
</tbody>
</table>
**SEND_ATTACH_RAW Procedure**

This procedure is the SEND Procedure overloaded for RAW attachments.

**Syntax**

```sql
UTL_MAIL.SEND_ATTACH_RAW (
    sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    mime_type         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii',
    priority          IN    PLS_INTEGER DEFAULT 3,
    attachment        IN    RAW,
    att_inline        IN    BOOLEAN DEFAULT TRUE,
    att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii',
    att_filename      IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    replyto           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>
</tr>
<tr>
<td>cc</td>
<td>Email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>Email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>String to be included as email subject string, default is NULL</td>
</tr>
<tr>
<td>message</td>
<td>Text message body</td>
</tr>
<tr>
<td>mime_type</td>
<td>Mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>
<td>Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.</td>
</tr>
<tr>
<td>attachment</td>
<td>RAW attachment</td>
</tr>
<tr>
<td>att_inline</td>
<td>Specifies whether the attachment is viewable inline with the message body, default is TRUE</td>
</tr>
<tr>
<td>att_mime_type</td>
<td>Mime type of the attachment, default is 'application/octet'</td>
</tr>
<tr>
<td>att_filename</td>
<td>String specifying a filename containing the attachment, default is NULL</td>
</tr>
<tr>
<td>replyto</td>
<td>Defines to whom the reply email is to be sent</td>
</tr>
</tbody>
</table>
SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```sql
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
    sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    mime_type         IN    VARCHAR2 CHARACTER SET ANY_CS
        DEFAULT 'text/plain; charset=us-ascii',
    priority          IN    PLS_INTEGER DEFAULT 3,
    attachment        IN    VARCHAR2 CHARACTER SET ANY_CS,
    att_inline        IN    BOOLEAN DEFAULT TRUE,
    att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS
        DEFAULT 'text/plain; charset=us-ascii,
    att_filename      IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    replyto           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>
</tr>
<tr>
<td>cc</td>
<td>Email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>Email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>String to be included as email subject string, default is NULL</td>
</tr>
<tr>
<td>message</td>
<td>Text message body</td>
</tr>
<tr>
<td>mime_type</td>
<td>Mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>

The UTL_MATCH package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- Using UTL_MATCH
  - Overview
  - Security Model
- Summary of UTL_MATCH Subprograms
Using UTL_MATCH

- Overview
- Security Model
Overview

"Edit Distance" also known as "Levenshtein Distance" (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings, s1 and s2. The distance is the number of insertions, deletions or substitutions required to transform s1 to s2.

The Edit Distance between strings "shackleford" and "shackelford" = 2

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

Table 258–1 shows similarity values returned by Jaro-Winkler and Edit Distance

</tr>
</tbody>
</table>
EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```
UTL_MATCH.EDIT_DISTANCE (  
   s1  IN  VARCHAR2,  
   s2  IN  VARCHAR2)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>The string to be transformed</td>
</tr>
<tr>
<td>s2</td>
<td>The string into which s1 is to be transformed</td>
</tr>
</tbody>
</table>

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-------------
returns 2
```
EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two Strings. The value is typically between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (  
   s1  IN  VARCHAR2,  
   s2  IN  VARCHAR2)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>The string to be transformed</td>
</tr>
<tr>
<td>s2</td>
<td>The string into which s1 is to be transformed</td>
</tr>
</tbody>
</table>

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
------------------
returns 82
```
JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

```sql
UTL_MATCH.JARO_WINKLER (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN BINARY_DOUBLE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>Input</td>
</tr>
<tr>
<td>s2</td>
<td>input</td>
</tr>
</tbody>
</table>

Examples

```sql
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;
```

-----------

returns 9.818E-001
JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```sql
UTL_MATCH.JARO_WINKLER (s1  IN  VARCHAR2,
                        s2  IN  VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>Input</td>
</tr>
<tr>
<td>s2</td>
<td>input</td>
</tr>
</tbody>
</table>

Examples

```sql
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
```

returns 98
The UTL_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

- **Using UTL_NLA**
  - Overview
  - Rules and Limits
  - Security Model

- **Subprogram Groups**
  - BLAS Level 1 (Vector-Vector Operations) Subprograms
  - BLAS Level 2 (Matrix-Vector Operations) Subprograms
  - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
  - LAPACK Driver Routines (Linear Equations) Subprograms
  - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

- **Summary of UTL_NLA Subprograms**
Using UTL_NLA

This section contains topics which relate to using the UTL_NLA package.

- Overview
- Rules and Limits
- Security Model
Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as VARRAYs.

Standards
For more information on the BLAS and LAPACK standards see
http://www.netlib.org/blas/
http://www.netlib.org/lapack/

Required Expertise
Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation
The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the BLAS_ prefix (for example, the BLAS_ASUM Functions). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.

- All LAPACK functions have the LAPACK_ prefix (for example, the LAPACK_GBSV Procedures). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all /work/ arguments have been removed. The UTL_NLA package manages the allocation and de-allocation of all work areas required by the libraries.

- A new optional parameter, pack, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.
Vectors and matrices are stored in VARRAYs with a maximum size of one million entries. Given this restriction, UTL_NLA vectors can be up to one million entries but matrices need to be of size RxC ≤ 1,000,000.
Security Model

The UTL_NLA package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).
Subprogram Groups

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 259-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ASUM (  
    n    IN     POSITIVEN,  
    x    IN     UTL_NLA_ARRAY_DBL,  
    incx IN     POSITIVEN)  
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_ASUM (  
    n    IN     POSITIVEN,  
    alpha IN     SCALAR_DOUBLE,  
    x    IN     UTL_NLA_ARRAY_FLT)  
RETURN BINARY_FLOAT
```

Parameters

---

259-50 Oracle Database PL/SQL Packages and Types Reference
incx

Specifies the increment for the elements of x. incx must not be zero.

y

UTL_NLA_ARRAY_FLT/DBL of dimension at least

\[(1 + (n - 1) \cdot \text{abs}(\text{incy}))\]

Before entry, the incremented array \(y\) must contain the \(m\) element vector \(y\).

incy

Specifies the increment for the elements of \(y\). incy must not be zero.

a

UTL_NLA_ARRAY_FLT/DBL of dimension (lda, n)

With \(\text{uplo} = 'U'\) or \('u'\), the leading \(n\) by \(n\) upper triangular part of the array \(A\) must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of \(A\) is not referenced. On exit, the upper triangular part of the array \(A\) is overwritten by the upper triangular part of the updated matrix.

With \(\text{uplo} = 'L'\) or \('l'\), the leading \(n\) by \(n\) lower triangular part of the array \(A\) must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of \(A\) is not referenced. On exit, the lower triangular part of the array \(A\) is overwritten by the lower triangular part of the updated matrix.

lda

Specifies the first dimension of \(a\) as declared in the calling (sub) program. lda must be at least 

\[\max(1, n)\]

pack

(Optional) Flags the packing of the matrices:

- 'C': column-major (default)
- 'R': row-major

Parameters

Table 259–30 BLAS_SYRK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uplo</td>
<td>Specifies whether the upper or lower triangular part of the array ( C ) is to be referenced:</td>
</tr>
<tr>
<td></td>
<td>■ uplo = 'U' or 'u': Only the upper triangular part of ( C ) is to be referenced.</td>
</tr>
<tr>
<td></td>
<td>■ uplo = 'L' or 'l': Only the lower triangular part of ( C ) is to be referenced.</td>
</tr>
</tbody>
</table>
Specifies the operations to be performed:

- \( \text{trans} = 'N' \) or \( 'n' \): \( C := \alpha A^\ast A' + \beta C \)
- \( \text{trans} = 'T' \) or \( 't' \): \( C := \alpha A^\ast A + \beta C \)
- \( \text{trans} = 'C' \) or \( 'c' \): \( C := \alpha A^\ast A^\prime + \beta C \)

**n**

Specifies the order of matrix \( C \). \( n \) must be at least zero.

**k**

On entry with \( \text{trans} = 'N' \) or \( 'n' \), \( k \) specifies the number of columns of the matrix \( A \). On entry with \( \text{trans} = 'T' \) or \( 't' \) or \( \text{trans} = 'C' \) or \( 'c' \), \( k \) specifies the number of rows of the matrix \( A \). \( k \) must be at least zero.

**alpha**

SCALAR_FLOAT/DoubLe. Specifies the scalar \( \alpha \).

**a**

UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where \( ka \) is \( k \) when \( \text{trans} = 'N' \) or \( 'n' \), and is \( n \) otherwise.

Before entry with \( \text{trans} = 'N' \) or \( 'n' \), the leading \( n \) by \( k \) part of the array \( A \) must contain the matrix \( A \), otherwise the leading \( k \) by \( n \) part of the array \( A \) must contain the matrix \( A \).

**lda**

Specifies the first dimension of \( a \) as declared in the calling (sub) program. When \( \text{trans} = 'N' \) or \( 'n' \), \( \text{lda} \) must be at least \( \text{max}(1,n) \), otherwise \( \text{lda} \) must be at least \( \text{max}(1,k) \).

**beta**

SCALAR_FLOAT/DoubLe. Specifies the scalar \( \beta \).

**c**

UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n).

Before entry with \( \text{uplo} = 'U' \) or \( 'u' \), the leading \( n \) by \( n \) upper triangular part of the array \( C \) must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of \( C \) is not referenced. On exit, the upper triangular part of the array \( C \) is overwritten by the upper triangular part of the updated matrix.

Before entry with \( \text{uplo} = 'L' \) or \( 'l' \), the leading \( n \) by \( n \) lower triangular part of the array \( C \) must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of \( C \) is not referenced. On exit, the lower triangular part of the array \( C \) is overwritten by the lower triangular part of the updated matrix.

**ldc**

Specifies the first dimension of \( C \) as declared in the calling (sub) program. \( \text{ldc} \) must be at least \( \text{max}(1,n) \).

**pack**

(Optional) Flags the packing of the matrices:

- \( 'C' \): column-major (default)
- \( 'R' \): row-major
BLAS_TBMV Procedures

This procedure performs the matrix-vector operations

\[ x := A \cdot x \]

or

\[ x := A^t \cdot x \]

where \( x \) is an \( n \) element vector and \( A \) is an \( n \) by \( n \) unit, or non-unit, upper or lower triangular band matrix, with \((k+1)\) diagonals.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 259-8 for other subprograms in this group

</tbody>
</table>
### Table 259–31  (Cont.) BLAS_TBMV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| diag      | Specifies whether or not A is unit triangular:  
  - diag = 'U' or 'u'. A is assumed to be unit triangular.  
  - diag = 'N' or 'n'. A is not assumed to be unit triangular. |
| n         | Specifies the order of the matrix A. n must be at least zero. |
| k         | Specifies whether or not A is unit triangular:  
  - with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A.  
  - with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A.  
  K must satisfy 0 .le. k. |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n).  
  Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.  
  Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.  
  Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity. |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1). |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x. |
| incx      | Specifies the increment for the elements of x. Must not be zero. |
| pack      | (Optional) Flags the packing of the matrices:  
  - 'C': column-major (default)  
  - 'R': row-major |
BLAS_TBSV Procedures

This procedure solves one of the systems of equations

\[ A^x = b \]

or

\[ A^{*x} = b \]

where \( b \) and \( x \) are \( n \) element vectors and \( A \) is an \( n \) by \( n \) unit, or non-unit, upper or lower triangular band matrix, with \((k+1)\) diagonals.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| uplo      | Specifies whether the matrix is an upper or lower triangular matrix:  
|           | \[ \text{uplo} = 'U' \text{ or } 'u'. A is an upper triangular matrix. \]  
|           | \[ \text{uplo} = 'L' \text{ or } 'l'. A is a lower triangular matrix. \]  
| trans     | Specifies the operation to be performed:  
|           | \[ \text{trans} = 'N' \text{ or } 'n': x := A \cdot x \]  
|           | \[ \text{trans} = 'T' \text{ or } 't': x := A^T \cdot x \]  
|           | \[ \text{trans} = 'C' \text{ or } 'c': x := A^H \cdot x \]  
| diag      | Specifies whether or not \( A \) is unit triangular:  
|           | \[ \text{diag} = 'U' \text{ or } 'u'. A is assumed to be unit triangular. \]  
|           | \[ \text{diag} = 'N' \text{ or } 'n'. A is not assumed to be unit triangular. \]  
| n         | Specifies the order of the matrix \( A \). \( n \) must be at least zero. |
Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.

Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.

Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.

Specifies the increment for the elements of x. Must not be zero.

(Optional) Flags the packing of the matrices:
- 'C': column-major (default)
- 'R': row-major
Summary of UTL_NLA Subprograms

BLAS_TPSV Procedures

This procedure solves one of the systems of equations

\[ A\times x = b \]

or

\[ A'^\times x = b \]

where \( b \) and \( x \) are \( n \) element vectors and \( A \) is an \( n \times n \) unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| side      | Specifies whether the symmetric matrix $\Lambda$ appears on the left or right in the operation:  
- $\text{side} = 'L' \text{ or } 'l': B := \alpha \cdot \text{op}(A) \cdot B$  
- $\text{side} = 'R' \text{ or } 'r': B := \alpha \cdot B \cdot \text{op}(A)$  |
| uplo      | Specifies whether the upper or lower triangular part of the array $\Lambda$ is to be referenced:  
- $\text{uplo} = 'U' \text{ or } 'u': \Lambda$ is an upper triangular matrix.  
- $\text{uplo} = 'L' \text{ or } 'l': \Lambda$ is a lower triangular matrix.  |
| transa    | Specifies the form of $\text{op}(A)$ to be used in the matrix multiplication as follows:  
- $\text{transa} = 'N' \text{ or } 'n$: \text{op}(A) = A$  
- $\text{transa} = 'T' \text{ or } 't': \text{op}(A) = A'$  
- $\text{transa} = 'C' \text{ or } 'c': \text{op}(A) = A'$  |
| diag      | Specifies whether or not $\Lambda$ is unit triangular:  
- $\text{diag} = 'U' \text{ or } 'u': \Lambda$ is assumed to be unit triangular.  
- $\text{diag} = 'N' \text{ or } 'n': \Lambda$ is not assumed to be unit triangular.  |
| m         | Specifies the number of rows of the $B$. $m$ must be at least zero.  |
| n         | Specifies the number of columns of the $B$. $n$ must be at least zero.  |
| alpha     | SCALAR_FLOAT/DATA. Specifies the scalar $\alpha$. When $\alpha$ is zero then $\Lambda$ is not referenced and $B$ need not be set before entry.  |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION $(\text{lda}, k)$ where $k$ is $m$ when $\text{side} = 'L' \text{ or } 'l'$, and is $n$ when $\text{side} = 'R' \text{ or } 'r'$.  
Before entry with $\text{uplo} = 'U' \text{ or } 'u'$, the leading $k$ by $k$ upper triangular part of the array $\Lambda$ must contain the upper triangular matrix, and the strictly lower triangular part of $\Lambda$ is not referenced.  
Before entry with $\text{uplo} = 'L' \text{ or } 'l'$, the leading $k$ by $k$ lower triangular part of the array $\Lambda$ must contain the lower triangular matrix and the strictly upper triangular part of $\Lambda$ is not referenced.  
Note that when $\text{diag} = 'U' \text{ or } 'u'$, the diagonal elements of $\Lambda$ are not referenced either, but are assumed to be unity.  |
| lda       | Specifies the first dimension of $a$ as declared in the calling (sub) program. When $\text{side} = 'L' \text{ or } 'l'$, $\text{lda}$ must be at least $\text{max}(1,m)$, otherwise $\text{lda}$ must be at least $\text{max}(1,n)$.  |
| b         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION $(\text{ldb}, n)$.  
Before entry, the leading $m$ by $n$ part of the array $B$ must contain the matrix $B$, and on exit is overwritten by the transformed matrix.  |
| ldb       | Specifies the first dimension of $b$ as declared in the calling (sub) program. $\text{ldb}$ must be at least $\text{max}(1,m)$.  |
| pack      | (Optional) Flags the packing of the matrices:  
- $'C'$: column-major (default)  
- $'R'$: row-major  |
BLAS_TRMV Procedures

This procedure performs the matrix-vector operations

| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'.  
  Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced.  
  Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced.  
  Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity. |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1, m), otherwise lda must be at least max (1, n). |
| b         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n).  
  Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X. |
| ldb       | Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1, m). |
| pack      | (Optional) Flags the packing of the matrices:  
  - 'C': column-major (default)  
  - 'R': row-major |
BLAS_TRSV Procedures

This procedure solves one of the systems of equations

\[ A x = b \]

or

\[ A^T x = b \]

where \( b \) and \( x \) are \( n \) element vectors and \( A \) is an \( n \) by \( n \) unit, or non-unit, upper or lower triangular matrix.

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.
LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations

\[ a \times x = b \]

where \( a \) is a band matrix of order \( n \) with \( k_l \) sub diagonals and \( k_u \) superdiagonals, and \( x \) and \( b \) are \( n \) by \( n \times r_h \) matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor \( A \) as

\[ A = L \times U \]

where \( L \) is a product of permutation and unit lower triangular matrices with \( k_l \) sub diagonals, and \( U \) is upper triangular with \( k_l + k_u \) superdiagonals. The factored form of \( A \) is then used to solve the system of equations

\[ A \times x = b \]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( n )</td>
<td>The number of linear equations, equivalent to the order of the matrix ( A ). ( n \geq 0 )</td>
</tr>
<tr>
<td>( k_l )</td>
<td>The number of sub diagonals within the band of ( A ). ( k_l \geq 0 ).</td>
</tr>
</tbody>
</table>
The number of superdiagonals within the band of a. \( ku \geq 0 \).

The number of right-hand sides, which is the number of columns of the matrix b. \( nrhs \geq 0 \).

On entry, the matrix a in band storage, in rows \( kl+1 \) to \( 2*kl+ku+1 \); rows 1 to \( kl \) of the array need not be set. The \( j \)-th column of A is stored in the \( j \)-th column of the array ab:

\[
ab(kl+ku+1+i-j,j) = a(i,j) \quad \text{for} \quad \max(1,j-ku) \leq i \leq \min(n,j+kl)
\]

On exit, details of the factorization: U is stored as an upper triangular band matrix with \( kl+ku \) superdiagonals in rows 1 to \( KL+KU+1 \), and the multipliers used during the factorization are stored in rows:

\( kl+ku+2 \) to \( 2*kl+ku+1 \)

The leading dimension of the array ab.

\( ldab \geq 2*kl+ku+1 \)

The pivot indices that define the permutation matrix P; row \( i \) of the matrix was interchanged with row \( ipiv(i) \).

On entry, the \( n \) by \( nrhs \) matrix of right hand side matrix b.

On exit, if \( info = 0 \), the \( n \) by \( nrhs \) solution matrix X.

The leading dimension of the array b.

\( ldb \geq \max(1,n) \)

\( info \)

- \( = 0 \): successful exit
- \( < 0 \): if \( info = -i \), the \( i \)-th argument had an illegal value
- \( > 0 \): if \( info = i \), \( U(i,i) \) is exactly zero. The factorization has been completed, but the factor \( U \) is exactly singular, and the solution has not been computed

(Optional) Flags the packing of the matrices:

- 'C': column-major (default)
- 'R': row-major

LAPACK_GEES Procedures

This procedure computes for an \( n \times n \) real nonsymmetric matrix \( A \), the eigenvalues, the real Schur form \( T \), and, optionally, the matrix of Schur vectors \( Z \). This gives the Schur factorization \( A = Z \cdot T \cdot (Z^T) \).

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

\[
\begin{bmatrix}
  a & b \\
  c & a \\
\end{bmatrix}
\]

where \( b \cdot c < 0 \). The eigenvalues of such a block are \( a \pm \sqrt{bc} \).

LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an \( m \times n \) matrix \( A \), or its transpose, using a QR or LQ factorization of \( A \). It is assumed that \( A \) has full rank.

The following options are provided:

1. If \( \text{TRANS} = 'N' \) and \( m \geq n \): find the least squares solution of an overdetermined system, that is, solve the least squares problem.

\[
\text{minimize} \quad || B - A\cdot X ||
\]

2. If \( \text{TRANS} = 'N' \) and \( m < n \): find the minimum norm solution of an underdetermined system \( A \cdot X = B \).

3. If \( \text{TRANS} = 'T' \) and \( m \geq n \): find the minimum norm solution of an undetermined system \( A^T \cdot X = B \).

4. If \( \text{TRANS} = 'T' \) and \( m < n \): find the least squares solution of an overdetermined system, that is, solve the least squares problem

\[
\text{minimize} \quad || B - A^T \cdot X ||.
\]

LAPACK_GESDD Procedures

This procedures computes the singular value decomposition (SVD) of a real \( m \) by \( n \) matrix \( A \), optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

\[
A = U \cdot \text{SIGMA} \cdot \text{transpose}(V)
\]

where \( \text{SIGMA} \) is an \( m \) by \( n \) matrix which is zero except for its \( \min(m,n) \) diagonal elements, \( U \) is an \( m \) by \( m \) orthogonal matrix, and \( V \) is an \( n \) by \( n \) orthogonal matrix. The diagonal elements of \( \text{SIGMA} \) are the singular values of \( A \), they are real and non-negative, and are returned in descending order. The first \( \min(m,n) \) columns of \( U \) and \( V \) are the left and right singular vectors of \( A \).

Note that the routine returns \( V^{*T} \), not \( V \).

LAPACK_GESV Procedures

This procedure computes the solution to a real system of linear equations

\[ a \times x = b \]

where \(a\) is an \(n\) by \(n\) matrix and \(x\) and \(b\) are \(n\) by \(nrhs\) matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor \(A\) as

\[ a = P \times L \times U \]

where \(P\) is a permutation matrix, \(L\) is unit lower triangular, and \(U\) is upper triangular. The factored form of \(a\) is then used to solve the system of equations

\[ a \times x = b \]

LAPACK_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real \( m \times n \) matrix \( A \), optionally computing the left and/or right singular vectors. The SVD is written

\[ A = U \times \text{SIGMA} \times \text{transpose}(V) \]

where \( \text{SIGMA} \) is an \( m \times n \) matrix which is zero except for its \( \min(m,n) \) diagonal elements, \( U \) is an \( m \times m \) orthogonal matrix, and \( V \) is an \( n \times n \) orthogonal matrix. The diagonal elements of \( \text{SIGMA} \) are the singular values of \( A \), they are real and non-negative, and are returned in descending order. The first \( \min(m,n) \) columns of \( U \) and \( V \) are the left and right singular vectors of \( A \).

Note that the routine returns \( V^\top \), not \( V \).

LAPACK_GEEV Procedures

This procedure computes for an $n \times n$ real nonsymmetric matrix $A$, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector $v(j)$ of $A$ satisfies $A * v(j) = \lambda(j) * v(j)$ where $\lambda(j)$ is its eigenvalue.
- The left eigenvector $u(j)$ of $A$ satisfies $u(j)^H * A = \lambda(j) * u(j)^H$ where $u(j)^H$ denotes the conjugate transpose of $u(j)$.

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

This procedure computes the solution to a real system of linear equations

\[ a \times x = b \]

where \( a \) is an \( n \) by \( n \) symmetric positive definite band matrix and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The Cholesky decomposition is used to factor \( A \) as

\[ A = U^{**T}U \text{ if } \text{UPLO} = 'U' \]

or

\[ A = L \times L^{**T} \text{ if } \text{UPLO} = 'L' \]

where \( U \) is an upper triangular matrix and \( L \) is a lower triangular matrix. The factored form of \( A \) is then used to solve the system of equations \( A \times X = B \).

| n         | The number of linear equations, that is, the order of the matrix \( a \). \( n \geq 0 \) |
kd

The number of superdiagonals of the matrix \(A\) if \(\text{uplo} = 'U'\), or the number of subdiagonals if \(\text{UPLO} = 'L'\). \(KD \geq 0\).

nrhs

The number of right-hand sides, which is the number of columns of the matrix \(b\). \(NRHS \geq 0\).

ab

\(\text{UTL_NLA\_ARRAY\_FLT/DBL, DIMENSION (ldab, n)}.\)

On entry, the upper or lower triangle of the symmetric band matrix \(a\), stored in the first \(kd+1\) rows of the array. The \(j\)-th column of \(a\) is stored in the \(j\)-th column of the array \(ab\) as follows:

- if \(\text{uplo} = 'U'\), \(\text{AB}(KD+1+i-j,j) = A(i,j)\) for \(\max(1,j-KD) \leq i \leq j\);
- if \(\text{uplo} = 'L'\), \(\text{AB}(1+i-j,j) = A(i,j)\) for \(j \leq i \leq \min(N,j+KD)\).

See below for further details. On exit, if \(info = 0\), the triangular factor \(U\) or \(L\) from the Cholesky factorization \(A = U^T*U\) or \(A = L*L^T\) of the bandmatrix \(A\), in the same storage format as \(a\).

ldab

The leading dimension of the array \(ab\).

\(LDAB \geq KD+1\)

b

\(\text{UTL_NLA\_ARRAY\_FLT/DBL, DIMENSION (ldb, nrhs)}.\)

On entry, the \(n\) by \(NRHS\) matrix of right hand side matrix \(b\).

On exit, if \(info = 0\), the \(n\) by \(NRHS\) solution matrix \(X\).

ldb

The leading dimension of the array \(b\).

\(LDDB \geq \max(1,n)\)

info

- \(= 0\) : successful exit
- \(< 0\) : if \(info = -i\), the \(i\)-th argument had an illegal value
- \(> 0\) : if \(info = i\), the leading minor of order \(i\) of \(a\) is not positive definite, so the factorization could not be completed, and the solution has not been computed.

pack

(Optional) Flags the packing of the matrices:

- \('C'\): column-major (default)
- \('R'\): row-major
This procedure computes the solution to a real system of linear equations

\[ a \times x = b \]

where \( a \) is an \( n \) by \( n \) symmetric positive definite matrix and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The Cholesky decomposition is used to factor \( A \) as

\[ A = U^T \times U \text{ if } uplo = 'U' \]

or

\[ A = L \times L^T \text{ if } uplo = 'L' \]

where \( U \) is an upper triangular matrix and \( L \) is a lower triangular matrix. The factored form of \( A \) is then used to solve the system of equations \( A \times X = B \).

Summary of UTL_NLA Subprograms

**ap**

UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2).

On entry, the upper or lower triangle of the symmetric matrix a, packed columnwise in a linear array. The j-th column of a is stored in the array ap as follows:

If uplo = 'U', AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j;
If uplo = 'L', AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n;

On exit, if info = 0, the factor U or 'L' from the Cholesky factorization A = U**T*U or A = L*L**T in the same storage format as A.

**b**

UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs).

On entry, the n by nrhs matrix of right hand side matrix b.

On exit, if info = 0, the n by nrhs solution matrix X.

**ldb**

The leading dimension of the array b.

ldb >= max(1,n)

**info**

- = 0 : successful exit
- < 0: if info = -i, the i-th argument had an illegal value
- > 0: if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.

**pack**

(Optional) Flags the packing of the matrices:

- 'C': column-major (default)
- 'R': row-major

```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| jobz      | • ‘N’: Compute eigenvalues only.  
|           | • ‘V’: Compute eigenvalues and eigenvectors.  
| uplo      | • ‘U’: Upper triangle of $A$ is stored.  
|           | • ‘L’: Lower triangle of $A$ is stored.  
| n         | The order of the matrix $A$. $N \geq 0$.  |
On entry, the upper or lower triangle of the symmetric matrix $a$ is stored in the array $ap$:

- If $uplo = 'U'$, $ap(i + (j-1)*j/2) = a(i,j)$ for $1 \leq i \leq j$.
- If $uplo = 'L'$, $ap(i + (j-1)*(2*n-j)/2) = a(i,j)$ for $j \leq i \leq n$.

On exit, $ap$ is overwritten by values generated during the reduction to tridiagonal form:

- If $uplo = 'U'$, the diagonal and first superdiagonal of the tridiagonal matrix $T$ overwrite the corresponding elements of $A$.
- If $uplo = 'L'$, the diagonal and first subdiagonal of $T$ overwrite the corresponding elements of $A$.

$w$  
$UTL_NLA\_ARRAY\_FLT/DBL$, $DIMENSION(n)$.
If $info = 0$, the eigenvalues in ascending order.

$z$  
$UTL_NLA\_ARRAY\_FLT/DBL$, $DIMENSION(ldz,n)$.
- If $jobz = 'V'$, then if $info = 0$, $z$ contains the orthonormal eigenvectors of the matrix $A$, with the $i$-th column of $z$ holding the eigenvector associated with $w(i)$.
- If $jobz = 'N'$, then $z$ is not referenced.

$ldz$  
The leading dimension of the array $z$. $ldz \geq 1$, and if $jobz = 'V'$, $ldz \geq \max(1,n)$.

$info$  
- $= 0$: successful exit
- $< 0$: if $info = -i$, the $i$-th argument had an illegal value
- $> 0$: if $info = i$, the algorithm failed to converge; $i$ off-diagonal elements of an intermediate tridiagonal form did not converge to zero

$pack$  
(Optional) Flags the packing of the matrices:
- $'C'$: column-major (default)
- $'R'$: row-major
LAPACK_SPEVD Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm. The divide and conquer algorithm makes very mild assumptions about floating point arithmetic.

Table 259–54 (Cont.) LAPACK_SPEVD Procedure Parameters
LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations
\[ a \cdot x = b \]
where \( a \) is an \( n \) by \( n \) symmetric matrix stored in packed format, and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The diagonal pivoting method is used to factor \( A \) as
\[ A = U \cdot D \cdot U^{T}, \text{if } \text{UPLO} = 'U' \]
or
\[ A = L \cdot D \cdot L^{T}, \text{if } \text{UPLO} = 'L' \]
where \( U \) (or \( L \)) is a product of permutation and unit upper (lower) triangular matrices, and \( D \) is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of \( A \) is then used to solve the system of equations \( A \cdot X = B \).

</thead>
</table>
| uplo      | ■ uplo = 'U'. Upper triangular of \( A \) is stored.  
            ■ uplo = 'L'. Lower triangular of \( A \) is stored.  
| n         | The number of linear equations, which is the order of the  
            matrix \( a \). \( N \geq 0 \).  
| nrhs      | The number of right-hand sides, which is the number of  
            columns of the matrix \( b \). \( nrhs \geq 0 \).  |
UTL_NLA

259-109

Table 259–55 (Cont.) LAPACK_SPSV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ap        | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array ap as follows:  
  - uplo = 'U': AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j  
  - uplo = 'L': AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n  
  See below for further details. On exit, the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSPTRF, stored as a packed triangular matrix in the same storage format as A. |
| ipiv      | INTEGER array, DIMENSION (n). Details of the interchanges and the block structure of d, as determined by SSPTRF.  
  - If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by 1 diagonal block.  
  - If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block.  
  - If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block. |
| b         | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X. |
| ldb       | The leading dimension of the array b. ldb >= max(1,n) |
| info      | = 0 : successful exit  
  < 0 : if info = -i, the i-th argument had an illegal value  
  > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed. |
| pack      | (Optional) Flags the packing of the matrices:  
  - 'C': column-major (default)  
  - 'R': row-major |

  uplo     IN      flag,  
  n        IN      POSITIVEN,  
  a        IN OUT  UTL_NLA_ARRAY_FLT,  
  lda      IN      POSITIVEN,  
  w        IN OUT  UTL_NLA_ARRAY_FLT,  
  info     OUT     INTEGER,  
  pack     IN      flag DEFAULT 'C');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| jobz      | ‘N’: Compute eigenvalues only.  
|           | ‘V’: Compute eigenvalues and eigenvectors. |
| uplo      | ‘U’: Upper triangle of $A$ is stored.  
|           | ‘L’: Upper triangle of $A$ is stored. |
| n         | The order of the matrix $A$. $N >= 0$. |
| a         | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). |

On entry, the symmetric matrix $A$:

- If `uplo = 'U'`, the leading $n$ by $n$ upper triangular part of $a$ contains the upper triangular part of the matrix $A$.
- If `uplo = 'L'`, the leading $n$ by $n$ lower triangular part of $a$ contains the lower triangular part of the matrix $A$.

On exit:

- If `jobz = 'V'`, then if `info = 0`, $a$ contains the orthonormal eigenvectors of the matrix $A$.
- If `jobz = 'N'`, then on exit the lower triangle (if `uplo = 'L'`) or the upper triangle (if `uplo = 'U'`) of $a$, including the diagonal, is destroyed.

LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations
\[ a \cdot x = b \]
where \( a \) is an \( n \) by \( n \) symmetric matrix, and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.
The diagonal pivoting method is used to factor \( A \) as
\[ A = U \cdot D \cdot U^T, \text{ if } \text{UPLO} = 'U' \]
or
\[ A = L \cdot D \cdot L^T, \text{ if } \text{UPLO} = 'L' \]
where \( U \) (or \( L \)) is a product of permutation and unit upper (lower) triangular matrices, and \( D \) is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of \( A \) is then used to solve the system of equations \( A \cdot X = B \).

Summary of UTL_NLA Subprograms

nrhs
The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.

a
UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1).
On entry, the symmetric matrix a. If uplo = 'U', the leading n by n upper triangular part of a contains the upper triangular part of the matrix a, and the strictly lower triangular part of a is not referenced. If uplo = 'L', the leading n by n lower triangular part of a contains the lower triangular part of the matrix a, and the strictly upper triangular part of a is not referenced.
On exit, if info = 0, the block diagonal matrix d and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSYTRF.

lda
The leading dimension of the array a. lda >= max(1,n)
ipiv
INTEGER array, DIMENSION (ldb, nrhs).
Details of the interchanges and the block structure of d, as determined by SSYTRF.
- If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by 1 diagonal block.
- If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block.
- If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.

b
UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs).
On entry, the n by nrhs matrix of right hand side matrix b.
On exit, if info = 0, the n by nrhs solution matrix X.

ldb
The leading dimension of the array b. ldb >= max(1,n)

info
■ = 0 : successful exit
■ < 0 : if info = -i, the i-th argument had an illegal value
■ > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.

pack
(Optional) Flags the packing of the matrices:
- 'C': column-major (default)
- 'R': row-major
The UTL_RAW package provides SQL functions for manipulating RAW datatypes.
This chapter contains the following topics:

- **Using UTL_RAW**
  - Overview
  - Operational Notes
- **Summary of UTL_RAW Subprograms**
Using UTL_RAW

- Overview
- Operational Notes
Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.
UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the `hextoraw` and `rawtohex` functions.

---

**Note:** Notes on datatypes:

- The `PLS_INTEGER` and `BINARY_INTEGER` datatypes are identical. This document uses `BINARY_INTEGER` to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.

- The `INTEGER` and `NUMBER(38)` datatypes are also identical. This document uses `INTEGER` throughout.
## Summary of UTL_RAW Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BIT_AND Function on page 260-7</strong></td>
<td>Performs bitwise &quot;and&quot; of the values in RAW r1 with RAW r2 and returns the &quot;anded&quot; result RAW.</td>

<td>Returns n copies of r concatenated together.</td>
</tr>
<tr>
<td><strong>LENGTH Function on page 260-30</strong></td>
<td>Returns the length in bytes of a RAW r.</td>
</tr>
</tbody>
</table>
### Table 260–1 (Cont.) UTL_RAW Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVERLAY Function</td>
<td>Overlays the specified portion of target RAW with overlay RAW, starting from byte position pos of target and proceeding for len bytes</td>
</tr>
<tr>
<td>REVERSE Function</td>
<td>Reverses a byte sequence in RAW r from end to end</td>
</tr>
<tr>
<td>SUBSTR Function</td>
<td>Returns len bytes, starting at pos from RAW r</td>
</tr>
<tr>
<td>TRANSLATE Function</td>
<td>Translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set</td>
</tr>
<tr>
<td>TRANSLITERATE Function</td>
<td>Converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set</td>
</tr>
<tr>
<td>XRANGE Function</td>
<td>Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value start_byte and ending with the value end_byte</td>
</tr>
</tbody>
</table>
**BIT_AND Function**

This function performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW.

**Syntax**

```plaintext
UTL_RAW.BIT_AND (  
   r1 IN RAW,  
   r2 IN RAW)  
RETURN RAW;
```

**Pragmas**

`pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;and&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;and&quot; with r1</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;and&quot; of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

**Usage Notes**

If r1 and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
**BIT_COMPLEMENT Function**

This function performs bitwise logical "complement" of the values in **RAW** `r` and returns the complement'ed result **RAW**. The result length equals the input **RAW** `r` length.

**Syntax**

```sql
UTL_RAW.BIT_COMPLEMENT (r IN RAW)
RETURN RAW;
```

**Pragmas**

```sql
pragma restrict_references(bit_complement, WINDS, RIND, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td><strong>RAW</strong> to perform &quot;complement&quot; operation</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
</table>
| **RAW** | The "complement" of `r`
| **NULL** | If `r` input parameter was **NULL** |
**BIT_OR Function**

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

**Syntax**

```lisp
UTL_RAW.BIT_OR ( r1 IN RAW, r2 IN RAW)
RETURN RAW;
```

**Pragmas**

```plaintext
pragma restrict_references(bit_or, WNDS, RNDS, WNP5, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;or&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;or&quot; with r1</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;or&quot; of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

**Usage Notes**

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor’d result RAW.

Syntax

```
UTL_RAW.BIT_XOR (
  r1 IN RAW,
  r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;xor&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;xor&quot; with r1</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;xor&quot; of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>If either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
CAST_FROM_BINARY_DOUBLE Function

This function returns the RAW binary representation of a BINARY_DOUBLE value.

Syntax

```plaintext
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
    n          IN BINARY_DOUBLE,
    endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```plaintext
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_DOUBLE value</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
  - byte 0: bit 63 ~ bit 56
  - byte 1: bit 55 ~ bit 48
  - byte 2: bit 47 ~ bit 40
  - byte 3: bit 39 ~ bit 32
  - byte 4: bit 31 ~ bit 24
  - byte 5: bit 23 ~ bit 16
  - byte 6: bit 15 ~ bit 8
  - byte 7: bit 7 ~ bit 0

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

<table>
<thead>
<tr>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
<th>rb4</th>
<th>rb5</th>
<th>rb6</th>
<th>rb7</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
</tr>
<tr>
<td>little_endian</td>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
</tr>
</tbody>
</table>
In case of machine-endian, the 8 bytes of the BINARY_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_FROM_BINARY_FLOAT Function

This function returns the RAW binary representation of a BINARY_FLOAT value.

Syntax

UTL_RAW.CAST_FROM_BINARY_FLOAT(
   n          IN BINARY_FLOAT,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;

Pragmas

pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 260–11 CAST_FROM_BINARY_FLOAT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_FLOAT value</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big-endian machine, or the same effect as little_endian on a little-endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
  byte 0: bit 31 ~ bit 24
  byte 1: bit 23 ~ bit 16
  byte 2: bit 15 ~ bit 8
  byte 3: bit 7 ~ bit 0
- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

<table>
<thead>
<tr>
<th></th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fb0</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>
- In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_FROM_BINARY_INTEGER Function

This function returns the RAW binary representation of a BINARY_INTEGER value.

Syntax

UTL_RAW.CAST_FROM_BINARY_INTEGER (  
n          IN BINARY_INTEGER  
endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)  
RETURN RAW;

Pragmas

pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 260–12  CAST_FROM_BINARY_INTEGER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_INTEGER value.</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the</td>
</tr>
<tr>
<td></td>
<td>defined constants big_endian (1), little_endian (2), and machine_endian (3).</td>
</tr>
<tr>
<td></td>
<td>The default is big_endian. A setting of machine_endian has the same effect</td>
</tr>
<tr>
<td></td>
<td>as big_endian on a big endian machine, or the same effect as little_endian</td>
</tr>
<tr>
<td></td>
<td>on a little endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the BINARY_INTEGER value.
CAST_FROM_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

Syntax

```plaintext
UTL_RAW.CAST_FROM_NUMBER (n IN NUMBER) RETURN RAW;
```

Pragmas

```plaintext
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>NUMBER value</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the NUMBER value.
CAST_TO_BINARY_DOUBLE Function

This function casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
  r          IN RAW
  endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a BINARY_DOUBLE</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_DOUBLE_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE_ERROR exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
  - byte 0: bit 63 ~ bit 56
  - byte 1: bit 55 ~ bit 48
  - byte 2: bit 47 ~ bit 40
  - byte 3: bit 39 ~ bit 32
  - byte 4: bit 31 ~ bit 24
  - byte 5: bit 23 ~ bit 16
  - byte 6: bit 15 ~ bit 8
  - byte 7: bit 7 ~ bit 0
- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

<table>
<thead>
<tr>
<th>endianess</th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
<th>rb4</th>
<th>rb5</th>
<th>rb6</th>
<th>rb7</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
<td>db7</td>
</tr>
<tr>
<td>little_endian</td>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
<td>db0</td>
</tr>
</tbody>
</table>
- In case of machine-endian, the 8 bytes of the RAW argument are copied straight across into the BINARY_DOUBLE return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_TO_BINARY_FLOAT Function

This function casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (  
  r          IN RAW  
  endianess  IN PLS_INTEGER DEFAULT 1)  
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a BINARY_FLOAT</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
  byte 0: bit 31 ~ bit 24  
  byte 1: bit 23 ~ bit 16  
  byte 2: bit 15 ~ bit 8  
  byte 3: bit 7 ~ bit 0

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

<table>
<thead>
<tr>
<th>endianess</th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fbo</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has
passed big_endian on a big-endian machine, or little_endian on a little-endian machine.
CAST_TO_BINARY_INTEGER Function

This function casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER.

Syntax

```sql
UTL_RAW.CAST_TO_BINARY_INTEGER (  
    r          IN RAW  
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)  
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>r</code></td>
<td>Binary representation of a BINARY_INTEGER</td>
</tr>
<tr>
<td><code>endianess</code></td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_INTEGER value
CAST_TO_NUMBER Function

This function casts the RAW binary representation of a NUMBER into a NUMBER.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (
    r  IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 260–17 CAST_TO_NUMBER function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a NUMBER</td>
</tr>
</tbody>
</table>

Return Values

The NUMBER value.
CAST_TO_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

---
**Note:** When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.
---

### Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
  r IN RAW)
RETURN NVARCHAR2;
```

### Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a NVARCHAR2</td>
</tr>
</tbody>
</table>

### Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVARCHAR2</td>
<td>Containing having the same data as the input RAW</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL</td>
</tr>
</tbody>
</table>
CAST_TO_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

Syntax

```sql
UTL_RAW.CAST_TO_RAW (  
   c  IN VARCHAR2)  
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(cast_to_raw, WDNS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>VARCHAR2 to be changed to a RAW</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field</td>
</tr>
<tr>
<td>NULL</td>
<td>If c input parameter was NULL</td>
</tr>
</tbody>
</table>
CAST_TO_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

**Note:** When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

**Syntax**

```sql
UTL_RAW.CAST_TO_VARCHAR2 (
    r IN RAW)
RETURN VARCHAR2;
```

**Pragmas**

```sql
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a VARCHAR2</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR2</td>
<td>Containing having the same data as the input RAW</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL</td>
</tr>
</tbody>
</table>
COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional pad parameter.

Syntax

```sql
UTL_RAW.COMPARE (  
    r1  IN RAW,  
    r2  IN RAW,  
    pad IN RAW DEFAULT NULL)  
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 260–24 COMPARE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>1st RAW to be compared, may be NULL or 0 length</td>
</tr>
<tr>
<td>r2</td>
<td>2nd RAW to be compared, may be NULL or 0 length</td>
</tr>
<tr>
<td>pad</td>
<td>This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: <code>x'00'</code></td>
</tr>
</tbody>
</table>

Return Values

**Table 260–25 COMPARE Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Equals 0 if RAW byte strings are both NULL or identical; or,</td>
</tr>
<tr>
<td></td>
<td>Equals position (numbered from 1) of the first mismatched byte</td>
</tr>
</tbody>
</table>
CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned.

Syntax

```
UTL_RAW.CONCAT (
    r1  IN RAW DEFAULT NULL,
    r2  IN RAW DEFAULT NULL,
    r3  IN RAW DEFAULT NULL,
    r4  IN RAW DEFAULT NULL,
    r5  IN RAW DEFAULT NULL,
    r6  IN RAW DEFAULT NULL,
    r7  IN RAW DEFAULT NULL,
    r8  IN RAW DEFAULT NULL,
    r9  IN RAW DEFAULT NULL,
    r10 IN RAW DEFAULT NULL,
    r11 IN RAW DEFAULT NULL,
    r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

r1....r12 are the RAW items to concatenate.

Return Values

```
Table 260–26 CONCAT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the items concatenated</td>
</tr>
</tbody>
</table>
```

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.
CONVERT Function

This function converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW.

Both from_charset and to_charset must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT ( 
    r            IN RAW, 
    to_charset   IN VARCHAR2, 
    from_charset IN VARCHAR2) 
RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW byte-string to be converted</td>
</tr>
<tr>
<td>to_charset</td>
<td>Name of the character set to which r is converted</td>
</tr>
<tr>
<td>from_charset</td>
<td>Name of the character set in which r is supplied</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Byte string r converted according to the specified character sets.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-06502</td>
<td>PL/SQL: numeric or value error</td>
</tr>
<tr>
<td>ORA-12703</td>
<td>This character set conversion is not supported</td>
</tr>
<tr>
<td>ORA-12705</td>
<td>Cannot access NLS data files or invalid environment specified</td>
</tr>
</tbody>
</table>

Usage Notes

- The NLS_LANG parameter form language_territory.character set is also accepted for to_charset and from_charset. However, this form is deprecated and should be avoided. Note that language and territory are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than floor(32767/4) = 8191 bytes if you want to avoid this truncation for all possible combinations of to_
charset and from_charset. You can use the maximum character width of the target character set to_charset, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is floor(32767/2) = 16383 bytes. For single-byte target character sets, no truncation is ever necessary.
**COPIES Function**

This function returns \( n \) copies of \( r \) concatenated together.

**Syntax**

```
UTL_RAW.COPIES (
    r IN RAW,
    n IN NUMBER
)
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(copies, WDNS, RNDS, WNPS, RNPS);
```

**Parameters**

**Table 260–30   COPIES Function Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r )</td>
<td>RAW to be copied</td>
</tr>
<tr>
<td>( n )</td>
<td>Number of times to copy the RAW (must be positive)</td>
</tr>
</tbody>
</table>

**Return Values**

This returns the RAW copied \( n \) times.

**Exceptions**

**Table 260–31   COPIES Function Exceptions**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- ( r ) is missing, NULL or 0 length</td>
</tr>
<tr>
<td></td>
<td>- ( n &lt; 1 )</td>
</tr>
<tr>
<td></td>
<td>- Length of result exceeds maximum length of a RAW</td>
</tr>
</tbody>
</table>
LENGTH Function

This function returns the length in bytes of a RAW r.

Syntax

```plaintext
UTL_RAW.LENGTH (r IN RAW) RETURN NUMBER;
```

Pragmas

```plaintext
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW byte stream to be measured</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Current length of the RAW</td>
</tr>
</tbody>
</table>
OVERLAY Function

This function overlays the specified portion of target RAW with overlay_str RAW, starting from byte position pos of target and proceeding for len bytes.

Syntax

```sql
UTL_RAW.OVERLAY (
    overlay_str IN RAW,
    target      IN RAW,
    pos         IN BINARY_INTEGER DEFAULT 1,
    len         IN BINARY_INTEGER DEFAULT NULL,
    pad         IN RAW            DEFAULT NULL)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 260–34 OVERLAY Function Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overlay_str</td>
<td>Byte-string used to overlay target</td>
</tr>
<tr>
<td>target</td>
<td>Byte-string which is to be overlaid</td>
</tr>
<tr>
<td>pos</td>
<td>Position in target (numbered from 1) to start overlay</td>
</tr>
<tr>
<td>len</td>
<td>The number of target bytes to overlay</td>
</tr>
<tr>
<td>pad</td>
<td>Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length</td>
</tr>
</tbody>
</table>

**Default and Optional Parameters**

**Table 260–35 OVERLAY Function Optional Parameters**

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>1</td>
</tr>
<tr>
<td>len</td>
<td>To the length of overlay_str</td>
</tr>
<tr>
<td>pad</td>
<td>x'00'</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 260–36 OVERLAY Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The target byte_string overlaid as specified.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If overlay_str has less than len bytes, then it is extended to len bytes using the pad byte. If overlay_str exceeds len bytes, then the extra bytes in overlay_str are
ignored. If len bytes beginning at position pos of target exceeds the length of target, then target is extended to contain the entire length of overlay_str.

If len is specified, it must be greater than or equal to 0. If pos is specified, it must be greater than or equal to 1. If pos exceeds the length of target, then target is padded with pad bytes to position pos, and target is further extended with overlay_str bytes.

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- Overlay_str is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- Target is missing or undefined</td>
</tr>
<tr>
<td></td>
<td>- Length of target exceeds maximum length of a RAW</td>
</tr>
<tr>
<td></td>
<td>- len &lt; 0</td>
</tr>
<tr>
<td></td>
<td>- pos &lt; 1</td>
</tr>
</tbody>
</table>
REVERSE Function

This function reverses a byte sequence in RAW r from end to end. For example, x’0102F3’ would be reversed to x’F30201’, and ‘xyz’ would be reversed to ‘zyx’. The result length is the same as the input RAW length.

Syntax

```plaintext
UTL_RAW.REVERSE ( 
    r IN RAW) 
RETURN RAW;
```

Pragmas

```plaintext
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW to reverse</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;reverse&quot; of r</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>r is NULL or has 0 length</td>
</tr>
</tbody>
</table>
SUBSTR Function

This function returns len bytes, starting at pos from RAW r.

Syntax

```sql
UTL_RAW.SUBSTR (  
    r   IN RAW,  
    pos IN BINARY_INTEGER,  
    len IN BINARY_INTEGER DEFAULT NULL)  
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW byte-string from which a portion is extracted</td>
</tr>
<tr>
<td>pos</td>
<td>Byte position in r at which to begin extraction</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes from pos to extract from r (optional)</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>Position pos through to the end of r</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>portion of r</td>
<td>Beginning at pos for len bytes long</td>
</tr>
<tr>
<td>NULL</td>
<td>r input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

- If pos is positive, then SUBSTR counts from the beginning of r to find the first byte. If pos is negative, then SUBSTR counts backward from the end of the r. The value pos cannot be 0.
- If len is omitted, then SUBSTR returns all bytes to the end of r. The value len cannot be less than 1.
Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>VALUE_ERROR is returned if:</td>
</tr>
<tr>
<td></td>
<td>■ pos = 0 or &gt; length of r</td>
</tr>
<tr>
<td></td>
<td>■ len &lt; 1 or &gt; length of r - (pos-1)</td>
</tr>
</tbody>
</table>
TRANSLATE Function

This function translates the bytes in the input RAW | according to the bytes in the translation RAWs from_set and to_set. If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```sql
UTL_RAW.TRANSLATE (  
    r        IN RAW,  
    from_set IN RAW,  
    to_set   IN RAW)  
RETURN RAW;
```

Note: Be aware that to_set and from_set are reversed in the calling sequence compared to TRANSLITERATE.

Pragmas

pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW source byte-string to be translated</td>
</tr>
<tr>
<td>from_set</td>
<td>RAW byte-codes to be translated, if present in r</td>
</tr>
<tr>
<td>to_set</td>
<td>RAW byte-codes to which corresponding from_set bytes are translated</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Translated byte-string</td>
</tr>
</tbody>
</table>

Usage Notes

- If to_set is shorter than from_set, the extra from_set bytes have no corresponding translation bytes. Bytes from the input RAW | that match any such from_set bytes are not translated or included in the result. They are effectively translated to NULL.
- If to_set is longer than from_set, the extra to_set bytes are ignored.
- If a byte value is repeated in from_set, the repeated occurrence is ignored.
Note: Differences from the TRANSLITERATE Function:

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

<table>
<thead>
<tr>
<th>Table 260–47 TRANSLATE Function Exceptions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Error</strong></td>
</tr>
<tr>
<td>-----------------</td>
</tr>
<tr>
<td>VALUE_ERROR</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
TRANSLITERATE Function

This function converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set. Successive bytes in r are looked up in the from_set, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the to_set, or the pad byte when no correspondence exists.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as r.

Syntax

```sql
UTL_RAW.TRANSLITERATE (  
    r        IN RAW,  
    to_set   IN RAW DEFAULT NULL,  
    from_set IN RAW DEFAULT NULL,  
    pad      IN RAW DEFAULT NULL) 
RETURN RAW;
```

Note: Be aware that to_set and from_set are reversed in the calling sequence compared to TRANSLATE.

Pragmas

```sql
pragma restrict_references(transliterate, WDNS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW input byte-string to be converted</td>
</tr>
<tr>
<td>to_set</td>
<td>RAW byte-codes to which corresponding from_set bytes are converted (any length)</td>
</tr>
<tr>
<td>from_set</td>
<td>RAW byte-codes to be converted, if presenting r (any length)</td>
</tr>
<tr>
<td>pad</td>
<td>1 byte used when to-set is shorter than the from_set</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>to_set</td>
<td>To the NULL string and effectively extended with pad to the length of from_set as necessary</td>
</tr>
<tr>
<td>from_set</td>
<td>x'00' through x'fff'</td>
</tr>
<tr>
<td>pad</td>
<td>x'00'</td>
</tr>
</tbody>
</table>
Return Values

Table 260–50  TRANSLITERATE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Converted byte-string.</td>
</tr>
</tbody>
</table>

Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such `from_set` bytes are converted in the result to the pad byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

Note: Differences from the TRANSFORM Function:

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by pad in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that TRANSFORM and TRANSLITERATE only differ in functionality when `to_set` has fewer bytes than `from_set`.

Exceptions

Table 260–51  TRANSLITERATE Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>R is NULL or has 0 length</td>
</tr>
</tbody>
</table>
XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the start_byte value is greater than the end_byte value, then the succession of resulting bytes begins with start_byte, wraps through x'FF' back to x'00', then ends at end_byte.

Syntax

```
UTL_RAW.XRANGE (
    start_byte IN RAW DEFAULT NULL,
    end_byte   IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_byte</td>
<td>Beginning byte-code value of resulting sequence. The default is x'00'.</td>
</tr>
<tr>
<td>end_byte</td>
<td>Ending byte-code value of resulting sequence. The default is x'FF'.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing succession of 1-byte hexadecimal encodings</td>
</tr>
</tbody>
</table>
The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- **Using UTL_RECOMP**
  - Overview
  - Operational Notes
  - Examples

- **Summary of UTL_RECOMP Subprograms**
Using UTL_RECOMP

- Overview
- Operational Notes
- Examples
Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.
Operational Notes

- This package uses the job queue for parallel recompilation.
- This package must be run using SQL*PLUS.
- You must be connected AS SYSDBA to run this script.
- This package expects the following packages to have been created with VALID status:
  - STANDARD (standard.sql)
  - DBMS_STANDARD (dbmsstdx.sql)
  - DBMS_JOB (dbmsjob.sql)
  - DBMS_RANDOM (dbmsrand.sql)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.
Examples

Recompile all objects sequentially:
EXECUTE UTL_RECOMP.RECOMP_SERIAL();

Recompile objects in schema SCOTT sequentially:
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');

Recompile all objects using 4 parallel threads:
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);

Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
## Summary of UTL_RECOMP Subprograms

### Table 261–1  UTL_RECOMP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECOMP_PARALLEL Procedure on page 261-7</td>
<td>Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel</td>
</tr>
<tr>
<td>RECOMP_SERIAL Procedure on page 261-8</td>
<td>Recompiles invalid objects in a given schema or all invalid objects in the database</td>
</tr>
</tbody>
</table>
RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```sql
UTL_RECOMP.RECOMP_PARALLEL(
    threads IN PLS_INTEGER DEFAULT NULL,
    schema IN VARCHAR2 DEFAULT NULL,
    flags IN PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads</td>
<td>The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.
RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
    schema   IN   VARCHAR2    DEFAULT NULL,
    flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>
The **UTL_REF** package provides PL/SQL procedures to support reference-based operations. Unlike SQL, **UTL_REF** procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- Using **UTL_REF**
  - Overview
  - Security Model
  - Types
  - Exceptions
- Summary of **UTL_REF** Subprograms
Using UTL_REF

- Overview
- Security Model
- Types
- Exceptions
Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.
Security Model

The procedural option is needed to use this package. This package must be created under SYS (CONNECT / AS SYSDBA). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.

Note: This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.
Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
    name   VARCHAR2(20),
    id     NUMBER,

    member function GET_ID
    (name VARCHAR2)
    RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID`().

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```
Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.

Table 262–1  UTL_REF Exceptions

<table>
<thead>
<tr>
<th>Exceptions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errnum == 942</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td>errnum == 1031</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td>errnum == 8177</td>
<td>Unable to serialize, if in a serializable transaction.</td>
</tr>
<tr>
<td>errnum == 60</td>
<td>Deadlock detected.</td>
</tr>
<tr>
<td>errnum == 1403</td>
<td>No data found (if the REF is NULL, and so on.).</td>
</tr>
</tbody>
</table>

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.
## Summary of UTL_REF Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_OBJECT Procedure</td>
<td>Deletes an object given a reference</td>
</tr>
<tr>
<td>LOCK_OBJECT Procedure</td>
<td>Locks an object given a reference</td>
</tr>
<tr>
<td>SELECT_OBJECT Procedure</td>
<td>Selects an object given a reference</td>
</tr>
<tr>
<td>UPDATE_OBJECT Procedure</td>
<td>Updates an object given a reference</td>
</tr>
</tbody>
</table>

*Table 262–2  UTL_REF Package Subprograms*
DELETE_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (reference IN REF '<typename>');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to delete.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address_t and others...

```
CREATE OR REPLACE TYPE Person_t (
    name VARCHAR2(64),
    gender CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
);
```

```
CREATE OR REPLACE TYPE BODY Person_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
        END;
    END;
);
```

```
CREATE OR REPLACE TYPE Employee_t (
    Under Person_t: Simulate implementation of inheritance using a REF to Person_t and delegation of setAddress to it.
    thePerson REF Person_t,
    empno NUMBER(5),
    deptREF Department_t,
    mgrREF Employee_t,
    reminders StringArray_t,
```

Table 262–3 DELETE_OBJECT Procedure Parameters
MEMBER PROCEDURE setAddress(addr IN Address_t),
MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t {
MEMBER PROCEDURE setAddress(addr IN Address_t) IS
  myMgr Employee_t;
  meAsPerson Person_t;
BEGIN

Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:

  UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
  meAsPerson.setAddress(addr);

Delegate to thePerson:

  UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
  if mgr is NOT NULL THEN

Give the manager a reminder:

    UTL_REF.LOCK_OBJECT(mgr);
    UTL_REF.SELECT_OBJECT(mgr, myMgr);
    myMgr.addReminder
      ('Update address in the employee directory for' ||
       thePerson.name || ' new address: ' || addr.asString);
    UTL_REF.UPDATE_OBJECT(mgr, myMgr);
  END IF;
EXCEPTION
  WHEN OTHERS THEN
  errnum := SQLCODE;
  errmsg := SUBSTR(SQLERRM, 1, 200);
LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
    INTO object
    FROM object_table t
    WHERE REF(t) = reference
    FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```
UTL_REF.LOCK_OBJECT (reference IN REF '<typename>');

UTL_REF.LOCK_OBJECT (reference IN REF '<typename>',
                           object    IN OUT '<typename>');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to lock.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.
SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
    reference IN REF '<typename>',
    object    IN OUT '<typename>');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference to the object to select or retrieve.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.
UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```sql
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```sql
UTL_REF.UPDATE_OBJECT (
    reference IN REF '<typename>',
    object    IN     '<typename>');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to update.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.
The UTL_SMTP package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

Using UTL_SMTP

- Overview
- Security Model
- Constants
- Types
- Reply Codes
- Exceptions
- Rules and Limits
- Examples
Overview

The `UTL_SMTP` protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The `UTL_SMTP` package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL_SMTP`, all text data (in other words, those in `VARCHAR2`) are converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to `RAW` and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.

`UTL_SMTP` provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, `UTL_SMTP` does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.
Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

Note: For more information, see Managing Fine-Grained Access in PL/SQL Packages and Types in *Oracle Database Security Guide*
Constants

The *UTL_SMTP* package uses the constants shown in Table 263–1, "UTL_SMTP Constants".

**Table 263–1 UTL_SMTP Constants**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL_SCHEMES</td>
<td>VARCHAR2(256)</td>
<td>'CRAM-MD5 PLAIN LOGIN'</td>
<td>List of all authentication schemes <em>UTL_SMTP</em> supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).</td>
</tr>
<tr>
<td>NON_CLEARTEXT_PASSWORD_SCHEMES</td>
<td>VARCHAR2(256)</td>
<td>'CRAM-MD5'</td>
<td>List of authentication schemes that <em>UTL_SMTP</em> supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.</td>
</tr>
</tbody>
</table>
Types

- CONNECTION Record Type
- REPLY, REPLIES Record Types

**CONNECTION Record Type**

This is a PL/SQL record type used to represent an SMTP connection.

**Syntax**

```plaintext
TYPE connection IS RECORD (
  host              VARCHAR2(255),
  port              PLS_INTEGER,
  tx_timeout        PLS_INTEGER,
  private_tcp_con   utl_tcp.connection,
  private_state     PLS_INTEGER);
```

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>port</td>
<td>Port number of the remote SMTP server connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td>private_tcp_con</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
<tr>
<td>private_state</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the `OPEN_CONNECTION` Functions. Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

**REPLY, REPLIES Record Types**

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.
Syntax

```plsql
TYPE reply IS RECORD (  
  code PLS_INTEGER,  
  text VARCHAR2(508));

TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>3-digit reply code</td>
</tr>
<tr>
<td>text</td>
<td>Text message of the reply</td>
</tr>
</tbody>
</table>
The following is a list of the SMTP reply codes.

<table>
<thead>
<tr>
<th>Reply Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>211</td>
<td>System status, or system help reply</td>
</tr>
<tr>
<td>214</td>
<td>Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]</td>
</tr>
<tr>
<td>220</td>
<td>&lt;domain&gt; Service ready</td>
</tr>
<tr>
<td>221</td>
<td>&lt;domain&gt; Service closing transmission channel</td>
</tr>
<tr>
<td>250</td>
<td>Requested mail action okay, completed</td>
</tr>
<tr>
<td>251</td>
<td>User not local; forwards to &lt;forward-path&gt;</td>
</tr>
<tr>
<td>252</td>
<td>OK, pending messages for node &lt;node&gt; started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.</td>
</tr>
<tr>
<td>253</td>
<td>OK, &lt;messages&gt; pending messages for node &lt;node&gt; started</td>
</tr>
<tr>
<td>354</td>
<td>Start mail input; end with &lt;CRLF.CRLF&gt;</td>
</tr>
<tr>
<td>355</td>
<td>Octet-offset is the transaction offset</td>
</tr>
<tr>
<td>421</td>
<td>&lt;domain&gt; Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)</td>
</tr>
<tr>
<td>450</td>
<td>Requested mail action not taken: mailbox unavailable [for example, mailbox busy]</td>
</tr>
<tr>
<td>451</td>
<td>Requested action terminated: local error in processing</td>
</tr>

<td>Command parameter not implemented</td>
</tr>
<tr>
<td>521</td>
<td>&lt;Machine&gt; does not accept mail.</td>
</tr>
<tr>
<td>530</td>
<td>Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>534</td>
<td>Authentication mechanism is too weak.</td>
</tr>
<tr>
<td>538</td>
<td>Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>550</td>
<td>Requested action not taken: mailbox unavailable [for, mailbox not found, no access]</td>
</tr>
<tr>
<td>Reply Code</td>
<td>Meaning</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
</tr>
<tr>
<td>551</td>
<td>User not local; please try <code>&lt;forward-path&gt;</code></td>
</tr>
<tr>
<td>552</td>
<td>Requested mail action terminated: exceeded storage allocation</td>
</tr>
<tr>
<td>553</td>
<td>Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]</td>
</tr>
<tr>
<td>554</td>
<td>Transaction failed</td>
</tr>
</tbody>
</table>
Operational Notes

SMTP connection is initiated by a call to OPEN_CONNECTION Functions which returns a SMTP connection. After a connection is established, the following calls are required to send a mail:

**HELO Function and Procedure** - identify the domain of the sender

**MAIL Function and Procedure** - start a mail, specify the sender

**RCPT Function** - specify the recipient

**OPEN_DATA Function and Procedure** - start the mail body

**WRITE_RAW_DATA Procedure** - write the mail body (multiple calls allowed)

**CLOSE_DATA Function and Procedure** - close the mail body and send the mail

The SMTP connection is closed by calling QUIT Function and Procedure.
Exceptions

The table lists the exceptions that can be raised by the interface of the UTL_SMTP package. The network error is transferred to a reply code of 421- service not available.

Table 263-5  UTL_SMTP Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_OPERATION</td>
<td>Raised when an invalid operation is made. In other words, calling API other than the WRITE_DATA Procedure, the WRITE_RAW_DATA Procedure or the CLOSE_DATA Function and Procedure after the OPEN_DATA Function and Procedure is called, or calling WRITE_DATA, WRITE_RAW_DATA or CLOSE_DATA without first calling OPEN_DATA.</td>
</tr>
<tr>
<td>TRANSIENT_ERROR</td>
<td>Raised when receiving a reply code in 400 range</td>
</tr>
<tr>
<td>PERMANENT_ERROR</td>
<td>Raised when receiving a reply code in 500 range</td>
</tr>
</tbody>
</table>
Rules and Limits

No limitation or range-checking is imposed by the API. However, you must be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

<table>
<thead>
<tr>
<th>Element</th>
<th>Size Limitation</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>Maximum total length of a user name is 64 characters</td>
</tr>
<tr>
<td>domain</td>
<td>Maximum total length of a domain name or number is 64 characters</td>
</tr>
<tr>
<td>path</td>
<td>Maximum total length of a reverse-path or forward-path is 256 characters</td>
</tr>
<tr>
<td></td>
<td>(including the punctuation and element separators)</td>
</tr>
<tr>
<td>command line</td>
<td>Maximum total length of a command line including the command word and the</td>
</tr>
<tr>
<td></td>
<td><code>&lt;CRLF&gt;</code> is 512 characters</td>
</tr>
<tr>
<td>reply line</td>
<td>Maximum total length of a reply line including the reply code and the <code>&lt;CRLF&gt;</code></td>
</tr>
<tr>
<td></td>
<td>is 512 characters</td>
</tr>
<tr>
<td>text line</td>
<td>Maximum total length of a text line including the <code>&lt;CRLF&gt;</code> is 1000 characters</td>
</tr>
<tr>
<td></td>
<td>(but not counting the leading dot duplicated for transparency)</td>
</tr>
<tr>
<td>recipients buffer</td>
<td>Maximum total number of recipients that must be buffered is 100 recipients</td>
</tr>
</tbody>
</table>
Examples

The following example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

DECLARE
  c UTL_SMTP.CONNECTION;
PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From', '"Sender" <sender@foo.com>');</n  send_header('To', '"Recipient" <recipient@foo.com>');</n  send_header('Subject', 'Hello');</n  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');</n  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
    BEGIN
      UTL_SMTP.QUIT(c);
    EXCEPTION
      WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
        NULL; -- When the SMTP server is down or unavailable, we don't have
        -- a connection to the server. The QUIT call raises an
        -- exception that we can ignore.
    END;
    raise_application_error(-20000,
      'Failed to send mail due to the following error: ' || sqlerrm);
END;
### Summary of UTL_SMTP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

</tbody>
</table>
**AUTH Function and Procedure**

This subprogram sends the `AUTH` command to authenticate to the SMTP server. The `UTL_SMTP` package goes through the user’s choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported. To determine the schemes the SMTP server supports from its `EHLO` reply, the user must call the `EHLO Function and Procedure`. Otherwise, `UTL_SMTP` uses the first scheme in the list.

**Syntax**

```sql
UTL_SMTP.AUTH (c          IN OUT NOCOPY connection,
                username   IN            VARCHAR2,
                password   IN            VARCHAR2,
                schemes    IN            VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)
RETURN reply;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>username</td>
<td>Username</td>
</tr>
<tr>
<td>password</td>
<td>Password</td>
</tr>
<tr>
<td>schemes</td>
<td>Space-separated list of authentication schemes <code>UTL_SMTP</code> is allowed to use in the preferred order. See the <code>ALL_SCHEMES</code> and <code>NON_CLEARTEXT_PASSWORD_SCHEMES</code> constants for suggestions.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see <code>REPLY</code>, <code>REPLIES</code> Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Currently only `PLAIN`, `LOGIN` and `CRAM-MD5` authentication schemes are supported by `UTL_SMTP`.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the `STARTTLS` command (for example, adding `PLAIN` and `LOGIN`), the caller must call the `EHLO Function and Procedure` again for `UTL_SMTP` to update the list after the `STARTTLS Function and Procedure` is called.
Examples

DECLARE
    c utl_smtp.connection;
BEGIN
    c := utl_smtp.open_connection(
        host => 'smtp.example.com',
        port => 25,
        wallet_path => 'file:/oracle/wallets/smtp_wallet',
        wallet_password => 'password',
        secure_connection_before_smtp => FALSE);
    UTL_SMTP.STARTTLS(c);
    UTL_SMTP.AUTH(
        c => c,
        username => 'scott',
        password => 'password',
        schemes => utl_smtp.all_schemes);
END;
CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session. To end the SMTP connection properly, use the QUIT Function and Procedure.

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
    c     IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>
CLOSE_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (c     IN OUT NOCOPY connection)
RETURN reply;
```

Parameters

Table 263–11  CLOSE_DATA Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

Table 263–12  CLOSE_DATA Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

CLOSE_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.
COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

Syntax

UTL_SMTP.COMMAND (  
  c IN OUT NOCOPY connection,  
  cmd IN VARCHAR2,  
  arg IN VARCHAR2 DEFAULT NULL)  
RETURN reply;

Parameters

Table 263–13 COMMAND Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>cmd</td>
<td>SMTP command to send to the server</td>
</tr>
<tr>
<td>arg</td>
<td>Optional argument to the SMTP argument. A space is inserted between cmd and arg.</td>
</tr>
</tbody>
</table>

Return Values

Table 263–14 COMMAND Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.
COMMAND_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (  
    c     IN OUT NOCOPY    connection,  
    cmd   IN               VARCHAR2,  
    arg   IN               VARCHAR2 DEFAULT NULL)  
RETURN replies;
```

Parameters

Table 263–15 COMMAND_REPLIES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>cmd</td>
<td>SMTP command to send to the server</td>
</tr>
<tr>
<td>arg</td>
<td>Optional argument to the SMTP argument. A space is inserted between cmd and arg.</td>
</tr>
</tbody>
</table>

Return Values

Table 263–16 COMMAND_REPLIES Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLEIS Record Types)</td>
</tr>
</tbody>
</table>

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.
DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

Syntax

```sql
UTL_SMTP.DATA (c IN OUT NOCOPY connection
body IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;
```

```sql
UTL_SMTP.DATA (c IN OUT NOCOPY connection
body IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Table 263–17 DATA Function and Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>c</td>
</tr>
<tr>
<td>body</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Table 263–18 DATA Function and Procedure Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Return Value</strong></td>
</tr>
<tr>
<td>reply</td>
</tr>
</tbody>
</table>

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a `<CR><LF>..<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>..<CR><LF>` (single period) in body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA subprogram must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command is not returned to the caller.
EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the EHLO command.

Syntax

```sql
UTL_SMTP.EHLO ( 
    c       IN OUT NOCOPY connection,  
    domain  IN)  
RETURN replies;
```

```sql
UTL_SMTP.EHLO ( 
    c       IN OUT NOCOPY connection,  
    domain  IN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>domain</td>
<td>Domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types).</td>
</tr>
</tbody>
</table>

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

Related Functions

HELO Function and Procedure
HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the HELO command.

Syntax

```sql
UTL_SMTP.HELO (c IN OUT NOCOPY connection,
domain IN VARCHAR2) RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>domain</td>
<td>Domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

EHLO Function and Procedure
HELP Function

This function sends the HELP command.

Syntax

```sql
UTL_SMTP.HELP (  
c         IN OUT NOCOPY   connection,  
command   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>command</td>
<td>Command to get the help message</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY, REPLIES Record Types)</td>
</tr>
</tbody>
</table>
MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

Syntax

UTL_SMTP.MAIL (c IN OUT NOCOPY connection, sender IN VARCHAR2, parameters IN VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.MAIL (c IN OUT NOCOPY connection, sender IN VARCHAR2, parameters IN VARCHAR2 DEFAULT NULL);

Parameters

Table 263–25 MAIL Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>sender</td>
<td>E-mail address of the user sending the message.</td>
</tr>
</tbody>
</table>
| parameters| Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of “XXX=XXX (XXX=XXX ....)”.

Return Values

Table 263–26 MAIL Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.
NOOP Function and Procedure

This subprogram issues the NULL command.

Syntax

```sql
UTL_SMTP.NOOP (  
    c  IN OUT NOCOPY connection)  
RETURN reply;
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.
OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```sql
UTL_SMTP.OPEN_CONNECTION (
    host                            IN  VARCHAR2,
    port                            IN  PLS_INTEGER DEFAULT 25,
    c                               OUT connection,
    tx_timeout                      IN  PLS_INTEGER DEFAULT NULL,
    wallet_path                     IN  VARCHAR2 DEFAULT NULL,
    wallet_password                 IN  VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp   IN  BOOLEAN DEFAULT FALSE)
RETURN reply;
```

```sql
UTL_SMTP.OPEN_CONNECTION (
    host                           IN  VARCHAR2,
    port                           IN  PLS_INTEGER DEFAULT 25,
    tx_timeout                     IN  PLS_INTEGER DEFAULT NULL,
    wallet_path                    IN  VARCHAR2 DEFAULT NULL,
    wallet_password                IN  VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp  IN  BOOLEAN DEFAULT FALSE)
RETURN connection;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Name of the SMTP server host</td>
</tr>
<tr>
<td>port</td>
<td>Port number on which SMTP server is listening (usually 25)</td>
</tr>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>Directory path that contains the Oracle wallet for SSL/TLS. The format is file: &lt;directory-path&gt;</td>
</tr>
<tr>
<td>wallet_password</td>
<td>Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.</td>
</tr>
<tr>
<td>secure_connection_before_smtp</td>
<td>If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.</td>
</tr>
</tbody>
</table>
Return Values

Table 263–30  OPEN_CONNECTION Functions Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN_CONNECTION that returns UTL_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of OPEN_CONNECTION that returns REPLY.
- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
    host => 'smtp.example.com',
    port => 465,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => TRUE);
END;
```
OPEN_DATA Function and Procedure

This subprogram sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

UTL_SMTP.OPEN_DATA (  
    c     IN OUT NOCOPY connection)  
RETURN reply;

UTL_SMTP.OPEN_DATA (  
    c     IN OUT NOCOPY connection);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in RFC822 format.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

- OPEN_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

Syntax

```
UTL_SMTP.QUIT (     
   c  IN OUT NOCOPY connection) 
RETURN reply;
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The QUIT command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by OPEN_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is canceled in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE_HOST and REMOTE_PORT of c are reset.

Related Functions

RSET Function and Procedure
RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

UTL_SMTP.RCPT (  
  c           IN OUT NOCOPY connection,  
  recipient   IN                VARCHAR2,  
  parameters  IN                VARCHAR2 DEFAULT NULL)  
RETURN reply;

UTL_SMTP.RCPT (  
  c           IN OUT NOCOPY connection,  
  recipient   IN                VARCHAR2,  
  parameters  IN                VARCHAR2 DEFAULT NULL);

Table 263–35  RCPT Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>recipient</td>
<td>E-mail address of the user to which the message is being sent</td>
</tr>
<tr>
<td>parameters</td>
<td>Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of &quot;XXX=XXX (XXX=XXX ....)&quot;.</td>
</tr>
</tbody>
</table>

Return Values

Table 263–36  RCPT Function and Procedure Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to MAIL, and the connection to the mail server must have been opened and initialized by prior calls to OPEN_CONNECTION and HELO or EHLO respectively.

The expected response from the server is a message beginning with status code 250 or 251.
RSET Function and Procedure

This subprogram terminates the current mail transaction.

Syntax

```sql
UTL_SMTP.RSET (  
    c  IN OUT NOCOPY connection)  
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to RSET with a message beginning with status code 250.

Related Functions

QUIT Function and Procedure
STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the `OPEN_CONNECTION` functions.

Syntax

```
UTL_SMTP.STARTTLS (  
    c  IN OUT NOCOPY connection)  
RETURN reply;
```

```
UTL_SMTP.STARTTLS (  
    c  IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>SMTP reply</td>
</tr>
</tbody>
</table>

Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

Examples

```
DECLARE  
  c utl_smtp.connection;
BEGIN  
  c := utl_smtp.open_connection(  
      host => 'smtp.example.com',  
      port => 25,  
      wallet_path => 'file:/oracle/wallets/smtp_wallet',  
      wallet_password => 'password',  
      secure_connection_before_smtp => FALSE);  
  utl_smtp.starttls(c);  
END
```
VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```plsql
UTL_SMTP.VRFY (  
c          IN OUT NOCOPY connection  
recipient  IN VARCHAR2)  
RETURN reply;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>recipient</td>
<td>E-mail address to be verified</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The server attempts to resolve the destination address recipient. If successful, it returns the recipient’s full name and fully qualified mailbox path. The connection to the server must have already been established by means of OPEN_CONNECTION and HELO or EHLO before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.
WRITE_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (  
c IN OUT NOCOPY connection,  
data IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME (RFC822) specification. The DATA routine terminates the message with a \(<CR><LF>..<CR><LF>\) sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of \(<CR><LF>..<CR><LF>\) (single period) in the body to \(<CR><LF>..<CR><LF>\) (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.

- Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.
WRITE_RAW_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_RAW_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (  
  c     IN OUT NOCOPY connection  
  data  IN RAW);
```

Parameters

**Table 263–44 WRITE_RAW_DATA Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be made in the correct order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a `<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>` , `<CR><LF>` (single period) in the body to `<CR><LF>` ... `<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must be called only after OPEN_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

- Note that there is no function form of the WRITE_DATA Procedure because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA Function and Procedure.
The **UTL_SPADV** package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

This chapter contains the following topic:

- **Using UTL_SPADV**
  - Overview
  - Security Model
  - Operational Notes

- **Summary of UTL_SPADV Subprograms**

**See Also:**  *Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor
Using UTL_SPADV

- Overview
- Security Model
- Operational Notes
Overview

This package enables you to collect and analyze statistics about the performance or Oracle Streams components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Streams performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

See Also: Oracle Streams Concepts and Administration
Security Model

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** *Oracle Streams Replication Administrator’s Guide* for information about configuring an Oracle Streams administrator
Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Streams administrator and run the utlspadv.sql script in the rdbms/admin directory in ORACLE_HOME.

The utlspadv.sql script creates the following tables:

- STREAMS$_PA_COMPONENT Table
- STREAMS$_PA_COMPONENT_LINK Table
- STREAMS$_PA_COMPONENT_PROP Table
- STREAMS$_PA_COMPONENT_STAT Table
- STREAMS$_PA_CONTROL Table
- STREAMS$_PA_DATABASE Table
- STREAMS$_PA_DATABASE_PROP Table
- STREAMS$_PA_MONITORING Table
- STREAMS$_PA_PATH_BOTTLENECK Table
- STREAMS$_PA_PATH_STAT Table
- STREAMS$_PA_SHOW_COMP_STAT Table
- STREAMS$_PA_SHOW_PATH_STAT Table

The Oracle Streams Performance Advisor populates these tables when it is run.

See Also: Oracle Streams Concepts and Administration

STREAMS$_PA_COMPONENT Table

The STREAMS$_PA_COMPONENT table displays information about the Oracle Streams components at each database.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPONENT_ID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Identification number assigned to the component by the Oracle Streams Performance Advisor</td>
</tr>
<tr>
<td>COMPONENT_NAME</td>
<td>VARCHAR2(194)</td>
<td></td>
<td>Name of the component</td>
</tr>
<tr>
<td>COMPONENT_DB</td>
<td>VARCHAR2(128)</td>
<td></td>
<td>Name of the database that contains the component</td>
</tr>
</tbody>
</table>
STREAMS$_PA_COMPONENT_LINK Table

The STREAMS$_PA_COMPONENT_LINK table displays information about how information flows between Oracle Streams components.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
</table>
| COMPONENT_TYPE          | VARCHAR2(20)      |      | Type of the component
  The following types are possible:
  - CAPTURE for a capture process
  - PROPAGATION SENDER for a propagation sender
  - PROPAGATION RECEIVER for a propagation receiver
  - APPLY for an apply process
  - QUEUE for a queue
| COMPONENT_CHANGED_TIME  | DATE              |      | Time when the component was last changed                                   |

Table 264–1 (Cont.) STREAMS$_PA_COMPONENT Table

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PATH_ID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Identification number assigned to the path by the Oracle Streams Performance Advisor</td>
</tr>
<tr>
<td>PATH_KEY</td>
<td>VARCHAR2(4000)</td>
<td></td>
<td>Unique key assigned to the path by the Oracle Streams Performance Advisor</td>
</tr>
</tbody>
</table>
| SOURCE_COMPONENT_ID     | NUMBER            | NOT NULL | Source component ID for the path
  The path starts with this component. |
| DESTINATION_COMPONENT_ID| NUMBER            | NOT NULL | Destination component ID for the path
  The path ends with this component. |
| POSITION                | NUMBER            |      | Position of the component in the path                                      |

STREAMS$_PA_COMPONENT_PROP Table

The STREAMS$_PA_COMPONENT_PROP table displays information about capture processes and apply processes necessary for analysis by the Streams Performance Advisor.
Using UTL_SPADV

The `STREAMS$_PA_COMPONENT_STAT` table displays performance statistics and session statistics about each Oracle Streams component.

### Table 264–3  STREAMS$_PA_COMPONENT_PROP Table

<table>
<thead>

### Table 264–4  STREAMS$_PA_COMPONENT_STAT Table

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADVISOR_RUN_ID</td>
<td>NUMBER</td>
<td></td>
<td>Identification number of the Oracle Streams Performance Advisor run</td>
</tr>
</tbody>
</table>
Table 264–4 (Cont.) STREAMS$ PA_COMPONENT_STAT Table

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADVISOR_RUN_TIME</td>
<td>DATE</td>
<td></td>
<td>Time when the Oracle Streams Performance Advisor was run for the advisor run ID</td>
</tr>
<tr>
<td>COMPONENT_ID</td>
<td>NUMBER</td>
<td></td>
<td>Identification number assigned to the component by the Oracle Streams Performance Advisor</td>
</tr>
<tr>
<td>STATISTIC_TIME</td>
<td>DATE</td>
<td></td>
<td>Time when the statistic was recorded</td>
</tr>
<tr>
<td>STATISTIC_NAME</td>
<td>VARCHAR2(64)</td>
<td></td>
<td>Name of the statistic</td>
</tr>
<tr>
<td>STATISTIC_VALUE</td>
<td>NUMBER</td>
<td></td>
<td>Value recorded for the statistic</td>
</tr>
<tr>
<td>STATISTIC_UNIT</td>
<td>VARCHAR2(64)</td>
<td></td>
<td>Unit of measurement for the statistic</td>
</tr>
<tr>
<td>SUB_COMPONENT_TYPE</td>
<td>VARCHAR2(64)</td>
<td></td>
<td>Type of the subcomponent</td>
</tr>
</tbody>
</table>

Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible:

- LOGMINER READER for a builder server of a capture process
- LOGMINER PREPARER for a preparer server of a capture process
- LOGMINER BUILDER for a reader server of a capture process
- CAPTURE SESSION for a capture process session

The following apply process subcomponent types are possible:

- PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database
- APPLY READER for a reader server of an apply process
- APPLY COORDINATOR for a coordinator process of an apply process
- APPLY SERVER for a reader server of an apply process

SESSION_ID          | NUMBER       |      | Identification number of the session for the component. Query the V$SESSION view for information about the session. |
SESSION_SERIAL#     | NUMBER       |      | Session serial number of the session for the component. Query the V$SESSION view for information about the session. |
STREAMS$_PA_CONTROL Table

The STREAMS$_PA_CONTROL table displays the parameters set for the COLLECT_STATS procedure in this package. The parameters control the monitoring behavior.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADVISOR_RUN_ID</td>
<td>NUMBER</td>
<td></td>
<td>Identification number of the Oracle Streams Performance Advisor run</td>
</tr>
<tr>
<td>ADVISOR_RUN_TIME</td>
<td>DATE</td>
<td></td>
<td>Time when the Oracle Streams Performance Advisor was last run</td>
</tr>
<tr>
<td>PARAM_NAME</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>The name of the parameter</td>
</tr>
<tr>
<td>PARAM_VALUE</td>
<td>VARCHAR2(4000)</td>
<td></td>
<td>The value set for the parameter</td>
</tr>
<tr>
<td>PARAM_INIT</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>The unit of the parameter</td>
</tr>
</tbody>
</table>

STREAMS$_PA_DATABASE Table

The STREAMS$_PA_DATABASE table displays information about each database that contains Oracle Streams components.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLOBAL_NAME</td>
<td>VARCHAR2(128)</td>
<td>NOT NULL</td>
<td>Global name of the database analyzed by the Oracle Streams Performance Advisor</td>
</tr>
<tr>
<td>LAST_QUERIED</td>
<td>DATE</td>
<td></td>
<td>The time when the Performance Advisor successfully collected information from a database in its last run</td>
</tr>
<tr>
<td>ERROR_NUMBER</td>
<td>NUMBER</td>
<td></td>
<td>The error number of the error encountered when the database was last queried</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR2(4000)</td>
<td></td>
<td>The error message of the error encountered when the database was last queried</td>
</tr>
</tbody>
</table>

STREAMS$_PA_DATABASE_PROP Table

The STREAMS$_PA_DATABASE_PROP table displays Oracle Streams database property information necessary for analysis by the Streams Performance Advisor.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLOBAL_NAME</td>
<td>VARCHAR2(128)</td>
<td>NOT NULL</td>
<td>Global name of the database analyzed by the Oracle Streams Performance Advisor</td>
</tr>
</tbody>
</table>
STREAMS$_PA_MONITORING Table
The `STREAMS$_PA_MONITORING` table displays information about each monitoring job running in a database.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOB_NAME</td>
<td>VARCHAR2(30)</td>
<td>NOT NULL</td>
<td>Name of the monitoring job</td>
</tr>
<tr>
<td>CLIENT_NAME</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>Name of the client that submitted the job</td>
</tr>
<tr>
<td>QUERY_USER_NAME</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>User granted privileges to view the monitoring results</td>
</tr>
<tr>
<td>SHOW_STATS_TABLE</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>Name of the table used by the SHOW_STATS procedure to display statistics</td>
</tr>
<tr>
<td>STARTED_TIME</td>
<td>TIMESTAMP</td>
<td></td>
<td>Time the monitoring job started</td>
</tr>
<tr>
<td>STOPPED_TIME</td>
<td>TIMESTAMP</td>
<td></td>
<td>Time the monitoring job last stopped</td>
</tr>
<tr>
<td>ALTERED_TIME</td>
<td>TIMESTAMP</td>
<td></td>
<td>Time the monitoring job was last altered</td>
</tr>
<tr>
<td>STATE</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>State of the monitoring job, either ENABLED or STOPPED</td>
</tr>
</tbody>
</table>

STREAMS$_PA_PATH_BOTTLENECK Table
The `STREAMS$_PA_PATH_BOTTLENECK` table displays information about Oracle Streams components that might be slowing down the flow of messages.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADVISOR_RUN_ID</td>
<td>NUMBER</td>
<td></td>
<td>Identification number of the Oracle Streams Performance Advisor run</td>
</tr>
<tr>
<td>ADVISOR_RUN_TIME</td>
<td>DATE</td>
<td></td>
<td>Time when the Oracle Streams Performance Advisor was last run</td>
</tr>
<tr>
<td>ADVISOR_RUN_REASON</td>
<td>VARCHAR2(4000)</td>
<td></td>
<td>Reason for the bottleneck</td>
</tr>
<tr>
<td>PATH_ID</td>
<td>NUMBER</td>
<td></td>
<td>Identification number assigned to the path by the Oracle Streams Performance Advisor</td>
</tr>
</tbody>
</table>
Using UTL_SPADV

STREAMS$_PA_PATH_STAT Table

The STREAMS$_PA_PATH_STAT table displays performance statistics about each stream path.

Table 264–9 (Cont.) STREAMS$_PA_PATH_BOTTLENECK Table

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>

</tbody>
</table>
Using UTL_SPADV

STREAMS$_PA_SHOW_PATH_STAT Table

The STREAMS$_PA_SHOW_PATH_STAT table displays statistics for the stream paths in an Oracle Streams configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

Table 264–12 STREAMS$_PA_SHOW_PATH_STAT Table

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PATH_ID</td>
<td>NUMBER</td>
<td></td>
<td>Identification number assigned to the path by the Oracle Streams Performance Advisor</td>
</tr>
<tr>
<td>ADVISOR_RUN_ID</td>
<td>NUMBER</td>
<td></td>
<td>Identification number of the Oracle Streams Performance Advisor run</td>
</tr>
<tr>
<td>ADVISOR_RUN_TIME</td>
<td>DATE</td>
<td></td>
<td>Time when the Oracle Streams Performance Advisor was last run</td>

<tr>
<td>SETTING</td>
<td>VARCHAR2(2000)</td>
<td></td>
<td>Setting for the Oracle Streams Performance Advisor Run</td>
</tr>
<tr>
<td>STATISTICS</td>
<td>VARCHAR2(4000)</td>
<td></td>
<td>Component-level statistics</td>
</tr>
<tr>
<td>SESSION_STATISTICS</td>
<td>VARCHAR2(4000)</td>
<td></td>
<td>Session-level statistics</td>
</tr>
<tr>
<td>OPTIMIZATION</td>
<td>NUMBER</td>
<td></td>
<td>Whether the path uses the combined capture and apply optimization</td>
</tr>
</tbody>
</table>

0 (zero) means that the path does not use the combined capture and apply optimization.

1 means that the path uses the combined capture and apply optimization.
### Summary of UTL_SPADV Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ALTER_MONITORING</strong> Procedure</td>
<td>Alters the monitoring job submitted by the current user.</td>
</tr>
<tr>
<td><strong>COLLECT_STATS</strong> Procedure</td>
<td>Uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.</td>
</tr>
<tr>
<td><strong>IS_MONITORING</strong> Function</td>
<td>Checks whether a monitoring job is currently running.</td>

<tr>
<td><strong>START_MONITORING</strong> Procedure</td>
<td>Starts a monitoring job.</td>
</tr>
<tr>
<td><strong>STOP_MONITORING</strong> Procedure</td>
<td>Stops a monitoring job.</td>
</tr>
</tbody>
</table>
**ALTER_MONITORING Procedure**

This procedure alters the monitoring job submitted by the current user.

**Syntax**

```sql
UTL_SPADV.ALTER_MONITORING(
    interval                      IN NUMBER  DEFAULT NULL,
    top_event_threshold           IN NUMBER  DEFAULT NULL,
    bottleneck_idle_threshold     IN NUMBER  DEFAULT NULL,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
    retention_time                IN NUMBER  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interval</code></td>
<td>The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If <code>NULL</code>, then the current value is not changed.</td>
</tr>
<tr>
<td><code>top_event_threshold</code></td>
<td>A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If <code>NULL</code>, then the current value is not changed.</td>
</tr>
<tr>
<td><code>bottleneck_idle_threshold</code></td>
<td>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If <code>NULL</code>, then the current value is not changed.</td>
</tr>
<tr>
<td><code>bottleneck_flowctrl_threshold</code></td>
<td>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If <code>NULL</code>, then the current value is not changed.</td>
</tr>
<tr>
<td><code>retention_time</code></td>
<td>The number of hours to retain monitoring results. If <code>NULL</code>, then the current value is not changed.</td>
</tr>
</tbody>
</table>
### Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20113</td>
<td>no active monitoring job found</td>
</tr>
</tbody>
</table>
COLLECT_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

**Note:** This procedure commits.

**See Also:** *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

### Syntax

```sql
UTL_SPADV.COLLECT_STATS(
    interval               IN NUMBER  DEFAULT 60,
    num_runs               IN NUMBER  DEFAULT 10,
    comp_stat_table        IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
    path_stat_table        IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    top_event_threshold    IN NUMBER  DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER  DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT 50)
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.</td>
</tr>
<tr>
<td>num_runs</td>
<td>The number of times that the Oracle Streams Performance Advisor is run by the procedure.</td>
</tr>
<tr>
<td>comp_stat_table</td>
<td>The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as <code>[schema_name.]object_name</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>path_stat_table</td>
<td>The name of the table that stores the statistics collected for stream paths. Specify the table name as <code>[schema_name.]object_name</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

Oracle recommends that you use the default table `STREAMS$_ADVISOR_COMP_STAT`.

See "Usage Notes" on page 264-18 for more information about this parameter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path_stat_table</td>
<td>The name of the table that stores the statistics collected for stream paths. Specify the table name as <code>[schema_name.]object_name</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

Oracle recommends that you use the default table `STREAMS$_ADVISOR_PATH_STAT`.

See "Usage Notes" on page 264-18 for more information about this parameter.
**COLLECT_STATS Procedure**

### Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.
IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns \texttt{TRUE} if a monitoring job is currently running or \texttt{FALSE} if a monitoring job is not currently running.

A monitoring job is submitted using the \texttt{START_MONITORING} procedure.

\textbf{See Also:} \textit{"START_MONITORING Procedure"} on page 264-25

Syntax

\begin{verbatim}
UTL_SPADV.IS_MONITORING(
    job_name    IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
    client_name IN VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
\end{verbatim}

Parameters

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
Parameter & Description \\
\hline
job_name & The name of the job for which to check. \\
client_name & The name of the client that submitted the job. \\
\hline
\end{tabular}
\caption{IS_MONITORING Function Parameters}
\end{table}
SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures. The output is formatted so that it can be imported into a spreadsheet for analysis.

---

**Note:** This procedure does not commit.

---

See Also:
- "COLLECT_STATS Procedure" on page 264-17
- "START_MONITORING Procedure" on page 264-25
- Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

**Syntax**

```sql
UTL_SPADV.SHOW_STATS(
    path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    path_id           IN NUMBER    DEFAULT NULL,
    bgn_run_id        IN NUMBER    DEFAULT -1,
    end_run_id        IN NUMBER    DEFAULT -10,
    show_path_id      IN BOOLEAN   DEFAULT TRUE,
    show_run_id       IN BOOLEAN   DEFAULT TRUE,
    show_run_time     IN BOOLEAN   DEFAULT TRUE,
    show_optimization IN BOOLEAN   DEFAULT TRUE,
    show_setting      IN BOOLEAN   DEFAULT FALSE,
    show_stat         IN BOOLEAN   DEFAULT TRUE,
    show_sess         IN BOOLEAN   DEFAULT FALSE,
    show_legend       IN BOOLEAN   DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path_stat_table</td>
<td>The name of the table that contains the stream path statistics. Specify the table name as <code>{schema_name}.object_name</code>. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$_ADVISOR_PATH_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$_PA_MONITORING view. The default table for a monitoring job is STREAMS$_PA_SHOW_PATH_STAT.</td>
</tr>
<tr>
<td>path_id</td>
<td>A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.</td>

</tr>
<tr>
<td>end_run_id</td>
<td>The last Oracle Streams Performance Advisor run ID to show in the range of runs.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Usage Notes&quot; on page 264-22 for more information about this parameter.</td>
</tr>
<tr>
<td>show_path_id</td>
<td>If TRUE, then the path ID for each stream path is included in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the path ID for each stream path is not included in the output.</td>
</tr>
<tr>
<td>show_run_id</td>
<td>If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.</td>
</tr>
<tr>
<td>show_run_time</td>
<td>If TRUE, then the Oracle Streams Performance Advisor run time is included in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.</td>
</tr>
<tr>
<td>show_optimization</td>
<td>If TRUE, then path output includes information pertaining to the combined capture and apply optimization.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.</td>
</tr>
<tr>
<td>show_setting</td>
<td>If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the settings for the threshold parameters are not included in the output.</td>
</tr>
<tr>
<td>show_stat</td>
<td>If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the component-level and subcomponent-level statistics are not included in the output.</td>
</tr>
<tr>
<td>show_sess</td>
<td>If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the session-level statistics are not included in the output.</td>
</tr>
<tr>
<td>show_legend</td>
<td>If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the legend is not included in the output.</td>
</tr>
</tbody>
</table>
Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

See Also:  *Oracle Streams Concepts and Administration* for information about the combined capture and apply optimization
SHOW_STATS_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures.

Note: This procedure does not commit.

See Also:
- "COLLECT_STATS Procedure" on page 264-17
- "START_MONITORING Procedure" on page 264-25
- Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

Syntax

UTL_SPADV.SHOW_STATS_HTML(
  directory       IN VARCHAR2,
  reportname      IN VARCHAR2  DEFAULT 'SPADVREPORT.HTML',
  comp_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
  path_id         IN NUMBER    DEFAULT NULL,
  bgn_run_id      IN NUMBER    DEFAULT -1,
  end_run_id      IN NUMBER    DEFAULT -10,
  detailed        IN BOOLEAN   DEFAULT TRUE);

Parameters

Table 264–19  SHOW_STATS_HTML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>The directory object for the directory on the local computer system into which the generated HTML report is placed. The specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes the procedure must have READ and WRITE privilege on each one.</td>
</tr>
<tr>
<td>reportname</td>
<td>The name of the HTML report</td>
</tr>
<tr>
<td>comp_stat_table</td>
<td>The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as [schema_name.]object_name. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the comp_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$ ADVISOR_COMP_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$ PA_MONITORING view. The default table for a monitoring job is STREAMS$ PA_SHOW_PATH_STAT. Oracle recommends that you start a monitoring job with the START_MONITORING procedure in this package and use the appropriate the STREAMS$ PA_SHOW_PATH_STAT table.</td>
</tr>
</tbody>
</table>
**Usage Notes**

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

<td>If TRUE, then the procedure generates component-level statistics. If FALSE, then the procedure does not generate component-level statistics.</td>
</tr>
</tbody>
</table>
START_MONITORING Procedure

This procedure starts a monitoring job.
This procedure runs the COLLECT_STATS procedure to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

---

**Note:** This procedure commits.

---

See Also:

- "COLLECT_STATS Procedure" on page 264-17
- Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

**Syntax**

```sql
DECLARE
  job_name VARCHAR2 := 'STREAMS$_MONITORING_JOB',
  client_name VARCHAR2 := NULL, query_user_name VARCHAR2 := NULL,
  interval NUMBER := 60,
  top_event_threshold NUMBER := 15,
  bottleneck_idle_threshold NUMBER := 50,
  bottleneck_flowctrl_threshold NUMBER := 50,
  retention_time NUMBER := 24;
BEGIN
  UTL_SPADV.START_MONITORING(
    job_name                      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
    client_name                   IN VARCHAR2  DEFAULT NULL,
    query_user_name               IN VARCHAR2  DEFAULT NULL,
    interval                      IN NUMBER    DEFAULT 60,

---

UTL_SPADV 264-25
The following are usage notes for the START_MONITORING procedure:

- **Requirements for the User Running the Procedure**
- **Full Monitoring Job Names**
- **Restrictions on Monitoring Jobs**

**Requirements for the User Running the Procedure**
The user who runs the START_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.
Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

<table>
<thead>
<tr>
<th>Setting for client_name parameter</th>
<th>Setting for job_name parameter</th>
<th>Full Monitoring Job Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>STREAMS$$_MONITORING_JOB</td>
<td>STREAMS$$_MONITORING_JOB</td>
</tr>
<tr>
<td>EM</td>
<td>STREAMS$$_MONITORING_JOB</td>
<td>EMSTREAMS$$_MONITORING_JOB</td>
</tr>
<tr>
<td>strm</td>
<td>STREAMS$$_MONITORING_JOB</td>
<td>strmSTREAMS$$_MONITORING_JOB</td>
</tr>
<tr>
<td>strm</td>
<td>mjob1</td>
<td>strmmjob1</td>
</tr>
</tbody>
</table>

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$$_MONITORING_JOB` and `STRMSTREAMS$$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.
STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```sql
UTL_SPADV.STOP_MONITORING(
    purge IN BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>purge</td>
<td>If TRUE, then the procedure purges information about the monitoring job from the result tables. If FALSE, then the procedure retains information about the monitoring job in the result tables.</td>
</tr>
</tbody>
</table>
With the UTL_TCP package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- **Using UTL_TCP**
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Rules and Limits
  - Examples
- **Summary of UTL_TCP Subprograms**
Using UTL_TCP

- Overview
- Security Model
- Types
- Exceptions
- Rules and Limits
- Examples
Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.
Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

**Note:** For more information about managing fine-grained access, see *Oracle Database Security Guide*
Types

- **CONNECTION Type**
- **CRLF**

**CONNECTION Type**

This is a PL/SQL record type used to represent a TCP/IP connection.

**Syntax**

```plsql
TYPE connection IS RECORD (  
    remote_host VARCHAR2(255),  
    remote_port PLS_INTEGER,  
    local_host VARCHAR2(255),  
    local_port PLS_INTEGER,  
    charset VARCHAR2(30),  
    newline VARCHAR2(2),  
    tx_timeout PLS_INTEGER,  
    private_sd PLS_INTEGER);
```

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>Name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>remote_port</td>
<td>Port number of the remote host connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_host</td>
<td>Name of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_port</td>
<td>Port number of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>charset</td>
<td>The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.</td>
</tr>
<tr>
<td>newline</td>
<td>Newline character sequence. This newline character sequence is appended to the text line sent by <strong>WRITE_LINE</strong> API.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The fields in a connection record are used to return information about the connection, which is often made using **OPEN_CONNECTION**. Changing the values of those fields has...
no effect on the connection. The fields private_XXXX are for implementation use only. You should not modify the values.

In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL_TCP package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

Syntax

CRLF CONSTANT VARCHAR2(2 CHAR);

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for WRITE_LINE, specified when a connection is opened. While such protocols use <CR><LF> to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.
Exceptions

The exceptions raised by the TCP/IP package are listed in Table 265–2.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER_TOO_SMALL</td>
<td>Buffer is too small for input that requires look-ahead</td>
</tr>
<tr>
<td>END_OF_INPUT</td>
<td>Raised when no more data is available to read from the connection</td>
</tr>
<tr>
<td>NETWORK_ERROR</td>
<td>Generic network error</td>
</tr>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument passed in an API call (for example, a negative buffer size)</td>
</tr>
<tr>
<td>TRANSFER_TIMEOUT</td>
<td>No data is read and a read time out occurred</td>
</tr>
<tr>
<td>PARTIAL_MULTIBYTE_CHAR</td>
<td>No complete character is read and a partial multibyte character is found at the end of the input</td>
</tr>
</tbody>
</table>
Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.
Using UTL_TCP

Examples
The following code example illustrates how the TCP/IP package can be used to
retrieve a Web page over HTTP. It connects to a Web server listening at port 80
(standard port for HTTP) and requests the root document.
DECLARE
c utl_tcp.connection; -- TCP/IP connection to the Web server
ret_val pls_integer;
BEGIN
c := utl_tcp.open_connection(remote_host => 'www.acme.com',
remote_port => 80,
charset
=> 'US7ASCII'); -- open connection
ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');
-- send HTTP request
ret_val := utl_tcp.write_line(c);
BEGIN
LOOP
dbms_output.put_line(utl_tcp.get_line(c, TRUE)); -- read result
END LOOP;
EXCEPTION
WHEN utl_tcp.end_of_input THEN
NULL; -- end of input
END;
utl_tcp.close_connection(c);
END;

The following code example illustrates how the TCP/IP package can be used by an
application to send e-mail (also known as email from PL/SQL). The application
connects to an SMTP server at port 25 and sends a simple text message.
PROCEDURE send_mail (sender
IN VARCHAR2,
recipient IN VARCHAR2,
message
IN VARCHAR2) IS
mailhost
VARCHAR2(30) := 'mailhost.mydomain.com';
smtp_error EXCEPTION;
mail_conn
utl_tcp.connection;
PROCEDURE smtp_command(command IN VARCHAR2,
ok
IN VARCHAR2 DEFAULT '250')
IS
response varchar2(3);
len pls_integer;
BEGIN

AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```
UTL_TCP.AVAILABLE (  
    c        IN OUT NOCOPY connection,  
    timeout  IN PLS_INTEGER DEFAULT 0)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to determine the amount of data that is available to be read</td>
</tr>
<tr>
<td>timeout</td>
<td>Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```
DECLARE  
    c   utl_tcp.connection  
    data VARCHAR2(256);  
    len  PLS_INTEGER;  
BEGIN  
    c := utl_tcp.open_connection(...);  
    LOOP  
        IF (utl_tcp.available(c) > 0) THEN  
            len := utl_tcp.read_text(c, data, 256);  
        ELSE  
            ---do some other things  
            ....  
        END IF  
    END LOOP;
```

END LOOP;
END;
CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

UTL_TCP.CLOSE_ALL_CONNECTIONS;

Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.
CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (  
  c IN OUT NOCOPY connection);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to close</td>
</tr>
</tbody>
</table>

Usage Notes

Connection must have been opened by a previous call to OPEN_CONNECTION. The fields remote_host, remote_port, local_host, local_port and charset of c are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
**FLUSH Procedure**

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

**Syntax**

```plsql
UTL_TCP.FLUSH (
    c IN OUT NOCOPY connection);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
</tbody>
</table>

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`. 
GET_LINE Function

This function returns the line of data read.

Syntax

```sql
UTL_TCP.GET_LINE (  
    c           IN OUT NOCOPY connection,  
    remove_crlf IN            BOOLEAN DEFAULT FALSE,  
    peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one or more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.
GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```sql
UTL_TCP.GET_LINE_NCHAR (  
c           IN OUT NOCOPY connection,  
remove_crlf IN            BOOLEAN DEFAULT FALSE,  
peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN NVARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one or more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.
GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (  
    c     IN OUT NOCOPY connection,  
    len   IN            PLS_INTEGER DEFAULT 1,  
    peek  IN            BOOLEAN     DEFAULT FALSE)  
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
GET_TEXT Function

This function returns the text data read.

Syntax

```plsql
UTL_TCP.GET_TEXT (    c IN OUT NOCOPY connection,
    len IN            PLS_INTEGER DEFAULT 1,
    peek IN           BOOLEAN     DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```sql
UTL_TCP.GET_TEXT_NCHAR (c IN OUT NOCOPY connection,
    len IN PLS_INTEGER DEFAULT 1,
    peek IN BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one or more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.
OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION  (  
    remote_host          IN VARCHAR2, 
    remote_port          IN PLS_INTEGER, 
    local_host           IN VARCHAR2 DEFAULT NULL, 
    local_port           IN PLS_INTEGER DEFAULT NULL, 
    in_buffer_size       IN PLS_INTEGER DEFAULT NULL, 
    out_buffer_size      IN PLS_INTEGER DEFAULT NULL, 
    charset              IN VARCHAR2 DEFAULT NULL, 
    newline              IN VARCHAR2 DEFAULT CRLF, 
    tx_timeout           IN PLS_INTEGER DEFAULT NULL, 
    wallet_path          IN  VARCHAR2 DEFAULT NULL, 
    wallet_password      IN  VARCHAR2 DEFAULT NULL, 
RETURN connection;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>Name of the host providing the service. When remote_host is NULL, it connects to the local host.</td>
</tr>
<tr>
<td>remote_port</td>
<td>Port number on which the service is listening for connections.</td>
</tr>
<tr>
<td>local_host</td>
<td>Name of the host providing the service. NULL means does not care.</td>
</tr>
<tr>
<td>local_port</td>
<td>Port number on which the service is listening for connections. NULL means don’t care.</td>
</tr>
<tr>
<td>in_buffer_size</td>
<td>The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.</td>
</tr>
<tr>
<td>out_buffer_size</td>
<td>The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.</td>
</tr>
<tr>
<td>charset</td>
<td>The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.</td>
</tr>
</tbody>
</table>
Table 265–12 (Cont.) OPEN_CONNECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>newline</td>
<td>Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>Directory path that contains the Oracle wallet for SSL/TLS. The format is file:directory-path</td>
</tr>
<tr>
<td>wallet_password</td>
<td>Password to open the wallet. When the wallet is auto-login enabled, the password may be set to NULL.</td>
</tr>
</tbody>
</table>

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

- In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields is not set in the connection record returned by the function.

- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

Examples

DECLARE
c UTL_TCP.CONNECTION;
BEGIN
c := UTL_TCP.OPEN_CONNECTION(
  host => 'www.example.com',
  port => 443,
  wallet_path => 'file:/oracle/wallets/smtp_wallet',
  wallet_password => '****');
UTL_TCP.SECURE_CONNECTION (c => c);
END;
READ_LINE Function

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (  
    c           IN OUT NOCOPY connection,  
    data        IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
    peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one or more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen
in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.
READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```sql
UTL_TCP.READ_RAW (
    c     IN OUT NOCOPY connection,
    data  IN OUT NOCOPY RAW,
    len   IN            PLS_INTEGER DEFAULT 1,
    peek  IN            BOOLEAN     DEFAULT FALSE
)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes of data to receive</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.
READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (   
    c    IN OUT NOCOPY connection,   
    data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,   
    len  IN            PLS_INTEGER DEFAULT 1,   
    peek IN            BOOLEAN     DEFAULT FALSE)   
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received</td>
</tr>
<tr>
<td>len</td>
<td>Number of characters of data to receive</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a VARCHAR2 buffer is specified in terms of bytes, while the parameter len refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the VARCHAR2 buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.
If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.
SECURE_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Function.

Syntax

```
UTL_TCP.SECURE_CONNECTION (  
    c    IN OUT NOCOPY connection);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
</tbody>
</table>
WRITE_LINE Function

This function transmits a text line to a service on an open connection. The \texttt{newline} character sequence is appended to the message before it is transmitted.

Syntax

\begin{verbatim}
UTL_TCP.WRITE_LINE ( 
  c    IN OUT NOCOPY connection, 
  data IN            VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS) 
RETURN PLS_INTEGER;
\end{verbatim}

Parameters

\textbf{Table 265–17 WRITE_LINE Function Parameters}

\begin{tabular}{ll}
\hline
Parameter & Description \\
\hline
c & TCP connection to which to send data \\
data & Buffer containing the data to be sent \\
\hline
\end{tabular}

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to \texttt{OPEN_CONNECTION}. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.
WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```plsql
UTL_TCP.WRITE_RAW (  
c    IN OUT NOCOPY connection,  
data IN            RAW,  
len  IN            PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes of data to transmit. When len is NULL, the whole length of data is written.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.
WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```sql
UTL_TCP.WRITE_TEXT (  
    c IN OUT NOCOPY connection,  
    data IN VARCHAR2 CHARACTER SET ANY_CS,  
    len IN PLS_INTEGER DEFAULT NULL)  
RETURN num_chars PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
<tr>
<td>len</td>
<td>The number of characters of data to transmit. When <code>len</code> is <code>NULL</code>, the whole length of data is written. The actual amount of data written may be less because of network condition.</td>
</tr>
</tbody>
</table>

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.
The UTL_URL package has two functions: ESCAPE and UNESCAPE.

  - Exceptions
  - Examples
- Summary of UTL_URL Subprograms
Using UTL_URL

■ Overview
■ Exceptions
■ Examples
Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle’s Web site is:

http://www.oracle.com

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (-), asterisk (*), accent ('), left parenthesis ( ), right parenthesis ( )

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), percentage sign (%), and comma (,)

The **UTL_URL** package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a Web page by way of the **UTL_HTTP** package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

http://www.w3.org/TR/html
Exceptions

Table 266–1 lists the exceptions that can be raised when the `UTL_URL` package API is invoked.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_URL</td>
<td>29262</td>
<td>The URL contains badly formed escape code sequences.</td>
</tr>
<tr>
<td>BAD_FIXED_WIDTH_CHARSET</td>
<td>29274</td>
<td>Fixed-width multibyte character set is not allowed as a URL character set.</td>
</tr>
</tbody>
</table>
Examples

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```sql
CREATE OR REPLACE FUNCTION form_url_encode (data IN VARCHAR2, charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the `form-URL-encode` scheme, the following function implements the decoding scheme:

```sql
CREATE OR REPLACE FUNCTION form_url_decode (data IN VARCHAR2, charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.unescape(
    replace(data, '+', ' '),
    charset);
END;
```
### Summary of UTL_URL Subprograms

**Table 266–2  UTL_URL Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ESCAPE Function on page 266-7</strong></td>
<td>Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format</td>
</tr>
<tr>
<td><strong>UNESCAPE Function on page 266-9</strong></td>
<td>Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters</td>
</tr>
</tbody>
</table>
ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

Syntax

```
UTL_URL.ESCAPE (
    url                   IN VARCHAR2 CHARACTER SET ANY_CS,
    escape_reserved_chars IN BOOLEAN  DEFAULT  FALSE,
    url_charset           IN VARCHAR2 DEFAULT  utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The original URL</td>
</tr>
<tr>
<td>escape_reserved_chars</td>
<td>Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.</td>
</tr>
<tr>
<td>url_charset</td>
<td>When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the UTL_HTTP package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ( ( ), right parenthesis ( )

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair $logon=scott/tiger into the query string of a URL, escape the $ and / separately as %24logon=scott%2Ftiger and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:
utl_url.escape('http://www.acme.com/a url with space.html')

Returns:

http://www.acme.com/a%20url%20with%20space.html

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with escape_reserved_chars set to TRUE) and then concatenate it with the rest of the URL. For example:

url := 'http://www.acme.com/search?check=' || utl_url.escape('Is the use of the "$" sign okay?', TRUE);

This expression escapes the question mark (?), dollar sign ($), and space characters in 'Is the use of the "$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using US7ASCII so that a space is escaped as %20 (hex code of a space in ASCII) instead of %40 (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.
UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the %XX escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
    url            IN VARCHAR2 CHARACTER SET ANY_CS,
    url_charset    IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL to unescape</td>
</tr>
<tr>
<td>url_charset</td>
<td>After a character is unescaped, the character is assumed to be in the source_charset character set and it will be converted from the source_charset to the database character set before the URL is returned. If source_charset is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the UTL_HTTP package, whose default value is &quot;ISO-8859-1&quot;. The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using US7ASCII so that %20 is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.
The `WPG_DOCLOAD` package provides an interface to download files, BLOBs and BFILES.

  \]
### Summary of WPG_DOCLOAD Subprograms

**Table 267–1  WPG_DOCLOAD Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNLOAD_FILE Procedures</td>
<td>Downloads files, BLOBS and BFILES</td>
</tr>
</tbody>
</table>

on page 267-5
DOWNLOAD_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that p_filename is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that p_blob is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that p_bfile is to be downloaded to the client's browser.

Syntax

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WPG_DOCLOAD.DOWNLOAD_FILE(p_filename IN VARCHAR2, p_bcaching IN BOOLEAN DEFAULT TRUE);</td>
<td>p_filename The file to download from the document table.</td>
<td></td>
</tr>
<tr>
<td>WPG_DOCLOAD.DOWNLOAD_FILE(p_blob IN OUT NOCOPY BLOB);</td>
<td>p_blob The BLOB to download.</td>
<td></td>
</tr>
<tr>
<td>WPG_DOCLOAD.DOWNLOAD_FILE(p_bfile IN OUT BFILE);</td>
<td>p_bfile The BFILE to download (see Usage Notes).</td>
<td></td>
</tr>
</tbody>
</table>

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the p_bcaching parameter should be set to FALSE to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.
- p_bfile and p_blob are declared as IN OUT because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.
An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- **Using ANYDATA TYPE**
  - Restrictions
  - Operational Notes
- **Summary of ANYDATA Subprograms**
Using ANYDATA TYPE

- Restrictions
- Operational Notes
Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILES is not currently supported.
Operational Notes

- Construction
- Access

**Construction**

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```sql
STATIC FUNCTION ConvertBDouble(db1 IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBFile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(f1 IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN 'collection_type') RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(invIn INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN '<object_type>') RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF '<object_type>') RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The BEGINCREATE Static Procedure call begins the construction process and ENDCREATE Member Procedure call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the PIECEWISE Member Procedure should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

**Access**

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of
these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB,
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
Summary of ANYDATA Subprograms

<table>
<thead>
<tr>
<th>Table 268–1 ANYDATA Type Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
</tr>
<tr>
<td>BEGINCREATE Static Procedure on page 268-7</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure on page 268-8</td>
</tr>
<tr>
<td>GET* Member Functions on page 268-9</td>
</tr>
<tr>
<td>GETTYPE Member Function on page 268-12</td>
</tr>
<tr>
<td>GETTYPENAME Member Function on page 268-13</td>
</tr>
<tr>
<td>PIECEWISE Member Procedure on page 268-14</td>
</tr>
<tr>
<td>SET* Member Procedures on page 268-15</td>
</tr>
</tbody>
</table>
BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
    dtype          IN OUT NOCOPY AnyType,
    adata          OUT NOCOPY ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtype</td>
<td>The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)</td>
</tr>
<tr>
<td>adata</td>
<td>ANYDATA being constructed.</td>
</tr>
</tbody>
</table>

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.
ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```plsql
MEMBER PROCEDURE EndCreate(
    self IN OUT NOCOPY ANYDATA);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
</tbody>
</table>
GET* Member Functions

These functions get the current data value (which should be of appropriate type).
The type of the current data value depends on the MODE with which we are accessing
(depending on whether we have invoked the PIECEWISE call).

If PIECEWISE has NOT been called, we are accessing the ANYDATA in its entirety and the
type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, we are accessing the ANYDATA piece-wise. The type of the
data value should match the type of the attribute (or collection element) at the current
position.

Syntax

MEMBER FUNCTION GetBDouble(
    self         IN ANYDATA,
    dbl          OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
    self         IN ANYDATA,
    b            OUT NOCOPY BFILE)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
    self         IN ANYDATA,
    fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
    self         IN ANYDATA,
    b            OUT NOCOPY BLOB)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetChar(
    self         IN ANYDATA,
    c            OUT NOCOPY CHAR)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetClob(
    self         IN ANYDATA,
    c            OUT NOCOPY CLOB)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetCollection(
    self         IN ANYDATA,
    col          OUT NOCOPY "<collection_type>"
RETURN       PLS_INTEGER;

    self         IN ANYDATA,
    dat          OUT NOCOPY DATE)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
    self         IN ANYDATA,
    inv          OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN       PLS_INTEGER;
MEMBER FUNCTION GetIntervalYM(
    self         IN ANYDATA,
    inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNchar(
    self         IN ANYDATA,
    nc           OUT NOCOPY NCHAR)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNClob(
    self         IN ANYDATA,
    nc           OUT NOCOPY NCLOB)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GetNumber(
    self         IN ANYDATA,
    num          OUT NOCOPY NUMBER)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
    self         IN ANYDATA,
    nc           OUT NOCOPY NVARCHAR2)
RETURN         PLS_INTEGER;

MEMBER FUNCTION GetObject(
    self         IN ANYDATA,
    obj          OUT NOCOPY '<object_type>')
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
    self         IN ANYDATA,
    r            OUT NOCOPY RAW)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRef(
    self         IN ANYDATA,
    rf           OUT NOCOPY REF '<object_type>')
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self         IN ANYDATA,
    c            OUT NOCOPY VARCHAR)
RETURN       PLS_INTEGER;
MEMBER FUNCTION GetVarchar2(
    self         IN ANYDATA,
    c            OUT NOCOPY VARCHAR2)
RETURN       PLS_INTEGER;

Parameters

Table 268–4   GET' Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number to be obtained.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE(
    self          IN ANYDATA,
    typ           OUT NOCOPY AnyType)
RETURN        PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>typ</td>
<td>The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.
GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.
If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.
If it is based on a user defined type, this function will return schema_name.type_name, for example, SCOTT.FOO.
If it is based on a transient anonymous type, this function will return NULL.

Syntax

MEMBER FUNCTION GETTYPENAME(
    self         IN ANYDATA)
RETURN       VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
</tbody>
</table>

Return Values

Type name of the ANYDATA.
PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

MEMBER PROCEDURE PIECEWISE(
  self      IN OUT NOCOPY ANYDATA);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The current data value.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.
SET* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

MEMBER PROCEDURE SETBDOUBLE(
    self IN OUT NOCOPY ANYDATA,
    dbl IN BINARY_DOUBLE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self IN OUT NOCOPY ANYDATA,
    b IN BFILE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETFLOAT(
    self IN OUT NOCOPY ANYDATA,
    fl IN BINARY_FLOAT,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self IN OUT NOCOPY ANYDATA,
    b IN BLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self IN OUT NOCOPY ANYDATA,
    c IN CHAR,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self IN OUT NOCOPY ANYDATA,
    c IN CLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self IN OUT NOCOPY ANYDATA,
    col IN "<collection_type>",
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self IN OUT NOCOPY ANYDATA,
    dat IN DATE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALSD(
    self IN OUT NOCOPY ANYDATA,
    inv IN INTERVAL DAY TO SECOND,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self IN OUT NOCOPY ANYDATA,
    inv IN INTERVAL YEAR TO MONTH,
    last_elem IN boolean DEFAULT FALSE);
MEMBER PROCEDURE SETNCHAR(
    self    IN OUT NOCOPY ANYDATA,
    nc      IN NCHAR,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self    IN OUT NOCOPY ANYDATA,
    nc      IN NClob,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self    IN OUT NOCOPY ANYDATA,
    num     IN NUMBER,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
    self    IN OUT NOCOPY ANYDATA,
    nc      IN NVarchar2,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self    IN OUT NOCOPY ANYDATA,
    obj     IN "<object_type>'",
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self    IN OUT NOCOPY ANYDATA,
    r       IN RAW,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self    IN OUT NOCOPY ANYDATA,
    rf      IN REF '<object_type>',
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self    IN OUT NOCOPY ANYDATA,
    ts      IN TIMESTAMP,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP2(
    self IN OUT NOCOPY ANYDATA,
    ts   IN TIMESTAMP WITH TIME ZONE,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
    self IN OUT NOCOPY ANYDATA,
    ts   IN TIMESTAMP WITH LOCAL TIME ZONE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR(
    self    IN OUT NOCOPY ANYDATA,
    c       IN VARCHAR,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self    IN OUT NOCOPY ANYDATA,
    c       IN VARCHAR2,
    last_elem IN boolean DEFAULT FALSE);
Parameters

Table 268–8  SET* Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be set.</td>
</tr>
<tr>
<td>last_elem</td>
<td>Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

Usage Notes

When BEGINCREATE is called, construction has already begun in a piece-wise fashion. Subsequent calls to SET* will set the successive attribute values.

If the ANYDATA is a standalone collection, the SET* call will set the successive collection elements.
An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- Construction
- Summary of ANYDATASET TYPE Subprograms
The *ANYDATASET* needs to be constructed value by value, sequentially.

For each data instance (of the type of the *ANYDATASET*), the *ADDINSTANCE* function must be invoked. This adds a new data instance to the *ANYDATASET*. Subsequently, *SET* can be called to set each value in its entirety.

The mode of construction/access can be changed to attribute/collection element wise by making calls to *PIECEWISE*.

- If the type of the *ANYDATASET* is *TYPECODE_OBJECT*, individual attributes will be set with subsequent *SET* calls. Likewise on access.

- If the type of the current data value is a collection type individual collection elements will be set with subsequent *SET* calls. Likewise on access. This call is very similar to *ANYDATA.PIECEWISE* call defined for the type *ANYDATA*.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

*ENDCREATE* should be called to finish the construction process (before which no access calls can be made).
## Summary of ANYDATASET TYPE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDINSTANCE Member Procedure on page 269-4</td>
<td>Adds a new data instance to an ANYDATASET.</td>
</tr>
<tr>
<td>BEGINCREATE Static Procedure on page 269-5</td>
<td>Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure on page 269-6</td>
<td>Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.</td>
</tr>
<tr>
<td>GET* Member Functions on page 269-7</td>
<td>Gets the current data value (which should be of appropriate type).</td>
</tr>
<tr>
<td>GETCOUNT Member Function on page 269-10</td>
<td>Gets the number of data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>GETINSTANCE Member Function on page 269-11</td>
<td>Gets the next instance in an ANYDATASET.</td>
</tr>
<tr>
<td>GETTYPE Member Function on page 269-12</td>

<td>Gets the AnyType describing the type of the data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>PIECEWISE Member Procedure on page 269-14</td>
<td>Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).</td>
</tr>
<tr>
<td>SET* Member Procedures on page 269-15</td>
<td>Sets the current data value.</td>
</tr>
</tbody>
</table>
ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```plaintext
MEMBER PROCEDURE AddInstance(
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.invalid_parameters: Invalid parameters.
- DBMS_TYPES.incorrect_usage: On incorrect usage.

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.
BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

STATIC PROCEDURE BeginCreate(  
typecode IN PLS_INTEGER,  
rtype IN OUT NOCOPY AnyType,  
aset OUT NOCOPY ANYDATASET);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>typecode</td>
<td>The typecode for the type of the ANYDATASET.</td>
</tr>
<tr>
<td>dtype</td>
<td>The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection types, and similar others.</td>
</tr>
<tr>
<td>aset</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)
ENDCREATE Member Procedure

This procedure ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

```plsql
MEMBER PROCEDURE ENDCREATE(
    self              IN OUT NOCOPY ANYDATASET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>
GET* Member Functions

These functions get the current data value (which should be of appropriate type).
The type of the current data value depends on the MODE with which you are accessing it (depending on how we have invoked the PIECEWISE call). If PIECEWISE has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

MEMBER FUNCTION GETBDOUBLE(
    self        IN ANYDATASET,
    dbl         OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
    self        IN ANYDATASET,
    fl          OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
    self        IN ANYDATASET,
    b           OUT NOCOPY BFILE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
    self        IN ANYDATASET,
    b           OUT NOCOPY BLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
    self        IN ANYDATASET,
    c           OUT NOCOPY CHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
    self        IN ANYDATASET,
    c           OUT NOCOPY CLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
    self        IN ANYDATASET,
    col         OUT NOCOPY "<collection_type>"
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETDATE(
    self        IN ANYDATASET,
    dat         OUT NOCOPY DATE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
    self        IN ANYDATASET,
    inv         IN OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN      PLS_INTEGER;
MEMBER FUNCTION GETINTERVALYM(
    self IN ANYDATASET,
    inv IN OUT NOCOPY INTERVAL YEAR TO MONTH
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
    self IN ANYDATASET,
    nc OUT NOCOPY NCHAR
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
    self IN ANYDATASET,
    nc OUT NOCOPY NCLOB
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
    self IN ANYDATASET,
    num OUT NOCOPY NUMBER
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
    self IN ANYDATASET,
    nc OUT NOCOPY NVARCHAR2
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
    self IN ANYDATASET,
    obj OUT NOCOPY "<object_type>"
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETRAW(
    self IN ANYDATASET,
    r OUT NOCOPY RAW
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETREF(
    self IN ANYDATASET,
    rf OUT NOCOPY REF "<object_type>"
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
    self IN ANYDATASET,
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP/TZ(
    self IN ANYDATASET,
    ts OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP/TZ(
    self IN ANYDATASET,
    ts OUT NOCOPY TIMESTAMP WITH TIME ZONE
) RETURN PLS_INTEGER;

MEMBER FUNCTION GETUROWID(
    self IN ANYDATASET,
    rid OUT NOCOPY UROWID
) RETURN PLS_INTEGER
MEMBER FUNCTION GETVARCHAR(
    self        IN ANYDATASET,
    c           OUT NOCOPY VARCHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
    self        IN ANYDATASET,
    c           OUT NOCOPY VARCHAR2)
RETURN      PLS_INTEGER;

Parameters

Table 269–5  GET* Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information., that is to be obtained.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.
GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GetCount(
    self     IN ANYDATASET)
RETURN      PLS_INTEGER;

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

Return Values

The number of data instances.
**GETINSTANCE Member Function**

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

**Syntax**

```plsql
MEMBER FUNCTION GETINSTANCE(
    self           IN OUT NOCOPY ANYDATASET)
RETURN         PLS_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

**Return Values**

- DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

**Usage Notes**

This function should be called even before accessing the first instance.
GETTYPE Member Function

GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GETTYPE(
    self           IN ANYDATASET,
    typ            OUT NOCOPY AnyType)
RETURN         PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET.</td>
</tr>
<tr>
<td>typ</td>
<td>The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.
**GETTYPENAME Member Function**

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return schema_name.type_name. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

**Syntax**

```
MEMBER FUNCTION GETTYPENAME(
   self           IN ANYDATASET)
RETURN         VARCHAR2;
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

**Return Values**

Type name of the ANYDATASET.
PIECEWISE Member Procedure

This procedure sets the *MODE* of construction, access of the data value to be an attribute at a time (if the data value is of *TYPECODE_OBJECT*).

It sets the *MODE* of construction, access of the data value to be a collection element at a time (if the data value is of a collection *TYPE*). Once this call has been made, subsequent *SET* and *GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
    self         IN OUT NOCOPY ANYDATASET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

- **DBMS_TYPES.INVALID_PARAMETERS**: Invalid parameters.
- **DBMS_TYPES.INCORRECT_USAGE**: On incorrect usage.

Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.
SET\* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the MODE with which we are constructing (depending on how we have invoked the PIECEWISE call). The type of the current data should be the type of the ANYDATASET if PIECEWISE has NOT been called. The type should be the type of the attribute at the current position if PIECEWISE has been called.

Syntax

MEMBER PROCEDURE SETBDOUBLE(
    self              IN OUT NOCOPY ANYDATASET,
    dbl               IN BINARY_DOUBLE,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self              IN OUT NOCOPY ANYDATASET,
    fl                IN BINARY_FLOAT,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BFILE,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BLOB,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN CHAR,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN CLOB,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self              IN OUT NOCOPY ANYDATASET,
    col               IN "<collection_type>",
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self              IN OUT NOCOPY ANYDATASET,
    dat               IN DATE,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self              IN OUT NOCOPY ANYDATASET,
    inv               IN INTERVAL DAY TO SECOND,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self              IN OUT NOCOPY ANYDATASET,
MEMBER PROCEDURE SETINCHARGE(
    self IN OUT NOCOPY ANYDATASET,
    nc IN NCHAR,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self IN OUT NOCOPY ANYDATASET,
    nc IN NClob,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self IN OUT NOCOPY ANYDATASET,
    num IN NUMBER,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
    self IN OUT NOCOPY ANYDATASET,
    nc IN NVarchar2,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self IN OUT NOCOPY ANYDATASET,
    obj IN '<object_type>',
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self IN OUT NOCOPY ANYDATASET,
    r IN RAW,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self IN OUT NOCOPY ANYDATASET,
    rf IN REF '<object_type>'s,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self IN OUT NOCOPY ANYDATASET,
    ts IN TIMESTAMP,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
    self IN OUT NOCOPY ANYDATASET,
    ts IN TIMESTAMP WITH TIME ZONE,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
    self IN OUT NOCOPY ANYDATASET,
    rid IN UROWID,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR(
    self IN OUT NOCOPY ANYDATASET,
c                 IN VARCHAR,
last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN VARCHAR2,
    last_elem BOOLEAN DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be set.</td>
</tr>
<tr>
<td>last_elem</td>
<td>Relevant only if PIECEWISE has been already called (for a collection). Set to TRUE if it is the last element of the collection, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Exceptions

- **DBMS_TYPES.INVALID_PARAMETERS**: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- **DBMS_TYPES.INCORRECT_USAGE**: Incorrect usage.
- **DBMS_TYPES.TYPE_MISMATCH**: When the expected type is different from the passed in type.
An ANYTYPE TYPE can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the CREATE TYPE statement. Only new transient types can be constructed using the ANYTYPE interfaces.

This chapter discusses the following:

- Summary of ANYTYPE Subprograms
### Summary of ANYTYPE Subprograms

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>
BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE(
    typecode       IN          PLS_INTEGER,
    atype          OUT NOCOPY  ANYTYPE);
```

Parameters

</table>
SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```plsql
MEMBER PROCEDURE SETINFO(
    self          IN OUT NOCOPY ANYTYPE,
    prec          IN PLS_INTEGER,
    scale         IN PLS_INTEGER,
    len           IN PLS_INTEGER,
    csid          IN PLS_INTEGER,
    csfrm         IN PLS_INTEGER,
    atype         IN ANYTYPE DEFAULT NULL,
    elem_tc       IN PLS_INTEGER DEFAULT NULL,
    elem_count    IN PLS_INTEGER DEFAULT 0);
```

Parameters

**Table 270–3  SETINFO Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>atype</td>
<td>Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.</td>
</tr>
</tbody>
</table>

The Following Parameters Are Required For Collection Types

**Table 270–4  SETINFO Procedure Parameters - Collection Types**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem_tc</td>
<td>Must be of the collection element’s typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>elem_count</td>
<td>Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY.</td>
</tr>
</tbody>
</table>
Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.
ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

MEMBER PROCEDURE ADDATTR(
    self          IN OUT NOCOPY ANYTYPE,
    aname         IN VARCHAR2,
    typecode      IN PLS_INTEGER,
    prec          IN PLS_INTEGER,
    scale         IN PLS_INTEGER,
    len           IN PLS_INTEGER,
    csid          IN PLS_INTEGER,
    csfrm         IN PLS_INTEGER,
    attr_type     IN ANYTYPE DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.</td>
</tr>
<tr>
<td>aname</td>
<td>Optional. Attribute's name. Could be NULL.</td>
</tr>
<tr>
<td>typecode</td>
<td>Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.</td>
</tr>
<tr>
<td>csid</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>attr_type</td>
<td>Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)
**ENDCREATE Member Procedure**

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

**Syntax**

```plaintext
MEMBER PROCEDURE ENDCREATE(
    self           IN OUT NOCOPY ANYTYPE);
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
</tbody>
</table>
GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

```
STATIC FUNCTION GETPERSISTENT(
    schema_name      IN VARCHAR2,
    type_name        IN VARCHAR2,
    version          IN VARCHAR2 DEFAULT NULL)
RETURN           ANYTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name of the type.</td>
</tr>
<tr>
<td>type_name</td>
<td>Type name.</td>
</tr>
<tr>
<td>version</td>
<td>Type version.</td>
</tr>
</tbody>
</table>

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.
GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

MEMBER FUNCTION GETINFO (  
  self        IN ANYTYPE,  
  prec        OUT PLS_INTEGER,  
  scale       OUT PLS_INTEGER,  
  len         OUT PLS_INTEGER,  
  csid        OUT PLS_INTEGER,  
  csfrm       OUT PLS_INTEGER,  
  schema_name OUT VARCHAR2,  
  type_name   OUT VARCHAR2,  
  version     OUT varchar2,  
  numelems    OUT PLS_INTEGER)  
RETURN      PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
<tr>
<td>prec</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csid</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Type's schema (if persistent).</td>
</tr>
<tr>
<td>type_name</td>
<td>Type's typename.</td>
</tr>
<tr>
<td>version</td>
<td>Type's version.</td>
</tr>
<tr>
<td>numelems</td>
<td>If self is a TYPECODE_VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.</td>
</tr>
</tbody>
</table>

Return Values

The typecode of self.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).
GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection’s element type if the self parameter is of a collection type.

Syntax

```plsql
MEMBER FUNCTION GETATTRELEMINFO ( 
    self           IN ANYTYPE,
    pos            IN PLS_INTEGER,
    prec           OUT PLS_INTEGER,
    scale          OUT PLS_INTEGER,
    len            OUT PLS_INTEGER,
    csid           OUT PLS_INTEGER,
    csfrm          OUT PLS_INTEGER,
    attr_elt_type  OUT ANYTYPE,
    aname          OUT VARCHAR2) 
RETURN         PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
<tr>
<td>pos</td>
<td>If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.</td>
</tr>
<tr>
<td>prec</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid, csfrm</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.</td>
</tr>
<tr>
<td>attr_elt_type</td>
<td>If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the attr_elt_type.</td>
</tr>
<tr>
<td>aname</td>
<td>Attribute name (if it is an attribute of an object type, NULL otherwise).</td>
</tr>
</tbody>
</table>

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).
This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, DBMS_AQ, and DBMS_AQADM.

See Also: Oracle Database Advanced Queuing User’s Guide for information about using Oracle Database Advanced Queuing.

This chapter contains the following topics:

- Using Oracle Database Advanced Queuing Types
- Summary of Types
Using Oracle Database Advanced Queuing Types

This section contains the following topic:

- Security Model
Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.
Summary of Types

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$_DESCRIPTOR Type
- AQ$_NTFN_DESCRIPTOR Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
- DEQUEUE_OPTIONS_T Type
- ENQUEUE_OPTIONS_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type
**AQ$_AGENT Type**

This type identifies a producer or a consumer of a message.

**Syntax**

```sql
TYPE SYS.AQ$_AGENT IS OBJECT ( 
    name       VARCHAR2(30),
    address    VARCHAR2(1024),
    protocol   NUMBER  DEFAULT 0);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of a producer or consumer of a message. The name must follow object name guidelines in the Oracle Database SQL Language Reference with regard to reserved characters.</td>
</tr>
<tr>
<td>address</td>
<td>Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.]queue[@dblink]</code>. For example, a queue named <code>emp_messages</code> in the <code>HR</code> queue at the site <code>dbs1.net</code> has the address: <code>hr.emp_messages@dbs1.net</code></td>
</tr>
<tr>
<td>protocol</td>
<td>Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.</td>
</tr>
</tbody>
</table>
**AQ$AGENT_LIST_T Type**

This type identifies the list of agents for which DBMS_AQ.LISTEN listens.

**See Also:** "AQ$AGENT Type" on page 271-5

**Syntax**

```sql
TYPE SYS.AQ$AGENT_LIST_T IS TABLE OF SYS.AQ$AGENT
INDEX BY BINARY INTEGER;
```
**AQ$ _DESCRIPTOR Type**

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

See Also: "MESSAGE_PROPERTIES_T Type" on page 271-26

**Syntax**

```plaintext
TYPE SYS.AQ$ _DESCRIPTOR IS OBJECT {
  queue_name   VARCHAR2(61),
  consumer_name VARCHAR2(30),
  msg_id       RAW(16),
  msg_prop     MSG_PROP_T,
  gen_desc     AQ$ _NTFN_DESCRIPTOR,
  msgid_array  SYS.AQ$ _NTFN_MSGID_ARRAY,
  ntfnsRecdInGrp NUMBER);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue in which the message was enqueued which resulted in the notification</td>
</tr>
<tr>
<td>consumer_name</td>
<td>Name of the consumer for the multiconsumer queue</td>
</tr>
<tr>
<td>msg_id</td>
<td>Identification number of the message</td>
</tr>
<tr>
<td>msg_prop</td>
<td>Message properties specified by the MSG_PROP_T type</td>
</tr>
<tr>
<td>gen_desc</td>
<td>Indicates the timeout specifications</td>
</tr>
<tr>
<td>msgid_array</td>
<td>Group notification message ID list</td>
</tr>
<tr>
<td>ntfnsRecdInGrp</td>
<td>Notifications received in group</td>
</tr>
</tbody>
</table>
**AQ$_NTFN_DESCRIPTOR Type**

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

**Syntax**

```sql
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT( ntfn_flags NUMBER)
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntfn_flags</td>
<td>Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.</td>
</tr>
</tbody>
</table>
**AQ$_NTFN_MSGID_ARRAY Type**

This type is for storing grouping notification data for AQ namespace, value $2^{30}$ which is the max varray size.

**Syntax**

```sql
TYPE SYS.AQ$_NTFN_MSGID_ARRAY AS VARRAY(1073741824)OF RAW(16);
```
AQ$_POST_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

Syntax

```sql
TYPE SYS.AQ$_POST_INFO IS OBJECT {
    name       VARCHAR2(128),
    namespace  NUMBER,
    payload    RAW(2000)  DEFAULT NULL;
}
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the anonymous subscription to which you want to post</td>
</tr>
<tr>
<td>namespace</td>
<td>To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS</td>
</tr>
<tr>
<td>payload</td>
<td>The payload to be posted to the anonymous subscription</td>
</tr>
</tbody>
</table>
**AQ$_POST_INFO_LIST Type**

Identifies the list of anonymous subscriptions to which you want to post messages.

**See Also:** [AQ$_POST_INFO Type](#) on page 271-10

**Syntax**

```sql
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```
**AQ$PURGE_OPTIONS_T Type**

This type specifies the options available for purging a queue table.

*See Also:* [PURGE_QUEUE_TABLE Procedure on page 25-48.](#)

**Syntax**

```plaintext
TYPE AQ$PURGE_OPTIONS_T is RECORD(
    block           BOOLEAN       DEFAULT FALSE
    delivery_mode   PLS_INTEGER   DEFAULT PERSISTENT);
```

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>block</td>
<td>TRUE/FALSE.</td>
</tr>
<tr>
<td></td>
<td>⚫ If <code>block</code> is TRUE, then an exclusive lock on all the queues in</td>
</tr>
<tr>
<td></td>
<td>the queue table is held while purging the queue table. This</td>
</tr>
<tr>
<td></td>
<td>will cause concurrent enqueuers and dequeuers to block</td>
</tr>
<tr>
<td></td>
<td>while the queue table is purged. The purge call always</td>
</tr>
<tr>
<td></td>
<td>succeeds if <code>block</code> is TRUE.</td>
</tr>
<tr>
<td></td>
<td>⚫ The default for <code>block</code> is FALSE. This will not block</td>
</tr>
<tr>
<td></td>
<td>enqueuers and dequeuers, but it can cause the purge to fail</td>
</tr>
<tr>
<td></td>
<td>with an error during high concurrency times.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>Kind of messages to purge, either DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT</td>
</tr>
</tbody>
</table>

---

271-12  Oracle Database PL/SQL Packages and Types Reference
AQ$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

See Also: "AQ$_AGENT Type" on page 271-5

Syntax

```sql
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```
AQ$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```sql
TYPE SYS.AQ$_REG_INFO IS OBJECT (
  name                              VARCHAR2(128),
  namespace                         NUMBER,
  callback                          VARCHAR2(4000),
  context                           RAW(2000)  DEFAULT NULL,
  qosflags                          NUMBER,
  timeout                           NUMBER,
  ntfn_grouping_class               NUMBER,
  ntfn_grouping_value               NUMBER    DEFAULT 600,
  ntfn_grouping_type                NUMBER,
  ntfn_grouping_start_time          TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count   NUMBER);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the name of the subscription. The subscription name is of the form schema.queue if the registration is for a single consumer queue or schema.queue:consumer_name if the registration is for a multiconsumer queues.</td>
</tr>
<tr>
<td>namespace</td>
<td>Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be DBMS_AQ.NAMESPACE_AQ. To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS.</td>
</tr>
<tr>
<td>callback</td>
<td>Specifies the action to be performed on message notification. For HTTP notifications, use <a href="http://www.company.com:8080">http://www.company.com:8080</a>. For e-mail notifications, use mailto://xyz@company.com. For raw message payload for the PLSQLCALLBACK procedure, use plsql://schema.procedure?PR=0. For user-defined type message payload converted to XML for the PLSQLCALLBACK procedure, use plsql://schema.procedure?PR=1.</td>
</tr>
<tr>
<td>context</td>
<td>Specifies the context that is to be passed to the callback function.</td>
</tr>
<tr>
<td>qosflags</td>
<td>Can be set to one or more of the following values to specify the notification quality of service:</td>
</tr>
<tr>
<td></td>
<td>- NTFN_QOS_RELIABLE - This value specifies that reliable notification is required. Reliable notifications persist across instance and database restarts.</td>
</tr>
<tr>
<td></td>
<td>- NTFN_QOS_PAYLOAD - This value specifies that payload delivery is required. It is supported only for client notification and only for RAW queues.</td>
</tr>
<tr>
<td></td>
<td>- NTFN_QOS_PURGE_ON_NTFN - This value specifies that the registration is to be purged automatically when the first notification is delivered to this registration location.</td>
</tr>
</tbody>
</table>
You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

Table 271–7 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 271–8 shows the actions performed when XML presentation is specified.
<table>
<thead>
<tr>
<th>Queue Payload Type</th>
<th>OCI Callback</th>
<th>E-mail</th>
<th>PL/SQL Callback</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>OCI callback receives the XML data in the payload.</td>
<td>XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.</td>
<td>PL/SQL callback receives the XML data in the payload.</td>
</tr>
<tr>
<td>Oracle object type</td>
<td>OCI callback receives the XML data in the payload.</td>
<td>XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.</td>
<td>PL/SQL callback receives the XML data in the payload.</td>
</tr>
</tbody>
</table>
**AQ$_REG_INFO_LIST Type**

Identifies the list of registrations to a queue.

**See Also:**  "AQ$_REG_INFO Type" on page 271-14

**Syntax**

```sql
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```
AQ$_SUBSCRIBER_LIST_T Type

Identifies the list of subscribers that subscribe to a queue.

See Also: "AQ$_AGENT Type" on page 271-5

Syntax

```sql
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```
DEQUEUE_OPTIONS_T Type

Specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
  consumer_name     VARCHAR2(30)    DEFAULT NULL,
  dequeue_mode      BINARY_INTEGER  DEFAULT REMOVE,
  navigation        BINARY_INTEGER  DEFAULT NEXT_MESSAGE,
  visibility        BINARY_INTEGER  DEFAULT ON_COMMIT,
  wait              BINARY_INTEGER  DEFAULT FOREVER,
  msgid             RAW(16)         DEFAULT NULL,
  correlation       VARCHAR2(128)   DEFAULT NULL,
  deq_condition     VARCHAR2(4000)  DEFAULT NULL,
  signature         aq$_sig_prop    DEFAULT NULL,
  transformation    VARCHAR2(61)    DEFAULT NULL,
  delivery_mode     PLS_INTEGER     DEFAULT PERSISTENT);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_name</td>
<td>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call.</td>
</tr>
<tr>
<td>dequeue_mode</td>
<td>Specifies the locking behavior associated with the dequeue. Possible settings are: \n  - BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. \n  - LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. \n  - REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. \n  - REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</td>
</tr>
</tbody>
</table>

Table 271–9  DEQUEUE_OPTIONS_T Attributes
DEQUEUE_OPTIONS_T Type

Table 271–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>navigation</td>
<td>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are: NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue. FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups. NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</td>
</tr>
<tr>
<td>visibility</td>
<td>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are: ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default. IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</td>
</tr>
<tr>
<td>wait</td>
<td>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are: FOREVER: Wait forever. This setting is the default. NO_WAIT: Do not wait. number: Wait time in seconds.</td>
</tr>
<tr>
<td>msgid</td>
<td>Specifies the message identifier of the message to be dequeued.</td>
</tr>
<tr>
<td>correlation</td>
<td>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</td>
</tr>
</tbody>
</table>
Oracle Database Advanced Queuing (AQ) Types

### deq_condition
A conditional expression based on the message properties, the message data properties, and PL/SQL functions.

A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the `WHERE` clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload. The `deq_condition` parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.

Currently not implemented

### transformation
Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.

### delivery_mode
The dequeeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be `BUFFERED` or `PERSISTENT` or `PERSISTENT_OR_BUFFERED`. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

---

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deq_condition</td>
<td>A conditional expression based on the message properties, the message data properties, and PL/SQL functions. A <code>deq_condition</code> is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the <code>WHERE</code> clause of a SQL query). Message properties include <code>priority</code>, <code>corrid</code> and other columns in the queue table. To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The <code>deq_condition</code> parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</td>
</tr>

</tr>
</tbody>
</table>
ENQUEUE_OPTIONS_T Type

Specifies the options available for the enqueue operation.

Syntax

```plsql
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
    visibility            BINARY_INTEGER  DEFAULT ON_COMMIT,
    relative_msgid        RAW(16)         DEFAULT NULL,
    sequence_deviation    BINARY_INTEGER  DEFAULT NULL,
    transformation        VARCHAR2(61)    DEFAULT NULL,
    delivery_mode         PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visibility</td>
<td>Specifies the transactional behavior of the enqueue request. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td>IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueuing to a non-persistent queue.</td>
</tr>
<tr>
<td>relative_msgid</td>
<td>Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.</td>
</tr>
<tr>
<td>sequence_deviation</td>
<td>Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>BEFORE: The message is enqueued ahead of the message specified by relative_msgid.</td>
</tr>
<tr>
<td></td>
<td>TOP: The message is enqueued ahead of any other messages.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied before enqueuing the message. The return type of the transformation function must match the type of the queue.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of 1.</td>
</tr>
</tbody>
</table>
SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in $aq$.descriptor, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```sql
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
  priority NUMBER,
  delay NUMBER,
  expiration NUMBER,
  correlation VARCHAR2(128),
  attempts NUMBER,
  exception_queue VARCHAR2(51),
  enqueue_time DATE,
  state NUMBER,
  sender_id aq$.agent,
  original_msgid RAW(16),
  delivery_mode NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.</td>
</tr>
<tr>
<td>delay</td>
<td>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow:</td>
</tr>
<tr>
<td></td>
<td>NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message</td>
</tr>
<tr>
<td>expiration</td>
<td>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow:</td>
</tr>
<tr>
<td></td>
<td>NEVER: The message does not expire number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.</td>
</tr>
<tr>
<td>correlation</td>
<td>Returns the identifier supplied by the producer of the message at enqueue time.</td>
</tr>
</tbody>
</table>
attempts

Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

exception_queue

Specifies the name of the queue into which the message is moved if it cannot be processed successfully.

Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:

- \texttt{RETRY\_COUNT}, the number of unsuccessful dequeue attempts, has exceeded the specification for the \texttt{MAX\_RETRIES} parameter in the \texttt{DBMS\_AQADM\_CREATE\_QUEUE} procedure during queue creation.

For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the \texttt{MAX\_RETRIES} parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than \texttt{MAX\_RETRIES}. You can view \texttt{MAX\_RETRIES} for a queue in the \texttt{ALL\_QUEUES} data dictionary view.

If a dequeue transaction fails because the server process dies (including \texttt{ALTER\_SYSTEM\_KILL\_SESSION}) or \texttt{SHUTDOWN\_ABORT} on the instance, then \texttt{RETRY\_COUNT} is not incremented.

- A message was not dequeued before the expiration time elapsed.

- Message propagation to the specified destination queue failed with one of the following errors:
  - \*: There were no recipients for the multiconsumer destination queue.
  - \*: Recipients were specified for a single-consumer destination queue.
  - \*: Destination queue was an exception queue
  - \*: There was an error when applying transformation.

The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a \texttt{NULL} value at dequeue time.

tenque_time

Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.

state

Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:

- \texttt{DBMS\_AQ\_READY}: The message is ready to be processed.
- \texttt{DBMS\_AQ\_WAITING}: The message delay has not yet been reached.
- \texttt{DBMS\_AQ\_PROCESSED}: The message has been processed and is retained.
- \texttt{DBMSAQ\_EXPIRED}: The message has been moved to the exception queue.

</tbody>
</table>
MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

See Also: AQ$_RECIPIENT_LIST_T Type on page 271-13

Syntax

```plaintext
TYPE message_properties_t IS RECORD (
    priority               BINARY_INTEGER  NOT NULL DEFAULT 1,
    delay                  BINARY_INTEGER  NOT NULL DEFAULT NO_DELAY,
    expiration             BINARY_INTEGER  NOT NULL DEFAULT NEVER,
    correlation            VARCHAR2(128)   DEFAULT NULL,
    attempts               BINARY_INTEGER,
    recipient_list         AQ$_RECIPIENT_LIST_T,
    exception_queue        VARCHAR2(61)    DEFAULT NULL,
    enqueue_time           DATE,
    state                  BINARY_INTEGER,
    sender_id              SYS.AQ$_AGENT   DEFAULT NULL,
    original_msgid         RAW(16)         DEFAULT NULL,
    signature              aq$_sig_prop    DEFAULT NULL,
    transaction_group      VARCHAR2(30)    DEFAULT NULL,
    user_property          SYS.ANYDATA     DEFAULT NULL,
    delivery_mode          PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.</td>
</tr>
<tr>
<td>delay</td>
<td>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message</td>
</tr>
</tbody>
</table>
Expiration
Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However, the queue monitor is started automatically by the system if needed.

The possible settings follow:
- NEVER: The message does not expire
- number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.

correlation
Returns the identifier supplied by the producer of the message at enqueue time.

attempts
Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

recipient_list
This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time.

For type definition, see the "AQ$AGENT Type" on page 271-5.
exception_queue

Specifies the name of the queue into which the message is moved if it cannot be processed successfully.

Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:

- **RETRY_COUNT**, the number of unsuccessful dequeue attempts, has exceeded the specification for the **MAX_RETRIES** parameter in the **DBMS_AQADM.CREATE_QUEUE** procedure during queue creation.

For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the **MAX_RETRIES** parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than **MAX_RETRIES**. You can view **MAX_RETRIES** for a queue in the **ALL_QUEUES** data dictionary view.

If a dequeue transaction fails because the server process dies (including **ALTER SYSTEM KILL SESSION**) or **SHUTDOWN ABORT** on the instance, then **RETRY_COUNT** is not incremented.

- A message was not dequeued before the expiration time elapsed.

- Message propagation to the specified destination queue failed with one of the following errors:
  - There were no recipients for the multiconsumer destination queue.
  - Recipients were specified for a single-consumer destination queue.
  - Destination queue was an exception queue
  - There was an error when applying transformation.

The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a **NULL** value at dequeue time.

enqueue_time

Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.

state

Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:

- **DBMS_AQ.READY**: The message is ready to be processed.
- **DBMS_AQ.WAITING**: The message delay has not yet been reached.
- **DBMS_AQ.PROCESSED**: The message has been processed and is retained.
- **DBMS_AQ.EXPIRED**: The message has been moved to the exception queue.

</tr>
<tr>
<td>transaction_group</td>
<td>Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.</td>
</tr>
<tr>
<td>user_property</td>
<td>This optional attribute is used to store additional information about the payload.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The message publisher specifies the delivery mode in the message properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.</td>
</tr>
</tbody>
</table>
MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties. Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T VARRAY`.

See Also:  "MESSAGE_PROPERTIES_T Type" on page 271-26

Syntax

```plsql
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
  OF MESSAGE_PROPERTIES_T;
```
MSGID.ARRAY.T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```
This chapter describes public types defined to support the DBMS_DBFS_CONTENT interface.

This chapter contains the following topics:

- **Using Content Types**
  - Overview
  - Security Model
- **Data Structures**
Using Content Types

- Overview
- Security Model
Overview

The type definitions described in this chapter support the DBMS_DBFS_CONTENT interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.
The user can access the content operational and administrative interfaces (packages, types, tables, and so on) by way of the `DBFS_ROLE`. This role can be granted to users as needed.
Data Structures

Types that support the DBMS_DBFS_CONTENT interface include both Object and Table types.

Object Types
- DBMS_DBFS_CONTENT_CONTEXT_T Object Type
- DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type
- DBMS_DBFS_CONTENT_PROPERTY_T Object Type

Table Types
- DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type
- DBMS_DBFS_CONTENT_PROPERTIES_T Table Type
- DBMS_DBFS_CONTENT_RAW_T Table Type
DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing asof queries, and whether or not the item(s) are read_only. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

```sql
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
    AUTHID DEFINER
AS OBJECT (
    principal     VARCHAR2(32),
    acl           VARCHAR2(1024),
    owner         VARCHAR2(32),
    asof          TIMESTAMP,
    read_only     INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>File system user</td>
</tr>
<tr>
<td>acl</td>
<td>Access control list</td>
</tr>
<tr>
<td>owner</td>
<td>Path item owner</td>
</tr>
<tr>
<td>asof</td>
<td>Timestamp</td>
</tr>
<tr>
<td>read_only</td>
<td>Nonzero if the path item is read-only</td>
</tr>
</tbody>
</table>
DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
AUTHID DEFINER
AS OBJECT (
    path          VARCHAR2(1024),
    item_name     VARCHAR2(256),
    item_type     INTEGER);

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to the path item</td>
</tr>
<tr>
<td>item_name</td>
<td>Name of the path item</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of path item. (See DBMS_DBFS_CONTENT Constants - Path Name Types)</td>
</tr>
</tbody>
</table>
DBMS_DBFS_CONTENTPROPERTY_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
  AUTHID DEFINER
AS OBJECT (
  propname VARCHAR2(32),
  propvalue VARCHAR2(1024),
  typecode INTEGER);

Fields

Table 272–3  DBMS_DBFS_CONTENTPROPERTY_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prop_name</td>
<td>Name of property</td>
</tr>
<tr>
<td>prop_value</td>
<td>Value of property</td>
</tr>
<tr>
<td>typecode</td>
<td>Property type (See Constants in DBMS_TYPES)</td>
</tr>
</tbody>
</table>
DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS TABLE OF dbms_dbfs_content_list_item_t;
DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

This type is a variable-sized array of property tuples of DBMS_DBFS_CONTENT_PROPERTY_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS TABLE OF dbms_dbfs_content_property_t;
DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of RAW. It is to enable RAW data transport for batch interfaces in the DBMS_DBFS_CONTENT interface.

Syntax

CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS TABLE OF RAW(32767);
Oracle supports the UriType family of types that can be used to store and query Uri-refs inside the database. The UriType itself is an abstract object type and the HTTPURITYPE, XDBURITYPE and DBURITYPE are subtypes of it.

You can create a UriType column and store instances of the DBURITYPE, XDBURITYPE or the HTTPURITYPE inside of it. You can also define your own subtypes of the UriType to handle different URL protocols.

Oracle also provides a UriFactory package that can be used as a factory method to automatically generate various instances of these UriTypes by scanning the prefix, such as http:// or /oradb. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix gopher:// to be handled by your subtype. The UriFactory will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- Summary of URITYPE Supertype Subprograms
- Summary of HTTPURITYPE Subtype Subprograms
- Summary of DBURITYPE Subtype Subprograms
- Summary of XDBURITYPE Subtype Subprograms
- Summary of URIFACTORY Package Subprograms

See Also:
- Oracle XML DB Developer’s Guide
The UriType is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETBLOB on page 273-3</td>
<td>Returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCLOB on page 273-4</td>
<td>Returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 273-5</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 273-6</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETURL on page 273-7</td>
<td>Returns the URL, in non-escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETXML on page 273-8</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>
GETBLOB

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getBlob() RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
GETCLOB

This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| MEMBER FUNCTION getClob() 
RETURN clob; | This function returns the CLOB located at the address specified by the URL. |
| MEMBER FUNCTION getClob(content OUT VARCHAR2) 
RETURN clob; | This function returns the CLOB located at the address specified by the URL and the content type. |

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

**Syntax**

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```
This function returns the URL, in escaped format, stored inside the UriType instance. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

```sql
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```
GETURL

This function returns the URL, in non-escaped format, stored inside the UriType instance. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;
GETXML

This function returns the XMLType located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getXML() RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>

Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the UriType that provides support for the HTTP protocol. This uses the UTL_HTTP package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 273–2  HTTPURITYPE Type Subprorgams

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI on page 273-10</td>
<td>Creates an instance of HTTPURITYPE from the given URI.</td>
</tr>
<tr>
<td>GETBLOB on page 273-11</td>
<td>Returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCLOB on page 273-12</td>
<td>Returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 273-13</td>
<td>Returns the content type of the document pointed to by the URL.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 273-14</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETURL on page 273-7</td>
<td>Returns the URL, in non-escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETXML on page 273-16</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>HTTPURITYPE on page 273-17</td>
<td>Creates an instance of HTTPURITYPE from the given URI.</td>
</tr>
</tbody>
</table>
This static function constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

**Syntax**

```plsql
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN HTTPURITYPE;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL; escaped format.</td>
</tr>
</tbody>
</table>
**GETBLOB**

This function returns the BLOB located at the address specified by the HTTP URL.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getBlob() RETURN blob;</td>
<td>This function returns the BLOB located at the address specified by the HTTP URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;</td>
<td>This function returns the BLOB located at the address specified by the HTTP URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getClob() RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the HTTP URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the HTTP URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

Syntax
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the HTTPURITYPE instance. The subtype instances override this member function. The HTTPURITYPE function does not store the prefix http://, but generates it for the external URL.

Syntax

MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
GETURL

This function returns the URL, in non-escaped format, stored inside the HTTPURITYPE instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;
GETXML

This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getXML()</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>RETURN XMLType;</td>
<td></td>
</tr>
<tr>
<td>MEMBER FUNCTION getXML(</td>
<td>This function returns the XMLType located at the address specified by the URL and the content type.</td>
</tr>
<tr>
<td>content OUT VARCHAR2)</td>
<td></td>
</tr>
<tr>
<td>RETURN XMLType;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
HTTPURITYPE

This constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

CONSTRUCTOR FUNCTION HTTPURITYPE(
    url IN varchar2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>
Summary of DBURITYPE Subtype Subprograms

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

Table 273–3  DBURITYPE Type Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI on page 273-19</td>
<td>Constructs a DBURITYPE instance.</td>
</tr>
<tr>
<td>DBURITYPE on page 273-20</td>
<td>Creates an instance of DBURITYPE from the given URI.</td>
</tr>
<tr>
<td>GETBLOB on page 273-21</td>
<td>Returns the BLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETCLOB on page 273-22</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 273-23</td>
<td>Returns the content type of the document pointed to by the URI.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 273-24</td>
<td>Returns the URL, in escaped format, stored inside the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETURL on page 273-25</td>
<td>Returns the URL, in non-escaped format, stored inside the DBURITYPE instance.</td>
</tr>
<tr>
<td>GETXML on page 273-26</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>
CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN DBURITYPE;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid DBURITYPE.</td>
</tr>
</tbody>
</table>
This constructs a DBURITYPE instance.

**Syntax**

CONSTRUCTOR FUNCTION DBURITYPE{
    url IN varchar2);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>
GETBLOB

This function returns the BLOB located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getBlob() RETURN blob;</td>
<td>This function returns the BLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;</td>
<td>This function returns the BLOB located at the address specified by the URL and the content type.</td>
</tr>
<tr>
<td>FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;</td>
<td>This function returns the BLOB located at the address specified by the URL in the specified character set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
This function returns the CLOB located at the address specified by the DBURITYPE instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getClob() RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getClob( content OUT VARCHAR2) RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the DBURITYPE instance and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

**Syntax**

```sql
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```
GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the DBURITYPE instance. The DBUri servlet URL that processes the DBURITYPE has to be appended before using the escaped URL in Web pages.

Syntax

MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax
MEMBER FUNCTION getUrl()
RETURN varchar2;
This function returns the `XMLType` located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION <code>getXML()</code> RETURN <code>XMLType</code>;</td>
<td>This function returns the <code>XMLType</code> located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION <code>getXML(content OUT VARCHAR2)</code> RETURN <code>XMLType</code>;</td>
<td>This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URIType column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by ‘#’. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 273–4  XDBURITYPE Type Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI on page 273-28</td>
<td>Returns the UriType corresponding to the specified URL.</td>
</tr>
<tr>
<td>GETBLOB on page 273-29</td>
<td>Returns the BLOB corresponding to the contents of the document specified by the XDBURITYPE instance.</td>
</tr>
<tr>
<td>GETCLOB on page 273-22</td>
<td>Returns the CLOB corresponding to the contents of the document specified by the XDBURITYPE instance.</td>
</tr>
<tr>
<td>GETCONTENTTYPE on page 273-31</td>
<td>Returns the content type of the document pointed to by the URI.</td>
</tr>
<tr>
<td>GETEXTERNALURL on page 273-24</td>
<td>Returns the URL, in escaped format, stored inside the XDBURITYPE instance.</td>
</tr>
<tr>
<td>GETURL on page 273-25</td>
<td>Returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.</td>
</tr>
<tr>
<td>GETXML on page 273-34</td>
<td>Returns the XMLType corresponding to the contents of the document specified by the URL.</td>
</tr>
<tr>
<td>XDBURITYPE on page 273-35</td>
<td>Creates an instance of XDBURITYPE from the given URI.</td>
</tr>
</tbody>
</table>
CREATEURI

This static function constructs a XDBURITYPE instance. Parses the URL given and creates a XDBURITYPE instance.

Syntax

STATIC FUNCTION createUri(
    url IN varchar2)
RETURN XDBURITYPE

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid XDBURITYPE.</td>

<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>
GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getClob() RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the XDBURITYPE instance.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;</td>
<td>Returns the CLOB located at the address specified by the XDBURITYPE instance and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

Syntax

MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the XDBURITYPE instance.

Syntax
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

Syntax
MEMBER FUNCTION getUrl()
RETURN varchar2;
This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION getXML() RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL.</td>
</tr>
<tr>
<td>MEMBER FUNCTION getXML( content OUT VARCHAR2) RETURN XMLType;</td>
<td>This function returns the XMLType located at the address specified by the URL and the content type.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

CONSTRUCTOR FUNCTION XDBURITYPE(
    url    IN   VARCHAR2,
    flags  IN   RAW := NULL)
RETURN self AS RESULT;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid XDBUriType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
<tr>
<td>flags</td>
<td>(IN)</td>
<td>Possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 2 - Indicates that any errors during document retrieval should be suppressed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 3 - Both flag bits (1, 2) are enabled</td>
</tr>
</tbody>
</table>
Summary of URIFACTORY Package Subprograms

The UriFactory package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The UriFactory package also provides the ability to register new subtypes of the UriType to handle various other protocols. For example, you can invent a new protocol ecom:// and define a subtype of the UriType to handle that protocol and register it with UriFactory. After that any factory method would generate the new subtype instance if it sees the ecom:// prefix.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETURI on page 273-37</td>
<td>Returns the correct URL handler for the given URL string.</td>
</tr>
<tr>
<td>ESCAPEURI on page 273-38</td>
<td>Returns a URL in escaped format.</td>
</tr>
<tr>
<td>UNESCAPEURI on page 273-39</td>
<td>Returns a URL in unescaped format.</td>
</tr>
<tr>
<td>REGISTERURLHANDLER on page 273-40</td>
<td>Registers a particular type name for handling a particular URL.</td>
</tr>
<tr>
<td>UNREGISTERURLHANDLER on page 273-41</td>
<td>Unregisters a URL handler.</td>
</tr>
</tbody>
</table>
GETURI

This factory method returns the correct URI handler for the given URI string. It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the `REGISTERURLHANDLER` function. If the prefix matches, GETURI would then use that subtype.

**Syntax**

```sql
FUNCTION getUri(
    url IN Varchar2)
RETURN UriType;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid HTTP URL.</td>
</tr>
</tbody>
</table>
This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the GETEXTERNALURL function or the GETURI function to get to the URL value instead of using the attribute present in the UriType.

Syntax

```sql
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string to be returned in escaped format.</td>
</tr>
</tbody>
</table>
UNESCAPEURI

This function returns a URL in unescaped format. This function is the reverse of the ESCAPEURI function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a VARCHAR2, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

FUNCTION unescapeUri()
RETURN varchar2;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string to be returned in unescaped format.</td>
</tr>
</tbody>
</table>
Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the UriType or one of its subtypes. It must also implement the createUri static member function. This function is called by the GETURI function to generate an instance of the type. The stripprefix parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```plsql
PROCEDURE registerUrlHandler(
  prefix IN varchar2,
  schemaName IN varchar2,
  typename IN varchar2,
  ignoreCase IN boolean := true,
  stripprefix IN boolean := true);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>(IN)</td>
<td>The prefix to handle; for example, http://.</td>
</tr>
<tr>
<td>schemaName</td>
<td>(IN)</td>
<td>Name of the schema where the type resides; case sensitive.</td>
</tr>
<tr>
<td>typename</td>
<td>(IN)</td>
<td>The name of the type to handle the URL; case sensitive.</td>
</tr>
<tr>
<td>ignoreCase</td>
<td>(IN)</td>
<td>Ignore case when matching prefixes.</td>
</tr>
<tr>
<td>stripprefix</td>
<td>(IN)</td>
<td>Strip prefix before generating the instance of the type.</td>
</tr>
</tbody>
</table>
UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as http://.

Syntax

```sql
PROCEDURE unregisterUrlHandler(
    prefix IN varchar2);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>(IN)</td>
<td>The prefix to be unregistered.</td>
</tr>
</tbody>
</table>
PL/SQL users can use the DBMS_AQ package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

- **Using JMS Types**
  - Overview
  - Security Model
  - Java Versus PL/SQL Datatypes
  - More on Bytes, Stream and Map Messages
  - Upcasting and Downcasting Between General and Specific Messages
  - JMS Types Error Reporting
  - Oracle JMS Type Constants
  - CONVERT_JMS_SELECTOR

- **Summary of JMS Types**
Using JMS Types

- Overview
- Security Model
- Java Versus PL/SQL Datatypes
- More on Bytes, Stream and Map Messages
- Upcasting and Downcasting Between General and Specific Messages
- JMS Types Error Reporting
- Oracle JMS Type Constants
- JMS Types Error Reporting
- Oracle JMS Type Constants
- CONVERT_JMS_SELECTOR
Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules.
PUBLIC is granted EXECUTE privilege on the following JMS types:

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMEARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type
Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving TEXT data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

See Also: JMS specification 3.11.3, Conversion Provided by StreamMessage and MapMessage

New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any datatype that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.
More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionalities that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses these common functionalities.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

**Note:** It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.
Get the Payload Data Back to PL/SQL

Calling the flush procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The flush call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The clean procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as prepare and clear_body give users an operation ID, which is used in later message access.

After users complete message processing, they must call the clean procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The clean_all static procedures of message ADTs aq$_jms_bytes_message, aq$_jms_map_message, and aq$_jms_stream_message clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages:

1. Call prepare for a message.
   
   This call also gives you an operation ID if you do not specify one.

2. Call multiple retrieving procedures with the provided operation ID.

3. Call the clean procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call clear_body for a message.
   
   For aq$_jms_map_message, you can also call prepare to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.

2. Call multiple updating procedures with the provided operation ID.

3. Call the flush method with the provided operation ID.

4. Call the clean procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the clear_body method to make the body writable. This method erases the current message body and sets the message body to be empty.
The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- **Map messages**
  The restriction is relaxed, because adding more entries on top of an existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- **Stream and bytes messages**
  The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

  Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the JServ static variable.

  The `prepare` procedure, on the other hand, overwrites the message payload in the JServ static variable with the payload in the PL/SQL ADT.

  Oracle provides member function `get_mode` for users to query the mode.

**Differences Between Bytes and Stream Messages**

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using `java.ObjectOutputStream` and bytes messages are encoded using `java.DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

---

**Note:** All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.
Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either RAW or BLOB in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

- `set_bytes(payload IN BLOB)`
- `set_bytes(payload IN RAW)`
- `get_bytes(payload OUT BLOB)`
- `get_bytes(payload OUT RAW)`

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).
Upcasting and Downcasting Between General and Specific Messages

OJMS ADT \texttt{aq\$\_jms\_message} is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of \texttt{aq\$\_jms\_message} by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an \texttt{aq\$\_jms\_message}, you must first downcast it to a specific message type according to its \texttt{message\_type} field.

To populate an \texttt{aq\$\_jms\_message}, you must first populate a specific message and upcast it to \texttt{aq\$\_jms\_message}. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.
## JMS Types Error Reporting

Table 274–1 lists Oracle JMS types related errors.

<table>
<thead>
<tr>
<th>ORA error number</th>
<th>dbms_jms_plsql package constants</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24190</td>
<td>ERROR_DATA_OVERFLOW</td>
<td>The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$_jms_text_message or get_bytes procedure with a RAW parameter of aq$_jms_bytes_message.</td>
</tr>
<tr>
<td>ORA-24191</td>
<td>ERROR_PROP_NAME_EXIST</td>
<td>Setting a property that is previous set</td>
</tr>
<tr>
<td>ORA-24192</td>
<td>ERROR_PROP_NAME_NULL</td>
<td>Occurs when setting a property with null property name.</td>
</tr>
<tr>
<td>ORA-24193</td>
<td>ERROR_EXCEED_RANGE</td>
<td>PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$_jms_head ADT; set_byte and set_short of aq$_jms_map_message ADT; write_byte and write_short of aq$_jms_stream_message and aq$_jms_bytes_message ADT.</td>
</tr>
<tr>
<td>ORA-24194</td>
<td>ERROR_TYPE_MISMATCH</td>
<td>The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.</td>
</tr>
<tr>
<td>ORA-24195</td>
<td>ERROR_MAP_TOO_LARGE</td>
<td>The size of the map exceeds the aq$_jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.</td>
</tr>
<tr>
<td>ORA-24196</td>
<td>ERROR_WRONG_MODE</td>
<td>The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.</td>
</tr>
<tr>
<td>ORA-24197</td>
<td>ERROR_JAVA_EXCEPTION</td>
<td>ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$_jms_map_message, aq$_jms_bytes_message, and aq$_jms_stream_message to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT aq$_jms_exception is created to represent the exception information on the PL/SQL side.</td>
</tr>
<tr>
<td>ORA-24198</td>
<td>ERROR_INVALID_ID</td>
<td>An invalid operation ID is being provided to access a message.</td>
</tr>
<tr>
<td>ORA-24199</td>
<td>ERROR_STORE_OVERFLOW</td>
<td>The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.</td>
</tr>
</tbody>
</table>
Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

**DBMS_AQ Package Constants**

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

**SYS.DBMS_JMS_PLSQL Package Constants**

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE           CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT          CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER        CONSTANT PLS_INTEGER;
DATA_TYPE_LONG           CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT          CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE         CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN        CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER      CONSTANT PLS_INTEGER;
DATA_TYPE_STRING         CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES          CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE  CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW   CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL  CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE    CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH   CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE   CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE      CONSTANT PLS_INTEGER := -24196;
```
ERROR_JAVA_EXCEPTION CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW CONSTANT PLS_INTEGER := -24199;
Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in ADD_SUBSCRIBER operations as subscriber rules or in DEQUEUE operations as dequeue conditions. These procedures are in the SYS.dbms_jms_plsql package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is dbms_jms_plsql.DESTPLOAD_JMSTYPE and also assumes that the J2EE compliant mode is true.

Syntax

Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: dest_pload_type. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE or SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA. The function returns exactly the same VARCHAR2 value as the selector parameter if the dest_pload_type parameter is SYS.dbms_jms_plsql.DESTPLOAD_USERADT. The function returns null if dest_pload_type parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a dest_pload_type parameter and a compliant parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the dest_pload_type parameter is SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE or SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA. The function returns exactly the
same VARCHAR2 value as the selector parameter if the dest_pload_type parameter is
SYS.dbms_jms_plsql.DESTPLOAD_USERADT. The function returns null if the dest_
pload_type parameter is none of these three constants.

The compliant parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

**Syntax**

Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER,
    compliant IN BOOLEAN )

**Returns**

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

**Exceptions**

ORA-24197 if the Java stored procedure throws an exception during execution.
Summary of JMS Types

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMEARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type
SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- CONSTRUCT Static Functions
- Cast Methods
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```sql
TYPE AQ$_JMS_MESSAGE AS OBJECT(
    header        aq$_jms_header,
    senderid      VARCHAR2(100),
    message_type  INT,  
    text_len      INT,
    bytes_len     INT,
    text_vc       VARCHAR2(4000),
    bytes_raw     RAW(2000),
    text_lob      CLOB,

MEMBER PROCEDURE get_text (payload OUT CLOB),
MEMBER PROCEDURE get_bytes (payload OUT RAW),
MEMBER PROCEDURE get_bytes (payload OUT BLOB));

CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of aq$_jms_message, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created aq$_jms_message instance depends on the mtype parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The mtype parameter must be one of the following constants described in "Oracle JMS Type Constants" on page 274-12:

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message
Creates an aq$_jms_message from an aq$_jms_text_message.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN aq$_
Summary of JMS Types

**JMS Types**

```sql
jms_message;
```

*Creates an aq$_jms_message from an aq$_jms_bytes_message.*

**STATIC FUNCTION construct (stream_msg IN aq$_jms_stream_message) RETURN aq$_jms_message;**

*Creates an aq$_jms_message from an aq$_jms_stream_message.*

**STATIC FUNCTION construct (map_msg IN aq$_jms_map_message) RETURN aq$_jms_message;**

*Creates an aq$_jms_message from an aq$_jms_map_message.*

**STATIC FUNCTION construct (object_msg IN aq$_jms_object_message) RETURN aq$_jms_message;**

*Creates an aq$_jms_message from an aq$_jms_object_message.*

---

**Cast Methods**

**cast_to_bytes_msg RETURN aq$_jms_bytes_message**

*Casts an aq$_jms_message to an aq$_jms_bytes_message. Returns an aq$_jms_bytes_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.*

**cast_to_map_msg RETURN aq$_jms_map_message**

*Casts an aq$_jms_message to an aq$_jms_map_message. Returns an aq$_jms_map_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.*

**cast_to_object_msg RETURN aq$_jms_object_message**

*Casts an aq$_jms_message to an aq$_jms_object_message. Returns an aq$_jms_object_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.*

**cast_to_stream_msg RETURN aq$_jms_stream_message**

*Casts an aq$_jms_message to an aq$_jms_stream_message. Returns an aq$_jms_stream_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.*

**cast_to_text_msg RETURN aq$_jms_text_message**

*Casts an aq$_jms_message to an aq$_jms_text_message. Returns an aq$_jms_text_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.*

---

**JMS Header Methods**

**set_replyto (replyto IN sys.aq$_agent)**

*Sets the replyto parameter, which corresponds to JMSReplyTo.*

**get_replyto RETURN sys.aq$_agent**

*Returns replyto, which corresponds to JMSReplyTo.*
**SYS.AQ$_JMS_MESSAGE Type**

**set_type (type IN VARCHAR)**
Sets the JMS type, which can be any text and corresponds to JMSType.

**get_type RETURN VARCHAR**
Returns type, which corresponds to JMSType.

**System Properties Methods**

**set_userid (userid IN VARCHAR)**
Sets userid, which corresponds to JMSXUserID.

**set_appid (appid IN VARCHAR)**
Sets appid, which corresponds to JMSXAppID.

**set_groupid (groupid IN VARCHAR)**
Sets groupid, which corresponds to JMSXGroupID.

**set_groupseq (groupseq IN INT)**
Sets groupseq, which corresponds to JMSXGroupSeq.

**get_userid RETURN VARCHAR**
Returns userid, which corresponds to JMSXUserID.

**get_appid RETURN VARCHAR**
Returns appid, which corresponds to JMSXAppID.

**get_groupid RETURN VARCHAR**
Returns groupid, which corresponds to JMSXGroupID.

**get_groupseq RETURN VARCHAR**
Returns groupseq, which corresponds to JMSXGroupSeq.

**User Properties Methods**

**clear_properties**
Clears all user properties. This procedure does not affect system properties.

**set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)**
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value in an internal representation (a NUMBER type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the byte datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)**
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_propert (property_name IN VARCHAR, property_value IN VARCHAR)**
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN**
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION**
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property (property_name IN VARCHAR) RETURN FLOAT**
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.
SYS.AQ$_JMS_MESSAGE Type

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a CLOB value, to an internal representation.

set_bytes (payload IN RAW)
Sets the payload, a RAW value, to an internal representation.

set_bytes (payload IN BLOB)
Sets the payload, a BLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.

get_bytes (payload OUT RAW)
Puts the internal representation of the payload into a RAW variable payload.

get_bytes (payload OUT BLOB)
Puts the internal representation of the payload into a BLOB variable payload.
SYS.AQ$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a TextMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

TYPE AQ$_JMS_TEXT_MESSAGE AS OBJECT(
  header aq$_jms_header,
  text_len INT,
  text_vc varchar2(4000),
  text_lob clob,
  STATIC FUNCTION construct RETURN aq$_jms_text_message,
  MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),

  MEMBER FUNCTION  get_int_property     (property_name IN VARCHAR) RETURN INT,
  MEMBER FUNCTION  get_long_property   (property_name IN VARCHAR) RETURN NUMBER,
SYS.AQ$_JMS_TEXT_MESSAGE Type

MEMBER FUNCTION get_short_property (property_name IN VARCHAR) RETURN INT,
MEMBER FUNCTION get_string_property (property_name IN VARCHAR) RETURN VARCHAR,
MEMBER PROCEDURE set_text (payload IN VARCHAR2),
MEMBER PROCEDURE set_text (payload IN CLOB),
MEMBER PROCEDURE get_text (payload OUT VARCHAR2),
MEMBER PROCEDURE get_text (payload OUT CLOB));

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty aq$_jms_text_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN INT
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.
**set_boolean_property** (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property** (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property** (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property** (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_int_property** (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property** (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property** property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property** (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property** (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property** (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.
get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is an Integer property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a CLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.
SYS.AQ$_JMS_BYTES_MESSAGE Type

This type is the ADT used to store a BytesMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:
- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(

MEMBER PROCEDURE write_utf (id IN PLS_INTEGER, value IN CLOB));

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty aq$_jms_bytes_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.
**get_type** RETURN VARCHAR
Returns type, which corresponds to JMSType.

**System Properties Methods**

**set_userid (userid IN VARCHAR)**
Sends userid, which corresponds to JMSXUserID in JMS.

**set_appid (appid IN VARCHAR)**
Sets appid, which corresponds to JMSXAppID in JMS.

**set_groupid (groupid IN VARCHAR)**
Sets groupid, which corresponds to JMSXGroupID in JMS.

**set_groupseq (groupseq IN INT)**
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

**get_userid RETURN VARCHAR**
Returns userid, which corresponds to JMSXUserID.

**get_appid RETURN VARCHAR**
Returns appid, which corresponds to JMSXAppID.

**get_groupid RETURN VARCHAR**
Returns groupid, which corresponds to JMSXGroupID.

**get_groupseq RETURN NUMBER**
Returns groupseq, which corresponds to JMSXGroupSeq.

**User Properties Methods**

**clear_properties**
Clears all user properties. This procedure does not affect system properties.

**set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)**
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN**
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION**
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property (property_name IN VARCHAR) RETURN FLOAT**
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get_long_property (property_name IN VARCHAR) RETURN NUMBER**
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.
**get_short_property** *(property_name IN VARCHAR) RETURN INT*
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

**get_string_property** *(property_name IN VARCHAR) RETURN VARCHAR*
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

---

**Payload Methods**

**set_bytes (payload in RAW)**
Sets the payload, a RAW value, to an internal representation.

**set_bytes (payload in BLOB)**
Sets the payload, a BLOB value, to an internal representation.

**get_bytes (payload out RAW)**
Puts the internal representation of the payload into a RAW variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of RAW in PL/SQL).

**get_bytes (payload out BLOB)**
Puts the internal representation of the payload into a BLOB variable payload.

**prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS_INTEGER)**
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**flush (id IN PLS_INTEGER)**
Takes the static variable in Jserv and synchronizes the content back to the aq$_jms_bytes_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear_body (id IN PLS_INTEGER)**
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session.
memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS_INTEGER)**
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean_all**
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Returns the current mode of this message. The return value is either SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY or SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN**
Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads a BYTE value from the bytes message and returns the BYTE value read. Null is returned if the end of the stream has been reached. Because there is no BYTE type in PL/SQL, Oracle Database uses PLS_INTEGER to represent a BYTE. Although PL/SQL users get a PLS_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a write_byte function, then there will not be an out of range error. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
Summary of JMS Types

**read_char (id IN PLS_INTEGER) RETURN CHAR**
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION**
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_float (id IN PLS_INTEGER) RETURN FLOAT**
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_int (id IN PLS_INTEGER) RETURN INT**
Reads an INT from the bytes message and returns the INT read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_long (id IN PLS_INTEGER) RETURN NUMBER**
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, PLS_INTEGER is used to represent a SHORT. Although PL/SQL users get an PLS_INTEGER, they are guaranteed that the value is in the Java short value range. If this value is issued with a write_short function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)**
Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)**
Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW)**
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB)**
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)**
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)**
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_char (id IN PLS_INTEGER, value IN CHAR)**
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
**write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)**
Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_float (id IN PLS_INTEGER, value IN FLOAT)**
Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)**
Writes an INT to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_long (id IN PLS_INTEGER, value IN NUMBER)**
Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)**
Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_utf (id IN PLS_INTEGER, value IN VARCHAR2)**
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_utf (id IN PLS_INTEGER, value IN CLOB)**
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a MapMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_map_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob,
  STATIC FUNCTION  construct   RETURN aq$_jms_map_message,
  MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type     (type    IN VARCHAR),
  MEMBER FUNCTION  get_replyto  RETURN sys.aq$_agent,

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_map_message
Creates an empty aq$_jms_map_message object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.
set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.
get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_map_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is
stored in the Oracle Database JVM session memory. If \texttt{id} is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**flush (id IN PLS_INTEGER)**
Takes the static variable in Jserv and synchronizes the content back to \texttt{aq$_jms_map$_message}. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear_body (id IN PLS_INTEGER)**
Sets the Java stored procedure static variable to empty payload. Parameter \texttt{id} is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If \texttt{id} is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS_INTEGER)**
Closes and cleans up the \texttt{DataInputStream} or \texttt{DataOutputStream} at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean_all**
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)**
Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**
Sets the \texttt{BYTE} value with the specified name in the map. Because there is no \texttt{BYTE} type in PL/SQL, \texttt{PLS_INTEGER} is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW)**
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)**
Sets a portion of the byte array value with the specified name in the map. Parameter \texttt{offset} is the initial offset within the byte array, and parameter \texttt{length} is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java \texttt{IndexOutOfBoundsException} exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0.
SYS.AQ$_JMS_MAP_MESSAGE Type

 Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)**
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)**
Sets a portion of the byte array value with the specified name in the map. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)**
Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)**
Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)**
This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**
Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)**
Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**
Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, PLS_INTEGER is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)**
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB))
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the BYTE value with the specified name. If there is no item by this name, then null is returned. Because there is no BYTE type in PL/SQL, PLS_INTEGER is used to represent a byte. Although the PL/SQL users get an PLS_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a set_byte function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)
Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL RAW type, a BLOB is always returned here. The BLOB returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION
Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the INT value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER
Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type
of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER**
Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no short type in PL/SQL, INT is used to represent a short. Although the PL/SQL users get an PLS_INTEGER, they are guaranteed that the value is in the Java short value range. If this value is issued with a set_short function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)**
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray**
Retrieves all the names within the map message and returns them in a varray. Because aq$._jms_namearray has a size as 1024 and each element is a VARCHAR(200), this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

**get_names (id IN PLS_INTEGER, names OUT aq$._jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER**
Retrieves a portion of the names within the map message. Because aq$_jms_namearray has a size as 1024 and each element is a VARCHAR(200), this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a length parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter offset is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)**
Returns a general value ADT AQ$_JMS_VALUE. If there is no item by this name, then null is returned. Users can use the type attribute of this ADT to interpret the data. See the map in the AQ$_JMS_VALUE ADT for the correspondence among dbms_jms_plsql package constants, Java datatype and AQ$_JMS_VALUE attribute. Note this member procedure might bring additional overhead compared to other get member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific get member procedure or function. Raises exception ORA-24197 if the Java stored
procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**
Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a StreamMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```plsql
TYPE aq$_jms_stream_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob,
  STATIC FUNCTION construct RETURN aq$_jms_stream_message,
  MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type     (type    IN VARCHAR),

MEMBER PROCEDURE write_short (id IN PLS_INTEGER, value IN PLS_INTEGER),
MEMBER PROCEDURE write_string (id IN PLS_INTEGER, value IN VARCHAR2),
MEMBER PROCEDURE write_string (id IN PLS_INTEGER, value IN CLOB));

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_stream_message
Creates an empty aq$_jms_stream_message object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds toJMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.
get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
**set_int_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property (property_name IN VARCHAR, property_value IN NUMBER)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN**
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION**
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get_float_property (property_name IN VARCHAR) RETURN FLOAT**
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get_int_property (property_name IN VARCHAR) RETURN INT**
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get_long_property (property_name IN VARCHAR) RETURN NUMBER**
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.
get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB variable without interpreting it.

set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the BLOB variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_stream_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the stream message in MESSAGE_ACCESS_READONLY mode.

flush (id IN PLS_INTEGER)
 Takes the static variable in Jserv and synchronizes the content back to aq$_jms_stream_message. This procedure will not affect the underlying access mode. This
procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear_body (id IN PLS_INTEGER)**
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$ JMS_BYTES_MESSAGE. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS_INTEGER)**
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean_all**
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Returns the current mode of this message. The return value is either SYS.dbms_aqjms.READ_ONLY or SYS.dbms_aqjms.WRITE_ONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN**
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no BYTE type in PL/SQL, INT is used to represent a byte. Although PL/SQL users get an INT, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a write_byte function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
read_bytes (id IN PLS_INTEGER) RETURN BLOB
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns an INT from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, PLS_INTEGER is used to represent a SHORT. Although PL/SQL users get an INT, they are guaranteed that the value is in the Java short value range. If this value is issued with a write_short function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the
expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_string RETURN CLOB**
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)**
Returns a general value ADT AQ$_JMS_VALUE. Users can use the type attribute of this ADT to interpret the data. See Table 274–2 on page 274-58 for the correspondence among dbms_jms_plsql package constants, Java datatype and AQ$_JMS_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)**
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_byte (id IN PLS_INTEGER, value IN INT)**
Writes a byte to the stream message. Because there is no BYTE type in PL/SQL, INT is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW)**
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)**
Writes a portion of a byte array as a byte array field to the stream message. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure. The index starts from 0.
Raise exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes an INT to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a short to the stream message. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
write_string (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
SYS.AQ$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an ObjectMessage in an Oracle Database Advanced Queuing queue.

Syntax

```
TYPE aq$_jms_object_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob);
```
SYS.AQ$_JMS_NAMEARRAY Type

This type represents the name array returned by the get_names procedure of aq$_jms_map_message. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);

Usage Notes
If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT AQ$_JMS_NAMEARRAY, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`. The type field in this ADT is used to decide which type of data this object is really holding. Table 274–2 lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(  
type number(2),  
num_val number,  
char_val char(1),  
text_val clob,  
bytes_val blob);
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Java Type</th>
<th><code>aq$_jms_value</code> Data Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_BYTE</td>
<td>byte</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_SHORT</td>
<td>short</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_INTEGER</td>
<td>int</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_LONG</td>

<td>java.lang.String</td>
<td>text_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_BYTES</td>
<td>byte[]</td>
<td>bytes_val</td>
</tr>
</tbody>
</table>
SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The id field is reserved for future use. The exp_name stores the Java exception name, the err_msg field stores the Java exception error message, and the stack field stores the stack trace of the Java exception.

Syntax

CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
    id          number, -- Reserved and not used. Right now always return 0.
    exp_name    varchar(200),
    err_msg     varchar(500),
    stack       varchar(4000));
This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- Using Logical Change Record Types
  - Overview
  - Security Model
- Summary of Logical Change Record Types
- Common Subprograms for LCR$_DDL$$_RECORD$ and LCR$_ROW$$_RECORD$
Using Logical Change Record Types

This section contains topics that relate to using the logical change record (LCR) types.

- Overview
- Security Model
Overview

In Oracle Streams, logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

See Also: Oracle Streams Concepts and Administration for more information about LCRs
Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.
Summary of Logical Change Record Types

Table 275–1  Logical Change Record (LCR) Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCR$_DDL_RECORD Type on page 275-6</td>
<td>Represents a data definition language (DDL) change to a database object</td>
</tr>
<tr>
<td>LCR$_ROW_RECORD Type on page 275-15</td>
<td>Represents a data manipulation language (DML) change to a database object</td>
</tr>
<tr>
<td>LCR$_ROW_LIST Type on page 275-47</td>
<td>Identifies a list of column values for a row in a table</td>
</tr>
<tr>
<td>LCR$_ROW_UNIT Type on page 275-48</td>
<td>Identifies the value for a column in a row</td>
</tr>
</tbody>
</table>

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM
This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This section contains information about the constructor for row LCRs and information about the member subprograms for this type:

- **LCR$_DDL_RECORD Constructor**
- **Summary of LCR$_DDL_RECORD Subprograms**, which also include the subprograms described in "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 275-36

---

**Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.

- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

---

**LCR$_DDL_RECORD Constructor**

Creates a `SYS.LCR$_DDL_RECORD` object with the specified information.

```sql
STATIC FUNCTION CONSTRUCT(
    source_database_name  IN  VARCHAR2,
    command_type IN  VARCHAR2,
    object_owner IN  VARCHAR2,
    object_name           IN  VARCHAR2,
    object_type           IN  VARCHAR2,
    ddl_text              IN  CLOB,
    logon_user            IN  VARCHAR2,
    current_schema IN  VARCHAR2,
    base_table_owner IN  VARCHAR2,
    base_table_name      IN  VARCHAR2,
    tag                   IN  RAW       DEFAULT NULL,
    transaction_id        IN  VARCHAR2  DEFAULT NULL,
    scn                   IN  NUMBER    DEFAULT NULL,
    position              IN  RAW       DEFAULT NULL,
    edition_name          IN  VARCHAR2  DEFAULT NULL,
    root_name             IN  VARCHAR2  DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```
**LCR$$_DDL\_RECORD\text{ Constructor Function Parameters**}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| source\_database\_name | The database where the DDL statement occurred  
If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred.  
If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value. |
| command\_type       | The type of command executed in the DDL statement  
Set this parameter to a non-NULL value.  
**See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer’s Guide* for a complete list of command types  
The following command types are not supported in DDL LCRs:  
ALTER MATERIALIZED VIEW  
ALTER MATERIALIZED VIEW LOG  
ALTER SUMMARY  
CREATE SCHEMA  
CREATE MATERIALIZED VIEW  
CREATE MATERIALIZED VIEW LOG  
CREATE SUMMARY  
DROP MATERIALIZED VIEW  
DROP MATERIALIZED VIEW LOG  
DROP SUMMARY  
RENAME  
The snapshot equivalents of the materialized view command types are also not supported. |
| object\_owner       | The user who owns the object on which the DDL statement was executed                                                                                                                                                                                                                                                                                                                                 |
| object\_name        | The database object on which the DDL statement was executed                                                                                                                                                                                                                                                                                                                                                      |

</tr>
<tr>
<td>SET_LOGON_USER Member Procedure on page 275-13</td>
<td>Sets the logon user name</td>
</tr>
<tr>
<td>SET_OBJECT_TYPE Member Procedure on page 275-13</td>
<td>Sets the object type</td>
</tr>
</tbody>
</table>
EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

Note: The EXECUTE member procedure can be invoked only in an apply handler for an Oracle Streams apply process.

Syntax

MEMBER PROCEDURE EXECUTE;

GET_BASE_TABLE_NAME Member Function

Gets the base (dependent) table name.

Syntax

MEMBER FUNCTION GET_BASE_TABLE_NAME() RETURN VARCHAR2;

GET_BASE_TABLE_OWNER Member Function

Gets the base (dependent) table owner.

Syntax

MEMBER FUNCTION GET_BASE_TABLE_OWNER() RETURN VARCHAR2;

GET_CURRENT_SCHEMA Member Function

Gets the current schema name.

Syntax

MEMBER FUNCTION GET_CURRENT_SCHEMA() RETURN VARCHAR2;

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$DDL_RECORD) IS
  ddl_text   CLOB;
```
BEGIN
    DBMS_OUTPUT.PUT_LINE('    -----------------------------------------' );
    DBMS_OUTPUT.PUT_LINE('    Displaying DDL text in a DDL LCR: ' );
    DBMS_OUTPUT.PUT_LINE('    -----------------------------------------' );
    DBMS_LOB.CREATETEMPORARY(ddl_text, true);
    ddl_lcr.GET_DDL_TEXT(ddl_text);
    DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
    DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/

**Note:** GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

### Syntax

```sql
MEMBER FUNCTION GET_DDL_TEXT(
    ddl_text  IN/OUT  CLOB);
```

### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_text</td>
<td>The DDL text in the DDL LCR</td>
</tr>
</tbody>
</table>

### GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

**See Also:** Oracle Database Development Guide

### Syntax

```sql
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

### GET_LOGON_USER Member Function

Gets the logon user name.

### Syntax

```sql
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

### GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

### Syntax

```sql
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```
SET_BASE_TABLE_NAME Member Procedure
Sets the base (dependent) table name.

Syntax

MEMBER PROCEDURE SET_BASE_TABLE_NAME(
    base_table_name  IN  VARCHAR2);

Parameter

Table 275–5 SET_BASE_TABLE_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_table_name</td>
<td>The name of the base table</td>
</tr>
</tbody>
</table>

SET_BASE_TABLE_OWNER Member Procedure
Sets the base (dependent) table owner.

Syntax

MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
    base_table_owner  IN  VARCHAR2);

Parameter

Table 275–6 SET_BASE_TABLE_OWNER Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tbody>
</table>
Summary of Logical Change Record Types

**LCR$_ROW_RECORD Type**

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR$_ROW_LIST type.

If you create or modify a row logical change record (row LCR), then make sure the command_type attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- **LCR$_ROW_RECORD Constructor**
- **Summary of LCR$_ROW_RECORD Subprograms**, which also include the subprograms described in Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 275-36

---

**Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.

- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

---

**See Also:**  [LCR$_ROW_LIST Type](#) on page 275-47

**LCR$_ROW_RECORD Constructor**

Creates a SYS.LCR$_ROW_RECORD object with the specified information.

```sql
STATIC FUNCTION CONSTRUCT(
    source_database_name  IN  VARCHAR2,
    command_type IN  VARCHAR2,
    object_owner IN  VARCHAR2,
    object_name           IN  VARCHAR2,
    tag                   IN  RAW                DEFAULT NULL,
    transaction_id        IN  VARCHAR2           DEFAULT NULL,
    scn                   IN  NUMBER             DEFAULT NULL,
    old_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    new_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    position              IN  RAW                DEFAULT NULL,
    root_name             IN  VARCHAR2           DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```
# LCR$_\text{ROW}_\text{RECORD}$ Constructor Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>source_database_name</strong></td>
<td>The database where the row change occurred</td>
</tr>
<tr>
<td></td>
<td>If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred.</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the function appends the local domain to the database name automatically.</td>
</tr>
<tr>
<td></td>
<td>For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</td>
</tr>
<tr>
<td><strong>command_type</strong></td>
<td>The type of command executed in the DML statement</td>
</tr>

<td>Gets a WHERE clause for the change that is encapsulated in the row LCR</td>
</tr>
</tbody>
</table>
ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

**Note:** To set a column value that already exists, run `SET_VALUE`.

**See Also:** `SET_VALUE Member Procedure` on page 275-31

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.
If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

**Note:**
- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a LONG or LONG RAW column.

### Syntax

```sql
MEMBER PROCEDURE ADD_COLUMN(
    value_type    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to add for the column</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the column</td>
</tr>
</tbody>
</table>

- **CONVERT_LONG_TO_LOB_CHUNK Member Procedure**

  Converts LONG data in a row LCR into a CLOB, or converts LONG RAW data in a row LCR into a BLOB.
  
  This procedure can change the operation code from LONG WRITE to LOB WRITE for the row LCR.
  
  This member procedure can be used in rule-based transformations.
  
  The following restrictions apply to this member procedure:
  
  - This member procedure cannot be used in apply handlers.
■ LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG_WRITE. Because LONG data can be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.

■ LOB to LONG conversion is not supported.

■ A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

See Also: Oracle Streams Replication Administrator’s Guide

Syntax

    MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

    MEMBER PROCEDURE DELETE_COLUMN(
    column_name  IN  VARCHAR2,
    value_type   IN  VARCHAR2  DEFAULT '*');

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| column_name  | The column name
|              | An error is raised if the column does not exist in the LCR. |
| value_type   | The type of value to delete for the column
|              | Specify old to delete the old value of the column. Specify new to delete the new value of the column. If * is specified, then the procedure deletes both the old and new values. |

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

■ The LCR is being processed by an apply handler.

■ The LCR is in a queue and was last enqueued by a mechanism other than an Oracle Streams capture process, such as an Oracle Streams apply process or an application.

■ The LCR has been constructed using the LCR$_ROW_RECORD constructor function but has not been enqueued.

■ The LCR is in the error queue.
Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or NULL.

If assemble_lobs is set to FALSE for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with VARCHAR2 and RAW data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with assemble_lobs set to FALSE attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with assemble_lobs set to TRUE attempts to execute a row LCR that contains one or more LOB values represented with VARCHAR2 or RAW data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```sql
MEMBER PROCEDURE EXECUTE(
    conflict_resolution  IN  BOOLEAN);
```

Parameters

### Table 275–16 EXECUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conflict_resolution</td>
<td>If TRUE, then any conflict resolution defined for the table using the SET_UPDATE_CONFLICT_HANDLER procedure in the DBMS_APPLY_ADM package is used to resolve conflicts resulting from the execution of the LCR. If FALSE, then conflict resolution is not used. An error is raised if this parameter is not specified or is set to NULL.</td>
</tr>
</tbody>
</table>

**GET_LOB_INFORMATION Member Function**

Gets the LOB information for the column.

The return value can be one of the following:

- DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;
- DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;
- DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;
- DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;
- DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;
- DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;
Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```sql
MEMBER FUNCTION GET_LOB_INFORMATION(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, either old or new</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

**GET_LOB_OFFSET Member Function**

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NUL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB_ERASE or LOB_WRITE

Otherwise, returns NULL.

Syntax

```sql
GET_LOB_OFFSET(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2)
RETURN NUMBER;
```
Parameters

Table 275–18  GET_LOB_OFFSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column</td>
</tr>
<tr>
<td></td>
<td>Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.

Syntax

MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2)
RETURN NUMBER,

Parameters

Table 275–19  GET_LOB_OPERATION_SIZE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column</td>
</tr>
<tr>
<td></td>
<td>Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

GET_LONG_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

- DBMS_LCR.NOT_A_LONG  CONSTANT NUMBER := 1;
- DBMS_LCR.NULL_LONG   CONSTANT NUMBER := 2;
- DBMS_LCR.INLINE_LONG CONSTANT NUMBER := 3;
- DBMS_LCR.LONG_CHUNK  CONSTANT NUMBER := 4;
- DBMS_LCR.LAST_LONG_CHUNK CONSTANT NUMBER := 5;

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying ‘Y’ for the use_old parameter is a convenient way to get the value of the columns.
Syntax

```plsql
MEMBER FUNCTION GET_LONG_INFORMATION(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

**Table 275–20 GET_LONG_INFORMATION Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, either old or new</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

**GET_ROW_TEXT Member Procedure**

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

**Syntax**

The following procedure returns the SQL statement in a CLOB datatype.

```plsql
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text  IN/OUT  CLOB);
```

The following procedure returns the SQL statement with bind variables in a CLOB datatype.

```plsql
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text    IN/OUT  CLOB,
    variable_list  IN/OUT  LCR$_ROW_LIST,
    bind_var_syntax IN  VARCHAR2  DEFAULT ':');
```

See Also: "LCR$_ROW_LIST Type" on page 275-47

Parameters

**Table 275–21 GET_ROW_TEXT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_text</td>
<td>The SQL statement for the change that is encapsulated in the LCR</td>
</tr>
</tbody>
</table>
**Summary of Logical Change Record Types**

**Table 275–21 (Cont.) GET_ROW_TEXT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_list</td>
<td>The values for the bind variables</td>
</tr>
<tr>
<td>bind_var_syntax</td>
<td>The syntax for the bind variables</td>
</tr>
</tbody>
</table>

One of the following values is valid:
- Specify :, the default, for bind values to be in the form :1, :2, and so on.
- Specify ? for bind values to be in the form ?.

**GET_VALUE Member Function**

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of a column.

**Syntax**

```sql
MEMBER FUNCTION GET_VALUE(
  value_type IN VARCHAR2,
  column_name IN VARCHAR2,
  use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

**Parameters**

**Table 275–22 GET_VALUE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column</td>
</tr>
<tr>
<td></td>
<td>Specify old to get the old value for the column. Specify new to get the new value for the column.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value.</td>
</tr>
<tr>
<td></td>
<td>If N and value_type is new, then the function returns NULL if no new value exists.</td>
</tr>
<tr>
<td></td>
<td>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</td>
</tr>
<tr>
<td></td>
<td>NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

**GET_VALUES Member Function**

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.
### Syntax

```plsql
MEMBER FUNCTION GET_VALUES(
    value_type  IN  VARCHAR2,
    use_old     IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of values to return. Specify <code>old</code> to return a list of old values. Specify <code>new</code> to return a list of new values.</td>
</tr>
<tr>
<td>use_old</td>
<td>If <code>Y</code> and <code>value_type</code> is <code>new</code>, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values. If <code>N</code> and <code>value_type</code> is <code>new</code>, then the function returns a list of all new values in the LCR without returning any old values. If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code>, then the function ignores the value of the <code>use_old</code> parameter. NULL is not a valid specification for the <code>use_old</code> parameter.</td>
</tr>
</tbody>
</table>

### GET_WHERE_CLAUSE Member Procedure

The `WHERE` clause is used to identify the change that is encapsulated in the row LCR.

Use the `WHERE` clause returned by `GET_WHERE_CLAUSE` instead of using the `ROWID`, because the `ROWID` is not ANSI compatible. The generated `WHERE` clause might not match the `WHERE` clause in the original DML operation.

The `ROWID` of an `INSERT` statement is the `ROWID` of the new row created by the `INSERT`. The `WHERE` clause generated for an `INSERT` operation identifies the new row. Therefore, the generated `WHERE` clause includes all of the new values inserted.

For example, consider the following `INSERT` into the `hr.departments` table:

```sql
INSERT INTO hr.departments (  
  department_id, department_name, manager_id, location_id)  
VALUES (10, 'HR', 20, 40);
```

The generated `WHERE` clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated `WHERE` clause is the following:

```sql
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND  
  "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The `ROWID` of an `UPDATE` statement is the `ROWID` of the row that was updated. The `WHERE` clause generated for an `UPDATE` operation identifies the row after the `UPDATE` executes. The generated `WHERE` clause is based on the old and new values of the `UPDATE`.

For example, consider the following `UPDATE` to the `hr.departments` table:

```sql
UPDATE hr.departments SET department_name='Management'  
WHERE department_name='Administration' AND location_id = 20 AND  
  manager_id = 30 AND department_id = 10;
```
The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```sql
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
    "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB datatype.

```sql
MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause  IN/OUT  CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB datatype.

```sql
MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause     IN/OUT  CLOB,
    variable_list    IN/OUT  LCR$_ROW_LIST,
    bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

**See Also:**

- LCR$_ROW_LIST Type on page 275-47
- Oracle Streams Concepts and Administration

### Parameters

**Table 275–24  GET_WHERE_CLAUSE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>where_clause</td>
<td>The WHERE clause of the SQL statement for the change that is encapsulated in the LCR</td>
</tr>
<tr>
<td>variable_list</td>
<td>The values for the bind variables in the order of the bind variables</td>
</tr>
<tr>
<td>bind_var_syntax</td>
<td>The syntax for the bind variables</td>
</tr>
</tbody>
</table>

One of the following values is valid:

- Specify :, the default, for bind values to be in the form :1, :2, and so on.
- Specify ? for bind values to be in the form ?.
GET_XML_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

- `DBMS_LCR.NOT_XML` CONSTANT NUMBER := 1;
- `DBMS_LCR.XML_DOC` CONSTANT NUMBER := 2;
- `DBMS_LCR.XML_DIFF` CONSTANT NUMBER := 3;

`DBMS_LCR.NOT_XML` indicates that the column is not an XMLType column.

`DBMS_LCR.XML_DOC` indicates that the column contains an XML document.

`DBMS_LCR.XML_DIFF` indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

Returns NULL if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
    column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameter

### Table 275–25 GET_XML_INFORMATION Function Parameter

<table>
<thead>
<tr>

</table>

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
    column_list  IN  VARCHAR2,
    value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

### Table 275–26 KEEP_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_list</td>
<td>The names of the columns kept for the row LCR</td>
</tr>
</tbody>
</table>

Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.
RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

```sql
MEMBER PROCEDURE RENAME_COLUMN(
    from_column_name  IN  VARCHAR2,
    to_column_name    IN  VARCHAR2,
    value_type        IN  VARCHAR2  DEFAULT '*');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_column_name</td>
<td>The existing column name</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new column name</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value for which to rename the column. Specify old to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify new to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If * is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.</td>
</tr>
</tbody>
</table>

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Syntax

```sql
MEMBER PROCEDURE SET_LOB_INFORMATION(
    value_type       IN  VARCHAR2,
    column_name      IN  VARCHAR2,
    lob_information  IN  NUMBER);
```
Parameters

Table 275–28  SET_LOB_INFORMATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column, either old or new</td>
</tr>
<tr>
<td></td>
<td>Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column.</td>
</tr>
<tr>
<td></td>
<td>An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.</td>
</tr>
<tr>
<td>lob_information</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;</td>
</tr>
</tbody>
</table>

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

MEMBER PROCEDURE SET_LOB_OFFSET(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    lob_offset IN NUMBER);

Parameters

Table 275–29  SET_LOB_OFFSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column</td>
</tr>
<tr>
<td></td>
<td>Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>An error is raised if the column value does not exist in the LCR.</td>
</tr>
<tr>
<td>lob_offset</td>
<td>The LOB offset number</td>
</tr>
<tr>
<td></td>
<td>Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.
Summary of Logical Change Record Types

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```sql
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type          IN  VARCHAR2,
  column_name         IN  VARCHAR2,
  lob_operation_size  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column</td>
</tr>
<tr>
<td></td>
<td>Currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
<tr>
<td></td>
<td>An exception is raised if the column value does not exist in the LCR.</td>
</tr>
<tr>
<td>lob_operation_size</td>
<td>If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.</td>
</tr>
</tbody>
</table>

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

Note: To add a column to a row LCR, run ADD_COLUMN.

See Also: ADD_COLUMN Member Procedure on page 275-18

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the column_value parameter in the member procedure. The SET_VALUE member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:
The handler attempts to enqueue a row LCR with an \texttt{ANYDATA} encapsulated LOB locator.

An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

\begin{itemize}
  \item Database compatibility must be 10.2.0 or higher to use LOB assembly.
  \item When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
  \item When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a \texttt{LONG} or \texttt{LONG RAW} column.
\end{itemize}

\textbf{Considerations for XMLType Columns}

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the \texttt{column_value} parameter. The \texttt{SET\_VALUE} member procedure verifies that an \texttt{ANYDATA} encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an \texttt{ANYDATA} encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

\begin{itemize}
  \item Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
  \item When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.
\end{itemize}

\textbf{Syntax}

\begin{verbatim}
MEMBER PROCEDURE SET\_VALUE(
  value_type    IN  VARCHAR2,
  column_name   IN  VARCHAR2,
  column_value  IN  ANYDATA);
\end{verbatim}
Parameters

Table 275–31  SET_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set</td>
</tr>
<tr>
<td></td>
<td>Specify old to set the old value of the column. Specify new to set the new value of the column.</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>An error is raised if the specified column_value does not exist in the LCR for the specified column_type.</td>
</tr>
<tr>
<td>column_value</td>
<td>The new value of the column</td>
</tr>
<tr>
<td></td>
<td>If NULL is specified, then this procedure raises an error. To set the value to NULL, encapsulate the NULL in an ANYDATA instance.</td>
</tr>
<tr>
<td></td>
<td>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.</td>
</tr>
</tbody>
</table>

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), then you can use this member procedure in the handler procedure. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.
Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value of one or more XMLType columns in a row LCR, specify an XMLType for each XMLType column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType columns are represented by the original (nonassembled) row LCRs.

Note:
- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on LONG or LONG RAW columns.

Syntax

MEMBER PROCEDURE SET_VALUES(
    value_type IN VARCHAR2,
    value_list IN SYS.LCR$_ROW_LIST);
Parameters

**Table 275–32 SET_VALUES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of values to replace</td>
</tr>
<tr>
<td></td>
<td>Specify old to replace the old values. Specify new to replace the new values.</td>
</tr>
<tr>
<td>value_list</td>
<td>List of values to replace the existing list</td>
</tr>
<tr>
<td></td>
<td>Use a NULL or an empty list to remove all values.</td>
</tr>
<tr>
<td></td>
<td>If the member procedure is used in a procedure DML handler or error handler</td>
</tr>
<tr>
<td></td>
<td>that uses LOB assembly, then specify one or more LOB locators for LOB</td>
</tr>
<tr>
<td></td>
<td>columns.</td>
</tr>
</tbody>
</table>

**SET_XML_INFORMATION Member Procedure**

Sets the XML information for the column.

**Syntax**

```sql
MEMBER PROCEDURE SET_XML_INFORMATION(
    column_name      IN  VARCHAR2,
    xml_information  IN  NUMBER);
```

**Parameters**

**Table 275–33 SET_XML_INFORMATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td></td>
<td>An exception is raised if the column value does not exist in the LCR.</td>
</tr>
<tr>
<td>xml_information</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NOT_XML CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.XML_DOC CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;</td>
</tr>
</tbody>
</table>

DBMS_LCR.NOT_XML indicates that the column is not an XMLType column.

DBMS_LCR.XML_DOC indicates that the column contains an XML document.

DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.
Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

The following functions and procedures are common to both the LCR$_DDL_RECORD and LCR$_ROW_RECORD type.

See Also: For descriptions of the subprograms for these types that are exclusive to each type:
- "Summary of LCR$_DDL_RECORD Subprograms" on page 275-9
- "Summary of LCR$_ROW_RECORD Subprograms" on page 275-17

Table 275–34 Summary of Common Subprograms for DDL and Row LCR Types

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_COMMAND_TYPE Member Function on page 275-37</td>
<td>Gets the command type of the logical change record (LCR)</td>
</tr>
<tr>
<td>GET_COMMIT_SCN Member Function on page 275-37</td>
<td>Gets the commit system change number (SCN) of the transaction to which the current LCR belongs</td>
</tr>
<tr>
<td>GET_COMMIT_SCN_FROM_POSITION Static Function on page 275-38</td>
<td>Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server</td>
</tr>
<tr>
<td>GET_COMMIT_TIME on page 275-38</td>
<td>Gets the commit time of the transaction to which the current LCR belongs</td>
</tr>
<tr>
<td>GET_COMPATIBLE Member Function on page 275-38</td>
<td>Gets the minimal database compatibility required to support the LCR</td>
</tr>
<tr>
<td>GET_EXTRA_ATTRIBUTE Member Function on page 275-39</td>
<td>Gets the value for the specified extra attribute in the LCR</td>
</tr>
<tr>
<td>GET_OBJECT_NAME Member Function on page 275-40</td>
<td>Gets the name of the object that is changed by the LCR</td>
</tr>
<tr>
<td>GET_OBJECT_OWNER Member Function on page 275-40</td>
<td>Gets the owner of the object that is changed by the LCR</td>
</tr>
<tr>
<td>GET_POSITION Member Function on page 275-41</td>
<td>Gets the position of the current LCR</td>
</tr>
<tr>
<td>GET_ROOT_NAME Member Function on page 275-41</td>
<td>Gets the global name of the root for a CDB.</td>
</tr>
<tr>
<td>GET_SCN Member Function on page 275-41</td>
<td>Gets the SCN of the LCR</td>
</tr>
<tr>
<td>GET_SCN_FROM_POSITION Static Function on page 275-41</td>
<td>Gets the SCN from the input position, which is generated by an XStream outbound server</td>
</tr>
<tr>
<td>GET_SOURCE_DATABASE_NAME Member Function on page 275-42</td>
<td>Gets the source database name.</td>
</tr>
<tr>
<td>GET_SOURCE_TIME Member Function on page 275-42</td>
<td>Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created</td>
</tr>
<tr>
<td>GET_TAG Member Function on page 275-42</td>
<td>Gets the tag for the LCR</td>
</tr>
</tbody>
</table>
### GET_COMMAND_TYPE Member Function

 Gets the command type of the LCR.

**See Also:** The "SQL Command Codes" table in the Oracle Call Interface Programmer’s Guide for a complete list of command types

**Syntax**

```sql
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

### GET_COMMIT_SCN Member Function

 Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns `NULL`.

**Syntax**

```sql
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```
GET_COMMIT_SCN_FROM_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

Syntax

```plaintext
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
    position  IN  RAW)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>position</td>
<td>The position. You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.</td>
</tr>
</tbody>
</table>

Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

GET_COMMIT_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns NULL.

Syntax

```plaintext
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

GET_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>COMPATIBLE Initialization Parameter Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_9_2</td>
<td>9.2.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_10_1</td>
<td>10.1.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_10_2</td>
<td>10.2.0</td>
</tr>
<tr>
<td>DBMS_STREAMS.COMPATIBLE_11_1</td>
<td>11.1.0</td>
</tr>
</tbody>
</table>
DDL LCRs always return `DBMS_STREAMS.COMPATIBLE_9_2`.

You can use the following functions in the `DBMS_STREAMS` package for constant compatibility return values:

- The `COMPATIBLE_9_2` function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.
- The `COMPATIBLE_10_1` function returns `DBMS_STREAMS.COMPATIBLE_10_1` constant.
- The `COMPATIBLE_10_2` function returns `DBMS_STREAMS.COMPATIBLE_10_2` constant.
- The `COMPATIBLE_11_1` function returns `DBMS_STREAMS.COMPATIBLE_11_1` constant.
- The `COMPATIBLE_11_2` function returns `DBMS_STREAMS.COMPATIBLE_11_2` constant.
- The `MAX_COMPATIBLE` function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the `GET_COMPATIBLE` member function for an LCR in rule conditions and apply handlers.

### Note:
You can determine which database objects in a database are not supported by Oracle Streams by querying the `DBA_STREAMS_UNSUPPORTED` data dictionary view.

### See Also:
- Oracle Streams Concepts and Administration for examples of rules that discard changes that are not supported by Oracle Streams
- Chapter 158, "DBMS_STREAMS" and Chapter 159, "DBMS_STREAMS_ADM"
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the `COMPATIBLE` initialization parameter

### Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

### GET_EXTRA_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an `ANYDATA` instance. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

### See Also:
- `INCLUDE_EXTRA_ATTRIBUTE Procedure` on page 34-33

### Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
    attribute_name  IN  VARCHAR2)
```
RETURN ANYDATA;

Parameters

Table 275–36  GET_EXTRA_ATTRIBUTE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>The name of the extra attribute to return</td>
</tr>
<tr>
<td></td>
<td>Valid names are:</td>
</tr>
<tr>
<td></td>
<td>■ row_id</td>
</tr>
<tr>
<td></td>
<td>The rowid of the row changed in a row LCR. This attribute is not included in</td>
</tr>
<tr>
<td></td>
<td>DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID.</td>
</tr>
<tr>
<td></td>
<td>■ serial#</td>
</tr>
<tr>
<td></td>
<td>The serial number of the session that performed the change captured in the</td>
</tr>
<tr>
<td></td>
<td>LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ session#</td>
</tr>
<tr>
<td></td>
<td>The identifier of the session that performed the change captured in the LCR</td>
</tr>
<tr>
<td></td>
<td>. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ thread#</td>
</tr>
<tr>
<td></td>
<td>The thread number of the instance in which the change captured in the LCR</td>
</tr>
<tr>
<td></td>
<td>was performed. Typically, the thread number is relevant only in an Oracle</td>
</tr>
<tr>
<td></td>
<td>Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>■ tx_name</td>
</tr>
<tr>
<td></td>
<td>The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>■ username</td>
</tr>
<tr>
<td></td>
<td>The name of the current user who performed the change captured in the LCR.</td>
</tr>
<tr>
<td></td>
<td>The type is VARCHAR2.</td>
</tr>
</tbody>
</table>

An error is raised if the specified attribute_name is not valid.

If no value exists for the specified extra attribute, then the function returns a NULL.

See Also: Oracle Database PL/SQL Language Reference for more information about the current user

GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME() 
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER() 
RETURN VARCHAR2;
```
**GET_POSITION Member Function**

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

**Syntax**

```plaintext
MEMBER FUNCTION GET_POSITION()
RETURN RAW;
```

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**GET_ROOT_NAME Member Function**

Gets the global name of the root in a CDB, which is the root name for the LCR.

**Syntax**

```plaintext
MEMBER FUNCTION GET_ROOT_NAME()
RETURN VARCHAR2;
```

**GET_SCN Member Function**

Gets the system change number (SCN) of the LCR.

**Syntax**

```plaintext
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

**GET_SCN_FROM_POSITION Static Function**

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

**Syntax**

```plaintext
STATIC FUNCTION GET_SCN_FROM_POSITION(
    position  IN  RAW)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>position</td>
<td>The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.</td>
</tr>
</tbody>
</table>

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*. 
GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;

GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

MEMBER FUNCTION GET_TAG()
RETURN RAW;

GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

See Also: Oracle Real Application Clusters Administration and Deployment Guide

Syntax

MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;

GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

Syntax

MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;

IS_NULL_TAG Member Function

Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.
### Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

**Logical Change Record TYPEs**

**Syntax**

```sql
MEMBER FUNCTION IS_NULL_TAG() RETURN VARCHAR2;
```

### SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

**See Also:**
- The description of the `command_type` parameter in LCR$_DDL_RECORD Constructor Function Parameters on page 275-7
- The description of the `command_type` parameter in LCR$_ROW_RECORD Type on page 275-15
- The "SQL Command Codes" table in the Oracle Call Interface Programmer’s Guide for a complete list of command types

**Syntax**

```sql
MEMBER PROCEDURE SET_COMMAND_TYPE(
    command_type IN VARCHAR2);
```

#### Parameter

**Table 275–38 SET_COMMAND_TYPE Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>command_type</code></td>
<td>The command type</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to a non-NULL value.</td>
</tr>
</tbody>
</table>

**See Also:** INCLUDE_EXTRA_ATTRIBUTE Procedure on page 34-33

### SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

**See Also:** INCLUDE_EXTRA_ATTRIBUTE Procedure on page 34-33

**Syntax**

```sql
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2,
    attribute_value IN ANYDATA);
```
Parameters

Table 275–39  SET_EXTRA_ATTRIBUTE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>The name of the extra attribute to set</td>
</tr>
<tr>
<td>attribute_value</td>
<td>The value to which the specified extra attribute is set</td>
</tr>
</tbody>
</table>

Valid names are:

- **row_id**
  The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2.

- **serial#**
  The serial number of the session that performed the change captured in the LCR. The type is NUMBER.

- **session#**
  The identifier of the session that performed the change captured in the LCR. The type is NUMBER.

- **thread#**
  The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.

- **tx_name**
  The name of the transaction that includes the LCR. The type is VARCHAR2.

- **username**
  The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.

An error is raised if the specified attribute_name is not valid.

See Also: Oracle Database PL/SQL Language Reference for more information about the current user.

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```sql
MEMBER PROCEDURE SET_OBJECT_NAME(
    object_name  IN  VARCHAR2);
```

Parameter

Table 275–40  SET_OBJECT_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the object</td>
</tr>
</tbody>
</table>
**SET_OBJECT_OWNER Member Procedure**
Sets the owner of the object that is changed by the LCR.

**Syntax**
```
MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner  IN  VARCHAR2);
```

**Parameter**

<table>
<thead>
<tr>
<th>Table 275–41 SET_OBJECT_OWNER Procedure Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>object_owner</td>
</tr>
</tbody>
</table>

**SET_ROOT_NAME Member Procedure**
Sets the global name of the root in a CDB. The setting is the root name for the LCR.

**Syntax**
```
MEMBER PROCEDURE SET_ROOT_NAME(
    root_name  IN  VARCHAR2);
```

**Parameter**

<table>
<thead>
<tr>
<th>Table 275–42 SET_OBJECT_OWNER Procedure Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>root_name</td>
</tr>
</tbody>
</table>

**SET_SOURCE_DATABASE_NAME Member Procedure**
Sets the source database name of the object that is changed by the LCR.

**Syntax**
```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name  IN  VARCHAR2);
```

**Parameter**

<table>
<thead>
<tr>
<th>Table 275–43 SET_SOURCE_DATABASE_NAME Procedure Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>source_database_name</td>
</tr>
</tbody>
</table>

If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.
SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

Syntax

```
MEMBER PROCEDURE SET_TAG(
  tag IN RAW);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| tag       | The binary tag for the LCR
|           | The size limit for a tag value is two kilobytes. |
LCR$ _ROW_LIST Type

Identifies a list of column values for a row in a table.
This type uses the LCR$ _ROW_UNIT type and is used in the LCR$ _ROW_RECORD type.

See Also:
- LCR$ _ROW_UNIT Type on page 275-48
- LCR$ _ROW_RECORD Type on page 275-15

Syntax

CREATE TYPE SYS.LCR$ _ROW_LIST AS TABLE OF SYS.LCR$ _ROW_UNIT
/

LCR$_ROW_UNIT Type

Identifies the value for a column in a row.

This type is used in the LCR$_ROW_LIST type.

See Also: LCR$_ROW_LIST Type on page 275-47

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name          VARCHAR2(4000),
  data                 ANYDATA,
  lob_information      NUMBER,
  lob_offset           NUMBER,
  lob_operation_size   NUMBER,
  long_information     NUMBER);
/
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>data</td>
<td>The data contained in the column</td>
</tr>
<tr>
<td>lob_information</td>
<td>Contains the LOB information for the column and contains one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NOT_A_LOB          CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NULL_LOB           CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.INLINE_LOB         CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.EMPTY_LOB          CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LOB_CHUNK          CONSTANT NUMBER := 5;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LAST_LOB_CHUNK     CONSTANT NUMBER := 6;</td>
</tr>
<tr>
<td>lob_offset</td>
<td>The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns</td>
</tr>
<tr>
<td>lob_operation_size</td>
<td>If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.</td>
</tr>
<tr>
<td>long_information</td>
<td>Contains the LONG information for the column and contains one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.not_a_long CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.null_long CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.inline_long CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.long_chunk CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;</td>
</tr>
</tbody>
</table>
The Oracle Multimedia ORDAudio object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. Oracle Multimedia ORDAudio can store and retrieve audio data of any data format. Oracle Multimedia ORDAudio can extract metadata from audio data of a variety of popular audio formats. Oracle Multimedia ORDAudio can also extract application attributes and store them in the comments attribute of the object in XML form.

- Documentation of ORDAudio
For a complete description of this type within the context of Oracle Multimedia, see ORDAudio in the Oracle Multimedia Reference.
The Oracle Multimedia ORDDicom object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

Oracle Multimedia ORDDicom provides methods to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. Oracle Multimedia ORDDicom also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- Documentation of ORDDicom
For a complete description of this type within the context of Oracle Multimedia, see ORDDicom in the *Oracle Multimedia DICOM Developer’s Guide.*
The Oracle Multimedia ORDDoc object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. Oracle Multimedia can store and retrieve media data of any data format. Oracle Multimedia ORDDoc datatype can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. However, you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- Documentation of ORDDoc
Documentation of ORDDoc

For a complete description of this type within the context of Oracle Multimedia, see ORDDoc in the Oracle Multimedia Reference.
The Oracle Multimedia ORDImage object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. Oracle Multimedia ORDImage can store and retrieve image data of any data format. Oracle Multimedia ORDImage can process (cut, scale, and generate thumbnails) of images, convert the format of images, extract properties of images of a variety of popular data formats, and extract and embed application metadata in images.

- Documentation of ORDImage
For a complete description of this type within the context of Oracle Multimedia, see ORDImage in the Oracle Multimedia Reference.
Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support:

- SI_StillImage
- SI_AverageColor
- SI_Color
- SI_ColorHistogram
- SI_FeatureList
- SI_PositionalColor
- SI_Texture

- Documentation of SQL/MM Still Image
Documentation of SQL/MM Still Image

For a complete description of this type within the context of Oracle Multimedia, see SQL/MM Still Image in the Oracle Multimedia Reference.
The Oracle Multimedia ORDVideo object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor’s name, producer’s name, and so on, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. Oracle Multimedia ORDVideo can store and retrieve video data of any data format. Oracle Multimedia ORDVideo can extract metadata from video data of a variety of popular video formats. Oracle Multimedia ORDVideo can also extract application attributes and store them in the comments attribute of the object in XML form.

- Documentation of ORDVideo
Documentation of ORDVideo

For a complete description of this type within the context of Oracle Multimedia, see ORDVideo in the Oracle Multimedia Reference.
The MGD_ID package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The MGD_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification). The MGD_ID package contains several predefined types.

See Also: Oracle Database Development Guide for more information.

This chapter contains the following topics:

- Using MGD_ID Package Object Types
- Summary of Types
- Summary of MGD_ID Subprograms

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that you have run the following set of commands before running the contents of each script:

```sql
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

See Also: Oracle Database Development Guide for more information.
Using MGD_ID Package Object Types

This section contains topics that relate to using the MGD_ID package object types.

- Security Model
Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`. 
Table 282–1 describes the MGD_ID Package object types.

<table>
<thead>
<tr>
<th>Object Type Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MGD_ID_COMPONENT Object Type</td>
<td>Datatype that specifies the name and value pair attributes that define a component</td>
</tr>
<tr>
<td>MGD_ID_COMPONENT_VARRAY Object Type</td>
<td>Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object</td>
</tr>
<tr>
<td>MGD_ID Object Type</td>
<td>Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components</td>
</tr>
</tbody>
</table>
**MGD_ID_COMPONENT Object Type**

The `MGD_ID_COMPONENT` type is a datatype that specifies the name and value pair attributes that define a component.

**Syntax**

```sql
MGD_ID_COMPONENT as object (name VARCHAR2(256),
                           value VARCHAR2(1024));
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of component</td>
</tr>
<tr>
<td>value</td>
<td>Value of the component as a character</td>
</tr>
</tbody>
</table>

**Examples**

See the [MGD_ID Constructor Function](#) for an example.
MGD_ID_COMPONENT_VARRAY Object Type

The MGD_ID_COMPONENT_VARRAY type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

Examples

See the MGD_ID Constructor Function for an example.
MGD_ID Object Type

The MGD_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

MGD_ID as object (category_id VARCHAR2(256),
    components MGD_ID_COMPONENT_VARRAY);

Attributes

Table 282–3 MGD_ID Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>

</tbody>
</table>
**MGD_ID Constructor Function**

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

**Syntax**

Constructs an MGD_ID object type based on the category ID and a list of components.

```sql
MGD_ID (    category_id      IN VARCHAR2,
            components       IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```sql
MGD_ID (    category_id        VARCHAR2,
            identifier         VARCHAR2,
            parameter_list      VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```sql
MGD_ID (    category_name      VARCHAR2,
            category_version   VARCHAR2,
            components         MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```sql
MGD_ID (    category_name      VARCHAR2,
            category_version   VARCHAR2,
            identifier         VARCHAR2,
            parameter_list      VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category identifier</td>
</tr>
<tr>
<td>components</td>
<td>List of component name value pairs</td>
</tr>
<tr>
<td>category_name</td>
<td>Category name, such as EPC</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version. If NULL, the latest version for the specified category name will be used.</td>
</tr>
</tbody>
</table>
Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is NULL, the `bit_length` is 8 times the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

Examples

The following examples construct identity code type objects.

Construct an `MGD_ID` object (SGTIN-64) passing in the category ID and a list of components.

```sql
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
    MGD_ID_COMPONENT_VARRAY(
        MGD_ID_COMPONENT('companyprefix','0037000'),
        MGD_ID_COMPONENT('itemref','030241'),
        MGD_ID_COMPONENT('serial','1041970'),
        MGD_ID_COMPONENT('schemes','SGTIN-64')
    )
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
```

```sql
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
MGD_ID_COMPONENT('itemref', '030241'),
MGD_ID_COMPONENT('serial', '1041970'),
MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
```
Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
    'urn:epc:id:sgtin:0037000.030241.1041970',
    'filter=3; scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.

Construct an MGD_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
    MGD_ID_COMPONENT_VARRAY(
        MGD_ID_COMPONENT('companyprefix', '0037000'),
        MGD_ID_COMPONENT('itemref', '030241'),
        MGD_ID_COMPONENT('serial', '1041970'),
        MGD_ID_COMPONENT('schemes', 'SGTIN-64')
    )
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.

Constructs an MGD_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.
-- Contents of constructor4.sql

```
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
    'urn:epc:id:sgtin:0037000.030241.1041970',
    'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor4.sql
```

```
**FORMAT Function**

This function returns the string representation of the MGD_ID object in the specified format.

**Syntax**

```sql
FORMAT (parameter_list IN VARCHAR2,
       output_format   IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

**Parameters**

*Table 282–7  FORMAT Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96</td>
</tr>
<tr>
<td>output_format</td>
<td>One of the supported output formats into which an MGD_ID component is formatted:</td>
</tr>
<tr>
<td></td>
<td>▪ BINARY</td>
</tr>
<tr>
<td></td>
<td>▪ LEGACY</td>
</tr>
<tr>
<td></td>
<td>▪ TAG_ENCODING</td>
</tr>
<tr>
<td></td>
<td>▪ PURE_IDENTITY</td>
</tr>
<tr>
<td></td>
<td>▪ ONS_HOSTNAME</td>
</tr>
</tbody>
</table>

**Examples**

See the example for the GET_COMPONENT Function.
GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
GET_COMPONENT (  
    component_name  IN  VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_name</td>
<td>Name of component</td>
</tr>
</tbody>
</table>

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
  id  MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  ----------------
  --PURE_IDENTIT
  ----------------
  dbms_output.put_line('..Testing constructor with pure identity');
  //--------------------------------------------------------------------------------------
  -- PUREIDENTITY representation can be translated to BINARY and
  -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
  //--------------------------------------------------------------------------------------
  id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970', 'scheme=SGTIN-64;filter=3');
  dbms_output.put_line(id.to_string);
  dbms_output.put_line('filter         = ' || id.get_component('filter'));
  dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
  dbms_output.put_line('itemref        = ' || id.get_component('itemref'));
  dbms_output.put_line('serial         = ' || id.get_component('serial'));
  dbms_output.put_line('BINARY format  = ' || id.format(NULL, 'BINARY'));
  dbms_output.put_line('PURE_IDENTITY format  = ' || id.format(NULL, 'PURE_IDENTITY'));

TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD_ID object.

Syntax

```
TO_STRING
RETURN VARCHAR2;
```

Examples

The following example converts the MGD_ID object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
  id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  DBMS_OUTPUT.put_line('..Testing to_string');
  id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
  DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
  DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @tostring3.sql

category_id =1; schemes = GID-96; objectclass = 30241; generalmanager = 0037000; scheme = GID-96; l = 1; serial = 1041970
PL/SQL procedure successfully completed.
.
.
```
**TRANSLATE Function**

This static function translates between different representations directly without first constructing an MGD_ID object. This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

**Syntax**

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```sql
TRANSLATE (  
category_name    IN VARCHAR2,
identifer       IN VARCHAR2,
parameter_list   IN VARCHAR2,
output_format    IN VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```sql
TRANSLATE (  
category_name    IN VARCHAR2,
category_version IN VARCHAR2,
identifer       IN VARCHAR2,
parameter_list   IN VARCHAR2,
output_format    IN VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_name</td>
<td>Name of category</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version. If NULL, the latest version of the specified category name will be used.</td>
</tr>
<tr>
<td>identifier</td>
<td>EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.</td>
</tr>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96</td>
</tr>
</tbody>
</table>
Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the parameter_list parameter.

Examples

The following examples translates one GID-96 representation into another:

```sql
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
  id MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  DBMS_OUTPUT.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  DBMS_OUTPUT.put_line(
    mgd_id.translate('EPC',
      NULL,'0011010100000000000010010000100010000000011101100100010000000011111100110001100100001000000000000000000000000000011111110011000110010',
      NULL, 'BINARY'));
  DBMS_OUTPUT.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
  DBMS_OUTPUT.put_line(
    mgd_id.translate('EPC',
      NULL,'00110101000000000000100100001000100000000111011001000100000000111111001100011001000010000000000000000000000000000111111100110001100100001000000000000000000000000000011111110011000110010',
      NULL, 'PURE_IDENTITY'));
  DBMS_OUTPUT.put_line('Category ID is EPC, Identifier is BINARY, Output format is TAG_ENCODING');
  DBMS_OUTPUT.put_line(
    mgd_id.translate('EPC',
      NULL,'00110101000000000000100100001000100000000111011001000100000000111111001100011001000010000000000000000000000000000111111100110001100100001000000000000000000000000000011111110011000110010',

MGD_ID Package Types  282-19
This chapter describes the types used with rules, rule sets, and evaluation contexts.
This chapter contains the following topics:

- **Using Rule Types**
  - Overview
  - Security Model

- **Summary of Rule Types**
Using Rule Types

This section contains topics that relate to using the types used with rules, rule sets, and evaluation contexts.

- Overview
- Security Model
Overview

This types in this chapter are used in rules and enable clients to evaluate rules with the rules engine.

See Also:

- Chapter 138, "DBMSRULE"
- Chapter 139, "DBMS_RULE_ADM"
- Oracle Streams Extended Examples for examples that use rule types
Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

See Also: Oracle Database Security Guide for more information about user group PUBLIC
Summary of Rule Types

Table 283–1 Rule Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>

<td>Identifies a list of variables and their types used in a rule evaluation context</td>
</tr>
<tr>
<td>RES$VARIABLE_VALUE Type on page 283-25</td>
<td>Specifies the value of a variable</td>
</tr>
<tr>
<td>RES$VARIABLE_VALUE_LIST Type on page 283-26</td>
<td>Identifies a list of variable values</td>
</tr>
</tbody>
</table>

Rule types are used with the following Oracle-supplied PL/SQL packages:

- DBMS_RULE
- DBMS_RULE_ADM

You can use the DBMS_RULE_ADM package to create and administer rules, rule sets, and evaluation contexts, and you can use the DBMS_RULE package to evaluate rules.
When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS_APPLY_ADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_STREAMS_AUTH

**See Also:** *Oracle Streams Concepts and Administration*
RE$ATTRIBUTE_VALUE Type

Specifies the value of a variable attribute.

---

**Note:** Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```sql
TYPE SYS.RE$ATTRIBUTE_VALUE ( 
  variable_name   VARCHAR2(32),
  attribute_name  VARCHAR2(4000),
  attribute_value  ANYDATA);
```

Attributes

**Table 283–2 RE$ATTRIBUTE_VALUE Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable used in a rule</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Specifies the attribute value</td>
</tr>
</tbody>
</table>
RE$ATTRIBUTE_VALUE_LIST Type

Identifies a list of attribute values.

Syntax

```sql
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```
RE$COLUMN_VALUE Type

Specifies the value of a table column.

---

**Note:** Enclose the column name in double quotation marks (""") if the name contains special characters.

---

Syntax

```sql
TYPE SYS.RE$COLUMN_VALUE {
    table_alias  VARCHAR2(32),
    column_name  VARCHAR2(4000),
    column_value ANYDATA);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the column name</td>
</tr>
<tr>
<td>column_value</td>
<td>Specifies the column value</td>
</tr>
</tbody>
</table>
RE$COLUMN_VALUE_LIST Type

Identifies a list of column values.

Syntax

    TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
**RE$NAME_ARRAY Type**

Identifies a list of names.

**Syntax**

```sql
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```
RE$NV_ARRAY Type

Identifies a list of name-value pairs.

Syntax

```sql
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```
RE$NV_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```sql
TYPE SYS.RE$NV_LIST AS OBJECT(
    actx_list SYS.RE$NV_ARRAY);
```

Attributes

**Table 283–4 RE$NV_LIST Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actx_list</td>
<td>The list of name-value pairs</td>
</tr>
</tbody>
</table>

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- ADD_PAIR Member Procedure
- GET_ALL_NAMES Member Function
- GET_VALUE Member Function
- REMOVE_PAIR Member Procedure

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

**Note:** Enclose the name in double quotation marks (“”) if the name contains special characters.

**Syntax**

```sql
MEMBER PROCEDURE ADD_PAIR(
    name   IN  VARCHAR2,
    value  IN  ANYDATA);
```

**Parameters**

**Table 283–5 ADD_PAIR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.</td>
</tr>
<tr>
<td>value</td>
<td>The value in the name-value pair being added to the list</td>
</tr>
</tbody>
</table>

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.
Syntax
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax
MEMBER FUNCTION GET_VALUE(
  name  IN  VARCHAR2)
RETURN ANYDATA;

Parameters

<table>
<thead>
<tr>
<th>Table 283–6 GET_VALUE Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax
MEMBER PROCEDURE REMOVE_PAIR(
  name  IN  VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Table 283–7 REMOVE_PAIR Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>
**RE$NV_NODE Type**

Identifies a name-value pair.

---

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

---

### Syntax

```
TYPE SYS.RE$NV_NODE {
   nvn_name VARCHAR2(30),
   nvn_value ANYDATA);
```

### Attributes

**Table 283–8**  RE$NV_NODE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvn_name</td>
<td>Specifies the name in the name-value pair</td>
</tr>
<tr>
<td>nvn_value</td>
<td>Specifies the value in the name-value pair</td>
</tr>
</tbody>
</table>
RE$RULE_HIT Type

Specifies a rule found because of an evaluation.

See Also:
- CREATE_RULE Procedure on page 139-15
- ALTER_RULE Procedure on page 139-11

Syntax

```
TYPE SYS.RE$RULE_HIT (
    rule_name       VARCHAR2(65),
    rule_action_context  RE$NV_LIST);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The rule name in the form <code>schema_name.rule_name</code>. For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>&quot;hr&quot;.&quot;employee_rule&quot;</code>.</td>
</tr>
<tr>
<td>rule_action_context</td>
<td>The rule action context as specified in the CREATE_RULE or ALTER_RULE procedure of the DBMSRULE_ADM package.</td>
</tr>
</tbody>
</table>
RE$RULE_HIT_LIST Type

Identifies a list of rules found because of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```
RE$TABLE_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

---

**Note:** Enclose the table name in double quotation marks (""") if the name contains special characters.

---

**See Also:** *Oracle Database SQL Language Reference* for information about schema object naming rules

**Syntax**

```sql
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
    table_alias  VARCHAR2(32),
    table_name   VARCHAR2(194));
```

**Attributes**

*Table 283-10  RE$TABLE_ALIAS Attributes*

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>The alias used for the table in a rule</td>
</tr>
</tbody>
</table>
| table_name  | The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: schema_name.table_name table_name

For example, if the schema_name is hr and the table_name is employees, then enter the following:

hr.employees
RE$TABLE_ALIAS_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```
RE$TABLE_VALUE Type

Specifies the value of a table row using a ROWID.

Syntax

```sql
TYPE SYS.RE$TABLE_VALUE(
    table_alias  VARCHAR2(32),
    table_rowid  VARCHAR2(18));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>table_rowid</td>
<td>Specifies the rowid for the table row</td>
</tr>
</tbody>
</table>
**RE$TABLE_VALUE_LIST Type**

Identifies a list of table values.

---

**Note:** Each table alias in the list must be unique.

---

**Syntax**

```sql
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```
RE$VARIABLE_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

---

**Note:** Enclose the variable name in double quotation marks ("”) if the name contains special characters.

---

**See Also:** Oracle Database SQL Language Reference for information about schema object naming rules

### Syntax

```sql
TYPE SYS.RE$VARIABLE_TYPE (  
    variable_name             VARCHAR2(32),  
    variable_type             VARCHAR2(4000),  
    variable_value_function   VARCHAR2(228),  
    variable_method_function  VARCHAR2(228));
```

### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>The variable name used in a rule</td>
</tr>
<tr>
<td>variable_type</td>
<td>The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the Oracle Database SQL Language Reference for more information about these types.</td>
</tr>
<tr>
<td>variable_value_function</td>
<td>A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
<tr>
<td>variable_method_function</td>
<td>Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>

### Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```
Any of the following parts of the format can be omitted: `schema_name`, `package_name`, and `@dblink`.

For example, if the `schema_name` is hr, the `package_name` is var_pac, the `function_name` is func_value, and the `dblink` is dbs1.net, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

**Signature for variable_value_function**

The function must have the following signature:

```
FUNCTION variable_value_function_name(
    evaluation_context_schema IN VARCHAR2,
    evaluation_context_name IN VARCHAR2,
    variable_name IN VARCHAR2,
    event_context IN SYS.RE$NV_LIST)
RETURN SYS.RE$VARIABLE_VALUE;
```

**Signature for variable_method_function**

This function must have the following signature:

```
FUNCTION variable_method_function_name(
    evaluation_context_schema IN VARCHAR2,
    evaluation_context_name IN VARCHAR2,
    variable_value IN SYS.RE$VARIABLE_VALUE,
    method_name IN VARCHAR2,
    event_context IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```
RE$VARIABLE_TYPE_LIST Type

Identifies a list of variables and their types used in a rule evaluation context.

Syntax

```sql
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```
**RE$VARIABLE_VALUE Type**

Specifies the value of a variable.

---

**Note:** Enclose the variable name in double quotation marks ("\") if the name contains special characters.

---

**Syntax**

```sql
TYPE SYS.RE$VARIABLE_VALUE {
    variable_name VARCHAR2(32),
    variable_data ANYDATA);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable name used in a rule</td>
</tr>
<tr>
<td>variable_data</td>
<td>Specifies the data for the variable value</td>
</tr>
</tbody>
</table>
RE$VARIABLE_VALUE_LIST Type

Identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```
UTL Streams Types describes abstract types used with Oracle XML functionality. Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

See Also: For more information, see Oracle XML DB Developer's Guide

This chapter contains the following topics:

- Using UTL Streams Types
- Summary of UTL Binary Streams Types
Using UTL Streams Types

- Security Model
Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.
## Summary of UTL Binary Streams Types

### Table 284–1  UTL Streams Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>UTL_BINARYINPUTSTREAM</code></td>
<td>Reads bytes and closes a stream.</td>
</tr>
<tr>
<td><code>UTL_BINARYOUTPUTSTREAM</code></td>
<td>Writes bytes and closes a stream.</td>
</tr>
<tr>
<td><code>UTL_CHARACTERINPUTSTREAM</code></td>
<td>Reads chars and closes a stream.</td>
</tr>
<tr>
<td><code>UTL_CHARACTEROUTPUTSTREAM</code></td>
<td>Writes chars and closes a stream.</td>
</tr>
</tbody>
</table>
UTL_BINARYINPUTSTREAM Type

This type is similar to java.io.InputStream in that it can only read and close a stream.

Syntax

CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (  
    MEMBER FUNCTION available (  
        self IN OUT NOCOPY Utl_BinaryInputStream)  
    RETURN INTEGER,  
    MEMBER FUNCTION read ( -- #1  
        self IN OUT NOCOPY Utl_BinaryInputStream,  
        numBytes IN INTEGER DEFAULT 1)  
    RETURN RAW,  
    MEMBER FUNCTION close (  
        self IN Out Nocopy Utl_BinaryInputStream)  
    ) NOT FINAL;

Attributes

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABLE</td>
<td>Returns the number of bytes available to be read</td>
</tr>
<tr>
<td>READ</td>
<td></td>
</tr>
</tbody>
</table>
| #1 - Reads the number of bytes specified by numBytes (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned.  
| #2 - Reads the number of bytes specified in numBytes into the parameter bytes. Additionally, the actual number of bytes read is returned in parameter numBytes. If this parameter is set to 0 then there are no more bytes to be read.  
| #3 - Reads the number of bytes specified in numBytes into the parameter bytes, beginning at the offset specified by parameter offset. The actual number of bytes read is returned in parameter numBytes. If this value is 0, then there are no additional bytes to be read. |
| CLOSE             | Releases all resources held on the node to support the stream |
UTL_BINARYOUTPUTSTREAM Type

This type is similar to java.io.OutputStream in that it can only write and close a stream.

Syntax

CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT {

MEMBER FUNCTION write (                                  -- #1
  self       IN OUT NOCOPY   sys.utl_BinaryOutputStream,
  bytes      IN              RAW,
  numBytes   IN              INTEGER DEFAULT 1)
RETURN INTEGER,

MEMBER PROCEDURE write (                                  -- #2
  self       IN OUT NOCOPY  sys.utl_BinaryOutputStream,
  bytes      IN NOCOPY      RAW,
  numBytes   IN OUT         INTEGER),

MEMBER PROCEDURE write (                                  -- #3
  self       IN OUT NOCOPY  utl_BinaryOutputStream,        bytes      IN
NOCOPY      RAW,
  offset     IN             INTEGER,
  numBytes   IN OUT         INTEGER),

MEMBER PROCEDURE flush ( self       IN OUT NOCOPY  utl_BinaryOutputStream),

MEMBER PROCEDURE close ( self       IN OUT NOCOPY utl_BinaryOutputStream)
)
NOT FINAL;

Attributes

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRITE #1</td>
<td>#1 - Writes the number of bytes specified by numBytes (default is 1) from RAW into the stream. The actual number of bytes written is returned.</td>
</tr>
<tr>
<td></td>
<td>#2 - Writes the number of bytes specified in parameter numBytes from parameter bytes to the stream. The actual number of bytes written is returned in parameter numBytes.</td>
</tr>
<tr>
<td></td>
<td>#3 - Writes the number of bytes specified by numBytes to the stream, beginning at the offset specified by parameter offset. The actual number of bytes written is returned in parameter numBytes.</td>
</tr>
<tr>
<td>FLUSH</td>
<td>Insures that any buffered bytes are copied to the node destination</td>
</tr>
<tr>
<td>CLOSE</td>
<td>Frees all resources associated with the stream</td>
</tr>
</tbody>
</table>
**UTL_CHARACTERINPUTSTREAM Type**

This type is similar to java.io.Reader in that it can only read characters (chars) and close a stream.

**Syntax**

```
CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

    MEMBER FUNCTION available (self IN OUT NOCOPY utl_CharacterInputStream) RETURN INTEGER,
    MEMBER FUNCTION read (self IN OUT NOCOPY utl_CharacterInputStream, numChars IN INTEGER DEFAULT 1, lineFeed IN BOOLEAN DEFAULT FALSE) RETURN VARCHAR2, MEMBER PROCEDURE read (self IN OUT NOCOPY utl_CharacterInputStream, chars IN OUT NOCOPY VARCHAR2, numChars IN OUT INTEGER, lineFeed IN BOOLEAN DEFAULT FALSE),
    MEMBER PROCEDURE read (self IN OUT NOCOPY utl_CharacterInputStream, chars IN OUT NOCOPY VARCHAR2, offset IN INTEGER, numChars IN OUT INTEGER, lineFeed IN BOOLEAN DEFAULT FALSE),
    MEMBER PROCEDURE close (self IN OUT NOCOPY utl_CharacterInputStream) ) NOT FINAL;
```

**Attributes**

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABLE</td>
<td>Returns the number of bytes available to be read</td>
</tr>
<tr>
<td>READ</td>
<td>• #1 - Returns the number of characters remaining to be read</td>
</tr>
<tr>
<td></td>
<td>• #2 - Reads the number of characters specified by numChars (default value is 1) and returns the characters as a VARCHAR2. If the value of lineFeed is true (default value is FALSE) then the reading stops if a linefeed character is found. If there are no remaining characters a value of NULL is returned.</td>
</tr>
<tr>
<td></td>
<td>• #3 - Reads the number of characters specified by parameter numChars into the parameter chars. Additionally, the actual number of characters read is returned in parameter numChars. If this value is 0, then there are no more characters to be read. If the value of lineFeed is TRUE (default is FALSE), then reading stops if a linefeed character is encountered.</td>
</tr>
<tr>
<td>CLOSE</td>
<td>Releases all resources held by the stream</td>
</tr>
</tbody>
</table>
UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to java.io.Reader in that it can only read characters (chars) and close a stream.

Syntax

```plsql
CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (   MEMBER FUNCTION write (                                      -- #1
  self      IN OUT NOCOPY   utl_CharacterOutputStream,
  chars     IN              VARCHAR2,
  numChars  IN              INTEGER DEFAULT 1,
  lineFeed  IN              BOOLEAN DEFAULT FALSE)
  RETURN INTEGER,
  MEMBER PROCEDURE write (                                      -- #2
  self      IN OUT NOCOPY   utl_CharacterOutputStream,
  chars     IN OUT NOCOPY   VARCHAR2,
  numChars  IN OUT          INTEGER,
  lineFeed  IN              BOOLEAN DEFAULT FALSE),
  member procedure write (                                      -- #3
  self     IN OUT NOCOPY    utl_CharacterOutputStream,
  chars    IN  NOCOPY       varchar2,
  offset   IN               integer,
  numChars IN OUT           integer,
  lineFeed  IN               boolean default false),
  MEMBER PROCEDURE flush (                                      -- #3
    self     IN OUT NOCOPY    utl_CharacterOutputStream),
  MEMBER PROCEDURE close (                                      -- #3
    self     IN OUT NOCOPY utl_CharacterOutputStream)
) NOT FINAL;
```

XMLType is a system-defined opaque type for handling XML data. It as predefined member functions on it to extract XML nodes and fragments.

You can create columns of XMLType and insert XML documents into it. You can also generate XML documents as XMLType instances dynamically using the `SYS_XMLAGG SQL function.

This chapter contains the following topics:

- **Summary of XMLType Subprograms**

**See Also:***

- *Oracle XML DB Developer’s Guide*
Summary of XMLType Subprograms

Table 285–1 summarizes functions and procedures of the XMLType.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATENONSCHEMABASE DXML</td>
<td>Creates a non schema based XML from the input schema based instance.</td>
</tr>
<tr>
<td>CREATESCHEMABASEDXML</td>
<td>Creates a schema based XMLType instance from the non-schema based instance using the input schema URL.</td>
</tr>
<tr>
<td>CREATEXML</td>
<td>Static function for creating and returning an XMLType instance.</td>
</tr>
<tr>
<td>EXISTSNODE</td>
<td>Takes a XMLType instance and a XPath and returns 1 or 0 indicating if applying the XPath returns a non-empty set of nodes.</td>
</tr>
<tr>
<td>EXTRACT</td>
<td>Takes a XMLType instance and an XPath, applies the XPath expression and returns the results as an XMLType.</td>
</tr>
<tr>
<td>GETBLOBVAL</td>
<td>Returns the value of the XMLType instance as a BLOB.</td>
</tr>
<tr>
<td>GETCLOBVAL</td>
<td>Returns the value of the XMLType instance as a CLOB.</td>
</tr>
<tr>
<td>GETNAMESPACE</td>
<td>Returns the namespace for the top level element in a schema based document.</td>
</tr>
<tr>
<td>GETNUMBERVAL</td>
<td>Returns the value of the XMLType instance as a NUMBER. This is only valid if the input XMLType instance contains a simple text node and is convertible to a number.</td>
</tr>
<tr>
<td>GETROOTELEMENT</td>
<td>Returns the root element of the input instance. Returns NULL if the instance is a fragment.</td>
</tr>
<tr>
<td>GETSCHEMAMURL</td>
<td>Returns the XML schema URL if the input is an XML Schema based.</td>
</tr>
<tr>
<td>GETSTRINGVAL</td>
<td>Returns the value of the XMLType instance as a string.</td>
</tr>
<tr>
<td>ISFRAGMENT</td>
<td>Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.</td>
</tr>
<tr>
<td>ISSCHEMABASED</td>
<td>Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.</td>
</tr>
<tr>
<td>ISSCHEMAVALID</td>
<td>Checks if the input instance is schema valid according to the given schema URL.</td>
</tr>
<tr>
<td>ISSCHEMAVALIDATED</td>
<td>Checks if the instance has been validated against the schema.</td>
</tr>
<tr>
<td>SCHEMVALIDATE</td>
<td>Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.</td>
</tr>
<tr>
<td>SETSCHEMVALIDATED</td>
<td>Sets the schema valid flag to avoid costly schema validation.</td>
</tr>
<tr>
<td>TOOBJECT</td>
<td>Converts the XMLType instance to an object type.</td>
</tr>
<tr>
<td>TRANSFORM</td>
<td>Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.</td>
</tr>
</tbody>
</table>
Table 285–1  (Cont.) XMLTYPE Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLTYPE on page 285-25</td>
<td>Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.</td>
</tr>
</tbody>
</table>
CREATE NONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```
CREATESCHEMABASEDXM.png

CREATESCHEMABASEDXML

Member function. Creates a schema based XMLType instance from a non-schema based XMLType value. It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

**Syntax**

```sql
MEMBER FUNCTION createSchemaBasedXML(
  schema IN varchar2 := NULL)
return XMLType deterministic;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Optional XMLSchema URL used to convert the value to the specified schema.</td>
</tr>
</tbody>
</table>
Static function for creating and returning an XMLType instance. The string and CLOB parameters used to pass in the date must contain well-formed and valid XML documents. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN varchar2) RETURN XMLType deterministic;</td>
<td>Creates the XMLType instance from a string.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN clob) RETURN XMLType deterministic;</td>
<td>Creates the XMLType instance from a CLOB.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN clob, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN varchar2, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN &quot;&lt;ADT_1&gt;&quot;, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN NUMBER := 0) RETURN XMLType deterministic;</td>
<td>Creates an XML instance from an instance of an user-defined type.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN XMLType deterministic;</td>
<td>Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.</td>
</tr>
</tbody>
</table>
### Summary of XMLType Subprograms

**STATIC FUNCTION createXML**

```sql
STATIC FUNCTION createXML (  
xmlData IN AnyData,  
schema in varchar2 := NULL,  
element in varchar2 := NULL,  
validated in number := 0)  
RETURN sys.XMLType deterministic  
parallel_enable
```

**Description**

Creates an XML instance from `ANYDATA`. If the `ANYDATA` instance contains an ADT, the `XMLType` returned is the same as would be returned for a call directly on the ADT. If the `ANYDATA` contains a scalar, the `XMLType` contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.

**STATIC FUNCTION createXML**

```sql
STATIC FUNCTION createXML (  
xmlData IN blob,  
csid IN number,  
schema IN varchar2,  
validated IN number := 0,  
wellformed IN number := 0)  
return sys.XMLType deterministic
```

**Description**

Creates an XML instance from a `BLOB`.

**STATIC FUNCTION createXML**

```sql
STATIC FUNCTION createXML (  
xmlData IN bfile,  
csid IN number,  
Schema IN varchar2,  
validated IN number := 0,  
wellformed IN number := 0)  
return sys.XMLType deterministic
```

**Description**

Creates an XML instance from a `BFILE`.

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xmlData</code></td>
<td>The actual data in the form of a <code>BFILE</code>, <code>BLOB</code>, <code>CLOB</code>, <code>REF</code> cursor, <code>VARCHAR2</code> or object type.</td>
</tr>
<tr>
<td><code>schema</code></td>
<td>Optional Schema URL to be used to make the input conform to the given schema. <strong>Caution:</strong> Oracle does not support use of types generated by Schema Registration (see Oracle XML DB Developer’s Guide).</td>
</tr>
<tr>
<td><code>validated</code></td>
<td>Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)</td>
</tr>
<tr>
<td><code>wellformed</code></td>
<td>Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)</td>
</tr>
<tr>
<td><code>element</code></td>
<td>Optional element name in the case of the <code>ADT_1</code> or <code>REF CURSOR</code> constructors. (Default is NULL). <strong>Caution:</strong> Oracle does not support use of types generated by Schema Registration (see Oracle XML DB Developer’s Guide).</td>
</tr>
<tr>
<td><code>csid</code></td>
<td>The character set id of input XML data.</td>
</tr>
</tbody>
</table>
Member function. Checks if the node exists. If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION existsNode(xpath IN varchar2) RETURN number deterministic;</td>
<td>Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.</td>
</tr>
<tr>
<td>MEMBER FUNCTION existsNode(xpath in varchar2, nsmap in varchar2) RETURN number deterministic;</td>
<td>This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpath</td>
<td>The XPath expression to test.</td>
</tr>
<tr>
<td>nsmap</td>
<td>Optional namespace mapping.</td>
</tr>
</tbody>
</table>
EXTRACT

Member function. Extracts an XMLType fragment and returns an XMLType instance containing the result node(s). If the XPath does not result in any nodes, then returns NULL. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEMBER FUNCTION extract( xpath IN varchar2) RETURN XMLType deterministic;</td>
<td>Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.</td>
</tr>
<tr>
<td>MEMBER FUNCTION extract( xpath IN varchar2, nsmap IN varchar2) RETURN XMLType deterministic;</td>
<td>This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpath</td>
<td>The XPath expression to apply.</td>
</tr>
<tr>
<td>nsmap</td>
<td>Optional prefix to namespace mapping information.</td>
</tr>
</tbody>
</table>
GETBLOBVAL

Member function. Returns a BLOB containing the serialized XML representation; if the BLOB returned is temporary, it must be freed after use.

Syntax

MEMBER FUNCTION getBlobVal{
    csid IN NUMBER
} RETURN BLOB DETERMINISTIC;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csid</td>
<td>The desired character set ID of output BLOB</td>
</tr>
</tbody>
</table>
GETCLOBVAL

Member function. Returns a CLOB containing the serialized XML representation; if the CLOB returned is temporary, it must be freed after use.

Syntax

MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns NULL if the input is a fragment or is a non-schema based instance.

Syntax

MEMBER FUNCTION getNamespace
return varchar2 deterministic;
GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the XMLType instance. The XMLType must point to a valid text node that contains a numerical value. The options are described in the following table.

Syntax

MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
GETROOTELEMENT

Member function. Gets the root element of the XMLType instance. Returns NULL if the instance is a fragment.

Syntax

MEMBER FUNCTION getRootElement
return varchar2 deterministic;
GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the XMLType instance, if the XMLType instance is a schema-based document. Otherwise returns NULL.

Syntax
MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
GETSTRINGVAL

Member function. Returns the document as a string. Returns a string containing the serialized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the VARCHAR2, which is 4000, then an error is raised at run time.

Syntax

MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
ISFRAGMENT

Determines if the XMLType instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

Syntax

MEMBER FUNCTION isFragment()
RETURN number deterministic;
Member function. Determines whether the XMLType instance is schema-based or not. Returns 1 or 0 depending on whether the XMLType instance is schema-based.

Syntax

MEMBER FUNCTION isSchemaBased
return number deterministic;
ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

**Syntax**

```sql
member function isSchemaValid(
    schurl IN VARCHAR2 := NULL,
    elem IN VARCHAR2 := NULL
) return NUMBER deterministic;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schurl</td>
<td>(IN)</td>
<td>The URL of the XML Schema against which to check conformance.</td>
</tr>
<tr>
<td>elem</td>
<td>(IN)</td>
<td>Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.</td>
</tr>
</tbody>
</table>
Member function. Returns the validation status of the XMLType instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
SCHEMVALIDATE

Member procedure. Validates the XML instance against its schema if it hasn't already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

MEMBER PROCEDURE schemaValidate(
   self IF OUT NOCOPY XMLType);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>(OUT)</td>
<td>XML instance being validated against the schema.</td>
</tr>
</tbody>
</table>
Member function. Sets the VALIDATION state of the input XML instance.

Syntax

MEMBER PROCEDURE setSchemaValidated(
    self IF OUT NOCOPY XMLType,
    flag IN BINARY_INTEGER := 1);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>(OUT)</td>
<td>XML instance.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>0 - NOT VALIDATED; 1 - VALIDATED (Default)</td>
</tr>
</tbody>
</table>
TOOBJECT

Member procedure. Converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based XML, the procedure uses canonical mapping between elements and object type attributes.

Syntax

MEMBER PROCEDURE toObject(
SELF in XMLType,
object OUT '<ADT_1>',
schema in varchar2 := NULL,
element in varchar2 := NULL);

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELF</td>
<td>(IN)</td>
<td>Instance to be converted. Implicit if used as a member procedure.</td>
</tr>
<tr>
<td>object</td>
<td>(IN)</td>
<td>Converted object. An object instance of the required type may be passed in to this function</td>
</tr>
<tr>
<td>schema</td>
<td>(IN)</td>
<td>Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema. Caution: Oracle does not support use of types generated by Schema Registration (see Oracle XML DB Developer’s Guide).</td>
</tr>
<tr>
<td>element</td>
<td>(IN)</td>
<td>Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. Caution: Oracle does not support use of types generated by Schema Registration (see Oracle XML DB Developer’s Guide).</td>
</tr>
</tbody>
</table>
Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the parammap is NULL, then a NULL is returned.

**Syntax**

```sql
MEMBER FUNCTION transform(
    xsl IN XMLType,
    parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xsl</td>
<td>(IN)</td>
<td>The XSL stylesheet describing the transformation</td>
</tr>
<tr>
<td>parammap</td>
<td>(IN)</td>
<td>Top level parameters to the XSL - string of name=value pairs</td>
</tr>
</tbody>
</table>
### XMLTYPE

XMLType constructor. The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN Number := 0) return self as result deterministic;</td>
<td>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;</td>
<td>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>constructor function XMLType(xmlData IN &quot;w&lt;ADT_1&gt;&quot;, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic;</td>
<td>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</td>
</tr>
<tr>
<td>constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic;</td>
<td>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</td>
</tr>
<tr>
<td>constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable</td>
<td>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is “ANYDATA” if it is not.</td>
</tr>
<tr>
<td>constructor function XMLType(xmlData IN blob, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic</td>
<td>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</td>
</tr>
</tbody>
</table>
### Syntax

```
constructor function XMLType(
    xmlData IN bfile,
    csid IN number,
    schema IN varchar2 := NULL,
    validated IN number := 0,
    wellformed IN number := 0)
return self as result deterministic
```

This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type.</td>
</tr>
<tr>
<td>schema</td>
<td>Optional Schema URL to be used to make the input conform to the given schema. <strong>Caution:</strong> Oracle does not support use of types generated by Schema Registration (see <em>Oracle XML DB Developer’s Guide</em>).</td>
</tr>
<tr>
<td>validated</td>
<td>Indicates that the instance is valid to the given XML Schema.</td>
</tr>
<tr>
<td>wellformed</td>
<td>Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.</td>
</tr>
<tr>
<td>element</td>
<td>Optional element name in the case of the <code>ADT_1</code> or <code>REF CURSOR</code> constructors. (Default is <code>NULL</code>). <strong>Caution:</strong> Oracle does not support use of types generated by Schema Registration (see <em>Oracle XML DB Developer’s Guide</em>).</td>
</tr>
<tr>
<td>csid</td>
<td>The character set id of input XML data.</td>
</tr>
</tbody>
</table>
